1.0 INTRODUCTION

1.1 PURPOSE

As defined by Section 15050 of the California Environmental Quality Act (CEQA) Guidelines, the County of Los Angeles (County) is serving as "Lead Agency" for the preparation of the Environmental Impact Report (EIR) for the Centennial Project (Project). This Consolidated Final EIR presents the environmental information and analyses that have been prepared for the Project pursuant to CEQA, including comments received addressing the adequacy of the Draft EIR, and responses to those comments. The purpose of this Consolidated Final EIR is to: (1) respond to all comments received by the County regarding the environmental information and analyses contained in the Draft EIR during the official comment period, as required by CEQA; (2) while not required, respond to all further correspondence and testimony received by the County after the close of the official comment period but before the scheduled December 11, 2018 Board of Supervisors hearing; (3) provide in one place all clarifications, corrections, or minor revisions to the text, tables, figures, and appendices of the Draft EIR and Final EIR generated either from responses to comments or independently by the County, including those identified in the Final EIR published in May 2018, and those identified subsequent to publication of the Final EIR but before the scheduled December 11, 2018 Board of Supervisors hearing. Section 15132 of the CEQA Guidelines lists the required contents of the Final EIR:

(a) The Draft EIR or a revision of the Draft EIR

(b) Comments and recommendations received on the Draft EIR either verbatim or in summary.

(c) A list of persons, organizations, and public agencies commenting on the Draft EIR.

(d) The County's responses to significant environmental points raised in the review and consultation process.

(e) Any other information added by the County as Lead Agency.

This Consolidated Final EIR, in addition to the remainder of the record, will be used by the County of Los Angeles' Board of Supervisors in the decision-making process for the Project. The Draft EIR text has not been modified to reflect these clarifications, except as shown in Section 4.0 of this Consolidated Final EIR.

Section 15097 of the State CEQA Guidelines states that the lead agency shall adopt a program for monitoring or reporting on the revisions that it has required for the project and the measures it has imposed to mitigate or avoid significant environmental effects. The Project's Mitigation Monitoring and Reporting Program (MMRP), describes the mitigation program to be implemented by the County for the proposed Centennial Project. A draft of the MMRP was included in Appendix 2.0-C to the Draft EIR. A revised version of the MMRP was included in the Final EIR as Appendix 2.0-C.Rev. A further revised MMRP has been prepared for

consideration by the Board of Supervisors and has been provided as Appendix 2.0-C.Rev to this Consolidated Final EIR. The revised MMRP reflects changes and additions to mitigation measures generated in response to comments or independently by the County.

The County has reviewed all comments and has determined that no substantial new environmental issues have been raised and that all issues raised in the comments have been adequately addressed in the Draft EIR and/or in Responses to Comments (Section 2.0), Responses to Correspondence Received and Public Testimony Given After Close of Official Draft EIR Public Comment Period (Section 3.0), and/or the Clarifications and Revisions to the EIR (Section 4.0).

1.2 ENVIRONMENTAL REVIEW PROCESS

Draft EIR

Upon completion of the Draft EIR, notice of the public review period was given in accordance with Section 15087 of the State CEQA Guidelines. In May 2017, a Notice of Availability (NOA) was prepared and distributed to the State Office of Planning and Research, Los Angeles County Clerk, responsible and trustee agencies, organizations, interested parties, and all parties who requested a copy of the EIR in accordance with CEQA. The County decided to provide a voluntary extension beyond the CEQA-mandated 45-day public review period to provide ample opportunity and time for the public to review the Draft EIR. Thus, comments on the Draft EIR were accepted during a 60-day public review period extending from May 18, 2017 through July 17, 2017.

The NOA was distributed to the mailing list and email list prepared for the Notice of Preparation (NOP) for the scoping stage of the proposed Project before issuance of the Draft EIR and was augmented to include individuals requested to be added to the list, as well as individuals who had provided comments on the NOP. The NOA and Draft EIR were posted on the County's website for viewing and downloading at http://planning.lacounty.gov/case (type "Centennial" into the case archive search box).

Hardcopies of the Draft EIR were available for public viewing at the County of Los Angeles Department of Regional Planning located at 320 West Temple Street, Los Angeles, California, as well as the following locations:

Lancaster Regional Library

San Fernando Library
217 North Maclay Avenue
San Fernando, California 91340

Quartz Hill Library
5040 West Avenue M-2
Quartz Hill, California 93536

The Hearing Examiner's Meeting included a presentation overview of the Project and the conclusions of the Draft EIR on June 29, 2017, at 6:00 PM at Gorman Elementary School located at 49847 Gorman School Road in Gorman, California 93243. At this public meeting, the Hearing Examiner presented the case to the community and received testimony from the community on the Project and the Draft EIR. The public hearing was also advertised in the local newspapers (*The Signal* and *Antelope Valley Press*) on May 17, 2017, and a public notice was posted on the Project site on May 25, 2017. Hearing Examiner Staff Summary for the public hearing was posted online on June 15, 2017.[1]

Subsequently, in July 2017, in response to requests from the public to provide an additional extension of the public review period, a *Notice of Time Extension of Public Comment Period for the Centennial Project Draft Environmental Impact Report* (Notice) was posted online[2] and emailed to all persons and parties who specifically requested a time extension. This Notice extended the Draft EIR public review period from July 17, 2017, through August 16, 2017. This 30-day extension was in addition to the original 60-day Draft EIR public review period, resulting in a combined 90-day comment period. All written comments received on the Draft EIR from May 19, 2017 through August 28, 2017 are responded to in this document.

In summary, the County conducted all required noticing and scoping for the proposed Project in accordance with Section 15083 of the State CEQA Guidelines and conducted the public review for the Draft EIR in compliance with Section 15087 of the State CEQA Guidelines. The extension of the public review period until August 16, 2017, exceeded the requirements of CEQA.

During the comment period, written comments on the Draft EIR were received by the County of Los Angeles Chief Executive Office. The County reviewed all comments and determined that no substantial new environmental issues were raised and that all issues raised in the comments were adequately addressed in the Draft EIR and/or in the Responses to

1 Los Angeles, County of. 2017 (June 15). Hearing Examiner Staff Summary: "Centennial Specific Plan Project." Los Angeles, CA: County of. http://planning.lacounty.gov/assets/upl/case/sp_02-232_pm060022-staff-report.pdf.

Comments and Draft EIR Clarifications and Revisions, which are located in Sections 2.0 and 3.0 of the May 2018 Final EIR, respectively.

Final EIR

The Final EIR for the proposed Project, dated May 2018, consists of the following documents:

- Draft EIR and Technical Appendices dated May 2017
- Responses to Comments and Draft EIR Clarifications and Revisions, which include:
    - A list of all persons, organizations, and public agencies that commented as well as the verbatim comments received on the Draft EIR;
    - Responses to written comments on the Draft EIR, as well as to oral comments received at the Hearing Examiner's meeting on June 29, 2017; and
    - Other information beyond the scope of CEQA provided by the County for context and information to the decision makers, agencies, and the public.

The Appendices to the Final EIR include a combination of new documents generated either from responses to comments or independently by the County, and revisions to technical appendices that were a part of the Draft EIR, as summarized below.

- Appendix A, Form Letters, includes all comment letters that were prepared by an unknown source and made available to the public for submittal to the County. These form letters include comments that are repetitive but were provided by different senders. A total of 2,204 commenters submitted these form letters via email.
- Appendix B, NOP Comment Letters.
- Appendix 5.7-D, Ranch-wide Management Plan, is a publicly available document that was requested to be included in the Final EIR for ease of reference.
- Appendix 5.7-E, Tejon Ranch Conservancy Ranch-Wide Agreement, is a publicly available document that was requested to be included in the Final EIR for ease of reference.
- Appendix 5.7-F, Environmental Management Practices for Golf Courses Fact Sheet, is a publicly available document that was requested to be included in the Final EIR for ease of reference.
- Appendix 5.10-C, Centennial Specific Plan Supplemental Traffic Study, is a new analysis that was prepared in response to a comment letter received.
- Appendix 5.11-E, Supplemental Information Concerning Centennial Air Quality Analysis, is a new analysis that was prepared in response to a comment letter received.
- Appendix 5.12-C, Centennial Traffic Noise Study Addendum, is a new analysis that was prepared in response to a comment letter received.

- Appendix 2.0-C.Rev, Mitigation Monitoring and Reporting Program (Revised), includes revisions to the Draft EIR Appendix 2.0-C.
- Appendix 5.7-A.Rev, Plant and Wildlife Compendia (Revised), includes revisions to the Draft EIR Appendix 5.7-A.
- Appendix 4.0-A.Rev, Centennial Specific Plan (Revised), includes revisions to the Draft EIR Appendix 4.0-A.

Three of the above-listed Appendices (Appendices A, 2.0-C.Rev, and 4.0-A.Rev) have been revised since the publishing of the May 2018 Final EIR. The May 2018 versions of these appendices have not been reproduced in this Consolidated Final EIR but are available on the County's website for viewing and downloading at http://planning.lacounty.gov/case (type "Centennial" into the case archive search box).

Consolidated Final EIR

The Los Angeles Regional Planning Commission considered the EIR and the requested Project entitlements (Specific Plan No. 02-232, General Plan Amendment No. 02-232, Zoning Change No. 03-232, Development Agreement No. RPPL2016003940, Vesting Tentative Parcel Map No. 060022, Conditional Use Permit No. 02-232, and Environmental Review No. 02-232) at three public hearings. The first hearing was held on June 6, 2018 and included a presentation of an overview of the Project and the conclusions of the EIR. The Regional Planning Commission received testimony from the community on the Project and the EIR, and asked for further information to be presented at a second hearing. The second hearing was held on July 11, 2018 and it included presentation of minor EIR clarifications and responses to the Regional Planning Commission's requests, as well as testimony from the community on the Project and the EIR heard by the Regional Planning Commission, and a request for further information to be presented at a third hearing. The final hearing was held on August 29, 2018, during which final EIR clarifications and information were presented to the Regional Planning Commission and the Regional Planning Commission heard and considered testimony from the community. On August 29, 2018, the Regional Planning Commission voted to recommend approval of the requested Project entitlements, certification of the EIR, and adoption of CEQA Findings and a Statement of Overriding Considerations to the Board of Supervisors.

This document, the Consolidated Final EIR, has been prepared to provide the Board of Supervisors and the public a single document containing responses to all comments received during the official Draft EIR comment period and subsequently, as well as all clarifications, corrections, or minor revisions to the text, tables, figures, and appendices of the Draft EIR and Final EIR. These clarifications, corrections, or minor revisions have been identified from responses to comments or independently by the County and include those identified in the Final EIR published in May 2018 and those identified subsequent to publication of the Final EIR but before the scheduled December 11, 2018 Board of Supervisors hearing.

The Appendices to this Consolidated Final EIR are as follows:

A	Form Letters
B	NOP Comment Letters
5.7-D	Ranch-wide Management Plan
5.7-E	Tejon Ranch Conservancy Ranch-wide Agreement
5.7-F	Environmental Management Practices for Golf Courses Fact Sheet
5.10-C	Centennial Specific Plan Supplemental Traffic Study
5.11-E	Supplemental Information Concerning Centennial Air Quality Analysis
5.12-C	Centennial Traffic Noise Study Addendum
2.0-C.Rev	Mitigation Monitoring and Reporting Program (Revised)
4.0-A.Rev	Centennial Specific Plan (Revised)
5.7-A.Rev	Plant and Wildlife Compendia (Revised)

Three of the above-listed Appendices (Appendices A, 2.0-C.Rev, and 4.0-A.Rev) have been revised since the publishing of the May 2018 Final EIR. The May 2018 versions of these appendices have not been reproduced in this Consolidated Final EIR but are available on the County's website for viewing and downloading at http://planning.lacounty.gov/case (type "Centennial" into the case archive search box).

1.3 NEXT PROCEDURAL STEPS

This Consolidated Final EIR and related documents, as well as the Regional Planning Commission's recommendations, will be provided to the Board of Supervisors. The Consolidated Final EIR and requested Project entitlements will then be available for consideration on the December 11, 2018 Board of Supervisors agenda. Consideration of recommendations relating to the proposed Project will be publicly noticed as required by state law.

Members of the public can view searchable agendas for scheduled Board of Supervisors meetings and access agenda-related County information and services directly on the following website: http://bos.lacounty.gov/Board-Meeting/Board-Agendas. This site has an email notification service enrollment process for copies of future Board of Supervisors agendas. The Final EIR document was posted in May 2018 and this Consolidated Final EIR will be posted for viewing and download with the previously posted Draft and Final EIRs prior to the County's consideration of the EIR and Project recommendations on the County's website: http://planning.lacounty.gov/case (type "Centennial" into the case archive search box).

1.4 FORMAT OF CONSOLIDATED FINAL EIR

Section 2.0 – Responses to Comments: Section 15088 of the CEQA Guidelines requires that the lead agency evaluate comments on environmental issues received from persons and agencies that reviewed the Draft EIR and prepare a written response addressing the comments received during the official comment period. In Section 2.0, Response to Comments, which were received during the 90-day official Draft EIR comment period ending August 16, 2017, of this Consolidated Final EIR, each comment letter received has been

categorized and labeled in alphabetical order, then divided into sequential numbered comments (i.e., category A, Letter A.1, Comments A.1-1, A.1-2, A.1-3 etc.). A copy of each numbered comment letter and a lettered response to each comment are provided in Section 2.0. A list of agencies and interested parties who commented on the Draft EIR during the official comment period is provided below in Section 1.5. In addition to the 91 comment letters listed in the table set forth in Section 1.5, 2,204 commenters submitted a form letter comment via email. The response to these form letters is also provided in Section 2.0 of this Consolidated Final EIR. All form letters were included as Appendix A to the Final EIR. For continuity, this section, 2.0, is reproduced exactly as it appears in the Final EIR.

Section 3.0 – Responses to Correspondence Received and Public Testimony Given After Close of Official Draft EIR Public Comment Period: Following publication of the Final EIR, the County continued to receive correspondence from the public addressing the Project and the EIR. While not required by CEQA, responses were prepared to every piece of correspondence received subsequent to publication of the Final EIR. In Section 3.0, each of these subsequent pieces of correspondence has been categorized and labeled in alphabetical order, then divided into sequential numbered comments (i.e. category F, Letter ADD-F.1, Comments ADD-F.1-1, ADD-F.1-2, ADD-F.1-3, etc.). A copy of each numbered piece of correspondence and a lettered response to each item of correspondence are provided in Sections 3.1, 3.3, 3.5, and 3.7 of this Consolidated Final EIR. A list of agencies and interested parties who have submitted Project or EIR-related correspondence to the County subsequent to publication of the Final EIR is also included. Section 3.0 also provides responses to all public testimony heard by the Regional Planning Commission at each of its three hearings on the Project and the EIR, in Sections 3.2, 3.4, and 3.6.

Section 4.0 – Clarifications and Revisions to the EIR: Section 4.0, Clarifications and Revisions to the EIR, includes all additions or corrections to the Draft EIR text, tables, and figures (Section 4.1), and corrections to the Final EIR (Section 4.2), generated either from responses to comments and Regional Planning Commission requests, or independently by the County. The clarifications and revisions to the EIR contained in the following pages are in the same order as the information appears in the EIR. Changes in text are signified by strikeouts (~~strikeouts~~) where text has been removed and by double underlining (<u>underline</u>) where text has been added. Further changes identified subsequent to the publication of the May 2018 Final EIR but before the December 11, 2018 Board of Supervisors hearing have been identified as such.

Finally, Section 4.3, Conformed and Annotated Draft EIR Section 5.21, *Climate Change*, of this Consolidated Final EIR, compiles into a single document all revisions made to Chapter 5.21 of the Draft EIR following the May 2017 publication of the Draft EIR for clarification and ease of reference. All such revisions made <u>after publication of the Draft EIR and prior to publication of the Final EIR</u> were initially disclosed in Final EIR, Section 3.0, *Draft EIR Clarifications and Revisions*. All such revisions made <u>after publication of the Final EIR</u> are also shown in Section 4.1 of this Consolidated Final EIR. The conformed and annotated version of Chapter 5.21 compiles all such revisions into a single document.

Section 4.3 of this Consolidated Final EIR also sets forth a series of annotations that explain the conclusions of the *Updated Greenhouse Gas Calculations for the Centennial Project Final Environmental Impact Report* (the "Updated GHG Report") presented to the Regional Planning Commission at its August 29, 2018 hearing and to the Board of Supervisors at its December 11, 2018 Project hearing.

Draft EIR revisions are provided to clarify, refine, and provide supplemental information to the Draft EIR, and are incorporated as part of this Consolidated Final EIR. Changes made in the Final EIR and further changes made since publication of the Final EIR do not constitute substantial new information that requires recirculation of the Draft EIR pursuant to Section 15088.5 of the State CEQA Guidelines. The California Environmental Quality Act (CEQA) requires recirculation of an environmental impact report (EIR) only when "new significant information is added to the EIR" after the EIR is circulated for public review but before the EIR is certified. CEQA Guidelines § 15088.5 (a); see also CEQA § 21092.1. "Significant new information" can include the following disclosures: (1) a new significant environmental impact that would result from the project or from a new proposed mitigation measure; (2) a substantial increase in the severity of an environmental impact unless mitigation measures are adopted that reduce the impact to a level of insignificance; (3) a feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the project's environmental impacts, but the project's proponents decline to adopt it; or (4) when a draft EIR is so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. (CEQA Guidelines § 15088.5[a]) However, "new information" added to the EIR is not "significant unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement." (CEQA Guidelines § 15088.5[a]; *Laurel Heights Improvement Assn. of San Francisco, Inc. v. Regents of the Univ. of Cal*. [1993] 6 Cal.4th 1112, 1129; *Center for Biological Diversity v. Cal. Dept. of Forestry and Fire Protection* [2014] 232 Cal.App.4th 931, 949) When the Legislature drafted the requirements for recirculating an EIR, the Legislature intended to balance the goal of promoting meaningful public participation with the goal of protecting against endless rounds of revisions and recirculation. (*Laurel Heights* at 1132) "Recirculation was intended to be an exception, rather than the general rule." (*Id*.)

Recirculation is not required when new information is added that "merely clarifies or amplifies or makes insignificant modifications in an adequate EIR." (CEQA Guidelines § 15088.5[b]) The response to comments received on the Draft and Final EIRs include additional information to clarify information or make minor modifications to the EIR. Recirculation of the Draft EIR is not required because the new information added to the EIR through these modifications clarifies or amplifies information already provided or makes insignificant modifications to the already adequate Draft EIR. While these additions to the EIR provide valuable information by which to evaluate the environmental impacts of the Project, and include clarification and insignificant modifications to the EIR, they do not trigger recirculation under the standard articulated in the Guidelines or in *Laurel Heights*. The information added to the EIR does not reveal any potentially new significant impacts which had not been previously analyzed. Similarly, information in the EIR demonstrates that

the new and revised mitigation measures are feasible and will adequately mitigate impacts discussed in the EIR; these measures generally have been made more protective of the environment. Recirculation is not required here.

1.5 LIST OF COMMENTERS

The Table below presents a summary listing of all comment letter received during the official 90-day Draft EIR comment period, including the commenting agency/individual; the assigned numbering for each comment letter; the date of the correspondence; and the page number where the comment letter can be found in Section 2.0 of this Consolidated Final EIR.

As presented in the Table below, J.1, Public Hearing Transcript and Responses includes a transcript of the Hearing Examiner public hearing, which is a text translation of the verbal presentation made by County staff and the verbal comments made by various members of the public.

As presented in Table 1-1 below, G.31, Form Letter 1 – Various Commenters and H.21, Form Letter 2 – Various Commenters include the responses to numerous form letters, included in Appendix A of the Final EIR. The majority of the form letters are exact duplicates of the same letter, with only the name of the sender and their zip code being different. Out of 2,204 form letters received, 99 were modified by the commenter to include additional comments. The additional comments addressed in these modified form letters have been addressed in responses to Comments G.31 and H.21 in Section 2.0 of the Final EIR.

In summary, a total of 2,295 comment letters on the Draft EIR was received by the County during the official 90-day comment period, including 91 letters from agencies, organizations, and individuals, and 2,204 emailed form letters. Of the 2,204 form letters submitted, 79 were duplicate form letter submissions.

* Comment submitted after 5 PM on final day of public review period.			

Correspondence received by the County subsequent to the publication of the Final EIR is listed in Section 3.0 of this Consolidated Final EIR.

2.0 RESPONSES TO COMMENTS

All comment letters received by the County and oral testimony received at the June 29, 2017 Hearing Examiner's meeting have been included and responded to in this Final EIR. Comments that raise environmental issues have been thoroughly addressed in these responses. Comments that do not require a response include those that (1) do not address the adequacy or completeness of the Draft EIR; (2) do not raise environmental issues; (3) do not address the proposed project; or (4) request the incorporation of additional information not relevant to environmental issues.

Section 15088 of the CEQA Guidelines, Evaluation of and Response to Comments, states:

a) The lead agency shall evaluate comments on environmental issues received from persons who reviewed the draft EIR and shall prepare a written response. The lead agency shall respond to comments received during the noticed comment period and any extensions and may respond to late comments.

b) The lead agency shall provide a written proposed response to a public agency on comments made by that public agency at least 10 days prior to certifying an environmental impact report.

c) The written response shall describe the disposition of significant environmental issues raised (e.g., revisions to the proposed project to mitigate anticipated impacts or objections). In particular, the major environmental issues raised when the Lead Agency's position is at variance with recommendations and objections raised in the comments must be addressed in detail giving reasons why specific comments and suggestions were not accepted. There must be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice.

d) The response to comments may take the form of a revision to the draft EIR or may be a separate section in the final EIR. Where the response to comments makes important changes in the information contained in the text of the draft EIR, the lead agency should either:

    1. Revise the text in the body of the EIR; or

    2. Include marginal notes showing that the information is revised in the response to comments.

Revisions to the Draft EIR have been prepared to make clarifications, corrections, or minor revisions to the text, tables, figures, and appendices of the Draft EIR generated either from responses to comments or independently by the County. Therefore, this Response to Comments section, along with the Section 3.0, Draft EIR Clarifications and Revisions, are included in this Final EIR along with the Draft EIR for consideration by the County of Los

Angeles prior consideration of whether to approve, revise, or deny the Project and/or the Final EIR.

Section 15088.5, Recirculation of an EIR Prior to Certification, of the CEQA Guidelines, states:

> (a) A lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review under Section 15087 but before certification. As used in this section, the term "information" can include changes in the project or environmental setting as well as additional data or other information. New information added to an EIR is not "significant" unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement. "Significant new information" requiring recirculation includes, for example, a disclosure showing that:
>
> (1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
>
> (2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
>
> (3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project's proponents decline to adopt it.
>
> (4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.
>
> (b) Recirculation is not required where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications in an adequate EIR.
>
> (c) If the revision is limited to a few chapters or portions of the EIR, the lead agency need only recirculate the chapters or portions that have been modified.
>
> (d) Recirculation of an EIR requires notice pursuant to Section 15087, and consultation pursuant to Section 15086.
>
> (e) A decision not to recirculate an EIR must be supported by substantial evidence in the administrative record.

(f) The lead agency shall evaluate and respond to comments as provided in Section 15088. Recirculating an EIR can result in the lead agency receiving more than one set of comments from reviewers. The following are two ways in which the lead agency may identify the set of comments to which it will respond. This dual approach avoids confusion over whether the lead agency must respond to comments which are duplicates or which are no longer pertinent due to revisions to the EIR. In no case shall the lead agency fail to respond to pertinent comments on significant environmental issues.

(1) When an EIR is substantially revised and the entire document is recirculated, the lead agency may require reviewers to submit new comments and, in such cases, need not respond to those comments received during the earlier circulation period. The lead agency shall advise reviewers, either in the text of the revised EIR or by an attachment to the revised EIR, that although part of the administrative record, the previous comments do not require a written response in the final EIR, and that new comments must be submitted for the revised EIR. The lead agency need only respond to those comments submitted in response to the recirculated revised EIR.

(2) When the EIR is revised only in part and the lead agency is recirculating only the revised chapters or portions of the EIR, the lead agency may request that reviewers limit their comments to the revised chapters or portions of the recirculated EIR. The lead agency need only respond to (i) comments received during the initial circulation period that relate to chapters or portions of the document that were not revised and recirculated, and (ii) comments received during the recirculation period that relate to the chapters or portions of the earlier EIR that were revised and recirculated. The lead agency's request that reviewers limit the scope of their comments shall be included either within the text of the revised EIR or by an attachment to the revised EIR.

(3) As part of providing notice of recirculation as required by Public Resources Code Section 21092.1, the lead agency shall send a notice of recirculation to every agency, person, or organization that commented on the prior EIR. The notice shall indicate, at a minimum, whether new comments may be submitted only on the recirculated portions of the EIR or on the entire EIR in order to be considered by the agency.

(g) When recirculating a revised EIR, either in whole or in part, the lead agency shall, in the revised EIR or by an attachment to the revised EIR, summarize the revisions made to the previously circulated draft EIR.

The Draft EIR revisions and information presented in the responses to comments do not result in any of the conditions set forth in Section 15088.5 of the State CEQA Guidelines requiring that the EIR be recirculated prior to its certification. Although CEQA requires recirculation of an EIR when "new significant information is added to the EIR" after the EIR is circulated for public review and before it is certified, "new information" added to the EIR "is not significant unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement." CEQA Guidelines § 15088.5(a); *Laurel Heights Improvement Assn. of San Francisco, Inc. v. Regents of the Univ. of Cal.* (1993) 6 Cal.4th 1112, 1129 ("*Laurel Heights*"). When the Legislature drafted the requirements for recirculating an EIR, the Legislature intended to balance the goal of promoting meaningful public participation with the goal of protecting against endless rounds of revisions and recirculation.[3] "Recirculation was intended to be an exception, rather than the general rule."[4]

Recirculation is not required when new information is added that "merely clarifies or amplifies or makes insignificant modifications in an adequate EIR."[5] In response to comments received on the Draft EIR, this EIR includes additional information to clarify information or make minor modifications to the EIR. The EIR includes additional new appendices which contain updated or clarifying information on air quality, water quality, biology, traffic, noise and other topics. The EIR also includes new and revised mitigation measures. While these additions to the EIR provide valuable information by which to evaluate the environmental impacts of the Project, and include clarification and insightful modifications to the EIR, they do not trigger recirculation under the standard articulated in the CEQA Guidelines or in *Laurel Heights*.

This determination is consistent with a line of cases in which courts have considered whether certain new types of information warrant recirculation and determined that they did not. *Silverado Modjeska Recreation & Park Dist. V. County of Orange* (2011) 197 Cal.App.4th 282 (holding that an EIR need not be recirculated because of new information about the proximity of sensitive toad larvae to the project site when the earlier analysis had assumed that the toad was present near the project); *Clover Valley Found. v. City of Rocklin* (2011) 197 Cal.App.4th 200 (finding that specific information added to the final EIR about cultural resource sites added narrative detail about the resources' characteristics but did not add new substantial information affecting the EIR's findings relating to significant impacts); *Marin Mun. Water Dist. v. KG Land Cal. Corp.* (1991) 235 Cal.App.3d 1652 (EIR on district's moratorium on water hookups did not need to be recirculated because of new information that moratorium would be extended by additional five years). Like the examples cited above, the information added to the EIR does not reveal any potentially new significant impacts which had not been previously analyzed. Similarly, information in the EIR demonstrates that the new and revised mitigation measures are feasible and will adequately mitigate impacts discussed in the EIR. Recirculation is not required here.

5 CEQA Guidelines § 15088.5(b)

2.1 RESPONSES TO COMMENT LETTERS RECEIVED

This section includes responses to Draft EIR comments received by the County. With respect to comments letters received, aside from certain courtesy statements, introductions, and closings, individual comments within the body of each letter have been identified and numbered. Brackets delineating the individual comments and a numeric identifier have been added to the right margin of the letter. Responses to each bracketed comment are included on the page(s) following each comment letter.

Any general reference or revision to an exhibit, appendix, page, or table described in the responses to comments below are intended to refer to the Draft EIR, unless otherwise specified.

Responses to comments were sent to the agencies, organizations, and individuals that provided comments at least 10 days prior to the County's consideration of the Final EIR. None of the comments or responses constitute "significant new information" or any of the conditions set forth in Section 15088.5 of the State CEQA Guidelines that would require recirculation of the Draft EIR.

A.1

File Code: 2350
Date: July 12, 2017

Mr. Jodie Sackett
County of Los Angeles Dept. of Regional Planning
Hall of Records, 13th Floor, Room 1348
320 West Temple Street
Los Angeles, CA 90012

Subject: Centennial Project, Draft Environmental Impact Report (DEIR)

Dear Mr. Sackett,

The concerns outlined in this letter focus on the Pacific Crest National Scenic Trail (PCT) and the access and recreation opportunities that could be improved through the project area. A.1-1

Overview:
The PCT was designated by Congress as a National Scenic Trail in 1968 and its route location was published in the Federal Register in 1973. This published route generally matches the route currently proposed through Tejon Ranch and under discussion by Tejon Ranch Company (TRC), the Tejon Ranch Conservancy (Conservancy), the U.S. Forest Service (USFS) and Pacific Crest Trail Association (PCTA). The route through the Ranch would be approximately 38 miles in length including the Centennial project along 300th Street West. This route provides a significantly improved trail experience by moving it out of the desert road walk and into spectacular oak savannah landscapes. A.1-2

All parties have worked diligently to determine a viable route and we have requested to TRC and the Conservancy that a conveyance agreement for a trail easement be executed by December 31, 2017 in order for us to move forward with the environmental analysis that would be required to construct the trail.

Specific Comments regarding Exhibit 5.14-2, Figure 3-40, and additional map needed:

- The DEIR has several references to Exhibit 5.14-2 which is supposed to depict the existing (interim location) of the trail - which it does not. The FEIR should include a corrected map. A.1-3

- The Exhibit 5.14-2 map indicates an underpass under Hwy 138 west of the intersection with 300th Street West. Figure 3-40 of the Centennial Specific Plan depicts a conceptual 10 ft. wide x 12 ft. high Trail Underpass, but is not included in the DEIR. The USFS minimum standard for an underpass with equestrian use is 10 ft. wide x 12 ft. high. If feasible, expanding the width and height of the underpass would be preferred. A.1-4

- There are no maps that depict the proposed 38 mile PCT Trail Alignment and/or existing 10,000 acre conservation viewshed easement connecting Tejon Ranch's other conserved lands north and south to the Centennial Project. This would help FEIR reviewers to understand the connection and reasonably foreseeable actions of moving the trail from its existing location on the floor of Antelope Valley to the crest of the Tehachapi Mountains. A.1-5

Mitigation Requirements

1. *Overlap of the 10,000-acre PCT Viewshed easement and the Area 1 off-site mitigation*

   The 10,000 acre conservation viewshed easement TRC dedicated in 2014 appears to overlap onto Area 1 of the proposed Off-Site Mitigation Preserves south of Hwy 138. Where the rest of the 10,000 acre conservation easement to the north of the project appears to be outside of the proposed Preserves (Areas 2-6). The FEIR should clarify/discuss the compatibility of the Trail easement inside Preserve Area #1. We believe the off-site mitigation preserves found in exhibit 4-12 are critical to the quality of key areas of the PCT relocation, with substantial public value. A.1-6

2. *300th Street Easement Dedication for the PCT*
   The DEIR states an area will be reserved for the PCT along the west side of 300th Street West through the Centennial project. The United States through the US Forest Service will need to hold easement rights prior to funds being expended for NEPA compliance and trail construction. This was agreed upon in 2008 in the Tejon Ranch Conservation and Land Use Agreement found at: https://www.sec.gov/Archives/edgar/data/96869/000119312508138009/dex1028.htm A.1-7

   Note: Where the 300th Street West and the potential PCT alignment traverse through the inholding there should be an interim provision for the trail to be within the street right-of-way. The FEIR should discuss what street improvements will be made to 300th Street West through this inholding area connecting back to the Centennial Project to the north. A.1-8

3. *Mitigation Measure MM13-4* which states a block wall shall be installed along the rear of structures abutting the trail and a 34 ft. landscaped setback along 300th Street West.

   Providing a Figure in the FEIR depicting a typical cross section of the PCT along 300th Street West with set-back measurements, screening wall, vegetation plantings and separate bike path would help to analyze visual impacts. For instance Figure 3-39 of Centennial Specific Plan depicts a typical cross section of the PCT, but is not included in the DEIR. A.1-9

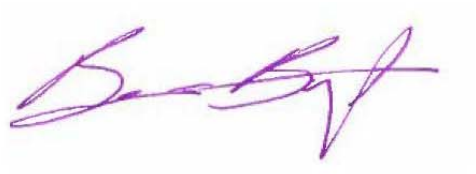
4. *Provisions for Recreation:*
   The FEIR should consider a mitigation/provision for a shade structure with water along the 300th St. West to benefit both PCT travelers and other recreationists. A.1-10

The PCT is open to foot and horse travel and closed to motorized and mechanized (bicycle use). Any connections to other trail systems should be designed to minimize potential conflicts or illegal use on the trail. A.1-11

Proposed structures adjacent to the PCT such as the waste water treatment facility, water transmission and management facilities, school and park, have the potential to negatively impact the trail. Additional mitigation measures should be considered if these proposed locations are selected. A.1-12

If you have additional questions, please contact Beth Boyst, Pacific Crest Trail Program Manager at bboyst@fs.fed.us or 707-562-8881. A.1-13

Sincerely,



BETH BOYST
Pacific Crest National Scenic Trail Manager

Responses to Comment Letter A.1
U.S. Forest Service, Pacific Southwest Region
July 12, 2017

Response to Comment A.1-1:

Thank you for your participation in this public process. The comment is acknowledged and will be included as part of the record. Because the comment does not raise a specific concern regarding the content of the Draft EIR, no further response is required.

Response to Comment A.1-2:

The Draft EIR includes a complete description of the Pacific Crest National Scenic Trail (PCT), its existing alignment, proposed alignment, and its federal designation as a National Scenic Trail.[6] Consistent with this comment, the Draft EIR further explains that the Forest Service, the Pacific Coast Trail Association (PCTA), the Tejon Ranch Conservancy (Conservancy), and the Tejon Ranch Company (TRC) are in ongoing discussions regarding an alternative realignment for the PCT. It is noted the Centennial Project accommodates a request from the PCTA made after Centennial Specific Plan preparation began, and as such it is assumed the PCTA was aware that a large master-planned community was proposed along a section of 300th Street West at the time the request to include space for the realigned PCT was made. The Forest Service, the PCTA, the Conservancy, and the Tejon Ranch Company are discussing the relocation of the existing segment of the PCT that currently crosses Lancaster Road at 270th Street West approximately two miles east-southeast of the Project site so that it is generally aligned along 300th Street West between SR-138 and the northeastern corner of the Project site, as shown on Draft EIR Exhibit 5.14-2.[7] A portion of the western right-of-way of 300th Street West has been reserved for the conceptual PCT realignment where this conceptual realignment is contiguous with a portion the Project site and where it bisects the northeastern corner of the site.[8] An appropriate buffer would be a buffer between the easement and Project development in the easternmost areas of the site.[9]

To facilitate the PCT realignment described in the Draft EIR, TRC has granted to the Conservancy two conservation easements that would preserve in perpetuity the conservation values of those portions of Tejon Ranch land located outside of the Project boundary and through which the proposed PCT alignment would extend. (See, Kern County Official Records Doc. #'s 214047995, 20140445960 ("Conservation Easements")). Both conservation easements expressly acknowledge that the Forest Service, the Conservancy, and TRC are in ongoing discussions regarding an alternative realignment for the PCT, and that TRC intends to convey to the Forest Service a perpetual trail easement for the construction, maintenance, and use of the PCT on the property covered by the conservation easements. (See Conservation Easements, Recital G.) Moreover, the Conservation Easements

6 Los Angeles County Department of Regional Planning (DRP). 2017 (May). *Centennial Project Draft Environmental Impact Report* (pp. 5.14-13, 14). Los Angeles, CA: DRP.
7 *Id.,* p. 5.14-14
8 Ibid.
9 *Id.,* Exhibit 4-10a

both expressly authorize public recreational use of the PCT on the conservation easement property and permit TRC to grant the trail easement to the Forest Service. (See, Conservation Easements Sections 6(b)(2)(O)). Both Conservation Easements further acknowledge that, in October 2009, PCTA and Forest Service, among other parties, entered into a Memorandum of Understanding that delegates to PCTA certain responsibilities for the construction, maintenance and use of that segment of the PCT alignment to be located on the Conservation Easement property. (See, Conservation Easements, Recital G.)

As explained in the Draft EIR, the proposed realignment of the PCT to the west side of 300th Street West through the Project site is not part of the Project, as it is not being proposed by the Project Applicant/Developer.[10] Indeed, the PCT realignment will be subject to a separate permitting and environmental review process prior to its implementation. However, construction of the trail within the 300th Street West right of way is considered a component of the Project development for purposes of this EIR.[11] Thus, the proposed PCT realignment, as depicted on Draft EIR Exhibit 4-10a, is assumed to be the future alignment through the Project site for evaluation purposes in the Draft EIR and is depicted on the Project's Recreation and Trails Plan.[12] Moreover, the Draft EIR analysis includes consideration of the Project's potential impacts on the PCT and its users.[13] The Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043) (AVAP EIR) also considered the environmental effects on the PCT associated with buildout of the Project site in accordance with the Antelope Valley Area Plan.[14]

Response to Comment A.1-3:

Exhibit 5.14-1 shows the existing location of the PCT, and references to Exhibit 5.14-2 were in error. The following revision has been made to the third sentence in the third full paragraph on page 5.14-12:

> Exhibit 5.14-~~2~~1 depicts the existing alignment of the PCT.

Any other references in the Draft EIR to the PCT being illustrated on Exhibit 5.14-2 are similarly revised to refer to Exhibit 5.14-1.

Response to Comment A.1-4:

This comment confirms that the conceptual trail underpass depicted on Figure 3-40 of the Specific Plan included as Appendix 4.0-A in the Draft EIR complies with the USFS minimum standard for an underpass with equestrian use. The request regarding the scale of the underpass is acknowledged and will be taken into consideration in the future design process. The comment will be included as part of the record and made available to the Regional

14 Los Angeles County Department of Regional Planning (DRP). 2014a (August). *Antelope Valley Area Plan, Draft Environmental Impact Report, State Clearinghouse # 2014061043* (pp. 3-2; 4-15; 5.15-6; 5.15-11 to -16; 5.16-5; Figure 5.15-1). Los Angeles, CA: DRP. http://planning.lacounty.gov/tnc/environmental/.

Planning Commission and Board of Supervisors prior to a final decision on the proposed Project.

The PCT trail alignment is also discussed in Section 5.15 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and in Section 3.16 of the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (SCH # 2015031035). Please consult those documents for additional information germane to this topic.

The Centennial Specific Plan is included in its entirely as Appendix 4.0-A of the Draft EIR; therefore, Figure 3-40 of the Specific Plan is included in the Draft EIR.

Response to Comment A.1-5:

As discussed in response to Comment A.1-2, the proposed realignment of the PCT to the west side of 300th Street West through the Project site is not part of the Project, as it is not being proposed by the Project Applicant/Developer.[15] Indeed, the PCT realignment will be subject to a separate permitting and environmental review process prior to its implementation. However, construction of the trail within the 300th Street West right of way is considered a component of the Project development for purposes of this EIR.[16] Thus, the proposed PCT realignment, as depicted on Draft EIR Exhibit 4-10a, is assumed to be the future alignment through the Project site for evaluation purposes in the Draft EIR and is depicted on the Project's Recreation and Trails Plan in order to help the public and County decision makers understand the relationship between the proposed Project and the proposed PCT trail alignment through the Project site.[17] Exhibit 4.10a also depicts the PCT trail alignment as it extends north and south of the Project site to provide additional locational context. Since the PCT trail realignment project is a separate project that will be subject to a separate environmental review and permitting process, and since the trail realignment is not being proposed by the Project Applicant/Developer but accommodates a request from the PCTA regarding the location of a realigned PCT made after Centennial Specific Plan preparation began, the EIR is not required to depict the entire 38-mile trail realignment, the vast majority of which will occur outside of the Project site boundary.

The proposed PCT trail realignment is also discussed in Section 5.15 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.16 of the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035). Please see those documents for further information on this topic.

Response to Comment A.1-6:

The comment correctly states that a portion of the proposed Pacific Crest Trail (PCT) realignment overlaps Area 1 of the Mitigation Preserve. The proposed realignment will shift

15 DRP 2017, p. 4-19
16 Ibid.
17 *Id.,* Exhibit 4-10a

the PCT from its current location along the eastern boundary of Area 1 to a more southerly position running from 300th street southward through the Mitigation Preserve then continuing southward. The Draft EIR shall be modified to include specific language indicating that the goals of the Mitigation Preserve and the Pacific Crest Trail are compatible, and that applicable mitigation measure minimizing impacts of trails shall specifically identify the PCT.

In response to this comment, the following text is hereby added immediately following the last full paragraph on Draft EIR page 5.7-136:

> The resources preserved in the reserve area, when supplemented by individual programs for special-status resources, would mitigate all significant impacts to biological resources on the Project site.
>
> The Mitigation Preserve contains existing uses such as trails and access roads, as well as the proposed realignment of the Pacific Crest Trail. The uses mentioned here are consistent with the goals of the mitigation preserve. MM 7-17 includes a public awareness program which includes signage denoting sensitive areas. These project requirements are expected to minimize disturbances associated with trail usage and human activity within and adjacent to the Mitigation Preserve.

Additionally, the following text is hereby added to MM 7-17 on Draft EIR pages 5.7-192 and 5.7-193:

> This program shall include signs that identify the boundaries of ecologically sensitive areas (including the avoided special status plant populations described in MM 7-1); the use of temporary, wildlife-friendly fencing around sensitive areas that appear to be receiving a high level of disturbance until the disturbance is reversed; and promotion of public education and awareness of such areas. In addition to signage being located along the boundaries of the Mitigation Preserve, signage denoting the boundaries of ecologically sensitive areas and other pertinent information shall be included along the Pacific Crest Trail where it overlaps the Mitigation Preserve.

Response to Comment A.1-7:

As discussed in response to Comment A.1-2, the proposed realignment of the PCT to the west side of 300th Street West through the Project site is not part of the Project, as it is not being proposed by the Project Applicant/Developer.[18] However, construction of the trail within the 300th Street West right of way is considered a component of the Project development for purposes of this EIR.[19] As this comment accurately notes, to facilitate the PCT realignment, TRC has granted to the Conservancy two conservation easements that would preserve in perpetuity the conservation values of those portions of Tejon Ranch land located outside of the Project boundary and through which the proposed PCT alignment would extend. (See,

[18] *Id.,* p. 4-19
[19] Ibid.

Kern County Official Records Doc. #'s 214047995, 20140445960 ("Conservation Easements")). Both conservation easements expressly acknowledge that the Forest Service, the Conservancy, and TRC are in ongoing discussions regarding an alternative realignment for the PCT, and obligate TRC to convey to the Forest Service a perpetual trail easement for the construction, maintenance, and use of the PCT on the property covered by the conservation easements. (See, Conservation Easements, Recital G.) Moreover, in October 2009, PCTA and Forest Service, among other parties, entered into a Memorandum of Understanding that delegates to PCTA certain responsibilities for the construction, maintenance and use of that segment of the PCT alignment to be located on the Conservation Easement property. (See, Conservation Easements, Recital G.)

As discussed in response to Comment A.1-5, the anticipated PCT trail alignment through the Project site is depicted on Draft EIR Exhibit 4-10a. The PCT trail alignment through the Project site is also included in the Centennial Specific Plan's Parks and Recreation Plan and depicted on the Centennial Conceptual Recreation and Trail Plan set forth a Specific Plan Figure 3-32.[20] As explained in the Draft EIR and Specific Plan, the proposed PCT alignment through the Project would enter the Project site from the north at 300th Street West, follow along the street south and connect to the Angeles National Forest southeast of the Project site.[21] A typical cross-section of the PCT along 300th Street West is depicted on Figure 3-39 of the proposed Specific Plan, and a conceptual SR-138 PCT underpass is depicted on Figure 3-40 of the proposed Specific Plan.[22] As shown on Specific Plan Figure 3-39, the PCT alignment along 300th Street West would be separated from the street by a landscaped Project multi-purpose path that would accommodate pedestrians and bicyclists in order to avoid conflicts with hiking and equestrian uses on the PCT alignment.

As discussed in Section 4.0 of the proposed Specific Plan, tentative subdivision maps and tentative map process will be used to establish the precise location of land use designations and street locations, and all map applications must include a detailed site plan depicting the use, location, and size of all improvements included in the mapped area, including streets and trails.[23] It is anticipated that the full 300th Street West right-of-way, inclusive of the PCT and Project multi-purpose path alignments, will be offered for dedication to the County as part of future tentative map applications, subject to a PCT trail easement, license or comparable property interest in favor of the Forest Service and/or PCTA encumbering the PCT alignment depicted on such tentative maps.

Response to Comment A.1-8:

As this comment correctly notes, the 300th Street West alignment through the Project site is bisected by inholding property that is not a part of the Project site and is owned by a third party (Inholding Property), as shown on Draft EIR Exhibit 4-7, Centennial Project – Circulation Plan. As discussed in response to Comment A.1-2, the proposed realignment of the PCT to the west side of 300th Street West through the Project site is not part of the Project,

20 *Id.,* Appendix 4.0-A, pp. 3-74, -88
21 *Id.,* p. 4-39; Appendix 4.0-A, p. 3-88
22 *Id.,* Appendix 4.0-A, pp. 3-90, -91
23 *Id.,* Appendix 4.0-A, pp. 4-7, -12

as it is not being proposed by the Project Applicant/Developer.[24] However, construction of the trail within the site's 300th Street West right of way is considered a component of the Project development for purposes of this EIR and the 300th Street West alignment through the Project site was included in the Project impact area assumed by the EIR.[25]

In February 2007, the owner of the "inholding area" described in this comment granted to the Project Applicant/Developer an easement encumbering a portion of inholding land adjacent to 300th Street West for the purpose of constructing, repairing, maintaining a pedestrian and equestrian trail for the use and enjoyment of the general public, which easement was recorded in the Official Records of Recorder's Office of Los Angeles County as document number 20070330445 (Inholding Trail Easement). The Inholding Trail Easement expressly provides that the Inholding Trail Easement may be conveyed by the Project Applicant/Developer to the Forest Service and shall become part of the PCT. It is anticipated that the Project Applicant will convey the Inholding Trail Easement to the Forest Service in conjunction with its conveyance of the PCT trail easement within Project site in accordance with the ongoing discussions between the Project Applicant/Developer and the Forest Service discussed in response to Comment A.1-7.

As discussed in response to Comment A.1-7, tentative subdivision maps and tentative map process will be used to establish the precise location of land use designations and street locations, and all map applications must include a detailed site plan depicting the use, location, and size of all improvements included in the mapped area, including streets and trails.[26] A typical cross-section of the PCT along 300th Street West showing proposed improvements is depicted on Figure 3-39 of the proposed Specific Plan.[27] As shown on Specific Plan Figure 3-39, the PCT alignment along 300th Street West would be separated from the street by a landscaped Project multi-purpose path that would accommodate pedestrians and bicyclists in order to avoid conflicts with hiking and equestrian uses on the PCT alignment.

Response to Comment A.1-9:

This comment states that providing a figure of a typical cross section of the Pacific Crest Trail along 300th Street West, such as Figure 3-39 in the Specific Plan, would be helpful to analyze visual impacts. As requested, Figure 3-39 of the Specific Plan has been inserted into Section 5.13, Visual Resources, of the Draft EIR as Exhibit 5.13-6. New exhibits are included in Section 3.0, Draft EIR Clarifications and Revisions, of this Final EIR. The following text change has also been made to the Draft EIR:

The sixth sentence in the third paragraph on page 5.13-21 of Section 5.13, Visual Resources, has been revised to state:

> MM 13-4 requires that structures proposed along the PCT alignment be screened by a block wall along the rear of the structures and a wide,

[24] *Id.,* p. 4-19
[25] *Id.,* Exhibit 5.7-11b
[26] *Id.,* Appendix 4.0-A, pp. 4-7, -12
[27] *Id.,* Appendix 4.0-A, p. 3-90

landscaped setback that would contain the conceptual PCT realignment (see Exhibit 5.13-6 for a typical cross section of the PCT).

Response to Comment A.1-10:

As shown on Draft EIR Exhibit 4-10a, Centennial Project – Recreation and Trails Plan, the PCT alignment through the Project site will connect with the Project's network of Community Trails and Regional Trails, which will be accessible by the public. As shown on the Recreation and Trails Plan, the Project's trail system will link to regional, community and neighborhood parks that will be developed by the Project. As shown on Exhibit 4-10a, there are multiple Project parks proposed within close proximity to the PCT and they will be improved with potable water facilities, shade structures and other amenities, as depicted on Draft EIR Appendix 4.0-A, Figures 3-34 through 3-36. Accordingly, it is anticipated that PCT users will have meaningful access to water and shade when traversing the Project site, as recommended by this comment.

Response to Comment A.1-11:

The primary trail connection to the proposed PCT alignment is the County multi-use (hiking, equestrian, and mountain biking) regional trail that spans the majority of the Project and connects at SR-138. As stated in Section 5.14, Parks and Recreation, "All proposed County regional trails shall be planned, designed, and developed in accordance with the County's Trails Manual".[28] Proposed greenways and community trails would also provide connectivity to the realigned PCT, if implemented.

As discussed in response to Comment A.1-7, the PCT alignment along 300th Street West would be separated from the street by a landscaped Project multi-purpose path that would accommodate pedestrians and bicyclists in order to avoid conflicts with hiking and equestrian uses on the PCT alignment. Please see Specific Plan Figure 3-39[29], which depicts a typical cross-section of the PCT trail alignment through Project site, as well as the adjacent multi-purpose path. Moreover, as indicated on page 5.14-19, "County and other trails are generally signed as to the allowed uses" on the relevant trails. The County Trails Manual discusses multi-agency trails, and the associated need for outreach among agencies and consideration of design to ensure appropriate trail use, such as signage and turnarounds.

As discussed in response to Comment A.1-2, it is expected the PCT stakeholders, the County, and Tejon Ranch would coordinate trail design as part of Centennial Project implementation, if approved, so that its ultimate location is beneficial to both the Project site and the wider Project area. The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project.

[28] *Id.,* p. 5.14-14; PDF 14-1, p. 5.14-15
[29] *Id.,* Appendix 4.0-A, p. 3-90

Response to Comment A.1-12:

As discussed in response to Comment A.1-5, the Centennial Project accommodates a request from the PCTA regarding the location of a realigned PCT made after Centennial Specific Plan preparation began. Regardless, it is recognized that the U.S. Forest Service and the PCTA strive to provide the best trail experience possible. In order to ensure the ultimate location of the PCT realignment is beneficial to both the Project site and the wider Project area, it is expected that discussion among the stakeholders for the PCT realignment will continue as part of Centennial Project implementation, if approved, and such design considerations will be acknowledged and contemplated. The Project's potential visual impact on the PCT and its uses were analyzed in in Section 5.13, Visual Resources, which determined that such impacts would be less than significant with implementation of MM 13-4 and due to both the distance and the intervening topography between the trail and the Project site.[30] MM 13-4 requires that Project structures proposed along the PCT to be screened by a block wall along the rear of the structures abutting the trail and a 34-foot-wide landscaped setback shall be provided that would contain the conceptual PCT realignment. Accordingly, additional mitigation to reduce the Project's potential visual impact on the PCT is unwarranted.

Response to Comment A.1-13:

The comment is acknowledged and will be included as part of the record. Because the comment does not raise a specific concern regarding the content of the Draft EIR, no further response is required.

626-574-1613

A.2

File Code: 2350
Date: July 17, 2017

Mr. Jodie Sackett
County of Los Angeles, Department of Regional Planning
Hall of Records, 13th Floor, Room 1348
320 West Temple Street
Los Angeles, CA 90012

Dear Mr. Sackett:

This letter responds to the Notice of Completion and Availability of the Draft Environmental Impact Report for the Centennial Project dated May 15, 2017. The DEIR refers to the Tejon Ranch Conservation and Land Use Agreement ("Tejon Agreement") signed June 17, 2008. The Tejon Agreement specified there will be environmental education outreach programs for local communities and underserved populations by Centennial and future projects. Additionally, the Tejon Agreement established a commitment to work with the US Forest Service on the realignment of 38 miles of the Pacific Crest Trail. A.2-1

Comments:

Pacific Crest Trail.
Please see the separate letter dated July 12, 2017 from Beth Boyst, Pacific Crest National Scenic Trail Manager, Pacific Southwest Region, US Forest Service. A.2-2

Environmental, Conservation, and Interpretive Education:
We suggest a review to strengthen this analysis. There may be partnering opportunities with the Angeles National Forest and with the California Department of Water Resources. CDWR operates Vista del Lago Visitor Center a short distance from the Centennial Project area on Interstate 5 with excellent displays about the sources and importance of water resources. The Angeles National Forest has an intense interest in conservation education, interpretive displays, and community outreach, especially to underserved populations and youths. This seems to blend well with the requirements of the Tejon Ranch Conservation and Land Use Agreement as you describe it on pages 4-45 and 4-46 of the DEIR. It is our understanding that a shuttle bus service will also be made available to the Centennial Project area. These bus services might be dual purposed to include Vista del Lago and various nearby educational and interpretative opportunities on the Angeles National Forest such as the historically significant Old Ridge Route with its grand views and unique geology. We encourage joint discussions. A.2-3

Proposed Underpass for Highway 138.
The Centennial Project's open spaces and trails affect the transit of people and horses, but also allow easy distribution of wildlife, noxious and invasive weeds, and invasive fauna (e,g., feral pigs). Listed mitigation measures for noxious weeds are appreciated, but how will that list be modified and updated? And, it is not clear that the monitoring and mitigation plan will detect and stop the spread of noxious weeds. Is there a feral cat or outdoor cat policy? Will dog fecal bags be provided? Are trash containers required to be raccoon proof? How will feral pigs be controlled? A.2-4

Trash Dumping onto the Angeles National Forest and Other Public Lands.
Is there a plan for large item waste disposal service – sofas, televisions, mattresses, carpet, etc.? Without such a plan, dumping could be a problem on public and other open land. A.2-5

Increased Fire and Erosion Risk on Public Lands.
We suggest that the effects of the Centennial Project on fire starts, fire behavior, and fire rates of spread A.2-6

require further analysis and discussion with the Angeles National Forest. Increased public access and activity elevates the probability of fire starts. Urban centers and utility corridors affect ambient temperatures, increasing the probability of starts and rapid spread. The lands and waters within the Angeles National Forest will be subject to greater fire risks. This will lead to erosion and sediment and rocks moving down slope, sometimes impacting private property at the Forest's edge. Although there are fire stations proposed, they may not be enough or in the best locations to minimize the threat of wildland fires. The mitigation measures as proposed do not show how the risk of wildland fire and post-fire effects have been reduced to less than significant effects.

A.2-6 cont.

Mitigation Plan for Oak Woodlands.
The mitigation plan is well explained, but there does not seem to be a timeline. Is it the plan to have these planted and woodlands augmented at the end of the First Phase? The grassland and oak mitigation plan for SEA 17 has not been discussed recently with the Angeles National Forest. We invite discussion.

A.2-7

Maximization of Groundwater Recharge and Groundwater Banking.
Graded slopes, built slopes, and otherwise altered surface water drainages can affect the groundwater movement as well as the groundwater-to-surface water expression from the alluvium in this area. Although the plan notes the surface water effects and that groundwater recharge will occur within the project area, the indirect effects of engineered slopes, effects to springs, effects to groundwater from the proposed well system, and effects to surface/groundwater interactions, all together, are a potential significant effect that may warrant additional analysis. We are concerned with potential water quality impacts to Quail Lake and the California Aqueduct and are concerned that there may be significant effects. More importantly, it is unclear how the project will maximize groundwater recharge and banking.

A.2-8

Assessment Summary for Direct and Cumulative Effects for Cultural Resources, Particularly Tribal and Native American.
The Centennial Project site covers approximately 12,323 acres in an area known for its association with the first Indian Reservation in California (Tejon Ranch.) It is in close association with a significant Native American travel corridor and ethnographically situated with the Federally Recognized Tribe (Tejon Ranch Indian Tribe) comprising primarily the Kitanemuk and Yokut groups. The Centennial Project would involve significant ground disturbance, perhaps resulting in significant and unavoidable impacts to archaeological sites, both surface expressions and buried cultural deposits.

A.2-9

If you have questions, please contact Bob Blount, District Ranger, Angeles National Forest at wmblount@fs.fed.us or at 661-269-2808 ext. 225.

A.2-10

Sincerely,

JEFFREY VAIL
Forest Supervisor

Responses to Comment Letter A.2
U.S. Forest Service, Angeles National Forest
July 17, 2017

Response to Comment A.2-1:

Thank you for your participation in this public process. The comment is noted for the record and will be provided to the Regional Planning Commission and the Board of Supervisors for consideration. No further response is required given that the comment does not raise a specific concern regarding the content of the Draft EIR.

Response to Comment A.2-2:

The referenced comment letter is denoted as letter A.1 in this document, and all comments provided by Ms. Boyst of the U.S. Forest Service have been considered and responses are provided herein. Please see responses to Comments A.1-1 through A.1-13.

Response to Comment A.2-3:

As discussed in response to Comment A.1-2, the Forest Service, the Pacific Coast Trail Association (PCTA), the Tejon Ranch Conservancy (Conservancy), and the Tejon Ranch Company (TRC) are in ongoing discussions regarding an alternative realignment for the PCT through the Project site. A portion of the western right-of-way of 300th Street West has been reserved for the conceptual PCT realignment where this conceptual realignment is contiguous with a portion the Project site and where it bisects the northeastern corner of the site. Moreover, TRC has granted to the Conservancy two conservation easements that would preserve in perpetuity the conservation values of those portions of Tejon Ranch land located outside of the Project boundary and through which the proposed PCT alignment would extend. (See, Kern County Official Records Doc. #'s 214047995, 20140445960 ("Conservation Easements")). Both conservation easements expressly acknowledge that the Forest Service, the Conservancy, and TRC are in ongoing discussions regarding an alternative realignment for the PCT, and that TRC intends to convey to the Forest Service a perpetual trail easement for the construction, maintenance, and use of the PCT on the property covered by the conservation easements. (See, Conservation Easements, Recital G.) Moreover, the Conservation Easements both expressly authorize public recreational use of the PCT on the conservation easement property and permit TRC to grant the trail easement to the Forest Service. (See, Conservation Easements Sections 6(b)(2)(O)). Both Conservation Easements further acknowledge that, in October 2009, PCTA and Forest Service, among other parties, entered into a Memorandum of Understanding that delegates to PCTA certain responsibilities for the construction, maintenance and use of that segment of the PCT alignment to be located on the Conservation Easement property. (See, Conservation Easements, Recital G.)

This comment's recommendation that joint discussions be conducted between the Project Applicant, Forest Service, Angeles National Forest and CDWR regarding potential synergies between the Project, Angeles National Forest and the Vista del Largo visitors center are

noted and will be provided to the Project Applicant, Regional Planning Commission, and Board of Supervisors for their consideration. Because this comment does not address or question the content of the Draft EIR or otherwise raise an environmental issue, no further response to required.

Response to Comment A.2-4:

Feral pig control helps control the spread of noxious weeds in the habitat mitigation measures (MMs 7-10 and 7-11) in Section 5.7, Biological Resources. As stated in reference to the preservation of grasslands in MM 7-10, "long-term management will include focused major problematic non-native species eradication (e.g., feral pigs) where feasible".[31] MM 7-11, which provides mitigation for oak woodlands, includes the following in Maintenance Plan and Guidelines, "The Maintenance Plan, to be approved by the County, will include (i) weed control; (ii) herbivory control (e.g., feral pigs)".[32] As discussed in MMs 7-11 and 7-12, the Maintenance Plans will include quantitative monitoring with County approved performance criteria that must be met in order to receive sign-off. Culling of excess feral pig populations is also a routine part of existing operations on Tejon Ranch and will continue on Mitigation Lands. Long-term management of the Mitigation Preserve will be managed by the Tejon Ranch Conservancy (TRC). These conditions are fully expected to detect and stop the spread of noxious weeds. Also, a list of invasive plants species that will be prohibited from being used in landscaping on the site is part of the *Centennial Specific Plan*.[33] Section 3.4.4 of the Specific Plan describes that the prohibited plants shall not be used either in public or private landscaping and it shall be the responsibility of the Homeowners Association to provide current information to homeowners about plant species that are not allowed to be planted in private yards, and to enforce any regulations regarding prohibited plant species, including eradication. The Homeowners Association may utilize sources such as the California Invasive Plant Council to periodically update the list of invasive species thereby providing current information to homeowners.

Continued implementation of the Ranch-wide Management Plan (RWMP) also includes the study of, and conservation activities focused on, reducing feral pig activity. For example, RWMP Conservation Activity NC-3.2(a) includes small-scale pig enclosures are proposed for select riparian areas. Conservation Activity NC-3.2(c) calls for relocation of water troughs where appropriate to replace streams, springs, or ponds as livestock water sources. Each identified spring will be fenced to protect the source from disturbance by livestock and feral pigs. Conservation Activity NC-4.3 includes installation of tree shelters to protect oak seedlings and saplings from herbivores, particularly from feral pigs. Conservation Activity NC-4.4(a) involves the implementation of management trials to assess the influence of feral pig predation on the wildlife species using oak woodland communities. Management trials will likely use physical exclusion of feral pigs from areas with pig-proof fencing but could include depressing pig numbers through increased harvest rates. Conservation Activity FS-1.2(a) provides for the collection of information on feral pig populations to support development of a management strategy. Use of riparian habitats by livestock and feral pigs

31 DRP 2017, p. 5.7-181
32 *Id.,* p. 5.7-108
33 *Id.,* p. 5.7-140, PDF 7-8

will be quantified in riparian study areas using motion-triggered camera traps at each permanent plot. Video data from these cameras will be used to determine the behavior of livestock and feral pigs and the amount of time they spend at each site. Because many wild pigs can have distinctive markings, the Conservancy will evaluate whether population estimates can be made from camera data. Pig disturbance will also be quantified along vegetation transects. Conservation Activity FS-1.3(a) involves the development of a feral pig management strategy. The Conservancy is initiating research on the population abundance and distribution of feral pigs on Tejon Ranch and the ecological damages they cause. The Conservancy will collaborate with TRC to use this information to develop a comprehensive feral pig management strategy to reduce the environmental damages caused by feral pigs to acceptable or lowest practical levels. Conservation Activity FS-1.3(b) includes collaboration with TRC and other organizations to pilot innovative management strategies for feral pigs. The Conservancy wishes to collaborate with TRC and other organizations to pilot innovative management strategies for feral pigs that may inform a management strategy on Tejon Ranch and in other parts of California. Potential management strategies may suggest feral pig control to reduce competition or predation intensity, harvest level modifications, and grazing management or other measures to enhance habitat. Compliance monitoring will focus on ensuring that management actions are implemented as intended (e.g., targeted feral pig abundances are achieved or pigs are effectively excluded from a wetland area). Effectiveness monitoring will evaluate responses to the management action, such as changes in abundance of herpetofauna following reduction of feral pig population. Specific compliance and effectiveness monitoring methods will depend on the wildlife management actions being evaluated and the nature of the expected or desired responses.

In order to be responsive to the Commenter's concern for the control of noxious weeds, MMs 7-15 and 7-17 shall be edited to include methods to help control the spread of noxious weeds such as: 1) cat policy, 2) providing dog bags, and 3) animal-proof trash bins. The following text is hereby added within the first paragraph of MM 7-15 on page 5.7-191 of the Draft EIR:

> Waste and recycling receptacles that discourage foraging by wildlife species adapted to urban environments shall be installed by the Project Applicant/Developer in common areas (i.e., any area where public trash receptacles would be placed, such as parks, sidewalks, community centers, and walking trails) throughout the Project site. Common, residential, and commercial areas will all be served with wildlife resistant trash receptacles.

Additionally, the following text is hereby added to the last paragraph of MM 7-17 on page 5.7-193 of the Draft EIR:

> Domestic cats shall be prohibited from free-roaming (i.e., be allowed outdoors), and shall be required to have a microchip. All dogs shall be required to be leashed while in the designated natural open space areas, and bags for removing pet excrement will be provided at trail entrances and other appropriate locations. In addition, all dogs and cats shall be required to be neutered or spayed; all dogs shall be required to have a microchip; and potential owners shall show evidence prior to entry into the Centennial

Development, as required by Los Angeles County Code (Section 10.20.350). These restrictions/features and their purpose will be described within educational material and distributed to new homeowners and made available to all homeowners as needed.

Response to Comment A.2-5:

The Project has committed to diverting 100 percent of soil during grading activities, and at least 75 percent of non-hazardous construction and demolition waste, away from landfills to recycling or salvage, which exceeds the 65 percent diversion requirement with the Tier I voluntary measure in Section A5.408.3.1 of the California Green Building Standards (CALGreen) Code and the 50 percent reduction required by Section 20.87.040 of the County Code. The Project will submit and implement a Recycling and Reuse Plan to Public Works in connection with obtaining a building or grading permit.[34] For operational waste, the Project includes a Solid Waste Management Plan (SWMP) for the recycling or diversion of 75 percent of the solid wastes generated from the Project from landfills.[35] The Specific Plan also allows green waste composting and solid waste and materials recovery facilities and recycling centers in areas designated as Utility (U).

PDF 17-3, MM 17-10, and Section 4.5.14, "Solid Waste Management Plan," on pages 4-85 through 4-88 of the Draft EIR discusses the components of the SWMP, which include a "three bin system," community education, waste collection and recycling, materials recovery facility/transfer station (MRF/TS), composting and green waste facilities, a County Smart Gardening Learning Center, and household hazardous waste collection. Televisions, appliances and other large electronic devices (computers, monitors, etc.) are considered electronic wastes and would be included in the educational or instructional materials provided to residents on the proper disposal of these items. As stated under "Household Hazardous Waste Collection" on page 4-88, "Household hazardous waste and less commonly disposed materials (such as electronics and appliances) would have special pickups or disposal locations and may also be accepted by an MRF/TS year round." The SWMP also includes seasonal (at least two times a year) pickup of household hazardous wastes and less common wastes (such as electronics and appliances).[36]

In addition, waste collection companies operating in the County are required to provide services and rates in accordance with County standards. Section 20.72.080 of the County Code sets the minimum requirements for residential solid waste collection services, which include a requirement for waste collectors to collect bulky items set out for collection that are not reasonably susceptible to being placed in waste containers or bundles, including stoves, refrigerators, furniture, water heaters, and other similar items. Waste collectors are allowed to charge additional fees and/or require advance notice for providing this service.

The availability of seasonal pick-ups and bulky item disposal through the solid waste collector are expected to avoid the need to self-dispose of large items. The future operation

34 DRP 2017, p. 5.17-25, PDF 17-2; pp. 5.17-33 and -34. MM 17-9
35 *Id.,* pp. 5.17-26 through -28, PDF 17-3; pp. 5.17-34 and -35, MM 17-10
36 *Id.,* p. 5.17-27

of an MRF/TS, which includes a household hazardous waste permanent collection and reuse center, at the Project site is also expected to make the disposal of large items at the MRF/TS more convenient (through a shorter driving distance from on-site residential areas to the MRF/TS location than to off-site open lands). This, in turn, would discourage illegal dumping at adjacent public and open lands, such as the Angeles National Forest.

See, also, Section 5.17.4 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.18 of the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment A.2-6:

The Draft EIR evaluates the Project's potential fire safety impacts under two thresholds of significance. First, the Draft EIR considers whether the Project would expose people or structures to a significant risk of loss, injury or death involving fires because it is located (i) within a Very High Fire Hazard Severity Zone (VHFHSZ), (ii) within a high fire hazard area with inadequate access, (iii) within an area with inadequate water and pressure to meet fire flow standards, or (iv) within proximity to land uses that have the potential for dangerous fire hazard. Second, the Draft EIR considers whether the Project constitutes a potentially dangerous fire hazard. The Draft EIR determined that, with implementation of MM 3-9, Project impacts related to fire hazards would be less than significant under the applicable thresholds of significance.[37] This determination, however, is not reliant solely upon implementation of MM 3-9 or other mitigation measures identified in the Draft EIR. Rather, the Draft EIR concluded that Project impacts related to fire safety would be less than significant only after taking into consideration (i) Project site access, (ii) Project site water flows, (iii) Project site topography, (iv) Project site vegetative cover, (v) existing and proposed regulatory controls, (vi) existing mutual aid agreements between federal, state, and local fire safety service providers, and (vii) Project improvements and mitigation measures related to landscaping and vegetation management, building construction, circulation, public utilities, and fire protection services, including but not limited to MM 3-9.

Phase I Environmental Site Assessments were prepared for the Project site to investigate potentially hazardous current and historic land uses that could adversely affect Project site development.[38] Based on these reports, there are no adjacent land uses that represent fire hazards.[39] However, as disclosed in the Draft EIR, portions of the Project site are designated by the California Department of Forestry and Fire Protection (CAL FIRE) as a VHFHSZ and as a High Fire Hazard Security Zone (HFHSZ), and the potential for wildland fire hazards would exist at the wildland/urban interface due to (a) the presence of brush; (b) increased human activity; and (c) the increased potential for fires due to accidental and arson-related causes.[40]

CAL FIRE classifies a zone as having a moderate, high, or very high fire hazard based on a combination of how a fire will behave and the probability of flames and embers threatening

37 DRP 2017, p. 5.3-39
38 *Id.,* p. 5.3-38
39 *Ibid*.
40 *Id.,* pp. 5.2-35. -36

buildings. As explained in the Draft EIR, current characteristics of the Project site that contribute to its hazard designation include (1) limited access, (2) lack of existing adequate fire flows, (3) topography, and (4) types of vegetative cover. These characteristics would be addressed as the Project site is developed, as discussed below.[41]

The Draft EIR explains that Project site's limited access will be significantly improved under Project conditions. The Project would construct an extensive backbone vehicular circulation system that would provide five points of access to the site via SR-138. The design of the Project's internal circulation system would implement the County's Fire Code standards, as applicable, regarding access (e.g., roadway widths, fire hydrant placement, length of single access streets, cul-de-sac dimensions, turning radius, street parking restrictions) (see Section 5.10, Traffic, Access and Circulation, for additional discussion of roadway design; see also the Mobility Plan described in Section 3.2 of the proposed Specific Plan [Draft EIR Appendix 4.0-A]).

Additionally, as required by MMs 16-1 through 16-3, the Project will provide within the Project site up to four new fire stations staffed by a minimum four-person engine company. In Village 1, one fire station is proposed east of the National Cement Plant Road. The second fire station is proposed in Village 4, and the third fire station is proposed in Village 7, with the location of a potential fourth station to be determined. These new fire stations are projected to provide an average five-minute response time for the first arriving unit for fire and eight minutes for the advanced life support (paramedic) unit on the site at Project buildout. This is consistent with the County of Los Angeles Fire Department's (LACFD's) goals for response times in urban areas. Ultimately, the LACFD would approve the final station site locations, and the Applicant would construct and equip the fire stations (MM 16-3). The LACFD has indicated that the proposed fire stations on the site would provide adequate fire service to the Project. Moreover, per MM 3-7, the Project must prepare an Emergency Response Plan for LACFD approval and, per MM 3-8, the Project must prepare a Traffic Control Plan in accordance with the California Manual on Uniform Traffic Control Devices for Caltrans approval. Consequently, access to, from, and in the vicinity of the Project site will be substantially improved from the existing condition.

With respect to fire flows, the Draft EIR explains that the Project would construct a Fire Code compliant water system to support proposed land uses and provide adequate fire flows and pressure to support any fire-suppression activity in the event of wildland or structural fires (refer to Section 5.18, Water Resources, for further discussion of the water system; see also the Water Service Plan described in Section 3.5 of the proposed Specific Plan [Draft EIR Appendix 4.0-A]). The proposed water system includes water mains, water tanks, pump stations (where necessary), and fire hydrants to ensure sufficient fire flows and water pressure to meet County of Los Angeles Department of Public Works' and LACFD's fire-suppression standards for improved property and development. These standard requirements must be met prior to the approval of building permits; therefore, the Project would implement a water system that would meet all County requirements in support of fire-suppression activities so that less than significant water-related fire hazards would

41 *Id.,* p. 5.2-35

occur. Under Project conditions, fire flows at the Project site will be substantially improved as compared to existing conditions.

Thus, under Project conditions, the Angeles National Forest will have far greater access to fire protection and emergency services in the vicinity of Project site than currently exists. Such access will contribute to LACFD's performance of its obligations under the *Cooperative Fire Protection Agreement Between The County Of Los Angeles Fire Department And The U.S. Forest Service Angeles National Forest* (Mutual Aid Agreement), approved by the Los Angeles County Board of Supervisors on December 20, 2016. The purpose of the Mutual Aid Agreement is to provide for cooperation between LACFD and U.S. Forest Service Angeles National Forest (ANF) in the prevention, detection, and suppression of wildland fires, fuels treatment and prescribed fires with both agencies' respective fire protection areas. The Mutual Aid Agreement also describes the conditions in which "mutual aid" periods are established to provide resources to each on a non-reimbursable basis, as well as the conditions of "Assistance by Hire" on a reimbursable basis. The Project's fire service improvements described above will significantly enhance the LACFD's ability to perform its obligations under the Mutual Aid Agreement to the benefit of the ANF in the vicinity of the Project site.

With regards to vegetative cover and topography, the majority of residential development is proposed for the flatter portions of the Project site. Some residential development, however, is proposed in areas that would be adjacent to large open space areas with moderate vegetative cover. Under existing conditions, the plant communities that make up this cover are highly combustible and would therefore present a high fire hazard and pose a potentially significant impact to development in these areas. As development of the Project site proceeds, however, fire hazards associated with the natural vegetative cover would be eliminated through its replacement with urban landscape vegetation, which is irrigated and less combustible than the existing vegetation.[42] Indeed, the Project's proposed Specific Plan includes a landscaping plant palette comprised of many plant species specifically selected for their fire resistance and requires that the Project's final plant palette be approved by the LACFD.[43]

As explained in the Draft EIR, topography is connected to wildland fire hazards because steep slopes are not only inaccessible to fire fighting vehicles, but steep canyons can create updraft conditions (much like a chimney) and a fire in a steep canyon can spread rapidly into adjacent areas.[44] Steep canyons that are densely covered with combustible vegetation are especially hazardous. Thus, the Draft EIR explains that the potential for wildland fire hazards would still exist at the wildland/urban interface due to (a) the presence of brush; (b) increased human activity; and (c) the increased potential for fires due to accidental and arson-related causes.[45] Generally, fire-prevention tactics for urban development in wildland fire hazard areas focus on (1) restricting the types of building materials used; (2) appropriate building design; and (3) incorporating setbacks, including fuel-modification

42 *Id.,* p. 5.3-36
43 *Id.,* Appendix 4.0-A, p. 3-42, Table 3-8
44 DRP 2017, p. 5.3-35
45 *Id.,* p. 5.3-36

zones.[46] All developments within a VHFHSZ and HFHSV are required to meet the building construction requirements specified in the County Code for these areas.

The County of Los Angeles' standards that would be applied to the Project to ensure appropriate building design and materials are specified in Chapter 7A of the County Building Code (Title 26) and in the Fire Code (Title 32); these standards include, but are not limited to the following:

- All roof coverings shall be of fire retardant Class A materials. Wood-shingle and wood-shake roofs are prohibited in Very High Fire Hazard Severity Zones (VHFHSZs) regardless of classification (Section 704A.1.2).
- Where the roof profile allows a space between the roof covering and roof decking, the spaces shall be constructed to prevent the intrusion of flames and embers; shall be firestopped with approved materials; or shall have one layer of No. 72 American Society of Testing and Materials (ASTM) cap sheet installed over the combustible decking (Section 704A.1.2).
- Ventilation openings shall be constructed on the underside of eaves and cornices. The Building Official may accept or approve special eave and cornice vents that resist the intrusion of flame and burning embers (Section 706A.3 et. seq.).
- Exterior windows, window walls, glazed doors, and glazed openings in exterior doors shall be multi-pane glazing units with a minimum of one tempered pane, or glass block units, or have a fire-resistance rating of not less than 20 minutes, when tested according to ASTM E 2010, or they shall conform to the performance requirements of the Office of the State Fire Marshall (SFM) 12-7A-2 (Section 704A.3.2.2).
- Spark arresters constructed with heavy wire mesh or other noncombustible material with openings not to exceed ½ inch shall be provided in chimneys of any fireplace, barbecue, incinerator, or any heating appliance in which solid or liquid fuel is used (Section 326.12.2).
- Clearance of brush and vegetative growth shall be maintained (Section 325.2).

The Project's proposed Specific Plan further ensures appropriate building placement and design by requiring LACFD review of all Project tentative tract maps and amendments.[47] Moreover, to further protect against fire, the Specific Plan's General Development Standards expressly prohibits the use of wood-burning fireplaces on the Project site.[48] Finally, public access would be restricted in areas of the Project site that are undeveloped and contain steep slopes in accordance with the Specific Plan's Trail Plan and Open Space Management Plan.[49] Despite limited access to the general population, those areas of the site with the greatest topographic relief would be accessible to fire-fighting equipment via helicopter, other air transport access, and existing unpaved fire roads. As required by the LACFD, upon their Project-level review (e.g., tract map review), clearance for fire access roads and gates would

46 *Id.,* p. 5.3-34
47 *Id.,* Appendix 4.0-A, pp. 4-12, -14
48 *Id.,* p. 2-70
49 *Id.,* pp. 3-88, -94

be incorporated into developed areas. Finally, Project implementation of the Fuel Modification Plan required by MM 3-9 would further reduce fire hazards at the wildland/urban interface.

The County Fire Department's Forestry Division (Forestry Division) provides several fire prevention services, including vegetation management services and fuel modification planning. The purpose of fuel modification is to provide defensible space between structures and wildlands. The LACFD's Fuel Modification Plan Guidelines, last revised in 2011, were created by the Forestry Division to help the public understand the process of fuel modification plan review and approval as well as set forth landscape design criteria for applicable properties located in Fire Hazard Severity Zones.[50]

A Fuel Modification Plan consists of three sequential zones where combustible native or ornamental vegetation has been modified and/or partially or totally replaced with drought-tolerant, low-fuel-volume plant species. The details of fuel modification plans vary in complexity and reflect the fire history; the amount and type of vegetation; the arrangement of the fuels; the topography; the local weather patterns; and the construction, design, and placement of structures.[51] The following is a generalized fuel modification plan and associated zones:

> Zone A is a minimum 20-foot setback zone from the edge of any structures; it is adjacent to structures and should offer protection from intense flames through either properly maintained, irrigated plants with high moisture content, or through walkways, gravel, stone, paved surfaces, or water features to create breaks in the fire's path.
>
> Zone B is the irrigation zone/transition zone that extends from the edge of Zone A up to 100 feet from structures; a large percentage of existing vegetation may be removed and replaced with irrigated, fire- and drought-resistant plants. It may have detached structures and may contain some native vegetation if spaced according to the planting guidelines that create a transition to the native brush and thinning zone (Zone C).
>
> Zone C is the native brush thinning zone and, if applicable, extends from the edge of Zone B up to 200 feet from structures. Vegetation will consist mainly of native plants with appropriate thinning and spacing; adequately spaced ornamental shrubs and trees are allowed (if approved by LACFD) but generally not recommended due to water conservation goals. The objective of this zone is to slow the rate of fire spread, reduce flame lengths, and minimize the intensity of the fires prior to reaching irrigated zones (i.e., Zones A and B) or the structure.

Every fuel modification plan must be reviewed by the LACFD Forestry Division for defensible space, reasonable fire safety, and compliance with Sections 325.2.1, 325.2.2, 325.10, and

50 DRP 2017, p. 5.3-31
51 *Id.,* p. 5.3-32

503.2.1 of the County Code, the Fire Department's Fuel Modification Guidelines, and California Code of Regulations Title 14, Division 1.5, Chapter 7, subchapter 2. After the plan has been approved by the Forestry Division, a signed and notarized copy of the Project Homeowners Association's approved Covenants, Conditions, and Restrictions that include the necessary fuel modification information will be recorded at the County clerk's office and a copy given to the LAFCD Fuel Modification Unit prior to site inspection and release. The fuel modification inspection ensures compliance with applicable requirements of the Fire Code, the Building Code, Section 701A.5 (Vegetation management compliance), and the Residential Code, Section R327.1.5 (Vegetation management compliance). An on-site inspection must be conducted by the LACFD Forestry Division and a final release issued by the forestry division prior to a certificate of occupancy being granted by the County building official.

Planting proposed as part of Project along any public or private roadway that may be used for emergency access will also be reviewed to ensure compliance with applicable Fire Code requirements and safety as part of the Fuel Modification Plan review. Fuel modification distances are site specific, designed for severe fire weather scenarios, and are not intended to be a blanket requirement for all sites. The Zone A and Zone B irrigated zones encompass the minimum 30 to 50 feet of required removal of all highly flammable brush required by the Fire Code. Zone C will typically coincide with the requirement to thin from 30 to 200 feet from any structure.

The State and County regulations that apply to the proposed Project are required regardless of CEQA. With adherence to the required and best-accepted practices for fuel-modification zone management, emergency access, building materials and methods, as well as the changes in land use, and existing mutual aid agreements, the Project's potential to constitute a potentially dangerous fire hazard, or to expose people or structures to a significant risk of loss, injury or death involving fires, would be reduced to a less than significant level.

In response to this comment, the following documents are added to the administrative record:

Los Angeles, County of. 2016. *Adopted Request for Approval of Cooperative Fire Protection Agreement Between The Consolidated Fire Protection District of Los Angeles County and the And The U.S. Forest Service Angeles National Forest.* http://file.lacounty.gov/SDSInter/bos/supdocs/110053.pdf (last accessed September 2017).

Please also see Section 5.8 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.9 of the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment A.2-7:

The plan for the phasing of mitigation is described in MM 7-10 on pages 5.7-180 through 5.7-182 of the Draft EIR. It describes how with each phase of development, there will be a comparable sized portion of the preserve with similar resources dedicated and mitigation

implementation within. Consultation with the Angeles National Forest regarding grasslands and oak mitigation activities in SEA 17 is not specifically required as a mitigation measure in the Draft EIR; however, the following sentence is added to the end of MM 7-11:

> Consultation with representatives from the Angeles National Forest regarding oak and grasslands mitigation activities in SEA 17 shall occur prior to the commencement of oak tree planting in SEA 17.

Response to Comment A.2-8:

Potential hydrology and flood impacts to Quail Lake are discussed on Draft EIR page 5.2-25, which states that no receiving channels will receive Project development area runoff discharges under developed conditions in the Quail Lake drainage area, which includes the lake. Potential water quality impacts to Quail Lake are discussed on Draft EIR page 5.4-68, which states that no runoff from Project developed areas will occur in the Quail Lake watershed, which includes the lake. Consequently, no runoff from Project developed areas will flow to Quail Lake and the Quail Lake drainage and watershed. The Project development will not affect the hydrology, flood or water quality conditions in the lake and the lake's watershed and drainage system. The Project will also avoid impacts to California Aqueduct water quality. As discussed on Draft EIR pages 5.4-73 and 5.4-74 the wastewater reclamation facilities (WRFs) must comply with Title 22 of the *California Code of Regulation,* the California Porter-Cologne Act, and the Lahontan Basin Plan's surface and groundwater quality objectives. Waste Discharge Requirements (WDRs) issued by the Lahontan Regional Water Quality Control Board will require the Project to include design features, such as berms, levees, spill containment features, and other topographical elevation features, to protect the WRFs during large flood events and to protect adjacent properties under any emergency conditions. As shown on Exhibit 4-14 in the Draft EIR, there are no sewer pipelines or force mainlines that would cross over the State Water Project (SWP) Aqueduct; therefore, there is no risk of sewer line rupture over the SWP Aqueduct. In addition, the California Aqueduct contains a levee system that protects its waters from stormwater flooding or other surface flows and the aqueduct channel is constructed with cement and other impervious materials. Consequently, Project runoff, groundwater recharge, discharge from the WRFs or any other activities that could affect surface and groundwater quality will not affect water quality in Quail Lake or in the California Aqueduct.

Project water banking facilities and operations are discussed on pages 5.18-52 to 5.18-54 of Draft EIR Section 5.18, Water Resources. All Project groundwater use and water banking operations will be conducted in accordance with the Antelope Valley Basin Adjudication Judgment and Physical Solution entered by the Superior Court in December 2015.[52] The Adjudication Judgment and Physical Solution was approved by the Court to sustainably manage Antelope Valley groundwater resources and Basin storage capacity over time. An existing 160-acre water banking facility and an on-site 100-acre facility will be used to store and later retrieve imported surface water as required to meet Project water demand. The existing facility is permitted under the Adjudication Judgment and Physical Solution and the on-site facility must meet the requirements of the Adjudication Judgment and Physical

[52] DRP 2017, Appendix 5.18-D

Solution as determined by a watermaster appointed by the Court. The banks will direct imported surface water into a series of constructed basin and weirs for percolation into the local aquifer. The local aquifer has substantially more storage capacity than would be required for Project water banking operations. A series of existing and new on-site and off-site wells will be used to monitor groundwater levels; to extract banked water; to recover return flows; and to extract groundwater for Project use in accordance with the Adjudication Judgment and Physical Solution, including the requirement to leave-behind a portion of the water placed into storage to benefit the aquifer as a whole. The water banking and related facility locations are shown on Draft EIR Exhibit 5.18-7. As discussed on Draft EIR pages 5.18-73 to 5.18-74, additional groundwater recharge will be maximized by not redirecting any existing watershed flows to other watersheds and by capturing and infiltrating onsite storm and dry period flows in a series of infiltration basins located throughout the Project. As discussed on Draft EIR page 5.2-26, the Project has been designed to maintain undeveloped areas with uncompacted soils to provide opportunities for infiltration of runoff in impervious areas and help to preserve pre-development infiltration, evapotranspiration, percolation, subsurface flow, groundwater recharge, and surface runoff conditions. As discussed on Draft EIR page 5.2-27, development on the Project site is generally located on existing poorly infiltrating soils and avoids soils with higher infiltration rates for flow and volume management and groundwater recharge. The Project's distributed and parcel-based low impact development and regional Best Management Practices hydrology, flood control and water quality measures will be implemented to provide infiltration capacity for developed areas that affect locations with higher infiltration rates. As discussed on Draft EIR pages 5.2-28 to 5.2-30, in additional to distributed parcel-based low impact development measures that promote infiltration and recharge, a series of regional basins will be constructed, generally with flat, vegetated bottoms that will, in addition to performing other hydrologic, flood and water quality protective functions, manage excess runoff volumes from the site through infiltration. The locations of the basins are shown on Draft EIR Exhibit 5.2-4. Normalized sizing charts were applied to the proposed development areas that are tributary to each basin to identify the flow retention and duration volumes required to match the pre-development infiltration rates as well as other design characteristics. The design volumes and other characteristics for each of the regional infiltration basins are summarized in Draft EIR Table 5.2-4. Consequently, Project water banking activities, including the leave-behind requirements of the Adjudication Judgment and Physical Solution, retention of open space, avoidance of onsite locations with higher infiltration rates, and the use of regional infiltration basins throughout the site will avoid significant impacts to maximize recharge rates in the Project area.

Please also see Sections 5.9 and 5.17 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Sections 3.10 and 3.18 of the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment A.2-9:

The Project's potential impacts to archaeological resources, including tribal cultural resources, are assessed in Section 5.6, Cultural and Tribal Resources. The Draft EIR has

identified a suite of mitigation measures that are consistent with the requirements of *Public Resources Code* § 21083.2 and together would ensure that the Project's potential impact on cultural resources would be mitigated to a less than significant level.

Consistent with this comment, the Draft EIR confirms the historic occupation of the Tejon region "by the Kitanemuk, Interior Chumash, Tataviam, Southern Valley Yokuts, and Kawaiisu, with the first three of these groups likely to have lived in and/or used the lands comprising the Project site.".[53] The Draft EIR further explains that "Tejon Ranch was the location of the first Native American reservation in the United States…".[54] Given the Project site's association with both Native Americans and the history of the Tejon Ranch subsequent to Spanish occupation, a thorough examination of potential impacts to historic, archaeological, and tribal cultural resources was performed as part of the Draft EIR analysis.

As an initial matter, Assembly Bill (AB) 52 consultation with Native American Tribes was completed for the Project, "…and mitigation measures were agreed upon by all parties involved, including the Tejon Ranch Company".[55] As discussed on Draft EIR page 5.6-48, during consultation, the Tataviam Tribe recommended that the Tejon Tribe serve as the lead tribal consultants, and that the Tataviam would provide its future comments through the Tejon. The Tejon Tribe subsequently informed the Lead Agency that its key consideration for protecting tribal resources included mitigation measures requiring the employment of Native American monitors from the Tejon Tribe during ground disturbing activities, as well as the permanent curation of any prehistoric artifacts and/or Tribal Cultural Resources discovered during construction of the Project. Consistent with the Tejon Tribe recommendations were incorporated into the Draft EIR's mitigation program for cultural resource impacts.

As part of the Draft EIR preparation process, cultural resource studies were conducted on the entire Project site between 2002 and 2015.[56] The surveys resulted in the identification of 57 potentially unique archaeological sites, as shown on Table 5.6-1. Of those 57 sites, 25 potentially unique archaeological sites were identified within the Project's sites development footprint and 30 potentially unique sites were identified in the Project site's open space area.[57]

Additional archaeological testing was performed on the 25 potentially unique sites located within the development footprint and it was determined that (i) two of the identified sites were not cultural resources (i.e., CA-LAN-3235 and CA-LAN-3249), and (ii) three of these sites are unique and eligible for listing on the California Register of Historic Resources (CRHR) and are thus considered significant archaeological resources pursuant to California Environmental Quality Act (CEQA) Guidelines Section 15064.5.[58] The Draft EIR assigns the following trinomial identification numbers to these three eligible sites: CA-LAN-3201, CA-

58 *Id.,* pp. 5.6-46, 5.6-54 to -57

LAN-3240, and CA-LAN-3242. These three sites are described in the Draft EIR pages 5.6-24, 5.6-35, and 5.6-36, respectively.

Impacts to CA-LAN-3201, CA-LAN-3240, and CA-LAN-3242 would be mitigated through avoidance by means of monitoring by a qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe during construction, and either Project redesign or preservation through restricted access, as required by MMs 6-1, 6-3, and 6-4. Moreover, MM 6-2 requires these three sites to be protected by temporary fencing during construction to ensure avoidance of the resource. All monitoring shall be conducted in accordance with an Archaeological Resource Monitoring Plan prepared by an archaeologist meeting the Secretary of the Interior's Standards for professional archaeology. If avoidance and preservation of CA-LAN-3201, CA-LAN-3240 and/or CA-LAN-3242 are determined to be infeasible, impacts to any such sites would be mitigated through implementation of a Phase III data recovery program consistent with CEQA Guidelines § 15126.4(b)(3)(C), as required by MMs 6-1 and 6-3. Excavated finds must be offered to the County of Los Angeles and/or its designee (i.e., the Tejon Indian Tribe) on a first refusal basis (MMs 6-1 and 6-3); the Tejon Indian Tribe can then make a determination whether the find is a significant tribal cultural resource and opt to accept the resource for curation in its facility. With implementation of MMs 6-1, 6-2, 6-3, and 6-4, impacts to sites CA-LAN-3201, CA-LAN-3240, and CA-LAN-3242 would be reduced to a less than significant level.

Implementation of the Project would result in a less than significant impact to the 22 sites within the development footprint that have been determined ineligible for CRHR listing or are not cultural resources, and no mitigation is required; however, as testing may not have recovered all significant materials, these sites and a reasonable radius around them will be monitored during grading pursuant to MM 6-1.[59] In the event monitoring discovers potentially significant materials associated with any one of these 22 sites, then a qualified archaeologist must perform a Phase II subsurface test-level investigation and surface collection in accordance with MM 6-1. Should the Phase II testing determine the that potentially significant material qualifies as significant archaeological resources pursuant to CEQA Guidelines § 15064.5, then potential impacts to any such resources shall be mitigated to a less than significant level through avoidance and preservation, in accordance with subsection (a) of MMs 6-1 and 6-4. If avoidance and preservation of any such resource is determined to be infeasible, then potential impacts to such resources shall be mitigated through implementation of a Phase III data recovery program consistent with CEQA Guidelines § 15126.4(b)(3)(C), as required by MM 6-1. Excavated finds must be offered to the County of Los Angeles and/or its designee (i.e., the Tejon Indian Tribe) on a first refusal basis (MMs 6-1 and 6-3); the Tejon Indian Tribe can then make a determination whether the find is a significant tribal cultural resource and opt to accept the resource for curation in its facility.

As identified in Table 5.6-1, there are a total of 30 prehistoric archaeological sites within the Project's proposed open space areas (i.e., areas outside the development footprint), including 27 prehistoric archaeological sites and 3 historic-period sites. The CRHR eligibility

[59] *Id.,* p. 5.6-48

of 18 of the 30 total sites located within Open Space-designated areas has been determined through archaeological testing.[60] Of the 18 sites evaluated, 1 site (CA-LAN-3206) has been determined eligible and 17 sites have been determined ineligible. The CRHR eligibility of the remaining 12 sites has not been evaluated to date, as these sites have never been within an anticipated development (i.e., grading) footprint during the evolution of the Project design.

For the 12 sites whose eligibility for the CRHR is unknown, because these resources have not yet been formally evaluated, the Draft EIR assumes that the sites are historically significant until, and unless, evaluation proves otherwise.[61] Because these 12 sites are outside the development footprint, direct impacts during grading and other construction activities are not expected. However, sites CA-LAN-3217 and CA-LAN-3227 are immediately adjacent the development footprint. Because of their proximity, the sites could suffer damage during grading activities. Because sites CA-LAN-3217 and CA-LAN-3227 are assumed CRHR-eligible, this would be considered a potential significant direct impact. Therefore, MM 6-1 requires monitoring by a qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe (pursuant to AB 52 consultation as described above) when grading is in the vicinity of these sites; MM 6-2 requires the sites to be fenced off during construction to ensure complete avoidance of the resources; and MM 6-4 provides further protective measures if necessary. With implementation of MMs 6-1, 6-2, and 6-4, potential direct impacts to sites CA-LAN-3217 and CA-LAN-3227 during construction would be reduced to a less than significant level.

Long-term operation of the Project would result in potential indirect impacts to the 12 sites with unknown eligibility and the 1 site located in the open space areas that is known to be eligible (CA-LAN-3206) if it is determined that such sites are vulnerable to disturbance due to increased access, by residents and visitors compared to the existing condition. Because archaeological excavation is considered an adverse effect on an archaeological resource, avoidance and preservation of resources without excavation would be the preferred method of managing these sites. Therefore, MM 6-4 requires preparation of an Archaeological Resources Site-Protection Program aimed to protect and preserve any identified archaeological resources that may be vulnerable to disturbance, unless a Phase II archaeological investigation performed by a qualified archaeologist determines that such site is not unique and thus not eligible for listing on the CRHR. The Archaeological Resources Site-Protection Program must be approved by the County and must include several alternatives to restrict access to these sites (e.g., fencing, planting, and capping), thereby protecting and preserving these sites. With implementation of MMs 6-2 and 6-4, potential indirect impacts to the 12 sites within the Project site open space area with unknown eligibility and the 1 site located in the open space areas that is known to be eligible (CA-LAN-3206) would be reduced to a less than significant level.

For the 17 sites located within the Project's open space determined to be ineligible, Project implementation would result in no impacts to these sites and no mitigation is required.

60 *Id.,* p. 5.6-49
61 *Id.,* p. 5.6-50

To further ensure that the Project's potential impacts to cultural resources are reduced to a less than significant level, MMs 6-1 through 6-4 are hereby revised, as follows:

MM 6-1 The Project Applicant/Developer shall retain a qualified Archaeologist who shall oversee archaeological monitoring of topsoil grading and removals (including clearing, grubbing, and trenching) in the immediate vicinity of the following 25 archaeological sites that are within the grading footprint and ~~1~~2 site<u>s</u> in the open space area that ~~is~~ <u>are</u> immediately adjacent to the development impact area: CA-LAN-3201, CA-LAN-3202H, <u>CA-LAN-3217,</u> CA-LAN-3219H, CA-LAN-3227, CA-LAN-3230, CA-LAN-3232, CA-LAN-3233, CA-LAN-3234, CA-LAN-3236, CA-LAN-3237, CA-LAN-3238, CA-LAN-3239, CA-LAN-3240, CA-LAN-3241, CA-LAN-3242, CA-LAN-3243, CA-LAN-3244, CA-LAN-3245, CA-LAN-3246, CA-LAN-3247, CA-LAN-3248, CA-LAN-3250, CA-LAN-3251, CA-LAN-3252, CA-LAN-3253, and CA-LAN-3985H. <u>CA-LAN-3217 and</u> CA-LAN-3227 ~~is~~ <u>are</u> ~~the site~~ immediately adjacent to the grading footprint. Additionally, a Native American monitor representing the Tejon Indian Tribe shall be present during topsoil grading and removals in the vicinity of the 2~~6~~<u>7</u> above-listed archaeological sites.

~~T~~<u>Prior to the issuance of grading permits, the</u> Project Applicant/Developer shall provide written evidence to the County that a qualified Archaeologist has been retained~~;~~ <u>to carry out all mitigation measures related to archeological and historical resources. A qualified Archaeologist is defined as an archaeologist meeting the Secretary of the Interior's Standards for professional archaeology. The qualified Archaeologist</u> shall<u>:</u> be present at the pre-grading meeting; ~~shall~~ establish procedures for archaeological resource surveillance, including coordination with representatives of the Tejon Indian Tribe on the location and schedule of Native American monitoring; and ~~shall~~ establish (in cooperation with the Project Applicant/Developer and/or County as well as the Tejon Indian Tribe) procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of any artifacts found, as appropriate.

The qualified Archaeologist shall develop and submit an Archaeological Resource Monitoring Plan to the County for sites in development areas. The qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe shall be retained to attend pre-grade meetings and to monitor earth-moving activities, including clearing, grubbing and trenching, in the vicinity (i.e., the area of a site reasonably expected to contain

archaeological resources plus a buffer of at least 10 meters [33 feet]) of any and/or all cultural resource sites. For implementation of each tract map, if no subsurface Native American or archaeological remains are identified in the vicinity of an archaeological resources site during that initial grading, continuous monitoring will no longer be required but the Project Archaeologist and Native American monitor shall spot-check all additional subsurface excavations in the vicinity of an archaeological resources site at least once a week for the duration of grading and excavation activities or until the monitor deems site clear. The Project Archaeologist shall be responsible for coordinating the location and schedule of Native American monitors.

The Archaeologist and Native American monitor shall carefully inspect these areas to assess the potential for significant prehistoric or historic remains. If potentially significant archaeological resources are uncovered, the qualified Archaeologist and Native American monitor shall halt or redirect ground-disturbing activities away from the vicinity, and a subsurface test and/or evaluation shall be performed to assess the discovery. Further subsurface investigation or data recovery shall be undertaken if the resource is determined by the Project Archaeologist to be unique or historically significant (i.e., important for its prehistoric or historic information) and therefore eligible for the California Register of Historical Resources (CRHR).

The archaeological procedures required by the Archaeological Resource Monitoring Plan shall be incorporated as a note on the Grading Plan cover sheet. If additional or unexpected archaeological features are discovered, the qualified Archaeologist shall report such findings in writing to the County and/or the Tejon Indian Tribe. If archaeological resources are found to be of possible significance, the qualified Archaeologist shall determine appropriate actions, in cooperation with the County and the Tejon Indian Tribe, for further exploration and/or salvage in accordance with this mitigation measure.

The Archaeologist shall submit a Follow-up Report to the County. The Follow-up Report shall include: the period of inspection; an analysis of any artifacts found; and the present repository of the artifacts. Recovered finds shall be offered to the County of Los Angeles and the Tejon Indian Tribe on a first refusal basis. If the artifacts are refused, the Project Applicant/Developer may retain said finds if written assurance

is provided that they will be properly preserved in Los Angeles County, unless (1) said finds are of special significance or (2) a museum in the County of Los Angeles indicates a desire to study and/or display them, in which case the items shall be donated to the County or its designee. If the Project Applicant/Developer provides no such assurance, the County shall retain the artifacts and shall be subject to the same stipulations set forth in this mitigation measure for disposition of artifacts. These actions, as well as final mitigation and disposition of the resources, shall be subject to the approval of the County.

The Project ~~Applicant/Developer shall retain a certified~~ Archaeologist ~~who~~ will perform a Phase II subsurface test-level investigation and surface collection for archaeological resource sites of undetermined CRHR eligibility discovered during monitoring. A Phase II Test-level Report shall be completed that evaluates the sites; includes a discussion of the sites' significance (depth, nature, condition, and extent of the resources); and contains recommendations for final mitigation and cost estimates (if required) to fully mitigate significant impacts. Should the Phase II subsurface test-level investigation and surface collection determine the ~~potential~~ presence of significant ~~subsurface~~ archaeological resources that are eligible for CRHR listing, then potential Project impacts to the eligible archaeological resources site shall be mitigated to a less than significant level through the implementation of one of the mitigation options discussed below~~.~~:

a. Relocation of grading boundaries and fuel modification zones to completely avoid disturbance to the site(s) of eligible archaeological resources. ~~Should boundary relocation be infeasible~~ If it is determined that the relocation of grading boundaries and fuel modification zones in accordance with this subsection (a) is not feasible, then a qualified Archaeologist shall be present in the vicinity of eligible archaeological resources sites during grading and fuel modification brush clearance. (**NOTE:** confidential archaeological mapping is on file at the Natural History Museum of Los Angeles County and the South Central Coastal Information Center [SCCIC] at California State University, Fullerton. Review of this material is restricted to qualified individuals and project proponents on a need to know basis.) Fencing shall be erected outside the eligible archaeological resources sites to visually depict the areas to be avoided during construction. All eligible archaeological resources sites

avoided in accordance with this subsection (a) shall be subject to the preservation requirements of MM 6-4.

b. Per California Environmental Quality Act (CEQA) Guidelines Section 15126.4(b)(3)(A), grading boundary redesign and preservation in accordance with subsection (a) shall be the preferred means to avoid impacts to eligible archaeological resources. However, consistent with CEQA Guidelines Section 15126(b)(3)(C), ~~I~~if it is determined that avoidance and/or preservation of any eligible archaeological resources sites in accordance with subsection (a) are not feasible, then prior to grading in the vicinity of such eligible archaeological resources sites, Phase III data recovery (salvage excavations) shall be conducted for ~~these~~ such eligible archaeological sites or any other eligible sites within the potential impact area of development that cannot be avoided. (**NOTE:** confidential archaeological mapping is on file at the Natural History Museum of Los Angeles County and the SCCIC. Review of this material is restricted to qualified individuals and project proponents on a need to know basis.) When Phase III data recovery is undertaken, a data recovery plan, which makes provision for adequately recovering the scientifically consequential information from and about the eligible archaeological resource, shall be prepared by a qualified Archaeologist prior to any excavation being undertaken. The Phase III work shall provide sufficient scientific information to fully mitigate the impacts of development on these sites to a level considered less than significant and shall be performed in accordance with the standards of the State Historic Preservation Office (SHPO).

Excavated assemblages shall be offered to the County and/or the Tejon Indian Tribe on a first refusal basis. If the artifacts are refused, the Project Applicant/Developer may retain said finds if written assurance is provided that they will be properly preserved in Los Angeles County, unless (1) said finds are of special significance or (2) a museum in the County of Los Angeles indicates a desire to study and/or display them, in which case the items shall be donated to the County or its designee. If the Project Applicant/Developer provides no such assurance, the County shall retain the artifacts and shall be subject to the same stipulations set forth in this mitigation measure for disposition of artifacts. Final mitigation shall be carried out based upon the recommendations in the Phase II

Test-Level Report, and the County of Los Angeles Department of Regional Planning shall make a determination as to the site's disposition based on the recommendations of the qualified Archaeologist. Possible determinations include, but are not limited to, preservation, salvage, partial salvage, or no mitigation necessary.

MM 6-2 Prior to ground disturbing activities, ~~A~~archaeological sites CA-LAN-3201, CA-LAN-3206, CA-LAN-3217, CA-LAN-3227, CA-LAN-3240, and CA-LAN-3242 shall be surrounded with high visibility construction fencing with a buffer of approximately 50 feet around each site to ensure that the archaeological sites are completely avoided during construction-related activities. A qualified Archaeologist shall work with surveying teams and the Construction Supervisor to fence the area to be avoided prior to the commencement of grading.

MM 6-3 Prior to the issuance of grading permits, the ~~The~~ Project Applicant/Developer shall ~~retain~~ provide written evidence to the County that a qualified Archaeologist has been retained to carry out all mitigate~~i~~ion measures related ~~impacts~~ to eligible archaeological sites within the development impact area. A qualified Archaeologist is defined as an archaeologist meeting the Secretary of the Interior's Standards for professional archaeology. ~~Additionally, and~~ A qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe shall be present during ground-disturbing activities (i.e, topsoil grading and removals) in the vicinity of the following three ~~below-listed~~ eligible archaeological sites~~.~~: CA-LAN-3201; CA-LAN-3240; CA-LAN-3242. Impacts to these three eligible sites ~~(CA-LAN-3201, CA-LAN-3240, and CA-LAN-3242)~~ shall be mitigated to a less than significant level through the implementation of one of the mitigation options described below~~.~~:

a. Relocation of grading boundaries and fuel modification zones to completely avoid disturbance to the site(s). ~~Should boundary relocation be infeasible~~ If it is determined that the relocation of grading boundaries and fuel modification zones in accordance with this subsection (a) is not feasible with respect to eligible archaeological resources sites CA-LAN-3201, CA-LAN-3240 and/or CA-LAN-3242, then a qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe shall be present in the vicinity of any such eligible archaeological resources

site during grading and fuel modification brush clearance to monitor all activities and ensure that archaeological resources are not impacted. (**NOTE:** confidential archaeological mapping is on file at the Natural History Museum of Los Angeles County and the SCCIC. Review of this material is restricted to qualified individuals and project proponents on a need to know basis.) Temporary construction ~~F~~fencing shall be erected outside ~~the~~ any such eligible archaeological resources site~~s~~ to visually depict the areas to be avoided during construction, in accordance with MM 6-2. Any temporary fencing materials (i.e., plastic web, chain link, etc.) placed during construction should not become permanent. Any permanent fencing erected in accordance with MM 6-4 to protect the sites should be visually pleasing and consistent with the overall aesthetic experience of the community of Centennial. All eligible archaeological resources sites avoided in accordance within this subsection (a) shall be subject to the preservation requirements of MM 6-4.

b. Per California Environmental Quality Act (CEQA) Guidelines Section 15126.4(b)(3)(A), grading boundary redesign and preservation in place in accordance with subsection (a) shall be the preferred means to avoid impacts to eligible archaeological resources. However, consistent with CEQA Guidelines Section 15126.4(b)(3)(C), if it is determined that ~~If~~ avoidance and/or preservation of any eligible archaeological resources sites in accordance with subsection (a) is ~~are~~ not feasible, then prior to grading in the vicinity of such archaeological resources sites, Phase III data recovery (salvage excavations) shall be conducted for ~~these~~ such archaeological resources sites or any other eligible sites within the potential impact area of development that cannot be avoided. (**NOTE:** confidential archaeological mapping is on file at the Natural History Museum of Los Angeles County and the SCCIC. Review of this material is restricted to qualified individuals and project proponents on a need to know basis.) When Phase III data recovery is undertaken, a data recovery plan, which makes provision for adequately recovering the scientifically consequential information from and about the eligible archaeological resource, shall be prepared by a qualified Archaeologist prior to any excavation being undertaken. The Phase III work shall provide sufficient

scientific information to fully mitigate the impacts of development on these sites and shall be performed in accordance with the standards of the SHPO.

Excavated finds shall be offered to the County and/or the Tejon Indian Tribe on a first refusal basis. If the artifacts are refused, the Project Applicant/Developer may retain said finds if written assurance is provided that they will be properly preserved in Los Angeles County, unless (1) said finds are of special significance or (2) a museum in the County of Los Angeles indicates a desire to study and/or display them, in which case the items shall be donated to the County or its designee. If the Project Applicant/Developer provides no such assurance, the County shall retain the artifacts and shall be subject to the same stipulations set forth in this mitigation measure for disposition of artifacts. Final mitigation shall be carried out based upon the recommendations in the Phase II Test-Level Report, and the County shall make a determination as to the site's disposition based on the recommendations of the qualified Archaeologist and the Native American monitor representing the Tejon Indian Tribe. Possible determinations include, but are not limited to, preservation, salvage, partial salvage, or no mitigation necessary.

MM 6-4 ~~The Project Applicant/Developer~~ A qualified Archaeologist meeting the requirements of the Secretary of the Interior's Standards for professional archaeology shall develop and implement an Archaeological Resources Site-Protection Program aimed to protect and preserve identified CRHR-eligible archaeological resources avoided in accordance with subsection (a) of MM 6-1 and/or MM 6-3, as well as any identified archaeological resources site located within the Project site's open space areas that is of known eligibility for CRHR listing and which are vulnerable to disturbance during Project construction and/or operation. Identified archaeological resources sites located within the Project site's open space that are of unknown eligibility for CRHR listing and which are vulnerable to disturbance shall also be protected under the Archaeological Resources Site-Protection Program in accordance with this MM 6-4, provided that no such site shall be subject to this MM 6-4 if a Phase II archaeological investigation performed by a qualified Archaeologist in accordance with Secretary of the Interior Standards determines that such site is not unique and is thus ineligible for CRHR listing. Th~~is~~e Archaeological Resources Site-Protection P~~p~~rogram shall be prepared by the qualified monitoring Archaeologist familiar with the resources present

within the Project boundaries, ~~and~~ shall be approved by the County, and shall include implementation of one or more of the following:

a. Fencing and/or other access-restriction methods shall be placed around the archaeologically sensitive areas of the Project site to inhibit human access. This ~~is especially~~ subsection (a) shall be applicable to sites CA-LAN-3217 and CA-LAN-3227, unless the qualified Archaeologist determines that such sites are more appropriately protected in accordance with subsections (b) or (c) of this MM 6-4.; or

b. Non-invasive plant species with thorns (e.g., prickly pear cactus [*Opuntia* spp.]) or other deterrent characteristics shall be planted in areas close to known resources in order to discourage human presence; this is generally applicable to the majority of sites to be preserved in areas of native vegetation.; or

c. Known eligible resources shall be capped with a layer of chemically inactive soil/sediment, in consultation with a qualified Archaeologist. This ~~is especially~~ subsection (c) shall be applicable to sites CA-LAN-3201, ~~CA-LAN-3206,~~ CA-LAN-3240, and CA-LAN-3242, to the extent such sites are avoided in accordance with subsection (a) of MM 6-3, unless the qualified Archaeologist determines that any such site is more appropriately protected in accordance with subsections (a) or (b) of this MM 6-4. This subsection (c) shall be applicable to site CA-LAN-3206, unless, pursuant to the County-approved Archaeological Resources Site-Protection Program required by this MM 6-4, it is determined that such site is not vulnerable to disturbance.

~~The above-mentioned mitigation~~ This MM 6-4 shall be implemented prior to the completion of construction activities and shall be overseen by the County and/or the Tejon Indian Tribe. The qualified Archaeologist shall prepare a written statement documenting appropriate site-protection measures for submittal to the County. Additionally, a Native American monitor representing the Tejon Indian Tribe shall be present during all initial surface grubbing, initial ground surface grading, and any excavation greater than one-half foot in depth. ~~For implementation of each tract map, if no subsurface Native American or archaeological remains are identified during that~~

~~initial grading, continuous monitoring will no longer be required but the Native American monitor shall spot-check all additional subsurface excavations at least once a week for the duration of grading and excavation activities or until monitor deems site clear. The Project Archaeologist shall be responsible for coordinating the location and schedule of Native American monitors.~~

The first sentence of the last full paragraph of Draft EIR page 5.6-46 is hereby revised to correct a typographical error, as follows:

> As identified in Table 5.6-1 above, there are a total of 2~~6~~5 prehistoric and historic archaeological sites within the development footprint.

The last sentence of Draft EIR page 5.6-48 is hereby revised to correct a typographical error, as follows:

> Implementation of the Project would result in a less than significant impact to the 2~~4~~2 sites within the development footprint that have been determined ineligible for CRHR or are not cultural resources, and no mitigation is required; however, as testing may not have recovered all significant materials, these sites and a reasonable radius around them will be monitored during grading.

The last three full sentences of the first partial paragraph on Draft EIR page 5.6-2 are hereby revised as follows to correct typographical errors:

> However, sites CA-LAN-3217 and CA-LAN-3227 ~~is~~ are immediately adjacent the development footprint. Because of ~~its~~ their proximity, the sites could suffer damage during grading activities. Therefore, MM~~s~~ 6.1, MM 6-2, and MM 6-4 would be implemented for th~~is~~ese sites, and potential direct impacts to sites CA-LAN-3217 and CA-LAN-3227 during construction would be reduced to a less than significant level.

The first full sentence, and the balance of the first partial paragraph, and the second full paragraph on Draft EIR page 5.6-50 are hereby revised as follows to correct typographical errors:

> Because these 12 sites are outside the development footprint, direct impacts during grading and other construction activities are not expected. However, sites CA-LAN-3217 and CA-LAN-3227 ~~is~~ are immediately adjacent the development footprint. Because of ~~its~~ their proximity, the sites could suffer damage during grading activities. Because sites CA-LAN-3217 and CA-LAN-3227 ~~is~~ are assumed CRHR-eligible, this would be considered a potential significant direct impact. Therefore, MM 6-1 requires monitoring by a qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe (pursuant to AB 52 consultation as described above) when grading is in the vicinity of these sites (MM 6-1); MM 6-2 requires the sites to

be fenced off during construction to ensure complete avoidance of the resource; and MM 6-4 provides further protective measures if necessary. ~~Excavated finds shall be offered to the County of Los Angeles and/or its designee (i.e., the Tejon Indian Tribe) on a first refusal basis (MM 6-1); the Tejon Indian Tribe can then make a determination whether the find is a significant tribal cultural resource and opt to accept the resource for curation in the Tejon Tribe's facility.~~ With implementation of MM 6-1, MM 6-2, and MM 6-4, potential direct impacts to sites CA-LAN-3217 and CA-LAN-3227 during construction would be reduced to a less than significant level.

Long-term operation of the Project would result in potential indirect impacts to the 12 sites in the Project's open space area with unknown eligibility and the 1 site located in the open space areas that is known to be eligible (CA-LAN-3206) if it is determined that such sites are vulnerable to disturbance due to increased access, by residents and visitors, to these areas of the site compared to the existing condition, wherein the sites are located entirely on private property. Because archaeological excavation is considered an adverse effect on an archaeological resource, avoidance and preservation of resources without excavation would be the preferred method of managing these sites. Therefore, MM 6-4 requires preparation of an Archaeological Resources Site-Protection Program aimed to protect and preserve any identified archaeological resources that may be vulnerable to disturbance, unless a Phase II archaeological investigation performed by a qualified archaeologist determines that such site is not unique and thus not eligible for listing on the CRHR. The Archaeological Resources Site-Protection Program must be approved by the County and must include several alternatives to restrict access to these sites (e.g., fencing, planting, and capping), thereby protecting and preserving these sites. With implementation of MM 6-2 and MM 6-4, potential indirect impacts to the 12 sites within the Project site open space area with unknown eligibility and the 1 site located in the open space areas that is known to be eligible (CA-LAN-3206) ~~site CA-LAN-3227 during grading/construction~~ would be reduced to a less than significant level.

Response to Comment A.2-10:

The comment is noted for the record and will be provided to the Regional Planning Commission and the Board of Supervisors for consideration. No further response is required given that the comment does not raise a specific concern regarding the content of the Draft EIR.

Mr. Jodie Sackett
County of Los Angeles
Department of Regional Planning
Hall of Records, Room 1348
320 West Temple St
Los Angeles, California, 90012

Subject: Notice of Draft EIR for Centennial Housing Project, Antelope Valley, California.

Dear Mr. Sackett:

On May 19, 2017, we (the U.S. Fish and Wildlife Service) received the County of Los Angeles' request for comment on a Draft Environmental Impact Report (DEIR) for the proposed Centennial project in Antelope Valley, 50 miles south of Bakersfield, California. The proposed housing development would include 19,333 dwelling units and associated commercial and civic land uses on approximately 12,323 acres. We provide these comments under the authorities of the Endangered Species Act of 1973, as amended (ESA). A.3-1

The U.S. Fish and Wildlife (Service) responsibilities include administering the Endangered Species Act, including sections 7, 9, and 10. Section 9 of the Endangered Species Act prohibits the "take" of any federally listed endangered or threatened species. "Take" is defined by the ESA as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. "Harm" is further defined as significant habitat modification or degradation that actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering (50 Code of Federal Regulations 17.3). "Harass" is defined as an intentional or negligent act or omission that creates the likelihood of injury to listed species by annoying it to such an extent as to significantly impair normal behavioral patterns which include breeding, feeding, or sheltering (50 Code of Federal Regulations 17.3). The U.S. Fish and Wildlife Service may provide an exemption from the take prohibitions through the issuance of a biological opinion for federal projects pursuant to section 7(a)(2) of the Endangered Species Act, or the issuance of an incidental take permit pursuant to section l0(a)(1)(B) for projects with no federal nexus. A.3-2

The Centennial project overlaps the range of the federally endangered California condor (*Gymnogyps californianus*), and it borders a critical habitat unit that is essential to the recovery of this species. California condors probably fly over the project area, but the DEIR suggests they do not land or forage in the project area on a regular basis, perhaps due to a lack of thermals and A.3-3

associated lift. However, large-scale developments such as this can produce thermals due to an increase in sunlight absorbing materials with a high heat capacity, potentially allowing soaring birds to utilize the area to a greater extent. Over 200,000 additional daily vehicle trips are predicted to occur in this sparsely populated and undeveloped area due to project development. As a result, a presumably substantial increase in roadkill carcasses could also attract California condors to the area, which would also gain a large number of anthropogenic perching sites. While these factors might provide a short-term benefit to individual birds, the hazards associated with foraging and flying in developed areas pose a long-term threat. A.3-3 cont.

We strongly recommend the project implement measures to discourage California condors from perching and foraging in the development area. This species occurs at an extremely low density and is distributed over a large range; which results in a low probability that the Centennial Project will harm one of these birds. With full implementation of the modified conservation measures listed below, this probability will be reduced to a level that does not warrant take coverage. A.3-4

The Service has issued guidance on California condor hazing methods that do not rise to the level of "Take" under the ESA (Service 2014). A number of these methods can only be conducted by a qualified biologist with approval from the Service. We recommend the DEIR include a requirement to contact a qualified biologist to determine when and where such hazing actions might be warranted. We also recommend retaining qualified, on-call condor biologists for the life of the project, who can conduct hazing as needed. A.3-5

We note that Mitigation Measure 7-6 from the DEIR would involve hiring an "authorized biologist" to oversee condor-related conservation measures during construction. Please be aware that the Service typically uses the term "authorized biologist" when referring to biologists that will work on projects requiring take coverage, and it does not appear that this project will need to request take coverage under sections 7 or 10 of the ESA. A.3-6

We appreciate that qualified biologists are not always available to respond in a timely fashion across the species' range, and that hazing is most effective if applied immediately following undesirable behavior. Because of this, we have concluded that a subset of less aggressive hazing methods can be used without a qualified biologist in order to decrease the response time while not increasing the likelihood of injuring California condors. These less aggressive methods include, but are not limited to: yelling, clapping, stomping, leashed barking dogs and the use of low-pressure water spraying devices (directed near, but not directly at, the birds). Commercially available automated systems may also be appropriate for this. We recommend individuals employing these techniques request instruction and guidance from us prior to deploying them, and above all, hazing methods must direct the birds toward a collision hazard-free escape route (without power lines, guy-wires, fences, etc.). Hazing should not be conducted if it, or the birds escape route, is unsafe for California condors. A.3-7

We note that mitigation measure 7-6 from the DEIR will also require the project proponents to minimize micro-trash during construction, install anti-perching devices on all surfaces of new A.3-8

antennae and phone/utility towers, and relocate cattle carcasses from within 1,000 feet of the project boundary to nearby open grasslands. The Service fully supports these measures and recommends the following modifications: 1) Micro-trash restrictions should be written into the covenants, codes, and restrictions (CC&R) that govern property owners within Centennial to extend this measure over the life of the project; 2) Whenever possible, utility towers and antennae should be self-supporting (i.e. not use guy wires), and be as visible as possible (using solid panel siding or dense/wide lattice work); 3) Reflective building materials (e.g. cool roofs), should be installed whenever possible to minimize updrafts that could attract soaring birds; 4) Develop a road-kill removal action plan that will reduce the number of roadside carcasses on nearby roads commonly driven by vehicles entering and leaving the Centennial development. As these carcasses are likely to occur as a result of this project, removing them would not alter the baseline conditions in the area, and would not constitute an effect on California condor foraging behavior.

A.3-8 cont.

Species listed under the California Endangered Species Act, but not under the Federal ESA, may occur in the area, as are species of special concern at the state level (e.g. Burrowing Owl, *Athene cunicularia*). We will defer to the California Department of Fish and Wildlife on how best to avoid impacts to these species, and if take coverage would be warranted based on natural resources with state level protections.

A.3-9

Thank you for the opportunity to comment on this matter. If you have any questions, please contact Jeffrey Ackley at the Palm Springs office (jeffrey_ackley@fws.gov or 760-322-2070 ext. 420).

A.3-10

Sincerely,

Responses to Comment Letter A.3
U.S. Fish and Wildlife Service
July 19, 2017

Response to Comment A.3-1:

The Commenter's summary of the Project description is correct as written, and no additional response is required.

Response to Comment A.3-2:

The comment states the legal responsibilities of the U.S. Fish and Wildlife Service and does not present a question on the Draft EIR. No further response is required.

Response to Comment A.3-3:

It is recognized that the Project has some potential to increase prey items in the area and add anthropogenic perching opportunities, and the Draft EIR fully addresses impacts associated with anticipated California condor activity in the Project area.[62] As described on page 5.7-148, MM 7-6 is included to further ensure that the proposed Project does not result in future significant impacts on the California condor. MM 7-6 of the Draft EIR states that all surfaces on new antennae and phone/utility towers shall be designed and operated with anti-perching devices in conformance with Avian Power Line Interaction Committee standards to deter California condors and other raptors from perching. It also states that during construction, the area shall be kept clean of debris.

Regarding increases in thermals resulting from Project development, the potential that changes of this nature could occur of a magnitude sufficient enough to support a change in condor behavior is highly unlikely. Throughout the daytime, particularly when the skies are free of clouds, urban surfaces are warmed by the absorption of solar radiation. Surfaces in the urban areas tend to warm faster than those of the surrounding rural areas.[63] By virtue of their high heat capacities, urban surfaces act as a giant reservoir of heat energy. For example, concrete can hold roughly 2,000 times as much heat as an equivalent volume of air.[64] A low albedo value, characteristic of black asphalt, absorbs a large percentage of solar heat creating warmer near-surface temperatures. As a result, the large daytime surface temperature within the Urban Heat Island (UHI) is easily seen via thermal remote sensing.[65] As is often the case with daytime heating, this warming also has the effect of generating convective winds within the urban boundary layer. It is theorized that, due to the atmospheric mixing that results, the air temperature perturbation within the UHI is generally minimal or nonexistent during the day, though the surface temperatures can reach extremely high levels.[66]

62 DRP 2017, pp. 5.7-17, -19, -22, -23, -63, -88, -94, -118 to -120, -145, -148, -173, -177, -178, -191
63 Camilloni and Barros 1997
64 H.-Y. Lee 1993
65 Ibid.
66 Camilloni and Barros 1997

At night, the situation reverses. The absence of solar heating causes the atmospheric convection to decrease, and the urban boundary layer begins to stabilize. If enough stabilization occurs, an inversion layer is formed. This traps urban air near the surface and keeps surface air warm from the still-warm urban surfaces, forming the nighttime warmer air temperatures within the UHI. Other than the heat retention properties of urban areas, the nighttime maximum in urban canyons could also be due to the blocking of "sky view" during cooling: surfaces lose heat at night principally by radiation to the comparatively cool sky, and this is blocked by the buildings in an urban area. Radiative cooling is more dominant when wind speed is low and the sky is cloudless, and indeed the UHI is found to be largest at night in these conditions.[67]

Similarly, an article published in *Atmospheric Environment*[68] states that during daytime, when evaporation is very small (<4 percent of net radiation), and therefore sensible heat uses dominate (Bowen ratio >8), the uptake of heat by the buildings and substrate is so large (58 percent) that convective heating of the atmosphere is reduced to a smaller role than expected (38 percent). The nocturnal release of heat from storage is equal to or larger than the net radiation and sufficient to maintain an upward convective heat flux throughout most nights.

The concept is further described in a study published in the *Journal of Applied Meteorology*.[69] The study explains how a method for inferring the distribution of surface heat and evaporative fluxes and the ground moisture availability and thermal inertia (ground conductive capacity) is used to analyze two urbanized areas, Los Angeles and St. Louis. The technique employs infrared satellite temperature measurements in conjunction with a one-dimensional boundary-layer model. Results show that there is a marked reduction of evaporation and moisture availability and a corresponding elevation of sensible heat flux over urbanized areas and over cropped areas with low vegetative cover. Conversely, low heat flux and high evaporation characterize vegetated and, especially, forested areas. Warm urban centers appear directly related to a reduction in vegetation, which normally allows for a greater fraction of available radiant energy to be converted into latent heat flux. The distribution of thermal inertia was surprisingly ill-defined and its variation between urban and rural areas was quite small. Thus, the increased heat storage within the urban fabric, which has been proposed as the underlying cause of the nocturnal heat island, may be caused mainly by enhanced daytime surface heating which occurs because of surface dryness, rather than by large spatial variations in the conductivity of the surface.

As described, condors are extremely infrequent visitors to the Project area, and that limited occurrence occurs almost exclusively as high elevation flyovers. Updrafts created by increased temperatures of the Project development are not expected to be significant, or to change the behavior of condors, because: (1) the development is small compared to large and very densely urbanized metropolitan areas such as Los Angeles shown to have such effects; (2) they are largely a night-time occurrence when condors are not flying; (3) high winds common to the area would further minimize the effects of such thermals; and (4) the

67 Morris, C.J.G. 2006-07-09
68 Oke, T.R., Spronken-Smith, R.A., Jáuregui, Grimmond C.S.B. 1999
69 Carlson, T.n., Dodd, J.k., Benjamin, S.G., Cooper, J.N. 1981

Project is surrounded by large open space areas, and includes significant internal expanses of parkland and other preserved open spaces. Consequently, project implementation would not be expected to result in thermals detectable by the condor nor influence behavior.

In order to be responsive to this and other commenters' requests for additional Project efforts to further reduce any potential adverse effects of the Project on the California condor, MM 7-6 on Draft EIR pages 5.7-177 and 5.7-178 shall be revised as follows:

MM 7-6 Construction Monitoring - The Project Applicant~~/Developer~~ shall retain a ~~qualified~~ CDFW/USFWS-approved "Authorized Biologist~~ with knowledge of California condors~~," to ~~monitor~~ be on-call during all construction activities. If condors are observed foraging or landing in the Project area~~. The resumes of the proposed Biologist(s) will be provided to the CDFW for concurrence. This Biologist(s) will be referred to as the "Authorized Biologist" hereinafter. During clearing and grubbing of construction areas~~, the Authorized Biologist shall ~~be present at all times. During mass grading, construction sites shall be monitored on a daily basis, and the Authorized Biologist will~~ have the authority to stop all construction activities until appropriate corrective measures have been ~~completed~~ implemented. If condors are observed landing in the Project area, the Applicant shall avoid further construction within 500 feet of the sighting until the animals have left the area, or as otherwise authorized by CDFW and USFWS. If the condors are nesting within 0.5-mile of any Project area, no construction activities shall occur within this 0.5-mile buffer until the condors leave, or as otherwise directed by CDFW and USFWS. All condor sightings in the Project area ~~will~~ shall be reported to CDFW and USFWS within 24 hours of the sighting.

~~To further protect California condors potentially foraging in the Project area over the long term from negative interactions with humans and/or artificial structures, the~~ Cattle Carcass Relocation - The Project Applicant~~/Developer~~ shall remove dead cattle that are found ~~or reported~~ within 1,000 feet of the boundary of a residential or commercial development within 24 hours. ~~Dead cattle shall be relocated to a predetermined location.~~ The Approved Biologist will select locations ~~where carcasses shall be placed shall be~~ a minimum of 1,000 feet from ~~a~~ development ~~area boundary. Appropriate locations~~ areas for ~~transfer~~ relocation of carcasses ~~include open grasslands and oak/grassland areas where condors can readily detect carcasses and easily land and take off without encountering physical obstacles such as powerlines and other utility structures~~. The proposed locations would be ~~selected and~~ approved by the CDFW and USFWS. ~~Pursuant to this measure, a~~ A telephone

number for reporting dead cattle shall be provided ~~and actively maintained. Any cattle carcasses transferred to the relocation areas shall be reported to the USFWS Condor Group~~ by the Applicant.

Utility Hazards - All surfaces on new antennae and phone/utility towers shall be designed, installed, and operated with anti-perching devices in conformance with Avian Power Line Interaction Committee standards to deter California condors and other raptors from perching. Whenever possible, utility towers and antennae should be self-supporting (i.e. not use guy wires), and be as visible as possible (using sold panel siding or dense/wide lattice work).

Condor Educational Curriculum - The Applicant shall provide a Condor Educational Curriculum that includes the life history of the California condor, how to identify condors, TRC hunting rules and regulations, prohibited behaviors related to condors such as hunting with lead ammunition, and the legal consequences of inadvertently or otherwise illegally shooting or harming California condors. The information will also identify types of microtrash that could be ingested by adult breeding condors and describe measures to eliminate microtrash and provide information on how to report roadkill for removal. In addition, these rules, regulations, and prohibitions shall be listed within CC&Rs.

Microtrash - During construction, the ~~area~~ Applicant shall ~~be~~ ensure that all Project areas are kept clean of debris ~~(e.g., cable, trash, and construction materials). The Project Applicant/Developer shall collect all~~ including microtrash and litter ~~(i.e., anything shiny, such as broken glass), vehicle fluids, and food waste from the Project area on a daily basis~~. Workers ~~shall~~ will be trained on the issue of microtrash: what constitutes microtrash, its potential effects on California condors, and how to avoid the deposition of microtrash.

In addition, the Applicant will ensure that routine community maintenance activities include regular efforts to eliminate microtrash on and near all work sites, recreational events, roads, and adjacent open space areas.

If it is determined that condors are ingesting microtrash in the Project area, the Applicant, CDFW, and USFWS shall evaluate potential remedies to reduce, and, if possible, eliminate microtrash ingestion. Such remedies may include increased education and awareness to residents, guests, staff, and workers regarding the dangers of microtrash, increased monitoring of events and activities that are potential sources of microtrash, and more frequent collection of microtrash.

Condor Deterrent Activities - If the Authorized Biologist deems it necessary, USFWS California condor hazing methods that do not rise to the level of "Take" under the ESA (Service 2014) will be employed. Only the Authorized Biologist, with approval from the USFWS, will conduct hazing and only when such actions are warranted. If the Authorized Biologist is not immediately available, a subset of less aggressive hazing methods, such as yelling, stomping, leashed dog barking or low pressure water spray, may be used when a clear escape route for the condors is identified and upon guidance from USFWS.

Condor Tracking – The Applicant will provide the USFWS with twenty-five (25) GPS satellite tracking transmitters (total cost not to exceed $150,000.00) prior to grading plan approval. This will allow the USFWS to more quickly identify the immediate location of birds that are not moving relative to the ground, which usually indicates that an injury, illness, or death has occurred. The ability to track the movements and locations of individual condors can aid in the monitoring of the overall effectiveness of measures to minimize and mitigate the indirect impact of microtrash by locating possible areas where microtrash was ingested. It can also aide in identifying the location where condors were shot if such an incident were to occur.

Response to Comment A.3-4:

Please see responses to Comments A.3-3 and A.3-5.

Response to Comment A.3-5:

In order to be responsive to the Commenter's request, MM 7-6 shall be modified to include the requirement for the Project to retain a qualified on-call condor biologist for the life of the Project who can employ "hazing" (frightening) methods if/when they deem it is necessary. Please see response to Comment A.3-3 for revisions/edits to the MM 7-6.

Response to Comment A.3-6:

For Draft EIR purposes, "authorized biologist" and "qualified biologist" have the same meaning (MM 7-6).[70] The Commenter is correct that the Project would not cause the 'take' of an ESA species and no Section 7 or Section 10 permit is required.

Response to Comment A.3-7:

Please see responses to Comments A.3-3 and A.3-5.

Response to Comment A.3-8:

In order to be responsive to this and other commenters' requests for additional Project efforts to further reduce any potential adverse effects of the Project on the California condor, MM 7-6 on Draft EIR pages 5.7-177 and 5.7-178 shall be revised. Please see response to Comment A.3-3 for these revisions and further response. In regard to CC&Rs, response to Comment A.3-3 describes additional text added to MM 7-6 including the following paragraph:

> Condor Educational Curriculum - The Applicant shall provide a Condor Educational Curriculum that includes the life history of the California condor, how to identify condors, TRC hunting rules and regulations, prohibited behaviors related to condors such as hunting with lead ammunition, and the legal consequences of inadvertently or otherwise illegally shooting or harming California condors. The information will also identify types of microtrash that could be ingested by adult breeding condors and describe measures to eliminate microtrash and provide information on how to report roadkill for removal. In addition, these rules, regulations, and prohibitions shall be listed within CC&Rs.

Additionally, MM 7-15 on Draft EIR page 5.7-191 states the following: The Homeowners Association shall supply an educational pamphlet to future residents of the Project site regarding: the importance of not feeding wildlife; information stating that trash (containing food) and microtrash that could potentially attract condors should not be accessible to wildlife; the necessity of keeping the ground free of fallen fruit from trees; and instructions about not leaving pet food outside.

The comment also suggests inclusion of a requirement for using reflective building materials (i.e., cool roofs) to minimize updrafts (or thermals) that could attract soaring birds. Please see response to Comment A.3-3 for a detailed discussion on this topic with evidence indicating that potential for such an effect on soaring raptors at the Centennial project site is not expected.

Response to Comment A.3-9:

Thank you for your comment and your participation in this public process. The consideration of State-level special status species that may occur in the Project area has been noted for the

[70] *Id.,* p. 5.7-177

record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment A.3-10:

This comment provides the Commenter's contact information. The comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. No further response is required given that the comment does not raise a specific concern regarding the content of the Draft EIR.

Hall of Records, 13th Floor, Room 1348
320 West Temple Street
Los Angeles, California 90012
JSackett@planning.lacounty.gov

DRAFT ENVIRONMENTAL IMPACT REPORT (EIR) FOR CENTENNIAL PROJECT (COUNTY PROJECT NO. 02-232, GENERAL PLAN AMENDMENT NO. 02-232, ZONE CHANGE NO. 02-232, VESTING TENTATIVE PARCEL MAP NO. 060022, CONDITIONAL USE PERMIT NO. 02-232, DEVELOPMENT AGREEMENT NO. RPPL2016003940) (SCH# 2004031072)

Dear Mr. Sackett:

The Department of Toxic Substances Control (DTSC) has reviewed the subject EIR. The following project description is stated in the EIR: "The Project site consists of approximately 12,323 acres (or approximately 19.3 square miles) and is located in the northwestern portion of the Antelope Valley in unincorporated Los Angeles County and is contiguous to the southern boundary of Kern County." The EIR further states: "The Project involves the development of a new community with residential, commercial, business park, recreational/entertainment, and institutional/civic uses. The Project includes open space, parks, schools, utilities, and infrastructure to support the proposed and uses and future residents."

Based on the review of the submitted document, DTSC has the following comments:

1. The EIR should identify and determine whether current or historic uses at the project site may have resulted in any release of hazardous wastes/substances. A Phase I Environmental Site Assessment may be necessary to identify any recognized environmental conditions. B.1-1

2. If there are any recognized environmental conditions in the project area, then proper investigation, sampling and remedial actions overseen by the appropriate regulatory agencies should be conducted prior to the new development or any construction. B.1-2

3. If the project plans include discharging wastewater to a storm drain, you may be required to obtain an NPDES permit from the overseeing Regional Water Quality Control Board (RWQCB). B.1-3

4. The EIR states: "Residential dwellings are located near the center of the northern property line (currently one residence is present and is occupied)." If planned activities include building modifications/demolitions, lead-based paints or products, mercury, and asbestos containing materials (ACMs) should be addressed in accordance with all applicable and relevant laws and regulations. In addition, evaluate whether polychlorinated biphenyls (PCBs) containing materials are present in onsite buildings and address as necessary to protect human health and the environment. B.1-4

5. The EIR states: "Currently, the Project site is primarily open space and ranchland. The 12,323 acres of land that comprise the Project site have primarily been used for open cattle grazing over the last 150 years. In addition to cattle grazing, the Tejon Ranch Company owns and cultivates approximately 1,000 acres in the eastern portion of the Project site as pivot fields.1 These 1,000 acres include 5 separate pivot fields that correlate with the approximately 652 acres of Prime Farmland on the site that are currently under cultivation for the production of alfalfa and three-way forage mix (e.g., barley, oats, sudan grass)." If the site was used for agricultural or related activities, residual pesticides may be present in onsite soil. DTSC recommends investigation and mitigation, as necessary, to address potential impact to human health and environment from residual pesticides. B.1-5

6. The EIR states: "Stained soil was observed in the area of the asphalt, which Tejon Ranch Company reports is planned to be removed in the future." DTSC recommends investigation and mitigation, as necessary, to address potential impact to human health and environment from the above stained soil. B.1-6

7. The EIR states: "An inactive portion of a hunter's camp is located in the western portion of the Project site. At the time of the survey, the camp consisted of six trailers, a shooting range, and two outhouses." The shooting range may contain hazardous wastes. DTSC recommends investigation and mitigation, as necessary, to address potential impact to human health and environment from shooting range. B.1-7

8. The EIR further states: "The groundwater contamination from the Industrial Landfill Area, Diesel Pipeline Area, and Cement Kiln Dust Piles is contained in perched groundwater lying entirely within the Cement Plant site and is at a considerable distance from the Project site (approximately one mile). DTSC is unable to evaluate impact from these potential sources of contamination due to lack of relevant detailed information in the EIR. B.1-8

9. If soil contamination is suspected or observed in the project area, then excavated soil should be sampled prior to export/disposal. If the soil is contaminated, it should be disposed of properly in accordance with all applicable and relevant laws and regulations. In addition, if the project proposes to import soil to backfill the excavated areas, proper evaluation and/or sampling should be conducted to make sure that the imported soil is free of contamination. B.1-9

10. If during construction/demolition of the project, soil and/or groundwater contamination is suspected, construction/demolition in the area should cease and appropriate health and safety procedures should be implemented. If it is determined that contaminated soil and/or groundwater exist, the EIR should identify how any required investigation and/or remediation will be conducted and the appropriate government agency to provide regulatory oversight. B.1-10

If you have any questions regarding this letter, please contact me at (714) 484-5380 or email at Johnson.Abraham@dtsc.ca.gov.

Responses to Comment Letter B.1
California Department of Toxic Substances Control
June 26, 2017

Response to Comment B.1-1:

Thank you for your participation in this public process. The first paragraph on page 5.3-6 of Section 5.3, Hazards and Fire Safety, of the Draft EIR under the heading "Phase I Environmental Site Assessment Results" states, "To determine the presence of and potential for hazardous materials and/or waste contamination on the Project site from existing and historic on- and off-site uses and/or from recognized environmental conditions (RECs), Phase I ESAs have been prepared, and updated where applicable, to collectively encompass the entire Project site." The applicable studies related to hazards are located in Appendix 5.3 of the Draft EIR, including a Phase I Environmental Site Assessment (ESA) prepared for the proposed Project.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH # 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of hazards and fire safety can be found in these documents: Section 5.8 of the AVAP EIR, and Section 3.9 of the RTP/SCS EIR.

Response to Comment B.1-2:

Exhibit 5.3-1, "Locations of Phase I Findings," illustrates the location and name of notable Phase I ESA findings, including RECs, as well as the distribution of Phase I ESA report areas and dates. Also, all notable physical features or uses documented on the Project site at the time of each Phase I ESA are listed pages 5.3-6 to 5.3-8. Phase II ESAs were also conducted (i.e., investigation and sampling), in 1999 and in 2008, based on the results of the Phase I ESAs; the scope, methodology, and results of the two Phase II ESAs are provided under the heading "Soil Sampling" beginning on page 5.3-11. As stated in the fourth paragraph on page 5.3-19, "The Phase I ESAs determine that listed sites and/or current or historic land uses in the Project vicinity would be unlikely to adversely affect site development and the future population on the site." Specific on- and off-site land uses discussed in the Phase I ESAs are further addressed under Threshold 3-4 beginning on page 5.3-19. As discussed, MM 3-4 related to documentation of re-abandonment of the historic oil wells on site, MM 3-5 related to mine closure, and MM 3-6 related to encountering unexpected hazardous materials at the homestead area or elsewhere on the Project site would reduce potential impacts associated with these RECs to a less than significant level. These mitigation measures would be implemented as part of the Project construction. Also, past and current operations of the National Cement Plant (identified as an REC) are analyzed under this

threshold on pages 5.3-20 and 5.3-21, and the Draft EIR concludes, "there is no evidence that either historic or regular operations at the National Cement Plant or on the realigned National Cement Plant Road have or would adversely impact the Project."

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of hazards and fire safety can be found in these documents: Section 5.8 of the AVAP EIR, and Section 3.9 of the RTP/SCS EIR.

Response to Comment B.1-3:

As discussed in Draft EIR Section 5.2, Hydrology and Flood, Section 5.4, Water Quality and Sections 7.3.2 and 7.3.4, Cumulative Impacts (Hydrology and Flood and Water Quality), the Project has been designed to meet or exceed the new development requirements of the Los Angeles County Municipal Separate Storm Sewer System (MS4) permit, which was issued as an NPDES permit in 2014, and the County of Los Angeles Low Impact Development Standards Manual (LID Standards Manual) and Low Impact Development (LID) Ordinance (County Code Section 12.84), which implement the MS4 permit. As discussed in Section 5.4 and Section 7.3.4 of Draft EIR, the Project will also comply with the state Construction General Permit, the Lahontan Regional Water Quality Control Board (RWQCB) Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit, each of which has been issued as an NPDES permit, to ensure that no violations of applicable storm water NPDES permits or other significant impacts to surface water or groundwater quality will occur during construction. The Draft EIR also notes that Project activities located within a California Department of Transportation (Caltrans) would be required to comply with the Caltrans Statewide NPDES Permit.[71] In the event a Project wastewater discharge to a storm drains requires NPDES permitting, the Project will obtain such permits from the applicable RWQCB.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project can be found in these documents: Section 5.9 of the AVAP EIR, and Section 3.10 of the RTP/SCS EIR.

[71] DRP 2017, p. 4-108

Response to Comment B.1-4:

As stated in the first paragraph on page 5.3-11, "During site reconnaissance conducted in 1999 by Converse Consultants for a previous Phase I ESA, materials potentially containing asbestos were observed on site. Four samples were taken to be analyzed for asbestos content…" Of these, three samples did not contain asbestos and one sample was asbestos-containing. Accordingly, as stated on page 5.3-20 under the heading "Homestead Area", "As part of the Project, the drums and the limited areas of identified asbestos and/or other debris in the area of the former homestead site would be removed in accordance with all applicable regulatory standards, which are determined based on the quantity, type, and media (i.e., soil, groundwater) of the identified contamination as encountered at the time of site development. If hazardous materials are encountered in the homestead area or anywhere else on the Project site, activities in the immediate area shall be halted until consultation with the appropriate agencies (e.g., DTSC, State Water Resources Control Board, Los Angeles County Fire Department [LACFD]) is performed and the method of removal is determined (MM 3-6)." "Therefore, there would be no impacts to proposed future land uses on the Project site because the limited and common type of contaminated materials that would likely be encountered on the site would be fully resolved during site development activities and prior to occupancy of future land uses. There would be a less than significant impact."

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of hazards and fire safety can be found in these documents: Section 5.8 of the AVAP EIR, and Section 3.9 of the RTP/SCS EIR.

Response to Comment B.1-5:

Pesticide use is addressed in Section 5.3.2 of the Draft EIR. As stated on page 5.3-12 under the heading "Pesticide Use", "As detailed in Section 5.5, Land Resources, areas in the northeastern corner of the Project site and surrounding off-site areas have been and are currently used for agricultural purposes." As discussed elsewhere in this section, the 12,323-acre Project has primarily been used for open grazing, rather than cultivation. The pesticides used on the approximately 1,000 acres cultivated in the eastern portion of the site are listed in Table 5.3-1 on page 5.3-13. As discussed on pages 5.3-12 and 5.3-13, "all of these pesticides are listed for general use," and, "A pesticide listed for general use is considered to present little or no danger to either the applicator or the environment if it is used as directed." The 1,000 acres of pivot fields on the site under cultivation by the Tejon Ranch Company have not involved the use of "legacy pesticides" that can result in health hazards, as these areas were not under cultivation when these products were permissible. As such, pesticides are not identified as an REC in the Phase I ESAs prepared for the Project site.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of hazards and fire safety can be found in these documents: Section 5.8 of the AVAP EIR, and Section 3.9 of the RTP/SCS EIR.

Response to Comment B.1-6:

This comment's referenced quote refers to an area near the northern portion of the site that was identified during site reconnaissance for the Phase I ESAs, and which the Tejon Ranch Company reported was planned to be removed.[72] As of August 2017, the asphalt debris and surface soil was removed by a professional waste disposal company for off-site transport and disposal at an appropriate location[73,74]; therefore, this observation from the Phase I ESAs would not impact development of the Project site.

In response to this comment, the following documents are added to the administrative record:

Keith, N. 2017a (August 10). Personal communication. Telephone correspondence from N. Keith (Tejon Ranch Company) and J. Neary (Psomas) regarding the disposition of the debris and soil identified in the Phase I ESAs and planned for removal subsequent to Draft EIR publication.

Keith, N. 2017b (October 3). Personal communication. Telephone correspondence from N. Keith (Tejon Ranch Company) and J. Neary (Psomas) regarding the method or removal for the debris and soil identified in the Phase I ESAs.

Response to Comment B.1-7:

The location of the former hunter's camp is in an Open Space-designated area to the northeast of the development footprint. The camp site has never been accessible to the general public or available for commercial use. At present, there are no structures or other improvements at the former camp site. Because this site is located in an Open Space-designated area, it would not be developed as part of the Project, nor would it be accessible to the general public for passive recreational or other uses. Therefore, there is not necessity

72 DRP 2017, p. 5.3-6

73 Keith, N. 2017a (August 10). Personal communication. Telephone correspondence from N. Keith (Tejon Ranch Company) and J. Neary (Psomas) regarding the disposition of the debris and soil identified in the Phase I ESAs and planned for removal subsequent to Draft EIR publication.

74 Keith, N. 2017b (October 3). Personal communication. Telephone correspondence from N. Keith (Tejon Ranch Company) and J. Neary (Psomas) regarding the method or removal for the debris and soil identified in the Phase I ESAs.

to investigate the former shooting range, as there would not be public exposure to this area as a result of the proposed Project. Moreover, the Phase 1 Environmental Site Assessment prepared for this Project site evaluated the environmental condition of the hunter's camp site and determined that the camp revealed no evidence of recognized environmental conditions.

Response to Comment B.1-8:

Relevant information pertaining to the remediation activities of source areas at the National Cement Plant are described on pages 5.3-9 and 5.3-10 of the Draft EIR, as follows (emphasis added):

> "The National Cement Plant—also known as the Los Robles Cement Plant—is located in Kern County approximately one mile north of the Project site; its location is shown on Exhibit 5.3-1. Raw materials quarried at the site are the primary ingredients in Type II Portland Cement. During the 1990s, several locations were discovered where on-site cement manufacturing operations and waste handling practices had, over the years, impacted the quality of soil and groundwater on the Cement Plant site. The waste discharge sources of the Cement Plant site include solid waste disposal to on-site landfills located to the east of the plant structures; liquid waste storage in a belowground waste oil tank located at the southeastern portion of the plant; chemical storage at a drum storage area in the plant's maintenance area at the southeastern portion of the plant; diesel fuel transfer in an underground pipeline in the plant operating area; and cement kiln dust disposal in large piles located to the west of the plant structures. These source areas are commonly referred to as "the Industrial Landfill Area", "the Maintenance Shop Area" (combines the Waste Oil Tank Area and the Drum Storage Area), "the Diesel Pipeline Area", and "the Cement Kiln Dust Piles", respectively. The Cement Plant is not a State or federal Superfund site.
>
> Each source area has undergone specific site-characterization processes to identify the nature and extent of the unauthorized releases. In each source area, the known cause of the unauthorized release has been removed, as required by the regulatory agency with oversight authority. However, in some source areas, approved levels of contaminants remain in the soil. In addition, groundwater quality beneath all source areas was impacted to varying degrees. As a result, the California Regional Water Quality Control Board, Lahontan Region (Lahontan RWQCB) has issued waste discharge requirements (WDRs) and/or cleanup and abatement orders (CAOs) for each of these source areas that required installation of groundwater treatment systems; that prescribe groundwater monitoring in order to ascertain the rate at which pollutant levels are declining; and that allow for corrective action (where necessary) based on the monitoring results to clean up contaminated groundwater.

The groundwater contamination from the Maintenance Shop Area had migrated at shallow depths off the Cement Plant site and under parts of Tejon Ranch adjacent to the southeastern corner of the Cement Plant site. To address groundwater contamination under Cleanup and Abatement Orders 6-90-59A3 and 6-94-90A3, a long-term groundwater pump and treatment system went into operation in July 2003. Quarterly Groundwater Monitoring Reports are prepared for the Lahontan RWQCB (copies of which are available with the County of Los Angeles Department of Regional Planning) to demonstrate containment of the plume and to track the success level in remediating the contaminants of concern (primarily halogenated volatile organic compounds [HVOCs]). Groundwater that is treated to potable water standards is now intermittently discharged into the incised channel in approximately the same area where the groundwater previously discharged naturally. Since the implementation of this groundwater treatment system, HVOCs have not been detected in the surface waters of the incised channel. It is noted that, prior to implementation of the treatment system, the HVOCs were detected at low concentrations and for a short distance before they volatilized. Therefore, this source area poses no threat to the Project site because the limits of surface and groundwater contamination are distant from the Project site and its water supply sources.

The groundwater contamination from the Industrial Landfill Area, Diesel Pipeline Area, and Cement Kiln Dust Piles is contained in perched groundwater lying entirely within the Cement Plant site and is at a considerable distance from the Project site (approximately one mile). There is no connection between the affected groundwater and the groundwater sources available to the Project site.

The Lahontan RWQCB is also the lead oversight agency for ongoing and future environmental activities at the Cement Plant to monitor groundwater quality and required remediation activities. The Lahontan RWQCB works closely with the responsible parties (with the former and current owners of the Cement Plant that have active responsibilities, and the property owner who has backup liability) to ensure that all environmental concerns are adequately identified and addressed in a timely manner. The CAOs charge the responsible parties with long-term remediation and containment actions to clean up and abate the effects of unauthorized waste discharges. The WDRs establish the discharge limitations for the constituents of concern (COC) and outline the monitoring and reporting requirements."

Further, the analysis of Threshold 3-4 under the header "National Cement Plant" on page 5.3-20 states (emphasis added):

"As discussed in detail previously, the National Cement Plant is located in Kern County approximately one mile north of the Project site (Exhibit 5.3-1), and groundwater contamination had resulted from historic activities of this

> facility. Accordingly, there has been agency oversight by DTSC and the Lahanton RWQCB (lead oversight agency) related to continuing remediation efforts. **As described fully above in the Environmental Setting section, the contaminant source areas pose no threat to the Project site and its water supply sources due to distance; lack of connectivity between the shallow groundwater impacted by historic releases and Tejon Ranch water supplies; and the results of ongoing groundwater remediation.** Finally, as part of the Water Quality Technical Report prepared for the Project, the National Cement Plant was reported to have been in compliance with regulatory permitting and related requirements (Geosyntec 2016). Further, in March 2007, the DTSC issued a closure letter for the Systech site, which indicated to the Tejon Ranch Company that the Systech site had been fully remediated (DTSC 2007). Therefore, this land use would result in no impacts to the Project site."

As indicated above and supported by detailed information and sources in the Draft EIR, due primarily both due distance (approximately one mile) and the perched/shallow location of impacted groundwater at this distance, the contamination being actively treated and monitored at the Cement Plant poses no impact to the Project site. Because this comment does not raise a specific concern regarding the facts presented or resultant findings of the Draft EIR with regard to groundwater contamination at the National Cement Plant, no further response is required.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH # 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of hazards and fire safety and hydrology and water quality can be found in these documents: Sections 5.8 (Hazards and Hazardous Materials) and 5.9 (Hydrology and Water Quality) of the AVAP EIR, and Sections 3.9 (Hazards and Hazardous Materials) and 3.10 (Hydrology and Water Quality) of the RTP/SCS EIR.

Response to Comment B.1-9:

Disposal of contaminated media is not always the appropriate remedial action, based on site-specific factors. As discussed in response to Comment B.1-4 above, MM 3-6 would be implemented in the event that unanticipated hazardous materials or waste is encountered and directs that coordination with applicable oversight agency(ies) be conducted and that all investigation and/or remediation be conducted pursuant to a Workplan approved by the primary oversight agency(ies). The purpose of this mitigation measure is to encompass all eventualities for unexpected contamination and ensure it is appropriately handled on a case-

by-case basis. As such, MM 3-6 is consistent with the guidance provided in this comment, as shown:

MM 3-6 If unanticipated hazardous materials or waste is encountered during construction, all work in the immediate vicinity of the suspect hazardous material shall be halted and the applicable oversight agency(ies) shall be notified. The applicable agency(ies) are determined based on the type and extent of the material encountered, and may include the California Department of Toxic Substances Control (DTSC), the State Water Quality Control Board, and/or local agencies, such as the County of Los Angeles Fire Department. The Project Applicant/Developer shall coordinate with appropriate agency(ies) on the appropriate means to address the suspect hazardous material/waste. All environmental investigation and/or remediation shall be conducted under a Workplan approved by the primary oversight agency(ies) and construction in the affected area shall not proceed until clearance has been issued by the applicable agency(ies).

As discussed in the first paragraph in Section 4.5.17, "Grading and Construction," "Grading for one phase with an approved tentative tract map may extend into adjacent phases that may or may not be covered by an approved tentative tract map and require the import or export of soils among phases, but earthwork within the Project boundary would achieve an overall earthwork balance." Therefore, Project implementation would not require off-site import of soil to backfill excavated areas. Encountering hazardous materials in on-site materials during excavation activities is addressed by MM 3-6.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of hazards and fire safety can be found in these documents: Section 5.8 of the AVAP EIR, and Section 3.9 of the RTP/SCS EIR.

Response to Comment B.1-10:

As discussed in Section 5.3, Hazards and Fire Safety, MM 3-6 requires that if unanticipated hazardous materials or waste is encountered during construction, including in soil or groundwater, all work in the immediate vicinity of the suspect hazardous material must be halted and the applicable oversight agencies must be notified based on the type and extent of the material encountered. The oversight agencies include the California Department of Toxic Substances Control, the State Water Quality Control Board, and/or local agencies, such as the County of Los Angeles Fire Department. MM 3-6 requires that the Project coordinate with the oversight agencies to identify the appropriate means to address any suspect

hazardous material or waste, and that all environmental investigation and/or remediation must be conducted under a work plan that is approved by the primary oversight agency. MM 3-6 provides that all construction in an area affected by the encounter of unanticipated hazardous materials or waste will not continue until clearance has been issued by the applicable agencies. Consequently, MM 3-6 addresses the requirements and process for unanticipated hazardous materials or waste encounters, including contaminated soil or groundwater, during construction or demolition as discussed in the comment. Because the type and scope of any unanticipated soil and/or groundwater contamination cannot be known in advance, and the appropriate agency(ies), investigation, and remediation is based on site-specific factors, MM 3-6 is intended to encompass all eventualities for unexpected contamination and ensure it is appropriately handled on a case-by-case basis. Please refer to response to Comment B.1-9 with regard to soil contamination. With regard to groundwater contamination, there are no known sources of groundwater contamination on or near the site that would affect water resources for the proposed Project. Please refer to response to Comment B.1-8 for discussion of shallow (perched) groundwater contamination on the National Cement Plant property.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of hazards and fire safety can be found in these documents: Section 5.8 of the AVAP EIR, and Section 3.9 of the RTP/SCS EIR.

Draft Environmental Impact Report for the Proposed Centennial Project, Community of Gorman, Los Angeles County, Southern Field Division, West Branch of California Aqueduct Milepost 4.0, SCH2004031072

Dear Mr. Dea:

Thank you for the opportunity to review and comment on the Draft Environmental Impact Report (DEIR) for the Proposed Centennial Project within the County of Los Angeles. The document describes a proposal by the Tejon Ranch Company to develop 19,333 residential units, in addition to business parks, commercial use spaces and institutional/civic structures and spaces within approximately 12,323 acres east of Interstate Route 5. The project is located approximately 25 miles north of the Community of Castaic. The Department of Water Resources' (DWR) West Branch California Aqueduct (Aqueduct), a part of the State Water Project (SWP), is located within the project boundaries on the north side of Hwy 138. B.2-1

DWR responded with comments to the 2015 Notice of Preparation (NOP) for this project in an October 30, 2015 letter to your office. Our letter does not appear within the State Agency comments appendix of the DEIR. We have enclosed a copy of our original comment letter and we reiterate the concerns addressed in the letter. Tejon Ranch Company will be required to comply with any and all provisions of Water Code Section 12899-12899.11 or California Code of Regulations, Title 23, Section 630-635 regarding encroachments within, or affecting, the SWP right-of-way. B.2-2

In addition to our earlier comments on the NOP, which need to be addressed in the DEIR, DWR has amended wildlife comments after reviewing the DEIR. This includes, but is not limited to, analysis and implementation of a buffer of natural habitat between the development and DWR right-of-way wide enough to prevent impacts to DWR maintenance and repair work during nesting bird season; and the addition of wildlife overpasses that begin and end outside DWR right-of-way. B.2-3

Buffers should take into consideration standard requirements by California Department of Fish and Wildlife for nesting raptors. Overpasses dedicated to wildlife movement will reduce the risk to DWR personnel from vehicle collision with large mammals, reduce the risk of accidents trying to avoid hitting wildlife, reduce the risk of animals hit by vehicles on bridges from falling into the Aqueduct, and prevent an increase in wildlife being trapped in the Aqueduct while trying to access open space. B.2-4

As indicated in our previous letter, portions of this project may require the issuance of an encroachment permit from DWR. B.2-5

Please provide DWR with a copy of any subsequent environmental documentation when it becomes available for public review. Any future correspondence relating to this proposed project shall be directed to:

Leroy Ellinghouse, Chief
SWP Right-of-Way Management Section
Division of Operations and Maintenance
Department of Water Resources
1416 Ninth Street, Room 641-1
Sacramento, CA 95814

B.2-6

If you have any questions, please contact Scott Williams at (916) 653-5746, or Leroy Ellinghouse of my staff at (916) 653-7168.

Sincerely,

for David M. Samson, Chief
State Water Project Operations Support Office
Division of Operations and Maintenance

Revised Notice of Preparation, Centennial Project, East of the Community of Gorman, North of Quail Lake, Los Angeles County, Southern Field Division, SCH2004031072

Dear Mr. Dea:

Thank you for the opportunity to review and comment on the Revised Notice of Preparation (NOP) of the Centennial Project (Project) located in an unincorporated area north of Quail Lake and south of Tehachapi Afterbay in Los Angeles County. The Project includes development of 12,323-acre master planned community with residential, business park, commercial, civic and institutional, and recreation and entertainment uses within the privately-owned Tejon Ranch. Community infrastructure facilities that will serve the Project include construction of wastewater reclamation facilities, water treatment facility, water bank, and materials recovery facility. A new bridge crossing over the West Branch of the California Aqueduct (Aqueduct) is also proposed in the Project. B.2-7

The Notice of Preparation of the Project was originally submitted in 2004 and is revised to include reduction in development area and no development in the northwest area of the Project site.

California Department of Water Resources (DWR) has concerns about the Project at the following areas:

Biological Resources

DWR personnel conduct routine maintenance and repairs adjacent to the Project. DWR requests impacts to wildlife that cause migration into DWR right-of-way be analyzed as nesting birds and special-status species relocating into DWR right-of-way will impact our ability to maintain and improve State Water Project (SWP) facilities. Nesting birds, including ground nesting raptors, and special status species moving into DWR right-of-way due to loss of habitat would likely require DWR having to consult with wildlife control agencies in order to perform the routine maintenance and repair. Movement of B.2-8

wildlife into DWR right of way has the potential to stop work until take permits are secured, whereas prior to development no take permits were required. B.2-8 cont.

Antelope, deer, and badgers are often seen in the area of the Project. Movement of wildlife species into the DWR right-of-way could result in increased accidents with large mammals and road kill. The environmental impact report (EIR) shall address wildlife movement caused by the Project. Page 6 of the NOP states that the Aqueduct is a barrier to wildlife movement; however, many species have been observed finding ways to cross the Aqueduct and an increased number of bridges along the Aqueduct could promote crossings by wildlife. B.2-9

Hydrology and Water Quality

Two golf courses are planned for each side of the Aqueduct. Golf courses traditionally use fertilizers and pesticides for maintenance. Fertilizers and pesticides could have a major impact on water quality to the California Aqueduct. Impacts to water quality caused by maintenance of the golf courses and project drainage need to be addressed in the EIR. In addition, the Project will increase use of fertilizers and pesticides used by residents. Fertilizers and pesticides could have a major impact on water quality to the California Aqueduct. Impacts to water quality caused by residential use need to be addressed as well. B.2-10

The Project also has the potential to increase the risk of household chemicals and hydrocarbons entering the Aqueduct. Improper disposal of motor oil and household chemicals is a recognized problem in many California communities and may have a significant impact to the Aqueduct as a result of the Project. Impacts to water quality of the Aqueduct shall be addressed. B.2-11

New bridge development and improvements to existing bridges over the Aqueduct have the potential to impact water quality during construction. Impacts to water quality due to construction shall be addressed. B.2-12

Drainages need to be designed to avoid the California Aqueduct, and must be specifically discussed in the EIR. B.2-13

The Project would be located adjacent to the California Aqueduct and Quail Lake. In addition, the western portion of the Project site is located within the watershed of Gorman Creek, which drains to Pyramid Lake. The EIR should evaluate whether the Project would cause erosion and introduce sediment into the Aqueduct or Quail Lake, and whether the Project would cause other pollutants to flow into these waters or B.2-14

Gorman Creek. Introduction of sediment into the SWP system could reduce the capacity of the SWP water storage and conveyance facilities, damage SWP mechanisms, and/or require DWR to perform additional, unnecessary, and potentially costly maintenance on the SWP facilities. Also, introduction of sediment and other pollutants into the SWP system could impair the quality of the water transported by the SWP. B.2-14 cont.

Geology and Soils

Ground subsidence due to overdraft of ground water is a problem that impacts canals throughout California. Ground subsidence near the Project could cause impacts to the Aqueduct that may result in the need to increase maintenance or call for major repairs. Groundwater use and overdraft prevention shall be addressed in the EIR document. B.2-15

Some portions of the Project would be built in close proximity to SWP facilities. The EIR should evaluate whether the Project would affect the geology and/or soils in the vicinity of the SWP facilities in a manner that would impair the geological stability of the SWP or the quality of the water flowing through the SWP. B.2-16

Hazards

The Project would be located near several SWP facilities, most of which are closed to the public for safety and infrastructure security reasons. The Project would substantially increase the number of people living, working, shopping, recreating, and otherwise visiting the Project area. The EIR should evaluate whether the Project would substantially increase the potential for public safety hazards (e.g., drowning), vandalism, or infrastructure security concerns attributable to the proposed population increase near the SWP. The Project should be designed to discourage and prevent unauthorized access to SWP facilities. B.2-17

The EIR should also evaluate the potential for the Project to introduce hazardous materials (e.g., construction fuels and chemicals) onto SWP land and into the water carried by the system. B.2-18

Land Use

The Project would be located adjacent to the California Aqueduct and Quail Lake. The Project should be designed to avoid unauthorized encroachment onto SWP facilities and to not interfere with DWR's ability to access and maintain the SWP. If the Project encroaches onto land owned or managed by DWR (e.g., the proposed access road, bridges, and water pipeline), the Project sponsor should coordinate with DWR during B.2-19

the early stages of the planning process about securing authorization for the encroachment(s).

Any construction activity in the vicinity of the California Aqueduct may require an encroachment permit issued by DWR. Information regarding regulations and forms for submitting an application for an encroachment permit to DWR can be found at:

http://www.water.ca.gov/engineering/Services/Real_Estate/Encroach_Rel/

B.2-19 cont.

Please provide DWR with a copy of any subsequent environmental documentation when it becomes available for public review. Any future correspondence relating to this proposed project shall be sent to:

Leroy Ellinghouse, Chief
SWP Encroachments Section
Division of Operations and Maintenance

Responses to Comment Letter B.2
Department of Water Resources
July 10, 2017

Response to Comment B.2-1:

Thank you for your participation in this public process. The comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. No further response is required given that the comment does not address or question the content of the Draft EIR.

Response to Comment B.2-2:

The DWR comment letter was received by the County. It was erroneously left out of the document during the printing process. Please find a response to your agency's Notice of Preparation (NOP) letter in responses to Comments B.2-8 through B.2-20.

Response to Comment B.2-3:

Although the project includes a buffer between development and the DWR right-of-way, where feasible, not all areas are buffered. However, there is no reasonable expectation that development of adjacent areas will increase the nesting bird restrictions on DWR right-of-way maintenance activities. Birds likely to nest within developed areas are typically extremely common species with high tolerance for disturbance. As such, nesting buffer restriction for these species would likely be minimal and DWR maintenance activities are not likely to be affected. Wildlife overpasses are not currently part of the proposed project; however, the applicant has committed to exploring opportunities and working with DWR for a crossing, if feasible.

Response to Comment B.2-4:

The standard CDFW nesting raptor buffer distance is 500 feet. As described in the response to Comment B.2-3, Project development is not expected to increase nesting bird, including raptors, restrictions on DWR right-of way activities due to the limited buffers expected for species typically nesting in developed areas.

Response to Comment B.2-5:

The Project has been designed to avoid unauthorized encroachment onto State Water Project (SWP) facilities. The Project shall not encroach onto land owned or managed by DWR (e.g. proposed access roads, bridges, and water pipeline) without first acquiring the appropriate encroachment permit.

Response to Comment B.2-6:

This comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment B.2-7:

The Notice of Preparation (NOP) comment letter from DWR has been included in Appendix 2.0-A of the Draft EIR. Responses to the NOP comment letter are provided below. This comment summarizes the Project description described in the NOP. Please see Section 4.0, Project Description, of the Draft EIR for a description of the Project analyzed in the Draft EIR.

Response to Comment B.2-8:

The Project includes a buffer between development and the DWR right-of-way where feasible. As explained in the Draft EIR, under existing pre-Project conditions, the California Aqueduct substantially reduces the permeability of the linkage for many wildlife species, though it remains functional for many species to some degree.[75] Oso Canyon and its many tributaries west of the Aqueduct and the east-west-oriented drainages that are located east of the Aqueduct undoubtedly are used by some animals as local travel paths as they move across their home range areas on the Project site; however, the Aqueduct serves to block east-west movement on the Project site for most ground-dwelling wildlife. Limited opportunities for wildlife to cross the Aqueduct have been identified at four locations, but wildlife movement across that formidable barrier is probably a rare event.[76]

Under Project conditions, there is no reasonable expectation that development of adjacent areas will increase the nesting bird and special status species restrictions on DWR right-of-way maintenance activities. Fencing along the DWR right-of-way and the lack of suitable habitat in the right-of-way would preclude wildlife from relocating into the right-of-way. Project development along the Aqueduct would reduce the potential for birds and special status species to be present on the site near the Aqueduct. Thus, it is unlikely for migratory birds, raptors and special status species to be present on the site so as to restrict DWR activities on their right-of-way. Birds that are likely to nest within developed areas of the site are typically extremely common species with a high tolerance for disturbance. As such, nesting buffer restrictions for these species would likely be minimal. In addition, open space areas with more suitable habitat would be provided near the DWR right-of-way at the northwestern section of the site, which may serve as habitat for wildlife species that would be displaced by the Project. Thus, the presence of common species on the developed portions of the site would not affect DWR maintenance and repair activities at the Aqueduct.

Response to Comment B.2-9:

Wildlife movement is addressed on pages 5.7-50 through 5.7-64 in Section 5.7, Biological Resources, of the Draft EIR. Under existing pre-Project conditions, the California Aqueduct substantially reduces the permeability of the linkage for many wildlife species, though it remains functional for many species to some degree.[77] Oso Canyon and its many tributaries west of the Aqueduct and the east-west-oriented drainages that are located east of the

75 DRP 2017, p. 5.7-62
76 *Id.*, p. 5.7-63
77 *Id.*, p. 5.7-62

Aqueduct undoubtedly are used by some animals as local travel paths as they move across their home range areas on the Project site; however, the Aqueduct serves to block east-west movement on the Project site for most ground-dwelling wildlife. Limited opportunities for wildlife to cross the Aqueduct have been identified at four locations, but wildlife movement across that formidable barrier is probably a rare event.[78] Moreover, the majority of the site is open grassland and does not support the forest and shrub cover that many larger, wide-ranging species tend to use during movement episodes.[79] Thus, the risk of accidents with large mammals and road kill on the Project site is unlikely.

The Draft EIR's biological resources analysis indicates that significant impacts to wildlife movement and general wildlife habitat would result from implementing the Project but these impacts would be reduced to less than significant levels with implementation of MM 7-14 through MM 7-18 on pages 5.7-190 through 5.7-193. A bridge over the West Branch of the California Aqueduct is proposed by the Project[80] and PDF 7-7[81] states that the Project Applicant will explore locating a wildlife-friendly crossing across the Aqueduct. However, this crossing will have to be approved by the County and DWR (as the agency with jurisdiction over of the Aqueduct). As discussed in response to Comment B.2-8, however, fencing along the DWR right-of-way and the lack of suitable habitat in the right-of-way would preclude wildlife from relocating into the right-of-way.

Response to Comment B.2-10:

Impacts related to fertilizer and pesticide is addressed in Section 5.4, Water Quality, and Section 5.7, Biological Resources, of the Draft EIR. The impact of fertilizer and pesticide use associated with golf courses on protected wetlands is addressed on page 5.7-164. The Draft EIR determined that this impact would be less than significant with implementation of Project Design Features and mitigation measures, including PDF 7-6[82] and MM 7-22,[83] which requires the Project Applicant/Developer to prepare a Golf Course Management Plan that requires any golf course developed on the site to be built and managed in accordance with the Audubon Cooperative Sanctuary Program for Golf Courses (or equivalent).[84] This program is a cooperative effort between the United States Golf Association and Audubon International that is designed to promote ecologically sound land management and to conserve natural resources.

Impacts on water quality due to fertilizer and pesticide use by development on the site are also addressed in Section 5.4, including pages 5.4-33, 5.4-77 through 5.4-79. The Draft EIR determined that this impact would be less than significant with implementation of MMs 4-1 and 4-2.

81 *Id.*, p. 5.7-139
82 *Ibid*.
83 *Id.*, p. 5.7-194
84 *Id.*, p. 5.7-164

As required by MM 4-2, the Project will implement an Integrated Pest Management (IPM) program consistent with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California, Division of Agriculture and the Natural Resources Statewide Integrated Pest Management Program. The IPM program will prevent or suppress pest problems (i.e., insects and diseases) through a combination of techniques including using pest-resistant plants; biological controls; cultural practices; habitat modification; and judicious use of pesticides. Pesticide best management practices (BMPs) will be implemented to promote safety (e.g., Material Safety Data Sheets, precautionary statements, protective equipment); compliance with regulatory requirements; spill mitigation; groundwater and surface water protection measures associated with pesticide use; and pesticide applicator certifications, licenses, and training (i.e., all pesticide applicators must be certified by the California Department of Pesticide Regulation (CDPR). Pesticides are subject to degradation and vary in their ability to eradicate pests. Some pesticides break down almost immediately into nontoxic byproducts, while others can be active for longer periods of time. Pesticides that degrade rapidly are less likely to adversely affect non-targeted organisms. In some instances, longer-lasting pesticides are preferable if fewer applications or smaller amounts of pesticide use are required to control pests. The proper amount and frequency of pesticide use will be addressed in the IPM program.

Pesticide loads and concentrations in Project runoff will be reduced by the regional and distributed low impact development BMPs required by MM 4-1. An IPM program that will reduce pesticide requirements by controlling pests with nontoxic measures will be implemented in accordance with MM 4-2 and will ensure that unavoidable pesticide use will be managed to minimize impacts to surface and groundwater. Compliance with MM 4-1 and MM 4-2 will be reconfirmed in drainage and landscape plans to be submitted to the County with each Project tract map application. All Project pesticide use will comply with applicable laws and regulations, including USEPA and CDPR pesticide use limitations. As a result, the Project would result in less than significant impacts related to pesticides.

Potential hydrology and flood impacts to Quail Lake, including runoff from golf course areas, are discussed on Draft EIR page 5.2-25, which states that no receiving channels will receive Project development area runoff discharges under developed conditions in the Quail Lake drainage area, which includes the lake. Potential water quality impacts to Quail Lake are discussed on Draft EIR page 5.4-68, which states that no runoff from Project developed areas will occur in the Quail Lake watershed, which includes the lake. Consequently, no runoff from Project developed areas will flow to or occur within Quail Lake and the Quail Lake drainage and watershed will not affect the hydrology, flood or water quality conditions in the lake and the lake's watershed and drainage system.

The Project will also avoid impacts to California Aqueduct water quality. As discussed on Draft EIR pages 5.4-73 through 5.4-74 the wastewater reclamation facilities (WRFs) must comply with Title 22 of the *California Code of Regulation,* the California Porter-Cologne Act, and the Lahontan Basin Plan's surface and groundwater quality objectives. Waste Discharge Requirements (WDRs) issued by the Lahontan Regional Water Quality Control Board will require the Project to include design features, such as berms, levees, spill containment

features, and other topographical elevation features, to protect the WRFs during large flood events and to protect adjacent properties under any emergency conditions. As shown on Exhibit 4-14 in the Draft EIR, there are no sewer pipelines or force mainlines that would cross over the State Water Project (SWP) Aqueduct; therefore, there is no risk of sewer line rupture over the SWP Aqueduct. In addition, the California Aqueduct contains a levee system that protects its waters from stormwater flooding or other surface flows and the aqueduct channel is constructed with cement and other impervious materials. Consequently, Project runoff, groundwater recharge, discharge from the WRFs or any other activities that could affect surface and groundwater quality will not affect water quality in Quail Lake or in the California Aqueduct.

Response to Comment B.2-11:

Drainage issues are discussed in Section 5.2, Hydrology and Flood, and Section 5.4, Water Quality, of the Draft EIR. As stated on page 5.2-17, approximately 88 percent of the proposed development would occur east of the West Branch of the Aqueduct, where flows are toward the north and northeast. Stormwater flows from areas west of the West Branch of the Aqueduct are conveyed under the Aqueduct via existing culverts. The existing flow patterns associated with larger tributary systems would be largely maintained by the Project and no direct stormwater discharges to the Aqueduct will occur. In addition, the Project includes 28 regional retention and detention basins to maintain runoff flow rates and volumes at pre-development conditions to avoid downstream hydromodification impacts, in accordance with the County's Low Impact Development Standards Manual. These basins would also provide stormwater treatment and pollutant removal from runoff flows. Section 5.4, Water Quality, of the Draft EIR addresses potential storm water pollutants, including chemicals and petroleum hydrocarbons, and PDF 4-1[85] and MM 4-1[86] would retain storm water flows within the development sites to meet water quality and hydrology and hydromodification standards. These measures would prevent changes in existing rates, volumes and stormwater quality of off-site flows and ensure that related Project impacts are less than significant.

Draft EIR Exhibit 5.2-4, Proposed Infiltration Basin Locations, shows the locations of the proposed development areas and the 28 regional detention and retention basins that comprise the primary hydromodification and hydrology best management practices (BMPs) that will be implemented for the Project. As discussed in Draft EIR Section 5.7, Biological Resources (specifically, Threshold 7-3), and as shown in Exhibit 5.2-5, Receiving Channels of Concern and 100-Year Floodplain, the Project will avoid most of the watercourses and watershed areas in the Gorman Creek, Quail Lake, and Oso Creek Drainage Areas. Approximately 18 percent of the proposed development would occur west of the West Branch of the Aqueduct, and drainage impacts in this area would primarily affect Oso Creek tributaries flowing north from the south side (i.e., the northerly face) of Oso Canyon. Drainage impacts in the Gorman Creek Drainage Area would largely be avoided and no drainage impacts will occur in the Quail Lake Drainage Area. Approximately 88 percent of the proposed development would occur east of the West Branch of the Aqueduct. As

85 DRP 2017, pp. 5.4-29, 30
86 *Id.,* p. 5.4-90

discussed in Draft EIR Section 5.7 (specifically, Threshold 7-3), and as shown in Exhibit 5.2-4, Proposed Infiltration Basin Locations, 18 of the proposed regional detention and retention basins will be located to the east of the Aqueduct. Smaller drainages in this location would generally be integrated with the Project's storm drain system. Flow patterns associated with several existing larger tributary systems, including the East Tributary systems and the Cow Spring Canyon, Horse Camp Canyon, the 300th Street Tributary systems, will largely be maintained by avoiding or constructing flow controls in existing channels or by recreating existing channels after site grading. Flow, low impact development (LID), and hydromodification management facilities (e.g., detention and retention basins) will be constructed adjacent to channels, primarily in downstream reach locations. None of the basins or runoff channels will discharge to the Aqueduct. The California Aqueduct contains a levee system that protects its waters from stormwater flooding or other surface flows and the aqueduct channel is constructed with cement and other impervious materials. Consequently, Project development area runoff will not directly flow into or indirectly affect (e.g., by groundwater infiltration) water quality in the California Aqueduct.

Pages 5.4-73 through 5.4-74 discuss the potential impacts of the two proposed water reclamation facilities (WRFs) to surface water bodies and the regulations and mitigation measures that would be implemented to prevent significant adverse impacts. The WRFs would include design features required by the Lahontan Regional Water Quality Control Board, such as berms, levees, spill containment features, and other topographical elevation features, to protect the WRFs during large flood events and to protect adjacent properties under any emergency conditions. As shown on Exhibit 4-14 in the Draft EIR, there are no sewer pipelines or force mainlines that would cross over the Aqueduct; therefore, there is no risk of sewer line rupture over the Aqueduct that may affect water in the Aqueduct. In addition, the Aqueduct contains a levee system that protects its waters from stormwater flooding or other surface flows. Thus, proposed development and the WRFs are not expected to have any adjacency impacts to the Aqueduct.

Section 5.3.2, Hazards and Hazardous Materials, discusses the disposal of hazardous materials in accordance with existing regulations during construction and long-term operation. Implementation of the Project would result in the on-site handling of hazardous materials that are common in urban environments. This includes the development of residential land uses, at varying densities, along with commercial/retail, business park, education, utility, and institutional/civic land uses. The materials that would be expected to be used on the Project site include commercial cleansers, solvents, and other janitorial or industrial-use materials; paints; landscape maintenance materials; pressurized gases; chlorine for pools; petroleum products at gas stations; and others. The handling, storage, and usage of these materials would be subject to applicable local, State, and/or federal regulations. In addition, any hazardous materials used during construction would also be transported, used, stored, and disposed of according to any applicable local, State, and/or federal regulations. In addition, as stated in MM 17-10 on page 5.17-34, the Project shall incorporate the Solid Waste Management Plan that would divert hazardous waste, electronic waste, and universal waste from the waste bin and provide seasonal pickup (at least two times a year) for household hazardous wastes and less commonly disposed materials (such

as electronics and appliances). This would prevent improper disposal of wastes at the Aqueduct and ensure that related Project impacts are less than significant.

Consequently, Project development, including runoff and the operations of the two WRFs, will not affect California Aqueduct water quality.

Response to Comment B.2-12:

Proposed Aqueduct crossings will not include any wastewater lines to avoid potential water quality impacts from the failure of any such facilities. The Project would require four crossings of the California Aqueduct, including the wellhead pipeline crossing of the East Branch of the Aqueduct. As discussed in Draft EIR Section 4.8.2, Responsible and Trustee Agencies, the Project would require an Encroachment Permit from the California Department of Water Resources (DWR) for the new and expanded bridge crossings of the Aqueduct and for the crossing of potable and recycled water pipes. The pipelines may extend over or under the Aqueduct, depending on DWR's requirements and the specific engineering conditions at each crossing location.

As requested by the Lahontan Regional Water Quality Control Board (Comment D.3), MM 2-4 has been added to the Draft EIR to clarify that all Project construction will comply with the California General Construction Permit issued by the State Water Resources Control Board (CAR000002, Order 2009-0009-DWQ as amended by Order 2010-0014-DWQ and Order 2012-0006-DWQ) (Construction General Permit). Project compliance with the General Construction Permit is also discussed in the second paragraph of page 5.2-2, the second full paragraph on page 5.2-25, and first full paragraph on page 5.2-26 in Section 5.2, Hydrology and Flood.[87] In addition, in response to requests from the Lahontan Regional Water Quality Control Board, MMs 2-4, 2-5, 3-10, 4-3, 4-4, 19-2, 19-6, and 19-7 have been added to the Draft EIR to further protect construction period and post-construction water quality.

Construction impacts on water quality are analyzed on pages 5.4-53 through 5.4-57 and pages 5.4-67 through 5.4-68 in Section 5.4, Water Quality, of the Draft EIR. The Construction General Permit requires the implementation of best management practices (BMPs) to reduce pollutants in the stormwater during the construction activities, as discussed on pages 5.4-7 through 5.4-9. Project compliance with the Construction General Permit (new MM 2-4) would ensure that construction period Project impacts, including to Aqueduct water quality from bridge construction, would be reduced to a less than significant level. Please also see response to Comment D.3-8.

Response to Comment B.2-13:

The Drainage Plan for the Project is discussed on pages 4-62 through 4-63. Draft EIR Exhibit 4-16, Centennial Project – Conceptual Drainage and Flood Control System, shows that no new drainages are proposed over or under the Aqueduct. As stated on page 5.2-17, the existing flow patterns on the site associated with larger tributary systems would be largely maintained by the Project and flows under the Aqueduct would be through existing

[87] DRP 2017, pp. 5.4-7 to -9; 5.4-50 to -56; 5.4-67 to -68; 5.4-71; and 5.4-74 to -76

culverts. As stated on page 5.2-33, runoff from new impervious surfaces related to intersection improvements along State Route 138 (SR-138), utility connections, and Aqueduct crossings would be controlled and distributed to parcel-specific low impact (LID) facilities or to the proposed regional detention and retention basin system. The on-site basins would control runoff flow rates and volumes, as well as treat stormwater to meet County LID standards.[88]

Draft EIR Exhibit 5.2-4, Proposed Infiltration Basin Locations, shows the locations of the proposed development areas and the 28 regional detention and retention basins that comprise the primary hydromodification and hydrology best management practices (BMPs) that will be implemented for the Project. As discussed in Draft EIR Section 5.7, Biological Resources (specifically, Threshold 7-3), and as shown in Exhibit 5.2-5, Receiving Channels of Concern and 100-Year Floodplain, the Project will avoid most of the watercourses and watershed areas in the Gorman Creek, Quail Lake, and Oso Creek Drainage Areas. Approximately 18 percent of the proposed development would occur west of the West Branch of the Aqueduct, and drainage impacts in this area would primarily affect Oso Creek tributaries flowing north from the south side (i.e., the northerly face) of Oso Canyon. Drainage impacts in the Gorman Creek Drainage Area would largely be avoided and no drainage impacts will occur in the Quail Lake Drainage Area. Approximately 88 percent of the proposed development would occur east of the West Branch of the Aqueduct. As discussed in Draft EIR Section 5.7 (specifically, Threshold 7-3), and as shown in Exhibit 5.2-4, Proposed Infiltration Basin Locations, 18 of the proposed regional detention and retention basins will be located to the east of the Aqueduct. Smaller drainages in this location would generally be integrated with the Project's storm drain system. Flow patterns associated with several existing larger tributary systems, including the East Tributary systems and the Cow Spring Canyon, Horse Camp Canyon, the 300th Street Tributary systems, will largely be maintained by avoiding or constructing flow controls in existing channels or by recreating existing channels after site grading. Flow, LID, and hydromodification management facilities (e.g., detention and retention basins) will be constructed adjacent to channels, primarily in downstream reach locations. None of the basins or runoff channels will discharge to the Aqueduct. The California Aqueduct contains a levee system that protects its waters from stormwater flooding or other surface flows and the aqueduct channel is constructed with cement and other impervious materials. Consequently, Project drainages have been designed to avoid and not directly flow into or to indirectly affect (e.g., by groundwater infiltration) the California Aqueduct.

Response to Comment B.2-14:

Draft EIR Exhibit 5.2-4, Proposed Infiltration Basin Locations, shows the locations of the proposed development areas and the 28 regional detention and retention basins that comprise the primary hydromodification and hydrology best management practices (BMPs) that will be implemented for the Project. As discussed in Draft EIR Section 5.7, Biological Resources (specifically, Threshold 7-3), and as shown in Exhibit 5.2-5, Receiving Channels of Concern and 100-Year Floodplain, the Project will avoid most of the watercourses and

[88] *Id.,* pp. 5.4-45 to -48

watershed areas in the Gorman Creek, Quail Lake, and Oso Creek Drainage Areas. As discussed in Draft EIR Section 5.7 (specifically, Threshold 7-3), and as shown in Exhibit 5.2-4, Proposed Infiltration Basin Locations, 18 of the proposed regional detention and retention basins will be located to the east of the Aqueduct. Smaller drainages in this location would generally be integrated with the Project's storm drain system. Flow patterns associated with several existing larger tributary systems, including the East Tributary systems and the Cow Spring Canyon, Horse Camp Canyon, the 300th Street Tributary systems, will largely be maintained by avoiding or constructing flow controls in existing channels or by recreating existing channels after site grading. Flow, LID, and hydromodification management facilities (e.g., detention and retention basins) will be constructed adjacent to channels, primarily in downstream reach locations. None of the basins or runoff channels will discharge to the Aqueduct. The California Aqueduct contains a levee system that protects its waters from stormwater flooding or other surface flows and the aqueduct channel is constructed with cement and other impervious materials. Consequently, Project drainages have been designed to avoid and not directly flow into the California Aqueduct.

As stated on page 5.2-17, the existing flow patterns on the site associated with larger tributary systems would be largely maintained by the Project and flows under the Aqueduct would be through existing culverts. The analysis under Threshold 2-1 specifically addresses the potential for erosion and siltation on- and off-site. As stated on page 5.2-25, Project development area runoff discharges would affect the East, Oso Creek, and Gorman Drainage Areas but no receiving channels will be affected in the Quail Lake Drainage Area. As requested by the Lahontan Regional Water Quality Control Board (Comment D.3), MM 2-4 has been added to the Draft EIR to clarify that all Project construction will comply with the California General Construction Permit issued by the State Water Resources Control Board (CAR000002, Order 2009-0009-DWQ as amended by Order 2010-0014-DWQ and Order 2012-0006-DWQ) (Construction General Permit), including the implementation erosion and sediment control BMPs during short-term construction activities. In addition, in response to requests from the Lahontan Regional Water Quality Control Board, MMs 2-4, 2-5, 3-10, 4-3, 4-4, 19-2, 19-6, and 19-7 have been added to the Draft EIR to further protect construction period and post-construction water quality. Under MM 2-1, the Project will meet the requirements in Section 8 – Hydromodification Impacts of the County Low Impact Development (LID) Standards Manual by implementing nonstructural and structural site design measures that reduce long-term erosion and sedimentation; on-site distributed and parcel-based LID measures that capture and avoid runoff and sediment mobilized by runoff; and a regional runoff retention and detention system that includes 28 basins distributed throughout the site. As concluded in Section 5.2, impacts related to erosion or siltation on- or off the site, including to the Quail Lake and Gorman Creek watersheds, will be less than significant.

Response to Comment B.2-15:

The Project's impacts associated with subsidence are addressed on page 5.1-24 in Section 5.1, Geotechnical, of the Draft EIR, and were determined to be less than significant. As discussed in the Draft EIR, there has been no subsidence or a negligible amount of subsidence in the adjacent Neenach and other western Antelope Valley groundwater

subbasins in the Project site vicinity. The hydrogeologic investigation determined that increased groundwater pumping and recharge as part of site development would not result in adverse impacts to the underlying groundwater basins and the Project would not result in impacts related to current or future subsidence. Further discussion of the hydrogeologic conditions in the Antelope Valley Basin can be found in the Bookman-Edmonston Groundwater Data in Appendix F of Appendix 5.1-A of the Draft EIR.

Impacts on groundwater, including overdraft protection and groundwater use are discussed in Section 5.18, Water Resources, of the Draft EIR and were determined to be less than significant. The Project's use of 1,634 acre-feet per year of groundwater, production of imported water return flows from urban water use in the Antelope Valley Basin, and water banking operations in the Antelope Valley will comply with the Antelope Valley Adjudication Judgment and Physical Solution, which was approved by the Superior Court in December 2015 to sustainably manage Antelope Valley groundwater resources over time.[89] A watermaster will be appointed under the supervision of the Court to implement the Adjudication Judgment and Physical Solution. The Adjudication Judgment and Physical Solution prohibits water use that causes material injury, which is defined in Section 3.5.18 of the Judgment to mean impacts to the Basin caused by pumping or storage of groundwater that cause material physical harm to the Basin, any Basin subarea, or any producer, party or production right under the Adjudication Judgment and Physical Solution. The Adjudication Judgment and Physical Solution incorporates and implements a judicial determination of the total sustainable yield of the Antelope Valley aquifer and limits the use of native supplies and imported water return flows to levels that will allow for the sustainable use of groundwater, including the avoidance of overdraft conditions. All groundwater use, water banking activities, and return flow production for the Project will comply with the requirements of the Adjudication Judgment and Physical Solution and will be consist with the prevention of groundwater overdraft and avoid other significant impacts to groundwater.

Response to Comment B.2-16:

While the Conceptual Land Use Plan in Exhibit 4-1, Centennial Project – Conceptual Land Use Plan, of the Draft EIR shows that future development would be located beside the California Aqueduct, minimum yard setbacks would be required on individual lots in addition to the DWR buffer along both sides of the Aqueduct. Also, as stated on page 5.1-22, geotechnical investigations would be performed for each tract map as the Project is implemented. Page 5.1-24 states that development would comply with County subdivision specifications, County building code requirements, the Project's Grading Plan, the Specific Plan's Hillside Design Guidelines, and existing and future tract map-level, geotechnical recommendations for the Project. This would prevent impacts to the geological stability of the adjacent structures, including the Aqueduct. The quality of water flowing through the SWP would not be affected by the Project. As discussed in the response to Comments B.2-10 through B.2-14 above, no discharges of stormwater, wastewater, or wastes would be made to the Aqueduct.

[89] DRP 2017, Appendix 5.18-D

Response to Comment B.2-17:

As explained by the California Supreme Court in *California Building Association v. Bay Area Air Quality Management District*, lead agencies are generally not required to analyze the impact of existing environmental conditions, such as existing aqueducts, on a Project's future users or residents.[90] Nevertheless, the Draft EIR discloses that project operation would include activities generally associated with urban development, and that urban areas include a variety of emergencies and minor criminal activity that would require response times within the Project site. There are existing fences along the DWR right-of-way that prevent trespassing, vandalism and other security concerns at the Aqueduct. As stated on page 5.16-21 of the Draft EIR, security fencing and private security would be provided by the Applicant in construction areas within the Project site. This is expected to reduce crime incidence on the site, including the DWR right-of-way.

In the long term, the Project would increase the number of people on the site and the potential for crime and medical emergencies. However, the Project includes the construction of a permanent County Sheriff station on the Project site, with a store-front substation that would be operational before the first certificate of occupancy for the Project is issued (MM 16-4).[91] The presence of sheriff deputies on the site is expected to reduce crime incidence, including trespassing, vandalism and other security concerns at the Aqueduct. In addition, the Project includes conceptual site locations for up to four new fire stations on the Project site. These new fire stations are projected to provide an average five-minute response time for the first arriving unit for fire and eight minutes for the advanced life support (paramedic) unit on the site at Project buildout. This is consistent with the County of Los Angeles Fire Department's (LACFD's) goals for response times in urban areas. Ultimately, the LACFD would approve the final station site locations, and the Project Applicant/Developer would construct and equip the fire stations (MM 16-3). The LACFD has indicated that the proposed fire stations on the site would provide adequate fire service to the Project. The Project Applicant/Developer would provide funding for the construction of fire protection facilities in accordance with the approved Project, in lieu of paying established developer fees at the time building permits are issued (MM 16-2). Implementation of MM 16-2 would provide for fire station sites and funding for fire protection services to serve the Project. Therefore, impacts on fire services would be reduced to a less than significant level.

Response to Comment B.2-18:

Draft EIR Section 5.3.2, Hazards and Hazardous Materials, addresses hazardous materials and their disposal in accordance with existing regulations during construction and long-term operation. As requested by the Lahontan Regional Water Quality Control Board (Comment D.3), MM 2-4 has been added to the Draft EIR to clarify that all Project construction will comply with the California General Construction Permit issued by the State Water Resources Control Board (CAR000002, Order 2009-0009-DWQ as amended by Order

[90] California Building Industry Association v. Bay Area Air Quality Management District (2015) 62 Cal.4th 269 (CBIA v. BAAQMD)

[91] DRP 2017, p. 5.16-25

2010-0014-DWQ and Order 2012-0006-DWQ) (Construction General Permit), including best management practices (BMPs) that address hazardous materials during construction. In addition, in response to requests from the Lahontan Regional Water Quality Control Board, MMs 2-4, 2-5, 3-10, 4-3, 4-4, 19-2, 19-6, and 19-7 have been added to the Draft EIR to further protect construction period and post-construction water quality.

Draft EIR Exhibit 5.2-4, Proposed Infiltration Basin Locations, shows the locations of the proposed development areas and the 28 regional detention and retention basins that comprise the primary hydromodification and hydrology (BMPs) that will be implemented for the Project. The Project will avoid most of the watercourses and watershed areas in the Gorman Creek, Quail Lake, and Oso Creek Drainage Areas. As discussed in Draft EIR Section 5.7, Biological Resources (specifically, Threshold 7-3), and as shown in Exhibit 5.2-4, Proposed Infiltration Basin Locations, 18 of the proposed regional detention and retention basins will be located to the east of the Aqueduct. Smaller drainages in this location would generally be integrated with the Project's storm drain system. Flow patterns associated with several existing larger tributary systems, including the East Tributary systems and the Cow Spring Canyon, Horse Camp Canyon, the 300th Street Tributary systems, will largely be maintained by avoiding or constructing flow controls in existing channels or by recreating existing channels after site grading. Flow, LID, and hydromodification management facilities (e.g., detention and retention basins) will be constructed adjacent to channels, primarily in downstream reach locations. None of the basins or runoff channels will discharge to the Aqueduct. Draft EIR pages 5.4-73 through 5.4-74 discuss the potential impacts of the two proposed water reclamation facilities (WRFs) to surface water bodies and the regulations and mitigation measures that would be implemented to prevent significant adverse impacts. The WRFs would include design features required by the Lahontan Regional Water Quality Control Board, such as berms, levees, spill containment features, and other topographical elevation features, to protect the WRFs during large flood events and to protect adjacent properties under any emergency conditions. As shown on Exhibit 4-14 in the Draft EIR, there are no sewer pipelines or force mainlines that would cross over the Aqueduct; therefore, there is no risk of sewer line rupture over the Aqueduct that may affect water in the Aqueduct. In addition, the Aqueduct contains a levee system that protects its waters from storm water flooding or other surface flows. Project drainages have been designed to avoid and not directly flow into the California Aqueduct. Consequently, the Project will avoid potential impacts to the Aqueduct and water carried by the Aqueduct from the use of construction-period fuels and chemicals by compliance with the Construction General Permit, discussed above. "In addition, any hazardous materials used during construction would also be transported, used, stored, and disposed of according to any applicable local, State, and/or federal regulations".[92]

Potential hazardous materials impacts to the Aqueduct and Aqueduct waters under post-construction conditions, including from hazardous materials transport, storm water, wastewater, or wastes, will be reduced compared to the existing condition wherein the National Cement Plant Road utilizes a bridge crossing. This existing bridge crossing would be incorporated into the Centennial Project's circulation plan, and the realigned National

[92] *Id.,* p. 5.3-16

Cement Plant Road would no longer cross over the West Branch of the Aqueduct. Any on-site transport of hazardous materials, which would be those typical of an urban environment,[93] and would "include commercial cleansers, solvents, and other janitorial or industrial-use materials; paints; landscape maintenance materials; pressurized gases; chlorine for pools; petroleum products at gas stations; and others. The handling, storage, and usage of these materials would be subject to applicable local, State, and/or federal regulations. While many such common materials are technically labeled "hazardous", the presence of such materials is common in a mixed-use urban environment, and their use on the Project site would not pose an unusual or uncommon threat to the health or safety of the future population of the Project site".[94] These materials would also not pose a threat to the waters of the Aqueduct or other SWP facilities, with implementation of the Project's Integrated Water Resources Management Plan.

Bridge crossings over the Aqueduct would be designed to convey stormwater away from the aqueduct so that pollutants contained in stormwater runoff are captured and managed within the project drainage system that is designed to comply with Los Angeles County Low Impact Development ordinance which includes stormwater quality management. Any accidental spill of "hazardous materials" on the bridge would be contained on the surface of the bridge structure and would be conveyed to the project drainage system where it would be managed through spill response programs and procedures already developed for urban areas that are followed by the County fire department and Hazmat Response teams.

As discussed in Section 5.3, Hazards and Fire Safety, "[t]he Business Park land use designation may include a hospital or other medical-related facilities and light industrial facilities; the Utility, Business Park (conditional), and Institutional/Civic (conditional) land use designations would have the option to construct a Materials Recycling Facility (MRF). These types of facilities are, again, typical of urban development and a myriad of specialized regulations are applicable to medical and industrial land uses, as appropriate. The proposed Business Park land use areas are situated entirely along the south side of SR-138, and the proposed public facilities land use areas where the MRF could be located are situated along the northeast boundary. These are "edge" areas of the Project site, rather than being intermixed with residential and other land uses.[95] The edge areas are also situated away from the West Branch of the Aqueduct and other SWP facilities.

Response to Comment B.2-19:

The Project site does not include land within the DWR right-of-way. An access road, bridge, and water pipelines are proposed over and/or under the Aqueduct and page 4-108 acknowledges that the Project would require an Encroachment Permit from DWR for two bridge crossings of the California Aqueduct ("A" Street and "B" Street), as well as for the crossing of potable and recycled water pipes. At the time that an encroachment permit is

93 *Ibid*.
94 *Ibid*.
95 *Ibid*.

required from DWR, the Project Applicant/Developer shall comply with the regulations and complete the forms needed for the permit application.

Response to Comment B.2-20:

Thank you for your comment and your participation in this public process. The DWR will continue to be included in the mailing list for the environmental review process for the Project and will be given copies of subsequent environmental documentation at the address provided.

LA/ 138/ PM 0.415 – 4.106

Dear Mr. Sackett:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced project.

The proposed project (Project) involves the development of a new community of 9 villages with each contain a mix of land uses, such as residential, commercial, business park, recreational/entertainment, and institutional/civic uses. It is in the northwestern portion of the Antelope Valley in unincorporated Los Angeles County.

The Project allows up to 19,333 dwelling units on approximately 4,987 gross acres of land designated for residential uses. Other land uses include approximately 7,363,818 square feet (sf) of Business Park uses (office, research and development, and warehousing or light manufacturing uses) on approximately 597 gross acres and approximately 1,034,550 sf of Commercial uses on approximately 102 acres. Proposed Institutional/Civic uses (such as schools for higher education, medical facilities, library, and other civic uses) encompass approximately 1,568,160 sf on approximately 110 acres. The Project includes conceptual site locations for up to 4 new fire stations and a new sheriff's station, and 2 wastewater reclamation facilities. The Project would also require the implementation of off-site features consisting of roadway improvements and connections and upgrades to existing off-site utility systems, and preserve 5,624 acres of on-site open space within the Open Space designation. B.3-1

Caltrans noted that the Project buildout would be implemented in phases based on future market conditions over an approximate 20-year period through a series of future tract and parcel maps. B.3-2

If residential development occurs prior to the commercial, business, and employment center, the typical morning and evening commutes could occur, thus establishing a sprawl type of development. To avoid an unsustainable scenario, the County as the lead agency should plan the phasing of the development accordingly. Both residential and employment centers should be developed concurrently. B.3-2 cont.

Furthermore, the Project included an Affordable Housing Program that provides Very Low-, Low, and Moderate-Income affordable housing opportunities in several housing categories, including for-sale units and/or rental units. Caltrans would like to remind that the provision of affordable housing for the various income levels is critical to minimize long-distance peak hour commutes. Special attention should be given to the phasing-in of development and housing affordability. B.3-3

Caltrans continues to strive to improve its standards and processes to provide flexibility while maintaining the safety and integrity of the State's transportation system. It is our goal to implement strategies that are in keeping with our mission statement, which is to "*provide a safe, sustainable, integrated, and efficient transportation system to enhance California's economy and livability.*"

The entire development should be pedestrian and bicycle friendly with bicycle and pedestrian connections to the outside community. Internal circulation of public transit and adequate bike parking should be provided throughout. To provide good connectivity within each community and between communities the grid pattern is preferred over the cul-de-sac design. Park-and-ride areas should be included and designed to accommodate regional transit. The different communities should be designed to accommodate Neighborhood Electric Vehicles (NEV's). B.3-4

Good geometric and traffic engineering design to accommodate bicyclists and pedestrians and that meet ADA standards and requirements are critical at every on and off ramp and freeway terminus intersections. Caltrans will work with the County to look for every opportunity to develop projects that improve safety and connectivity for pedestrians and bicyclists.

As a follow-up to a tele-conference meeting on July 13, 2017 between County of Los Angeles and Caltrans in regarding to Project's traffic analysis report and the proposed mitigation measures. Please see below for Caltrans' comments regarding the Project's DEIR and the Traffic Study. B.3-5

- In reviewing the Project' DEIR and the Traffic Study, there were references to the Northwest SR-138 Corridor Improvement project (NW SR-138 project); Caltrans recommend that a brief summary of the NW SR-138 project be included in the DEIR and the Traffic Study. Such as the purpose, proposals, alternatives, and how it relates to the Project.

  Caltrans selected Alternative 2 of the NW SR-138 project as the Preferred Alternative. The Project's proposed improvements should be consistent with what was already approved in the NW SR-138 project. B.3-6

- The traffic data, results, and conclusions indicated in the Project's DEIR and Traffic Study should be consistent with the NW SR-138 project' Traffic Study. This will avoid conflicting data. B.3-7

- Intersection Control Evaluation (ICE) Report pertaining to State Routes, should be consistent with NW SR-138 project, since the ICE Policy has been established.

  However, if the Project chooses to include its own intersection analysis on State Routes, it should be amended to what was previously concurred with in the NW SR-138 project, and submitted to Caltrans for review prior to the Final Environmental Impact Report (FEIR). B.3-8

- To further address the Project's potential significant impacts to State Routes, as agreed to during the teleconference held on July 13, 2017 with Caltrans, the County of Los Angeles and its traffic consultants, a follow-up meeting is necessary to further discuss and refine the details regarding proposed mitigation measures and fair share contributions, including a Mitigation Agreement with Caltrans. Such that the Project is to be developed over time according to market demands and so would the transportation improvements. Therefore, Caltrans requests that the Transportation facilities necessary to accommodate build-out of the entire Project should be identified at this stage, along with a plan that indicates which improvements will be would be implemented by each phase and the amount of the fair share contributions that will be due at that time. B.3-9

In the spirit of mutual cooperation, Caltrans would like to request a meeting with the Lead Agency and consultants to evaluate traffic impacts, identify potential improvement, and established a funding mechanism that helps mitigate cumulative transportation impacts in the project vicinity. B.3-10

If you have any questions, please feel free to contact the project coordinator, Ms. Frances Lee, at (213) 897-0673 or electronically at frances.lee@dot.ca.gov. B.3-11

Sincerely,

DIANNA WATSON
Branch Chief, Community Planning & LD IGR Review

Responses to Comment Letter B.3
California Department of Transportation
July 14, 2017

Response to Comment B.3-1:

Thank you for your participation in this public process. The comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. No further response is required given that the comment does not raise a specific concern regarding the content of the Draft EIR.

Response to Comment B.3-2:

Thank you for the comment concerning balanced Project development over time. The Draft EIR includes a Conceptual Phasing Plan implemented over a 20-year period.[96] As summarized in Draft EIR Table 4-1, Centennial Project Overview, and on Draft EIR page 4-6, at full buildout the Project would include approximately 12,323 acres and would allow up to 19,333 dwelling units (du) on approximately 4,987 gross acres of land designated for residential uses. Other land uses include approximately 7,363,818 square feet (sf) of Business Park uses (office, research and development, and warehousing or light manufacturing uses) on approximately 597 gross acres; and approximately 1,034,550 sf of Commercial uses on approximately 102 acres. Proposed Institutional/Civic land uses (such as schools for higher education, medical facilities, library, and other civic uses) encompass approximately 1,568,160 sf on approximately 110 acres. The Project includes approximately 130,680 sf of Recreation/Entertainment uses (clubhouse, farmers market, childcare facilities, health clubs) on approximately 75 acres. Proposed sites for major utility facilities that would serve the entire community (e.g., wastewater reclamation facilities, water treatment facility, water bank, materials recovery facility) encompass approximately 191 acres, and Kindergarten through 12th grade (K-12 schools would be located on approximately 145 acres. Approximately 5,624 acres (approximately 45.6 percent) of the 12,323-acre Project site are proposed for Open Space for natural resource protection and greenways, and parks for active and passive recreational use.

Development within the Project site will require the preparation and implementation of tentative tract maps (TTMs) for each phase and component of the Project. As discussed on Draft EIR page 4-92, the TTMs serve as the implementing mechanisms for Project land uses, and all TTM land uses must be consistent with the Centennial Specific Plan.[97] Chapter 4 of the Specific Plan describes the processes and procedures for implementing the Specific Plan, including the processes and procedures for subsequent Project approvals such as future TTMs. Chapter 4 of the Specific Plan also establishes mechanisms that allow for flexibility in the development of the Project to respond to market conditions over the anticipated buildout of the Project while ensuring consistency with the purpose and intent of the Specific Plan. Specific Plan Section, 4.5.2 Discretionary Conformance Review, provides that significant

96 DRP 2017, Exhibit 4-20; *Id.,* pp. 4-91 and -92
97 Final EIR Appendix 4.0-A.Rev

modifications of the Specific Plan, including land use adjustments under Specific Plan Section 4.6, (Adjustment, Transfer, and Conversion Regulations) are subject to discretionary review and approval, including additional CEQA analysis as applicable.[98]

Section 1.4 of the Specific Plan provides that the Specific Plan constitutes the land use regulations (zoning) for the Project and that subsequent or concurrent approvals such as parcel maps, tract maps, site plans, and use permits must be consistent with the Specific Plan. Chapters 1, 2, 3, and 4 of the Specific Plan will be adopted by ordinance and are subject to the penalty provisions of the Los Angeles County Code. All subdivision map, variance, conditional use permit, deviations from standards, building, or other permit conditions imposed pursuant to the Specific Plan will also be subject to the penalty provisions and citation procedures of the County Code. As discussed in the California Bureau of Real Estate Reference Guide, the California Subdivision Map Act[99] sets forth the conditions for approval of subdivision maps and requires enactment of subdivision ordinances by which local governments have direct control over the types of subdivision projects to be undertaken and the physical improvements to be installed. The primary objectives of the Act include the coordination of subdivision design (lots, street patterns, rights-of-way for drainage and sewers, etc.) with applicable plans and insuring that public improvements are properly completed to avoid undue burdens on the taxpayers of the community.[100]

The Los Angeles County Subdivision Ordinance was enacted in accordance with state law, and the approval of each future TTM for the Project must ensure compliance with the Specific Plan and that public facilities, including transportation improvements that meet Project demand under forecasted cumulative conditions, are implemented without resulting in undue burdens to County and other taxpayers.

The mitigation measures for the Centennial Project are listed in the Mitigation Monitoring and Reporting Program (MMRP).[101] The MMRP requires that Project traffic conditions, impacts and improvements, including required Project funding for state highway improvements, be analyzed in conjunction with each TTM application. MM 10-2, for example, requires a traffic study prepared by a Traffic Engineer or Civil Engineer licensed in the State of California to the satisfaction of the County be submitted with each TTM application for review by the County. MMs 10-25 and 10-26 (see the Final EIR MMRP), presented as MMs 10-29 and 10-30 in the Draft EIR, require that the Project Applicant confirm that all Specific Plan traffic-related requirements, including the creating and operation of a Transportation Management Agency, the implementation of facilities and measures that encourage non-automotive transportation, and the implementation of Transportation Demand Management measures, prior to County approval of a TTM. Consequently, Project and local traffic conditions and the need for the implementation of applicable mitigation measures in the MMRP that identify improvements to local and state highway facilities will be evaluated as the Project is developed and TTMs are submitted for County review and

98 DRP 2017, Appendix 4.0-A, p. 4-8
99 Government Code § 66410, et seq.
100 California Bureau of Real Estate Reference Guide, Chapter 17, Subdivisions and Other Controls, available at http://www.dre.ca.gov/Publications/ReferenceBook.html.
101 Final EIR Appendix 2.0-C.Rev

approval. If the Project traffic evaluated in a TTM application deviates significantly from projected levels, the County has the authority deny the approval of any new TTMs and additional development until Project conditions are verified to be within projected levels, or a new project application, with new CEQA analysis, is reviewed and approved.

As discussed on Draft EIR pages 4-91 to 4-92, while the development of specific future phases and components of the Project will be based on the state of the economy, market demand for uses on the site and the timing of regional and off-site infrastructure, the Project land use approval process required by the Specific Plan, the implementation of the Subdivision Map Act by the County, and the MMRP ensure that future development will occur in a balanced pattern. As discussed above, Project development may only proceed after County approval of future TTMs. The TTM review and approval process requires an environmental evaluation to confirm that the Project's interim buildout (including the interim buildout of different categories of uses) does not cause any new or more significant adverse environmental impacts that were not evaluated in the EIR. The MMRP specifically requires that traffic studies be prepared and that Specific Plan transportation measures be confirmed in conjunction with each TTM application. In the event that, as the comment suggests, the Project's residential development was to occur prior to the proposed onsite employment or commercial land uses, the environmental and traffic analysis required for each TTM would find that Project-related traffic differs from the traffic volumes and patterns considered in the EIR. If these differences are found to generate new or more severe significant impacts, a subsequent environmental impact report, additional public and agency review, and future feasible mitigation to avoid or reduce Project traffic-related impacts under the conditions documented during the TTM review and approval process would be required before any additional development is approved.

The Specific Plan and the MMRP also require that project infrastructure be in place prior to residential, employment-generating and commercial development. As discussed on pages 4-92 to 4-96 of the Draft EIR, the first phase of development will include permanent and temporary uses, major infrastructure, public services, and roadway/circulation improvements to ensure that all services and infrastructure components are of sufficient size and capacity to serve early residents and occupants (e.g., schools, roadways, public park maintenance, and utilities). The MMRP requires that sufficient services and infrastructure, such as water, wastewater, utilities, roadways, be confirmed during the review and approval process for each TTM (see references to a "Tentative Tract Map" in the column titled, "When Monitoring to Occur" in Final EIR Appendix 2.0-C.Rev). The Draft EIR states that if future development phases are delayed or do not occur, these facilities will continue to provide permanent services and infrastructure. As a result, the Project will have incentives to develop residential, commercial and employment-generating uses in accordance with the balanced pattern discussed in the Draft EIR and required by the Specific Plan to ensure that early-phase infrastructure investments are efficiently utilized over time.

In summary, as discussed in the Draft EIR, the Project development approval process has been designed to ensure that all proposed land uses, including residential, commercial and employment-generating land uses, occur in a balanced manner. Future development will be implemented in accordance with the Specific Plan and the review and approval of TTMs for

the site. The extent to which the balanced development required by the Specific Plan and discussed in the Draft EIR is being achieved over time, including environmental and traffic impacts, will be evaluated during the TTM review and approval process. If Project development does not occur as projected, a subsequent environmental impact report, additional public and agency review, and future feasible mitigation to avoid or reduce Project traffic-related impacts under the conditions documented during the TTM review and approval process would be required before any additional development is approved. As a result, the Project cannot generate long-term development that substantially deviates from the balanced development and associated interim and long-term traffic patterns described in the Draft EIR.

Response to Comment B.3-3:

The Project includes MM 21-14, which states the following:

> Ten percent of all homes in Centennial communities that permit housing, with the exception of the lowest density area (Community 8-2) will be affordable, in conformance with the Affordable Housing Implementation Plan (see Appendix 3-H of the *Centennial Specific Plan*).
>
> (DRP 2017, p. 5.21-91)

The Project's Affordable Housing Implementation Plan[102] provides the additional detail requested by the Commenter on the income levels of the required affordable units, which prescribe the required percentage of units for include moderate, low and very low-income households. It is also noted that housing affordability is also addressed by the range of market rate units in the Project, as well as the Project's overall addition to the supply of housing within the region. The non-partisan Legislative Analyst's Office has concluded that California has a housing shortage that is most acute in coastal areas, that this housing shortage has resulted in a dramatic increase in housing costs, that housing costs have in turn caused California to have the highest poverty rate in the nation, and that only a very significant increase in overall housing supply help alleviate the supply shortfall and help normalize housing prices. See, e.g., Legislative Analyst's Office, California's High Housing Costs: Causes and Consequences;[103] Census Bureau Poverty summary;[104] Recent Trends in Housing Affordability.[105] The Project addresses housing affordability both by deed restricting 10 percent of its units for affordable housing, and by developing a broad range of market based housing at different price points for working families who do not qualify for subsidized affordable housing.

---

Response to Comment B.3-4:

This comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. The Project has been designed to incorporate the pedestrian, biking, connectivity, neighborhood electric vehicle (NEV) and other standards and objectives discussed in this comment. As discussed in Draft EIR pages 4-30 to 4-40, the Project's Mobility Plan is an integral part of the Centennial Land Use Plan and provides for an integrated network of roadways, walking, and biking trails to reduce automotive use and facilitate safe and efficient travel. Centennial will implement a system of complete streets and multi-mode, non-motorized transportation facilities consistent with the California Complete Streets Act of 2008 and in accordance with applicable County policies. An extensive network of sidewalks, greenway trails (approximately 13 miles), and community trails (approximately 60 miles) would link residential, schools, shopping, and employment areas. Non-motorized transportation planning elements are integrated into the Centennial Circulation Plan to encourage non-automotive transit modes, including: small- to medium-sized streets and blocks that allow for shorter walking distances to retail, parks, schools, and other destinations; facilities that make walking, cycling, and transit use safe, comfortable, attractive, and efficient transportation options; parking behind buildings to encourage walking in retail areas along street frontage; and streetscapes designed as public spaces to promote social interaction and physical activity. Consistent with these objectives, MM 14-1 requires that the Project: provide a functional system of community trails, greenway trails, and natural corridors to serve as recreational opportunities and as alternative means of transportation to reduce vehicular traffic; provide complete streets throughout the community to provide alternative modes of transport (walking, biking, low-speed vehicles [LSVs] such as neighborhood electric scooters, bikes and other low-speed electric vehicles [NEVs]; incorporate sidewalks (separated by a parkway from streets) and trees to be the main street elements to create a walking environment, promoting pedestrian activity; provide Class I – IV bike lanes throughout the Project to ensure a variety of alternative transportation options; provide permanently anchored bicycle racks within 200 feet of visitors' entrance of nonresidential buildings, readily visible to passers-by, for 5 percent of new visitor motorized vehicle parking spaces being added, with a minimum of two-bike capacity rack; for new nonresidential buildings with over 10 tenant-occupants or for additions or alterations that add 10 or more tenant vehicular parking spaces, provide secure bicycle parking spaces at a rate of 5 percent of tenant parking being added, with a minimum of one space; for residential buildings, provide permanently anchored bicycle racks within 100 feet of the visitor's entrance, readily visible to passers-by, for 5 percent of visitor motorized vehicle parking capacity with a minimum of one two-bike capacity rack; for nonresidential buildings within the Business Park and Commercial areas with 75,000 or more square feet of gross floor area, provide locker rooms and shower facilities; and for multifamily buildings, provide on-site bicycle parking for at least one bicycle per every two dwelling units. The Mobility Plan also requires the formation and funding of a Transportation Management Agency prior to the issuance of the first occupancy permit for monitoring the form of travel, or transit modes, used by the people who live and work in Centennial and ensuring that the use of single occupancy vehicles for travel is reduced in accordance with the Project's mobility performance standard. As a result, the Project incorporates the transportation and mobility objectives discussed in this comment.

Response to Comment B.3-5:

This comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment B.3-6:

The Draft EIR discusses the Northwest State Route 138 Corridor Improvement Project ("NW SR-138 project"), including State Route (SR) 138 improvement alternatives, design, purpose and how the alternatives related to the Project's proposed circulation system in Section 4.0, Project Description, pages 4-39 to 4-41, Section 5.10, Traffic, Access, and Circulation, pages 5.10-35 and 5.10-36, and Section 7.0, Cumulative Impacts, pages 7-8 to 7-9. This information was based on the Draft EIR/EIS for the NW SR-138 project which was circulated for public review and comment in July 2016. A Notice of Completion and Availability for the Project Draft EIR was filed by the County on May 15, 2017 and the 60-day comment period began on May 17, 2017.

As noted on Draft EIR page 4-41, the NW SR-138 project Draft EIR/EIS, Transportation Analysis Report (TAR) and Intersection Control Evaluation report (ICE Report) deferred the selection of a preferred SR-138 improvement alternative until the NW SR-138 project Final EIR/EIS ("NW SR-138 FEIR") was published. In June 2017, during the comment period for the Draft EIR, Caltrans issued the NW SR-138 FEIR and identified Alternative 2 (Expressway/Highway) ("Alt 2") as the preferred alternative for the SR-138 improvements.

In July 2017 Caltrans submitted a comment letter requesting that the Project traffic analysis discuss and incorporate the Alt 2 facilities to be consistent with the NW SR-138 FEIR. In response, the Centennial Specific Plan Supplemental Traffic Study (STS) was prepared to incorporate Alt 2 with the Project traffic analysis. The STS is attached as Appendix 5.10-C of the Final EIR. As in the Draft EIR, the STS considers potential Project impacts under existing and future (cumulative) traffic conditions. Potential impacts are evaluated using the Highway Capacity Manual (HCM) methodology utilized in the NW SR-138 FEIR. As discussed on Draft EIR pages 5.10-2 to 5.10-5, both the Draft EIR and the NW SR-138 FEIR use the North County Sub-Area Model to evaluate traffic conditions in north Los Angeles County. The Draft EIR utilizes a more recent version of the model that was updated by Los Angeles County to reflect the Antelope Valley Area Plan (AVAP) approved by the County in June 2015. The STS also uses the traffic forecasts from the updated North County Sub-Area Model provided by the County to analyze potential Project and cumulative impacts to reflect the most current information available regarding traffic conditions in the North County region.

The Draft EIR considered potential Project impacts with improvements required to accommodate the full buildout of the Project under existing traffic plus Project buildout conditions, and cumulative traffic plus Project buildout conditions. The Draft EIR identified mitigation measures that would maintain acceptable level of service (LOS) standards at all applicable highway segments, intersections, and ramps. To incorporate Alt 2 into the Draft EIR analysis, the STS considers potential Project impacts: (a) utilizing the current SR-138 facilities; (b) utilizing the Alt 2 facilities described in the NW SR-138 FEIR; and (c) utilizing the Alt 2 facilities and additional improvements to SR-138 that may be required under

cumulative conditions with full Project buildout. The STS identifies certain mitigation measure clarifications required to address the design details of Alt 2 and to connect the Project internal circulation system with the Alt 2 facilities. The STS determined that the implementation of Alt 2, and additional improvements to SR-138 that may be required under cumulative conditions with full Project buildout, will not result in any new or more severe significant physical construction and operational impacts than considered in the NW SR-138 FEIR and the Draft EIR.[106] The STS also demonstrates that, using the HCM methodology, the Project will not result in any new or more severe significant impacts to applicable highway segments, intersections and ramps than considered in the Draft EIR.

The STS findings include the following:

- Under interim cumulative traffic conditions, the current SR-138 facilities would accommodate approximately 10 percent of the Project's full buildout traffic without adversely affecting applicable LOS standards.[107]
- Under existing traffic plus Project conditions, the implementation of Alt 2 would accommodate the full buildout of the Project without adversely affecting applicable LOS standards.[108]
- Under interim cumulative traffic plus Project conditions, the implementation of Alt 2 would accommodate approximately 75 percent of the Project's full buildout traffic without adversely affecting applicable LOS standards.[109]
- Under long-range cumulative traffic plus Project conditions, the implementation of Alt 2 and additional SR-138 improvements would accommodate the full buildout of the Project without adversely affecting applicable LOS standards.[110]

The STS compares the Project's potential impacts identified in the Draft EIR for Interstate-5 (I-5), SR-14 and SR-99 facilities using the volume to capacity methodology specified by the Congestion Management Plan for Los Angeles County and the Project's potential impacts using the Caltrans' recommended HCM methodology. HCM calculations were prepared for 62 locations within the Draft EIR study area consisting of freeway segments in advance of and after major system interchanges as well as representative locations between major system interchanges. The analyzed locations provide a comprehensive coverage of the Draft EIR study area because they include the freeway facilities with the greatest potential to be affected by congestion. Under existing plus Project conditions, the Draft EIR and the STS show that all applicable highway segments, intersections and ramps would operate at acceptable LOS levels.[111] Under cumulative plus Project conditions with mitigation, the Draft EIR and the STS show that almost all applicable highway segments, intersections and ramps would operate at acceptable LOS levels.[112] The STS indicates that certain study locations,

106 DRP 2017, Final EIR Appendix 5.10-C, Sections 2.5 and 3
107 Final EIR Appendix 5.10-C, Tables 3-3 and 3-4
108 *Id.,* Appendix 5.10-C, Tables 3-1, 3-2 and 3-9
109 *Id.,* Appendix 5.10-C, Tables 3-5 and 3-6
110 *Id.,* Appendix 5.10-C, Table 3-7, Tables 3-8 and 3-9
111 *Id.,* Appendix 5.10-C, Table 4-1
112 *Id.,* Appendix 5.10-C, Table 4-2

such as the Grapevine grade segment of I-5, would not meet HCM-based LOS standards because topographic conditions, lane and speed controls, and other localized conditions would result in higher traffic densities. As shown in STS Table A-5, however, LOS conditions would be worse under cumulative without Project conditions, and LOS conditions improve under cumulative with Project conditions with the implementation of the Project MMs.[113] Consequently, the Project does not result in a significant impact at any location that does not meet HCM-based LOS standards under cumulative with Project conditions with mitigation.

As discussed above, the Draft EIR considered improvements to SR-138 that would be required to accommodate the full buildout of the Project under cumulative traffic conditions. The implementation of Alt 2 would accommodate approximately 75 percent of the Project's full buildout traffic under interim cumulative conditions, and additional improvements consistent with the SR-138 facilities considered in the Draft EIR would be required to accommodate all of the Project's full buildout traffic under long-range cumulative conditions. The NW SR-138 FEIR also clarified certain aspects of the SR-138 design details that would be implemented with Alt 2, including the number and locations of intersections along SR-138 from I-5 to SR-14. The NW SR-138 FEIR addressed several types of intersection configurations for each location but defers selection of the final configurations to the SR-138 design phase. Subject to minor adjustments for consistency with these Alt 2 design details, the SR-138 facilities that would result from the additional improvements to Alt 2 required for full Project buildout under long-range cumulative conditions as described in the STS are substantially similar to the full buildout SR-138 facilities discussed in the Draft EIR. The STS provides a summary of SR-138 improvements in the context of the implementation of Alt 2, including the following:

- To connect the Project circulation system to the Alt 2 facilities, an additional intersection and certain intersection upgrades, such as additional lanes, will be constructed at locations where SR-138 borders the Specific Plan boundary.[114]
- The implementation of Alt 2, including minor modifications in certain intersection locations within the Specific Plan area to accommodate the Alt 2 design details, that accommodate approximately 75 percent of the Project's full buildout traffic under interim cumulative traffic conditions.[115]
- SR-138 improvements in addition to Alt 2 that would be required to accommodate all of the Project's buildout traffic under the long-range cumulative traffic conditions projected in the Draft EIR and STS.[116]

As discussed in the STS[117], and as shown below, the Project's MMs have been clarified to reflect the implementation of these improvements with Alt 2. As required by MMs 10-3 and 10-4, the Project will contribute fair share funding or provide funding for SR-138 improvements in accordance with a mitigation agreement with Caltrans for the

113 *Id.,* Appendix 5.10-C, Section 5
114 *Id.,* Appendix 5.10-C, Sections 2.2 and 2.3
115 *Id.,* Appendix 5.10-C, Section 2.1
116 *Id.,* Appendix 5.10-C, Section 2.4
117 *Id.,* Appendix 5.10-C, Section 5

implementation of Alt 2, improvements required to connect the Project circulation system with the Alt 2 facilities, and, if confirmed in traffic studies submitted in conjunction with the review and approval process for future Project tract maps, additional SR-138 improvements that may be required to accommodate full Project buildout under cumulative traffic conditions.

As requested by Caltrans, the following revisions to the Draft EIR are provided to reflect the preferred Alternative 2 SR-138 improvements identified in the NW SR-138 FEIR.

The third full paragraph on Draft EIR page 4-41 is hereby revised as follows:

> The draft NW SR-138 EIR/EIS, TAR and ICE Report ~~do~~ did not identify a preferred alternative and Caltrans deferred the selection of a preferred alternative to the Final EIR/EIS. In June 2017 the Final EIR/EIS identified Alternative 2 (Expressway/Highway) as the preferred alternative. Alternative 2 includes a 6-lane freeway from the I-5 interchange to Gorman Post Road, a 6-lane Expressway from Gorman Post Road to 300th Street West, a 4-lane expressway from 300th Street West to 240th Street West, and a 4-lane limited access conventional highway from 240th Street West to the SR-14 interchange, generally following the existing alignment of SR-138. Caltrans has also reserved the right to determine the specific preferred intersection control based on the traffic and safety data at the time the improvements occur. Thus, depending on the timing of the implementation of the realigned SR-138; and the timing of the implementation of the Project; the ultimate connection requirements for Project roads to SR-138 may need additional future design analysis in conjunction with future phases of development. All construction activities within Caltrans right-of-way would be closely coordinated with Caltrans, subject to their review and design standards, and subject to their approval. A Supplemental Traffic Study (STS) has been prepared to incorporate the preferred Alternative 2 for SR-138 into the Project analysis. The STS is attached as Appendix 5.10-C of this Final EIR. The STS evaluates potential impacts using the Highway Capacity Manual (HCM) methodology and the North County Sub-Area Model utilized in the NW SR-138 Final EIR/EIS as updated by Los Angeles County to reflect the Antelope Valley Area Plan approved by the County in June 2015. The STS determined that the implementation of Alternative 2, and additional improvements to SR-138 that may be required under cumulative conditions with full Project buildout, will not result in any new or more severe significant physical construction and operational impacts than considered in the NW SR-138 Final EIR/EIS and the Project Draft EIR. The STS also demonstrates that, using the HCM methodology, the Project will not result in any new or more severe significant impacts to applicable highway segments, intersections and ramps than considered in the Project Draft EIR.

The second full paragraph on Draft EIR page 5.10-36 is hereby revised as follows:

> There is no implementation schedule for the NW SR-138 Project; however, the draft EIR/EIS for the proposed improvements was made available for public review in July 2016. The draft NW SR-138 EIR/EIS, TAR and ICE Report ~~do~~ did not identify a preferred alternative and Caltrans deferred the selection of a preferred alternative to the Final EIR/EIS. In June 2017 the Final EIR/EIS identified Alternative 2 (Expressway/Highway) as the preferred alternative. Alternative 2 would include a 6-lane freeway from the I-5 interchange to Gorman Post Road, a 6-lane Expressway from Gorman Post Road to 300th Street West, a 4-lane expressway from 300th Street West to 240th Street West, and a 4-lane limited access conventional highway from 240th Street West to the SR-14 interchange, generally following the existing alignment of SR-138. Caltrans has also reserved the right to determine the specific preferred intersection control based on the traffic and safety data at the time the improvements occur. A Supplemental Traffic Study (STS) has been prepared to incorporate the preferred Alternative 2 for SR-138 into the Project analysis. The STS is attached as Appendix 5.10-C of this Final EIR. The STS evaluates potential impacts using the Highway Capacity Manual (HCM) methodology and the North County Sub-Area Model utilized in the NW SR-138 Final EIR/EIS as updated by Los Angeles County to reflect the Antelope Valley Area Plan approved by the County in June 2015. The STS determined that the implementation of Alternative 2, and additional improvements to SR-138 that may be required under cumulative conditions with full Project buildout, will not result in any new or more severe significant physical construction and operational impacts than considered in the NW SR-138 Final EIR/EIS and the Project Draft EIR. The STS also demonstrates that, using the HCM methodology, the Project will not result in any new or more severe significant impacts to applicable highway segments, intersections and ramps than considered in the Project Draft EIR.

The carryover paragraph on Draft EIR page 7-9 is hereby revised as follows:

> existing alignment of SR-138. The portion of SR-138 between 300th Street West and Gorman Post Road, which is applicable to the Project site, is envisioned by Caltrans to be a six-lane expressway. This alternative would involve at-grade signalized intersections at Cement Plant Road and 300th Street West; a grade-separated overcrossing at the Gorman Post Road intersection (same as Build Alternative 1); and a new grade separate structure (standard box culvert) east of Quail Lake near the airport (same as Build Alterative 1). Same as Build Alternative 1, this alternative would include an extension of the existing RCB culvert at the Quail Lake Outlet into the west branch of the California Aqueduct. In June 2017 the Final EIR/EIS identified Alternative 2 (Expressway/Highway) as the preferred alternative. Alternative 2 would include a 6-lane freeway from the I-5 interchange to Gorman Post Road, a 6-lane Expressway from Gorman Post Road to 300th Street West, a 4-

lane expressway from 300th Street West to 240th Street West, and a 4-lane limited access conventional highway from 240th Street West to the SR-14 interchange, generally following the existing alignment of SR-138. A Supplemental Traffic Study (STS) has been prepared to incorporate the preferred Alternative 2 for SR-138 into the Project analysis. The STS is attached as Appendix 5.10-C of this Final EIR. The STS evaluates potential impacts using the Highway Capacity Manual (HCM) methodology and the North County Sub-Area Model utilized in the NW SR-138 Final EIR/EIS as updated by Los Angeles County to reflect the Antelope Valley Area Plan approved by the County in June 2015. The STS determined that the implementation of Alternative 2, and additional improvements to SR-138 that may be required under cumulative conditions with full Project buildout, will not result in any new or more severe significant physical construction and operational impacts than considered in the NW SR-138 Final EIR/EIS and the Project Draft EIR. The STS also demonstrates that, using the HCM methodology, the Project will not result in any new or more severe significant impacts to applicable highway segments, intersections and ramps than considered in the Project Draft EIR.

The two full paragraphs on Draft EIR page 5.10-130 are hereby revised as follows:

The on-site roadway network has been designed to accommodate projected traffic from proposed land uses. Impacts on the internal roadway system would be less than significant after mitigation. If improvements at Project access points on SR-138 are not constructed, impacts would be significant and unavoidable. Project buildout would result in significant traffic impacts on off-site roadways and freeways, including SR-138, I-5 mainline segments and interchange ramps, and arterial roadway intersections (see Table 5.10-~~30~~32 below). Mitigation measures have been identified to reduce all significant Project impacts, as listed in Table 5.10-~~31~~33, Mitigation Summary. In addition, MM 10-~~23~~20 would protect the right-of-way needed to widen and realign SR-138.

Although mitigation measures identified for Caltrans facilities would reduce Project impacts, it is outside the control of the County of Los Angeles to implement these measures. The ~~CTIP~~ Traffic Mitigation Agreement or the Project Applicant's fair share contribution requirements in MM 10-3 and MMs 10-6 through 10-~~28~~24 and MMs 10-~~31~~27 through 10-4~~5~~41 will provide funding for the planning, design, and construction of certain improvements. MM 10-4 requires the Project Applicant to work to establish a funding program to collect fair share contributions from other projects for the required improvements. Compliance with these mitigation measures would reduce traffic impacts to a less than significant level. Potential Project impacts would be significant and unavoidable, however, if the improvements are not constructed by Caltrans because the County (as the Lead Agency) lacks

jurisdiction and control over State highway facilities and cannot mandate the construction of improvements to these facilities.

Table 5.10-33 on Draft EIR pages 5.10-132 to 5.10-134 is hereby revised as follows:

TABLE 5.10-33
MITIGATION SUMMARY

Mitigation
SR-138
Existing Plus Project Mitigation • Improve SR-138 to a four lane expressway from I-5 to 240th Street West and to a limited access conventional four-lane highway from 240th Street West to 190th Street West, with right-of-way reserved for a six-lane expressway between I-5 and 300th Street West or comparable improvements consistent with the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~. (MM 10-6/Traffic Study MM-1) • Intersection improvements from the westerly access of the Centennial Specific Plan area to SR-14 ~~30th Street West or~~ comparable improvements consistent with the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~: o Specific Plan Westerly Access and SR-138 o Specific Plan Central Access and SR-138 o 300th Street West and SR-138 ~~o 290th Street West and SR-138~~ o Margalo Drive and SR-138 o Three Points and SR-138 o ~~245th~~ 250th Street West and SR-138 o ~~230th~~ 210th Street West and SR-138 ~~o 190th Street West and SR-138~~ o 170th Street West and SR-138 ~~o 110th Street West and SR-138~~ o 90th Street West and SR-138 o 60th Street West and SR-138 ~~o 30th Street West and SR-138~~ **Cumulative Conditions Mitigation** • Dedicate right-of-way within the Project site at each site access location to accommodate the ultimate intersection or interchange configuration as determined by the Northwest 138 Corridor Improvement project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~ (MM 10-20~~23~~/Supplemental Traffic Study MM-18) • To accommodate up to 75 percent of the Project and anticipated cumulative development, ~~C~~contribute fair share of adding one lane in both directions (six lanes total) on SR-138 from I-5 to 300th Street West and one lane in both directions (four lanes total) on SR-138 from 300th Street West to the SR-14 interchange (in addition to above), or contribute fair share to the SR-138 improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~. (MM 10-22~~24~~/Supplemental Traffic Study MM-19) • To accommodate 100 percent of the Project and anticipated cumulative development, ~~C~~contribute fair share of adding a second additional ~~one auxiliary~~ lane in both directions (six lanes total) on SR-138 from 300th Street West to approximately ½ mile east of 250th~~245th~~ Street West (in addition to above), or contribute fair share to the SR-138 improvements being advanced by Caltrans in the Northwest 138

TABLE 5.10-33
MITIGATION SUMMARY

Mitigation
Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~. (MM 10-23~~25~~/Supplemental Traffic Study MM-20) • Fair share participation and/or contribution to the Kern COG RTP/SCS improvement projects on SR-58 between I-5 in Kern County and I-15 in San Bernardino County, which could include development of a high capacity goods movement facility along the SR-58 and/or E-220 corridors. (MM 10-24~~26~~/Traffic Study MM-21) • ~~Fair share participation and/or contribution to the SR-138 improvements to a limited access facility with grade-separated interchanges, consistent with the County's analysis of the AVAP, or fair share participation and/or contribution to the SR-138 improvements (freeway/ expressway or expressway/limited access conventional highway) being advanced by Caltrans in the Northwest 138 Corridor Improvement project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-27/Traffic Study MM-22)~~ • ~~Fair share participation and/or contribution to strengthening and widening the inside and outside shoulders of I-5 between the Fort Tejon and Grapevine Road interchanges and between the SR-138 and Lake Hughes Road interchanges. (MM 10-28/Traffic Study MM-23)~~
I-5
Cumulative Conditions Mitigation • On-Site Transportation Management Association (TMA) that would coordinate and manage the following programs: (MM 10-25~~29~~/Traffic Study MM-24) 1. Ride Share Program 2. Transit Program 3. Commuter Bus Program • Contribute fair share to planned freeway mainline improvements for the following segments: (MM 10-27~~31~~/Traffic Study MM-25) 1. Between Parker Road and SR-14 – add one HOV or HOT lane in each direction. 2. Between Lake Hughes and Parker – add one auxiliary lane in each direction. • Fair share participation and/or contribution to the development of a high capacity goods movement facility along the SR-58 and/or E-220 corridors between I-5 in Kern County and I-15 in San Bernardino County. (MM 10-24~~26~~/Traffic Study MM-26)
I-5/SR-138 Interchange
Existing Plus Project Mitigation • To mitigate the westbound SR-138 to SB I-5 connector ramp, construct one auxiliary lane to the I-5 mainline, or contribute fair share to the SR-138/I-5 connector ramps improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~. (MM 10-18~~21~~/Traffic Study MM-16) **Cumulative Conditions Mitigation** • To mitigate the westbound SR-138 to SB I-5 connector ramp, contribute fair-share to the construction of two auxiliary lanes to the I-5 mainline, or contribute fair share to the SR-138/I-5 connector ramps improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~. (MM 10-28~~32~~/Traffic Study MM-27) • To mitigate the northbound I-5 to eastbound SR-138 connector ramp, contribute fair share to the construction of two auxiliary lanes to the I-5 mainline before the northbound I-5 to eastbound SR-138 connector ramp, or contribute fair share to the SR-138/I-5 connector ramps improvements being

MITIGATION SUMMARY

Mitigation
advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~. (MM 10-29~~33~~/Traffic Study MM-28)
SR-14/SR-138 Interchange
Cumulative Conditions Mitigation • Contribute fair share to the construction of one mainline auxiliary lane and a second off-ramp lane for the SR-14 northbound off ramp to SR-138, or contribute fair share to the SR-138/SR-14 connector ramps improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~. (MM 10-30~~34~~/Traffic Study MM-29) • Contribute fair share to the construction of a second lane on the SR-14 southbound on-ramp from SR-138, or contribute fair share to the SR-138/SR-14 connector ramps improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~. (MM 10-31~~35~~/Traffic Study MM-30)
Off-Site Intersections
Existing Plus Project Mitigation • Contribute fair-share to recommended mitigation measures at the following intersections, or contribute fair share to the SR-138 improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~: o Intersection improvements from the westerly access of the Centennial Specific Plan area to the SR-14 interchange ~~30th Street West~~ (MMs 10-7 through 10-17~~20~~/Supplemental Traffic Study MM-2 through MM-15) o I-5 SB Ramps and Sedona/The Old Road (Intersection 26) (MM 10-19~~22~~/Traffic Study MM-17) **Cumulative Conditions Mitigation** • Contribute fair-share to recommended mitigation measures at the following intersections, or contribute fair share to the SR-138 improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~: o SR-14 SB Ramps and SR-138 (Caltrans Intersection) (MM 10-32~~36~~/Supplemental Traffic Study MM-31) o SR-14 NB Ramps and SR-138 (Caltrans Intersection) (MM 10-33~~37~~/Supplemental Traffic Study MM-32) o I-5 NB Ramps and Lake Hughes (LA County/Caltrans Intersection) (MM 10-34~~38~~/Supplemental Traffic Study MM-33) o I-5 SB Ramps and Sedona/The Old Road (LA County/Caltrans Intersection) (MM 10-19~~22~~/Traffic Study MM-34) o I-5 SB Ramps and Magic Mountain (LA County/Caltrans Intersection) (MM 10-35~~39~~/Traffic Study MM-35) o I-5 NB Ramps and Magic Mountain (City of Santa Clarita/Caltrans Intersection) (MM 10-36~~40~~/Traffic Study MM-36) o I-5 SB Ramps and Valencia (LA County/Caltrans Intersection) (MM 10-37~~41~~/Traffic Study MM-37) o I-5 NB Ramps and Valencia (City of Santa Clarita/Caltrans Intersection) (MM 10-38~~42~~/Traffic Study MM-38) o I-5 SB Ramps and McBean (LA County/Caltrans Intersection) (MM 10-39~~43~~/Traffic Study MM-39)

Sources: ~~Stantec 2017 (Table 4-11).~~ Draft EIR Appendix 5.10-A (Traffic Study) and Final EIR Appendix 5.10-C (Supplemental Traffic Study)

The following mitigation measures and accompanying text beginning with the last partial paragraph on Draft EIR page 5.10-145 to the end of the first full paragraph on Draft EIR page 5.10-157 are hereby revised as follows:

MM 10-3 The Project Applicant/Developer shall seek to enter into a ~~Centennial Transportation Improvement Program (CTIP)~~ Traffic Mitigation Agreement for Land Development Impacts to California State Transportation Facilities with Caltrans and shall comply with the terms the ~~CTIP agreement~~ Traffic Mitigation Agreement if approved and implemented. Compliance with the ~~CTIP~~ Traffic Mitigation Agreement shall constitute compliance with the mitigation measures for the Project's traffic impacts on the State highway system. Any required improvements that result from direct Project impacts (i.e., not from cumulative impacts), and are required on Caltrans-owned facilities, shall be implemented through a ~~CTIP~~ Traffic Mitigation Agreement. Any required improvements that result from cumulative traffic impacts may be implemented through payment of fair share fees.

MM 10-6 *(Supplemental Traffic Study MM-1)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement to improve SR-138 to a four lane expressway from I-5 to 240th Street West and to a limited access four lane conventional highway from 240th Street West to 190th Street West, with right-of-way reserved for a six-lane expressway between ~~I-5~~ Gorman Post Road and 300th Street West, or comparable improvements consistent with the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

MM 10-7 *(Supplemental Traffic Study MM-2)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall

comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement for the following intersection improvements at Specific Plan Westerly Access and SR-138:

- Widen SR-138 to a ~~four~~ six-lane ~~highway~~ expressway from westerly project entrance to 300th ~~290th~~ Street West, ~~with auxiliary lanes between intersections,~~ resulting in three through lanes in the WB and EB directions.
- Construct intersection to include: two NB left-turn lanes, three NB through lanes and one NB right-turn lane.
- In the SB direction, construct two left turn lanes, three through lanes and ~~one free-flow~~ two right-turn lanes.
- In the EB direction, construct three left-turn lanes and one right-turn lane.
- In the WB direction, construct two left-turn lanes and ~~a~~ ~~free-flow~~ two right-turn lanes.
- Install traffic signal.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

MM 10-8 *(Supplemental Traffic Study MM-3)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement for implementation of the following intersection improvements at Specific Plan Central Access and SR-138:

- Widen SR-138 to a ~~four~~ six-lane ~~highway~~ expressway from westerly project entrance to 300th ~~290th~~ Street West, ~~with auxiliary lanes between intersections,~~ resulting in three through lanes in the WB and EB directions.
- In the NB and SB directions, construct two left-turn lanes, three through lanes and one right-turn lane.
- In the EB direction, construct two left-turn lanes and one right-turn lane.
- In the WB direction, construct two left-turn lanes and ~~a~~ ~~free-flow~~ two right-turn lanes.

- Install traffic signal and include SB and NB right-turn overlap phasing.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

MM 10-9 *(Supplemental Traffic Study MM-4)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement for implementation of the following intersection improvements at 300th Street West and SR-138:

- Widen SR-138 to a ~~four~~ six-lane ~~highway~~ expressway from westerly project entrance to 300th ~~290th~~ Street West, ~~with auxiliary lanes between intersections,~~ resulting in three through lanes in the WB and EB directions.
- Construct two left-turn lanes and one right-turn lane in the EB direction and two left-turn lanes and dual right-turn lanes in the WB direction.
- In the NB direction, construct two left-turn lanes, three through lanes, and one right-turn lane.
- In the SB direction, construct two left turn lanes, three through lanes and one ~~free-flow~~ right-turn lane.
- Install traffic signal and include WB right-turn overlap phasing.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

~~**MM 10-10** *(Traffic Study MM-5)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 290th Street West and SR-138:~~

- ~~Widen SR-138 to a four-lane highway from westerly project entrance to 290th Street West, with auxiliary lanes between intersections, resulting in three through lanes in the WB and EB directions.~~

~~• Additional intersection improvements include: two EB left turn lanes, one WB right turn lane, two SB left turn and two SB right-turn lanes.~~

~~• Install traffic signal.~~

~~Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).~~

MM 10-1011 *(Supplemental Traffic Study MM-6)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement for implementation of the following intersection improvements at Margalo Drive and SR-138:

- Widen SR-138 to a four-lane ~~highway~~ expressway from 300th ~~290th~~ Street West to 240th ~~190th~~ Street West ~~with roadway augmentation at intersection, approximately ¼ mile in length for the west and east legs resulting in three through lanes in the WB and EB directions.~~
- Additional intersection improvements include: ~~one~~ two EB left turn lanes, ~~and~~ one WB right-turn lane, one SB left-turn lane, and two SB right-turn lanes.
- Install traffic signal.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

MM 10-1112 *(Supplemental Traffic Study MM-7)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement for implementation of the following intersection improvements at Three Points and SR-138:

- Widen SR-138 to a four-lane ~~highway~~ expressway from 300th ~~290th~~ Street West to 240th ~~190th~~ Street West ~~with roadway augmentation at intersection, approximately ¼ mile in length for the west and east legs~~ resulting in ~~three~~ two through lanes in the WB and EB directions.
- Additional improvements include adding one NB left-turn lane, ~~and~~ one SB left turn lane and one SB right turn lane.

Or contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

MM 10-12~~13~~ *(Supplemental Traffic Study MM-8)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement for implementation of the following intersection improvements at 250~~245~~th Street West and SR-138:

- Widen SR-138 to a four-lane expressway ~~highway~~ from 300th ~~290th~~ Street West to 240th ~~190th~~ Street West ~~with roadway augmentation at intersection, approximately ¼ mile in length for the west and east legs~~ resulting in ~~three~~ two through lanes in the WB and EB directions.
- Additional improvements include adding one ~~NB left-turn lane and one~~ SB left turn lane, one EB left-turn lane, one WB U-turn lane and one dedicated ~~EB~~ WB right-turn lane.
- Install traffic signal.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

MM 10-13~~14~~ *(Supplemental Traffic Study MM-9)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement for implementation of the following intersection improvements at 210th ~~230~~th Street West and SR-138:

- Widen SR-138 to a four-lane limited access conventional highway from 240th ~~290~~th Street West to 190th Street West.
- Additional improvements include one SB left-turn lane, one ~~SB~~ NB ~~right~~ left-turn lane, ~~and~~ one EB left-turn lane, one EB right-turn lane, and one WB left-turn lane.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

~~**MM 10-15** *(Traffic Study MM-10)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 190th Street West and SR-138:~~

- ~~Widen SR-138 to a four-lane highway from 290th Street West to 190th Street West with roadway augmentation at intersection, approximately ¼ mile in length for the west and east legs resulting in three through lanes in the WB and EB directions.~~
- ~~Additional improvements include adding one EB left-turn lane, one WB left-turn lane, one NB left-turn lane and one SB left turn lane and one dedicated EB right-turn lane.~~
- ~~Install traffic signal.~~

~~Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).~~

MM 10-~~14~~16 *(Supplemental Traffic Study MM-11)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement for implementation of the following intersection improvements at 170th Street West and SR-138:

- Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.
- Additional improvements include one EB left-turn lane, one WB left-turn lane, one NB left-turn lane and one SB left-turn lane.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

~~**MM 10-17** *(Traffic Study MM-12)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 110th Street West and SR-138:~~

- ~~Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.~~
- ~~Additional improvements include: one EB left-turn lane, one WB left-turn lane, two NB left-turn lanes, one SB left-turn lane and two SB right-turn lanes.~~
- ~~Install traffic signal.~~

~~Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).~~

MM 10-15~~18~~ *(Supplemental Traffic Study MM-13)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement for implementation of the following intersection improvements at 90th Street West and SR-138:

- Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.
- Additional improvements include: ~~one~~ two EB left-turn lanes, one EB right-turn lane, one WB left-turn lane, one WB right-turn lane, one NB left-turn lane and one SB left-turn lane.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

MM 10-16~~19~~ *(Supplemental Traffic Study MM-14)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement for implementation of the following intersection improvements at 60th Street West and SR-138:

- Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.

- Additional improvements include: one EB left-turn lane, one EB right-turn lane, one WB left-turn lane, one WB right-turn lane, one NB left-turn lane and one SB left-turn lane.
- Install traffic signal.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

MM 10-17~~20~~ *(Supplemental Traffic Study MM-15)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement for implementation of the following intersection improvements at ~~30th Street West~~ the SR-14 and SR-138 interchange:

- ~~Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.~~
- ~~Additional improvements include adding one EB left-turn lane and one WB left-turn lane.~~
- Install traffic signals at the NB off-ramp and the SB off-ramp.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

MM 10-18~~21~~ *(Traffic Study MM-16)* To provide adequate capacity at the I-5/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding toward the following ramp improvement at I-5/SR-138:

- Addition of one auxiliary lane at the connector ramp from westbound SR-138 to southbound I-5 for existing plus Project conditions

MM 10-19~~22~~ *(Traffic Study MM-17 and MM-34)* To provide adequate capacity at The Old Road at I-5 SB Ramps/Sedona intersection, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute

fair share funding toward the addition of a second southbound left-turn lane from The Old Road to the I-5 Southbound On-Ramp.

MM 10-2023 *(Supplemental Traffic Study MM-18)* To mitigate the increase of side-street delay for the existing adjacent off-site areas and for planned on-site side streets along SR-138, the Project Applicant/Developer shall either (1) comply with the terms of the ~~Centennial Transportation Improvement Program (CTIP)~~ Traffic Mitigation Agreement or (2) dedicate right-of-way within the project site at each site access location to accommodate the ultimate intersection or interchange configuration to be determined by the Northwest Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~ at the following SR-138 intersections:

- Westerly Access
- Central Access
- 300th Street West
- ~~290th Street West~~

MM 10-21 *(Supplemental Traffic Study MM-22)* To provide adequate on- and off-site capacity to accommodate up to 10 percent of the Project and anticipated cumulative development, the Project Applicant/Developer shall comply with the terms of the Traffic Mitigation Agreement for the following SR-138 intersection improvements for site access:

- Westerly Access: Provide one EB left-turn lane, one EB through lane, one EB right-turn lane, one WB left-turn lane, one WB through lane, one WB right-turn lane, one NB left-turn lane, one shared NB through/right lane, one SB left-turn lane, and one shared SB through/right lane. Install traffic signal.
- Central Access: Provide one EB left-turn lane, one EB through lane, one EB right-turn lane, one WB left-turn lane, one WB through lane, one WB right-turn lane, one NB left-turn lane, one NB through lane, one NB right-turn lane, one SB left-turn lane, one SB through lane, and one SB right-turn lane. Install traffic signal.
- 300th Street West: Provide one EB left-turn lane, one EB through lane, one EB right-turn lane, one WB left-turn lane, one WB through lane, one WB right-turn lane, one

NB left-turn lane, one shared NB through/right lane, one SB left-turn lane, and one shared SB through/right lane. Install traffic signal.

- 190th Street West: Provide one EB left-turn lane, one EB through lane, one WB through lane, one WB right-turn lane, one SB left-turn lane, and one SB right lane.

MM 10-2224 *(Supplemental Traffic Study MM-19)* To provide adequate on- and off-site capacity to accommodate up to 75 percent of the Project and anticipated cumulative development, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding toward the widening of SR-138, including:

- Addition of ~~an auxiliary~~ one additional lane in each direction (six lane~~s total~~ freeway) from I-5 to Gorman Post Road
- Addition of two additional lanes in each direction (six lane expressway) from Gorman Post Road to 300th Street West
- Addition of one additional lane in each direction (four lane expressway) from 300th Street West to 240th Street West
- Addition of one additional lane in each direction (four lane limited access conventional highway) from 240th Street West to the SR-14 interchange

MM 10-2325 *(Supplemental Traffic Study MM-20)* To provide adequate on- and off-site capacity to accommodate 100 percent of the Project and anticipated cumulative development, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding toward the widening of SR-138, including:

- Addition of ~~an auxiliary~~ a second additional lane in each direction (six lanes total) from 300th Street West to approximately ½ mile east of 250th ~~245th~~ Street West
- Construct additional intersection turn lanes at the following SR-138 intersections:
    - Westerly Project Access
    - 300th Street West
    - Margalo Drive

- Three Points Road
- 60th Street West

MM 10-2426 *(Traffic Study MM-21 and MM-26)* To provide adequate capacity to the I-5 mainline freeway, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding towards RTP/SCS improvement projects on SR-58 between I-5 in Kern County and I-15 in San Bernardino County, as verified by the County in consultation with the Kern COG and Caltrans. Improvements could include development of a high capacity goods movement facility along the SR-58 and/or E-220 corridors.

~~**MM 10-27** *(Traffic Study MM-22)* To provide adequate capacity on SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for the SR-138 improvements to a limited access facility with grade-separated interchanges, consistent with the County's analysis of the AVAP, or fair share participation and/or contribution to the SR-138 improvements (freeway/expressway or expressway/limited access conventional highway) being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).~~

~~**MM 10-28** *(Traffic Study MM-23)* To provide adequate capacity to the I-5 mainline freeway, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding towards the following planned improvements to I-5:~~

- ~~I-5 between Fort Tejon and Grapevine Road and between SR-138 and Lake Hughes Road interchanges: Strengthening and widening the inside and outside shoulders of I-5.~~

MM 10-2529 *(Traffic Study MM-24)* The Project Applicant/Developer shall implement the Mobility Plan, included as Section 3.2 of the Specific Plan, which provides an extensive system of sidewalks, greenway trails, community trails, a dedicated transit easement, and two transit hubs to serve as alternative means of transportation on the Project site. The Mobility Plan also requires creation and ongoing operation of a Transportation Management Association (TMA) to implement ongoing transportation improvements and programs.

The Project Applicant/Developer, through the required implementation of the Mobility Plan, shall:

- Reinforce and serve the Land Use Plan;
- Provide future residents, visitors and employees with multiple modes of transit/non-single occupancy vehicle (non-SOV) accessibility for internal and external trips ~~by future residents and visitors~~;
- Provide options to reduce vehicle trips and emissions by linking effective travel demand management with transportation systems and parking policies;
- Provide residents and employees on the Project site with multiple modes of transportation options (i.e., walk, bike, public transit, private auto, car share, bike share, etc.);
- Provides for 80 percent on average, but no less than 50 percent of each Village's residential units to be located within one-half mile of a Village center that includes retail and service uses;
- Provide parks within a 5-minute walk (0.25 mile) of 80 percent of all residential units;
- Provide a transit route easement no less than 25 feet wide in the Centennial Commerce District connecting the Town Center, Business Park, and Industrial/Civic areas and also northerly connecting to the Village Five Core;
- Require TMA implementation of a combination of transit and transportation measures to ~~reduce~~ ensure that a minimum of 30 percent of total daily internal on-site trips are completed by using transit modes other than ~~single-occupancy automobile~~ SOV use ~~by 30 percent in relation to standard ITE-generation rates for the overall Project~~; ~~and~~
- Require TMA implementation of a combination of transit and transportation measures to ~~reduce~~ ensure that a minimum of 20 percent of total off-site peak hour commutes to and from the Project site are completed by using transit modes other than SOVs ~~single-occupancy automobiles by 20 percent~~.;
- Require TMA implementation of a program to coordinate with automotive dealers on the Project site to promote CNG, electric, and hybrid electric vehicles~~.~~;

- Require TMA oversight of requirement for service fleet vehicles for agencies or businesses located on-site to be alternative fuel vehicles to the maximum extent feasible, as determine by the Project Applicant/Developer.; and
- Require TMA implementation of a combination of measures to provide adequate temporary bike parking during large public events conducted at civic center, large amphitheaters, fairgrounds or athletic stadium uses that may be permitted, temporarily permitted, or conditionally permitted on the Project site pursuant to the Specific Plan. Such measures may include, but are not limited to, providing valet bike parking, temporarily anchored bike parking racks, or a secured temporary bike parking enclosure.

The Circulation Plan sets forth requirements for roadway classifications; intersection controls; and traffic calming measures. Where approved by the California Department of Transportation (Caltrans) and the County and where maintenance and durability costs are comparable to traditional materials, use "cool" pavement materials, which reduce heat island effect.

MM 10-2630 *(Traffic Study MM-24)* Each component of the Mobility Plan incorporates Transportation Demand Management (TDM) features to reduce dependence on the automobile, provide for a more efficient use of transportation resources among Project occupants, and thereby reduce pollutant emissions. Related to this is the creation and ongoing operation of a Transportation Management Association (TMA) to fund and manage the operation of ongoing transportation programs, including but not limited to transit and on-demand services.

The key TDM elements that are inherent in the overall Mobility Plan are:

- Sidewalks, greenway trails, and community trails that link residential, schools, shopping, and employment areas;
- Small- to medium-sized streets and blocks that allow for shorter walking distances to retail, parks, schools, and other destinations;
- Pedestrian environments incorporated with public streets;

- Transit route easement connecting the residential and commerce areas;
- Parking behind buildings to encourage walking in retail areas along street frontage; and
- Parks within 0.25 mile of 80 percent of all residential units.

MM 10-27~~31~~ *(Traffic Study MM-25)* To provide adequate capacity to the I-5 mainline freeway, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding towards the following planned improvements to I-5:

- I-5 between Lake Hughes and Parker: Addition of one auxiliary lane in each direction.
- I-5 between Parker Road and SR-14: Addition of one HOV or HOT lane in each direction.

MM 10-28~~32~~ *(Traffic Study MM-27)* To provide adequate capacity at the I-5/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding toward the following ramp improvement at I-5/SR-138:

- Addition of two auxiliary lanes at the connector ramp from westbound SR-138 to southbound I-5 for ~~Year 2035~~ cumulative buildout conditions.

MM 10-29~~33~~ *(Traffic Study MM-28)* To provide adequate capacity at the I-5/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding toward the following ramp improvement at I-5/SR-138:

- Addition of two auxiliary lanes at the connector ramp mainline before the northbound I-5 to eastbound SR-138 connector ramp.

MM 10-30~~34~~ *(Traffic Study MM-29)* To provide adequate capacity at the SR-14/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding toward the following ramp improvement at SR-14/SR-138:

- Construction of one auxiliary lane and a second off-ramp lane for the SR-14 northbound off ramp to SR-138.

MM 10-31~~35~~ *(Traffic Study MM-30)* To provide adequate capacity at the SR-14/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding toward the following ramp improvement at SR-14/SR-138:

- Construction of a second lane on the SR-14 southbound on-ramp from SR-138.

MM 10-32~~36~~ *(Supplemental Traffic Study MM-31)* To provide adequate capacity at the SR-14 SB Ramps and SR-138 interchange, the Project Applicant/Developer shall (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement for the reconfiguration of the interchange to include two eastbound through lanes and ~~three~~ two westbound through lanes~~. In the southbound direction, add a second right-turn lane;~~ and install a traffic signal ~~and include right-turn overlap phasing~~ or (2) contribute fair share funding for intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

MM 10-33~~37~~ *(Supplemental Traffic Study MM-32)* To provide adequate capacity at SR-14 NB Ramps and SR-138 interchange, the Project Applicant/Developer shall (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement for the reconfiguration of the interchange to include two eastbound through lanes and two westbound through lanes ~~and, in the northbound direction, add two left-turn lanes~~ and a traffic signal or (2) contribute fair share funding for intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project ~~(specific improvements pending Caltrans selection of a~~ preferred alternative~~)~~.

MM 10-34~~38~~ *(Traffic Study MM-33)* To provide adequate capacity at Lake Hughes Road at I-NB Ramps intersection, the Project Applicant/Developer shall (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding towards planned improvements to I-5 for the addition of one lane to the northbound off-ramp and restripe the configuration to include one left-turn, one shared left/right-turn lane, and one dedicated right-turn lane.

MM 10-35~~39~~ *(Traffic Study MM-35)* To provide adequate capacity at the Magic Mountain Parkway at I-5 SB Ramps intersection, the Project Applicant/Developer shall (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding towards planned improvements to I-5 for the restriping of the southbound off-ramp to provide two left-turn lanes, one shared left-turn/through lane, and one right-turn lane.

MM 10-36~~40~~ *(Traffic Study MM-36)* To provide adequate capacity at the Magic Mountain Parkway at I-5 NB Ramps intersection, the Project Applicant/Developer shall (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding towards planned improvements to I-5 for the conversion of the shared through/right-turn lane to a shared left/through/right-turn lane.

MM 10-37~~41~~ *(Traffic Study MM-37)* To provide adequate capacity at the Valencia Road at I-5 SB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding toward the striping of a third westbound through lane.

MM 10-38~~42~~ *(Traffic Study MM-38)* To provide adequate capacity at the Valencia Road at I-5 NB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding toward the traffic signal modification to add a northbound right-turn overlap phase.

MM 10-39~~43~~ *(Traffic Study MM-39)* To provide adequate capacity at the McBean Parkway at I-5 SB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding toward the restriping of the dedicated westbound right-turn lane to a shared through/right-turn lane.

MM 10-40~~44~~ *(Traffic Study MM-40)* To provide adequate capacity at the Calgrove Road at I-5 SB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding toward adding a second eastbound through lane and a de-facto right-turn lane and a second through lane in the westbound direction.

MM 10-41~~45~~ *(Traffic Study MM-41)* To provide adequate capacity at the Calgrove Road at I-5 NB Ramps intersection, the Project

Applicant/Developer shall either (1) comply with the terms of the ~~CTIP~~ Traffic Mitigation Agreement or (2) contribute fair share funding toward restriping to add a westbound de facto right-turn lane.

Since Caltrans has ~~deferred the selection of a preferred build alternative for the Northwest 138 Corridor Improvement Project and has also~~ reserved the right to determine the specific types of intersection controls at the time the improvements occur ~~and MMs 10-6 through 10-27 and MMs 10-31 through 10-35 would mitigate the Project's impacts and cumulative impacts on the SR-138~~, ~~these~~ mitigation measures related to intersection controls on SR-138 are subject to change pending Caltrans determination of the specific types of intersection controls that will be implemented ~~preferred 138 Corridor alternative~~. T~~herefore, t~~he Centennial Project will contribute its fair share and/or contribute towards the cost of the Northwest 138 Corridor Improvement Project preferred Alternative 2. ~~for the alternative ultimately selected by Caltrans and Metro.~~ Refer to the Traffic Study (Draft EIR Appendix 5.10-A) and the Supplemental Traffic Study (Final EIR Appendix 5.10-C) for additional detail on the traffic mitigation.

Under MM 10-25~~29~~, the Project is required to reduce use of automobiles by implementing PDFs and TDM measures to be administered and monitored by a Transportation Management Association. These mandatory mitigation measures require ~~the reduction of single-occupancy automobile use for~~ that a minimum of 20 percent of total peak morning and afternoon off-site commute~~s~~ trips and a minimum of 30 percent of total on-site internal trips be completed by using transit modes other than ~~20 percent, and require the reduction of~~ single occupancy automobile use ~~within the Project site by 30 percent~~. The traffic analysis above conservatively assumes full trip (i.e., single occupancy automobile) volumes on- and off-site, and thus, is conservative and actual traffic volumes from the Project are anticipated to be lower.

5.10.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION

Mitigation measures have been established to reduce the Project's significant impacts on traffic access and circulation. However, these mitigation measures call for improvements to Caltrans facilities, which are outside the control of the County of Los Angeles and the Project Applicant. Implementation of the ~~CTIP~~ Traffic Mitigation Agreement or fair share contributions by the Project Applicant in accordance with MM 10-3, MMs 10-6 through 10-24~~28~~, and MMs 10-27~~31~~ through 10-41~~45~~ will ensure that the Project provides fair share funding required to mitigate potential Project impacts. Implementation of a traffic mitigation fee program (MM 10-4) would provide a mechanism for providing fair share contributions from other projects and future activity affecting State facilities.

Response to Comment B.3-7:

This comment addresses traffic study information for SR-138.[118] This information was based on the Draft EIR/EIS for the NW SR-138 project which was circulated for public review and comment in July 2016. A Notice of Completion and Availability for the NW SR-138 Project Draft EIR was filed by the County on May 15, 2017 and the 60-day comment period began on May 17, 2017.

As noted on Draft EIR page 4-41, the NW SR-138 project Draft EIR/EIS, Transportation Analysis Report (TAR) and Intersection Control Evaluation report (ICE Report) deferred the selection of a preferred SR-138 improvement alternative until the NW SR-138 project Final EIR/EIS ("NW SR-138 FEIR") was published. In June 2017, during the comment period for the Draft EIR, Caltrans issued the NW SR-138 FEIR and identified Alternative 2 (Expressway/Highway) ("Alt 2") as the preferred alternative for the SR-138 improvements.

In July 2017 Caltrans submitted a comment letter requesting that the Project traffic analysis discuss and incorporate the Alt 2 facilities to be consistent with the NW SR-138 FEIR. In response, a Supplemental Traffic Study (STS) was prepared to incorporate Alt 2 with the Project traffic analysis. The STS is attached as Appendix 5.10-C of the Final EIR. As in the Draft EIR, the STS considers potential Project impacts under existing and future (cumulative) traffic conditions. Potential impacts are evaluated using the Highway Capacity Manual (HCM) methodology utilized in the NW SR-138 FEIR. As discussed on Draft EIR pages 5.10-2 to 5.10-5, both the Draft EIR and the NW SR-138 FEIR use the North County Sub-Area Model to evaluate traffic conditions in north Los Angeles County. The Draft EIR utilizes a more recent version of the model that was updated by Los Angeles County to reflect the Antelope Valley Area Plan (AVAP) approved by the County in June 2015. The STS also uses the traffic forecasts from the updated North County Sub-Area Model provided by the County to analyze potential Project and cumulative impacts to reflect the most current information available regarding traffic conditions in the North County region.

The Draft EIR considered potential Project impacts with improvements required to accommodate the full buildout of the Project under existing traffic plus Project buildout conditions, and cumulative traffic plus Project buildout conditions. The Draft EIR identified mitigation measures that would maintain acceptable level of service (LOS) standards at all applicable highway segments, intersections and ramps. To incorporate Alt 2 into the Draft EIR analysis, the STS considers potential Project impacts: (a) utilizing the current SR-138 facilities; (b) utilizing the Alt 2 facilities described in the NW SR-138 FEIR; and (c) utilizing the Alt 2 facilities and additional improvements to SR-138 that may be required under cumulative conditions with full Project buildout. The STS identifies certain mitigation measure clarifications required to address the design details of Alt 2 and to connect the Project internal circulation system with the Alt 2 facilities. The STS determined that the implementation of Alt 2, and additional improvements to SR-138 that may be required under cumulative conditions with full Project buildout, will not result in any new or more severe significant physical construction and operational impacts than considered in the NW 138

[118] DRP 2017, pp. 4-39 to -41; 5.10-34 to -36; 7-8 and -9

FEIR and the Draft EIR.[119] The STS also demonstrates that, using the HCM methodology, the Project will not result in any new or more severe significant impacts to applicable highway segments, intersections and ramps than considered in the Draft EIR.

The STS findings include the following:

- Under interim cumulative traffic conditions, the current SR-138 facilities would accommodate approximately 10 percent of the Project's full buildout traffic without adversely affecting applicable LOS standards.[120]
- Under existing traffic plus Project conditions, the implementation of Alt 2 would accommodate the full buildout of the Project without adversely affecting applicable LOS standards.[121]
- Under interim cumulative traffic plus Project conditions, the implementation of Alt 2 would accommodate approximately 75 percent of the Project's full buildout traffic without adversely affecting applicable LOS standards.[122]
- Under long-range cumulative traffic plus Project conditions, the implementation of Alt 2 and additional SR-138 improvements would accommodate the full buildout of the Project without adversely affecting applicable LOS standards.[123]

The STS compares the Project's potential impacts identified in the Draft EIR for Interstate-5 (I-5), SR-14 and SR-99 facilities using the volume to capacity methodology specified by the Congestion Management Plan for Los Angeles County and the Project's potential impacts using the Caltrans' recommended HCM methodology. HCM calculations were prepared for 62 locations within the Draft EIR study area consisting of freeway segments in advance of and after major system interchanges as well as representative locations between major system interchanges. The analyzed locations provide a comprehensive coverage of the Draft EIR study area because they include the freeway facilities with the greatest potential to be affected by congestion. Under existing plus Project conditions, the Draft EIR and the STS show that all applicable highway segments, intersections and ramps would operate at acceptable LOS levels.[124] Under cumulative plus Project conditions with mitigation, the Draft EIR and the STS show that almost all applicable highway segments, intersections and ramps would operate at acceptable LOS levels.[125] The STS indicates that certain study locations, such as the Grapevine grade segment of I-5, would not meet HCM-based LOS standards because topographic conditions, lane and speed controls, and other localized conditions would result in higher traffic densities. As shown in STS Table A-5, however, LOS conditions would be worse under cumulative without Project conditions, and LOS conditions improve under cumulative with Project conditions with the implementation of the Project mitigation measures.[126] Consequently, the Project does not result in a significant impact at any location

119 Final EIR Appendix 5.10-C, Sections 2.5 and 3
120 *Id.,* Appendix 5.10-C, Tables 3-3 and 3-4
121 *Id.,* Appendix 5.10-C, Tables 3-1, 3-2 and 3-9
122 *Id.,* Appendix 5.10-C, Tables 3-5 and 3-6
123 *Id.,* Appendix 5.10-C, Table 3-7, Tables 3-8 and 3-9
124 *Id.,* Appendix 5.10-C, Table 4-1
125 *Id.,* Appendix 5.10-C, Table 4-2
126 *Id.,* Appendix 5.10-C, Section 5

that does not meet HCM-based LOS standards under cumulative with Project conditions with mitigation.

As discussed above, the Draft EIR considered improvements to SR-138 that would be required to accommodate the full buildout of the Project under cumulative traffic conditions. The implementation of Alt 2 would accommodate approximately 75 percent of the Project's full buildout traffic under interim cumulative conditions, and additional improvements consistent with the SR-138 facilities considered in the Draft EIR would be required to accommodate all of the Project's full buildout traffic under long-range cumulative conditions. The NW SR-138 FEIR also clarified certain aspects of the SR-138 design details that would be implemented with Alt 2, including the number and locations of intersections along SR-138 from I-5 to SR-14. The NW SR-138 FEIR addressed several types of intersection configurations for each location but defers selection of the final configurations to the SR-138 design phase. Subject to minor adjustments for consistency with these Alt 2 design details, the SR-138 facilities that would result from the additional improvements to Alt 2 required for full Project buildout under long-range cumulative conditions as described in the STS are substantially similar to the full buildout SR-138 facilities discussed in the Draft EIR. The STS provides a summary of SR-138 improvements in the context of the implementation of Alt 2, including the following:

- To connect the Project circulation system to the Alt 2 facilities, an additional intersection and certain intersection upgrades, such as additional lanes, will be constructed at locations where SR-138 borders the Specific Plan boundary.[127]
- The implementation of Alt 2, including minor modifications in certain intersection locations within the Specific Plan area to accommodate the Alt 2 design details, that accommodate approximately 75 percent of the Project's full buildout traffic under interim cumulative traffic conditions.[128]
- SR-138 improvements in addition to Alt 2 that would be required to accommodate all of the Project's buildout traffic under the long-range cumulative traffic conditions projected in the Draft EIR and STS.[129]

As discussed in the STS,[130] the Project's mitigation measures have been clarified to reflect the implementation of these improvements with Alt 2. As required by MMs 10-3 and 10-4, the Project will contribute fair share funding or provide funding for SR-138 improvements in accordance with a mitigation agreement with Caltrans for the implementation of Alt 2, improvements required to connect the Project circulation system with the Alt 2 facilities, and, if confirmed in traffic studies submitted in conjunction with the review and approval process for future Project tract maps, additional SR-138 improvements that may be required to accommodate full Project buildout under cumulative traffic conditions. As a result, the STS

127 *Id.,* Appendix 5.10-C, Sections 2.2 and 2.3
128 *Id.,* Appendix 5.10-C, Section 2.1
129 *Id.,* Appendix 5.10-C, Section 2.4
130 *Id.,* Appendix 5.10-C, Section 5

prepared in response to Caltrans comments incorporates the SR-138 improvements and identified in the NW SR-138 FEIR with the Draft EIR traffic analysis.

Response to Comment B.3-8:

This comment addresses intersection evaluations for the Project along SR-138. As noted on Draft EIR page 4-41, the NW SR-138 project Draft EIR/EIS, Transportation Analysis Report (TAR) and Intersection Control Evaluation report (ICE Report) deferred the selection of a preferred SR-138 improvement alternative until the NW SR-138 project Final EIR/EIS ("NW SR-138 FEIR") was published. In June 2017, during the comment period for the Draft EIR, Caltrans issued the NW SR-138 FEIR and identified Alternative 2 (Expressway/Highway) ("Alt 2") as the preferred alternative for the SR-138 improvements. Alt 2 includes a six-lane divided freeway between I-5 and Gorman Post Road, constructing a six-lane divided expressway between Gorman Post Road and 300th Street West, constructing a four-lane divided expressway between 300th Street West and 240th Street West, and constructing a four-lane conventional highway between 240th Street West and SR-14. The NW SR-138 FEIR also clarified certain aspects of the SR-138 design details that would be implemented with Alt 2, including the number and locations of intersections along SR-138 from I-5 to SR-14. The NW SR-138 FEIR addressed several types of intersection configurations for each location but defers selection of the final configurations to the SR-138 design phase.

In July 2017 Caltrans submitted a comment letter on the Draft EIR requesting that the Project traffic analysis discuss and incorporate the Alt 2 facilities to be consistent with the NW SR-138 FEIR. In response, a Supplemental Traffic Study (STS) was prepared to incorporate Alt 2 with the Project traffic analysis. The STS is attached as Appendix 5.10-C of the Final EIR. The STS determined that:

- Under interim cumulative traffic conditions, the current SR-138 facilities would accommodate approximately 10 percent of the Project's full buildout traffic without adversely affecting applicable LOS standards.[131]
- Under existing traffic plus Project conditions, the implementation of Alt 2 would accommodate the full buildout of the Project without adversely affecting applicable LOS standards.[132]
- Under interim cumulative traffic plus Project conditions, the implementation of Alt 2 would accommodate approximately 75 percent of the Project's full buildout traffic without adversely affecting applicable LOS standards.[133]
- Under long-range cumulative traffic plus Project conditions, the implementation of Alt 2 and additional SR-138 improvements would accommodate the full buildout of the Project without adversely affecting applicable LOS standards.[134]

131 *Id.,* Appendix 5.10-C, Tables 3-3 and 3-4
132 *Id.,* Appendix 5.10-C, Tables 3-1, 3-2, and 3-9
133 *Id.,* Appendix 5.10-C, Tables 3-5 and 3-6
134 *Id.,* Appendix 5.10-C, Tables 3-7 through 3-9

The STS provides a summary of SR-138 improvements in the context of the implementation of Alt 2, including intersection improvements required to connect the Project circulation system with SR-138, and other intersection improvements that may be required if projected long-range cumulative conditions are verified in subsequent traffic studies conducted in future Project tract map applications.[135]

The intersection improvements required to connect the Project circulation system with SR-138 include the following: (a) at the Cement Plant (Private) Road (West Project Access) intersection, add a third eastbound left-turn lane, add a second westbound left-turn lane, add a second northbound left-turn lane, add a second northbound through lane, add one northbound right-turn lane, add a second southbound left-turn lane, add a second southbound through lane, and add two southbound right-turn lanes; (b) at the Project Central Access Road (Centennial Town Center) intersection, provide a new intersection to include two eastbound left-turn lanes, three eastbound through lanes, one eastbound right-turn lane, two westbound left-turn lanes, three westbound through lanes, two westbound right-turn lanes, two northbound left-turn lanes, three northbound through lanes, one northbound right-turn lane, two southbound left-turn lanes, three southbound through lanes, and one southbound right-turn lane, and maintain right of way for the addition of a fourth eastbound and a fourth westbound through lane (½ mile total) if needed for cumulative traffic; and (c) at the 300th Street West Intersection, add a second westbound left-turn lane, add a second northbound left-turn lane, add a second northbound through lane, add one northbound right-turn lane, add two southbound left-turn lanes, and add a second southbound through lane.[136]

To accommodate full Project buildout and long-range cumulative traffic on SR-138, additional enhancements may be required at the West Project Access, Central Access Road, 300th Street West, Margalo Drive, Three Points Road, 250th Street West and 60th Street West intersections.[137] The need for any of these improvements will be evaluated in the traffic studies required for each Project tract map application in accordance with the MMRP for the Project.[138]

As discussed in the STS[139] all of the Project connection intersection improvements and potential intersection enhancements under long-range cumulative conditions would occur within the right-of-way footprint of Alternative 2 evaluated in the NW SR-138 FEIR and within the Project development footprint evaluated in the Draft EIR and will not result in any new or more severe significant physical construction and operational impacts than considered in the NW SR-138 FEIR and the Draft EIR.[140] All Project-related intersection improvements to SR-138 will be coordinated with Caltrans, including evaluating under applicable intersection control evaluation policies. As discussed in the STS[141] the Project's mitigation measures have been clarified to reflect the implementation of these

135 *Id.,* Appendix 2.0-C.Rev, MMRP
136 *Id.,* Appendix 5.10-C, Sections 2.2 and 2.3
137 *Id.,* Appendix 5.10-C, Section 2-4
138 *Id.,* Appendix 2.0-C.Rev
139 *Id.,* Appendix 5.10-C, Section 2.5
140 *Id.,* Appendix 5.10-C, Sections 2.5 and 3
141 *Id.,* Appendix 5.10-C, Section 5

improvements with Alt 2. As required by MMs 10-3 and 10-4, the Project will contribute fair share funding or provide funding for SR-138 improvements in accordance with a mitigation agreement with Caltrans for the implementation of Alt 2, improvements required to connect the Project circulation system with the Alt 2 facilities, and, if confirmed in traffic studies submitted in conjunction with the review and approval process for future Project tract maps, additional SR-138 improvements that may be required to accommodate full Project buildout under cumulative traffic conditions.

Response to Comment B.3-9:

This comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. As discussed in Draft EIR Section 5.10, Traffic, Access, and Circulation, the Project Applicant intends to implement and fund State transportation facility mitigation measures through the proposed Traffic Mitigation Agreement, which would provide funding contributions, phasing, guarantees of payments, and collection of third-party contributions for required SR-138 mitigation. Alternatively, the Project will pay a fair share contribution towards the construction of transportation facilities that will mitigate for potential Project impacts. More specifically, as discussed on Draft EIR page 5.10-91, and in the Supplemental Traffic Study (STS) prepared to incorporate the identification of preferred Alternative 2 in the Northwest State Route 138 Corridor Improvement project Final EIR/EIS with the Project traffic analysis, MMs 10-3 and 10-4 require the Project Applicant to seek to enter into a Traffic Mitigation Agreement and transportation mitigation fee program that would fully mitigate for all impacts to SR-138 highway segments under cumulative plus Project conditions or to contribute fair share funding for the required improvements.

The STS is attached as Appendix 5.10-C of the Final EIR. The STS determined that:

- Under interim cumulative traffic conditions, the current SR-138 facilities would accommodate approximately 10 percent of the Project's full buildout traffic without adversely affecting applicable LOS standards.[142]
- Under existing traffic plus Project conditions, the implementation of Alt 2 would accommodate the full buildout of the Project without adversely affecting applicable LOS standards.[143]
- Under interim cumulative traffic plus Project conditions, the implementation of Alt 2 would accommodate approximately 75 percent of the Project's full buildout traffic without adversely affecting applicable LOS standards.[144]
- Under long-range cumulative traffic plus Project conditions, the implementation of Alt 2 and additional SR-138 improvements would accommodate the full buildout of the Project without adversely affecting applicable LOS standards.[145]

142 *Id.,* Appendix 5.10-C, Tables 3-3 and 3-4
143 *Id.,* Appendix 5.10-C, Tables 3-1, 3-2 and 3-9
144 *Id.,* Appendix 5.10-C, Tables 3-5 and 3-6
145 *Id.,* Appendix 5.10-C, Table 3-7, Tables 3-8 and 3-9

The STS provides a summary of SR-138 improvements in the context of the implementation of Alt 2, including the following:

- To connect the Project circulation system to the Alt 2 facilities, an additional intersection and certain intersection upgrades, such as additional lanes, will be constructed at locations where SR-138 borders the Specific Plan boundary.[146]
- The implementation of Alt 2, including minor modifications in certain intersection locations within the Specific Plan area to accommodate the Alt 2 design details, that accommodate approximately 75 percent of the Project's full buildout traffic under interim cumulative traffic conditions.[147]
- SR-138 improvements in addition to Alt 2 that would be required to accommodate all of the Project's buildout traffic under the long-range cumulative traffic conditions projected in the Draft EIR and STS.[148]

The Project mitigation measures have been updated to reflect the incorporation of SR-138 Alternative 2 with the Project traffic analysis and the improvements described in the STS.[149] MMs 10-6 through 10-18, MM 10-20, and MMs 10-28 through 10-33 require fair share funding mitigation for impacts to SR-138 segments, intersections and ramps. MM 10-20 requires that the Project dedicate right-of-way along the segment of the SR-138 that runs adjacent to the Project site to ensure that sufficient land is reserved for future rights-of-way that would be used to widen and realign SR-138 at these locations. Compliance with these mitigation measures or the fair share contributions towards the improvements described above would reduce the potential cumulative plus Project impacts to SR-138 highway segments identified to less than significant levels.

Response to Comment B.3-10:

The comment is noted for the record and will be provided to the Regional Planning Commission and the Board of Supervisors for consideration. No further response is required given that the comment does not raise a specific concern regarding the content of the Draft EIR.

Response to Comment B.3-11:

This comment provides the Commenter's contact information. The comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. No further response is required given that the comment does not raise a specific concern regarding the content of the Draft EIR.

Subject: Draft Environmental Impact Report (DEIR) and Centennial Specific Plan (CSP) for the Centennial Project (State Clearinghouse number 2004031072).

Dear Mr. Sackett:

The California Department of Fish and Wildlife (CDFW) has reviewed the DEIR and CSP submitted by Los Angeles County (Lead Agency) for the proposed Centennial Project (Project). The Project is located approximately 35 miles north of the City of Santa Clarita in Los Angeles County; approximately 50 miles south of the City of Bakersfield in Kern County; and approximately 36 and 43 miles west of the Cities of Lancaster and Palmdale, respectively, in Los Angeles County. State Route 138 (SR 138) bisects the southern portion of the Project site in an east-west orientation, just south of the Kern County/Los Angeles County boundary in the immediate vicinity of Quail Lake. The California Aqueduct splits into a west and east branch just to the north of the Project site. The west branch of the California Aqueduct continues south bisecting the western portion of the Project site. The east branch of the California Aqueduct continues in an easterly direction and borders the Project site to the north. B.4-1

The proposed Project includes the development of a new community with residential, commercial, business, recreational/entertainment, and institutional/civic uses. The Project site is comprised of approximately 12,323 acres and would allow up to 19,333 dwelling units on approximately 4,987 acres. Other land uses include approximately 7,363,818 square feet (sf) of business park uses (office, research and development, warehouse and light manufacturing) on approximately 597 acres and approximately 1,034,550 sf of commercial uses on approximately 102 acres. Proposed institutional/civic uses (schools, medical facilities, libraries, etc.) encompass approximately 1,568,160 sf on approximately 110 acres. In addition, the Project will provide parks, public and private recreational amenities, schools, public services, helipads, transit centers, and water and waste water treatment facilities. Proposed land uses will allow for the development of new oil and gas wells and extraction facilities, including surface mining; the development of new renewable energy resources, including solar, wind and other renewable energy generation facilities; shooting ranges; and hunting, camping and hiking activities. B.4-2

There are several drainages on the Project site, including drainages within Oso Canyon and Tentrock Canyon, and an unnamed drainage that parallels SR 138 on its north side. Portions of the Project site will be left as open space, primarily within Significant Ecological Area (SEA) 17, which is located along the northwestern and southeastern edges of the Project site, and within the creeks and drainages that will not be filled, as well as drainage features that will be

recreated after Project development. Primary access to the Project site will be from SR 138, with additional access available from 300th Street West and 290th Street West and the relocated National Cement Plant Road. Upgrades to SR 138 and Interstate 5 (I5) are planned through a separate California Department of Transportation (Caltrans) development project to accommodate increasing traffic usage of the aforementioned roadways. Offsite facilities are also proposed as a part of the Project to accommodate the new infrastructure to serve the Project site. Current land use on the Project site predominantly consists of annual grassland grazing with agriculture production occurring along the eastern edge of the Project site. B.4-2 cont.

The Project area and the surrounding Tejon Ranch lands are one of the largest, most-intact, privately-held, natural habitat areas remaining in California, and support a diverse assemblage of vegetation communities and special status species. Vegetation communities known to occur on the Project site include, but are not limited to, Wright's buckwheat scrub, mixed oak woodland, alluvial scrub, cottonwood woodland, riparian herb, rush riparian grassland, southern arroyo willow riparian, southern cottonwood-willow woodland, southern willow scrub, valley oak riparian woodland, unvegetated wash, willow riparian forest, willow riparian woodland, alkali meadow, Baltic rush, coastal and valley freshwater marsh, seeps and ephemeral ponds, and native perennial grasslands, wildflower fields, and native and nonnative annual grasslands.

Special status species known to occur on or within the vicinity of the Project site include but are not limited to, the State and federally endangered and State fully protected California condor (*Gymnogyps californianus*); State and federally endangered least Bell's vireo (*Vireo bellii pusillus*) and southwestern willow flycatcher (*Empidonax traillii extimus*); State endangered tricolored blackbird (*Agelaius tricolor*) and western yellow-billed cuckoo (*Coccyzus americanus occidentalis*); State threatened Swainson's hawk (*Buteo swainsoni,* SWHA) and Tehachapi slender salamander (*Batrachoseps stebbinsi*); State fully protected golden eagle (*Aquila chrysaetos*), and white-tailed kite (*Elanus leucurus*); California Rare Plant Rank (CRPR) 1B.1 Piute Mountains navarretia (*Navarretia setiloba*); CRPR 1B.2 round-leaved filaree (*California macrophyllum*) and State Species of Special Concern burrowing owl (*Athene cunicularia,* BUOW), silvery legless lizard (*Anniella pulchra pulchra*), coast horned lizard (*Phrynosoma blainvillii*), two-striped garter snake (*Thamnophis hammondii*), northern harrier (*Circus cyaneus*), American badger (*Taxidea taxus*) and Tehachapi pocket mouse (*Perognathus alticolus inexpectatus*). The Project site is also one of the largest remaining perennial and annual grassland habitat areas in Los Angeles County. The Project as proposed would result in a cumulatively significant impact to native perennial grasslands and regional wildlife movement. B.4-3

Our specific comments follow and are organized in the same sequence as the sections in the DEIR. B.4-4

Department Jurisdiction

Trustee Agency Authority: CDFW is a Trustee Agency with the responsibility under the California Environmental Quality Act (CEQA) for commenting on projects that could impact plant, fish and wildlife resources. Pursuant to Fish and Game Code Section 1802, CDFW has jurisdiction over the conservation, protection and management of fish, wildlife, native plants and habitat necessary for biologically sustainable populations of those species. As a Trustee Agency for plant, fish and wildlife resources, CDFW is responsible for providing, as available, B.4-5

biological expertise to review and comment on environmental documents and impacts arising from project activities, as those terms are used under CEQA.

Responsible Agency Authority: CDFW has regulatory authority over projects that could result in "take" of any species listed or is a candidate for listing by the State (State-listed) as threatened or endangered, pursuant to the California Endangered Species Act (CESA). For this or any other project which impacts listed species, an incidental take permit (ITP) is the mechanism for providing take authorization under CESA. CEQA requires a Mandatory Finding of Significance if a project is likely to substantially impact threatened or endangered species (sections 21001{c}, 21083, Guidelines sections 15380, 15064, 15065). Impacts must be avoided or mitigated to less than significant levels unless the CEQA Lead Agency makes and supports a Statement of Overriding Consideration (SOC). A CEQA Lead Agency's SOC would not preclude the Project proponent's obligation to comply with CESA.

Lake and Streambed Alteration Notification: CDFW has regulatory authority with regard to activities occurring in streams and/or lakes that could adversely affect any fish or wildlife resource, pursuant to Fish and Game Code sections 1600 *et seq*. Section 1602(a) of the Fish and Game Code requires an entity to notify CDFW before engaging in activities that would substantially change the bed, channel, or bank of a stream or substantially divert or obstruct the natural flow of a stream. Project activities are proposed that will involve work within the bed, bank, or channel (which may include associated riparian resources) of several CDFW jurisdictional resources; therefore, CDFW recommends the Project applicant submit a Lake and Streambed Alteration Notification to CDFW for the Project.

Other Rare Species: Species of plants and animals need not be listed as Endangered, Rare or Threatened (E, R or T) pursuant to CESA and/or the Federal Endangered Species Act (ESA) to be considered E, R or T under CEQA. If a species can be shown to meet the criteria for a listing as E, R or T under CESA and/or ESA as specified in the CEQA Guidelines (California Code of Regulations [CCR], Title 14, Chapter 3, Section 15380), it should be fully considered in the environmental analysis for the Project.

Fully Protected Species: CDFW has jurisdiction over fully protected species of birds, mammals, amphibians, reptiles, and fish, pursuant to Fish and Game Code sections 3511, 4700, 5050, and 5515. Take of any fully protected species is prohibited, and CDFW cannot authorize their take except under the provisions of a Natural Communities Conservation Plan (NCCP), 2081.7 or a Memorandum of Understanding for scientific purposes. Neither the Lead Agency nor Project proponent are plan participants of an NCCP; 2081.7 does not apply to the proposed Project, and a development project is not considered a scientific purpose.

Several fully protected species are known to occur on the Project site. This status, and the absence of an NCCP for the Project, precludes CDFW from authorizing any amount of incidental take for fully protected species. When projects show the potential to cause take of fully protected species, we advise on appropriate measures to avoid take. Given the legal status of fully protected animals, take avoidance measures must meet very high standards of effectiveness, substantially greater than the measures to minimize take required under ITPs.

Bird Protection: CDFW has jurisdiction over actions that may result in the disturbance or destruction of active nest sites or the unauthorized take of birds. Sections of the Fish and

B.4-5 cont.

Game Code that protect birds, their eggs and nests include sections 3503 (regarding unlawful take, possession or needless destruction of the nest or eggs of any bird), 3503.5 (regarding the take, possession or destruction of any birds-of-prey or their nests or eggs), and 3513 (regarding unlawful take of any migratory nongame bird). B.4-5 cont.

Potential Impacts and Recommendations

Draft Environmental Impact Report:

Project Description (Section 4.0): Exhibit 4-7 in the DEIR shows that the current Cement Plant Road will be upgraded from the current 2-lane road to a 6-lane major highway. The northern portion of Cement Plant Road is located in the northern portion of the SEA. The DEIR states that the SEA will not be impacted. No dimensions are provided as to the current and proposed upgraded footprint (including width) of Cement Plant Road so it is unclear to CDFW if the current footprint of Cement Plant Road is wide enough to support an upgrade to a 6-lane major highway without impacting the SEA. B.4-6

The DEIR states that the cable and internet provider has not been identified at this point in time, but would be provided by one of the two available providers within the Project area. Depending on the provider chosen, the new cable and internet line may be extended either 4 or 8 miles from its existing location to reach the Project site. The Biological Resources section of the DEIR did not address the potential routes of the telecom line extension, nor conduct biological surveys to identify potential impacts to species that may result from the installation of the telecom line extension. CDFW recommends the DEIR be revised to include survey results and a biological analysis of potential impacts from the installation of the telecom line. B.4-7

CDFW also recommends that all new and existing dry utilities be installed underground to minimize impacts to migratory birds, including California condor. B.4-8

Hydrology and Flood (Section 5.2): The Hydrology and Flood Section of the DEIR discloses that existing onsite drainages will be integrated into the Project's storm drain system. Integration activities include removal, reengineering, and reduction of drainage areas due to diversion and re-route of Project runoff. Channels within the Project site will be avoided, integrated into the storm drain system or be reengineered after site grading. Most Project runoff will be subject to control and treatment in a regional system that consists of 28 detention and retention basins located throughout the Project site, with 11 of these basins occurring within or adjacent to a channel (Exhibit 5.2-4 and 5.2-5). In addition to capturing Project site runoff, onsite basins and reengineered natural streams will also be designed to capture potential mudflows and may be revegetated or enhanced with drought tolerant and native species, some of which do not currently exist on the Project site. B.4-9

The aforementioned modifications to the drainages and channels on the Project site are a substantial change in the biological function and composition of these features and may result in adverse impacts to CDFW jurisdictional areas (e.g., streams), wildlife and special status species and their associated habitats, as well as additional offsite resources, and would require acquisition of a lake and streambed alteration agreement from CDFW pursuant to Fish and Game Code Section 1600 et seq. CDFW recommends the DEIR be revised to include a detailed analysis of the biological impacts of these modifications, including increased pollutant,

chemical, and fertilizer loads in jurisdictional areas from site runoff, changes in species composition and habitat use from revegetation and reengineering of jurisdictional features, in-channel hydromodification measures (plunge pools, bank stabilization, flow diversion, culverts, etc.) and increased sediment deposit. B.4-9 cont.

The Hydrology and Flood Section of the DEIR also states that the Project will conform to the County's flood and hydrology control standards (during a 50-year design storm event) by either reducing offsite flows and volumes or by maintaining existing site conditions. According to Table 5.2-7 in the DEIR, existing offsite flow conditions will only remain unchanged in the Gorman Watershed. All other watersheds will have a reduction in existing offsite flow/volume conditions. CDFW recommends the DEIR be revised to include an analysis of the biological impacts of a reduction in offsite flow/volume and include a discussion as to whether offsite flows will exit the Project site in the same location as pre-Project conditions in order to maintain offsite connectivity and existing offsite biological resources. In addition, CDFW is unclear if these basins will also be used for recreational or multi-use purposes. The DEIR discusses a potential fishing lake in Section 4.5.6 (Parks/Recreation); however, additional details such as, but not limited to, the location, size, fish species stocked, vegetation, fencing, and any additional recreational uses are not described in the Biological Resources section of the DEIR. Since fishing lakes may serve as a point source for introduced and/or invasive species, CDFW recommends the DEIR be revised to further describe and analyze the potential siting of lakes, ponds, and other perennial waterbodies and their locations. The impacts of these features need to be fully described, disclosed, and analyzed in the Biological Resources Section of the DEIR. These impacts include, but are not limited to the introduction of sport fish, the potential for introduction of invasive species from the general public (such as non-native fish, amphibians, and reptiles), the impacts of these introductions on native species within and adjacent to the Project site, and specific measures to reduce these impacts to less than significant. B.4-10

Hazards and Fire Safety (Section 5.3): An abandoned mine shaft, approximately four feet high by five feet wide (at the entrance), and partially blocked by soil, extends approximately eight feet into the side of a hill near Quail Lake. In order to eliminate potential risks and prevent future access into the abandoned mine, the DEIR proposes to permanently close the mine. However, the DEIR does not provide any information on any potential wildlife species that may be using the mine, nor does it provide information on any surveys that have been done to monitor wildlife species' potential use of the mine. Abandoned mines are known to provide habitat for a variety of wildlife species, including, but not limited to, maternity and/or roosting habitat for bat species. CDFW recommends the Project Applicant conduct focused bat and wildlife surveys, over the course of one year (to account for seasonal use), to determine potential species' use of the mine. CDFW further recommends this section, as well as the Biological Resources section, of the DEIR be revised to include the results of these surveys, an analysis of the impacts to special status species from the potential closure of the mine, and specific measures to avoid, minimize, and mitigate these impacts. B.4-11

Mitigation Measure 3-2 of the Hazards and Fire Safety section of the DEIR requires the access way into the Project site be paved or treated with environmentally safe dust-control agents (i.e., dust palliatives). The DEIR also allows for the use of these dust-control agents in other areas of the Project site. The location, extent of use, and environmental safety of these dust-control agents has not been described in the DEIR, nor have they been analyzed in regards to potential special status species and habitat impacts in the Biological Resources B.4-12

section of the DEIR. The use of dust control agents and paved access roads may impact special status species and their associated habitats (e.g., changes in soil moisture infiltration rates, obstruction of movement pathways, increased salt concentrations from dust control agents, etc.) and this is not discussed in the DEIR. Therefore, CDFW recommends the Biological Resources section of the DEIR be revised to include and further describe these activities and their locations; fully analyze the potential impacts of dust control agents on biological resources, and the specific measures to avoid, minimize and fully mitigate these impacts. . B.4-12 cont.

Mitigation Measure 3-9 of the Hazards and Fire Safety section of the DEIR requires the future development of a Fuel Modification Plan. This Plan will described the extent and location of the fuel modification zone, clearance area, plant pallet and planting locations. The deferred development of this Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of this Plan is not required. CDFW recommends the DEIR be revised to include the Fuel Modification Plan for CDFW review. B.4-13

Water Quality (Section 5.4): The Water Quality section of the DEIR states that the Lahontan Regional Water Quality Control Board (RWQCB) and the Los Angeles RWQCB have issued permits for the Project governing construction-related dewatering and discharge operations. The Lahontan RWQCB permit regulates construction dewatering, diverted stream flows, dredge spoils dewatering and subterranean seepage dewatering among other activities. The Los Angeles RWQCB permit regulates construction-related dewatering discharges, and addresses discharges from temporary dewatering operations associated with construction and permanent dewatering operations associated with development. The location, extent of dewatering and discharges, and environmental impacts from these activities have not been described in the DEIR, nor have they been analyzed in regards to potential special status species and habitat impacts. Since these actions may impact special status species and their associated habitats and requires the submission of a Lake and Streambed Alteration Notification to CDFW for these activities, CDFW recommends the Biological Resources section of the DEIR be revised to further describe and analyze these potential activities and related biological impacts. B.4-14

Project Design Feature (PDF) 4-2 in the Water Quality section of the DEIR describes the development of an Integrated Pest Management (IPM) and landscaping best management practices (BMP) that will be confirmed in a Landscaping Plan submitted to the County during the review and approval process for each tract map application. The Plan and BMPs will be consistent with Section 3.3 of the CSP. However, the CSP only provides a guideline to the development of the Plan and BMPs and is subject to change, and therefore, may not be incorporated into the Plan and BMPs. In addition, the DEIR does not include these guidelines as Mitigation Measures and therefore they are not enforceable. The deferred development of the BMPs and Landscaping Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of the Plan and BMPs are not required. In addition, the guidelines in the CSP are not included as Mitigation Measures in the DEIR, are not enforceable, and are subject to change during each tract map application. CDFW recommends the DEIR be revised to include the IPM BMPs, the landscaping BMPs, and the Landscaping Plan for CDFW review and comment. B.4-15

CDFW also recommends the IPM prohibit the use of all rodenticides containing anticoagulants or other toxins that may result in secondary poisoning in non-target wildlife. This prohibition needs to be implemented via notification to homebuyers through their home purchase contracts and CC&Rs and as part of the larger natural area maintenance plan for the Project. If use of rodenticides that may result in secondary poisoning in non-target wildlife cannot feasibly be prohibited from use on the Project site, CDFW recommends regular monitoring of blood samples drawn from predator species on the Project site and within adjacent Tejon Ranch lands to document any indication of secondary toxicity health concerns. An adaptive management plan that includes: measures to remedy secondary toxicity problems, further enforcement, public awareness efforts, capture and treatment of infected wildlife with vitamin K supplements as directed by a veterinarian, and an established baseline for representative predator species in the Project area before Project related rodenticide pest control measures are likely to occur. All of these activities need to be incorporated into a Project resource management plan, included in the DEIR as a Mitigation Measure, and funded by the Project Applicant for the life of the Project. CDFW further recommends the DEIR be revised to include a Mitigation Measure for the above recommendations related to the IPM and BMP. B.4-16

Land Resources (Section 5.5): PDF 5-1 in the Land Resources section states that grazing operations on portions of the Open Space preserve areas will be continued as a management tool for grassland conservation, subject to the specifications of the Native Perennial Grassland and Wildflower Field Mitigation Plan to be prepared as part of Project implementation. Several PDFs in the DEIR are not included as Mitigation Measures in the DEIR and are therefore not enforceable. PDF 5-1 is one of these measures. The lack of enforceability and the delayed development of this plan, which may have a significant role in potentially protecting and reducing impacts to several important biological resources on the site, does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of this plan is not required. CDFW recommends the DEIR be revised to include the Native Perennial Grassland and Wildflower Field Mitigation Plan for CDFW review and comment and the DEIR be further revised to incorporate all PDFs as enforceable Mitigation Measures. B.4-17

Biological Resources (Section 5.7):

Tricolored Blackbird: Tricolored blackbird (TCBB) is a State endangered species. Breeding colonies of tricolored blackbird occur at Quail Lake and at a pond on the north central portion of the Project site. Oso Creek also provides additional onsite habitat for this species. In addition to breeding habitat, the Project site also provides foraging habitat for this species. The DEIR proposes a no-disturbance buffer of 400 feet for permanent impacts and the allowance of temporary impacts within 400 feet during non-breeding season for the Oso Creek TCBB colonies. A no-disturbance buffer is not identified in the DEIR for the TCBB colony at the pond location. The ecological rationale for instituting this size buffer is not discussed or supported by the reproductive, foraging, and habitat needs for all life stages of the species. Foraging habitat adjacent to and available in close proximity to nesting sites must be sufficient in size to support a robust population of insects and seed to sustain the colony year after year and preclude edge effects from the development to cause degradation of both nesting and foraging habitat. The invasion of rats, feral dogs and cats, pesticide use impacts on insect prey species and poisoning from development encroachment in close proximity to the breeding colonies needs to be fully B.4-18

analyzed and subsequently utilized to inform and quantify all no-disturbance buffers in the DEIR. B.4-18 cont.

CDFW does not concur that the no-disturbance buffers currently proposed in the DEIR are sufficient to fully avoid and preclude take (as defined under Section 86 of Fish and Game Code) of TCBB. Therefore, CDFW is recommending consultation and acquisition of an ITP pursuant to Fish and Game Code Section 2081 in advance of Project implementation. B.4-19

California Condor: "Based upon the pre-historic range of the California condor and that of pronghorn antelope and other ungulates, the proximity of the Antelope Valley to the Tehachapi and San Gabriel Mountains probably meant that the west end of the Antelope Valley floor (including Centennial) was used for foraging by condors at least on an infrequent basis (Bloom 2009: DEIR Appendix)." Increasingly, condors are expanding their current flight paths to include more frequent flights over the west end of the Antelope Valley floor, including the Project site. United States Fish and Wildlife Service (USFWS) telemetry data has also documented an occurrence of a condor landing (possibly to feed on a carcass) on the Project site. In addition, condors released from captive breeding programs appear to be more curious and adaptive to human presence than those that were in the wild prior to 1987 (when the last condor was captured for captive breeding) (Bloom 2009: DEIR Appendix). "The presence of human structures, pets, and livestock can actually serve as an attractant to condors, particularly along the development/Open Space interface" (Bloom 2009: DEIR Appendix). B.4-20

CDFW disagrees with the DEIR's conclusion that Project implementation is not expected to result in impacts to California condor due to "condor not occupying the low valley floor areas that are likely to incur the greatest level of disturbance from future development". Specifically, the *Environmental Assessment of the Centennial Specific Plan Project Site on the California Condor (Gymnogyps californianus),* included as an appendix to the DEIR, determines that the Project site will result in direct impacts to condors in the loss of potential foraging habitat and indirect impacts to condors through increased human and domestic animal use of the Project site and within the Project vicinity (Bloom 2009: DEIR Appendix). CDFW recommends that the Measures to Avoid, Minimize, Mitigate Potential Impacts and the Measures to Contribute to the Conservation and Recovery of the Condor, within the *Environmental Assessment of the Centennial Specific Plan Project Site on the California Condor (Gymnogyps californianus)* be incorporated as Mitigation Measures into a revised DEIR; including the aforementioned measures related to microtrash, illegal shooting, and global positioning system (GPS) tracking. B.4-21

CDFW also disagrees with the DEIR's conclusion that the Tehachapi Uplands Multiple Species Habitat Conservation Plan (TUMSHCP) will provide for the long-term preservation of essential condor areas that would offset potential impacts from the Project. Projects impacts were not contemplated under the TUMSHCP and therefore, mitigation lands that have been preserved under the TUMSHCP to offset impacts to condor cannot be considered in the DEIR as additional available habitat that would aid in offsetting Project impacts. Similarly, the Ranchwide Agreement requires permanent protection of 178,000 acres within 30 years of receiving the first development entitlement, which was conferred to Tejon Mountain Village in 2009. The conservation of a portion of these mitigation lands is dependent on development milestones of Tejon Mountain Village and should not be considered as additional available adjacent habitat that may aid in offsetting Project impacts when to date, no lands have been conserved other than the 62,000 acres purchased by the State in 2010, and it is unknown when additional future B.4-22

conservation will occur. Therefore, CDFW does not agree that impacts to habitat and some species, including the California condor, by the Project will be mitigated to less than significant because of their ability to use habitat lands included in the Ranchwide Agreement and the TUMSHCP. Moreover, the Ranchwide Agreement will allow some activities (e.g., hunting, filming, recreational use, etc.) that may be incompatible with species protection and recovery. In addition, the ability for the Project to develop energy production measures (e.g., solar and wind facilities, etc.) within the Open Space mitigation lands further reduces the quality of the proposed onsite mitigation lands and may have detrimental impacts on several special status species, including but not limited to, California condor. B.4-22 cont.

As described above, California condor is a State and federal endangered and State fully protected species. The avoidance buffers listed in Mitigation Measure 7-6 for California condor are not sufficient to ensure full avoidance of this species. CDFW recommends the Project Applicant consult with CDFW and USFWS to determined appropriate avoidance buffers for California condors and these measures be included in a revised DEIR. B.4-23

Burrowing Owl: BUOWs are known to occur on and adjacent to the Project site. CDFW recommends the Lead Agency require the *Staff Report on Burrowing Owl Mitigation* (dated March 7, 2012), be followed in its entirety and without modification, including the listed no-disturbance buffers, mitigation and relocation recommendations and that these measures be added to the DEIR as enforceable conditions. The staff report can be found on our website at www.dfg.ca.gov/wildlife/nongame/docs/BUOWStaffReport.pdf. CDFW recommends that a qualified biologist conduct a survey no more than 30 days before the onset of any Project activities in each construction area. If Project activities are delayed or suspended for more than 30 days, the area should be resurveyed. B.4-24

As outlined in the *Staff Report on Burrowing Owl Mitigation* (CDFG 2012), burrow exclusion in and of itself will not always avoid or minimize and mitigate BUOW impacts to less than significant levels, and eviction of BUOWs is a potentially significant impact under CEQA. When temporary or permanent burrow exclusion and/or burrow closure is implemented, BUOWs should not be excluded from burrows unless or until: B.4-25

1. A BUOW Exclusion Plan is developed and approved by the Lead Agency and CDFW;
2. Permanent loss of occupied burrow(s) and habitat and temporary exclusion is mitigated;
3. Site monitoring is conducted prior to, during and after exclusion of BUOWs from their burrows sufficient to ensure take is avoided; and
4. Excluded BUOWs are documented using artificial or natural burrows on an adjoining mitigation site.

Swainson's Hawk: SWHAs are known to occur on the Project site in a non-nesting capacity (DEIR 2017) and may nest on the Project site in the future. Because of the known site fidelity (repeated use of the same nest site annually) demonstrated by SWHA, CDFW considers any documented SWHA nest to be active unless it is demonstrated by protocol-level surveys B.4-26

conducted during the nesting season (January 1 through September 15) to be unoccupied. Annual grasslands, alfalfa, fallow fields, dry-land and irrigated pasture, non-flooded rice land, cereal grain crops (including corn after harvest), as well as beet, tomato and other low-growing row or field crops are all considered SWHA foraging habitat (CDFG 1994). CDFW recommends the Lead Agency require surveys for nesting SWHA and that the surveys be conducted within a 0.5-mile buffer around each construction area, before starting any Project-related activities, following the survey methodology developed by the SWHA Technical Advisory Committee (SWHA TAC 2000). In the event that SWHA is detected within a 0.5 mile, consultation with CDFW is recommended to discuss how to implement the Project and avoid take (e.g., minimize impacts). CDFW also recommends the Lead Agency require the Project developer follow the measures outlined in the *Staff Report Regarding Mitigation for Impacts to Swainson's Hawks (Bueto swainsoni) in the Central Valley of California* (CDFG 1994). If take cannot be avoided, acquisition of an ITP would be warranted in advance of Project implementation for Project-related incidental take of SWHA. Please note, that encroachment within the 0.5-mile no-disturbance buffer is not recommended without prior acquisition of an ITP (since such encroachment has been demonstrated to cause nest failure). B.4-26 cont.

Raptors and Migratory Birds: For the protection of raptors and migratory song birds and to assist in avoiding take of avian species as required by Fish and Game Code sections 3503, 3503.5 and 3513, if Project-related activities will occur during the breeding season (January through mid-September), CDFW recommends the Lead Agency require surveys be conducted by a qualified biologist no more than 14 days prior to the beginning of any Project-related activity likely to impact raptors and migratory song birds, for each construction area. If Project activities are delayed or suspended for more than 14 days during the breeding season, repeat the surveys. If nesting raptors and migratory song birds are identified, CDFW recommends the Lead Agency require the active nest be monitored by a qualified biologist for the first 24 hours prior to any construction related activities to establish a behavioral baseline. Once work commences, all nests should be continuously monitored to detect any behavioral changes as a result of the Project. If behavioral changes are observed, the work causing that change should cease and CDFW be consulted for additional avoidance and minimization measures. If monitoring of identified nests by a qualified biologist is not feasible, the following minimum no-disturbance buffers are advised to be implemented: B.4-27

1. 250 feet around active passerine (perching birds and songbirds) nests,
2. 500 feet around active non-listed raptor nests and
3. 0.5 mile around active listed bird nests.

These buffers should be maintained until the breeding season has ended or until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival.

Other Avian Species: Since Project build-out will occur over many years, and avoidance of certain listed species is being assumed, we recommend repeating focused surveys (protocol-level where applicable) in all areas with potentially suitable habitat for species such as Least Bell's vireo and southwestern willow flycatcher, in the season prior to construction of any given construction area of the development. B.4-28

American Badger: To minimize potential Project-related impacts to American badger, CDFW recommends mitigation measures be revised to require wintering surveys be conducted no more than 14 days prior to the initiation of construction related impacts in each construction area and within a 100-foot buffer. If Project activities are delayed or suspended for more than 14 days, repeat the surveys. Occupied dens should be clearly marked with fencing or flagging and a 100-foot no-disturbance buffer zone placed around the den in a manner that does not isolate the badger from intact adjacent habitat or prevent the badger from accessing the den. If den avoidance is infeasible, CDFW shall be contacted. Please note that trapping, flushing and/or collapsing of occupied badger dens would result in take as defined in Fish and Game Code Section 86. Similarly, CDFW recommends mitigation measures be included to require natal den surveys be conducted no more than 14 days prior to the initiation of construction-related impacts in each construction area and within a 200-foot buffer. Occupied natal dens should be clearly marked with fencing or flagging and a 200-foot no-disturbance buffer zone placed around the den in a manner that does not isolate the badger from intact adjacent habitat or prevent the badger from accessing the den. The 200-foot no-disturbance buffer shall remain in place until a qualified biologist has determined, and CDFW has agreed in writing, that young have left the den and are no longer reliant upon the den or parental care for survival. B.4-29

Bats: The DEIR does not adequately describe the potential for impacts to bats, nor does the DEIR provide any alternative discussion or avoidance strategies to mitigate the loss of occupied bat habitat. The DEIR concludes the Project site contains suitable foraging habitat for several bat species. However, the DEIR incorrectly concludes no suitable maternity or hibernation roost locations are known to be present on or in the immediate vicinity of the site. As previously discussed above, the Project intends to permanently close an old mine shaft which could be currently utilized by bats. Tree cavities can also be used by bats for roosting and maternity habitat. Mitigation Measure 7-9 of the DEIR indicates a field survey for bats would occur no earlier than 20 days prior to any grading activity that would occur during the breeding season (April-August) to determine if active roosts of special status bats are present. B.4-30

Bats are considered non-game mammals and are protected by state law from take and/or harassment (Fish and Game Code § 4150, CCR § 251.1). Several bat species are also considered Species of Special Concern, which meet the CEQA definition of rare, threatened, or endangered species (CEQA Guidelines §15065). CDFW considers adverse impacts to a Species of Special Concern, for the purposes of CEQA, to be significant without mitigation. Mitigation is more than avoiding maternity roosts, wintering sites, night roosts, mating roosts and foraging sites; mitigation is also providing similarly functioning habitat to replace what is impacted. B.4-31

To minimize potential Project-related impacts to bat species, CDFW recommends the Lead Agency revise Mitigation Measure 7-9 to require the developer to conduct preconstruction surveys to establish areas of occupancy the year prior to the start of construction in each construction area and that surveys be conducted by a minimum of two CDFW-approved biologists and consist of: B.4-32

- Two spring surveys (April through June) and two winter surveys (November through January)

- Each survey consists of one dusk emergence survey (start one hour before sunset and last for three hours), followed by one pre-dawn re-entry survey (start one hour before sunrise and last for two hours), and one daytime visual inspection of all potential roosting habitat on the Project site
- Conduct each survey within one 24-hour period
- Focus visual inspections on the identification of bat sign (i.e., individuals, guano, urine staining, corpses, feeding remains, scratch marks and bats squeaking and chattering)
- Use bat detectors, bat call analysis and visual observations during all dusk emergence and pre-dawn re-entry surveys

Data Collection for Each Survey:

- Whether bats are, or have been, present on the Project site
- Assemblage of species using the site
- Frequency of site use (including seasonal changes)
- Type of roost (i.e., maternity roost, day roost, night roost, feeding perch, mating roost, satellite roost, transitional roost or winter hibernaculum)
- Location, ambient temperature, internal dimensions and the aspect and orientation of the roost
- Spatial and temporal distribution of bat activity
- Flight paths, exit and entrance points
- Intensity of bat usage (i.e., number of bats, time and duration of use)
- Identification of any survey constraints

B.4-32 cont.

If bats are found to occupy the Project site, CDFW recommends the Lead Agency require the Project developer implement the general bat avoidance, minimization and mitigation measures outlined below. CDFW is available to discuss and refine these measures with the Lead Agency and the Project developer:

- Avoid direct and indirect impacts to roosting sites by establishing a no-disturbance buffer of 300 feet around roost sites.
- Prohibit clearing and grubbing adjacent to the roost site and lighting use near the roost site where it would shine on the roost or interfere with bats entering or leaving the roost. Prohibit the operation of internal combustion equipment, such as generators, pumps and vehicles within 300 feet of the roost site. Prohibit the use of bird netting.
- If avoidance of roost sites is infeasible, maintain portions of the features that provide naturalized habitat to the greatest extent possible and improve existing roost sites and/or provide new roost sites on buildings or on the Project site. Implement these measures only after consultation with CDFW.

B.4-33

- New roost sites must be in place prior to the initiation of Project-related activities to allow enough time for bats to relocate.
- Design and locate new and enhanced roost sites to be compatible with the bats' search image and habitat requirements (i.e., thermal regulation, interior size, ventilation, etc.). Design new and enhanced roost sites in consultation with CDFW.
- Exclude bats from directly affected work areas selectively and only to the extent necessary to prevent morbidity or mortality to the colony. Use one-way bat exclusion devices, installed in a bat-safe way, to exclude bats and then use expandable foam, steel wool or other method to block the entrance, after the bats have gone. Exclude bats only after consultation with CDFW, at a time that is compatible with the species' normal behavior patterns (i.e., breeding, feeding, hibernating, etc.). In general, exclusions shall not occur during the maternity/pup-rearing season nor during the hibernation season, as determined by conditions at the Project site.

B.4-33 cont.

Pronghorn (Antilocapra americana): Pronghorn numbers and habitat use of the Project site, as described in the DEIR, appear to be antidotal and potential Project impacts appear to minimize the status of pronghorn on the Project site and within the region. The DEIR states, "Although not classified as a special status species, the relatively small population of reintroduced pronghorn antelope on the Project site is considered of interest due to limited numbers and historical presence in the region. Project implementation would reduce the amount of available foraging habitat for this population. However, impacts on a reintroduced population of a non-special status species that may result from Project implementation would be considered adverse but less than significant under applicable CEQA significance thresholds. As part of the Ranchwide Management Plan, which is an implementation tool of the Ranchwide Agreement, the Project Applicant will work with the Tejon Ranch Conservancy to identify and implement potential enhancement measures that are also supported by CDFW. Potential measures could focus on enhancing pronghorn fawn survivorship with GPS-tracking devices and other measures to evaluate and minimize losses from coyote predation; completing further evaluation of modeling tools at a site-specific level (such as those used on the Carrizo Plain), and incorporating volunteer involvement with supportive activities such as fencing retrofits."

B.4-34

The presence of pronghorn on the Project site and within the region rises to a higher level of CEQA impact consideration than cited in the DEIR. This determination is based on the local and regional ecosystem value of pronghorn reintroduction into portions of Kern and Los Angeles Counties' Antelope Valley Region. This species once existed in the region, but was extirpated prior to reintroduction efforts in the 1980s on Tejon Ranch. CDFW recommends that unmitigated Project impacts to pronghorn be considered significant by the Lead Agency under CEQA. CEQA directs that a special emphasis be placed on environmental resources that are rare or unique to the region and would be affected by a proposed project (CEQA §15125 (c)). Lead Agencies have a duty under CEQA to avoid or minimize environmental damage where feasible (CEQA Section 15021).

B.4-35

CDFW recommends a revised DEIR be completed and a map included documenting pronghorn sighting data points and sighting dates on and adjacent to the Project site. The Department of Water Resources has documented pronghorn occurrences in grassland habitat that the DEIR currently describes as pronghorn having limited access to because of restrictions. CDFW also recommends the revised DEIR describe the most likely California Aqueduct crossing locations

B.4-36

used by pronghorn to gain habitat access and incorporate Mitigation Measures into the DEIR to enhance these crossing locations on the Project site and within Tejon Ranch lands to further facilitate access to existing grassland habitat for pronghorn. B.4-36 cont.

The Pronghorn population has persisted in the region for decades and its small size places it in great peril of local extinction. CDFW concurs with the DEIR that any activity employed to improve habitat quality and fawn survival for pronghorn in the Project area would benefit this species. However, the Project will result in greater stressors to the pronghorn population because of loss of habitat, continued loss of already restricted movement opportunities for pronghorn to access habitat south of SR 138 and west of I5, increased threat from vehicle collision, and harassment and predation by domestic pets and humans. In July 2017, a pronghorn was observed on the Peterson Ranch Habitat Mitigation Bank approximately 25 miles southeast of the Project site in Los Angeles County which further demonstrates CDFW's concern for the persistence of this species in the region and providing for unrestricted movement across SR 138. Therefore, CDFW recommends further evaluation on the direct, indirect and cumulative effects of the Project, during and after full buildout, including use of habitat by pronghorn on the Project site and movement through the site and offsite habitats. This evaluation should be based on precise Pronghorn composition counts that can be replicated and serve as reliable estimates of population size and habitat use. The use of telemetry tracking of pronghorn individuals would further the understanding of habitat use, mortality factors, and movement trends on the Project site and within the region. Movement monitoring of pronghorn would have been invaluable in determining the movement route taken by the pronghorn individual observed on the Peterson Ranch Mitigation Bank in July 2017 to inform habitat movement pathway preservation and Project mitigation measures for this species. B.4-37

Ring-tailed Cat: The Biological Resources section of the DEIR concludes that the Project site does not support habitat for the State fully protected ring-tailed cat (*Bassariscus astutus*). However, ring-tailed cat is a secretive, nocturnal species that can be easily missed in survey and impact assessment efforts. Therefore, CDFW recommends additional survey efforts for ring-tailed cat and avoidance of occupied habitat for this species since ring-tailed cat is a State fully protected species. Take of ring-tailed cat or any State fully protected species is prohibited and cannot be authorized by CDFW (Fish and Game Code Sections 3511, 4700, 5050, and 5515). B.4-38

Western Pond Turtle: Western pond turtle (*Emys marmorata pallida*) has the potential to occur adjacent to Quail Lake and within several areas of the Project site. CDFW recommends a Mitigation Measure be incorporated into the DEIR to require protection for western pond turtle during their breeding season and require a no-disturbance buffer of 475 feet from the outside edge of Quail Lake into the Project site to protect nesting areas. CDFW is recommending a 475-foot buffer since female pond turtles can move overland for up to 325 feet to find suitable sites for egg-laying. In addition to avoiding a minimum of 325 feet from the edge of a water feature, CDFW recommends an additional 150 feet beyond the 325-foot overland travel range to protect nests and nesting sites from direct and indirect Project disturbance. CDFW also recommends focused surveys for western pond turtles be conducted in all areas of the Project site that provide potential habitat for western pond turtle and survey results be incorporate into a revised DEIR to allow CDFW to make specific recommendations and comments on additional mitigation measures proposed to minimize impacts to this species. B.4-39

Western Spadefoot: Western spadefoot (*Spea hammondii*) aestivate underground in upland habitat and emerge during heavy rainfall events in order to migrate to nearby water bodies (including those that are ephemeral in nature) to breed. Western spadefoot may occur on the Project site. If breeding sites for western spadefoot are identified in the Project site during pre-construction surveys, CDFW recommends the Lead Agency require the Project developer consult with CDFW prior to the implementation of the Project to develop a plan to avoid impacts to western spadefoot, and obtain CDFW's written concurrence with the plan prior to plan implementation. B.4-40

Argentine Ants: CDFW recommends revising Mitigation Measure 7-16 to establish argentine ant control "dry zones" of a minimum of 650 feet and encourage landscape plans to incorporate these same "dry zones" landscaping and require all nursery plant material within 700 feet of Open Space areas, preserved populations, and mitigation lands be inspected and certificated as being free of argentine ants. Irrigation of Open Space areas, preserved fauna populations, and mitigation lands are also strongly discouraged and plantings within these areas should be hand watered only if absolutely necessary. Restoration should be timed to take advantage of the natural rainy season. B.4-41

Special Status Plants: Mitigation Measure 7-1 in the Biological Resources section of the DEIR relies on the future completion of focused plant surveys to confirm the proposed mitigation lands support populations of California androsace (*Androsace elongate* ssp. *acuta*), crownscale (*Atriplex coronate var. coronata*), round-leaved filaree, Mojave spineflower (*Chorizanthe spinosa*), sylvan scorzonella (*Microseris sylvatica*) and adobe yampah (*Perideridia pringlei*) to confirm compliance with the DEIR's proposed 2:1 mitigation ratio for impacts to these species. B.4-42

The 2:1 replacement to impact ratio is not substantiated within the DEIR and does not describe nor demonstrate that successful rare plant mitigation is attainable. Scientific literature does not support the assertion that transplanting plants into areas of microhabitat where they do not occur is viable in assuring long-term persistence of the species. Therefore, CDFW does not support transplantation of rare plants as a mitigation strategy. CDFW recommends avoidance of rare plant populations by delineation and observation of a no-disturbance buffer from the outer edge of the plant population(s) or specific habitat type(s) required by special status plant species, including a sufficient buffer area that ensures habitat is available for pollinators, maintains the current topography and drainage conditions of existing plant populations, and minimizes anthropogenic impacts. Because the collection of seed and establishment of new sensitive status plant populations has not been substantiated in the literature, transplantation is experimental in nature, and CDFW is not aware of any long-term studies that document the viability and persistence of either transplanted or seeded populations of these particular special status plant species. If full avoidance of existing populations or clusters of individual plants cannot be achieved, CDFW recommends avoidance in combination with conservation, funding, and management of existing, healthy populations in perpetuity as the preferred mitigation method. Furthermore, mitigation for impacts to special status plant species need to be completed prior to the initiation of Project-related activities. B.4-43

Mitigation Measure 7-1 also relies on the future development of a Special Status Plant Species Restoration Plan. The deferred development of the Special Status Plant Species Restoration Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of the Plan is not required. CDFW recommends B.4-44

the DEIR be revised to include the Special Status Plant Species Restoration Plan for CDFW review and comment. B.4-44 cont.

Eight populations of crownscale, totaling more than 16,000 plants, were identified during surveys on the Project site. The identifying characteristics exhibited on these plants were mixed between the more common crownscale and the federal endangered San Jacinto Valley crownscale (*Atriplex coronata var. notatior*) which is only known to occur 100 miles to the east of the Project. Based on distribution and on a single taxonomic verification, the DEIR determines the onsite occurrences are the more common crownscale species. However, CDFW recommends consulting multiple experts and conducting genetic work to determine if this is an unrecognized species, or an isolated occurrence of San Jacinto Valley crownscale in Los Angeles County before removing this population. Additionally, if this is an isolated population, outside of its known range, CDFW recommends conducting an additional analysis to determine how removal of this species potentially shrinks the species' range. B.4-45

Piute Mountains navarretia is a CRPR 1B.1 species. Before surveys for the Project site were conducted this species was only reported to occur in Kern and Tulare Counties. To date, surveys on the Project site have identified three (3) populations of Piute Mountains navarretia with approximately 20,100 individuals. Known occurrences of Piute Mountains navarretia on the site are currently outside of the proposed impact area. CDFW recommends additional protocol surveys for this species be completed prior to Project implementation, for the entire site in potentially suitable habitat, following a good rain year, in an effort to detect additional populations. CDFW also recommends this species be fully avoided and managed to preserve these populations in perpetuity. B.4-46

Federally Listed Species: CDFW also recommends consulting with the USFWS on potential impacts to federally listed species. Take under ESA is more broadly defined than CESA; take under ESA also includes significant habitat modification or degradation that could result in death or injury to a listed species by interfering with essential behavioral patterns such as breeding, foraging, or nesting. Consultation with the USFWS in order to comply with ESA is advised well in advance of Project implementation. B.4-47

Significant Ecological Area: CDFW recommends that development south of SR 138 be removed from the Project. Introducing development to the area south of SR 138 will have negative impacts to the SEA, specifically creation of a large edge effect on the adjacent SEA, including light, noise, temperature increase, increased albedo, increased Argentine ant risk, increased fire risk, point source for invasive species introduction, and human disturbances (e.g., trash, dogs, loitering, etc.), thereby lowering its conservation value. In addition, by removing development south of SR 138, the Project will also avoid several special status plant occurrences. B.4-48

Vegetation Mapping: The vegetation mapping units used in the DEIR were set at a scale of approximately 1 acre; and patches of vegetation smaller than 1 acre were generally not mapped except for observed seeps and ephemeral ponds. CDFW is concerned the smaller scale variation of vegetation assemblages are not accurately reflected in the DEIR vegetation mapping. CDFW recommends all unique stands or polygons be recorded, no matter the size. Providing detailed mapping enables CDFW to assess the value and the appropriateness of proposed mitigation accurately. CDFW recommends conducting vegetation mapping following the standards of mapping all unique, homogenous stands, no matter the size, and including this B.4-49

revised information in the DEIR. CDFW is unable to accurately assess impacts or values of the vegetation assemblage within the Project area, nor the proposed mitigation lands until revised mapping is completed. B.4-49 cont.

Oak Woodlands: The DEIR determines that significant impacts to oak tree resources would be reduced to less than significant levels with implementation of Mitigation Measures 7-11 and 7-19 through 7-20, in accordance with the County of Los Angeles Oak Tree Ordinance and in compliance with the Los Angeles County Oak Woodlands Conservation Management Plan. The DEIR analyzes impacts to oak trees over eight inches in diameter at breast height (DBH), proposes to use existing oak woodlands, counts planting within these areas as creation, only includes a five (5) year monitoring period, does not require grazing in all of these areas, and does not account for the acreage of oak woodland as a community with an existing density of trees. B.4-50

CDFW recommends the DEIR be revised to reflect a 4-inch DBH when considering which oak trees, and trees in general, require mitigation. More importantly, the oak woodland community needs to be considered in its entirety when considering mitigation to replicate the habitat function. Oak trees are a dense, slow growing hardwood requiring decades to mature. CDFW recommends revising the mitigation measures to require monitoring oak trees/oak woodlands for a minimum of 15 years and up to 20 years to determine success. To reestablish the oak woodlands, CDFW recommends three planting seasons. The first planting season, year 0, being the acorn and sun tolerate ground covers; the second planting season occurring at approximately year 5, introducing sun/shade tolerate species; and the third planting season at year 10 with the introduction of more shade tolerate understory species. To determine the appropriate species and density of the oak woodlands, three representative oak woodland sites need to be analyzed for species composition, density, and richness. The created sites, once established, need to reflect the representative sites. Furthermore, CDFW recommends the creation site be deemed successful only after 10 contiguous years without irrigation. However, CDFW recommends irrigation be prohibited in establishing oak woodlands as the trees grow at an abnormal rate and establish a root system that will not optimally sustain the tree once irrigation has been removed. CDFW recommends a revision to Mitigation Measure 7-11 to reflect the temporal loss in creating oak woodlands. CDFW also recommends the creation of 18.6 acres to compensate for the loss of non-heritage oaks/oak woodlands and an additional 10:1 ratio for heritage oak trees. These areas should be protected against anthropogenic impacts for the life of the project. B.4-51

Riparian, Wetland and Stream Features: The DEIR states that significant impacts to jurisdictional drainages, wetlands, and riparian vegetation from the Project would be reduced to less than significant levels with implementation of Mitigation Measure 7-12, which states that (1) all lost functional values shall be replaced; (2) appropriate regulatory agency permits and/or agreements shall be obtained; and (3) the mitigation measures stipulated in those permits/agreements shall be implemented. Mitigation Measure 7-12 also states that Functional Capacity Units (FCU) will be used to determine the mitigation level necessary to restore riparian functions. CDFW does not agree with the use of FCUs as the basis for determining mitigation requirements. FCUs do not guarantee that wetland/riparian habitat is mitigated to the level necessary to be called "in-kind". Plant species assemblages for each unique wetland/riparian patch need to be maintained to be considered in-kind mitigation. CDFW recommends full avoidance of both wetland features, as well as any lake, river, or stream under Section 1600 of B.4-52

the Fish and Game Code. This would eliminate the need to create the proposed 78.4 acres of wetland/riparian habitat, the creation of which would in turn impact another vegetation community that would require mitigation. CDFW also recommends developing success criteria (Mitigation Measure 7-12) tied to on the ground species richness, abundance, percent cover, and diversity, by vegetation layer. Additionally, the monitoring period for replacement planting success should not start until all irrigation and weed control has been completed and removed. Irrigation and weed control are considered part of the establishment period and monitoring during these periods would provide data that is heavily skewed. Success criteria need to be based on trends; no positive trend in weed cover (weed control should be completed prior to planting and during the establishment period, nor during monitoring) and no negative trends of native vegetation over the monitoring period. This trend analysis provides a more thorough indication of the trajectory of the success of the restored habitat. B.4-52 cont.

Refuse: To reduce urban wildlife conflicts that often result in mortality to bears and other wildlife species, CDFW recommends Mitigation Measure 7-15 in the DEIR be revised to require the use of bear-proof trash cans throughout the entire Project site, including during Project construction, after full Project build-out and for the life of the Project. CDFW also recommends Mitigation Measure 7-15 be revise to require the use of bear-proof trash cans at all individual homes and not limit use to common areas as specified in Mitigation Measure 7-15. B.4-53

Fencing: CDFW recommends the DEIR be revised to include capping of all vertical open pipes used for fence posts, property line stakes, signs, roof ventilation, chimneys, vault toilets, and similar structures and metal fence stakes used on the Project. Capping can be accomplished using bolts or other materials to avoid raptor talons becoming entrapped within the bolt holes of metal fence stakes. Further information on this subject may be found at: http://kern.audubon.org/death_pipes.htm. B.4-54

Grubbing and Grading: CDFW recommends the DEIR be revised to require that any grading/grubbing be done in phases in order to facilitate pushing wildlife of higher mobility towards intact adjacent habitat. Islands of habitat should not be created during site disturbance where wildlife will enter and then be subject to mortality when these areas are grubbed and/or graded. Attempts to salvage species of low mobility should be made prior to the initiation of ground disturbance activities. Salvaged species should be salvaged out of harm's way onto adjacent suitable habitat not disturbed by the project in areas with enough intact suitable habitat to support these species home range sizes. B.4-55

Wildlife Movement Corridors: Mitigation Measure 7-14 of the DEIR describes a designated SR 138 underpass where the highway crosses the Project's western border. The proposed underpass will be 100 feet wide and will flare out on both sides of the highway to a 150 foot width in Project Open Space adjacent to the highway. The DEIR states that these design specifications are expected to allow some local wildlife to safely pass between Open Space areas on opposite sides of SR 138.

CDFW is unclear what the width of the underpass will be throughout the entire length of the underpass structure since the DEIR only specifies that the underpass will flare out where it meets SR 138. If the underpass does maintain the 150 foot width throughout the entire length of the structure, this would only allow for 25 feet of extra clearance on each side of the multi-use pathway that will go through the center of the structure to allow for wildlife movement. It is also B.4-56

unclear if the additional 25 feet on each side will be dedicated to wildlife movement and if design features will be incorporated to limit human and domestic animal encroachment into these corridors and encourage species use. In addition, CDFW would like to note that such a limited corridor width would not be sufficient to serve as a wildlife movement corridor for the Project site. CDFW also recommends the other planned underpass and overpass bridge crossings that will be constructed across SR 138 to facilitate both pedestrian and bike access to employment centers be designed to also facilitate wildlife movement across the site. In addition, CDFW recommends the unnamed drainage that parallels SR 138 to the north be avoided by Project development so that it may continue to "serve as a valuable foraging resource" and wildlife movement area across the site. B.4-56 cont.

A camera station study of wildlife movement observations along the I5 was conducted; however, a wildlife movement study throughout the remainder of the Project site has not been completed and wildlife movement information throughout the remainder of the Project site. Based on the information provided in the DEIR, this information appears to be anecdotal in nature. CDFW recommends the Lead Agency require a complete systematic, long-term wildlife movement study that encompasses the entire Project site and extends to offsite areas of existing wildlife habitat. CDFW recommends the study be conducted over a period of at least two years and consider all directions through and around the Project site. Camera stations and tracking medium should be used at each of the California Aqueduct, I5, and SR 138 crossings. CDFW also recommends the study consider species life histories, behavior, and an assessment of how the Project may modify species behavior and movement. Based on this study, a mitigation strategy should be developed that incorporates the study's findings, site specific information, and includes Open Space planning to enable wildlife to move safely through and around the entirety of the Project site. B.4-57

Focused Protocol Surveys: CDFW recommends the DEIR incorporate an enforceable measure to require focused protocol surveys to be conducted in all areas of potentially suitable habitat for the entirety of the Project impact area, and a 500-foot buffer, prior to the initiation of construction-related activities for all special status species that have a potential to occur on the Project site. The surveys should be conducted in the year prior to disturbance for each construction area. This CDFW recommendation is necessary because previous surveys varied in their areas of coverage and levels of intensity and were not designed for maximum species detectability. For more information on species specific protocols see https://www.wildlife.ca.gov/Conservation/Survey-Protocols. . B.4-58

Additional Mitigation Measure Comments: CDFW recommends Mitigation Measure 7-3 be revised to remove the following statement: "If a wildlife species is in harm's way and has not moved on its own, the Biologist will attempt to scare them away from the area. If wildlife does not move, and where feasible, the wildlife species will be relocated to suitable habitat." Implementation of this portion of the mitigation measure would result in take through harassment and direct mortality of wildlife species (if relocation is deemed not feasible) and is prohibited under Fish and Game Code. B.4-59

Grazing: Grazing operations will be directed under the Grassland Mitigation Plan, which is a component of the Mitigation Preserve Management Plan and/or the Ranchwide Management Plan. The deferred development of this Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of this B.4-60

plan is not required. CDFW recommends the DEIR be revised to include the Grassland Mitigation Plan for CDFW review and comment. B.4-60 cont.

Jurisdictional Features: The Jurisdictional Delineation Report discloses that jurisdictional features were mapped to the extent of the Ordinary High Water Mark (OHWM) and edge of riparian vegetation, where applicable. The DEIR acknowledges that CDFW jurisdiction can extend beyond the OHWM to the edge of riparian habitat where this habitat type is present. However, at a minimum, CDFW jurisdiction extends to the back edge of the bank, includes associated riparian habitat, and may also include terracing and the adjacent floodplain, depending upon site indicators. The OHWM is a definition used by the United States Army Corps of Engineers to determine the extent of its jurisdiction under the federal Clean Water Act. CDFW jurisdiction is separate from, and unrelated to, that of the Clean Water Act, and in most cases extends beyond the OHWM. Therefore, the extent of impacts to CDFW jurisdictional features is likely greater than what is disclosed in the Jurisdictional Delineation Report and included in the DEIR. In addition, implementation of the restoration and enhancement activities proposed in the DEIR would also require notification pursuant to Fish and Game Code Section 1600 et seq. and may also require acquisition of an ITP because the proposed activities have the potential to impact State-listed species. Potential impacts to all special status species and habitats within the area of the proposed offsite activities also need to be evaluated in the DEIR for CEQA review. B.4-61

CDFW also recommends Exhibit 5.7-9 in the Biological Resources section of the DEIR be revised. The jurisdictional features on this exhibit have been kept to scale and therefore the majority of CDFW jurisdictional features are not visible. CDFW cannot determine if these features are not visible because of the mapping scale or because they have been omitted. B.4-62

Offsite Mitigation: The DEIR proposes a total of 23,547 acres of offsite mitigation lands, comprised of six separate Areas, as depicted on Exhibit 5.7-10 in the Biological Resources section. Area 1 contains 6,417 acres; Area 2 contains 2,556 acres; Area 3 contains 4,183 acres; Area 4 contains 7,319 acres; Area 5 contains 643 acres; and Area 6 contains 2,429 acres of proposed offsite mitigation lands. As noted in the DEIR, these lands are a part of the Ranchwide Agreement.

The lands in Areas 3, 4, and 5 (totaling 12,145 acres) have already been conserved through an agreement and purchase of a conservation easement using funds entirely provided by the State of California. The easement was conveyed to the State and is currently held by the Wildlife Conservation Board (WCB). The conservation easement precludes the use of the lands in Areas 3, 4, and 5 in baseline habitat condition from serving as mitigation for any proposed development projects, including Centennial. The lands in Areas 3, 4, and 5 may serve as mitigation only in the event that enhancement actions are implemented and performed in perpetuity that will add functional habitat value to the lands above baseline. Further, all enhancement actions are required to be reviewed and approved by WCB. As currently discussed and contemplated in the DEIR, Areas 3, 4, and 5 are not intended to undergo enhancement activities and are considered as mitigation in baseline condition. However, in accordance with the terms and conditions of the conservation easement conveyed over these areas, these lands cannot be used to offset impacts from the implementation of the Project. Therefore, with the removal of the offsite 12,145 acres that constitute Areas 3, 4, and 5 from consideration as compensatory mitigation for the Project, the remaining Areas (1, 2 and 6) B.4-63

contain a total of only 11,402 acres. This effectively reduces the available compensatory habitat mitigation for the Project to a 2:1 mitigation ratio and cannot effectively reduce the loss of the varied and rare habitat types from Project impacts to a less than significant level. B.4-63 cont.

Land Use, Entitlements and Planning (Section 5.8): This section of the DEIR includes the Antelope Valley Area Plan (AVAP) Consistency Analysis (Table 5.8-1). This analysis evaluates the Project's consistency with the requirements of the AVAP. CDFW disagrees with several statements of consistency in the aforementioned table. For example, Goal Land Use (LU) 2 of the AVAP is: "a land use pattern that protects environmental resources". The DEIR determines that the Project is consistent with this goal through the preservation of the SEA, biological mitigation lands, Tejon Ranch land preserved under the Tejon Ranch Land Use and Conservation Agreement and the Project's land use plan. The SEA is designated as Open Space in the DEIR and the CSP. As described in the DEIR and further detailed in the CSP, the Open Space land use designation allows for a variety of uses, including, but not limited to: golf courses; information centers; apiaries; fish hatcheries; nurseries (growth and sales); commercial greenhouses; stables; trails (bike, equestrian, pedestrian); helispots; helipads; monuments and interpretive sites; wineries; cemeteries; amusement rides; bike, motor scooter and boat rentals; campgrounds; lakes; swimming pools; photovoltaic panels; outdoor festivals and fairs; filming; crop production and agricultural uses; storage and maintenance yards; special events; model home complexes; and other accessory uses and structures. The continuation of hunting activities are also allowed in SEA 17 (as described in Noise section 5.12 of the DEIR) but not included in the land use designation table in the CSP. B.4-64

Allowing these and similar uses within the Open Space lands does not preserve the value of these lands and in many cases would prohibit the use of these Open Space areas (including those Open Space areas within the center of the Project site) for use by special status species (plant and animals) that currently use the lands on the Project site. It would also impede the use of any potential wildlife movement corridors, across and in some cases, adjacent to the Project site. Furthermore, provisions in the CSP allow for the current land use designations to be changed. This would allow for the possibility that current Open Space areas may be changed to other designated uses, including but not limited to: residential, industrial, and commercial. This level of built-in flexibility, combined with the lack of detailed design plans and descriptions in the DEIR does not provide CDFW with enough information to determine what the Project impacts will be. As stated above, the allowed land uses in lands adjacent to Open Space areas may also impact the ability of wildlife to use and move through the Open Space areas. As one example, there is a recreation/entertainment and residential area located on the west side of the Project site, north of SR 138, directly adjacent to a potential wildlife movement corridor. The land uses in these development areas allow for amphitheaters; solar and renewable energy generation (including photovoltaic panels, microturbines, and associated facilities); and outdoor festivals and fairs among other uses, which may severely impact the ability of wildlife to continue to use this area of the Project site as a movement corridor. B.4-65

The goal of Policy LU 2.1 in Table 5.8-1 is "to limit the amount of potential development in....wildlife corridors." The DEIR states that the Project preserves important regional wildlife corridors and biological connectivity of regional open space. However, the DEIR also states that cumulative impacts to regional wildlife movement will be significant with mitigation. Due to significant impacts in regional wildlife movement, and for the reasons outlined in the sections above, CDFW disagrees with the DEIR's determination that the Project is consistent with Policy B.4-66

LU 2.1. Regional and local wildlife movement corridors occur on the Project site and are not sufficiently avoided and protected or replaced by the Project. B.4-66 cont.

Policy LU 2.5 in Table 5.8-1 refers to limited development in riparian areas. The DEIR states that the Project is consistent with this policy by avoiding or minimally impacting riparian areas on the site by designating major drainage channels on the site as Open Space. While the Project has designated major drainage channels as Open Space, they have also allowed these channels to be reengineered, revegetated and altered to collect site runoff, mudflows, serve as recharge and retention basins and incorporated adjacent multi-use trails. Also, as mentioned above, Open Spaces have a variety of allowable land uses that are not all consistent with minimizing impacts to riparian areas. Therefore, CDFW does not agree with the DEIR's determination that the Project is consistent with Policy LU 2.5 with respect to riparian conservation. B.4-67

The goal of Policy M 10.5 in Table 5.8-1 is to locate and design trail routes to minimize impacts to sensitive environmental resources and ecosystems. The DEIR states that trails will be located along roads and in greenways and have been designed to minimize impacts to sensitive environmental resources and ecosystems. The DEIR also states that signs will be posted along trails cautioning against disturbance and trails will be designed to discourage people and pets from entering sensitive drainages. As discussed above, trail design (e.g., lighting requirements, fencing, location, signage, etc.) is discussed in the DEIR and the CSP; however, all of these items are not included as Mitigation Measures in the DEIR and are only discussed as guidelines in the CSP, which are subject to change and/or omission during final site design. Therefore, CDFW does not agree with the DEIR's determination that the Project is consistent with Policy M 10.5. CDFW recommends wildlife friendly fencing be designed and included in a revised DEIR to minimize potential impacts to the SEA and other Open Space areas from human and pet-related disturbances and protect the sensitive resources and habitats that occur within these areas. B.4-68

Goal COS 4 in Table 5.8-1 is a goal to protect sensitive habitat and species to promote biodiversity. The DEIR states that the Project will protect sensitive habitat and species through the protection of Open Space, authorized Open Space uses and measures. Policy COS 4.2 refers to limiting the amount of potential development in the SEA, wildlife corridors, and other sensitive habitat areas. The DEIR states that the Project is consistent with this policy by avoiding SEA development and protecting Open Space that protects wildlife corridors and other sensitive habitat areas, including SEAs. Policy COS 4.7 in Table 5.8-1 refers to development standards that maximize opportunities for wildlife movement. The DEIR states that no fencing that would restrict wildlife movement is proposed in Open Space areas, which serve as wildlife corridors. CDFW does not agree with the DEIR's determination that the Project is consistent with the aforementioned policies and goals. Please refer to the discussions above for further detail on land use within the SEA. B.4-69

The goal of Policy COS 4.8 is to ensure ongoing habitat preservation by coordinating with CDFW to obtain the latest information regarding threatened and endangered species. The DEIR states that the Project is consistent with this policy by providing for ongoing habitat preservation within designated Open Space and states that the latest information regarding sensitive plant and wildlife species is incorporated in the Biological Resources section. CDFW would like to note that while discussions for the Project have occurred in the past, recent B.4-70

discussions (within the last 3 years) have not occurred between CDFW and the Project Applicant, with the exception of two preliminary reviews of a draft jurisdictional report and one site visit to discuss jurisdictional features. In addition, CDFW also notes that the status of tricolored black bird (*Agelaius tricolor*), described in the Biological Resources section, has changed from State Candidate to State Endangered. B.4-70 cont.

Noise (Section 5.12): The Noise section includes a statement that limits construction to the hours of 7:00 a.m. to 7:00 p.m., Monday through Saturday, in compliance with County code requirements. However, CDFW recommends that all Project-related activities be restricted to daylight hours and nightwork be prohibited throughout the entire Project site to reduce the potential to adversely affect special status species, their movement and their associated habitat use on and adjacent to the Project site. CDFW also recommends vehicle and equipment access within the Project site be restricted to existing roads and overland travel be minimized and confined to areas where development will occur. CDFW also recommends the DEIR be revised to incorporate these recommendations as Mitigation Measures in the DEIR. B.4-71

Mitigation Measure 12-7 in the Noise section requires the preparation of a Blasting Plan. The Blasting Plan will include information such as a pre-blast survey, the location and hours of blasting and other additional items. Blasting has the potential to adversely affect special status species and their associated habitat on and adjacent to the Project site. The deferred development of the Blasting Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of the Plan is not required. CDFW recommends the DEIR be revised to include the Blasting Plan for CDFW review and comment. B.4-72

Visual Resources (Section 5.13): Mitigation Measure 13-6 in the Visual Resources section of the DEIR requires the development of an Exterior Lighting Plan (also referred to as the Dark Sky Plan). This Plan applies to all proposed structures and development areas that border natural Open Space resources. Exterior lighting on the Project site has the potential to adversely affect special status species, their movement and their associated habitat on and adjacent to the Project site. The deferred development of the Exterior Lighting Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of the Plan is not required. CDFW recommends the DEIR be revised to include the Exterior Lighting Plan for CDFW review and comment. B.4-73

Parks and Recreation (Section 5.14): The Parks and Recreation section of the DEIR requires the development of a Public Access Plan "to ensure significant, but well managed, public access into the Conservation Easement Areas." CDFW is unclear if this Plan will incorporate public access into both the SEA and the offsite mitigation lands since the Conservation Easement Areas are not clearly and consistently defined in the DEIR. The DEIR states that "there would be no disturbance or development within the designated SEA" (see page1-6 of the DEIR); however, allowing public access within the SEA would be considered a Project impact and would need to be analyzed in the Biological Resources section of the DEIR. In addition, impacts from public use of the mitigation lands should also be analyzed in the Biological Resources section of the DEIR. Furthermore, the deferred development of the Public Access Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of the Plan is not required. CDFW recommends B.4-74

the DEIR be revised to include the Public Access Plan for CDFW review and comment and that public access, development and disturbance within the SEA be prohibited. B.4-74 cont.

Cumulative Impacts (Section 7.0): The Cumulative Impacts section of the DEIR makes the determination that the Project will result in a cumulatively significant impact to native grasslands and regional wildlife movement. CDFW agrees with this determination. Based on the current design of the Project, CDFW has also determined that development of the Project will result in significant impacts to local wildlife movement and special status plant species. CDFW recommends the Project be redesigned to allow for local and regional wildlife movement through the site (including grassland and drainage areas east of the California Aqueduct) and avoid and preserve a significantly larger proportion of special status plant species occurring in the grassland areas of the Project site east of the California Aqueduct. B.4-75

Centennial Specific Plan (CSP): Figure 3-2 in the CSP appears to indicate the presence of roads within the SEA. It is unclear from this map if these are existing or newly proposed roads since they are not labeled in the map legend. These roads have not been described in any other area of the DEIR or the CSP. The DEIR and CSP states that Project-related impacts will not occur within the SEA. Please clarify the presence and intended use of the roads within the SEA. B.4-76

The CSP and DEIR include the Open Space lands to the east of the California Aqueduct as part of the Project's onsite mitigation. As previously discussed, these areas as currently designed, do not support species movement and/or use in these Open Space areas of the Project site, and therefore should be removed from the onsite mitigation acreages until the Project is redesigned to address these species issues. B.4-77

The CSP leaves several items of enforcement and control under the responsibility of the Home Owners Association (HOA). These items include, but are not limited to, the maintenance of internal and transitional slopes, the maintenance of fuel modification zones, the control of Argentine ants, the enforcement of drought-tolerant planting and education, the enforcement of prohibited plant species and the eradication efforts of these species. It is unclear to CDFW where the funding, training and dedicated staffing will come from to enforce these policies. CDFW would also like to note that previous projects that have proposed and implemented similar measures have had mixed success with implementation of these measures. The failure to implement these measures may significantly impact sensitive biological resources on the Project site and needs to be evaluated in the DEIR. B.4-78

The planting guidelines in the CSP allow for the use of ground covers and turf grasses. Because of their potential to quickly spread into adjacent native vegetation and Open Space areas, CDFW recommends prohibiting the use of ground covers and Bermuda grass in Open Space areas and areas adjacent to Open Space and native vegetation. B.4-79

The CSP Hillside Design Guidelines (HDG) include a guideline to retain and incorporate 50 percent or more of the existing onsite trees and woodlands into the overall Landscaping Plan. It is unclear to CDFW if this percentage will include the lands within the SEA or if this requirement focuses on the remainder of the Project site. If this guideline includes the SEA area, CDFW would like to know what percentage of the SEA will be counted toward achieving the 50 percent success metric. The HDG also includes a guideline to use bridge design techniques that "allow easy wildlife migration" beneath the bridge with a minimum 6-foot vertical B.4-80

and horizontal clearance. However, the details of the bridge design techniques are not provided in the CSP nor discussed in the DEIR. CDFW recommends the DEIR and Biological Resources section be revised to include information on the bridge design techniques and an analysis for potential wildlife movement. This is necessary to demonstrate the bridge design techniques will be functionally permeable and facilitate use by wildlife. As previously mentioned, the CSP is a guidance document and is subject to change; therefore, CDFW also recommends the bridge design techniques be included as a Mitigation Measure in the DEIR. B.4-80 cont.

The Single Family Detached (SFD) Average Fee Lot figure in the Housing Glossary section of the CSP includes an Open Space designation, which is defined as the front yard, fenced side yard, rear yard and street parkway. CDFW requests clarification as to whether the acreages associated with the SFD Open Space designation are included in the Open Space acreage calculations for onsite mitigation lands. B.4-81

Thank you for the opportunity to comment on the DEIR and CSP. If you have any questions regarding these comments, please contact Lori Bono, Senior Environmental Scientist (Specialist), at (559) 243-4014, extension 350, or lori.bono@wildlife.ca.gov. B.4-82

Sincerely,

Julie A. Vance

Responses to Comment Letter B.4
California Department of Fish and Wildlife
July 17, 2017

Response to Comment B.4-1:

Thank you for your comment and your participation in this public process. This introductory comment does not raise any specific concerns regarding the Project's potential environmental effects or the adequacy of the Draft EIR. Therefore, no further response is required. This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Following receipt of this comment, the Applicant met with representatives of the CDFW on two occasions and had three additional conference calls to review each of the comments raised in CDFW's letter in detail. The Final EIR includes additional details, clarifications, and text modifications, as discussed with CDFW following receipt of this Draft EIR comment letter.

Response to Comment B.4-2:

This introductory comment summarizes the Project description and does not raise any specific concerns regarding the Project's potential environmental effects or the adequacy of the Draft EIR. Therefore, no further response is required. This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment B.4-3:

This introductory comment does not raise any specific concerns regarding the Project's potential environmental effects or the adequacy of the Draft EIR. Therefore, no further response is required. This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment B.4-4:

The comment is noted. No further response is required given that the comment does not address or question the content of the Draft EIR.

Response to Comment B.4-5:

The descriptions of the statutory and CEQA jurisdiction of the California Department of Fish and Wildlife are noted for the record. The Draft EIR also includes a regulatory setting description of relevant laws and regulations in Section 5.7.2, Relevant Plans, Policies and Regulations.

Response to Comment B.4-6:

Exhibit 4-7, Centennial Project – Circulation Plan, depicts the Project's roadway circulation plan and labels the roads according to roadway type (e.g. major highway, secondary highway, collector, SR-138). The existing alignment of the Cement Plant Road within the SEA would remain unchanged and would not be widened or otherwise altered with Project implementation. The proposed re-alignment of Cement Plant Road begins within the Project's development area footprint and would be designed as a two-lane collector road, and not a six-lane major highway as stated in the comment. As such, the realignment of Cement Plant Road would have no impacts on the SEA.

Response to Comment B.4-7:

The extension of existing cable and internet from their current location to the Project site would occur via existing utility poles or within existing underground vaults. As a result, activities associated with the extension of these services are expected to entail only maintenance and minor modification of existing facilities, and would not disturb vegetation or wildlife.

Response to Comment B.4-8:

This comment states that CDFW recommends that all new and existing dry utilities be installed underground to minimize impacts to migratory birds. As stated in the Project Description, "All on-site dry utilities will be constructed within public right-of-way…", and "Existing overhead lines along SR-138 and Gorman Post Road, as well as the lines running from the Bailey Substation to the northwest within the site, may be relocated; they may remain overhead; or they may be placed underground".[150] Maintaining existing overhead utility lines would not result in an impact associated with the Project, as this is the existing condition. Whether or not existing overhead lines are placed underground is a decision that would occur as part of Project implementation (if approved). The comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment B.4-9:

Although the Project has been designed to avoid impacts to many drainages identified on the Project site, some drainages will be impacted. Impacts range from minor temporary disturbance of some drainage areas to the permanent loss of other drainage areas. The temporary and permanent loss of vegetation, habitat and functions and the effect on plant and wildlife species is analyzed in the Draft EIR; these analyses are located throughout Section 5.7.6 beginning on page 5.7-141 through page 5.7-173. Jurisdictional drainage impacts are specifically discussed on pages 5.7-162 and 5.7-163 and shown in Figure 5.7-13. The Draft EIR also considers graded/reengineered drainages as a permanent loss in terms of biological resource impacts, even though some functions may be restored in the post-Project drainage condition. Additionally, a new Exhibit B.4-9, On-Site Open Space Areas, has

[150] DRP 2017, p. 4-95

been prepared as part of this response to comment, and illustrates where most of the existing drainage corridors are retained as the general location of re-engineered drainages. New exhibits are included in Section 3.0, Draft EIR Clarifications and Revisions, of this Final EIR.

The effects of Project implementation on downstream (i.e. off-site) biological resources is expected to be negligible because the changes in existing drainage hydraulics and water quality as it exits the development areas are negligible. As discussed in Sections 5.2, Hydrology and Flood, and 5.4, Water Quality, regional and distributed water quality treatment measures (e.g. regional detention and retention basins and parcel-specific measures) will meet County LID standards for new development and will provide sufficient treatment capacity to reduce potential surface and ground water quality. As discussed in Section 5.2, Hydrology and Flood, the hydromodification BMPs for the Project would be consistent with County requirements for new development set forth in the County LID Standards Manual, as incorporated in MM 2-1.[151] Performance standards for post-development peak flow rates and volumes during major (50-year) storm events are also consistent with County requirements and are incorporated in MM 2-2.[152] As required in MM 2-2, all BMPs must be implemented to ensure that, for the capital event, there is no increase in peak discharge rates and no increase in runoff volume offsite compared with peak discharge rates and runoff volumes under existing, pre-development conditions. Compliance with the hydrology and flood performance standard shall be demonstrated by using a methodology approved Los Angeles County Department of Public Works for comparing Project site pre- and post-development peak discharge rates and runoff volumes.[153] Furthermore, Section 5.2 provides that all soft-bottom drainage facilities – including regional and distributed basins and stream channels – would be designed to fully drain or infiltrate captured water in less than four days.[154] As a result, invasive aquatic wildlife species would be precluded from becoming established. The seasonality of flows is expected to match pre-project conditions other than a small quantity of urban run-off flow expected to be near perennial. To manage these flows, forebays at the entrance of each LID basin are designed to capture these flows where vegetation increases can be managed routinely. As a result, impacts on biological resources are expected to be less than significant. In addition, to provide assurance that the Project's flood control and other water retention features do not allow establishment of invasive aquatic wildlife, MM 7-16 has been modified to incorporate monitoring and eradication if necessary. The following text modification is made to the last paragraph of MM 7-16 on page 5.7-192 of the Draft EIR (which also addresses management of potential future recreational pond features addressed in response to Comment B.4-10):

> To prevent the establishment of invasive aquatic wildlife such as the American bullfrog (*Lithobates catesbeianus*) and the African clawed frog (*Xenopus laevis*), all Project flood control and other water retention features shall be monitored seasonally and following rain fall events to confirm pooling does not persist for more than 15 days. If such pooling beyond 15 days is detected,

151 *Id.,* p. 5.2-49
152 *Id.,* pp. 5.2-49 and -50
153 *Id.,* pp. 5.2-49 and -50
154 *Id.,* p. 5.2-48

> including, for example, in artificially created fishing/casting ponds which can only be constructed following issuance of a conditional use permit and further environmental review, the constructed pond location shall be checked routinely for presence of aquatic invasive wildlife by a qualified biologist until the unexpected pooling no longer persists. If detected, eradication measures to remove all invasive aquatic wildlife shall be implemented by the qualified biologist and may include one or more techniques, including trapping, pithing, and pellet shooting.

As noted by the Commenter, Project implementation will result in reduced flows in several watersheds.[155] Reductions in the Oso Creek watershed area are relatively minor relative to the total watershed flow. Oso Creek has significant inflow from other tributaries immediately downstream of the Project, which provides the majority of downstream flows; therefore, no significant offsite impacts from reduced flows will result in the Oso Creek watershed. The eastern flowing watersheds do not support downstream aquatic or riparian resources. When flowing northeastward off the site, these drainages merge and sheet flow across the bridge over the east branch of the California Aqueduct and are no longer discernable.[156] Historical imagery shows that flows are very infrequent this far downstream and dissipate quickly across active agricultural fields. The result of the reduced downstream surface flows is an increase in infiltration upstream on the Project site, whereby the underground aquifers do not experience a reduction. As a result, downstream resources are not expected to be impacted to any measurable degree. To clarify the lack of downstream changes occurring off-site, additional language has been added to the Draft EIR on page 5.7-163 as a stand-alone paragraph after the paragraph starting with "Additionally" and before the paragraph starting with "Impacts" near the bottom of the page.

> The Project's drainage masterplan is designed to ensure, as required by State mandate, that the quantity and quality of water leaving the Project is not greater than the pre-Project condition at the point of discharge. Additionally, although the Project results in reduced flows in some downstream areas, they are either very minor, such as in Oso Creek, or there are no aquatic/riparian resources supported downstream, such as the eastern drainages. Lastly, the timing of flows, both seasonally as well as pooling and flowing durations, are not expected to defer substantially from pre-project conditions, as further addressed in Section 5.2, Hydrology and Flood, of the Draft EIR. As a result, off-site downstream drainages as well as the associated habitats and plant and wildlife species are not expected to be impacted to any measurable degree. Furthermore, those drainages that are proposed for a continuous series of in-channel hydraulic measures are considered impacted in their entirety.

In addition to meeting the RWQCB and County's hydrology and water quality standards, MM 7-12 on page 5.7-187 of the Draft EIR also specifies that the Project Applicant/Developer

155 *Id.,* Table 5.2-7
156 *Id.,* p. 5.2-18

is required to obtain the necessary permits or agreements, including compliance with the Streambed Alteration Agreement requirements of the California Fish and Game Code.

Response to Comment B.4-10:

Please see response to Comment B.4-9 above. As discussed in this response, regarding the location of the exiting flows from the Project site, the effects of Project implementation on downstream (i.e. off-site) biological resources is expected to be negligible because the changes in drainage hydraulics and water quality as it exits the development areas are negligible. Historical imagery shows that flows are very infrequent this far downstream and dissipate quickly across active agricultural fields. The result of the reduced downstream surface flows is an increase in infiltration upstream on the Project site, whereby the underground aquifers do not experience a reduction. As a result, downstream resources are not expected to be impacted to any measurable degree. To clarify the lack of downstream changes occurring off-site, additional language has been added to the Draft EIR, as described in response to Comment B.4-9. The discharge locations (nodes 1 through 8) in the existing condition were relabeled to conduct the post-development analysis, and are located at the same points along the Project boundary.[157] Therefore, off-site discharges would maintain the same connectivity to drainage courses and associated biological resources. Regarding the use of the proposed retention and detention basins, these facilities would not be used for recreational purposes. These would solely act as flood control facilities and not as components of proposed parklands.

In addition, although some of the existing drainages will be graded/reengineered/re-contoured or modified with drop structures, many biological functions will be realized in the post-Project drainage condition. A new Exhibit B.4-9, On-Site Open Space Areas, has been prepared and illustrates where most of the existing drainage corridors are retained as the general location of re-engineered drainages. New exhibits are included in Section 3.0, Draft EIR Clarifications and Revisions, of this Final EIR. This consistency in the approximate location of these drainage pathways allows for the retention of connectivity between on and off-site drainages.

As presented in Section 4.8, Intended Use, of the Draft EIR, in addition to the Project's discretionary actions (i.e. approval of the Specific Plan, General Plan Amendment, Zone Change, Vesting Tentative Parcel Map, Development Agreement, and Conditional Use Permit), additional ministerial and discretionary actions related to the future approvals are anticipated for Project implementation. Project buildout would be implemented in phases, based on future market conditions, over an approximate 20-year period, through a series of future tract and parcel maps.

A fishing/casting pond for non-commercial use is among the recreational amenities that could be included in the Project's recreational open space. There is no current plan, location or other information known about the potential amenity; the final amenity suite for each park area (e.g. playgrounds, tennis courts, picnic areas, etc.) will be designed as part of the tentative tract mapping process for sub-areas of the Project site. To address the

[157] *Id.*, p. 5.2-39

Commenter's concern about the potential impacts associated with such a non-commercial fishing/casting pond, the Specific Plan Table 2-16, Land Use Matrix, has been revised to require a subsequent County discretionary approval ("C" for conditional use permit) instead of a ministerial approval ("P" for permitted without further discretionary review). As a constructed, non-commercial recreational amenity, such as an artificial pond will be required to comply with all applicable water quality and safety laws and regulations, and is not anticipated to have any new or worse significant environmental impacts. The detailed designated and operational features of any such future pond will be subject to review and approval as part of the future discretionary tentative tract map approval process. Some future actions will be ministerial in nature as they will not require any special discretion or judgment on the part of the County official in processing the application; such actions will not require future CEQA review. Other actions will require the exercise of discretion by the County or may propose a scope of development that has not been reviewed as part of the Draft EIR. Future CEQA review of these discretionary actions shall be processed in accordance with CEQA and the State CEQA Guidelines. Examples of such future discretionary actions include: land uses requiring substantial conformance review, conditional use permits (CUP), parcel maps, and tentative maps, as presented in further detail on pages 4-106 to 4-107of the Draft EIR.

In addition, to provide assurance that the Project's flood control and other water retention features do not allow establishment of invasive aquatic wildlife, MM 7-16 will be modified to incorporate monitoring and eradication, if necessary. The following text is hereby added to the last paragraph of MM 7-16 on page 5.7-192 of the Draft EIR:

> To prevent the establishment of invasive aquatic wildlife such as the American bullfrog (*Lithobates catesbeianus*) and the African clawed frog (*Xenopus laevis*), all Project flood control and other water retention features shall be monitored seasonally and following rain fall events to confirm pooling does not persist for more than 15 days. If such pooling beyond 15 days is detected, including, for example, in artificially created fishing/casting ponds which can only be constructed following issuance of a conditional use permit and further environmental review, the constructed pond location shall be checked routinely for presence of aquatic invasive wildlife by a qualified biologist until the unexpected pooling no longer persists. If detected, eradication measures to remove all invasive aquatic wildlife shall be implemented by the qualified biologist and may include one or more techniques, including trapping, pithing, and pellet shooting.

Response to Comment B.4-11:

The remnant mineshaft, as stated in the comment, is described in Section 5.3, Hazards and Fire Safety, for the purpose of providing a general description of the mineshaft dimensions for context to potential site hazards. That site reconnaissance documentation was conducted in 1999.[158] Subsequent to this, several biological surveys of the Project site have been conducted, with the most recent site reconnaissance that would have observed the mineshaft

[158] DRP 2017, Exhibit 5.3-1

occurring for the 2015 special status plant surveys. Site surveys determined that the mineshaft did not constitute suitable habitat for bat roosts and no evidence of bat occupation was detected.

Discussions of suitable bat habitat found on site are provided in Draft EIR Section 5.7, Biological Resources, Table 5.7-8, on pages 5.7-97 and 5.7-98, with further discussion on pages 5.7-124 and 5.7-125. In addition, the following text is hereby inserted at the end of the second paragraph in the "Mammals" section on page 5.7-50 of the Draft EIR:

> The habitat value, and potential for sensitive bat species occurrence, was evaluated for the remnant mineshaft entrance in the northwest of Quail Lake. The entrance is shallow and exposed (approximately 6 feet deep by 4 feet tall by 5 ½ feet wide), and accordingly, does not provide the type of habitat used by bats. No bats were observed, and there is no evidence of prior bat occupancy.

In addition, based on the lack of characteristics typically associated with a mine shaft, other wildlife species known to prefer such features are not expected to occur. However, the location in general has been surveyed in the past and may be surveyed in the future if it falls within potentially suitable habitat of a species for which surveys are being conducted in accordance with MMs 7-2, 7-3, and 7-5 described on pages 5.7-175 through 5.7-177 of the Draft EIR.

Response to Comment B.4-12:

In order to reduce the potential for fugitive dust during short-term construction activities, MM 3-2 in Section 5.3, Hazards and Fire Safety, requires the use of environmentally safe dust control agents or paving on unpaved access roads during rough grading and construction activities.[159] Such access roads would connect paved/developed roadways in completed phases of the Project to areas of disturbance from grading. The exact location(s) of these access roads is unknown and would be determined as the phased implementation of the Project moves forward. However, these temporary construction access roads would occur within the overall Project grading footprint. For these disturbed areas, the Draft EIR considers them to be impacted and wildlife habitat values are considered lost. It is possible that wildlife will traverse graded construction areas that are treated with soil binders. As such, the text below is hereby added to the end of page 5.7-166 of Section 5.7, Biological Resources, of the Draft EIR under the heading "Indirect Impacts" in order to provide an assessment of the impacts on wildlife that may continue to utilize these areas during the construction phases when dust control agents are in use:

> During grading and construction, implementation of environmentally safe dust control agents may be used on unpaved access roads that connect paved/developed roadways in completed phases of the Project to areas of disturbance from grading. Although the application of dust control agents would occur on disturbed access roads that would be devoid of vegetation,

[159] *Id.,* p. 5.3-26

> some wildlife may enter the construction area. Due to the lack of cover and forage, the frequency and number of animals is expected to be minimal and limited to more mobile species such as birds, large mammals, and some insects. Because MM 3-2 requires that the use of dust control agents be environmentally safe, and because the use of graded/disturbed construction areas by wildlife is anticipated to be minimal, impacts to wildlife would be less than significant.

Response to Comment B.4-13:

This comment states that future development of the Fuel Modification Plan for the Project does not provide CDFW with an opportunity to assess potential species and habitat impacts, and recommends revising the Draft EIR to include the Fuel Modification Plan.

Fuel modification planning is based many details that are not available prior to tract-map level site design, such as lot-by-lot land use types, proximity of land uses to fire hazard zones, and adjacent scopes. Therefore, a Fuel Modification Plan cannot be developed based on a conceptual land use plan, such as provided in a Specific Plan for a master-planned community. Regardless, the future implementation of the required Fuel Modification Plan was considered in the analysis of biological resources by including an average 50-foot-wide buffer to the grading/impact footprint to ensure that all anticipated potential impacts from implementation of Project were captured in the Draft EIR. Also, MM 7-1 restricts disturbance, including by fuel modification, of the crownscale and Mojave spineflower populations that are located in the described areas and MM 7-21 prohibits fuel modification zones from encroaching on the adjacent Significant Ecological Area (SEA).

Response to Comment B.4-14:

The Commenter's description of the jurisdictional activities of the two Regional Water Quality Control Boards (RWQCBs) is noted for the record. The regulatory setting descriptions provided in Section 5.2.2, Relevant Plans, Policies, and Regulations, of Section 5.2, Hydrology and Flood, includes additional information about RWQCB jurisdiction. The Draft EIR includes a project-level analysis of all planned land disturbances in Section 5.7, Biological Resources;[160] and a further analysis of changes in on-site hydrology, during construction and operation, in Section 5.2.[161] Loss of habitat values in jurisdictional waters and riparian areas is included in Section 5.7 of the Draft EIR.[162]

Although the location of specific building foundations is not known at this time, dewatering associated with the testing of water lines, sprinkler systems, and other facilities, like foundations, is anticipated, as discussed on page 5.4-55 of Section 5.4, Water Quality. The Project will comply with the State's Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit during construction. Best Management Practices (BMPs) that would be implemented under

160 *Id.,* pp. 5.7-141 to -162
161 *Id.,* pp. 5.2-23 to -43
162 *Id.,* pp. 5.7-162 to -164

the General Dewatering Permit for construction dewatering include infiltration of clean groundwater; on-site treatment using suitable treatment technologies; on-site or transport off site for sanitary sewer discharge with local sewer district approval; or use of a sedimentation bag for small volumes of localized dewatering.[163] In summary, the Project's construction period runoff that is subject to treatment BMPs that comply with the State's Construction General Permit, and with the Limited Threat Discharge and Dewatering Permits adopted by the Lahontan and Los Angeles RWQCBs during construction, would have less than significant impacts to water quality, and therefore, would not significantly impact biological resources. In addition, to provide assurance that the Project's flood control and other water retention features do not allow establishment of invasive aquatic wildlife, MM 7-16 will be modified to incorporate monitoring and eradication if necessary. The following text is hereby added to the last paragraph of MM 7-16 on page 5.7-192 of the Draft EIR:

> To prevent the establishment of invasive aquatic wildlife such as the American bullfrog (*Lithobates catesbeianus*) and the African clawed frog (*Xenopus laevis*), all Project flood control and other water retainment features shall be monitored seasonally and following rain fall events to confirm pooling does not persist for more than 15 days. If such pooling beyond 15 days is detected, including, for example, in artificially created fishing/casting ponds which can only be constructed following issuance of a conditional use permit and further environmental review, the constructed pond location shall be checked routinely for presence of aquatic invasive wildlife by a qualified biologist until the unexpected pooling no longer persists. If detected, eradication measures to remove all invasive aquatic wildlife shall be implemented by the qualified biologist and may include one or more techniques, including trapping, pithing, and pellet shooting.

The biological resources analysis in Section 5.7 of the Draft EIR is comprehensive, and assesses the impacts associated with the complete loss of biological resources within the impact footprint as well as implementation of the suite of mitigation measures and PDFs set forth in both Sections 5.2 and 5.7. This bigger picture, conservative approach is adequate to determine Project impacts of these dewatering and discharge activities at this time, as part of the CEQA process.

With respect to the Jurisdictional Delineation (JD) of water resources on the site, during the preparation of the Draft EIR, Psomas received input from the Lahontan Regional Water Quality Control Board (LRWQCB) and California Department of Fish and Game (CDFW) on the JD based on conference calls to discuss the findings of JD report and site visits conducted in February 2016 and May 2017. LRWQCB staff did not have any suggested revisions to the findings of the JD report.

The JD report identified as "waters" on the Project site intermittent or ephemeral lengths of "episodic" streams that flow for only a short time during and immediately after rain events. During the May 2017 site visit, CDFW staff did not identify any streams, wetlands, or riparian

[163] *Id.,* pp. 5.4-29 and -30, -53 to -57

areas that were omitted from the JD report. CDFW staff did, however, recommend expanding the acreage of some of the intermittent and ephemeral streams on the Project site based on an interpretive report published by the California Energy Commission (CEC) called "Methods to Describe and Delineate Episodic Stream Processes on Arid Landscapes for Permitting Utility-Scale Solar Power Plants, with the MESA Field Guide".[164] For several decades prior to issuance of the MESA Memo, CDFW had interpreted and applied its "streambed alteration agreement" permit program under *California Fish and Game Code* Section 1600 to regulate stream widths based on the onsite physical "bed and bank" features of ephemeral and intermittent streams, which typically flow only during and for a short time after rain events, that are common in arid climates such as the Project site. Under the MESA Memo, however, CEC staff—working with CDFW staff—decided that for utility-scale solar power plants in arid climates, agency permit authority should be expanded to include areas near a stream that did not have a "bed and bank" but showed any evidence of water flow or erosion.

Applying the MESA Memo outside the context of CEC's utility-scale permit authority has been controversial, particularly since it dramatically expands longstanding CDFW Section 1600 program interpretations without any change to this existing program's statutes and regulations.[165] CDFW's website does not identify the MESA Memo as an applicable CDFW Section 1600 guidance document; it is instead identified as an "additional resource" developed "from other agencies"—in this case the California Energy Commission.[166]

Although CDFW staff have continued to implement the MESA Memo expanded interpretation under the agency's interpretation of the Section 1600 permit program, the California Legislature passed Senate Bill 506 in the 2017 session which directed CDFW to update its website with guidance documents that CDFW was and intended to continue to apply to its Section 1600 permit program. Governor Brown vetoed SB 506, however, and in in his veto message instead noted that CDFW "is beginning a rulemaking process on the Lake and Streambed Alteration Program" and thus that posting any interpretative or regulatory guidance on its website was "premature." The Governor's veto message concluded, "I am directing the Department to update its website to reflect the new guidance, once the regulations are complete." Since CDFW has not yet proposed any new regulations or otherwise begun the rulemaking process, CDFW staff's recommended addition of "Mesa Memo" acreage to the JD report is similarly premature. As part of its responsible agency authority, CDFW has permit jurisdiction over Section 1600 streambed alterations under existing and future changes to its regulatory program. For lead agency CEQA compliance purposes, the physical features of the site are accurately described under existing adopted statutes and regulations. CDFW's MESA Memo, and staff interpretations of the application of the MESA memo on the Project site, are noted for the record as is CDFW's responsible agency jurisdiction to interpret and apply the Section 1600 program at the Project site. If the MESA Memo is in fact adopted as a future regulation, with no changes made during the rulemaking process or by the Legislature, there would be no change to the impacts analyzed, but more of the Project site would be subject to the Section 1600 CDFW permit program requirements. For informational purposes, based on CDFW staff's interpretation and application of the

164 Please see http://www.energy.ca.gov/2014publications/CEC-500-2014-013/index (MESA Memo).

Response to Comment B.4-15:

The Draft EIR includes PDF 4-2 and MM 4-2 in Section 5.4, Water Quality, which require that the Project implement an Integrated Pest Management (IPM) program consistent with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California, Division of Agriculture and the Natural Resources Statewide Integrated Pest Management Program. The IPM program must prevent or suppress pest problems (i.e., insects and diseases) through a combination of techniques including using pest-resistant plants, biological controls, cultural practices, habitat modification, and judicious use of pesticides. Pesticide management BMPs will be implemented to promote safety (e.g., Material Safety Data Sheets, precautionary statements, protective equipment); compliance with regulatory requirements; spill mitigation; groundwater and surface water protection measures associated with pesticide use; and pesticide applicator certifications, licenses, and training (i.e., all pesticide applicators must be certified by the California Department of Pesticide Regulation).[167] MM 4-2 provides more than guidelines for development of the IPM; it sets forth a performance standard that requires prevention or suppression of pest problems as well as a combination of techniques described above to achieve the performance standard[168], and therefore is legally sufficient (see response to Comment F.8-173). To ensure that the performance standards above are met, County approval will be required, and MM 4-2 in the Draft EIR will be modified, as follows:

> The Project shall implement integrated pest management (IPM) and landscaping best management practices (BMPs) consistent with the

[167] DRP 2017, pp. 5.4-30 and -90
[168] *Id.,* pp. 5.4-30, -31; 5.4-79, -90, -91

> integrated pest management and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program. The integrated pest management program will be provided to the County in association with the Landscape Plan submitted to the County with each tentative tract map.

In addition, the following sentence in the Impact Summary on pages 5.4-66, 5.4-71, and 5.4-89 in the Draft EIR will be modified, as follows:

> Compliance with the LID performance standards and integrated pest management and landscaping BMP requirements will be reconfirmed ~~in drainage and landscape plans to be submitted to the County~~ in conjunction with each Project tract map review and approval process.

Response to Comment B.4-16:

MM 4-2 in the Draft EIR will be modified to prohibit the use of rodenticides containing anticoagulants on the Project site or Mitigation Preserve lands.[169] The following text will be added as the seventh bullet (last bullet) to MM 4-2 in Section 5.4, Water Quality:

- All rodenticides containing anticoagulants shall be prohibited from use on the Project site or Mitigation Preserve lands. The probation shall be clearly described and distributed to home buyers through their home purchase contract and CC&Rs.

It is noted that CC&Rs are a binding enforcement mechanism, and that violations of the CC&Rs are subject to private enforcement by the master developer and HOA. As a volunteered mitigation measure the County also has CEQA enforcement authority per the MMRP. With this addition, the subsequent recommendations in the comment regarding how to manage/minimize the impacts, if not feasible to prohibit the use of rodenticides containing anticoagulants, are no longer applicable.

Response to Comment B.4-17:

In an effort to make the plan for implementing grassland preservation and management available immediately, the Ranch-wide Management Plan (RWMP) shall be adopted as the managing plan, included in the Final EIR, and no new plan will be prepared. Management of the Mitigation Preserve shall be in accordance with the RWMP, which incorporates BMPs for grazing, including Residual Dry Matter targets, and weed management, including invasive plant mapping and targeted removal actions (see RWMP Vol. II Sections 5.1 and 5.2). The RWMP includes standards for management of the grasslands areas that will preserve the grasslands in perpetuity. The RWMP has been submitted for review and approval to CDFW and USFWS, as applicable. The RWMP provides a comprehensive framework, with the context of the TRCRWA, for the effective preservation and management of the preserved

[169] *Id.,* p. 5.4-90

open space lands located on Tejon Ranch, including the mitigation lands for the Project site. The RWMP shall be included as Final EIR Appendix 5.7-D and the Tejon Ranch Conservancy Ranch-Wide Agreement (TRCRWA) shall be included as Final EIR Appendix 5.7-E, and the following edit is hereby made to page 5.7-62.

> Under the TRCRWA, the Tejon Ranch Conservancy will adopt, update, monitor and enforce implementation of the Ranch-~~W~~wide Management Plan (RWMP) (Final EIR Appendix 5.7-D) on dedicated conservation areas and option areas subject to conservation, preservation, mitigation, and enhancement measures, as required under applicable law or imposed by federal, State or local agencies as part of any permit or approval for the Ranch or projects within the Ranch.

All references to the Native Perennial Grassland and Wildflower Fields Management Plan within the Draft EIR are replaced with the RWMP. Additional edits to MM 7-10 are described in response to Comment B.4-63, including edits to the last paragraph of MM 7-10 on page 5.7-182 of the Draft EIR:

> The ~~open space~~ Mitigation Preserve ~~preserve~~, including the grasslands within it, shall be preserved in perpetuity to offset Project impacts on native grasslands and wildflower fields prior to issuance of a grading permit for the Project site. The phasing of mitigation has been previously described. The preservation and management of these grasslands through the RWMP ~~Native Perennial Grassland and Wildflower Field Mitigation Plan~~ will sufficiently offset and fully mitigate the impacts on native grasslands and wildflower fields associated with the Project.

The preservation phasing [of grassland areas] through conservation easements shall be based on the percentage total area of impact per phase of development, regardless of the specific resource impacts. The specific location of the acreage to be dedicated within a particular phase will be chosen to maximize the replacement of resource values lost during that phase of construction while maintaining as much contiguous acreage as possible. In order to preserve an adequate quantity of grassland, lands outside the County of Los Angeles, within the County of Kern, would be used for mitigation. As each phase is proposed, a percentage of the mitigation preserve (which is equivalent to the percentage of that phase's impacts out of the total project impacts) shall be dedicated concurrent with the entitlement approval of that phase. The open space preserve, including the grasslands within it, shall be preserved in perpetuity to offset Project impacts on native grasslands and wildflower fields prior to issuance of a grading permit for each phase. The phasing of mitigation has been previously described. The preservation of 14,908 acres of grasslands coupled with the long-term management through implementation of the Ranch-wide Management Plan will sufficiently offset and fully mitigate the impacts on native grasslands and wildflower fields associated with the Project.

With regard to the enforceability of this mitigation, which would include continued grazing as appropriate, the MMRP constitutes a binding requirement upon the Applicant to implement all mitigation measures associated with the project. With specific regard to

MM 7-10, the timing hook for implementation of the mitigation measure is preservation of the phase's share of mitigation land prior to issuance of the grading permit for that phase. The Mitigation Monitoring and Reporting Program (MMRP) has been included in the Final EIR as Appendix 2.0-C.Rev.

With regard to the Commenter's suggestion that PDF 5-1 and all other PDFs be made mitigation measures, it is noted that all PDFs are already inherent elements of the Project. They are described throughout the Draft EIR in order to highlight the ways in which the Project has already been designed to minimize potential environmental impacts. Mitigation measures, on the other hand, are designed to reduce significant adverse impacts of a project. As such, to the extent any PDFs describe actions that are feasible mitigation measures that would reduce adverse Project impacts, all such elements of the PDFs have already been identified and incorporated into mitigation measures applicable to the Project.[170]

Response to Comment B.4-18:

As of Draft EIR preparation, the tricolored blackbird was not a State Endangered Species, but rather a Candidate under review for this status. On April 19, 2018, the California Fish and Game Commission authorized the listing of tricolored blackbird as a "threatened" species.[171,172] However, it is noted that Candidate species are afforded the same legal protections as state listed species. Therefore, consultation with CDFW will be required. The relevant analysis therefore remains the same under CEQA, and no mitigation measure updates are required.

No tricolored blackbird have been seen at the northern portion of the Project site in recent years; however, the permanent setback described for this species in MM 7-7 in Section 5.7, Biological Resources, on pages 5.7-178 and 5.7-179 will apply to both the Quail Lake use area as well as the pond use area in the northern portion of the Project site. Thus, all permanent direct impacts to potential breeding ponds will be avoided as discussed in the Draft EIR However, the MM 7-7 will be revised to require that all temporary impacts will be avoided within ¼ mile during the nesting season to avoid indirect effects during construction. See responses to Comments B.4-18, B.4-19, F.3-14, F.3-15, F.3-16 F.3-17, F.3-18, F.3-19, F.3-20, F.3-21, F.8-156, and F.8-158 and other applicable responses for further information.

With respect to foraging habitat, the Draft EIR indicated that loss of foraging habitat could interrupt breeding if both Quail Lake and the north pond were used for breeding at the same time. As noted above, it has been nine years since any tricolored blackbird were found at the north pond, the habitat has become severely degraded, and the area is not likely to become suitable in the future. The species routinely shifts breeding locations, and there are also existing suitable breeding locations within the Mitigation Preserve as described in Appendix 5.7-C of the Draft EIR, so the likelihood that both areas will be used for breeding at the same time is extremely low. Nevertheless, MM 7-7 has been modified to require a ¼ mile

170 DRP 2017, p. 2-6, 4-16

171 California Fish and Game Commission (FGC). 2018 (April). Revised Meeting Agenda, April 18-19, 2018, 9:00 AM. Sacramento, CA: FGC. http://cal-span.org/unipage/?site=cal-span&owner=CFG&date=2018-04-19.

172 Nossaman, LLP. 2018 (April 19). California Lists Tricolored Blackbird. Irvine, CA: Nossaman. https://www.endangeredspecieslawandpolicy.com/2018/04/articles/listing/california-lists-tricolored-blackbird/.

setback during breeding season, which will protect the existing foraging habitat for that season during construction, and the land use adjacent to Quail Lake up to approximately ½ mile is almost entirely open space recreation and, therefore, will be permeable and available for foraging. Please also see discussion of coordination with CDFW in response to Comment B.4-1.

In addition, potential indirect impacts to tricolored blackbird are assessed in the Draft EIR, these potential indirect impacts include (1) increased lighting and glare effects on wildlife species in the remaining and adjacent open space areas; (2) potential increase in use of pesticides, herbicides, and in release of pollutants into adjacent drainages, creeks, and wetlands as a result of landscaping maintenance, irrigation, and storm water runoff; (3) increase in non-native plant species that are adapted to more urban environments and can out-compete native species for available resources, thus reducing the distribution and population of native species; (4) increases in human activity and domestic animal presence that can disturb natural habitat areas by trampling and extirpating native vegetation and displacing wildlife populations. Implementation of MMs 13-2 and 13-6 from Section 5.13, Visual Resources, which require the Project Applicant to develop a Lighting Plan to reduce potential impacts to biological resources caused by light and glare. MM 4-2 in Section 5.4, Water Quality, and is hereby edited to add the following text on page 5.4-91.

- Pesticide management, which includes safety requirements (e.g., Material Safety Data Sheets, precautionary statements, protective equipment); regulatory requirements; spill mitigation measures; groundwater and surface water protection measures associated with pesticide use; and pesticide applicators must be certified by the California Department of Pesticide Regulation.
- <u>All rodenticides containing anticoagulants shall be prohibited from use on the Project site or Mitigation Preserve lands. The probation shall be clearly described and distributed to home buyers through their home purchase contract and CC&Rs.</u>

MM 7-13 requires a Landscaping Plan (subject to County review) and will identify both a plant palette composed of non-invasive species and a list of invasive plant species prohibited from being planted on the Project site. MM 7-157 requires a public awareness program to restrict public access to the riparian and open space areas. MM 7-15 would require installation of waste and recycling receptacles that discourage foraging by wildlife species; inspection of all landscaping materials to ensure that they are free of Argentine ants prior to planting; and distribution of educational pamphlets to future Project residents regarding the importance of not feeding wildlife. MM 7-17 requires the implementation of a public awareness program in an effort to restrict public access to the riparian and open space areas to designated trails and to prevent unleashed domestic animals from entering these areas. This program will also include signs that identify the boundaries of ecologically sensitive areas; the use of temporary fencing around sensitive areas; and the promotion of public education and awareness of such areas. In addition, only passive recreational activities shall be permitted in designated natural open space areas, and all dogs shall be required to be leashed while in the designated natural open space areas.

Furthermore, as described in response to Comment B.4-63, MM 7-10 has been modified to preserve additional mitigation lands, which includes preservation and management of 14,908 acres of suitable foraging habitat for tricolored blackbird and the Mitigation Preserve includes 1.1 acres of existing breeding habitat. Finally, MM 7-12 will preserve and enhance wetland areas, which will provide more breeding habitat. Thus, with mitigation, there is sufficient foraging habitat to support the existing colonies in the Project vicinity and provide for the long-term preservation of breeding and foraging opportunities in the Mitigation Preserve. This preservation of breeding and foraging habitat in a diversity of areas allows for this wide-range foraging species to continue to persist in the region.

Therefore, the third full paragraph on page 5.7-149 of the Draft EIR is clarified as follows:

> Due to the shifting of tricolored blackbird nesting locations from year to year, a subset of two or three of the available nesting locations may represent the entire regional breeding population. A substantial reduction of foraging lands surrounding this subset of nesting locations could result in considerable reduction of nesting success. A review of the Quail Lake and the on-site colony subset identified a potential post-Project reduction of approximately 20 percent of potentially suitable foraging habitat at each location. In a given year, if these two areas were used for nesting, the reduced availability of suitable foraging land could result in substantial reduction in nesting success. However, the north pond has become unsuitable habitat, so the likelihood of its future use by tricolored blackbird is very low. Additionally, the species shifts breeding locations between sites, and there are also existing potentially suitable breeding locations within the Mitigation Preserve, so the likelihood that both areas will be used for breeding at the same time is extremely low. Nevertheless, MM 7-7 has been modified to require a ¼ mile setback during breeding season, which will protect the breeding colony for that season during construction. Furthermore, MM 7-10 has been modified to preserve additional mitigation lands, which includes preservation and management of 15,258 acres of suitable foraging habitat for tricolored blackbird and the Mitigation Preserve includes 1.1 acres of existing breeding habitat. Finally, MM 7-12 will preserve and enhance wetland areas, which will provide more breeding habitat. Thus, with mitigation, there is sufficient foraging habitat to support the existing colonies in the Project vicinity and provide additional breeding and foraging opportunities in the Mitigation Preserve. This preservation of breeding and foraging habitat in a diversity of areas allows for this wide forage ranging species to continue to persist in the region. Based on the revised MMs 7-7, 7-10, and 7-12, the impacts to foraging habitat are less than significant.

To further clarify this concern and those mentioned in other comments, the following edits are hereby made to MM 7-7 on pages 5.7-178 and 5.7-179:

> The Project shall incorporate avoidance and additional open space buffer features for each of the two ~~this~~ known tricolored blackbird nesting areas on and adjacent to the Project site ~~area~~. Permanent impacts will be restricted to

a distance of 400 feet from the nesting area excluding small impact areas associated with infrastructure and utilities along SR-138 immediately south of Quail Lake. The nesting area will be delineated by a qualified Ornithologist based on all available data (three years of site-specific data shall be used). Temporary impacts (i.e., construction noise) within a ¼ mile ~~400 feet~~ of active nesting areas shall be restricted to the non-breeding season. The breeding season for this species shall be considered April 1 through July 1. The applicant shall consult with CDFW and may obtain an Incidental Take permit if determined appropriate.

~~The Project shall include enhancement, restoration, and/or preservation of potentially suitable tricolored blackbird breeding and foraging habitat. Potentially suitable areas for enhancement and preservation include lower Oso Canyon proximate to Cement Plant Road, as well as any other created water bodies as part of the Project Drainage Plan, where feasible. Enhancement factors shall include the creation of bulrush marsh habitat or other substrate known to support breeding tricolored blackbirds; a persistent nearby standing water during the breeding season; and available adjacent foraging habitat with an appropriate food source.~~

As described on page 5.7-150, in addition to MM 7-7, the Project design incorporates a buffer. To provide further clarification of the distances of those buffers, the first full paragraph on page 5.7-150 is hereby revised as follows:

To avoid all direct impacts and minimize indirect impacts to the nesting colonies on the Project site, MM 7-7 is included. This measure states that the Project shall incorporate avoidance and additional open space buffer features for the identified nesting areas such as at the northern edge of the Project site and at Quail Lake. Permanent impacts will be restricted to a minimum distance of 400 feet from the nesting area. The nesting area will be delineated by a qualified Ornithologist based on all available data (a minimum of three years of site-specific data shall be used). Temporary impacts (i.e., construction noise) within ¼ mile ~~400 feet~~ of active nesting areas shall be restricted to the non-breeding season. The breeding season for this species shall be considered April 1 through July 1. In addition to MM 7-7, the Project design incorporates a buffer of between 1,000 and 2,000 feet along the northern shore of Quail Lake to minimize impacts to adjacent foraging grounds. At the east end of the Lake, east of the mouth of the aqueduct, where a small section of shoreline is close to the project impact footprint, land uses include a regional park within a low density development zone so that lands immediately beyond the required 400 foot buffer (if nesting is identified) remain permeable and retain some potential for foraging for this species.

See above and other applicable responses including responses to Comments B.4-18, B.4-19, F.3-14, F.3-15, F.3-16 F.3-17, F.3-18, F.3-19, F.3-20, F.3-21, F.8-156, and F.8-158.

Response to Comment B.4-19:

The Project Applicant is required to comply with all applicable federal, State, and local laws independent of the mitigation measures set forth in the Draft EIR. Mitigation to avoid and reduce impacts to this species has been included in the Draft EIR, as further described in response to Comment B.4-18 above. The Commenter's conclusion that an Incidental Take Permit is required under State law is noted. Please refer to response to Comment B.4-18 regarding species listing, responses to Comments B.4-29 and B.4-61 regarding applicable mitigation measures requiring pre-construction surveys, and to Applicant's independent legal obligation to secure all required permits (including where applicable ITP permits). Please also refer to response to Comment B.4-18 regarding the modified buffer distance, and further clarification regarding elevation change and Specific Plan development restrictions. Please also see discussion of coordination with CDFW in response to Comment B.4-1.

Response to Comment B.4-20:

As noted, the Bloom report (2009) was included as an appendix to the Draft EIR. The Commenter's statements regarding the Bloom report are noted for the record.

Response to Comment B.4-21:

The Draft EIR fully addresses impacts associated with anticipated California condor activity in the Project area.[173] As discussed on page 5.7-148 of the Draft EIR, the Project is not likely to lead to events that significantly impact the California condor. Furthermore, as described on page 5.7-148, MM 7-6 is included to further ensure that the proposed Project does not result in future impacts on the California condor. However, to respond to the comment, MM 7-6 is revised to better incorporate the recommendations from the Bloom report (2009). MM 7-6 on Draft EIR pages 5.7-177 and 5.7-178 shall hereby be revised as follows:

MM 7-6 Construction Monitoring - The Project Applicant~~/Developer~~ shall retain a ~~qualified~~ CDFW/USFWS-approved "Authorized Biologist~~ with knowledge of California condors~~," to ~~monitor~~ be on-call during all construction activities. If condors are observed foraging or landing in the Project area~~. The resumes of the proposed Biologist(s) will be provided to the CDFW for concurrence. This Biologist(s) will be referred to as the "Authorized Biologist" hereinafter. During clearing and grubbing of construction areas~~, the Authorized Biologist shall ~~be present at all times. During mass grading, construction sites shall be monitored on a daily basis, and the Authorized Biologist will~~ have the authority to stop all construction activities until appropriate corrective measures have been ~~completed~~ implemented. If condors are observed landing in the Project area, the Applicant shall avoid further construction within 500 feet of the sighting until the animals have left the area, or as

[173] DRP 2017

otherwise authorized by CDFW and USFWS. If the condors are nesting within 0.5-mile of any Project area, no construction activities shall occur within this 0.5-mile buffer until the condors leave, or as otherwise directed by CDFW and USFWS. All condor sightings in the Project area ~~will~~ shall be reported to CDFW and USFWS within 24 hours of the sighting.

~~To further protect California condors potentially foraging in the Project area over the long term from negative interactions with humans and/or artificial structures, the~~ Cattle Carcass Relocation - The Project Applicant~~/Developer~~ shall remove dead cattle that are found ~~or reported~~ within 1,000 feet of the boundary of a residential or commercial development within 24 hours. ~~Dead cattle shall be relocated to a predetermined location.~~ The Approved Biologist will select locations ~~where carcasses shall be placed shall be~~ a minimum of 1,000 feet from ~~a~~ development ~~area boundary. Appropriate locations~~ areas for ~~transfer~~ relocation of carcasses ~~include open grasslands and oak/grassland areas where condors can readily detect carcasses and easily land and take off without encountering physical obstacles such as powerlines and other utility structures~~. The proposed locations would be ~~selected and~~ approved by the CDFW and USFWS. ~~Pursuant to this measure, a~~ A telephone number for reporting dead cattle shall be provided ~~and actively maintained. Any cattle carcasses transferred to the relocation areas shall be reported to the USFWS Condor Group~~ by the Applicant.

Utility Hazards - All surfaces on new antennae and phone/utility towers shall be designed, installed, and operated with anti-perching devices in conformance with Avian Power Line Interaction Committee standards to deter California condors and other raptors from perching. Whenever possible, utility towers and antennae should be self-supporting (i.e. not use guy wires), and be as visible as possible (using sold panel siding or dense/wide lattice work).

Condor Educational Curriculum - The Applicant shall provide a Condor Educational Curriculum that includes the life history of the California condor, how to identify condors, TRC hunting rules and regulations, prohibited behaviors related to condors such as hunting with lead ammunition, and the legal consequences of inadvertently or otherwise illegally shooting or harming California condors. The information will also identify types of microtrash that could be ingested by adult breeding condors and describe measures to eliminate microtrash and

provide information on how to report roadkill for removal. In addition, these rules, regulations, and prohibitions shall be listed within CC&Rs.

Microtrash - During construction, the ~~area~~ Applicant shall ~~be~~ ensure that all Project areas are kept clean of debris ~~(e.g., cable, trash, and construction materials). The Project Applicant/Developer shall collect all~~ including microtrash and litter ~~(i.e., anything shiny, such as broken glass), vehicle fluids, and food waste from the Project area on a daily basis~~. Workers ~~shall~~ will be trained on the issue of microtrash: what constitutes microtrash, its potential effects on California condors, and how to avoid the deposition of microtrash.

In addition, the Applicant will ensure that routine community maintenance activities include regular efforts to eliminate microtrash on and near all work sites, recreational events, roads, and adjacent open space areas.

If it is determined that condors are ingesting microtrash in the Project area, the Applicant, CDFW, and USFWS shall evaluate potential remedies to reduce, and, if possible, eliminate microtrash ingestion. Such remedies may include increased education and awareness to residents, guests, staff, and workers regarding the dangers of microtrash, increased monitoring of events and activities that are potential sources of microtrash, and more frequent collection of microtrash.

Condor Deterrent Activities - If the Authorized Biologist deems it necessary, USFWS California condor hazing methods that do not rise to the level of "Take" under the ESA (Service 2014) will be employed. Only the Authorized Biologist, with approval from the USFWS, will conduct hazing and only when such actions are warranted. If the Authorized Biologist is not immediately available, a subset of less aggressive hazing methods, such as yelling, stomping, leashed dog barking or low pressure water spray, may be used when a clear escape route for the condors is identified and upon guidance from USFWS.

Condor Tracking – The Applicant will provide the USFWS with twenty-five (25) GPS satellite tracking transmitters (total cost not to exceed $150,000.00) prior to grading plan approval. This will allow the USFWS to more quickly identify the immediate location of birds that are not moving relative to the ground, which usually indicates that an injury, illness, or death has occurred. The ability to track the movements and locations of

individual condors can aid in the monitoring of the overall effectiveness of measures to minimize and mitigate the indirect impact of microtrash by locating possible areas where microtrash was ingested. It can also aide in identifying the location where condors were shot if such an incident were to occur.

Response to Comment B.4-22:

The Draft EIR does not indicate that that TUMSHCP provides mitigation for Project impacts on the condor. Rather, the Draft EIR, as found on page 5.7-63 and on page 5.7-173, indicates that, in addition to the Centennial Mitigation Preserve, many species may benefit from the TUMSHCP and other open space conservation efforts, like the Ranch-Wide Agreement (TRCRWA)[174] and Antelope Valley Area Plan (AVAP).

With respect to condor, no significant impact is expected to result from loss of foraging habitat. Based on the USFWS analysis, even with the cumulative build out of all development areas on the Ranch, the TUMSHCP would benefit the recovery of the condor. As discussed in the Supplemental Draft EIS for the TUMSHCP, the USFWS has reviewed all of the proposed development on the Ranch, including the Centennial Project, and through approval of the TUMSHCP, concluded "Consequently, even with the Commercial and Residential Development Activities proposed under the alternatives [TMV, Grapevine and Centennial], given the estimated amount of foraging habitat that would remain on Tejon Ranch (Ranch), and the estimated food for condors that would be produced from cattle, pig, and native ungulate carcasses on that foraging habitat, it is likely that the Ranch would continue to function as an essential and viable foraging area for the expanding condor population."[175] It is clear from this statement that the USFWS made a determination that with the TUMSHCP implementation, the Centennial Project is not expected to change the Ranch's ability to function as an essential and viable foraging area for the expanding condor population. See also Biological Opinion on the Proposed Issuance of an Incidental Take Permit for the TUMSHCP (April 26, 2013).

While the TRCRWA itself is not considered mitigation for the Centennial Project, the agreement allows its conservation lands to be used as mitigation lands for development, and the Centennial Mitigation Preserve is within its boundaries. Overall, as discussed on page 5.7-16 of the Draft EIR, the TRCRWA allows TRC and its development partners to pursue approvals from permitting agencies to develop of portions of the Ranch, including the Project site, while providing for the designation and permanent protection of approximately 145,000 acres of contiguous open space areas immediately north of the Project site to protect the biological resources and wildlife connectivity of the 270,000-acre Ranch. The TRCRWA also established options for the dedication or sale of approximately 62,000 acres in 5 additional areas of the Ranch for further open space preservation. In addition, 33,000 acres of designated open space within the development areas have been preserved. Collectively, these open space dedication and acquisition areas comprise approximately 240,000 acres,

174 Final EIR Appendix 5.7-E
175 *Ibid*.

or approximately 90 percent, of the 270,000-acre Ranch. The open space preservation and development constraints in the TRCRWA have been recorded on title, and comprise the reasonable foreseeable land uses on the Ranch. Under the TRCRWA, the Conservancy will adopt, update, monitor and enforce implementation of the Ranch-wide Management Plan (RWMP) on dedicated conservation areas and option areas subject to conservation, preservation, mitigation, and enhancement measures, as required under applicable law or imposed by federal, State or local agencies as part of any permit or approval for the Ranch or projects within the Ranch. Maintenance of the open space or conserved lands will be the responsibility of the Conservancy, funded in large part by a fee based on a portion of the purchase price for each residential parcel on the Ranch. Since Centennial constitutes over 75 percent of the currently planned residential units on the Ranch, it will bear the substantial costs of funding the Conservancy and maintaining wildlife movement corridor areas through the Ranch.

The Project design is also consistent with the AVAP inclusive of open space designations, SEA protection, and preservation of habitat linkages.[176] The AVAP is a community-based plan that is a subset of the County of Los Angeles General Plan, which includes the Project area. The AVAP EIR provides an analysis of all potential, reasonably foreseeable environmental impacts related to the implementation of the AVAP "to indicate possible ways to reduce or avoid environmental damage and to identify alternatives" to the AVAP.[177] Additionally, the AVAP EIR discloses "significant environmental impacts that cannot be avoided; growth inducing impacts; effects not found to be significant; and significant cumulative impacts of all past, present and reasonably foreseeable future projects."[178] The development areas of the Project, as required, fall within the AVAP designated development areas.

While neither the TUMSHCP nor the TRCRWA nor the AVAP mitigate for Centennial Project impacts, they contribute to the regional conservation of the Condor and other species that occur within their shared boundaries.

With respect to allowed uses within the Project's proposed Mitigation Preserve lands, the Specific Plan has been updated to reflect additional restricted uses in open space. Neither wind energy conversion systems nor solar and renewable energy generation facilities are permitted within the Open Space land use designation. Public access is prohibited on both the onsite and offsite preserve lands; though existing private recreational use may continue. Existing allowed uses such as hunting is restricted to designated hunting areas on the offsite Mitigation Preserve area only, and such use is considered compatible because no new disturbances are expected. Furthermore, hunting on the Ranch as a whole is subject to the restrictions in the TUMSHCP to protect the condor.

177 Los Angeles County Department of Regional Planning (DRP). 2014b (October). *Final Environmental Impact Report, Antelope Valley Area Plan, County of Los Angeles* (p. 2-1). Los Angeles, CA: DRP. http://planning.lacounty.gov/assets/upl/project/tnc_feir.pdf.

178 Ibid.

Response to Comment B.4-23:

The condor mitigation measures have been expanded as noted in response to Comment B.4-21. Please see response to Comment B.4-21.

Response to Comment B.4-24:

The following text is hereby inserted after the second paragraph of MM 7-2 on page 5.7-175:

> Prior to issuance of grading or building permit, the Project Proponent shall conduct appropriate burrowing owl pre-construction surveys and avoidance and mitigation measures as identified below.
>
> *Burrowing Owl Pre-Construction Surveys*
>
> The project biologist shall conduct pre-construction take-avoidance surveys no more than 30 days prior to ground-disturbing activities within each construction area. Focused burrowing owl surveys shall be conducted in accordance with the CDFW Staff Report on Burrowing Owl Mitigation (March 2012). Breeding season surveys shall include at least four survey passes completed between February 15 and July 15, with at least one visit between February 15 and April 15, and a minimum of three survey visits (at least 3 weeks apart) between April 15 and July 15, including at least one visit after June 15. Non-breeding season surveys shall include at least four visits spread evenly throughout the non-breeding season. The surveys shall be conducted in suitable burrowing owl habitat within 150 meters (492 feet) of the project footprint. Surveys shall be conducted by walking 20-meter transects. Because burrowing owls can recolonize a site after a few days, time lapses between project activities trigger subsequent take avoidance surveys, including, but not limited to an additional survey within 24 hours of ground-disturbing activities. Once surveys are completed, the project biologist shall prepare a survey report on the survey methods and results.
>
> *Burrowing Owl Avoidance and Mitigation Measures*
>
> Submit for DRP and CDFW approval and subsequently implement a Burrowing Owl Exclusion Plan, which includes four avoidance and relocation strategy tiers and associated mitigation requirements set forth in the CDFW Staff Report on Burrowing Owl Mitigation (CDFG 2012): Tier 1 – Avoidance Buffers; Tier 2 – Passive Relocation; Tier 3 – Prevention of Recolonization of Development Areas; and Tier 4 – Active Relocation (Optional). Site monitoring shall be required prior to, during, and after exclusions of burrowing owls from their burrows. Excluded burrowing owls shall be monitored and documented using artificial or natural borrows on adjoining Mitigation Preserve lands or other open space.

> Avoidance buffers shall be established in accordance with the buffer distances described in the CDFW Staff Report on Burrowing Owl Mitigation (CDFG 2012), which range from 50 to 500 meters, depending on the season and level of disturbance. The buffers may be reduced, but only after consultation with and approval from CDFW.

In addition, the following paragraph in MM 7-2 on page 5.7-175 is hereby deleted:

> ~~Pre-construction burrowing owl and Swainson's hawk surveys shall be conducted in all potentially suitable habitat areas prior to initial site preparation. Methods employed shall be consistent with standard and appropriate protocols for both species within the appropriate season of the year prior to construction. Burrowing owl pre-construction surveys shall be conducted prior to the start of construction/ground-breaking activities. Surveys will be conducted following the California Department of Fish and Wildlife's (CDFW's) 2012 burrowing owl survey protocol. These surveys shall be conducted weekly beginning 30 days prior to the start of construction with the final survey occurring 1 day prior to construction.~~

Response to Comment B.4-25:

The mitigation measure for the burrowing owl is revised as described in response to Comment B.4-24. The revisions include points 1, 3, and 4 in the comment. Regarding point 2 of the comment, the Draft EIR discusses impacts to the burrowing owl on page 5.7-150, while impacts to individuals is considered potential significant and imitation is provided, the loss of habitat is determined to be adverse but less than significant. The availability of potentially suitable habitat for this species in the region is extensive and includes the majority of the landscape within it. As such, the loss of habitat resulting from Project implementation is relatively minor and would not be expected to have a discernable effect on regional populations of the species. Furthermore, the Mitigation Preserve described in PDF 7-1 on page 5.7-135 sets aside over 27,000 acres of land composed of lands which are largely suitable for burrowing owl and burrowing owl have been detected within the Mitigation Preserve.[179] Consequently, no mitigation is required for the permanent loss of burrowing owl habitat.

Response to Comment B.4-26:

Mitigation to avoid impacts to Swainson's hawk is included in MM 7-2 on page 5.7-175 of the Draft EIR. However, in an effort to incorporate the specifics requested by the Commenter, the measure is revised. MM 7-2 is hereby revised as follows (see also response to Comment F.8-144 for changes to MM 7-2 related to golden eagle):

> ~~Pre-construction burrowing owl and Swainson's hawk surveys shall be conducted in all potentially suitable habitat areas prior to initial site preparation. Methods employed shall be consistent with standard and~~

[179] DRP 2017, Appendix 5.7-C, Mitigation Preserve Review

~~appropriate protocols for both species within the appropriate season of the year prior to construction. Burrowing owl pre-construction surveys shall be conducted prior to the start of construction/ground-breaking activities. Surveys will be conducted following the California Department of Fish and Wildlife's (CDFW's) 2012 burrowing owl survey protocol. These surveys shall be conducted weekly beginning 30 days prior to the start of construction with the final survey occurring 1 day prior to construction.~~

~~If pre-construction surveys locate an active Swainson's hawk nest on the Project site, then no construction activities will occur within ½ mile of the nest between March 1 and September 15. Furthermore, a Swainson's hawk Monitoring and Mitigation Plan shall be prepared within 90 days after locating an active Swainson's hawk nest in consultation with the County and the CDFW.~~

Prior to issuance of grading or building permit, the Project Proponent shall conduct appropriate Swainson's hawk pre-construction surveys and avoidance and mitigation measures as identified below.

Swainson's hawk pre-construction surveys

Pre-construction surveys for Swainson's hawk shall be conducted during the two survey periods prior to construction by the Project Lead Biologist following the survey methods developed by the Swainson's Hawk Technical Advisory Committee (SWHA TAC 2000). These methods include surveying for active nests within a 0.5-mile radius of all Project activities prior to construction activities.

Swainson's hawk avoidance measures

If active Swainson's hawk nests (defined as nests used during one or more of the last 5 years) are found during these surveys, the Project Proponent shall utilize the CDFW *Staff Report Regarding Mitigation for Impacts to Swainson's Hawks* (Buteo swainsoni) *in the Central Valley of California* for addressing the species as modified below. During initial ground disturbance construction, no intensive disturbances (e.g., heavy equipment operation associated with construction, use of cranes or draglines, new rock-crushing activities) or other Project-related activities that may cause nest abandonment or forced fledging shall occur within 0.5-mile of an active nest between January 1 and September 15, unless take authorization is obtained and provides otherwise.

The buffer zone may be decreased to 0.25-mile around nests for subsequent construction (i.e., in areas where disturbance—such as heavy equipment operation associated with construction, use of cranes or draglines, new rock-crushing activities—is not a normal occurrence during the nesting season). Active nest trees (where the nest is intact and has been used in the last 5 years) shall not be removed unless there is no practicable

way of avoiding them. Encroachment of construction within the 0.5-mile buffer and removal of active nesting trees shall only be undertaken subject to consultation with CDFW and issuance of a California Fish and Game Code Section 2081 Incidental Take Permit, and associated conditions, if any are required. The tree removal period shall be limited to between October 1 and December 31.

Swainson's hawk monitoring during construction

If construction or other Project-related activities that may cause nest abandonment or forced fledging are necessary within the buffer zone, prior acquisition of an Incidental Take Permit shall be required. Monitoring of the nest site by the Project Lead Biologist is required to determine whether the nest is abandoned. If the nest is abandoned and if the nestlings are still alive, the master developer shall fund the recovery and hacking (i.e., the controlled release of captive-reared young) of the nestling(s). Existing activities such as agricultural activities, commuter traffic, and routine facility maintenance activities within 0.25-mile of an active nest shall not be prohibited.

Response to Comment B.4-27:

Mitigation to avoid impacts to nesting birds is included in the Draft EIR in MM 7-8 on page 5.7-179. However, to incorporate the specifics requested by the Commenter, the measure is revised. MM 7-8 on pages 5.7-179 and 5.7-180 of the Draft EIR is hereby replaced in its entirety with the following:

The Project Biologist shall conduct pre-construction nesting bird surveys no earlier than seven days prior to any Project-related construction/ground disturbance activities within each construction area and a 500-foot buffer that occurs during the nesting/breeding season of special-status bird species potentially nesting on the site, with the exception of the special-status bird species addressed under separate subheadings below (including burrowing owl, golden eagle, and Swainson's hawk). The pre-construction surveys shall be conducted between January 1 and September 15, or as determined by the Project Biologist. If construction activities are delayed for more than 14 consecutive days, the surveys shall be repeated.

The purpose of the pre-construction nesting bird surveys will be to determine whether occupied nests are present in the disturbance zone or within 500 feet of the disturbance zone boundary.

If occupied nests are found, then limits of construction to avoid occupied nests shall be established by the Project Biologist in the field with flagging, fencing, fencing, or other appropriate barriers. The following minimum no-disturbance buffers will be required: 250 feet around active non-listed passerine nests and 500 feet around active non-listed raptor nests.

Construction personnel shall be instructed on the sensitivity of nest areas. Project-related activities will not occur within the no-disturbance buffers. The Project Biologist shall serve as a construction monitor during those periods when construction activities are to occur near active nest areas to avoid inadvertent impacts to these nests. The Project Biologist may adjust the 250-foot or 500-foot setback at his or her discretion depending on the species, the behavioral baseline conditions determined through passive monitoring, and the location of the nest (e.g., if the nest is well-protected in an area buffered by dense vegetation). Once a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival, construction may proceed in the setback areas. Monitoring reports shall include information regarding active nests and status of nests.

Response to Comment B.4-28:

In order to refine the methods for least Bell's vireo and southwestern willow flycatcher pre-construction surveys and avoidance, the following text is hereby inserted after the first paragraph of MM 7-5 on page 5.7-177 of the Draft EIR:

Preconstruction surveys and avoidance measures for the least Bell's vireo and southwestern willow flycatcher, specifically shall be as follows:

Least Bell's vireo and southwestern willow flycatcher pre-construction surveys

In the season prior to construction, within all potentially suitable habitat within 0.5 mile of proposed construction areas, the Project Biologist shall conduct focused surveys for least Bell's vireo and southwestern willow flycatcher. Least Bell's vireo surveys will follow the currently accepted Least Bell's Vireo Survey Guidelines (USFWS 2001). Surveys for southwestern willow flycatcher will be conducted using the methods outlined in A Natural History Summary and Survey Protocol for the Southwestern Willow Flycatcher, issued by the U.S. Geological Survey (USGS) and U.S. Department of the Interior and approved by the U.S. Fish and Wildlife Service (USFWS) (Sogge et al. 2010). Surveys for least Bell's vireo and southwestern willow flycatcher will be conducted concurrently.

Least Bell's vireo and southwestern willow flycatcher avoidance measures

If active nests are found, clearing and construction within 0.5 mile of the nest shall be postponed or halted until the nest is vacated and juveniles have fledged, as determined by the Project Biologist, and there is no evidence of a second attempt at nesting. If no active nests are observed, construction may proceed. If active nests are found, work may proceed provided that construction activity is located at least 0.5 mile from active nests (or as authorized through take permits). This buffer may be adjusted provided noise levels do not exceed 60 dBA hourly L_{eq} at the edge of the nest site as

> determined by a qualified biologist in coordination with a qualified acoustician.
>
> If the noise meets or exceeds the 60 dBA L_{eq} threshold, or if the biologist determines that the construction activities are disturbing nesting activities, the biologist shall have the authority to halt the construction and shall devise methods to reduce the noise and/or disturbance in the vicinity. This may include methods such as, but not limited to, turning off vehicle engines and other equipment whenever possible to reduce noise, installing a protective noise barrier between the nest site and the construction activities, and working in other areas until the young have fledged. If noise levels still exceed 60 dBA L_{eq} hourly at the edge of nesting territories and/or a no-construction buffer cannot be maintained, construction shall be deferred in that area until the nestlings have fledged. All active nests shall be monitored on a weekly basis until the nestlings fledge. The qualified biologist shall be responsible for documenting the results of the surveys and the ongoing monitoring and for reporting these results to CDFW and USFWS.

Response to Comment B.4-29:

The Draft EIR provides mitigation for impacts to the American badger, among other species, through implementation of MM 7-2 on pages 5.7-175 through 5.7-176 of the Draft EIR, which require pre-construction surveys, biological monitoring during construction, and relocation of some species to areas outside Project's impact footprint. The Commenter recommends a series of modifications for the badger specifically to address various lifecycle stages of this species. In review of the Commenter's request and the approved Grapevine Project EIR's American badger mitigation measure, MMs 7-2 and 7-3 of the Draft EIR have been modified. The first sentence of MM 7-2 on page 5.7-175 is hereby revised as follows:

> A pre-construction/grading survey of all areas proposed for construction/ grading activities that contain potentially suitable habitat for silvery legless lizard, coast horned lizard, and two-striped garter snake~~, and American badger~~ shall be conducted by a qualified Biologist.

The following text is hereby added to the end of MM 7-2 on page 5.7-176:

> For the American badger specifically, the following pre-construction survey and avoidance measure protocols shall be implemented.
>
> *American Badger Pre-Construction Surveys and Avoidance Conditions*
>
> Pre-construction winter/non-natal surveys for American badger shall be required for any construction activities commencing between November 1 and February 15. Surveys shall be conducted within potentially suitable habitat, within 100 feet of disturbance zones, no more than 14 days prior to construction activities to determine whether American badger winter dens are present within disturbance zone or within 100 feet of the

disturbance zone boundary. If Project activities are delayed or suspended for more than 14 days, the project-construction surveys shall be repeated.

If an American badger winter or non-natal den is occupied within the disturbance zone or within 100 feet of the disturbance zone, then the den location shall be clearly marked with fencing or flagging, in a manner that does not isolate the badger from intact adjacent habitat or prevent the badger from accessing the den, to avoid inadvertent impacts on the den. The den shall be monitored by a qualified biologist to confirm normal activities during construction. If it is not practicable to avoid the wintering or non-natal den during construction activities, CDFW will be contacted. Construction activities shall be allowed to proceed when the den is vacated.

Pre-construction natal den surveys for American badger shall be required for any construction activities commencing between March 15 and July 31. Pre-construction surveys shall be conducted within potentially suitable habitat, within 200 feet of the disturbance zone, by the project biologist, no earlier than 14 days prior to ground-disturbing construction activities to determine whether American badger natal dens are present within the project disturbance zone or within 200 feet of the disturbance zone.

If active natal dens are located within these areas during pre-construction surveys, construction activities shall be postponed. If natal dens are detected during construction, construction activities shall be halted within 200 feet of the natal den. This buffer may be reduced based on the location of the den or type of construction activity, based on the direction of the project biologist and CDFW has agreed in writing. Construction activities shall not preclude the ability of the documented badgers to disperse to on-site open space or off-site habitat when the natal den is vacated (i.e., habitat suitable for dispersal must be maintained until dispersal occurs). Construction will be postponed or halted in these areas until it is determined by the project biologist that the young are no longer dependent on the natal den. To avoid inadvertent impacts during construction and to ensure that construction activities are at least 200 feet from active natal dens, any active natal dens within the survey area shall be clearly marked with fencing or flagging in a manner that does not isolate the badger from sufficient intact adjacent habitat, prevent the badger from accessing the den, or inhibiting normal behavioral activities (e.g., foraging and dispersing from the site) by the mother and pups. Construction activities shall be allowed to proceed when the den is vacated.

The second sentence of MM 7-3 on page 5.7-176 is hereby revised as follows:

The Biologist shall relocate silvery legless lizard, coast horned lizard, two-striped garter snake~~, American badger,~~ and any other special status wildlife

species that can be moved which would otherwise be destroyed or adversely affected by construction and/or site-preparation activities.

Response to Comment B.4-30:

Discussions of suitable bat habitat found on-site are provided in the Draft EIR Section 5.7, Biological Resources, in Table 5.7-8 on page 5.7-97 and 5.7-98, with further discussion on pages 5.7-124 and 5.7-125. Mitigation for potential impacts to bats is provided in MM 7-9 on page 5.7-180 of the Draft EIR. MM 7-9 is revised/replaced in response to Comment B.4-32 below. This revised MM 7-9 includes avoidance requirements if bats are detected, and states that construction within 100 feet of non-maternity roosts, and within 300 feet of maternity roosts, shall be postponed or halted until the roost is vacated and juveniles are self-sufficient, as determined by the Biologist.

Regarding the Commenter's assertion that suitable maternity or hibernation roost locations may be present on the Project site, biological surveys of the Project site have been conducted and no suitable roost locations were identified.[180] A site visit conducted on November 27, 2017 confirmed that the "mineshaft"[181] did not constitute suitable habitat for bat roosts, and no evidence of bat occupation was detected.

In response to the comment, the following text is hereby inserted at the end of the second paragraph in the "Mammals" section on page 5.7-50 of the Draft EIR:

> The habitat value, and potential for sensitive bat species occurrence, was evaluated for the remnant "mineshaft" entrance northwest of Quail Lake. The site is shallow and exposed (approximately 6 feet deep by 4 feet tall by 5 ½ feet wide) and, accordingly, does not provide the type of habitat used by bats. No bats were observed, and there is no evidence of prior or current bat occupancy.

In addition, the Draft EIR text is modified to indicate that there is a low potential for maternity roosts to occur in woodland areas within tree cavities, although they are typically too small. The following edit is hereby made within the first paragraph on page 5.7-152 of the Draft EIR:

> The oak woodlands in western portions of the Project site may provide temporary roost sites for individual Townsend's big-eared bats. Maternity roosts are less likely due to the typically small size of tree cavities, but may occur. Potential foraging habitat is expected to be limited to edge habitats along streams and areas adjacent to and within the oak woodlands in western portions of the Project site outside the Project's impact footprint; therefore,

180 DRP 2017, pp. 5.7-97, -98

181 Although the site is formally described as a "mineshaft" in the Parks and Recreation Department Land Use Designation, site visits have confirmed the site can more accurately be described as an exploratory "drift", or horizontal, opening. No associated remnant support structures were observed. The site is approximately 6 feet deep by 4 feet tall by 5 ½ feet wide.

> Project implementation is not expected to impact the Townsend's big-eared bat and no mitigation is required.

The revised MM 7-9, as shown in response to Comment B.4-32 below, provides adequate protections for the avoidance of impacts to bat species.

Response to Comment B.4-31:

Due to loss in foraging habitat for bat species, the Draft EIR impact assessment will be modified. The following text will be modified on page 5.7-152 in Section 5.7.6, Environmental Impacts, of the Draft EIR:

> This loss is small relative to the amount of foraging habitat available to these two species elsewhere in the region; therefore, the loss of potential foraging habitat for the pallid bat and western mastiff bat is considered to be adverse but less than significant and no mitigation is required. Similarly, regional bat populations in general would be impacted by the Project due to loss of foraging grounds and some suitable roosting sites. These losses represent a relatively small percentage of the total regional foraging and roosting opportunities, and regional bat populations would not be reduced to below self-sustaining levels. Furthermore, the Project's approximate 27,000-acre Mitigation Preserve provides long term sustainable resources for regional populations. Therefore, Project impacts on bat species in general is considered less than significant. The loss of individual pallid bats, however, may be considered significant under Section 15380 of the State CEQA Guidelines. Implementation of ~~MM 7-3 for biological monitoring during construction, MM 7-4 for clear demarcation of disturbance limits, and~~ MM 7-9 for pre-construction bat surveys and minimization and avoidance measures ~~are~~ is recommended to avoid taking of roosting individuals that may be present within the Project's impact footprint.

Response to Comment B.4-32:

Although the Draft EIR proposes implementation of MM 7-9 for pre-construction bat surveys, MM 7-3 for biological monitoring during construction, and MM 7-4 for clear demarcation of disturbance limits to avoid taking of solitary roosting individuals, the suggested measure is hereby added to replace MM 7-9 in its entirety, as follows:

> **MM 7-9** Prior to issuance of grading or building permit, the Project Proponent shall conduct appropriate pre-construction bat surveys for bat roosts for pallid bat, western mastiff bat, western red bat, Townsend's big-eared bat as identified below.
>
> a) Pre-Construction Surveys: No earlier than one year prior to the commencement of construction activities for each construction area, a pre-construction survey shall be conducted by qualified project biologists to establish areas of roosts occupancy of special-status bats

(including maternity roosts, non-maternity roosts, and winter hibernacula) are present in the Project disturbance zone and within 300 feet of the Project disturbance zone boundary. The number of required project biologists and number of survey nights will be based on the size of the construction area to assure that the whole of the construction area can be adequately surveyed. The surveys shall consist of:

i. Two spring surveys (April through June) and two winter surveys (November through January);

ii. Each survey consists of one dusk emergence survey (start one hour before sunset and last for three hours), followed by one pre-dawn re-entry survey (start one hour before sunrise and last for two hours), and one daytime visual inspection of all potential roosting habitat in the construction area;

iii. For each survey areas, conduct all three survey types within one 24-hour period;

iv. Construction areas too large to be adequately assessed in one survey, as determined by the Project biologist, shall be divided into multiple smaller survey areas.

iv. Focus visual inspections on the identification of bat sign (i.e., individuals, guano, urine staining, corpses, feeding remains, scratch marks and bats squeaking and chattering); and

v. Use bat detectors, bat call analysis and visual observations during all dusk emergence and pre-dawn re-entry surveys.

Data collection for each survey shall include the following information:

i. Whether bats are, or have been, present at roosts on the Project site;

ii. Assemblage of species using the site for roosting;

iii. Type of roost (i.e., maternity roost, day roost, night roost, feeding perch, mating roost, satellite roost, transitional roost or winter hibernaculum);

iv. Location, ambient temperature, internal dimensions and the aspect and orientation of the roost;

v. Spatial and temporal distribution of bat roosting activity;

vi. Flight paths, exit and entrance points;

vii. Number of bats, time and duration of use observed during roost surveys;

viii. Photographs; and

ix. Identification of any survey constraints.

x. If roosts are detected during pre-construction surveys, the following avoidance measures will be implemented unless relocation and/or take is authorized under California Endangered Species Act (CESA), as required by applicable law.

b) Avoidance Measures Fencing Installation

i. For Maternity Roosts: If an active maternity roost is identified in these areas, the maternity roost will not be directly or indirectly disturbed by prohibiting clearing and grubbing adjacent to the roost site, prohibiting lighting use near the roost site where it would shine on the roost or interfere with bats entering or leaving the roost, prohibiting the bird netting and prohibiting the operation of internal combustion equipment, such as generators, pumps and vehicles within 300 feet of the roost site until the maternity roost is vacated and juveniles have fledged, as determined by the project biologist. The rearing season for native bat species in California is approximately April 1 through August 31.

ii. For Hibernacula or Non-Maternity Roosts: If non-breeding bat roosts (hibernacula or non-maternity roosts) are found within the disturbance zone, the following shall be implemented:

a. Avoid direct and indirect impacts to roosting sites by prohibiting all project-related activities within 100 feet of the roost.

b. Additionally, within 300 feet of the roost, prohibit clearing and grubbing adjacent to the roost site and lighting use near the roost site where it would shine on the roost or interfere with bats entering or leaving the roost.

Prohibit the operation of internal combustion equipment, such as generators, pumps and vehicles, and the use of bird netting.

c. If avoidance of roost sites is infeasible, maintain portions of the features that provide naturalized habitat to the greatest extent possible and improve existing roost sites and/or provide new roost sites on buildings or on the Project site. Implement these measures only after consultation with CDFW.

d. New roost sites must be in place prior to the initiation of Project-related activities to allow enough time for bats to relocate.

e. Design and locate new and enhanced roost sites to be compatible with the bats' search image and habitat requirements (i.e., thermal regulation, interior size, ventilation, etc.). Design new and enhanced roost sites in consultation with CDFW.

f. Exclude bats from directly affected work areas selectively and only to the extent necessary to prevent morbidity or mortality to the colony. Use one-way bat exclusion devices, installed in a bat-safe way, to exclude bats and then use steel wool or other method to block the entrance, after the bats have gone. Exclude bats only after consultation with CDFW, at a time that is compatible with the species' normal behavior patterns (i.e., breeding, feeding, hibernating, etc.). In general, exclusions shall not occur during the maternity/pup-rearing season or during the hibernation season, as determined by conditions at the Project site.

Response to Comment B.4-33:

The recommended avoidance and minimization measures have been added to the Draft EIR, as described in response to Comment B.4-32 above.

Response to Comment B.4-34:

The information supporting the occurrence of pronghorn in the Project area is based on best available scientific information.[182] In addition to published data cited in Section 5.7, Biological Resources, biologists surveying the Project site on multiple occasions over the course of multiple years have recorded observations of pronghorn and other species, and the suitability of habitat and likelihood of use by pronghorn based on these and other factors observed in the field. Additional supporting data were derived from Tejon Ranch hunting management staff. There is no intent to minimize the status of the pronghorn in the region. The status as non-special status is based on the CDFW Special Animals list, and the regional distribution information provided is at a greater level of detail than nearly all other common species evaluated. Additionally, supplemental data have recently been supplied by the Tejon Ranch Conservancy depicting areas of observed use from 2013 through 2017 (see new Exhibit B.4-34). New exhibits are included in Section 3.0, Draft EIR Clarifications and Revisions, of this Final EIR. The pattern of use derived from the Conservancy data and shown on the data map is consistent with the Draft EIR and shows minimal on-site use and far greater use of areas immediately northeast of the site within the off-site Mitigation Preserve lands. Furthermore, the areas where pronghorn are detected on-site are predominantly within the on-site Mitigation Preserve in the northwest portion of the site.

Response to Comment B.4-35:

Although not included on the CDFW list of Special Animals, it is acknowledged that CDFW has an interest in maintaining the pronghorn herd in the Antelope Valley. Therefore, the EIR takes a conservative approach and assesses impacts on the pronghorn stating on page 5.7-153 of the Draft EIR "although not classified as a special status species (CDFW 2017b), the relatively small population of reintroduced pronghorn antelope on the Project site is considered of interest due to limited numbers and historical presence..." The pronghorn CEQA impact analysis provided in Draft EIR is appropriate and consistent with standard practice for sensitive species as well as best available scientific information, including on-site observations. Additional population distribution information has been obtained from the Tejon Ranch Conservancy since release of the Draft EIR for review. Data show a distribution concentrated northeast of the Project site, and within the Mitigation Preserve, with much more infrequent occurrence on the Project site (see new Exhibit B.4-34). New exhibits are included in Section 3.0, Draft EIR Clarifications and Revisions, of this Final EIR. Furthermore, the on-site observations are largely within the on-site preserve area. These data are consistent with the Draft EIR analysis. It is also acknowledged that pronghorn have been observed, and are therefore expected to occasionally forage, within proposed Project impact areas. Draft EIR page 5.7-153 states "Project implementation would reduce the amount of available foraging habitat for this population." Regarding movement of local population of animals, page 5.7-166 of the Draft EIR states "This reduction would result from increased barriers to access as well substantial increases in truck traffic at the SR-138 crossing due to the realignment of Cement Plant Road to intersect with SR-138 immediately adjacent to the potential local wildlife crossing point at the SR-138 (Location 4 on

[182] DRP 2017, pp. 5.7-127, 128

Exhibit 5.7-6)". The Draft EIR adequately assesses pronghorn impacts and the determination of less than significant impacts remains appropriate inclusive of all available species data. In addition, as stated on page 5.7-153 of the Draft EIR, as part of the Ranch-wide Management Plan,[183] which is an implementation tool of the Ranch-Wide Agreement, the Project Applicant will work with the Tejon Ranch Conservancy to identify and implement potential enhancement measures that are also supported by CDFW. Potential measures could focus on enhancing pronghorn fawn survivorship with GPS-tracking devices and other measures to evaluate and minimize losses from coyote predation; completing further evaluation of modeling tools at a site-specific level (such as those used on the Carrizo Plain), and incorporating volunteer involvement with supportive activities such as fencing retrofits. Additionally, the RWMP includes specific elements targeting pronghorn conservation including:

> *Conservation Activity NC-1.4(a). Develop and implement pronghorn habitat enhancements…*
>
> *The Conservancy will implement enhanced monitoring of the Tejon Ranch pronghorn population to better understand their status and distribution on the Ranch and to identify conditions that may be limiting their population. Using this information and botanical data for the grassland monitoring plots (Conservation Activity NC-1.1), the Conservancy will develop and evaluate standards for residual dry matter (RDM) and vegetation height applicable to grazing management in Antelope Valley grassland. These standards will be used to achieve multiple goals, including enhancing native plant species and enhancing pronghorn habitat. Based on the results of this work, the Conservancy will work with TRC to implement grazing management trials to evaluate management prescriptions that may enhance pronghorn habitat, native plant species, and other target species. For example, the Conservancy hypothesizes that rotating livestock into pastures with low suitability for pronghorn fawning during the spring fawning season may reduce potential disturbance to fawning females and improve fawn survival. Implementing this grazing management practice will likely require improving the availability and distribution of water for livestock, particularly in the southeast portion of Tejon Ranch (Figure 3-2).*
>
> *Conservation Activity NC-1.4(b). Modify fences to enhance pronghorn movements. Pronghorn generally attempt to move under barbed-wire fencing rather than move between the strands or jump over the fence. The Conservancy will enhance the ability of pronghorn to move through suitable habitat by replacing the lower strands on barbed-wire fences with smooth wire in key fence segments in the Antelope Valley (Figure 3-3).*

[183] Tejon Ranch Conservancy (TRC). 2013 (June). *Tejon Ranch Conservancy Ranch-wide Management Plan.* Frazier Park, CA: TRC. http://www.tejonconservancy.org/rwmp.htm.

In an effort to provide additional clarity in the Draft EIR regarding impacts on pronghorn movement, the following edit is hereby made to the third sentence of the third full paragraph on page 5.7-153:

> Project implementation would reduce the amount of available foraging habitat and some opportunities for crossing SR-138 for this population.

Response to Comment B.4-36:

As mentioned in response to Comment B.4-35, additional population distribution data have been obtained from the Tejon Ranch Conservancy. The data include sighting data points and sighting dates on and adjacent to the Project site (see new Exhibit B.4-34). New exhibits are included in Section 3.0, Draft EIR Clarifications and Revisions, of this Final EIR. Regarding the Department of Water Resources (DWR) observations, it is entirely feasible and not unexpected for periodic observations of pronghorn to occur within an area determined to have limited access. Crossing points over the California Aqueduct are discussed and described in the wildlife movement discussion starting on page 5.7-50 of the Draft EIR and are applicable to pronghorn in addition to other wildlife. The most likely crossings for pronghorn to gain access to habitat could be assessed; however, with the limited use of such areas as described in response to Comment B.4-34, determining the most frequent of the infrequently used crossing points would not aid the impact assessment for the species in the Draft EIR. As currently designed, the project incorporates a crossing opportunity under SR-138 connecting areas of appropriate habitat that would be retained subsequent to project buildout. Incorporating additional crossings over the California Aqueduct into the interior of developed portions of the Project site would not be consistent with the interest to retain a healthy regional population of pronghorn. The regional population would be unlikely to benefit from such a mitigation measure and may in fact be harmed. However, in addition the RWMP pronghorn conservation elements described in response to Comment B.4-36, MM 7-14 may also benefit pronghorn crossing of the SR-138. The measures states that a designated SR-138 underpass shall be located where the highway crosses the Project's western border near the current intersection with Cement Plant Road. The width of the underpass shall be 100 feet and shall flare out on both sides of the highway to a 150-foot width in the Project open space adjacent to the highway. These specifications are expected to allow some local wildlife to safely pass between open space areas on opposite sides of the highway. For additional information about the pronghorn please refer to responses to Comments B.4-34, B.4-35, B.4-36, B.4-37, F.8-165, F.8-165A, F.8-166, and F.8-167. Additionally, a new Exhibit B.4-34, Pronghorn Observations on Tejon Ranch, has been prepared as part of this response to comment. New exhibits are included in Section 3.0, Draft EIR Clarifications and Revisions, of this Final EIR.

Response to Comment B.4-37:

Please see responses to Comments B.4-35 and B.4-36, above.

Regarding the observation of pronghorn at Petersen Ranch, the occurrence would be considered an outlier at this time. Individuals of regional populations of wildlife species are sometimes found outside the known occurrence area. Unless the occurrence is repeated, it

is typically considered a single event and not evidence of a population trend or expanded distribution. The individual animal observed was a solo male, and because he was observed at multiple locations over time this may have caused concern about more widespread occupancy of other individual animals, but the data show that the pronghorn herd predominantly occupies the foothill areas east of the Project site and elsewhere in the area. Please refer to new Exhibit B.4-34, included in Section 3.0, Draft EIR Clarifications and Revisions, of this Final EIR, and responses to Comments B.4-34, B.4-35, B.4-36, B.4-37, F.8-165, F.8-165A, F.8-166, and F.8-167. However, it is feasible that the occurrence is representative of a yet to be verified expansion into the Petersen Ranch area or a rare event that could eventually lead to increase in use of that area. If this is the case, and the area does not have low survivorship conditions, the linkage to the area should be considered noteworthy. Based on review of aerial maps of the region, the linkage used to reach Petersen Ranch may be any one of dozens of low quality connections with no indication of which is more likely to be functional. However, movement from the core use area for the herd on Tejon Ranch seems highly unlikely given the difficulties of traversing 25 miles of mostly non-suitable habitat and mostly non-preferred terrain. Further evaluation of impacts to this species is unwarranted based on responses to Comments B.4-35 and B.4-36, and the existing evaluation in the Draft EIR.

Response to Comment B.4-38:

The Draft EIR's assessment of ring-tailed cat (or ringtail) use of the Project site and the impact assessment are based on best available scientific information coupled with habitat assessments conducted by biologists traversing the site on multiple occasions searching for potentially suitable habitat elements and evidence of occupation. No ringtail has been reported, or been known to occur, within 40 miles of the Project site. The determination for ring-tail is based predominantly on known range and distribution and habitat suitability. Based on these elements, Project site surveys would generally not be necessary based on the distance to known occurrences. Additionally, because the project will be built out over a 20-year period, surveys completed prior to project approval would not prove future absence and thus pre-construction surveys are the more appropriate mitigation approach under CEQA. To further ensure that ringtails are not directly impacted, a pre-construction survey and direction on how to proceed depending on the results of the survey will be added to MM 7-2, beginning on page 5.7-175. Specifically, pre-construction surveys for ringtail, as well as mandatory consultation with CDFW if any ringtail occurrence is discovered, have been added for this fully protected species, consistent with CDFW-approved mitigation for the Grapevine Tejon and Newhall Ranch projects. MM 7-2 is modified by inserting the following text to the end of the measure in a new paragraph:

> Pre-construction surveys for the ring-tailed cat shall be conducted throughout the Project disturbance area in the appropriate season within the year prior to disturbance. If results are negative, Project activities will proceed without further restrictions in regard to this species. If detected, the applicant shall consult with CDFW and modify Project activities at that time to ensure complete avoidance and no take of ring-tailed cat will occur.

Response to Comment B.4-39:

The Project has been designed to avoid impacts to the western pond turtle.[184] Based on the potential for this species to move upland from Quail Lake and the CDFW's statement that this species can move overland up to 325 feet, the following text in the second paragraph of MM 7-2 on page 5.7-175 of the Draft EIR has been revised as follows:

> Areas adjacent to Quail Lake and on the Project site potentially supporting western pond turtle breeding habitat shall not be disturbed during the breeding season for the turtles (April through August). No Project activities shall occur within ~~300~~ 400 feet from the edge of Quail Lake, due to potential for nesting in those areas.

With this revision to the Draft EIR, a 400-foot no-disturbance buffer during the nesting season has been incorporated (MM 7-2).[185] This 400-foot buffer provides an additional 75 feet of buffer beyond the 325-foot overland range for this species, as cited by the Commenter. Given that 325 is feet is at the considered upper limit of travel away from Quail Lake, the frequency of occurrence at such a distance would be considered very low and uncommon. Most previous studies indicate that the majority of females nest well within 50 meters of water (Rathbun, Siepel, & Holland, 1992; Reese & Welsh, 1997). In addition, conditions within the area where construction would occur within 475 feet of Quail Lake are largely marginal to unsuitable. Soils are mapped as sandy/gravel fan deposits in this area. Research indicates pond turtle prefer soils with some clay component because nest conditions require very specific humidity. The slope is mapped at less than 25 percent in this area, with most being 40 percent, and pond turtles prefer slopes of 15 percent or less. These conditions likely limit turtle movement outside the shore line in this area. In addition, the north side of Quail Lake includes a paved road between lake shore and upland habitat which may discourage upland movement. Therefore, the majority of potential nesting locations are buffered by distances greater than 75 feet. Note also that the Caltrans SR-138 widening project EIR concludes that the project would have no significant impact to pond turtle even though construction is immediately adjacent to Quail Lake. Construction impacts from the Caltrans project include only installation of snow fencing and require that a monitor is present during construction. The 75-foot buffer is therefore an effective and efficient method to protect the western pond turtle and expanding the buffer to 475 feet would provide minimal additional protection for the species and is not warranted.

Regarding the recommendation for focused surveys, MM 7-5, described on page 5.7-177 of the Draft EIR, requires that focused surveys for the western pond turtle, as well as other species listed, be conducted within the year prior to construction and within the appropriate season. Surveys shall be conducted in accordance with the approved CDFW or U.S. Fish and Wildlife Service (USFWS) protocol. In order to clarify the location of the required survey, the following edits are hereby made to MM 7-5 on page 5.7-177 of the Draft EIR, as follows:

184 DRP 2017, p. 5.7-147
185 *Id.,* p. 5.7-175

Surveys shall be conducted within all areas of potentially suitable habitat and in accordance with the approved CDFW or U.S. Fish and Wildlife Species (USFWS) protocol for that species.

Response to Comment B.4-40:

Mitigation to avoid impacts to western spadefoot is included in MM 7-5 on page 5.7-177 of the Draft EIR. However, in an effort to incorporate the specifics requested by the Commenter, the measure is revised. MM 7-5 is hereby revised with an insert at the end of the measure as follows:

Western spadefoot pre-constructions surveys and avoidance measures shall be implemented as follows:

Western spadefoot pre-construction surveys

Prior to approval of a Grading Permit, the applicant shall provide to the County evidence verified by the Project Biologist that the area proposed to be graded, including a 300-foot buffer area, has been surveyed for suitable western spadefoot breeding habitat. If suitable breeding habitat is identified, the verification shall include a map of the delineated areas, including the 300-foot buffer, which are to be avoided. Surveys shall be conducted within 60 days prior to construction during a time of year when the species can be detected above ground at suitable breeding sites. Suitable breeding habitat is defined as areas of temporarily ponded water, including within creeks and within the valley floor uplands. Suitable breeding sites should support ponded water for at least three weeks. To ensure that diseases are not conveyed between work sites by the Project Biologist or his or her assistants, the fieldwork code of practice developed by the Declining Amphibian Populations Task Force will be followed at all times.

Western spadefoot avoidance measures

If western spadefoot is detected within the Project footprint, measure "(i)" shall be implemented with appropriate review and concurrence from CDFW. If western spadefoot is detected outside the Project footprint, but within 300 feet of the Project footprint boundary, measure "(ii)" shall be implemented. Prior to implementation of avoidance measures, the Project Biologist shall confer with CDFW.

If western spadefoot is detected (including egg masses and larvae) in water within the Project footprint and cannot be permanently avoided (e.g., by placing a resource avoidance area over the site), suitable breeding habitat shall be created within suitable natural sites in open space outside of the Project footprint under the direction of the Project Biologist. The amount of occupied breeding habitat to be impacted by the Project shall be

replaced at a 2:1 ratio. The habitat creation location shall be in suitable habitat within on-site open space and as far away as feasible from residential and commercial development and roads. The created breeding habitat shall be designed such that it supports standing water for no longer than three months following winter rains so that aquatic predators (e.g., fish, bullfrogs, and crayfish) cannot become established. Terrestrial habitat surrounding the proposed relocation site shall be as similar in type, aspect, and density to the location of the impacted breeding site as feasible. No site preparation or construction activities shall be permitted within 300 feet of the vicinity of the impacted breeding site until the design and construction of the pool habitat in preserved areas of the site have been completed and all detected western spadefoot tadpoles, egg masses, and adults are moved to the created breeding habitat.

The Project Biologist shall monitor the relocation site for a cumulative total of five years in which environmental conditions are conducive for western spadefoots to successfully complete the breeding cycle (i.e., adequate rain for pools to hold water for a sufficient period). Monitoring shall be conducted during and immediately following peak breeding season such that surveys can be conducted for adults as well as for egg masses, larval, and metamorphic western spadefoot. Success criteria for the monitoring program shall include verifiable evidence of western spadefoot reproduction at the relocation site during five years with suitable breeding conditions.

If western spadefoot is detected (including egg masses and larvae) in water within 300 feet of the Project footprint boundary, but not within the Project footprint itself, an exclusion fence shall be constructed along the Project boundary between the construction footprint and the occupied breeding site to prevent western spadefoots from moving into and aestivating within the construction footprint. The exclusion fencing shall consist of 16-inch metal flashing, or an equivalent material, which shall be buried at least 6 inches below the ground surface, extending at least 8 inches above the ground. The fencing shall cover a sufficient length of the boundary to inhibit western spadefoots from entering the Project footprint without entrapping aestivating western spadefoot. The necessary length and appropriate location of the exclusion fence relative to the occupied breeding site shall be determined by the Project Biologist.

No construction activities involving heavy equipment generating noise, ground vibration, and/or dust shall be allowed within 300 feet of occupied breeding sites until western spadefoots have metamorphized and are no longer present in the breeding pool, as determined by the Project Biologist. Acceptable Project activities (e.g., quiet and/or low impact activities) within 300 feet of the occupied breeding site shall be allowed at the discretion of the Project Biologist.

Response to Comment B.4-41:

MMs 7-16 and 7-18 on pages 5.7-191 and 5.7-193 of the Draft EIR describe Project requirements to reduce impacts of non-native ants and other pests. The Commenter's recommendations to modify MM 7-16 to incorporate "dry zones" to protect against Argentine ants will be made. MM 7-16 beginning on page 5.7-191 of the Draft EIR shall be modified by adding the following language to the end of the measure as a new paragraph:

> Similarly, to preclude the invasion of Argentine ants into Mitigation Preserve lands, "dry zones" of a minimum of 350 feet shall be established between development and the Mitigation Preserve. Soil moistures shall be maintained at levels below about 10 percent soil saturation within dry zones to deter the establishment of nesting colonies of ants. All landscaping materials to be used in these zones shall be inspected and certified as "free" of Argentine ants prior to planting. Additionally, these materials shall be inspected by a qualified restoration specialist for the presence of Argentine ants. Plants or other materials with Argentine ants shall be rejected.

The effectiveness of deterring Argentine ants is approximately 99 percent at 100 meters (approximately 328 feet) according to Suarez et al. (1998) and Menke and Holway (2006). Although the study does indicate that 200 meters (approximately 650 feet) provided 100 percent effectiveness, the doubling of the buffer to gain the additional 1 percent is not warranted, particularly since research supporting the larger buffer was not done in the type of dry climate zone present in Antelope Valley. In addition, because there is no irrigation within the Mitigation Preserve, and the larger buffer distance suggested by the Commenter was derived from a study that did not include the generally dry conditions that exist on the Project site for most of the year, even if 1 percent of ants were to reach its edge, the ants' ability to expand into the Mitigation Preserve would be limited to 150 feet at most – and the Mitigation Preserve and associated Tejon Ranch open space lands preserved pursuant to the Tejon Ranch Conservation and Land Use Agreement (Ranch-Wide Agreement [TRCRWA]) comprises hundreds of thousands of acres – this 1 percent risk at the Mitigation Preserve edge is not biologically significant and would not compromise the functions and values within the Mitigation Preserve. Other elements of the recommendation, including the requirement for certification of Argentine ant-free landscaping materials and for restoration activities to take advantage of the rainy season, are already incorporated within MMs 7-16 and 7-18.

In response to the comment, one additional change is made to MM 7-16 in the last paragraph of the MM on page 5.7-192. Although the comment requests all landscape materials to be used within 700 feet of protected open space areas to be certified ant-free, the distance has been dropped altogether and replaced with "all" plants. The text of the fifth control is hereby changed as follows:

> (5) Ensuring that all landscape container plants ~~installed within 200 feet of preserved populations~~ are ant free prior to installation to reduce the chance of colonies establishing in areas close to the preserved populations;

Response to Comment B.4-42:

As shown in response to Comment B.4-43 below, MM 7-1 has been clarified to reflect the hierarchy of mitigation for rare plants: First, areas in the Mitigation Preserve meeting the 2:1 ratio will be preserved, and if there is insufficient preservation (based on final impacts), then the measure includes enhancement and creation. Therefore, there is no reliance on the future surveys to confirm compliance with preservation, but rather to ensure compliance by verifying the acreage of impact is two times greater than the acreage of mitigation.

Response to Comment B.4-43:

In accordance with the recommendation in Comment B.4-43, the Project's priority shall be preservation of the six special status plant species impacted by the Project prior to issuance of grading permits at a 2:1 ratio of individual plants preserved:impacted. If the preservation ratio is less than 2:1 for one or more of the six impacted species, enhancement and restoration methods to expand preserved population(s) of the species to a quantity representing a minimum 2:1 ratio within the Mitigation Preserve. Creation is also a mitigation option to achieve the plant mitigation ratio, but is less preferable to preservation and enhancement, and would occur only in suitable locations (e.g., appropriate soils, topography, slope, etc.). Both enhancement and creation would require further monitoring and verification to assure that the 2:1 ratio is maintained in the long term, and this long-term requirement would be added to the RWMP if or to the extent required in the future.

To modify the Draft EIR in accordance with this preservation component per the discussion above, the last two sentences of the second paragraph on page 5.7-142 are hereby edited as follows:

> Implementation of MM 7-1, proposed to mitigate for impacts to special status plants, would reduce the level of impact by promoting the distribution of this species in the Project region through the preservation and/or ~~propagation~~ enhancement of ~~new~~ existing populations and creation of new populations, if necessary, in the Mitigation Preserve. The expansion of the local population of this species is expected to increase its potential to be sustained in perpetuity.

To modify the Draft EIR in accordance with this preservation component per the discussion above, the last two sentences of the first partial paragraph on page 5.7-143 are hereby edited as follows:

> Implementation of MM 7-1, to mitigate for impacts to special status plants, would reduce the level of impact by promoting the distribution of this species in the Project region through the preservation and/or ~~propagation~~ enhancement of ~~new~~ existing populations in the Mitigation Preserve. The expansion of the local population of this species is expected to increase its potential to be sustained in perpetuity.

Additionally, the final sentence in the fourth paragraph of MM 7-1 on page 5.7-174 is hereby edited as follows:

> These existing areas shall be (in order of priority) preserved, enhanced, expanded, ~~or~~ restored, or created ~~or new areas shall be created in suitable habitat~~ in order to compensate at a 2:1 ratio for the thousands of individual special status plants that will be lost due to the Project.

Beyond preservation (the priority for plant mitigation goals), the preferred methods for achieving the 2:1 replacement ratio of special status plant species are those that have the most potential for success—enhancement or expanding of existing populations. These methods have the highest potential for success due to a likelihood of existing suitable microhabitat, soils types, presence of pollinators, and genetic diversity. Other recent large projects in the region, such as the SR-138 widening and the Tehachapi Renewable Transmission Project have 2:1 mitigation for rare plants. Newhall Ranch uses a ratio of 3:1 for Endangered plant species. Creation of populations is the method of last resort that shall be employed if the 2:1 ratio cannot be met through preservation and enhancement. Although literature is not available for the species impacted on the Project site, successful rare plant restoration projects have been conducted. For example, The New England Wild Flower Society developed a successful method to germinate Robbins' cinquefoil seeds and to accelerate their development into seed-producing adults for transplanting. Between 1973 and 2006 the population rebounded 2.5 times. The species was removed from the federal Endangered list in 2002. Follow up monitoring post-recovery goals, indicated the cinquefoil numbers and condition remained stable.[186] Further, successful reintroduction has also been accomplished with the special status species western yampah (*Perideridia erythrorhiza*), endemic to southern Oregon.[187] Although long-term monitoring data is not available, during the three years the transplantation was monitored, 90 percent of transplanted plants reproduced successfully.

Evidence for a greater degree of potential success is based on observations of many of the special status plants requiring mitigation located in the Mitigation Preserve during a reconnaissance survey and during focused plant surveys. Such observations indicate highly compatible conditions for the proposed preservation, creation, and/or enhancement/restoration of special status plant populations. Apart from direct observations of special status plants requiring mitigation, the level of compatibility is supported by similarities in soil type, slope, aspect, and distance from known populations. Additionally, special status plant species impacted by the Project (*California androsace*, *adobe yampah*, and *sylvan microseris*), and many other special status plant species not impacted by the Project, have been documented in the Mitigation Preserve by the Tejon Mountain Village Project.[188] The documentation of multiple populations of these species on the Mitigation Preserve further adds to the regional value of these mitigation lands and the increases the likelihood of persistence of the species in the region.

186 United States Department of Agriculture, Forest Service (USDAFS). 2017 (November, access date). Recovery of Robbins' Cinquefoil - *A Partnership Success*. Washington, DC: USDAFS. https://www.fs.fed.us/wildflowers/Rare_Plants/conservation/success/potentilla_robbinsiana_recovery.shtml.

187 Roberts, Kimberly A. 2003. Conservation Biology of *Perideridia erythrorhiza* (Apiaceae): Experimental Reintroduction and Life History. Oregon: Oregon State University.

188 Kern County Planning Department (Kern County). 2009 (May). *Draft Environmental Impact Report, SCH# 2005101018, Tejon Mountain Village by TMV, LLC*. Kern County, CA: Kern County.

The Draft EIR includes a Review of the Mitigation Preserve as Appendix 5.7-C. In summary, the evaluation of potential mitigation lands generally considers lands within closer proximity to the impacted lands as highest potential value. This generality stems from that fact that conditions are generally more similar in close proximity than further apart. Conditions include weather, geographic position, soil type, slope, and many others. The mitigation lands selected utilize this approach and include lands on site and immediately adjacent and then with the most similar conditions when moving further away from the Project site to capture additional acreage.

All of the lands selected for the Mitigation Preserve in Los Angeles County fall within the County's Significant Ecological Area designation. Although the designation does not preclude development, it is an indication of high biological value in the County. With inclusion in the Centennial Mitigation Preserve, these County SEA lands will now be preserved in perpetuity allowing for the maximum protection of the biological values the SEA designation was intended to protect, such as unique assemblages of oak tree species, wildflower fields, and regional wildlife movement corridors. Furthermore, the lack of future development or other landscape disturbances to these lands will also influence adjacent undeveloped SEA lands by reducing the potential for the spread of non-native plants and wildlife.

The majority of the acreage in the Mitigation Preserve was selected for its grassland resources. Extensive research was conducted in the grasslands on the Project site to understand and document composition of these distinctive communities of herbaceous plants and wildflowers. Grassland communities in the Mitigation Preserve were subsequently studied to ensure their composition was similar and the quality was the same or better. Studies included native bunchgrass modeling, model testing/truthing, indices of nativeness, indices of similarity, plot sampling, and many other methods. In addition, through these studies and a subsequent series of field visits, many populations of special status plant species—including California androsace, round leaved filaree, adobe yampah, Mojave spineflower, and Sylvan scorzonella—have been identified in the Mitigation Preserve and on many additional acres of potentially suitable habitat for these and other species.

For example, vast wildflower fields were observed in Off-Site Preserve Area 3 spanning hundreds of acres. Wildflower fields occur mainly in the grassland vegetation. Dominant species comprising wildflower fields include California poppy, common monolopia, and Great Valley phacelia, with various other native herbaceous species interspersed throughout. Occupied and potentially suitable habitat for round leaved filaree was abundant in Off-Site Preserve Area 3 and contained the most acreage of all On-Site and Off-Site Mitigation Areas visited (approximately 300 acres). Potential round leaved filaree habitat occurs scattered throughout the grassland vegetation in Off-Site Preserve Area 3 in varying patch sizes. The largest patches occur in the flatlands in the southeastern areas and occur on both sides of the California Aqueduct, which projects into Off-Site Preserve Area 3 in the southeast. CNDDB records indicate that thousands (5,000—8,000) of filaree individuals have been documented within Off-Site Preserve Area 3.[189] Additionally, sylvan scorzonella

[189] California Department of Fish and Wildlife (CDFW). 2016. California Natural Diversity Database. Records of Occurrence for round-leaved filaree in Kern and Los Angeles Counties. Sacramento, CA: CDFW, Natural Heritage Division.

individuals were detected in the eastern portion of Off-Site Preserve Area 3, and many acres of potentially suitable habitat were observed. Many acres of potentially suitable California androsace habitat were also detected in Off-Site Preserve Area 3. Potentially suitable adobe yampah habitat was not directly detected during field reconnaissance due to the nuanced nature of the habitat. As mentioned previously, potentially suitable habitat is assumed present on north-facing slopes and slope cuts associated with drainages in Off-Site Preserve Area 3 as suitable soils are present in these areas.

These findings support the effectiveness of the Mitigation Preserve to off-set the impacts to grasslands as well as the associated rare plant species impacted by the Project. Another important element considered in the selection of mitigation lands was the potential to support existing populations/and or potentially suitable habitat for wildlife species impacted by the Project. In finding areas with similar vegetation types and in close proximity to the Project site, the Mitigation Preserve captures habitat that is very similar to the site, which would be expected to be occupied by a very similar suite of wildlife species. In addition, field visits in the Mitigation Preserve have identified several unique wetland habitat areas with potential to support tricolored blackbird breeding and hundreds of acres of potential foraging land. Some of these areas are, in fact, occupied by breeding colonies of tricolored blackbirds, which have been recorded foraging throughout the areas. Occupied burrowing owl habitat and hundreds of acres of potentially suitable habitat for this species has also been recently detected from within the Mitigation Preserve. These results are not unexpected given the process used in selecting these lands. Furthermore, regional wildlife movement corridors identified in the higher elevations of the surrounding landscape will benefit from the preservation of the selected lands due to the effect of buffering from undeveloped lands. The evidence gathered supports the determination that lands in the Mitigation Preserve are appropriate and well suited to meet the applicable mitigation requirement and adequately off-set Project impacts.

Furthermore, the Project's 39,000-acre Mitigation Preserve is coupled with two regional conservation plans, the Tejon Ranch Conservation and Land Use Agreement (TRCRWA) and the Tehachapi Upland Multiple Species Habitat Conservation Plan (TUMSHCP), which further contribute to sustaining regional plant populations. Under the TRCRWA, the Tejon Ranch Conservancy will adopt, update, monitor and enforce implementation of the Ranch-wide Management Plan (RWMP) on dedicated conservation areas and option areas subject to conservation, preservation, mitigation, and enhancement measures, as required under applicable law or imposed by federal, State or local agencies as part of any permit or approval for Tejon Ranch (Ranch) or projects within the Ranch. Maintenance of the open space or conserved lands will be the responsibility of the Conservancy, funded in large part by a fee based on a portion of the purchase price for each residential parcel on the Ranch. Since Centennial constitutes over 75 percent of the currently planned residential units on the Ranch, it will bear the substantial costs of funding the Conservancy.[190]

In addition, the TUMSHCP ensures the persistence of covered species, including sustaining viable populations of those species. Lands to be conserved as part of the TUMSHCP are

[190] DRP 2017, pp. 5.7-62, -63

adjacent to other lands within Tejon Ranch ownership and are also slated to be protected as part of the TRCRWA. The sum of these interconnected open space commitments, development restrictions, and mitigation measures is a conservation commitment that is, by design, consistent with conservation biology principles calling for large, interconnected blocks of habitat that support the life history requirements of Covered Species and other resident plant and wildlife populations. Through the various conditions and measures stipulated by the TUMSHCP for the various covered species, habitat for these and many additional species will be preserved and enhanced, which will promote healthy plant and wildlife communities throughout the region. Although the focus of the TUMSHCP is on the California condor and other species of the montane upland communities, many of the same species occur in the foothills and lowland areas as well, including the Centennial site. These species will benefit from the TUMSHCP in addition to the Centennial Mitigation Preserve program.[191] In addition, the U.S. Fish and Wildlife Service considered development within the region, specifically inclusive of several major projects including Centennial, Newhall, Tejon Mountain Village, and Grapevine, in the TUMHSCP, and concluded that the TUMSHCP includes measures to minimize and mitigate remaining impacts on Covered Species and measures that contribute to conservation and recovery.[192]

No lands required as mitigation for any other permit or development project of Tejon Ranch are included in the Mitigation Preserve. Under the TRCRWA, areas that cannot be developed based on this private party agreement between Tejon Ranch and the environmental group signatories (Sierra Club, Natural Resources Defense Council, Audubon Society, Planning & Conservation League, and Endangered Habitats League), are expressly allowed to be used as mitigation for planned development activities including Centennial. Certain lands for which Conservation Easements were acquired by the State Wildlife Conservation Board cannot be used for mitigation preservation credits in their baseline condition, but can expressly be used for mitigation enhancement, restoration, and/or creation credits. The voluntary conservation undertaken by Tejon Ranch in the TRCRWA was expressly endorsed by the State's resource and environmental agencies, and use of these voluntary conservation areas as mitigation for future development projects was likewise expressly recognized and endorsed, in an appendix to the TRCRWA.

Response to Comment B.4-44:

Each of the referenced plans includes performance objectives and identifies feasible means of achieving those performance objectives, which is a form of mitigation measure commonly used and repeatedly confirmed as legally adequate in CEQA court cases. Please refer to response to Comment F.8-173, infra, for a summary of the performance standards and feasible measures for achieving the performance standard for referenced plants.

MM 7-1, as further clarified in response to Comment F.8-173, provides the required level of specificity and performance standard requirements to ensure the adequate mitigation of the impacted biological resources. In order to ensure that CDFW, as requested in the comment, has the ability to review and assess the adequacy of the Plan, the Final EIR also includes a

191 *Id.,* p. 5.7-63
192 *Id.,* pp. 5.7-16 to -18

revised MM 7-1 beginning on page 5.7-173. The second sentence of the first full paragraph on page 5.7-174 shall be modified as follows:

> The Project Applicant shall develop the Special Status Plant Species Restoration Plan and the County and CDFW shall approve it prior to any vegetation clearing or grading on the site.

Response to Comment B.4-45:

The evaluation and determination of the taxonomy of the crownscale populations detected on the Project site was initially confirmed by BonTerra Psomas botanist Jordan Zylstra and then verified by expert botanist Andy C. Sanders (University of California, Riverside Herbarium) as described in the 2015-2016 Special Status Plant Report. Mr. Sanders was confident with the identification and did not find evidence to indicate other potential identifications and as such, additional expertise is unwarranted. The taxonomy of the crownscale populations on the Project site has been sufficiently confirmed to warrant a determination of significant, and this is the determination given in the Draft EIR and the rationale for which mitigation for crownscale impacts has been incorporated into the Draft EIR as MM 7-1. Additionally, a portion of the population occurring north of SR-138 and east of the existing Cement Plant Road shall be avoided during Project construction (see MM 7-1). In an effort to provide additional protective measures on this population, signage will be used post-construction to lessen impacts on the population from human disturbance. In response to this comment, the following text is hereby added at the end of the second to last paragraph of MM 7-1 on page 5.7-175:

> Additional protective measures are included in MM 7-17.

The following text is hereby added to the second sentence of the first paragraph of MM 7-17 on pages 5.7-192 and 5.7-193:

> This program shall include signs that identify the boundaries of ecologically sensitive areas (including the avoided special status plant populations described in MM 7-1);

Response to Comment B.4-46:

The Commenter correctly notes that all known populations of the Piute Mountain navarretia are avoided by development, and are located in the open space preserve area, as depicted on Exhibit 5.7-7a, Special Status Plant Species Observations, of the Draft EIR. Multiple intensive focused special status plant surveys have been conducted on the Project site since 1999. Focused surveys have been conducted during years with relatively normal rainfall, and in various stages of drought. Potentially suitable Piute Mountains navarretia habitat has been thoroughly surveyed, with 100 percent coverage, many times (see Table 5.7-2, Biological Surveys Conducted on the Project Site [1999-2015]). The likelihood of populations occurring outside known areas is very low due to the enormous effort over the past 16 years of surveying for this plant. In the unlikely event that additional isolated plants are discovered, the fact that the Project preserves all known southern occurrences of these populations is

enough to conclude that the avoidance design of the Project makes impacts to Piute Mountains navarretia less than significant.

Response to Comment B.4-47:

The Commenter's recommendation that the Project Applicant consult directly with USFWS is noted. The Applicant is independently required to comply with all applicable legal requirements, including compliance with the federal Endangered Species Act, and this Act's prohibition on the 'take' of federally-listed ESA species without the requisite ESA permit. The Draft EIR assessed potential impacts to all federally-listed species with potential to occur and concluded there would not be a significant impact to any federally-listed species, directly or indirectly.[193] Therefore, no ESA 'take' of a federally-listed species is anticipated to occur as part of the Project. The required MMs for biological resource impacts will further decrease the potential for 'take' of a federally-listed species (MMs 7-1 through 7-22).[194] In addition, in order to be responsive to this comment and USFWS comments regarding the addition of Project efforts to further reduce any potential adverse effects of the Project on the California condor, MM 7-6 on Draft EIR pages 5.7-177 and 5.7-178 is revised in regard to construction monitoring, utility hazards, condor educational curriculum, microtrash, condor deterrent activities, and condor tracking as described in response to Comment B.4-21. See also, responses to Comments A.3-3, A.3-4, A.3-5, A.3-7, B.4-20, B.4-21, B.4-22, and B.4-23.

Response to Comment B.4-48:

Development does not need to be removed from south of SR-138 to protect the SEA. The proposed Project is consistent with the SEA Program and Ordinance. As stated in the Antelope Valley Area Plan (AVAP), under the existing SEA Ordinance, proposed development is required to be designed so that it is highly compatible with the biotic resources present—including setting aside appropriate and sufficient undisturbed areas; maintaining water bodies, watercourses, and their tributaries in their natural state; leaving wildlife movement corridors undisturbed and in a natural state; retaining sufficient natural vegetative cover and/or open spaces to buffer critical resource areas from the proposed development; providing fences or walls where necessary to buffer important habitat from development; and locating and designing roads and utilities so they do not conflict with critical resources. Under the AVAP, the SEA boundaries grew considerably, and in response, the Project disturbance areas shrunk considerably in order to conform to SEA boundaries and west Economic Opportunity Areas (EOAs). A new Exhibit B.4-48, Historical Disturbance Limits Comparison, has been prepared as part of this response to comment. New exhibits are included in Section 3.0, Draft EIR Clarifications and Revisions, of this Final EIR. The AVAP determined placement for these EOAs with edge effects and appropriate buffering taken into consideration. SEA edges are analyzed in the Draft EIR as open space areas and mitigated for appropriately, and do not represent an additional constraint that must be analyzed and mitigated for separately.

193 DRP 2017, pp. 5.7-145 to -155
194 *Id.,* pp. 5.7-173 to -194

In addition, the Project Applicant has worked with the Los Angeles County SEATAC committee and the County staff biologist for several years assessing impacts and modifying mitigation to reduce impacts on the SEA. The Project design has been modified to entirely avoid all direct impact to the SEA. MM 7-4 requires fencing of all open space areas during construction activities to ensure that construction activities remain within the development footprint, preventing accidental direct impacts of the SEA.[195]

Potential indirect Project impacts on biological resources on and near the Project, which includes those occurring within the SEA south of SR-138, are analyzed and mitigated to a less than significant level in the Draft EIR.[196] Implementation MM 13-6 from Section 5.13, Visual Resources, which requires the Project Applicant to develop a Lighting Plan to reduce potential impacts to biological resources caused by light and glare, would reduce the level of the impact.[197] As stated on page 5.7-170 of the Draft EIR, in an effort to minimize operational noise impacts, the Conceptual Land Use Plan (see Exhibit 4-1) has been designed to maximize the distance between areas of high noise and preserved open space. Higher density housing and higher volume traffic roadways are near the center of developed areas, while the lower density housing and lower traffic roadways occur at the edge of the Project near open space areas. As a result, potential indirect wildlife impacts due to Project-related noise are reduced to a level considered less than significant.[198] The risk of invasion of Argentine ants into open space areas is mitigated to a less than significant level though implementation of MM 7-16, as modified by and further described in response to Comment B.4-41. To preclude the invasion of Argentine ants into open space areas and preserved populations of special status plants, a variety of methods shall be implemented, as described in MM 7-16, such as inspections of landscaping materials, quarterly monitoring of the development at potential infestation areas, and direct control of known infestations.[199] In order to control fire risk, MM 7-21 requires an Implementation Plan which shall be submitted as part of the tentative tract map that boarders an SEA or mitigation preserve area.[200] As stated on page 5.7-167, in order to reduce the potential for introduction and spread of invasive species, PDF 7-8 and MM 7-15 shall be implemented. These measures include the development of a Landscaping Plan (subject to County review) and will identify both a plant palette composed of non-invasive species and a list of invasive plant species prohibited from being planted on the Project site. These efforts are expected to minimize invasive species impacts of the Project and reduce the level of the impact to less than significant.

Potential impacts on adjacent open space areas from human disturbances are mitigated to a less than significant level through implementation of MM 7-15 and MM 7-17. MM 7-15 requires wildlife proof trash receptacles and informational pamphlets be provided to homeowners on the importance of not feeding wildlife.[201] MM 7-17 requires a public awareness program and various controls for domestic pets such as cats and dogs, including but not limited to: informational signage in front of open space areas, restriction of public

195 *Id.,* p. 5.7-177

access in open space areas to designated trails, dog leash requirements, dog bags provided in appropriate areas, cats and dogs are required to be neutered/spayed, and prohibition of domestic animals into open space areas except for designated trails (pages 5.7-192 and 5.7-193, inclusive of revisions made in this Response to Comments).

Response to Comment B.4-49:

The scale of the vegetation mapping is inclusive of all unique stands no matter the size. As described on page 5.7-25 of the Draft EIR, one acre minimum was used for non-unique stands such as grasslands, but unique stands, which are more likely to be special status, were mapped at a smaller scale. For instance, if a patch of scrub occurred at a ¼ acre scale within a large patch of grassland, the scrub would not likely get mapped. Ephemeral ponds and seeps were used as examples of unique stands which are representative of the Project site, but could have been any number of unique vegetation types. The Draft EIR will be modified to change the methods description to better explain the approach. The second sentence of the first full paragraph on page 5.7-25 will be changed as follows:

> The minimum mapping unit was set at approximately one acre, and patches of vegetation smaller than this were generally not mapped except for observed seeps~~, and~~ ephemeral ponds, and other unique stands.

Response to Comment B.4-50:

The Commenter's summary of oak tree mitigation measures is accurate, except that the Draft EIR does analyze Project impacts to oak woodlands as habitat types[202] and provides appropriate mitigation in MM 7-11, which requires a minimum 2:1 replacement of impacted mixed oak woodland (13.4 acres total).[203]

Response to Comment B.4-51:

The Project considers impacts to all oak trees as part of the oak woodland impact assessment described on pages 5.7-171 and 5.7-172. The specific tree assessment is provided only as required by County of Los Angeles Oak Tree Ordinance (No. 88-0157). However, the oak woodland mitigation (MM 7-11) has been modified to clarify that the habitat-level oak woodland mitigation plan (as revised at the end of bullet 4), includes additional woodland species which will be planted in appropriate locations and at the appropriate time to best ensure the success of the habitat creation/restoration. The monitoring period, presented on page 5.7-186, is not meant to see the woodland reach maturity, but rather to see the mitigation through to a point of a reasonable expectation for continued growth based on demonstration of growth, removed from irrigation for at least five years. Based on this, a monitoring period of ten years would be more than sufficient to demonstrate establishment and no evidence of the greater than ten years has been provided. However, implementation of the Ranch-wide Management Plan, included as Appendix 5.7-D of the Final EIR, provides for the management in perpetuity all mitigation lands, including oak woodlands, within the

202 *Id.,* pp. 5.7-36 to -38
203 *Id.,* p. 5.7-182

Mitigation Preserve. As such, long-term monitoring of the oak woodlands and other biological resources are incorporated. Furthermore, implementation of MM 7-11 includes 10:1 mitigation for impacts to heritage trees. Details of the mitigation will be listed within the Oak Woodland Habitat Mitigation Plan described in MM 7-11 on pages 5.7-182 through 5.7-187. In addition, the intent behind the recommendation to prohibit irrigation is understood and irrigation would be minimized to the maximum extent and eventually removed for at least five years prior to completion and approval of the Mitigation Plan.

The following additional text is hereby added to MM 7-11, beginning at the end of bullet number 4, on page 5.7-184 of the Draft EIR.

4. To provide overstory, midstory, and understory tree/plant coverage, some container plants and oak trees, grown from locally collected acorns, will be installed in addition to the application of native seed mixes. Since studies indicate that the younger the planting is, the more likely the chance is for successful establishment and long-term viability locally collected acorns as well as locally collected, nursery cultivated young oak trees (one-gallon or five-gallon containers of oaks) would be planted on site. The oak woodland planting and seeding palettes will include a diversity of locally-collected native shrubs, subshrubs, grasses, forbs, and ferns, to provide a beneficial mosaic of understory vegetation.

5. The oak mitigation program will include the extensive salvage (from the impacted oak habitat areas) and placement of coarse woody debris, brush piles, and boulders (as available) to immediately provide (a) suitable micro-habitats for the establishment of plant species with particular shade and moisture requirements (e.g., ferns) and (b) improved habitat resources (e.g., cover) for wildlife species.

~~4.~~6. Irrigation will be provided to the oak plantings in a manner that simulates natural rain events; i.e., infrequent, deep watering. Irrigation will be suspended during periods of substantial rainfall, and irrigation will be terminated at the earliest possible date (depending on seasonal weather patterns) in coordination with the County Forester, to optimize the drought resiliency and proper root development of the planted oaks. Additionally, all irrigation must be terminated for a minimum of five years before the oak mitigation areas will be eligible for final approval/sign-off.

It should also be noted that Project implementation will preserve 3,090 acres of oak woodland within the Mitigation Preserve. Furthermore, the preserved oak woodlands are very similar to the oak woodlands impacted by the Project.

Response to Comment B.4-52:

The Project uses Functional Capacity Units (FCU) as a way quantify functionality, in addition to acreage and linear feet. Page 5.7-29 of the Draft EIR explains that a wetland functional assessment of jurisdictional areas was conducted in order to characterize and evaluate the functions of the site's drainages and riparian habitats. A Hybrid Functional Assessment (HFA) method was then created by combining components of three different functional assessment methods (the Hydrogeomorphic [HGM] approach, the Landscape Level Functional Assessment, and CRAM). These three methods were adapted to perform a functional assessment at the Project site. At the time the combined functional assessment was created, CRAM was a method still in development. Since that time, CRAM has become a widely accepted functional assessment by all regulatory agencies. For this reason and because the combined functional assessment approach was never formally approved by the regulatory agencies, as described on page 5.7-29 of the Draft EIR, the observations and findings of previous surveys were combined with the observations during the 2015 field surveys to perform a CRAM evaluation of the various jurisdictional features on the site.

The approach of quantifying wetland functions and values and mitigating with the goal of replacing those lost functions and values has become increasingly widespread and preferred. As noted in JD-7 of Appendix 5.7-B of the Draft EIR, the evaluation of functions associated with compensatory mitigation sites relies on a function-based assessment tool such as the U.S. Army Corps of Engineers' USACE HGM Methodology. Such an approach is set forth in a Regulatory Guidance Letter (RGL) published by the USACE on December 24, 2002 and in a Special Public Notice published by the Los Angeles District on January 27, 2003. In both documents, the USACE encouraged the utilization of functional assessments for evaluating impacts to aquatic resources and determining appropriate mitigation ratios. On page 2 of the December 24, 2002 RGL, the USACE notes: *The Corps has traditionally used acres as a standard measure for determining impacts and required mitigation for wetlands and other aquatic resources, primarily because useful functional assessment methods were not available. However, Districts are encouraged to increase their reliance on functional assessment methods.*

In response to the comment, in addition to functional value replacement, the mitigation methodology in MM 7-12 may alternatively use the more traditional mitigation ratio approach at the following rates, as used in another recent Tejon Ranch project EIR. MM 7-12 shall hereby be modified in the third full paragraph on page 5.7-188 of the Draft EIR as follows:

> The purpose of the mitigation is to replace lost habitat value, as measured in FCU <u>(or other acceptable functional value units)</u> rather than based on a standard acreage ratio. <u>Alternatively, a more traditional mitigation ratio approach may be employed using following rates:</u>
>
> <u>a. Wetland Waters: 2:1, including 1:1 restoration and 1:1 enhancement, of wetland waters.</u>

b. Streams:

i. 1:1 preservation of ephemeral and/or intermittent streams for permanent impacts to ephemeral non-wetland waters of the state (non-riparian)

ii. 1:1 preservation of intermittent streams for permanent impacts to intermittent non-wetland waters of the state (non-riparian)

iii. 1:1 restoration of intermittent streams for temporary impacts to intermittent non-wetland waters of the state (non-riparian)

c. Riparian Vegetation: 2:1, including 1:1 restoration and 1:1 enhancement of riparian vegetation.

There are sufficient drainages in the Mitigation Preserve to meet these ratios. See responses to Comments B.4-14 and B.4-61.

Regarding the Commenter's concern that the approach does not guarantee in-kind replacement, most of the drainages on site are considerably degraded as a result of years of cattle grazing resulting in below average functional value scores as described in JD-7 and JD-8 of Appendix 5.7-B of the Draft EIR. Replacing the lost functions and values allow mitigation activities to enhance, restore, or create jurisdictional features with higher functional value than the features being impacted. In doing so, there is no net loss of the wetland functions even though there can be a reduction in overall acreage and/or linear feet. Additionally, the performance criteria to be described in the Streambed and Wetland Habitat Creation and Enhancement Plan as provided in MM 7-12 (see response to Comment F.8-173) include performance objectives and feasible actions for achieving those objectives, and shall be met to the satisfaction of the permitting agencies to demonstrate successful mitigation. The approach demonstrates that impacts to drainages and their associated habitats are mitigated sufficiently to reduce impacts to a level of less than significant pursuant to CEQA. Additionally, in an effort to ensure that riparian vegetation associated with jurisdictional drainage features are replaced with the same vegetation types that would be impacted by the Project, as listed beginning on page 5.7-160 of the Draft EIR (including riparian herb, rush riparian grassland, southern arroyo willow riparian, southern cottonwood willow woodland, southern willow scrub, unvegetated wash, valley oak riparian woodland, willow riparian forest, willow riparian woodland, alkali meadow, Baltic rush, and coastal and valley freshwater marsh), MM 7-12 on page 5.7-187 of the Draft EIR shall be revised to reflect a requirement for in-kind replacement of riparian vegetation.

Furthermore, MM 7-12, as noted on page 5.7-187, requires the Project Applicant/Developer to obtain the appropriate regulatory agency permits and/or agreements from the USACE, the CDFW, and the applicable RWQCB and comply with all conditions specified in the regulatory agency permits and/or agreements. Through this permitting process, other mitigation actions may be required above and beyond the minimum mitigation required to achieve a less than significant finding per CEQA as previously described. Consequently, the proposed mitigation described in MM 7-12 of the Draft EIR, inclusive of edits described above, is

expected to exceed the mitigation necessary to reduce impacts to a less than significant level. Estimated acreages of drainage features within the Mitigation Preserve are listed in the table below (also see response to Comment B.4-61):

Area Type	Total Mitigation Area (acres)
Ephemeral Streams	87.31
Intermittent Streams	96.26
Riparian Vegetation	96.26

Additionally, the first full paragraph on page 5.7-188 shall hereby be revised as follows:

> The extent of drainages and wetlands that would be preserved under the Project will provide opportunities to expand and enhance the drainages, wetlands, and riparian vegetation throughout the Mitigation Preserve ~~on the Project site~~.

Response to Comment B.4-53:

Although small mammals, such as rat and mouse species, and medium sized mammals, such as Virginia opossum, common raccoon, and coyote, may found in the developed areas, as discussed on page 5.7-50 and 5.7-168 of the Draft EIR, bears are not expected to occur within the developed portion of the Project site as they are uncommon even in in the Project site's undeveloped state. However, it is acknowledged that bears are present in the Tehachapi and Liebre ranges, and do on occasion enter existing developed areas in Los Angeles County – and could enter the Specific Plan area following development. It is also possible for an increase in occurrence in the future as bears explore new opportunities. However, standard LA County trash receptacles are wildlife resistant, and the Homeowners Association can specify the best waste receptacle model for individual home owners, in accordance with County Sanitation guidelines. Effective management of trash helps deter bears from re-entering developed areas. All common area trash receptacles must also be wildlife resistant per MM 7-15

Response to Comment B.4-54:

MM 7-15 on page 5.7-191 of the Draft EIR is hereby modified to add an additional paragraph to the end as follows:

> All vertical open pipes used for fence posts, property line stakes, signs, roof veneration, chimneys, vault toilets, and similar structures and metal fence stakes used on the Project site shall be capped. Capping can be accomplished using bolts or other materials to avoid raptor talons becoming entrapped within the bolt holes of metal fence stakes.

Response to Comment B.4-55:

These recommendations are partially included within MM 7-2 which states that a pre-construction/grading survey of all areas proposed for construction/grading activities that contain potentially suitable habitat for silvery legless lizard, coast horned lizard, and two-striped garter snake shall be conducted by a qualified Biologist. Surveys will consist of 1 pass-through by a qualified Wildlife Biologist walking 50-meter belt transects across areas to be impacted while visually searching for the species listed above. Surveys will be conducted no more than three days prior to the disturbance of the surveyed area. If any of these species or other wildlife species that can be easily moved are observed within the construction/grading zone, the Biologist (who must have a valid California Scientific Collecting Permit) shall relocate them to a suitable area outside the construction zone. Suitable areas would include appropriate habitats within the proposed open space areas in the northwestern portion of the Project site and would be identified in a Wildlife Relocation Plan (described below) prior to surveys but before construction begins. In order to capture additional recommendations in the comment, MM 7-2 is hereby modified by adding the following paragraph to the beginning of the measure on page 5.7-175 of the Draft EIR:

> All grubbing/grading within a phase of construction shall be scheduled and implemented to facilitate the voluntary movement of localized wildlife towards intact adjacent habitat. Islands of habitat should not be created during site disturbance unless they are to be retained as un-impacted following the Project buildout.

Response to Comment B.4-56:

As stated in MM 7-14, the width of the underpass will be 100 feet and then will flare out to a 150-foot width adjacent to the SR-138. The second sentence of MM 7-14, beginning on Draft EIR page 5.7-190 will be modified to clarify as follows:

> The width of the underpass shall be 100 feet as it passes under SR-138 and shall flare out on both sides of the highway as it moves away from SR-138 to a 150-foot width in the Project open space adjacent to the highway.

The flare out areas on either end of the underpass are intended to act as funnels to guide users toward the underpass. No portion of the underpass would be specifically dedicated. The entire underpass would be open for pedestrian and wildlife movement with an expectation that night time usage would be greater for wildlife.[204] The underpass is not intended to serve as a wildlife corridor between all open space portions of the Project and the Liebre Mountains. The passage is intended for local wildlife usage within the area and infrequent regional movement that may traverse from areas northwest of the Project site to areas south of the Project site. In addition, the additional underpass to be constructed for pedestrian and bike access is expected to provide some local movement for animals within the Project area.

[204] DRP 2017. pp. 5.7-57, -58

Response to Comment B.4-57:

The assessment of wildlife movement impacts is typically based on an understanding of movement science and the existing topography, vegetation, and species' life histories and behavior on the Project site, the Project site region, and beyond the Project site region. In addition, landscape features that may prohibit some or all types of wildlife movement need to be identified. This information is available through existing literature and Project field surveys[205], and does not rely on camera or other tracking station methods. Such methods are often problematic because they 1) rely heavily on capturing movement events that may not occur in the sampling period; or 2) may be missed for a variety of reasons resulting in a false negative. One of the most widely accepted studies of regional linkages in southern California is the South Coast Missing Linkages Project and more specifically for the Project region: Linkage Design for the Tehachapi Connection. These studies do not rely on tracking station data, but rather on theory and assumed barriers to movement and assumed opportunities for movement. The Draft EIR is able to adequately make the determination of significance using this approach and although tracking station data have potential to add data, they would not be necessary.

Response to Comment B.4-58:

Please see MM 7-5 on page 5.7-177 of the Draft EIR which requires focused surveys for applicable special status species within the appropriate season in the year prior to impacts, as suggested. As specified in MM 7-5, specific requirements include: 1) surveys with all potentially suitable habitat on the Project site; 2) within the year prior to disturbance and within the appropriate season; and 3) according to approved CDFW and or USFWS protocol guidelines. The applicable species for this measure include arroyo toad, Tehachapi slender salamander, California red-legged frog (concurrent with two-striped garter snake and western pond turtle focused surveys), western spadefoot, mountain plover, southwestern willow flycatcher, and least Bell's vireo. Buffer distances for surveys shall be consistent with the survey protocol guidelines. Other special status species are included in the pre-construction surveys described in MM 7-2 on page 5.7-175 of the Draft EIR, including silvery legless lizard, coast horned lizard, two-striped garter snake, burrowing owl, Swainson's hawk, and American badger.

In regard to the comment that surveys varied in their coverage and level of intensity, please note that some survey areas, such as survey areas for plants, were modified from year to year because the impact area was reduced over time. Consequently, the survey area similarly changed from year to year for some survey efforts. However, most survey areas have remained largely the same over the years and all surveys have been designed for maximum detectability and for determination of the status of occupation on the site for each subject species.

[205] *Id.,* pp. 5.7-23, -50 to -64

Response to Comment B.4-59:

The last paragraph in MM 7-3 on page 5.7-177 of the Draft EIR is modified to clarify as follows:

> In addition, a Biological Monitor will be on site during all initial vegetation removal and will employ salvage methods to minimize direct impacts to common wildlife species. Where feasible, the biological monitor will attempt to ensure wildlife are out of potential direct impact. ~~If a wildlife species is in harm's way and has not moved on its own, the Biologist will attempt to scare them away from the area. If wildlife does not move, and where feasible, the wildlife species will be relocated to suitable habitat.~~

Response to Comment B.4-60:

In an effort to make the plan for implementing grassland preservation and management available, the Ranch-wide Management Plan (RWMP) shall be adopted as the managing plan and no new plan will be prepared. Management of the Mitigation Preserve shall be in accordance with the RWMP, which incorporates BMPs for grazing, including Residual Dry Matter targets, and weed management, including invasive plant mapping and targeted removal actions. The RWMP includes standards for management of the grasslands areas that will preserve the grasslands in perpetuity. The RWMP has been submitted for review and approval to CDFW and USFWS, as applicable. The RWMP provides a comprehensive framework, with the context of the Ranch-Wide Agreement (TRCRWA), for the effective preservation and management of the preserved open space lands located on Tejon Ranch, including the mitigation lands for the Project site. The RWMP shall be included in the Final EIR as a new appendix and the following edit is hereby made to page 5.7-62.

> Under the TRCRWA, the Tejon Ranch Conservancy will adopt, update, monitor and enforce implementation of the Ranch-~~W~~wide Management Plan (RWMP) (Final EIR Appendix 5.7-D) on dedicated conservation areas and option areas subject to conservation, preservation, mitigation, and enhancement measures, as required under applicable law or imposed by federal, State or local agencies as part of any permit or approval for the Ranch or projects within the Ranch.

Response to Comment B.4-61:

The Draft EIR and the attached Jurisdictional Delineation report (JD)[206] describe the regulatory definitions of State and federal waters[207]. The methods employed were consistent with these regulations and as described by the Commenter. Methodology for delineating CDFW jurisdiction can be found on page 5.7-134 of the Draft EIR where it states, "…all the drainages, adjacent wetlands, and riparian areas on the Project site are under the jurisdiction of the CDFW pursuant to Sections 1600–1616 of the California Fish and Game Code. CDFW jurisdiction extends to the top of the bank, at a minimum, and to the outer edge of the canopy

206 *Id.,* Appendix 5.7-B, JD-8
207 *Id.,* pp. 5.7-3 to -6

of riparian vegetation, if a canopy is present."[208,209] In addition, as discussed in response to Comment B.4-14, CDFW may adopt more expansive Section 1600 regulations which would increase the applicability of the Section 1600 permit program on the Project site.

The Project offsite mitigation areas also include preserved waters, wetlands and riparian areas, and provides opportunities for restoration, enhancement and creation, to satisfy all required Project mitigation requirements. The following tables identify estimated jurisdictional features by jurisdiction and type based on current statutes and regulations; if the MESA Memo is adopted as a regulation, it is anticipated that the expansion of the jurisdictional area in the offsite mitigation areas will be similar to the expansion of the jurisdictional area on the Project site as discussed further in response to Comment B.4-14.

208 BonTerra Psomas. 2015 (November). Jurisdictional Delineation Report, Centennial Project, Los Angeles County, California. Pasadena, CA: BonTerra Psomas.
209 DRP 2017, Appendix 5.7-B, JD-8

In addition, it is acknowledged that restoration/enhancement activities may result in impacts to jurisdictional areas and that such impacts would be subject to a 1600 agreement. The Project Applicant/Developer will notify CDFW through the permitting process and expects such impact to be self-mitigating based on the purpose of the activity and the benefits to plant and wildlife resources. However, based on the description of the mitigation measures (inclusive of revisions made to the Draft EIR through the response to comments process), no impact to State-listed species are expected to result from Project implementation, inclusive of proposed general restoration/enhancement activities. Therefore, no Incidental Take Permit (ITP) is required at this time. It is acknowledged that if changes in the occupation of the site or adjacent areas by State listed species would result in potential impacts to these species, consultation with CDFW would be required and potentially an ITP. Please also see discussion of coordination with CDFW in response to Comment B.4-1.

Response to Comment B.4-62:

Exhibit 5.7-9 and Exhibit 5.7-13 have been modified to increase the size of features to facilitate viewing ability as suggested. The footnote on the figures has been revised to indicate that some features appear larger than they actually are. Revised exhibits are included in Section 3.0, Draft EIR Clarifications and Revisions, of this Final EIR.

Response to Comment B.4-63:

The Draft EIR notes that of the six areas of mitigation lands, two (Areas 3 and 4) are the subject of conservation easements. As noted by the Commenter, off-site mitigation lands acquired by the Wildlife Conservation Board (WCB) are not eligible for passive mitigation credit; however, these lands are eligible mitigation lands for enhancement, restoration, and creation of biological values (see WCB Easement Sections 6(b)(1)(B); and 1 (jj); see also Ranch-Wide Agreement Exhibit R, P.2 Bullet 3). The WCB easement areas include 7,490 acres of grasslands, not 12,145 acres (see revised Draft EIR Exhibit 5.7-10). While those areas continue to be available for enhancement, in response to comments and discussion with CDFW, the Applicant proposes to add additional Antelope Valley grasslands within Tejon Ranch to ensure the 2:1 preservation ratio is met. The additional offsite grasslands mitigation area, Area 7, is depicted in revised Exhibit 5.7-10, and comprises 7,877 acres of additional preserved grasslands located within the contiguous preserved open space areas of Tejon Ranch. The WCB conservation easement areas also remain part of the open space mitigation lands for the Project, but MM 7-1 (presented as MM 7-10 in the Draft EIR) has been revised to clarify that these areas are available only for enhancement, restoration, and creation mitigation and not for preservation. With the addition of the new mitigation preservation lands, the 2:1 preservation ratio is met without enhancement activities on WCB lands. Therefore, the following text in the third paragraph of PDF 7-1 on pages 5.7-135 and 5.7-136, is hereby revised as follows:

> These areas combine to form an extensive regional mitigation preserve system of ~~27,408~~ 43,079 acres (see revised Exhibit 5.7-10, Mitigation Preserve). Detailed floral sampling was conducted within grasslands on the Project site

including impact areas, as well as within the Mitigation Preserve (NRC 2006a, 2007a, 2007b, 2007c, 2008b). Generally, studies consisted of quadrat sampling (338 total quadrats) and analysis of data generated results on regional species composition, between-site species composition, and plant community-based analysis. within grasslands on the Project site within the impact area and mitigation areas (NRC 2008b) and 2016, and 2017 site reconnaissance surveys over a period of ~~four~~ five days, within mitigation areas.

The following text in the first sentence of the fourth paragraph of PDF 7-1 on page 5.7-136, is hereby revised as follows:

The proposed ~~27,408~~ 43,079-acre preserve system contains all major habitat types affected by the Project, as well as particular individual biological resource values which are described in each of the corresponding mitigation plans.

The following text in the second paragraph of PDF 7-2 on page 5.7-137, is hereby revised as follows:

Mitigation lands for impacts to biological resources would consist of approximately ~~3,861~~ 3,866 acres of unimpacted~~/~~ SEA lands on the site and ~~23,547~~ 39,213 acres within additional off-site areas, ~~including~~ consisting of areas on Tejon Ranch, referred to as Areas 1 through ~~6~~7. These mitigation lands comprise two on-site and ~~six~~ seven off-site areas which would provide sufficient land and biological resources to implement mitigation strategies to fully mitigate for Project impacts. ~~Two~~ The majority of three of these areas, Areas 3 ~~and~~, 4, and 5, are the subject of the Wildlife Conservation Board conservation easements that expressly allow for such mitigation use of these lands. These areas, although available for mitigation activities that include enhancement, restoration, or creation, are not available for preserved mitigation acreage since the existing Conservation Easement already requires preservation (but allows mitigation use for enhancement, restoration, or creation).

The following text after paragraph ten of PDF 7-2 on page 5.7-138, is hereby revised as follows:

Area 7 consists of two distinct areas that comprise 15,668 acres total. Area 7 is in Kern County on the northern slope of the Antelope Valley. The westernmost portion of Area 7 sits between Areas 3 and 4, while the easternmost portion occurs east of Area 4 and borders Area 6 to the north. Approximately half of Area 7 is dominated by undifferentiated grasslands, which are scattered throughout but mostly occurring in the southern half of this mitigation area. The other half of Area 7 is covered in various scrub types such as mixed chaparral, desert scrub, and sagebrush, and at higher elevations oak woodland, montane chaparral, montane hardwood-conifer forest, and

pinyon-juniper forest. Several major northwest-to-southeast trending drainage features are found within Area 7 that contain riparian vegetation, oak woodland, and Joshua tree woodland.

The combined off-site Mitigation P~~p~~reserve area amounts to ~~23,547~~ 39,213 acres of mitigation lands. In total, the mitigation preserve system available for mitigation covers ~~27,408~~ 43,079 acres and includes both on- and off-site mitigation areas.

The following text is hereby inserted at the end of the last paragraph in PDF 7-2 on page 5.7-138 of the Draft EIR:

Appropriate lands with grassland resources have been included in the Mitigation Preserve to ensure a 2:1 replacement ratio in areas outside the existing WCB conservation easements. Furthermore, enhancement activities may be implemented within, but may not be limited to, Mitigation Preserve Areas 3, 4, and 5.

The following text in Section 5.7.6, Environmental Impacts, on page 5.7-160, is hereby revised as follows:

Implementation of MM 7-10 would reduce these impacts to less than significant levels through preservation of ~~14,375~~ 14,908 acres of on-site and off-site grasslands.

The following text in Section 5.7.6, Environmental Impacts, on page 5.7-160, is hereby revised as follows:

The grassland mitigation is based on site-specific characteristics including, for example, the existence of native grasslands in the ~~27,408~~ 43,079-acre on-site (unimpacted/SEA lands) and off-site preserve areas.

The following text in Section 5.7.6, Environmental Impacts, on page 5.7-160, is hereby revised as follows:

Specifically, the Project proposes to preserve ~~14,375~~ 14,908 acres of grasslands within the ~~27,404~~ 43,079-acre on-site (unimpacted/SEA lands) and off-site mitigation preserve, which is part of a larger 240,000-acre conservation area (including dedication and acquisition areas).

The following text in the first paragraph and Table A of MM 7-10 on pages 5.7-180 and 5.7-181, is hereby revised as follows:

The Project Applicant/Developer shall preserve grasslands, including native perennial grassland and associated wildflower field vegetation types, at a minimum 2:1 ratio within the ~~approximate 27,408-acre~~ Mitigation P~~p~~reserve (see Table A). The Project would impact 6,416 acres of grasslands; therefore,

a total of 12,832 acres of grassland mitigation acreage is required to bring impacts to a less than significant level.

TABLE A
GRASSLAND MITIGATION ACREAGES

Mitigation Area	Grasslands	Total Acreage
On-Site Mitigation Preserve ~~Unimpacted/SEA~~		
On-Site Mitigation Preserve ~~Unimpacted/SEA~~	1,989	~~3,861~~ 3,866
Subtotal (Total On-Site Mitigation Area)	*1,989*	*~~3,861~~ 3,866*
Off-Site Mitigation Preserve ~~Open Space~~		
Area 1	~~1,641~~ 1,734	6,417
Area 2	~~1,602~~1,597	2,556
Area 3	~~3,059~~ 0	4,183
Area 4	~~4,429~~ 706	7,319
Area 5	~~643~~ 0	643
Area 6	~~1,012~~ 1,005	2,429
Area 7	7,877	15,668
Subtotal (Total Off-site Mitigation Area)	*~~12,386~~ 12,919*	*~~23,547~~ 39,213*
Total Mitigation Area	**~~14,375~~ 14,908****	**~~27,408~~ 43,079**
~~SEA: Significant Ecological Area~~ **Goal for 2:1 Grassland Mitigation is 12,832 Acres		

The following text in the first sentence of the third paragraph of MM 7-10 on page 5.7-182, is hereby revised as follows:

> As outlined in Table A above, the ~~14,375~~ 14,908 acres of grassland preservation will occur in open space areas on site and in the ~~six~~ seven other areas.

The following text is hereby revised in the last paragraph of MM 7-10 on page 5.7-182 of the Draft EIR:

> The ~~open space~~ Mitigation Preserve ~~preserve~~, including the grasslands within it, shall be preserved in perpetuity to offset Project impacts on native grasslands and wildflower fields prior to issuance of a grading permit for the Project site. The phasing of mitigation has been previously described. The preservation and management of these grasslands through the Ranch-wide Management ~~Native Perennial Grassland and Wildflower Field Mitigation~~ Plan will sufficiently offset and fully mitigate the impacts on native grasslands and wildflower fields associated with the Project.

The following text in the third sentence of the third paragraph of MM 7-11 on page 5.7-182, is hereby revised as follows:

> The combined acreage of oak woodland preserved both on site (unimpacted/Significant Ecological Area [SEA]) and within the off-site mitigation areas is ~~3,102~~ 3,090 acres and is expected to substantially exceed the required 50 percent of mitigation as preservation.

Additionally, in an effort to make the grassland preservation management plan available, the Ranch-wide Management Plan (RWMP) shall be included in the Final EIR as a new appendix and the following edit is hereby made to page 5.7-62.

> Under the TRCRWA, the Tejon Ranch Conservancy will adopt, update, monitor and enforce implementation of the Ranch-~~W~~wide Management Plan (RWMP) (Final EIR Appendix 5.7-D) on dedicated conservation areas and option areas subject to conservation, preservation, mitigation, and enhancement measures, as required under applicable law or imposed by federal, State or local agencies as part of any permit or approval for the Ranch or projects within the Ranch.

Response to Comment B.4-64:

This comment asserts that the Project is inconsistent with certain goals and policies of the Antelope Valley Area Plan (AVAP), citing Goal LU 2 specifically. The County disagrees with the Commenter's assertion. The Project is consistent with the goals and policies of the AVAP, as described in Draft EIR Table 5.8-1.

A lead agency's land use consistency determination is entitled to "great deference" and must be upheld unless "*no reasonable person* could have reached the same conclusion" as the agency (emphasis added).[210] "Because policies in a general plan reflect a range of competing interests, the governmental agency must be allowed to weigh and balance the plan's policies when applying them, and it has broad discretion to construe its policies in light of the plan's purposes."[211] As long as "officials considered the applicable policies and the extent to which the proposed project conforms with those policies," the agency's determination must be affirmed.[212] This highly deferential standard applies not just to a local government's determinations under the State's Planning & Zoning Law, but also to a lead agency's determination of plan consistency in a CEQA document, whether that determination is made in an Negative Declaration,[213] or, as here, in an EIR.[214]

With respect to Goal LU 2, it applies to the land use pattern of the AVAP as a whole; consistency with the AVAP does not require each individual project developed within the

212 *Ibid*.

213 Joshua Tree Downtown Business All. v. Cty. of San Bernardino (2016) 1 Cal.App.5th 677, 695-97

214 Pfeiffer, 200 Cal.App.4th at 1561-63; N. Coast Rivers All. v. Marin Mun. Water Dist. Bd. of Directors (2013) 216 Cal.App.4th 614, 632-33

AVAP planning area to provide a "land use pattern that protects environmental resources." This is evident from the plain text of the six AVAP policies adopted to implement AVAP Goal LU 2. Five of the six policies – i.e., Policies LU 2.2 through LU 2.6 – expressly exclude economic opportunity areas (EOAs.), for example. The remaining Policy LU 2.1 calls for limiting the amount of potential development in Significant Ecological Areas (SEA) through appropriate land use designations with very low residential densities, as indicated in the AVAP Land Use Policy Map.

The Project site is located entirely within the AVAP's West EOA.[215] Accordingly, it is exempt from five of the six AVAP policies adopted to implement Goal LU 2. Moreover, the Project is consistent with the remaining Policy LU 2.1 because all SEA land located within the Project boundary is designated as Open Space under the proposed Centennial Specific Plan, consistent with the AVAP's Land Use Policy Map. Furthermore, the proposed Project does not include any development within, and, therefore, no direct impacts on, SEA land.[216]

In addition, to clarify the scope of permitted uses within the open space areas associated with the Project, four open space subdesignations (three on-site, one off-site) are hereby added to page 4-24 of Section 4.0, Project Description of the Draft EIR, and conforming edits are made to the Specific Plan:

> CENTENNIAL OPEN SPACE DEFINITIONS
>
> Mitigation Preserve: The Mitigation Preserve encompasses 43,079 acres of land to be preserved and managed in perpetuity for biological resources values. The Preserve consists of an On-site Mitigation Preserve, comprised of approximately 3,866 acres within the Project boundaries, but outside of the development footprint, and an Off-site Mitigation Preserve made up of 39,213 acres within adjacent and nearby off-site lands. These mitigation lands provide sufficient land and biological resource values to implement mitigation strategies to fully mitigate for Project biological resource impacts.
>
> On-site Mitigation Preserve
>
> The On-site Mitigation Preserve is divided into two areas. The southern on-site mitigation area includes 968 acres located immediately south of the development footprint along south side of SR-138. The northern on-site mitigation area consists of 2,898 acres located to the north and west of the development footprint on the west side of the aqueduct. All of the lands within the on-site portion of the Mitigation Preserve are within Los Angeles County SEA No. 17.
>
> Uses within the On-site Mitigation Preserve shall be restricted to use and continued maintenance of existing ranch roads and trails for access as well as hiking and biking for private inholding owners and permitted Ranch guests.

215 DRP 2017, p. 4-4
216 *Id.,* p. 5.7-2

Public access and recreational hunting shall be prohibited. Authorized motorized vehicles including but not limited to Tejon Ranch employees, utility maintenance vehicles, that have a Tejon Ranch permit and emergency vehicles shall be restricted to existing ranch roads and all recreational motorized vehicles shall be prohibited. No improvements beyond what is necessary to maintain roads, fences, etcetera, in their current state shall be allowed, with the exception of the placement of two new water towers discussed below. Only habitat enhancement, restoration and creation activities approved by the County and described in the Mitigation Preserve Management Plan shall be permitted. New impacts shall be limited to the placement of two water towers with disturbance impacts of no more than five acres each. Grazing shall be allowed to continue as directed by the Mitigation Preserve Management Plan strictly for resource management values.

Off-site Mitigation Preserve

The Off-site Mitigation Preserve is divided into seven areas. Area 1 consists of 6,417 acres located adjacent to and immediately east of the southeastern corner of the Project site. Area 2 consists of 2,556 acres located adjacent and contiguous to the northwestern portions of the Project site. Nearly all of the land within these two preserve areas also occurs within SEA No. 17. Area 3 consists of 4,183 acres; this mitigation area is located in Kern County, immediately north of the Project site. Area 4 consists of 7,319 acres located on the northern slope of the Antelope Valley, northeast of both Area 3 and the Project site. Area 5 consists of 643 acres and is a square-shaped parcel located in Kern County on the northern slope of the Antelope Valley, immediately east of Area 4 and northeast of the Project site. Area 6 consists of 2,429 acres and is located in Kern County on the northern slope of the Antelope Valley, farthest to the northeast of the Centennial Project site. Area 7 (two distinct portions) consists of a combined15,668 acres located in Kern County on the northern slope of the Antelope Valley. The westernmost portion of Area 7 sits between Areas 3 and 4, while the easternmost portion occurs east of Area 4 and boarders Area 6 to the north. The combined off-site Mitigation Preserve area amounts to 39,213 acres of mitigation lands. Cumulatively, both on and off-site, the Mitigation Preserve encompasses 43,079 acres of Project mitigation lands. The majority of three of these areas, Areas 3, 4, and 5 are the subject of conservation easements, therefore, although available for mitigation including enhancement, restoration, and creation, are not available for mitigation acreage value as preservation.

Uses within the Off-site Mitigation Preserve shall be restricted to use and continued maintenance of existing ranch roads and trails for access as well as hiking and biking for private inholding owners and permitted Ranch guests. Public access shall be prohibited. Authorized motorized vehicles including but not limited to Tejon Ranch employees, utility maintenance vehicles, that have a Tejon Ranch permit and emergency vehicles shall be restricted to existing

ranch roads and all recreational motorized vehicles shall be prohibited. No improvements beyond what is necessary to maintain roads, fences, etcetera, in their current state shall be allowed, Recreational hunting shall be restricted to Ranch authorized individuals and within designated hunting areas only. Only habitat enhancement, restoration and creation activities approved by the County and described in the Mitigation Preserve Management Plan shall be permitted. Grazing shall be allowed to continue as directed by the Mitigation Preserve Management Plan strictly for resource management values.

Green Space

Disturbed Green Space consists of areas within the project boundary that are impacted and will need to be mitigated. Disturbed Green Space will be amenities for the Project and could include one or more of the following uses: golf course, equestrian, natural parks, trails, cultural monuments, water retention basins, open space uses, utilities, grading, crop production, grazing, special events, and mitigation activities. No Mitigation credit has been taken into account for the Project impacts from the Green Spaces. While Green Spaces could be impacted initially, the concept of these areas is to restore it for community amenities and visual aesthetics between neighborhoods of development.

Undisturbed Green Space consists of areas within the project boundary that are not impacted and require no mitigation. There is no project mitigation credit taken for preserving these areas. To preserve these areas and to make sure there is no future mitigation needed, the uses are restricted to the following: Continued maintenance of existing ranch roads and trails for access as well as hiking and biking for private inholding owners and permitted Ranch guests. Public access and recreational hunting shall be prohibited. Authorized motorized vehicles including but not limited to Tejon Ranch employees, utility maintenance vehicles, that have a Tejon Ranch permit and emergency vehicles shall be restricted to existing ranch roads and all recreational motorized vehicles shall be prohibited. Restricted access signage shall be posted along interface with public areas. Wildlife friendly fencing will be used to demarcate the edge of restricted access green space.

In addition, MM 7-23 is hereby added to EIR Section 5.7.7, as follows:

MM 7-23 Notwithstanding any provision of the Centennial Specific Plan to the contrary, land designated by the Centennial Specific Plan as On-Site Mitigation Preserve, Off-Site Mitigation Preserve, Disturbed Green Space, and Undisturbed Green Space shall only be used in a manner consistent with the following land use restrictions:

On-Site Mitigation Preserve: Uses within the On-site Mitigation Preserve shall be restricted to use and continued maintenance of existing ranch roads and trails for access as well as hiking and biking for private inholding owners and permitted Ranch guests. Public access and recreational hunting shall be prohibited. Authorized motorized vehicles including but not limited to Tejon Ranch employees, utility maintenance vehicles, that have a Tejon Ranch permit and emergency vehicles shall be restricted to existing ranch roads and all recreational motorized vehicles shall be prohibited. No improvements beyond what is necessary to maintain roads, fences, etcetera, in their current state shall be allowed, with the exception of the placement of two new water towers discussed below. Only habitat enhancement, restoration and creation activities approved by the County and described in the Mitigation Preserve Management Plan shall be permitted. New impacts shall be limited to the placement of two water towers with disturbance impacts of no more than five acres each. Grazing shall be allowed to continue as directed by the Mitigation Preserve Management Plan strictly for resource management values.

Off-Site Mitigation Preserve: Uses within the Off-site Mitigation Preserve shall be restricted to use and continued maintenance of existing ranch roads and trails for access as well as hiking and biking for private inholding owners and permitted Ranch guests. Public access shall be prohibited. Authorized motorized vehicles including but not limited to Tejon Ranch employees, utility maintenance vehicles, that have a Tejon Ranch permit and emergency vehicles shall be restricted to existing ranch roads and all recreational motorized vehicles shall be prohibited. No improvements beyond what is necessary to maintain roads, fences, etcetera, in their current state shall be allowed, Recreational hunting shall be restricted to Ranch authorized individuals and within designated hunting areas only. Only habitat enhancement, restoration and creation activities approved by the County and described in the Mitigation Preserve Management Plan shall be permitted. Grazing shall be allowed to continue as directed by the Mitigation Preserve Management Plan strictly for resource management values.

Disturbed Green Space: Uses within Disturbed Green Space shall be restricted to one or more of the following: golf course, equestrian, natural parks, trails, cultural monuments, water retention basins, open space uses, utilities, grading, crop production, grazing, special events, and mitigation activities.

> Undisturbed Green Space: Uses within Undisturbed Green Spaces shall be restricted to one or more of the following: continued maintenance of existing ranch roads and trails for access as well as hiking and biking for private inholding owners and permitted Ranch guests. Public access and recreational hunting shall be prohibited. Authorized motorized vehicles including but not limited to Tejon Ranch employees, utility maintenance vehicles, that have a Tejon Ranch permit and emergency vehicles shall be restricted to existing ranch roads and all recreational motorized vehicles shall be prohibited. Restricted access signage shall be posted along interface with public areas. Wildlife friendly fencing will be used to demarcate the edge of restricted access green space.

These revisions ensure that buildout of the Specific Plan will result in a land use pattern that protects environmental resources in accordance with AVAP Goal LU 2 and that on-site hunting will be prohibited within the Specific Plan boundaries.

Response to Comment B.4-65:

This comment claims that allowing certain land uses on Project site lands designated as Open Space does not preserve value of such lands and may prohibit their use by special status species that currently use the Project site. Please see response to Comment B.4-64, which clarifies land use designations for various categories of open space under the Centennial Specific Plan so as to ensure that on-site biological resources are adequately protected and to address the concerns raised by this comment.

The vast majority of the Project's open space will be designated as On-Site Mitigation Preserve or Undisturbed Green Space. Pursuant to the new mitigation measure described in response to Comment B.4-64, within the On-Site Mitigation Preserve no improvements beyond what is necessary to maintain roads and fences will be allowed, with the exception of the placement of two water towers with a maximum disturbance of five acres each. Moreover, habitat enhancement, restoration and creation may only occur as described in the Project's Mitigation Preserve Management Plan and must be approved by the County. Public access and recreational hunting will also be prohibited on this land, though hiking and biking for private inholding owners and permitted Ranch guests would be permitted. Authorized motorized vehicles including, but not limited to Tejon Ranch employees, utility maintenance vehicles that have a Tejon Ranch permit, and emergency vehicles will be restricted to existing ranch roads and all recreational motorized vehicles will also be prohibited within the On-Site Mitigation Preserve. Grazing within the On-Site Mitigation Preserve will be allowed to continue strictly for resource management values and as directed by the Mitigation Preserve Management Plan.

Uses within Undisturbed Green Space shall be restricted to the continued maintenance of existing ranch roads and trails for access as well as hiking and biking for private inholding

owners and permitted Ranch guests. Public access, recreational motorized vehicles, and recreational hunting are prohibited in Undisturbed Green Space, whereas authorized motorized vehicles including but not limited to Tejon Ranch employees, utility maintenance vehicles, that have a Tejon Ranch permit and emergency vehicles will be restricted to existing ranch roads. Finally, uses with Disturbed Green Space will be limited to golf course, equestrian, natural parks, trails, cultural monuments, water retention basins, open space uses, utilities, grading, crop production, grazing, special events, and/or mitigation activities.

With respect to the Residential/Entertainment and Residential land use designations applicable to the Project's proposed Village 9 on the west side of the Project site, north of State Route 138, such area is also located within the impact area analyzed by the Draft EIR.[217] Therefore, the land disturbance associated with these uses was also addressed by the Draft EIR's biological impact analysis, which includes an assessment of, and mitigates for, the effects of such disturbance on wildlife movement and edge effects.[218]

As the Commenter correctly notes, Section 4.9 of the Specific Plan allows for its proposed land use designations to be modified through a Specific Plan amendment adopted pursuant to California Government Code § 65453. However, the Specific Plan makes clear that such action would be discretionary and thus subject to further CEQA compliance.[219] Depending on the nature of the proposed Specific Plan amendment, a supplemental environmental analysis and additional mitigation may be required.[220]

Response to Comment B.4-66:

This comment mischaracterizes AVAP Policy LU 2.1 by quoting its text out of context. The full text of Policy LU 2.1 is as follows: "Limit the amount of potential development in Significant Ecological Areas, including Joshua Tree Woodlands, wildlife corridors, and other sensitive habitat areas, through appropriate land use designations with very low residential densities, as indicated in Land Use Policy Map (Map 2.1) of this Area Plan." Thus, per its plain text, Policy LU 2.1 is concerned with wildlife corridors to the extent they are located within the boundaries of an SEA. As explained in response to Comment B.4-64, all of the Project site land that is located within an SEA will be included within the Project's proposed Mitigation Preserves, where all new disturbance and development will be prohibited by conservation easement. Thus, any wildlife corridors located within such SEA lands will be protected and left undisturbed if the Project is approved. Accordingly, the County disagrees with the Commenter's claim that the Project is inconsistent with AVAP Policy LU 2.1.

With respect to the Commenter's claim that the Project does not sufficiently avoid or protect regional and local wildlife corridors, please see responses to Comments B.4-56 and B.4-57. See, also, responses to Comments B.4-64 and B.4-65.

217 DRP 2017, Exhibit 5.7-12
218 *Id.,* pp. 5.7-142 to -194
219 *Id.,* Appendix 4.0-A, p. 4-26
220 *Ibid*.

Response to Comment B.4-67:

This comment claims that the Project is inconsistent with AVAP Policy LU 2.5. The County disagrees with the Commenter. The plain text of Policy LU 2.5 expressly excludes economic opportunity areas (EOAs) from its application. The Project site is located entirely within the boundaries of the AVAP's West EOA.[221] Accordingly, AVAP Policy LU 2.5 does not apply to the Project.

With respect to this comment's concerns about the Project's potential impact on major drainage channels designated as Open Space, please see responses to Comments B.4-9 and B.4-10.

Response to Comment B.4-68:

This comment claims that the Project is inconsistent with AVAP Policy M 10.5. The County disagrees with the Commenter. The Commenter correctly notes that the Draft EIR and Specific Plan provide that new trails constructed as part of the Project will be located along roads and in greenways and designed to minimize adverse effects on adjacent land uses, as required by the Specific Plan's Green Development Program and Mobility Plan.[222] Also, as explained in the Draft EIR, no fencing that would restrict wildlife movement is proposed in Open Space areas that serve as wildlife corridors.[223]

The Commenter is incorrect that the Draft EIR does not require mitigation to ensure that Project trail design minimizes effects on biological resources. MM 7-17 requires the Project to implement a public awareness program in an effort to restrict public access to the riparian and Open Space area on the Project site to designated trails. This program must include (i) signs that identify the boundaries or ecologically sensitive areas, (ii) the use of temporary fencing around sensitive areas that appear to be receiving a high level of disturbance until the disturbance is revered, and (iii) the promotion of public education and awareness of such sensitive areas." MM 7-17 also provides that only passive recreational activities shall be permitted in Open Space areas and shall be restricted to trails, and that dogs must be leashed within designated Open Space areas. In addition, MM 7-15 requires the Project to install waste and recycling receptacles that discourage foraging by wildlife species adapted to urban environments in common areas, including along walking trails. Moreover, MM 13-2 and 13-6 require the Project Applicant to develop a lighting plan to reduce potential impacts to biological resources caused by light and glare. Project compliance with the Specific Plan's Green Development Program and Mobility Plan, along with implementation of MMs 7-17, 13-2, and 13-6 will ensure the Project designs trail routes in a manner that minimizes adverse effects on biological resources, consistent with AVAP Policy M 10.5.

221 *Id.,* p. 4-4
222 *Id.,* pp. 4-38, -39; Appendix 2-A of Appendix 4.0, p. 10; Appendix 2-C, p. 2
223 *Id.,* p. 5.8-45

In response to this comment's request for wildlife-friendly fencing, MM 7-17 has been revised as follows:

MM 7-17 The Project Applicant/Developer shall implement a public awareness program (prior to the first occupancy permit) in an effort to restrict public access to the riparian and open space areas on the Project site to designated trails and to prevent unleashed domestic animals from entering these areas. The program's educational materials shall discuss the presence of native animals (e.g., coyote, bobcat, and mountain lion), indicate that those native animals could prey on pets, indicate that no actions shall be taken against native animals should they prey on pets allowed outdoors, and indicate that pets must be leashed while using the designated trail system and/or in any areas within or adjacent to open space. The educational materials shall also discuss the impacts pets can have on native birds. Control of stray and feral cats and dogs will be conducted in open space areas on an as-needed basis. Feral cats and dogs may be trapped and deposited with the local Society for the Prevention of Cruelty to Animals or the Los Angeles County Department of Animal Control. This program shall include signs that identify the boundaries of ecologically sensitive areas (including the avoided special status plant populations described in MM 7-1); the use of temporary, wildlife-friendly fencing around sensitive areas that appear to be receiving a high level of disturbance until the disturbance is reversed; and promotion of public education and awareness of such areas. In addition to signage being located along the boundaries of the Mitigation Preserve, signage denoting the boundaries of ecologically sensitive areas and other pertinent information shall be included along the Pacific Crest Trail where it overlaps the Mitigation Preserve. The Project Applicant/Developer shall be responsible for the initial development of the public awareness program and installation of interpretive signs and wildlife-friendly fencing. The Homeowners Association, the Project Applicant/Developer, or an acceptable Land Manager/Agency (as approved by the County) shall be responsible for maintaining this program, including signs and wildlife-friendly fencing.

Only passive recreational activities shall be permitted within the designated natural open space areas and shall be restricted to trails. Some areas may allow slightly greater impacts if designated as picnic and/or camping areas.

> Domestic cats shall be prohibited from free-roaming (i.e., be allowed outdoors), and shall be required to have a microchip. All dogs shall be required to be leashed while in the designated natural open space areas, and bags for removing pet excrement will be provided at trail entrances and other appropriate locations. In addition, all dogs and cats shall be required to be neutered or spayed; all dogs shall be required to have a microchip; and potential owners shall show evidence prior to entry into the Centennial Development, as required by Los Angeles County Code (Section 10.20.350). These restrictions/features and their purpose will be described within educational material and distributed to new homeowners and made available to all homeowners as needed.

With respect to the comment's concern regarding the potential adverse effects of future Specific Plan amendments, all such amendments would require the County's discretionary approval and would thus be subject to CEQA compliance. Depending on the nature of the proposed Specific Plan amendment, a supplemental environmental analysis and additional mitigation may be required.[224]

Finally, the land disturbance associated with the Project's proposed trails plan[225] was included in the impact area assumed by the Draft EIR's biological impact analysis, which includes an assessment of, and mitigates for, the effects of such disturbance on biological resources.[226]

Response to Comment B.4-69:

This comment claims that the Project is inconsistent with AVAP Goal COS 4 and Policies COS 4.2 and 4.7. The County disagrees.

Per Goal COS 4, it is goal of the AVAP that sensitive habitats and species be protected to promote biodiversity. As explained in response to Comment B.4-64 and in the Draft EIR, of the 5,624 acres of designated Open Space within the Project site, approximately 5,116 acres (42 percent of the total Project site) are intended to (1) remain in their original natural condition; (2) be restored; and/or (3) be enhanced by weed abatement, fencing, and native species planting, among other means.[227] Of this amount, 3,866 acres are designated as SEA 17 to be preserved in perpetuity within the Project site boundaries.[228] Moreover, the Project would also preserve 39,213 acres of off-site sensitive habitat and open space.[229] The Project Applicant would provide a conservation easement to ensure the protection of both the off-

224 *Id.,* Appendix 4.0-A, p. 4-26
225 *Id.,* Exhibit 4-10a
226 *Id.,* pp. 5.7-142 to -194
227 *Id.,* p. 1-6
228 *Ibid*.
229 *Id.,* p. 4-44

site and on-site preservation areas in perpetuity.[230] Thus, the project is consistent with AVAP Goal GOS 4.

The text of AVAP Policy COS 4.2 is identical to the text of Policy LU 2.1. Please see response to Comment B.4-66 regarding the Project's consistency with Policy LU 2.1.

AVAP Policy COS 4.7 restricts, but does not prohibit, fencing in wildlife corridors. As explained in the Draft EIR, significant wildlife corridors on the Project site are located in SEA 17. As discussed above, all such land will be protected by conservation easement in its existing natural state. As explained in the Draft EIR, no fencing that would restrict wildlife movement is proposed in Open Space areas that serve as wildlife corridors.[231] Thus, the Project is consistent with Policy COS 4.7. See, also, responses to Comments B.4-64 through B.4-68.

Response to Comment B.4-70:

This comment states the Project is inconsistent with AVAP Policy COS 4.8. The County disagrees.

Policy COS 4.8 states: "Ensure ongoing habitat preservation by coordinating with the California Department of Fish and [Wildlife (CDFW)] to obtain the latest information regarding threatened and endangered species." This comment confirms that the Project has coordinated with CDFW in the past, and Draft EIR MMs 7-1, 7-2, 7-3, 7-6, 7-8, and 7-12 all require the Project to coordinate with CDFW during Project construction and to obtain all necessary CDFW permits and approvals prior to disturbance. Accordingly, the Project is consistent with Policy COS 4.8.

The current status of tricolored black bird is actually Candidate State Endangered as described in the Draft EIR. See, also, responses to Comments B.4-18 and B.4-19, which address the Commenter's concerns regarding tricolored black bird.

Response to Comment B.4-71:

The following additions have been made after the final full paragraph in MM 7-3 on pages 5.7-176 and 5.7-177:

> In order to further reduce impacts to special status wildlife, restrictions shall be placed on the Contractor. These restrictions are related to hours of operation and blasting requirements. Responsibilities of the Construction Contractor shall include:
>
> - All Project-related activities during construction shall be restricted to daylight hours. Night work and associated lighting shall not be permitted during and night work shall be prohibited throughout the

230 *Id.,* pp. 4-45 and -46
231 *Id.,* p. 5.8-45

Project site to reduce the potential adverse effect on special status species.

- Vehicle and equipment access within the Project site shall be restricted to existing roads and overland travel shall be minimized and confined to areas where development will occur to the greatest extent feasible.

Response to Comment B.4-72:

It is acknowledged that the Blasting Plan in MM 12-7 would not require additional CEQA review and would not allow CDFW an opportunity for review. In an effort to require adherence to measures that help mitigate adverse effects to special status species, MM 7-3 in Section 5.7, Biological Resources, will be amended to include specific guidelines in lieu of a Blasting Plan.

The following additions have been made to MM 7-3 (following the edits made in response to Comment B.4-71) on pages 5.7-176 and 5.7-177:

b. Vehicle and equipment access within the Project site shall be restricted to existing roads and overland travel shall be minimized and confined to areas where development will occur to the greatest extent feasible.

c. If blasting is required, applicable federal, State, and local requirements would be observed, and any necessary permits and authorizations would be obtained.

d. Best Management Practices Guidelines developed by the Institute of Makers of Explosives (IME) would be implemented.

e. To avoid impacts to special-status-biological resources, blasting would occur during the rough-grading activities of construction phase of the Project only between the hours of 10:00 am and 4:00 pm.

f. To avoid potential affects to birds, blasting would occur outside the nesting bird season (i.e. blasting shall occur only between September 15 and January 1). No blasting shall occur within 1 mile of the winter perch for bald eagle during the winter season (October 15 to March 15).

g. Prior to blasting, a blasting monitoring team including the Project biologist and one acoustician would be formed. The Project biologist would assess and provide guidance related to the criteria for impact on any nearby noise sensitive species. The acoustician should have a minimum of five years of acoustical measurement experience and would be responsible for the blast noise and vibration measurements.

h. Blasts should be measured with a calibrated Type 1 sound level meter set to the fast or impulse integration response. If possible, the low frequency cut off should be set as low as possible, ideally 2 Hz or lower. Peak sound levels should be measured at a known distance from blast between the blast site and the noise sensitive species habitat (identified by the Project

biologist). If the Project biologist sees fit, the low frequency cut off requirements may be waived or adjusted to address the sensitive species in the area. If measured peak levels exceed the criteria, blasts shall be altered in a way to reduce the impact. Such mitigation efforts may include: Reducing the explosive material, altering the packing and placement of the explosive material, or changing the location of the blasting efforts.

i. The biologist has the authority to stop blasting efforts or advise the blast team on the method of mitigation.

Response to Comment B.4-73:

The Draft EIR includes mitigation for the development of a Lighting Plan, however, the measure includes specific requirements for mitigating light pollution such as: restrictions on distance from open spaces and direction of light, mercury vapor and halide lighting, illumination levels, low-pressure sodium, lighting fixtures or flashing lights, exterior lighting standards and fixtures, lighting direction, security lighting fixtures. Additionally, time-control devices shall be utilized on exterior lighting sources; street, parking lot, and structural lighting fixtures shall provide adequate illumination while minimizing light spillover. The measure, as it is written, is comprehensive and reduces potentially significant impacts on special status species to levels less than significant.

Response to Comment B.4-74:

To clarify, neither the Parks and Recreation section nor the remainder of the Draft EIR, require this plan through mitigation or other methods. As stated on page 5.14-22 of the Section 5.14, Parks and Recreation, "Also, a Public Access Plan will be developed in connection with the development of the Ranch-wide Management Plan (RWMP) to ensure significant, but well-managed, public access into the Conservation Easement Area". The RWMP manages the approximately 240,000 acres encompassed by the Tejon Ranch Conservation and Land Use Agreement (TRCRWA).[232] Portions of the TRCRWA lands overlap the mitigation areas associated with the Project. The reference to public access pursuant to this Plan, to be developed by the RWMP as indicated in the Parks and Recreation section, was solely to demonstrate the recreation value that properly-managed access into selected open space areas proximate to the proposed land uses. The Public Access Plan applies to Conservation Easement areas, and is prepared by the Tejon Ranch Conservancy with consultation with and input from TRCRWA signatories (environmental organizations and Tejon Ranch), and applicable state and/or federal agencies for Conservation Easements held by the state of California (e.g., the Wildlife Conservation Board) or required as mitigation land for federal or state resource agency permits (e.g., US Fish and Wildlife Service and Department of Fish and Game). The Public Access Plan on these Conservation Easement Areas is neither part of the Project nor will it be prepared by the Applicant.

As discussed in Section 4.0, Project Description, "the Developer would provide a conservation easement for both the 3,861 on-site preserved acres and the 23,547 off-site

[232] Final EIR Appendix 5.7-E

preserved acres".[233] The area to be covered by a conservation easement, which accounts for areas used for Project mitigation rather than as part of the larger Tejon Ranch Conservation and Land Use Agreement, is referred to in the Draft EIR alternatively as the Project's Open Space Preserve or Mitigation Preserve. The on-site Open Space is shown on Exhibit 4-11, Centennial Project – On-Site Open Space/Mitigation Area, and the off-site Mitigation Preserve areas are shown on Exhibit 4-12, Centennial Project – Off-Site Mitigation Preserve. This graphic also depicts the Project's Mitigation Preserve in the content of the larger Tejon Ranch Conservation Area, which is not part of the Project.

This comment also states that the future preparation of the Public Access Plan does not provide the CDFW with an opportunity to assess potential species and habitat impacts, and recommends both revising the Draft EIR to include the Public Access Plan and that public access, development, and disturbance within the SEA is prohibited. As noted above, the Public Access Plan is neither part of the Centennial Project nor will it be prepared by the Applicant, but by the RWMP. Therefore, regarding public access into the SEA as part of the Public Access Plan, the contents of this plan is not under the control of the Applicant or otherwise part of the Project. The proposed Project expressly precludes disturbance within SEA 17.

Response to Comment B.4-75:

As discussed on page 5.7-166 of Draft EIR Section 5.7, Biological Resources, the Project has been designed to allow for local movement through the site. Open space areas, inclusive of undisturbed and green space areas, combine to create a network of connections throughout much of the Project site and connecting to off-site areas. A new Exhibit B.4-9, On-Site Open Space Areas, has been prepared and combines project design features from different Draft EIR exhibits and demonstrates the connectivity, which will allow local movement through the Project illustrates where most of the existing drainage corridors are retained as the general location of re-engineered drainages. New exhibits are included in Section 3.0, Draft EIR Clarifications and Revisions, of this Final EIR. The Project's open space areas will allow for movement of more common species adapted to urban and suburban conditions, and impacts on local wildlife dispersal would be less than significant, and would not be cumulatively considerable. The Project would only affect portions of populations of species that are not considered to be of conservation concern, and dispersal impediments are not expected to substantially affect the likelihood of the regional population persistence of those species. The Project site was also modified from its original proposed boundaries, to the revised boundaries established in the Antelope Valley Area Plan (AVAP). This boundary modification excluded development in the designated Sensitive Ecological Areas (SEAs), adopted through the AVAP, and resulted in a pullback from the northwest portion of the originally-proposed project site and added additional acres of development on the eastern edge of the original Project boundaries consistent with the land use zoning of the AVAP. Regional movement has been shown to generally move around the currently proposed Project site.[234] As such, the design of the Project is not intended to change existing patterns and draw wildlife into the Project development, and specifically avoids drawing wildlife

[233] DRP 2017, p. 4-44

[234] *Id.,* pp. 5.7-56 to -62; *Id.,* Exhibit 5.7-6

away from the regional pathways in the avoided designated SEA areas. Additionally, as described on page 5.7-170 of the Draft EIR, impacts on wildlife movement are reduced through PDFs 7-7 and 7-8, and are further minimized with implementation of MMs 7-13 through 7-19, which incorporate planning and construction methods to reduce potential indirect impacts such as developing a Lighting Plan and Landscaping Plan and to create public awareness concerning multiple urban interface issues. With implementation of the identified PDFs and MMs, impacts to wildlife movement would be less than significant. Please also see response to Comment B.4-57. A redesign of the Project is unwarranted because the current design minimizes impacts on wildlife movement.

Regarding preservation of special status plants, a further redesign of the Project is unwarranted. The Project design has been modified substantially to reduce impacts on special status plants as well as other biological resources through multiple years of consultation with the Significant Ecological Area Technical Advisory Committee (SEATAC) as was required when the Project was proposed to develop in portions of an SEA. Subsequently, the County Board of Supervisors unanimously approved the current SEA boundaries through the adoption of the AVAP as well as the boundary for the West Economic Opportunity Area which includes the Specific Plan Area. The Project was redesigned to be consistent with these new boundaries and avoid all SEA designated areas. Furthermore, in response to comments submitted by CDFW, much more grassland was preserved, and plant mitigation measures were modified to require more preservation. These efforts have reduced the Project's impacts on special status plants considerably by avoiding a greater percentage of impacted populations along the southern boundary and avoiding some species entirely. In addition, Mitigation implementation is hinged on Project implementation, and Project implementation requires approval of the Final EIR. In general, project applicants are constrained from proceeding with mitigation until Project approval has been granted, as mitigation is part of the process and requires CEQA review. The Special Status Plant Species Restoration Plan and MM 7-1 on page 5.7-173 of the Draft EIR also include specific performance objectives and identifies feasible means of achieving those performance objectives, which is a form of mitigation measure commonly used and has been repeatedly confirmed as legally adequate in CEQA court cases. Please see the response to Comment B.4-44, which discusses performance objectives for this mitigation plan. The performance objectives provided are those necessary to ensure impacts to special status plant species are properly mitigated for, and functions and values of these communities are preserved and managed in perpetuity.[235]

As described in MM 7-1 on page 5.7-173 of the Draft EIR, the Special Status Plant Species Restoration Plan shall include methods for enhancement and restoration such as direct seeding, transplantation, non-native invasive weed control, grazing management, etc. The Plan shall also include appropriate locations for restoration that match the parameters of existing populations. The mitigation ratio for special status plants (2:1) is intended to ensure at least an equal or greater population is preserved.

[235] *Id.,* pp. 5.7-173 to -175

Mitigation lands have been surveyed, a literature review has been conducted, and a soils, slope, aspect analysis has been conducted to confirm similar conditions occur on the Project site and Mitigation Preserve. During these efforts, several of the special status species that have been documented on the Project site were found in the Mitigation Preserve.

The EIR also continues to include a mitigation requirement for the round-leaved filaree, because Los Angeles County considers it sensitive within the region, despite it having been recently removed from the CNPS and CNDDB list.

In addition, please see response to Comment B.4-43.

Response to Comment B.4-76:

Figure 3-2 of the Centennial Specific Plan shows regional circulation in relationship to the Specific Plan area. It depicts existing paved roads and private dirt roads as well as proposed circulation within the development footprint. Roads that appear within the Open Space designated areas (green color) are existing roads that will remain. The only paved road that will remain within the open space area is the existing Cement Plant access road. For reference, the proposed circulation within the specific Plan area is shown on Figure 3-1.

Response to Comment B.4-77:

Areas reflected as undisturbed open space or greenspace (parks and recreation and other uses) on the east side of the Aqueduct north of SR-138 are not proposed for mitigation purposes and are not part of the Mitigation Preserve. The revised Exhibit 5.7-10 depicts those areas that represent the Mitigation Preserve for the Project. Although some areas of the Project interior, which the development footprint avoids, are proposed to remain as undisturbed open space, they are not used to meet mitigation acreage requirements. All mitigation acreage requirements are contained within the Mitigation Preserve as described on Draft EIR page 5.7-135.

Response to Comment B.4-78:

The Project proponent is proposing to take responsibility for the construction of certain Project infrastructure and other improvements and facilities. Thereafter, upon completion of the facilities, the Project proponent and/or various private, governmental, and quasi-governmental entities will undertake the long-term operation and maintenance of those facilities. As development progresses, the details on the final list of entities and responsibilities will be required before any construction is authorized. One such entity will likely be one or more homeowner's associations (HOA) established to maintain certain Project amenities and common areas, and to enforce various policies required by the Project's proposed Specific Plan, among other tasks.

The creation and operation of an HOA is governed by the Davis-Stirling Common Interest Development Act, California Civil Code § 4000 *et seq*. (HOA Act). Under the HOA Act, an HOA for a master planned community is created with a "declaration" of covenants, conditions and restrictions (CC&Rs) that is recorded on title. An HOA may exercise the same broad powers

as a nonprofit mutual benefit corporation established pursuant to California Corporations Code § 7140. An HOA's authority, and its obligations, are set forth in the recorded CC&Rs, which are drafted by the project proponent.

The CC&Rs serve as the "Constitution" of a common interest development and the fundamental source of power of the HOA. CC&Rs must contain (i) a legal description of the development, (ii) a statement regarding the type of common interest development the declaration covers, (iii) the name of the HOA, (iv) the restrictions on the use and enjoyment of any portion of the common interest development that are intended to be enforceable by equitable servitudes, and (v) any other matters the declarant (i.e., the developer) or the HOA members consider appropriate.

Terms typically included in HOA CC&Rs concern HOA membership and voting rights, methods for calculating and collecting assessments, maintenance responsibilities, restrictions on the use and operation of separate and common interests in the development, accounting and insurance requirements, and mechanisms governing enforcement of the declaration. Once the first buyer accepts the declaration by purchasing a separate interest in a common interest development, the terms and conditions of the CC&Rs become enforceable equitable servitudes, unless unreasonable, and inure to the benefit of and bind all owners of separate interests in the development.

An HOA can be required to assume a development obligation in perpetuity, and neither the HOA nor its membership can eliminate or amend an assessment levied or an obligation established pursuant to the recorded CC&Rs. Additionally, as a backup in case of challenges or defaults of the HOA, the HOA may legally contract with an appropriate authority to maintain facilities to a specific standard and secure performance with CC&Rs and the remedies afforded thereunder, so long as the HOA has the authority within its organic document to do so.

HOAs are governed by a board, appointed initially by the project proponent and then later elected by the various property owners that are part of the HOA. The board of the HOA has control over the repair and maintenance of the common areas of the development. Moreover, the HOA is permitted to charge regular fees to homeowners within the development (comparable to taxes). These revenues are used for functions like paying for maintaining common areas like corridors, walkways, parking, landscaping, and amenities. The HOA can levy fines or sue homeowners for damages and/or injunctive relief to enforce the HOA's rules, CC&Rs and to collect fees.

Accordingly, the HOA will be empowered to raise the revenue necessary to perform its obligations under, and to enforce restrictions set forth in, the CC&R's. This includes all obligations regarding the ongoing maintenance of any Project improvements managed by the HOA, such as proposed parks and slopes. In addition, the HOA will be authorized to hire third-parties that are qualified to perform such tasks, as needed. For example, the Specific Plan provides that the Master HOA will hire a Community Forester trained in urban forestry, arboriculture, horticulture, landscape architecture, or closely related fields to undertake various responsibilities related to landscape maintenance, and plant palette selection and

enforcement).[236] The trained Community Forester will also develop policy for managing public trees, prepare an annual tree management plan, and prepare lists of plants permitted and prohibited within the Project area, subject to the review and approval of the County staff biologist).[237] Per MM 7-13, the approved list of permitted and prohibited plants will be incorporated into the Project Landscape Plan for review and approval of the County staff biologist. In addition, per the Specific Plan and MM 7-13, the HOA will be responsible for providing current information to homeowners about plant species that have been identified by the Community Forester and County staff biologist as prohibited within the community.[238]

With respect to the fuel modification zones, the Specific Plan provides that such areas shall be maintained by either an HOA or other designated entity. However, to govern such maintenance activities, MM 3-9 requires the Project Applicant/Developer to prepare a Fuel Modification Plan that complies with the requirements of Title 32 of the County of Los Angeles Code. Per Title 32, the Fuel Modification Plan must be submitted for preliminary approval by the Los Angeles County Fire Department prior to any subdivision of land. MM 3-9 further requires the Project Applicant/Developer to provide all new residents and business owners with recorded CC&Rs or disclosure statements that identify their responsibilities for maintaining fuel modification zone(s) on their properties, as defined in the approved Fuel Modification Plan, which must be submitted to the County for its review and approval.

With regard to the control of Argentine ants, MM 7-16 provides that all landscaping materials for common/public areas must be inspected and certified by landscape supplies as being "free" of Argentine ants prior to planting. Moreover, this mitigation measure requires that all container plants and other landscaping materials installed within common/public areas within 200 feet of open space areas be inspected by a qualified restoration specialist for the presence of ants and to reject any plants discovered with ants. In addition, upon initiating landscaping, MM 7-16 requires a qualified biologist to undertake quarterly monitoring for the presence of Argentine ants and, if detected, to implement direct control measures to prevent the invasion from worsening. Per MM 7-16, ant monitoring and control by a qualified biologist must continue for a period of five years following the initiation of landscaping and only after such five-year period will monitoring and control duties be transferred to the HOA, at which point the HOA can hire qualified personnel to undertake such tasks, as discussed above, funded by HOA fee revenues. Additionally, to further guard against Argentine ants, the HOA must discourage irrigated landscape planting through distribution of education information and other feasible methods.

As provided in the Specific Plan, the County shall impose, at the time of approval of each Project tentative map for residential uses, a condition of approval requiring the applicant to submit its form of CC&Rs for the review and approval of the County.[239] Moreover, per the Specific Plan, the Project's Master HOA must be formed, and its declaration of CC&R's

236 DRP 2017, Appendix 4.0-A, p. 1-6
237 *Id.,* Appendix 4.0-A, pp. 1-6, 3-42, 3-50
238 *Id.,* Appendix 4.0-A, p. 3-50
239 *Id.,* Appendix 2-B of Appendix 4.0-A, p. 7

recorded immediately after recordation of the first final map for a unit phase within the Project consisting of one or more residential lots. As final maps for additional unit phases are approved and recorded, such land will be annexed by the Master HOA and made subject to the CC&Rs.[240] In addition, all mitigation measures identified in the EIR will be incorporated into an enforceable Mitigation, Monitoring, and Reporting Program (MMRP) and made enforceable conditions of Project approval. These requirements will ensure that the Project's CC&Rs comply with the requirements of the Specific Plan and properly allocate responsibilities and duties identified in the Specific Plan to be undertaken by the Project HOA.

The County is entitled to presume to that the Project Applicant, HOA, and homeowners will comply with all applicable conditions of approvals, the MMRP, and the CC&Rs. Contrary to this comment's claim, CEQA does not obligate the Lead Agency to analyze speculative, indirect environmental effects to biological resources that might occur if the Project applicant, HOA, or the Project homeowners fail to meet their legal obligations under the Project approvals and/or CC&Rs. Such speculative effects are not a reasonably foreseeable consequence of Project approval.

Response to Comment B.4-79:

Project Design Feature (PDF) 7-8 requires the preparation of a list of invasive plants species to be prohibited from use within the Project site. Although the Centennial Specific Plan includes a partial list of prohibited plants, it should be noted that any list of invasive or detrimental plants is not entirely comprehensive because many non-native species, under favorable environmental conditions, can become invasive or detrimental. For this reason, this list may be modified over time by the community forester with approval from the County staff biologist. A more exhaustive list of these plants, periodically updated by region, is published by the California Invasive Plant Council (Cal-IPC). Cal-IPC's list of invasive plants will serve as the guideline for prohibited species at Centennial.

Additionally, as stated in the Centennial Specific Plan, vegetation selected for planting shall be subject to review by the County staff biologist. Prior to selecting non-native species for use, such species should be examined to see whether they have become invasive or detrimental in other areas. Species poisonous to humans and wildlife should generally be avoided. Seed mixes for herbaceous species (ground covers including lawns or hydroseed mixes) should be certified as weed-free and not containing any of the species on the prohibited species list. Please note the inclusion of Bermuda grass on the Cal-IPC inventory.

Response to Comment B.4-80:

As stated on Draft EIR page 5.7-87 in Section 5.7, Biological Resources, of the 1,370.8 acres of mixed oak woodland existing on the Project site, 1,364.6 acres would not be impacted by the Project (500.8 acres north of SR-138 and 870.0 acres south of SR-138). Additionally, of the 1,370.8 acres of mixed oak woodland existing on the Project site, 1,291.8 acres (473.2 north of SR-138 and 818.6 acres south of SR-138) would be preserved in the on-site

[240] *Id.,* Appendix 2-B of Appendix 4.0-A, p. 2

preservation areas (unimpacted areas within SEA 17). Consequently, 99 percent of the mixed oak woodlands on the Project site would be retained. Based on this information, it can be estimated that approximately 99 percent of the trees are preserved as well. The Specific Plan's Hillside Design Guidelines require that 50 percent or more of existing on-site trees and woodlands (particularly native and drought-tolerant species, and oak woodlands) be retained and incorporated into the overall Project landscaping plan. The Project's 99 percent preservation would exceed this Specific Plan requirement. In addition, all of the oak woodlands used to meet the Hillside Design Guideline of retaining and incorporating 50 percent or more of on-site trees and woodlands into the over Landscaping Plan are also located within the Los Angeles County SEA boundaries.

Although the Specific Plan Hillside Design Guidelines include guidance for the use of bridge design techniques that allow easy wildlife migration beneath bridges, the Draft EIR does not require mitigation for bridge design in regard to wildlife movement. Therefore, additional details for bridge design beyond the Specific Plan guidelines are not required. However, MM-14 on Draft EIR pages 5.7-190 and 5.7-191 describes some specific measures for the design of a highway underpass, which is intended for use by pedestrians as well as wildlife, consistent with the AVAP. As described, the width of the underpass shall be 100 feet and shall flare out on both sides of the highway to a 150-foot width in the Project open space adjacent to the highway. These specifications are expected to allow some local wildlife to safely pass between open space areas on opposite sides of the highway.

Response to Comment B.4-81:

The Project's mitigation lands, the Mitigation Preserve, do not include the open space areas described in the comment such as yards and parkways. The revised Exhibit 5.7-10 depicts the Mitigation Preserve areas for the Project. Although some interior areas, which the Project development footprint avoids, are proposed to remain as undisturbed open space, they are not used to meet mitigation acreage requirements. All mitigation acreage requirements are contained within the Mitigation Preserve as described starting on Draft EIR page 5.7-135.

The Open Space definition has been refined to provide more clarity to this issue. Revised open space designation definitions shall be incorporated into the Final Centennial Specific Plan. Also see response to Comment B.4-77.

Response to Comment B.4-82:

This concluding comment does not raise any specific concerns regarding the Project's potential environmental effects or the adequacy of the Draft EIR. Therefore, no further response is required. This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Dear Samuel Dea:

The enclosed comment (s) on your Draft EIR was (were) received by the State Clearinghouse after the end of the state review period, which closed on June 30, 2017. We are forwarding these comments to you because they provide information or raise issues that should be addressed in your final environmental document.

The California Environmental Quality Act does not require Lead Agencies to respond to late comments. However, we encourage you to incorporate these additional comments into your final environmental document and to consider them prior to taking final action on the proposed project. B.5-1

Please contact the State Clearinghouse at (916) 445-0613 if you have any questions concerning the environmental review process. If you have a question regarding the above-named project, please refer to the ten-digit State Clearinghouse number (2004031072) when contacting this office.

Sincerely,

Scott Morgan
Director, State Clearinghouse

STATE CLEARINGHOUSE

Comments - Draft Environmental Impact Report, Centennial Project, Los Angeles County, State Clearinghouse No. 2004031072

The California Regional Water Quality Control Board, Lahontan Region (Water Board) reviewed the Draft Environmental Impact Report (DEIR) for the Centennial Project (Project), received on May 17, 2017. The DEIR was prepared by BonTerra PSMOAS on behalf of Los Angeles County (County) and submitted in compliance with provisions of the California Environmental Quality Act (CEQA). Water Board staff, acting as a responsible agency, is providing these comments to specify the scope and content of the environmental information germane to our statutory responsibilities pursuant to CEQA Guidelines, California Code of Regulations (CCR), title 14, section 15096.

The Water Board is pleased that the County integrated "Low Impact Development" (LID) strategies into various elements of the Project Plan and encourages the County to take this opportunity to also integrate strategies that promote watershed management and groundwater sustainability. As a whole, the DEIR describes a project that incorporates many water quality protection features and sustainable water saving components necessary in the arid high desert with hydrologically closed groundwater basins. This letter contains general and specific comments that we request be addressed, primarily: (1) a jurisdictional determination regarding waters of the United States must be established; (2) long-term groundwater pumping to satisfy Project water supply demand should consider cumulative growth in the Antelope Valley as a whole; and (3) we recommend that Project Alternative E (discussed below) be selected as the preferred alternative.

B.5-1 (cont.)

Project Description

The Project is a planned new 12,323 acre community development with residential, commercial, business, recreation and civic uses in Kern and Los Angeles Counties.

Peter C. Pumphrey, chair | Patty Z. Kouyoumdjian, executive officer

2501 Lake Tahoe Blvd., So. Lake Tahoe, CA 96150 | 15095 Amargosa Road, Bldg 2, Ste 210, Victorville CA 92394
e-mail Lahontan@waterboards.ca.gov | website www.waterboards.ca.gov/lahontan

RECYCLED PAPER

The Project involves the development of nine villages that will each contain a mix of land uses. While not an exact description of the Project area, it is generally bounded to the south by the San Gabriel Mountains and the San Andreas Fault and to the north and west by the Tehachapi Mountains and the Garlock Fault. The West Branch of the State Water Project's (SWP) California Aqueduct bisects the Project. The East Branch of the SWP Aqueduct is along the northeast side of the Project. The Project site has historically been used for livestock grazing. The National Cement Plant is located approximately one mile north of the Project Site.

The Project would allow up to 19,333 dwelling units on approximately 4,987 acres of land. Project build-out will occur over a 20 year period through tracts and parcel maps approved by the County. Of the 5,624 acres designated Open Space, approximately 5,116 acres are intended to:

(1) Remain in their original natural condition;
(2) Be restored; and/or
(3) Be enhanced by native species planting, abatement and fencing.

Over 90% of the Project is within the Lahontan Water Board jurisdiction and less than 10% within the Los Angeles Water Board jurisdiction. The Project plan includes two wastewater reclamation facilities that will be constructed for the tertiary treatment of wastewater generated by the Project, both in the Lahontan Region. Produced recycled water will be used to reduce the Project's demand for imported water and groundwater resources to supply potable water needs.

B.5-1 (cont.)

The Project's water supply needs are not directly under the purview of the Water Board. However, the Project's water supply is from imported SWP water, groundwater, and 40% from recycled water. After EIR certification, it is anticipated that the Golden Valley Municipal Water District (currently serving the community of Gorman) will annex the Project into its service area and become responsible for providing water and wastewater treatment services.

Project development will occur within nine "villages," eight located east of the SWP Aqueduct, and one west of the Aqueduct. Over the Project life, 20 separate Tentative Tract Parcels will be separately vested, each having specific development conditions.

Water Board Authority

All groundwater and surface waters are considered waters of the State. All waters of the State are protected under California law. State law assigns responsibility for protection of water quality in the Lahontan Region to the Lahontan Water Board. Some waters of the State are also waters of the U.S. The Federal Clean Water Act (CWA) provides additional protection for those waters of the State that are also waters of the U.S.

The Water Quality Control Plan for the Lahontan Region (Basin Plan) contains policies that the Water Board uses with other laws and regulations to protect the quality of waters of the State within the Lahontan Region. The Basin Plan sets forth water quality

standards for surface water and groundwater of the Region, which include designated beneficial uses as well as narrative and numerical objectives which must be maintained or attained to protect those uses. The Basin Plan can be accessed via the Water Board's web site at: http://www.waterboards.ca.gov/lahontan/water_issues/programs/basin_plan/references.shtml.

General Comments

We recognize the effort put forth by the County to incorporate the policies and objectives of various state, regional and local and agencies into the Project plan and have the following general comments. The Project spans the jurisdiction of two Regional Boards, Lahontan and Los Angeles; our comments are germane only to that area of the Project within the Lahontan Region.

1. There may, or may not be, waters of the United States in the Project vicinity. *Before DEIR certification is considered by Los Angeles County, the proponent should establish with the United States Army Corps of Engineers and United States Environmental Protection Agency, Region VIX, whether or not waters of the United States are present in within the Project boundary.* This decision will dictate the applicable federal surface water protection requirements that may apply.

2. The Project water demand will be supplied from numerous sources: (1) imported SWP water, (2) recycled water, (3) imported water return flow, and (4) groundwater pumped from the Antelope Valley groundwater aquifer, which is court adjudicated because of pumping overdraft. SWP water availability is subject to many variables. Imported water return flow amounts appear speculative. The DEIR estimates a constant annual groundwater demand of 1,634 acre-feet per year (Table 5.18-10). The cumulative groundwater demand from projected development across the Antelope Valley as a whole may not be sustainable into the long-term. While Water Board staff supports the Water Resources Mitigation Measures identified in section 5.18, we also believe the water supply impact may not be "less than significant after mitigation" as stated on page 5-18-76. The DEIR did not evaluate the cumulative impact from continuous groundwater aquifer pumping from all current and projected future groundwater withdrawals in the Antelope Valley considering projected growth. *Clarify how the Project water supply will be sustained in the long-term considering the cumulative groundwater demand from all current and projected future development activities.*

3. The Water Board is encouraged by the foresight of Alternative E: Density Clustering East of the Aqueduct. This moves all of the developments to the east side of the aqueduct, thereby reducing the need for Village 9 and the small 0.34 million gallons per day (MGD) package plant that would service the development. This would prevent any threat to the drinking water conveyance and supply in the form of the State Water Project Aqueduct and Quail Lake. *The Water Board recommends Los Angeles County select Alternative E as the preferred Project alternative.*

B.5-1 (cont.)

SPECIFIC COMMENTS

Water Board staff provides the following specific comments regarding the Project that should be addressed in the Final EIR.

4. Hydromodification – Water Board staff support that the Project proponents have considered hydromodification, hydrology and flood control, and mapping out the 100 year floodplain to ensure LID and Best Management Practices (BMP) are met in the design of the project, and in particular the following mitigation measures (MMs): MM 2-1 for Hydromodification and Drainage system engineering, MM 2-2 Hydrology and flood-control BMPs that will provide capital flood protection, capital storm event, and MM 2-3 Tentative Maps depicting the 100 year floodplain mapped by the Federal Emergency Management Agency (FEMA).

5. Water Resources – Water Board staff believes that MM 18-2 (Water Use Reports) are a very important Project plan element that should be adhered to and modified only when development is not proceeding at the predicted rate. This measure should be coordinated with the zoned density and build-out milestones. We are pleased that for Water Resource MM 18-1 (Water Efficiency Measures) that the county has planned to meter water use, reduce potable water use with on-site recycled water, require water efficient appliances, require water efficient irrigation, and budget water based on water rates.

6. Wastewater Collection - For Wastewater Collection mitigation measures MM 19-1 thru MM 19-3 and MM 19-5, the Water Board requests to remain notified through each stage of development in order to provide input as development proceeds and balance workload as water quality permit actions are requested. For MM 19-4 and MM 19-5 (West and East wastewater treatment plants, respectively), Water Board staff is concerned about the proximity of these plants to the SWP Aqueduct and protection of that invaluable resource to overall water supply for southern California.

7. Page 3-5 – The text indicates that 90% of the Project is within Region 6 (Lahontan Region) and 10% is within Region 4 (Los Angeles Region). Page 5-54 states that 93% of the Project is within the Region 6. Elsewhere, the appendices state that 96% of the Project is within Region 6 and 4% in Region 4. *Clarify portions of the Project within each regional board jurisdiction consistently throughout the DEIR.*

8. Page 5.2-25 and page 5.4-2 – The DEIR states that the Project must comply with the state General Construction Permit. *Clarify whether the entirety of the Project will comply with the state General Construction Permit whether or not federal receiving waters of the United States are present.* The Water Board requests the Project proponents to comply with the state General Construction Permit in the Antelope Valley regardless of whether federal waters are present and to implement appropriate construction and post-construction BMPs.

9. Page 5.2-49 – Section 6.2.7 discusses Hydrology and Flood Mitigation Measures. The Water Board's November 4, 2015 letter providing comments on the Notice of Preparation (NOP) (item 5) indicated that maintenance of post-construction BMPs

B.5-1 (cont.)

should encourage deep rooted plants that are trimmed, not eradicated. *Include a Mitigation Measure requiring BMP maintenance that encourages stabilized native grasses and/or deep rooting plants to minimize sediment transport.*

10. Page 5.3-20 – The Homestead Area section indicates that there is an onsite historical well that will be destroyed in accordance with the California Well Standards. *Include a Mitigation Measure requiring destruction of this well in accordance with the California Well Standards.* We appreciate the Project proponent's intent to properly destroy this well. However, a mitigation measure should be added ensuring this activity is carried out to protect groundwater resources from possible contamination.

11. Page 5.4-69 – Table 5.4-12 indicates there is no Lahontan Basin Plan groundwater quality objective for nitrate as nitrogen. While this is correct, it is also misleading. The Lahontan Basin Plan, page 3-13, indicates that groundwater quality objectives are based on state drinking water standards. The state drinking water standard for nitrate as nitrate is 45 milligrams per liter (mg/L), which is the equivalent of 10 mg/L nitrate as nitrogen. *Clarify the text and Table 5.4-12 with respect to the Lahontan Basin Plan nitrate groundwater quality objective.*

12. Page 5.4-90 – Two Water Quality Mitigation Measures are identified, MM 4-1 to use BMPs and incorporate LID for Project construction and MM 4-2 to integrate integrated pest management measures. The Water Board is pleased that the Project will implement LID and water quality control BMPs that will retain storm water runoff, specifically permeable pavement. The Project will result in significant site grading as the various villages are developed. We request that an additional construction related BMP be specifically identified and utilized. During construction, native topsoil should be retained, temporarily stored, and used as top soil cover for disturbed areas to the maximum extent feasible. Efforts should be taken to ensure that native seeds contained within removed and temporarily stored native topsoil are appropriately nurtured to germinate disturbed areas. *Include as a Mitigation Measure the retention and reuse of native topsoil during grading to re-establish native plants for soil stabilization to the maximum extent feasible.*

13. Page 5.4-90 – Water Board staff's November 4, 2015 letter on the NOP requested that a Restoration and Revegetation Monitoring Plan be prepared (item 10). The list of mitigation measures included with the Biological Resources section of the DEIR (chapter 5.7) does not include this plan intended to ensure that revegetation efforts are successful. *Include as a Mitigation Measure a Restoration and Revegetation Monitoring Plan to ensure successful revegetation efforts, along with metrics for success.*

14. Page 5.4-91 – The DEIR does not seem to reference the Salt and Nutrient Management Plan for the Antelope Valley. This plan was developed as required by the State Board's Recycled Water Policy. See: http://www.ladpw.org/wwd/avirwmp/docs/saltplan/Salt%20and%20Nutrient%20Management%20Plan%20for%20Antelope%20Valley_May%202014.pdf

B.5-1 (cont.)

Significant elements of that plan are monitoring (Section 5) and salt and nutrient source reduction implementation measures (Section 6). The monitoring section indicates that groundwater monitoring well information is limited in some parts of the Antelope Valley. Section 6.3 of that plan identifies additional implementation measures that should be considered, including, but not limited to, reducing salt/nutrient loading into the basin using ultrafiltration or reverse osmosis, and replacing chlorine disinfection with ultraviolet disinfection. The Project proponent should:

a. *Reference the Salt and Nutrient Management Plan for the Antelope Valley in the EIR.*

b. *Identify or install appropriate groundwater monitoring wells that will be incorporated into the Antelope Valley monitoring network to evaluate Project impacts over time, in conjunction with other Antelope Valley groundwater impacts.*

c. *Identify, evaluate, and incorporate specific best management practices that will be employed now and over the Project life to reduce salt and nutrient loading into the Antelope Valley groundwater basin.*

d. *Include in the EIR Mitigation Measures for an ongoing commitment to participate in collective groundwater basin monitoring efforts and reduce salt and nutrient loading over the Project life.*

B.5-1 (cont.)

15. Appendix 5.4-A (Centennial Project Water Quality Technical Report), about page 36 – While referenced on page 5.18-13, the State Board adopted general water recycling and waste discharge requirements for the use of recycled water that is managed by an administrator (Order WQ-2016-0068-DDW). This Order is an appropriate regulatory tool for the use of recycled water. *Include reference to the State Board Order WQ-2016-0068-DDW, Water Reclamation Requirements for Recycled Water Use.*

16. Appendix 5.19-B (Centennial Project Wastewater Treatment Report) – The Project at build-out will include two wastewater reclamation facilities (WRF) designed for an average daily flow as follows: WRF East a 4.28 MGD, and WRF West at 0.34 MGD. Both plants are projected to use membrane bioreactor technology to achieve tertiary effluent standards. Storage reservoirs will be constructed to temporarily store water prior to distribution in recycled water pipelines. The following comments relate to wastewater collection and treatment.

a. NOP Comments - Water Board staff's November 4, 2015 letter on the NOP requested additional information regarding wastewater collection, treatment, and disposal (Item 13). The DEIR did not provide all of the information requested. *Include in the EIR the information requested in Item 13 of Water Board staff's November 4, 2015 letter.*

b. Wastewater collection and treatment – Page 4-60 indicates that eight sewer lift stations will be required. *Mitigation measures should be added requiring sewer lift stations, wastewater treatment, and effluent storage facilities to be equipped with emergency backup power sources and spill containment features in the event that power failure occurs*. This is especially critical for the Project features immediately up stream of the SWP Aqueduct and adjacent to streams.

c. Nitrogen reduction – The text is silent on whether nitrogen reduction technology will be utilized. *Mitigation measures should be added indicating that the WRFs will be required to achieve total nitrogen levels of less than 10 mg/L to ensure that any incidental recharge from the use of recycled water will not adversely affect receiving groundwater*.

d. Disinfection – The text indicates that chlorine disinfection will be used. There is no indication that alternative disinfection measures were evaluated. *Mitigation measures should be added requiring an evaluation of alternative disinfection including ultraviolet disinfection*. The Water Board strongly recommends ultraviolet disinfection to ensure that disinfection byproducts are not produced, incidental recharge from the use of recycled water will not adversely affect receiving groundwater, and effluent total dissolved solids concentrations are lower.

e. Effluent storage – The text does not indicate the location, size, volume, or construction method for the storage reservoirs. *The EIR should include this information.* While the EIR states that storage reservoirs will be lined, *the EIR should specify the type of liner and method of construction*. Liners must be of appropriate materials to prevent degradation and/or pollution of receiving groundwater. *If all effluent is to be contained for recycled water use, then sufficient capacity must exist to store winter flow when recycled water demand decreases. If some effluent will be percolated, then a groundwater degradation analysis must be provided*. The proposed method of monitoring potential reservoir leakage, including groundwater monitoring, should be stated.

f. Biosolids handing – To address greenhouse gas emissions and the effects of climate change, the digesters should be equipped with methane gas recovery used for onsite power generation needs. *The location and proposed construction method of onsite sludge drying beds should be discussed*.

B.5-1 (cont.)

Permitting Requirements

A number of activities that will be implemented under the Project have potential to impact waters of the State and, therefore, may require permits issued by either the State Water Resources Control Board (State Water Board) or Lahontan Water Board. The required permits may include the following.

17. Streambed alteration and/or discharge of dredge and/or fill material to a surface water, including water diversions, may require a CWA, section 401 water quality certification for impacts to federal waters (waters of the United States) or dredge and fill Waste Discharge Requirements for impacts to non-federal waters.

18. Land disturbance of more than 1 acre may require a CWA, section 402(p) storm water permit, including a National Pollutant Discharge Elimination System (NPDES) General Construction Storm Water Permit, Water Quality Order (WQO) 2009-0009-DWQ as amended by 2010-0014-DWQ and 2012-006-DWQ, obtained from the State Water Board, or an individual storm water permit obtained from the Lahontan Water Board.

19. Water diversion and/or dewatering activities may be subject to discharge and monitoring requirements under either NPDES General Permit, Limited Threat Discharges to Surface Waters, Board Order R6T-2014-0049 for diverted stream flows or dredge spoils dewatering, or General Waste Discharge Requirements for Discharges to Land with a Low Threat to Water Quality, WQO-2003-0003, both issued by the Lahontan Water Board.

20. Wastewater collection systems are subject to the Statewide General Waste Discharge Requirements for Sanitary Sewer Systems, Order 2006-0003-DWQ.

21. Wastewater treatment is subject to individual waste discharge requirements issued by the Water Board. This requires that a report of waste discharge be filed with the Water Board no less than 140 days before discharge occurs.

22. If waters of the United States are present at the wastewater treatment plant sites, then storm water runoff must be covered under the statewide General Permit for Storm Water Discharges Associated with Industrial Activities, Order 2014-0057-DWQ.

23. Recycled water use is subject to water reclamation requirements issued by the Water Board, after the State Board Division of Drinking Water approves an Engineering Report to satisfy Title 22, California Code of Regulations. Alternately, an Administrator may file for coverage under Statewide Water Reclamation Requirements for Recycled Water Use, Order WQ 2016-0068-DDW.

Project proponents should consult with Water Board staff early on should project implementation result in activities that trigger these permitting actions. Information and application forms for these permits can be found at http://www.waterboards.ca.gov/lahontan/.

B.5-1 (cont.)

Thank you for the opportunity to comment on the DEIR. If you have any questions regarding this letter, please contact me at (760-241-2434 (jehiel.cass@waterboards.ca.gov). Please send all future correspondence regarding this Project to the Water Board's email address at lahontan@waterboards.ca.gov and be sure to include the State Clearinghouse No. (2004031072) and Project name (Centennial Ranch) in the subject line.

Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Centennial Development Project, Los Angeles County, State Clearinghouse Number 2004031072

The Notice of Preparation of a Draft Environmental Impact Report (DEIR) for the above-referenced project (Project) was prepared by the County of Los Angeles Planning Department (County) and circulated for public comment in compliance with provisions of the California Environmental Quality Act (CEQA). As a responsible agency, the California Regional Water Quality Control Board, Lahontan Region (Water Board) is providing these comments to specify the scope and content of the environmental information germane to our statutory responsibilities pursuant to CEQA Guidelines, California Code of Regulations, title 14, section 15096. Based on our review of the proposed Project, we recommend that several issues be considered in the preparation of the Notice of Preparation (NOP), particularly: 1) established numerical and narrative water quality objectives and standards should be used when evaluating thresholds of significance for Project impacts; (2) post-construction best management practices (BMPs) for stormwater control are an essential part of project planning and should be discussed in the DEIR; and 3) all potential downstream impacts to hydrology and water quality must be evaluated as a result of Project implementation. Our comments on the Project are outlined below.

B.5-1 (cont.)

Project Overview

The Centennial Project is a large residential-commercial development that will include 19,333 dwelling units on an area of a total of 12,323 acres in western Antelope Valley, 36 miles west of Lancaster. Approximately 6,700 acres of land will be developed into a series of communities over a 20 year period, and approximately 5,600 acres of land will be preserved for open space for drainages and conservation. New infrastructure facilities including shopping centers, water treatment facilities, water banking facilities will be built on approximately 180 acres, while approximately 140 acres will be set aside for K-12 schools. Commercial buildings will occupy approximately 100 acres, hospitals, medical facilities, and higher education buildings will occupy approximately 110 acres, and recreational and entertainment facilities will occupy approximately 80 acres.

Water Board's Authority

All groundwater and surface waters are considered waters of the State. Surface waters include streams, lakes, ponds, and wetlands, and may be ephemeral, intermittent, or perennial. All waters of the State are protected under California law. State law assigns responsibility for protection of water quality in the Lahontan Region to the Lahontan Water Board. Some waters of the State are also waters of the U.S. The Federal Clean Water Act (CWA) provides additional protection for those waters of the State that are also waters of the U.S.

The *Water Quality Control Plan for the Lahontan Region* (Basin Plan) contains policies that the Water Board uses with other laws and regulations to protect the quality of waters of the State within the Lahontan Region. The Basin Plan sets forth water quality standards for surface water and groundwater of the Region, which include designated beneficial uses as well as narrative and numerical objectives which must be maintained or attained to protect those uses. The Basin Plan can be accessed via the Water Board's web site at http://www.waterboards.ca.gov/lahontan/water_issues/programs/basin_plan/references.shtml.

Specific Issues to be Considered in the NOP

Based on our review of the information provided, we recommend that the following issues be considered in preparation of the DEIR.

1. The DEIR should identify all the applicable water quality standards that pertain to this project and identify which standards could potentially be violated by Project alternatives and use these standards when evaluating thresholds of significance for impacts. Water quality objectives and standards, both numerical and narrative, for all waters of the State within the Lahontan Region, including surface waters and groundwater, are outlined in Chapter 3 of the Basin Plan. Water quality objectives and standards are intended to protect the public health and welfare, and to maintain or enhance water quality in relation to the existing and/or potential beneficial uses of the water.

2. The Project area is located within the Neenach Hydrologic Area of the Antelope Hydrologic Unit, 626.00. The Project area lies over the Antelope Valley groundwater basin (Department of Water Resources unit 6-44). We note that the NOP in section 3.e. does not include the Basin Plan in its list of relevant plans. The beneficial uses of minor surface waters and wetlands are listed in Chapter 2 of the Basin Plan. The DEIR should identify and list all the beneficial uses of the surface water and groundwater resources within the Project area, and include an analysis of the potential impacts to water quality and hydrology with respect to those beneficial uses.

3. Healthy watersheds are sustainable. Watersheds supply drinking water, provide for recreational uses, and support ecosystems. Watershed processes include the movement of water (i.e. infiltration and surface runoff), the transport of sediment, and the delivery of organic material to surface waters. These processes create and sustain the streams, lakes, wetlands, and other receiving waters of the Antelope Hydrologic Unit, including groundwater. The DEIR should discuss the project components and their potential impacts to watersheds on the project area.

B.5-1 (cont.)

4. The DEIR should describe a proposed long-term maintenance and monitoring plan that will be implemented to evaluate and maintain the established baseline conditions. Specific routine and non-routine activities should be identified, such as dredging/excavation and re-contouring, and the thresholds that will trigger when maintenance activities are warranted.

5. The DEIR should describe the long-term post-construction best management practices (BMPs) maintenance plan. It is understood that routine sediment removal is necessary to maintain the function of a basin, and the removal of accumulated sediments in the bottom of a basin would completely remove any vegetation that may have been present. However, we also recognize the benefits of vegetation for water quality by filtering sediments and constituents of concerns from water. We *strongly recommend* that the County proponent include in their long term maintenance plan provisions for mowing rather than eradication, so that vegetation can more easily reestablish itself post-maintenance. Maintaining healthy deep-rooted vegetation is crucial to soil stabilization. Re-contouring and vegetation grubbing should only be done on an as-needed basis.

6. The DEIR should describe the project design standards used for sizing and constructing hydraulic features. Surface waters support a variety of beneficial uses including municipal and agricultural uses, groundwater and fresh water recharge, habitat, flood attenuation, and water quality enhancement. To ensure that no net loss of function and value will occur as a result of Project implementation, we request that culverts be designed to (1) pass storm flows without impoundment upstream, (2) with sufficient energy dissipation provided at the outlet to reduce flow velocities to pre-Project conditions, and (3) sufficiently sized to allow for habitat connectivity across/beneath the roadway.

7. All rock slope protection and energy dissipation rip-rap placed within stream channels should be **ungrouted** and the minimum amount necessary to provide scour protection and energy dissipation to prevent erosion. The DEIR should describe channel design and energy dissipation to prevent erosion. The DEIR should describe channel design criteria.

8. Construction and post-construction storm water management must be considered a significant Project component, and BMPs that effectively treat storm water runoff should be included as part of the Project. The DEIR should specify those temporary and permanent long-term sediment and erosion control BMPs that will be implemented to mitigate potential water quality impacts related to stormwater. The temporary BMPs need to be implemented for the Project until such time that vegetation has been restored to pre-Project conditions. We request that vegetation clearing be kept to a minimum and, where feasible, existing vegetation be mowed so that vegetation could more readily reestablish post-construction. A long-term BMP maintenance plan should be included in the DEIR.

9. The DEIR should identify all impacts to water resources and describe how impacts were avoided, minimized, or proposed to be mitigated. The Water Board requires that impacts to water resources be avoided where feasible and minimized to the extent practical. Compensatory mitigation will be required for all unavoidable permanent impacts to surface water resources. Water Board staff coordinate all mitigation requirements with staff from other federal and state regulatory agencies,

B.5-1 (cont.)

including the USACE and the California Department of Fish and Wildlife. In determining appropriate mitigation ratios for impacts to waters of the State, Water Board staff considers Basin Plan requirements (minimum 1.5:1 mitigation ratio for impacts to wetlands) and utilizes *12501-SPD Regulatory Program Standard Operating Procedure for Determination of Mitigation Ratios*, published December 2012 by the USACE, South Pacific Division.

10. All temporary impacts to water resource and upland areas should be restored (recontoured and revegetated) to match pre-Project conditions. A Restoration and Revegetation Monitoring Plan should be prepared and described in the DEIR that requires monitoring for some period of time (usually no less than 3 years), outlines a schedule with performance measures to be met in order for the restoration/revegetation to be deemed successful, and contains adaptive management criteria in the event performance measures are not being met.

11. Equipment staging areas, excavated soil stockpiles, and hazardous materials (i.e. oils and fuels) should be sited in upland areas outside surface waters and adjacent flood plain areas. We recommend that a comprehensive Spill Prevention and Response Plan be prepared and described in the DEIR that outlines the site-specific monitoring requirements and lists the BMPs necessary to prevent hazardous material spills or to contain and cleanup a hazardous material spill, should one occur.

12. Buffer areas should be identified and exclusion fencing used to protect water resources and to prevent unauthorized vehicles or equipment from entering or otherwise disturbing the surface waters. Equipment should use existing roadways to the extent feasible. These features should be described in the DEIR.

13. The project plans to construct and operate a domestic wastewater treatment plant. The plant will produce recycled water for use within the project area. Onsite disposal of treated wastewater must not cause pollution and minimize degradation. Denitrification should be included in the plant design. The DEIR should fully describe the following.

    a. Treatment plant and disposal pond locations,
    b. Treatment plant design criteria,
    c. Storage and disposal pond design criteria,
    d. Expected wastewater quality,
    e. Receiving groundwater quality,
    f. Expected receiving groundwater degradation (nature and extent) resulting from the discharge according to State Board Resolution 68-16,
    g. Background receiving groundwater quality and direction of flow established from a statistically significant data set,
    h. Location and well construction design of monitoring wells installed to evaluate groundwater quality,
    i. Lift station locations and design,
    j. Backup power features,
    k. Recycled water storage, delivery, and use area design standards, and
    l. Entity responsible for owning and operating the treatment plant and recycled water infrastructure.

B.5-1 (cont.)

Permitting Requirements

A number of activities associated with the proposed Project have the potential to impact waters of the State and, therefore, may require permits issued by either the State Water Resources Control Board (State Water Board) or Lahontan Water Board. The required permits may include the following.

14. Streambed alteration and/or discharge of fill material to a surface water may require a CWA, section 401 water quality certification for impacts to federal waters (waters of the U.S.), or dredge and fill waste discharge requirements for impacts to non-federal waters, both issued by the Lahontan Water Board.

15. Land disturbance of more than 1 acre may require a CWA, section 402(p) storm water permit, including a National Pollutant Discharge Elimination System (NPDES) General Construction Storm Water Permit, Water Quality Order (WQO) 2009-0009-DWQ, obtained from the State Water Board, or individual storm water permit obtained from the Lahontan Water Board if water of the United States are affected. The DEIR should identify where waters of the United States are present with in the project area. The Water Board may establish individual waste discharge requirements to address stormwater impacts to state only waters.

16. New industrial operations may require coverage under the Industrial General Stormwater Permit (2014-0057-DWQ) if waters of the United States are affected. Information on the Industrial General Stormwater Permit is available on the State Water Board's web site at http://www.swrcb.ca.gov/water_issues/programs/stormwater/industrial.shtml. These permits must be obtained from the Lahontan Water Board.

17. Disposal from wastewater treatment facilities will require a waste discharge requirements which must be obtained from the Lahontan Water Board. Information on what information is needed in a report of waste discharge is available on the State Water Board's web site at http://www.waterboards.ca.gov/water_issues/programs/land_disposal/waste_discharge_requirements.shtml

18. Water diversion and/or dewatering activities may be subject to discharge and monitoring requirements under either NPDES General Permit, Limited Threat Discharges to Surface Waters, Board Order R6T-2014-0049, or General Waste Discharge Requirements for Discharges to Land with a Low Threat to Water Quality, WQO-2003-0003, both issued by the Lahontan Water Board. The DEIR should identify any and all proposed diversion or dewatering actions.

19. Recycled water uses are subject to water reclamation and waste discharge requirements issued by the Water Board. An Engineering Report must be submitted to the Water Board and State Division of Drinking Water, which also must approve the Engineering Report.

Please be advised of the permits that may be required for the proposed Project, as outlined above. The specific Project activities that may trigger these permitting actions should be identified in the appropriate sections of the NOP. The Project proponent should consult with Water Board staff early on should Project implementation result in activities that trigger

B.5-1 (cont.)

these permitting actions. Information regarding these permits, including application forms, can be downloaded from our web site at http://www.waterboards.ca.gov/lahontan/.

Thank you for the opportunity to comment on the NOP. If you have any questions regarding this letter, please contact me at (760) 241-7391 thomas.browne@waterboards.ca.gov or Jehiel Cass, Senior Water Resource Control Engineer, at (760) 241-2434 jehiel.cass@waterboards.ca.gov.

Please send all future correspondence regarding this Project to the Water Board's email address at Lahontan@waterboards.ca.gov and be sure to include the State Clearinghouse Number, when available, and Project name in the subject line.

Dear Samuel Dea:

The enclosed comment (s) on your Draft EIR was (were) received by the State Clearinghouse after the end of the state review period, which closed on June 30, 2017. We are forwarding these comments to you because they provide information or raise issues that should be addressed in your final environmental document.

The California Environmental Quality Act does not require Lead Agencies to respond to late comments. However, we encourage you to incorporate these additional comments into your final environmental document and to consider them prior to taking final action on the proposed project.

B.5-1 (cont.)

Please contact the State Clearinghouse at (916) 445-0613 if you have any questions concerning the environmental review process. If you have a question regarding the above-named project, please refer to the ten-digit State Clearinghouse number (2004031072) when contacting this office.

Sincerely,

Scott Morgan
Director, State Clearinghouse

RE: Centennial Project
Draft Environmental Impact Report
SCH# 2004031072
IGR# 07-LA-2016-00925-FL
Vic. LA/ 5/ PM 82.625
LA/ 138/ PM 0.415 – 4.106

Dear Mr. Sackett:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced project.

The proposed project (Project) involves the development of a new community of 9 villages with each contain a mix of land uses, such as residential, commercial, business park, recreational/entertainment, and institutional/civic uses. It is in the northwestern portion of the Antelope Valley in unincorporated Los Angeles County.

The Project allows up to 19,333 dwelling units on approximately 4,987 gross acres of land designated for residential uses. Other land uses include approximately 7,363,818 square feet (sf) of Business Park uses (office, research and development, and warehousing or light manufacturing uses) on approximately 597 gross acres and approximately 1,034,550 sf of Commercial uses on approximately 102 acres. Proposed Institutional/Civic uses (such as schools for higher education, medical facilities, library, and other civic uses) encompass approximately 1,568,160 sf on approximately 110 acres. The Project includes conceptual site locations for up to 4 new fire stations and a new sheriff's station, and 2 wastewater reclamation facilities. The Project would also require the implementation of off-site features consisting of roadway improvements and connections and upgrades to existing off-site utility systems, and preserve 5,624 acres of on-site open space within the Open Space designation.

Caltrans noted that the Project buildout would be implemented in phases based on future market conditions over an approximate 20-year period through a series of future tract and parcel maps.

B.5-1
(cont.)

If residential development occurs prior to the commercial, business, and employment center, the typical morning and evening commutes could occur, thus establishing a sprawl type of development. To avoid an unsustainable scenario, the County as the lead agency should plan the phasing of the development accordingly. Both residential and employment centers should be developed concurrently.

Furthermore, the Project included an Affordable Housing Program that provides Very Low-, Low, and Moderate-Income affordable housing opportunities in several housing categories, including for-sale units and/or rental units. Caltrans would like to remind that the provision of affordable housing for the various income levels is critical to minimize long-distance peak hour commutes. Special attention should be given to the phasing-in of development and housing affordability.

Caltrans continues to strive to improve its standards and processes to provide flexibility while maintaining the safety and integrity of the State's transportation system. It is our goal to implement strategies that are in keeping with our mission statement, which is to "*provide a safe, sustainable, integrated, and efficient transportation system to enhance California's economy and livability.*"

The entire development should be pedestrian and bicycle friendly with bicycle and pedestrian connections to the outside community. Internal circulation of public transit and adequate bike parking should be provided throughout. To provide good connectivity within each community and between communities the grid pattern is preferred over the cul-de-sac design. Park-and-ride areas should be included and designed to accommodate regional transit. The different communities should be designed to accommodate Neighborhood Electric Vehicles (NEV's).

B.5-1 (cont.)

Good geometric and traffic engineering design to accommodate bicyclists and pedestrians and that meet ADA standards and requirements are critical at every on and off ramp and freeway terminus intersections. Caltrans will work with the County to look for every opportunity to develop projects that improve safety and connectivity for pedestrians and bicyclists.

As a follow-up to a tele-conference meeting on July 13, 2017 between County of Los Angeles and Caltrans in regarding to Project's traffic analysis report and the proposed mitigation measures. Please see below for Caltrans' comments regarding the Project's DEIR and the Traffic Study.

- In reviewing the Project' DEIR and the Traffic Study, there were references to the Northwest SR-138 Corridor Improvement project (NW SR-138 project); Caltrans recommend that a brief summary of the NW SR-138 project be included in the DEIR and the Traffic Study. Such as the purpose, proposals, alternatives, and how it relates to the Project.

  Caltrans selected Alternative 2 of the NW SR-138 project as the Preferred Alternative. The Project's proposed improvements should be consistent with what was already approved in the NW SR-138 project.

- The traffic data, results, and conclusions indicated in the Project's DEIR and Traffic Study should be consistent with the NW SR-138 project' Traffic Study. This will avoid conflicting data.

- Intersection Control Evaluation (ICE) Report pertaining to State Routes, should be consistent with NW SR-138 project, since the ICE Policy has been established.

  However, if the Project chooses to include its own intersection analysis on State Routes, it should be amended to what was previously concurred with in the NW SR-138 project, and submitted to Caltrans for review prior to the Final Environmental Impact Report (FEIR).

- To further address the Project's potential significant impacts to State Routes, as agreed to during the teleconference held on July 13, 2017 with Caltrans, the County of Los Angeles and its traffic consultants, a follow-up meeting is necessary to further discuss and refine the details regarding proposed mitigation measures and fair share contributions, including a Mitigation Agreement with Caltrans. Such that the Project is to be developed over time according to market demands and so would the transportation improvements. Therefore, Caltrans requests that the Transportation facilities necessary to accommodate build-out of the entire Project should be identified at this stage, along with a plan that indicates which improvements will be would be implemented by each phase and the amount of the fair share contributions that will be due at that time.

B.5-1 (cont.)

In the spirit of mutual cooperation, Caltrans would like to request a meeting with the Lead Agency and consultants to evaluate traffic impacts, identify potential improvement, and established a funding mechanism that helps mitigate cumulative transportation impacts in the project vicinity.

If you have any questions, please feel free to contact the project coordinator, Ms. Frances Lee, at (213) 897-0673 or electronically at frances.lee@dot.ca.gov.

Sincerely,

DIANNA WATSON

Subject: Centennial Project
SCH#: 2004031072

Dear Samuel Dea:

The enclosed comment (s) on your Draft EIR was (were) received by the State Clearinghouse after the end of the state review period, which closed on June 30, 2017. We are forwarding these comments to you because they provide information or raise issues that should be addressed in your final environmental document.

B.5-1 (cont.)

The California Environmental Quality Act does not require Lead Agencies to respond to late comments. However, we encourage you to incorporate these additional comments into your final environmental document and to consider them prior to taking final action on the proposed project.

Please contact the State Clearinghouse at (916) 445-0613 if you have any questions concerning the environmental review process. If you have a question regarding the above-named project, please refer to the ten-digit State Clearinghouse number (2004031072) when contacting this office.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Subject: Draft Environmental Impact Report (DEIR) and Centennial Specific Plan (CSP) for the Centennial Project (State Clearinghouse number 2004031072).

Dear Mr. Sackett:

The California Department of Fish and Wildlife (CDFW) has reviewed the DEIR and CSP submitted by Los Angeles County (Lead Agency) for the proposed Centennial Project (Project). The Project is located approximately 35 miles north of the City of Santa Clarita in Los Angeles County; approximately 50 miles south of the City of Bakersfield in Kern County; and approximately 36 and 43 miles west of the Cities of Lancaster and Palmdale, respectively, in Los Angeles County. State Route 138 (SR 138) bisects the southern portion of the Project site in an east-west orientation, just south of the Kern County/Los Angeles County boundary in the immediate vicinity of Quail Lake. The California Aqueduct splits into a west and east branch just to the north of the Project site. The west branch of the California Aqueduct continues south bisecting the western portion of the Project site. The east branch of the California Aqueduct continues in an easterly direction and borders the Project site to the north.

The proposed Project includes the development of a new community with residential, commercial, business, recreational/entertainment, and institutional/civic uses. The Project site is comprised of approximately 12,323 acres and would allow up to 19,333 dwelling units on approximately 4,987 acres. Other land uses include approximately 7,363,818 square feet (sf) of business park uses (office, research and development, warehouse and light manufacturing) on approximately 597 acres and approximately 1,034,550 sf of commercial uses on approximately 102 acres. Proposed institutional/civic uses (schools, medical facilities, libraries, etc.) encompass approximately 1,568,160 sf on approximately 110 acres. In addition, the Project will provide parks, public and private recreational amenities, schools, public services, helipads, transit centers, and water and waste water treatment facilities. Proposed land uses will allow for the development of new oil and gas wells and extraction facilities, including surface mining; the development of new renewable energy resources, including solar, wind and other renewable energy generation facilities; shooting ranges; and hunting, camping and hiking activities.

There are several drainages on the Project site, including drainages within Oso Canyon and Tentrock Canyon, and an unnamed drainage that parallels SR 138 on its north side. Portions of the Project site will be left as open space, primarily within Significant Ecological Area (SEA) 17, which is located along the northwestern and southeastern edges of the Project site, and within the creeks and drainages that will not be filled, as well as drainage features that will be

B.5-1 (cont.)

recreated after Project development. Primary access to the Project site will be from SR 138, with additional access available from 300th Street West and 290th Street West and the relocated National Cement Plant Road. Upgrades to SR 138 and Interstate 5 (I5) are planned through a separate California Department of Transportation (Caltrans) development project to accommodate increasing traffic usage of the aforementioned roadways. Offsite facilities are also proposed as a part of the Project to accommodate the new infrastructure to serve the Project site. Current land use on the Project site predominantly consists of annual grassland grazing with agriculture production occurring along the eastern edge of the Project site.

The Project area and the surrounding Tejon Ranch lands are one of the largest, most-intact, privately-held, natural habitat areas remaining in California, and support a diverse assemblage of vegetation communities and special status species. Vegetation communities known to occur on the Project site include, but are not limited to, Wright's buckwheat scrub, mixed oak woodland, alluvial scrub, cottonwood woodland, riparian herb, rush riparian grassland, southern arroyo willow riparian, southern cottonwood-willow woodland, southern willow scrub, valley oak riparian woodland, unvegetated wash, willow riparian forest, willow riparian woodland, alkali meadow, Baltic rush, coastal and valley freshwater marsh, seeps and ephemeral ponds, and native perennial grasslands, wildflower fields, and native and nonnative annual grasslands.

Special status species known to occur on or within the vicinity of the Project site include but are not limited to, the State and federally endangered and State fully protected California condor (*Gymnogyps californianus*); State and federally endangered least Bell's vireo (*Vireo bellii pusillus*) and southwestern willow flycatcher (*Empidonax traillii extimus*); State endangered tricolored blackbird (*Agelaius tricolor*) and western yellow-billed cuckoo (*Coccyzus americanus occidentalis*); State threatened Swainson's hawk (*Buteo swainsoni,* SWHA) and Tehachapi slender salamander (*Batrachoseps stebbinsi*); State fully protected golden eagle (*Aquila chrysaetos*), and white-tailed kite (*Elanus leucurus*); California Rare Plant Rank (CRPR) 1B.1 Piute Mountains navarretia (*Navarretia setiloba*); CRPR 1B.2 round-leaved filaree (*California macrophyllum*) and State Species of Special Concern burrowing owl (*Athene cunicularia,* BUOW), silvery legless lizard (*Anniella pulchra pulchra*), coast horned lizard (*Phrynosoma blainvillii*), two-striped garter snake (*Thamnophis hammondii*), northern harrier (*Circus cyaneus*), American badger (*Taxidea taxus*) and Tehachapi pocket mouse (*Perognathus alticolus inexpectatus*). The Project site is also one of the largest remaining perennial and annual grassland habitat areas in Los Angeles County. The Project as proposed would result in a cumulatively significant impact to native perennial grasslands and regional wildlife movement.

B.5-1 (cont.)

Our specific comments follow and are organized in the same sequence as the sections in the DEIR.

Department Jurisdiction

Trustee Agency Authority: CDFW is a Trustee Agency with the responsibility under the California Environmental Quality Act (CEQA) for commenting on projects that could impact plant, fish and wildlife resources. Pursuant to Fish and Game Code Section 1802, CDFW has jurisdiction over the conservation, protection and management of fish, wildlife, native plants and habitat necessary for biologically sustainable populations of those species. As a Trustee Agency for plant, fish and wildlife resources, CDFW is responsible for providing, as available,

biological expertise to review and comment on environmental documents and impacts arising from project activities, as those terms are used under CEQA.

Responsible Agency Authority: CDFW has regulatory authority over projects that could result in "take" of any species listed or is a candidate for listing by the State (State-listed) as threatened or endangered, pursuant to the California Endangered Species Act (CESA). For this or any other project which impacts listed species, an incidental take permit (ITP) is the mechanism for providing take authorization under CESA. CEQA requires a Mandatory Finding of Significance if a project is likely to substantially impact threatened or endangered species (sections 21001{c}, 21083, Guidelines sections 15380, 15064, 15065). Impacts must be avoided or mitigated to less than significant levels unless the CEQA Lead Agency makes and supports a Statement of Overriding Consideration (SOC). A CEQA Lead Agency's SOC would not preclude the Project proponent's obligation to comply with CESA.

Lake and Streambed Alteration Notification: CDFW has regulatory authority with regard to activities occurring in streams and/or lakes that could adversely affect any fish or wildlife resource, pursuant to Fish and Game Code sections 1600 *et seq.* Section 1602(a) of the Fish and Game Code requires an entity to notify CDFW before engaging in activities that would substantially change the bed, channel, or bank of a stream or substantially divert or obstruct the natural flow of a stream. Project activities are proposed that will involve work within the bed, bank, or channel (which may include associated riparian resources) of several CDFW jurisdictional resources; therefore, CDFW recommends the Project applicant submit a Lake and Streambed Alteration Notification to CDFW for the Project.

Other Rare Species: Species of plants and animals need not be listed as Endangered, Rare or Threatened (E, R or T) pursuant to CESA and/or the Federal Endangered Species Act (ESA) to be considered E, R or T under CEQA. If a species can be shown to meet the criteria for a listing as E, R or T under CESA and/or ESA as specified in the CEQA Guidelines (California Code of Regulations [CCR], Title 14, Chapter 3, Section 15380), it should be fully considered in the environmental analysis for the Project.

Fully Protected Species: CDFW has jurisdiction over fully protected species of birds, mammals, amphibians, reptiles, and fish, pursuant to Fish and Game Code sections 3511, 4700, 5050, and 5515. Take of any fully protected species is prohibited, and CDFW cannot authorize their take except under the provisions of a Natural Communities Conservation Plan (NCCP), 2081.7 or a Memorandum of Understanding for scientific purposes. Neither the Lead Agency nor Project proponent are plan participants of an NCCP; 2081.7 does not apply to the proposed Project, and a development project is not considered a scientific purpose.

Several fully protected species are known to occur on the Project site. This status, and the absence of an NCCP for the Project, precludes CDFW from authorizing any amount of incidental take for fully protected species. When projects show the potential to cause take of fully protected species, we advise on appropriate measures to avoid take. Given the legal status of fully protected animals, take avoidance measures must meet very high standards of effectiveness, substantially greater than the measures to minimize take required under ITPs.

Bird Protection: CDFW has jurisdiction over actions that may result in the disturbance or destruction of active nest sites or the unauthorized take of birds. Sections of the Fish and

B.5-1 (cont.)

Game Code that protect birds, their eggs and nests include sections 3503 (regarding unlawful take, possession or needless destruction of the nest or eggs of any bird), 3503.5 (regarding the take, possession or destruction of any birds-of-prey or their nests or eggs), and 3513 (regarding unlawful take of any migratory nongame bird).

Potential Impacts and Recommendations

Draft Environmental Impact Report:

Project Description (Section 4.0): Exhibit 4-7 in the DEIR shows that the current Cement Plant Road will be upgraded from the current 2-lane road to a 6-lane major highway. The northern portion of Cement Plant Road is located in the northern portion of the SEA. The DEIR states that the SEA will not be impacted. No dimensions are provided as to the current and proposed upgraded footprint (including width) of Cement Plant Road so it is unclear to CDFW if the current footprint of Cement Plant Road is wide enough to support an upgrade to a 6-lane major highway without impacting the SEA.

The DEIR states that the cable and internet provider has not been identified at this point in time, but would be provided by one of the two available providers within the Project area. Depending on the provider chosen, the new cable and internet line may be extended either 4 or 8 miles from its existing location to reach the Project site. The Biological Resources section of the DEIR did not address the potential routes of the telecom line extension, nor conduct biological surveys to identify potential impacts to species that may result from the installation of the telecom line extension. CDFW recommends the DEIR be revised to include survey results and a biological analysis of potential impacts from the installation of the telecom line.

B.5-1 (cont.)

CDFW also recommends that all new and existing dry utilities be installed underground to minimize impacts to migratory birds, including California condor.

Hydrology and Flood (Section 5.2): The Hydrology and Flood Section of the DEIR discloses that existing onsite drainages will be integrated into the Project's storm drain system. Integration activities include removal, reengineering, and reduction of drainage areas due to diversion and re-route of Project runoff. Channels within the Project site will be avoided, integrated into the storm drain system or be reengineered after site grading. Most Project runoff will be subject to control and treatment in a regional system that consists of 28 detention and retention basins located throughout the Project site, with 11 of these basins occurring within or adjacent to a channel (Exhibit 5.2-4 and 5.2-5). In addition to capturing Project site runoff, onsite basins and reengineered natural streams will also be designed to capture potential mudflows and may be revegetated or enhanced with drought tolerant and native species, some of which do not currently exist on the Project site.

The aforementioned modifications to the drainages and channels on the Project site are a substantial change in the biological function and composition of these features and may result in adverse impacts to CDFW jurisdictional areas (e.g., streams), wildlife and special status species and their associated habitats, as well as additional offsite resources, and would require acquisition of a lake and streambed alteration agreement from CDFW pursuant to Fish and Game Code Section 1600 et seq. CDFW recommends the DEIR be revised to include a detailed analysis of the biological impacts of these modifications, including increased pollutant,

chemical, and fertilizer loads in jurisdictional areas from site runoff, changes in species composition and habitat use from revegetation and reengineering of jurisdictional features, in-channel hydromodification measures (plunge pools, bank stabilization, flow diversion, culverts, etc.) and increased sediment deposit.

The Hydrology and Flood Section of the DEIR also states that the Project will conform to the County's flood and hydrology control standards (during a 50-year design storm event) by either reducing offsite flows and volumes or by maintaining existing site conditions. According to Table 5.2-7 in the DEIR, existing offsite flow conditions will only remain unchanged in the Gorman Watershed. All other watersheds will have a reduction in existing offsite flow/volume conditions. CDFW recommends the DEIR be revised to include an analysis of the biological impacts of a reduction in offsite flow/volume and include a discussion as to whether offsite flows will exit the Project site in the same location as pre-Project conditions in order to maintain offsite connectivity and existing offsite biological resources. In addition, CDFW is unclear if these basins will also be used for recreational or multi-use purposes. The DEIR discusses a potential fishing lake in Section 4.5.6 (Parks/Recreation); however, additional details such as, but not limited to, the location, size, fish species stocked, vegetation, fencing, and any additional recreational uses are not described in the Biological Resources section of the DEIR. Since fishing lakes may serve as a point source for introduced and/or invasive species, CDFW recommends the DEIR be revised to further describe and analyze the potential siting of lakes, ponds, and other perennial waterbodies and their locations. The impacts of these features need to be fully described, disclosed, and analyzed in the Biological Resources Section of the DEIR. These impacts include, but are not limited to the introduction of sport fish, the potential for introduction of invasive species from the general public (such as non-native fish, amphibians, and reptiles), the impacts of these introductions on native species within and adjacent to the Project site, and specific measures to reduce these impacts to less than significant.

B.5-1 (cont.)

Hazards and Fire Safety (Section 5.3): An abandoned mine shaft, approximately four feet high by five feet wide (at the entrance), and partially blocked by soil, extends approximately eight feet into the side of a hill near Quail Lake. In order to eliminate potential risks and prevent future access into the abandoned mine, the DEIR proposes to permanently close the mine. However, the DEIR does not provide any information on any potential wildlife species that may be using the mine, nor does it provide information on any surveys that have been done to monitor wildlife species' potential use of the mine. Abandoned mines are known to provide habitat for a variety of wildlife species, including, but not limited to, maternity and/or roosting habitat for bat species. CDFW recommends the Project Applicant conduct focused bat and wildlife surveys, over the course of one year (to account for seasonal use), to determine potential species' use of the mine. CDFW further recommends this section, as well as the Biological Resources section, of the DEIR be revised to include the results of these surveys, an analysis of the impacts to special status species from the potential closure of the mine, and specific measures to avoid, minimize, and mitigate these impacts.

Mitigation Measure 3-2 of the Hazards and Fire Safety section of the DEIR requires the access way into the Project site be paved or treated with environmentally safe dust-control agents (i.e., dust palliatives). The DEIR also allows for the use of these dust-control agents in other areas of the Project site. The location, extent of use, and environmental safety of these dust-control agents has not been described in the DEIR, nor have they been analyzed in regards to potential special status species and habitat impacts in the Biological Resources

section of the DEIR. The use of dust control agents and paved access roads may impact special status species and their associated habitats (e.g., changes in soil moisture infiltration rates, obstruction of movement pathways, increased salt concentrations from dust control agents, etc.) and this is not discussed in the DEIR. Therefore, CDFW recommends the Biological Resources section of the DEIR be revised to include and further describe these activities and their locations; fully analyze the potential impacts of dust control agents on biological resources, and the specific measures to avoid, minimize and fully mitigate these impacts. .

Mitigation Measure 3-9 of the Hazards and Fire Safety section of the DEIR requires the future development of a Fuel Modification Plan. This Plan will described the extent and location of the fuel modification zone, clearance area, plant pallet and planting locations. The deferred development of this Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of this Plan is not required. CDFW recommends the DEIR be revised to include the Fuel Modification Plan for CDFW review.

Water Quality (Section 5.4): The Water Quality section of the DEIR states that the Lahontan Regional Water Quality Control Board (RWQCB) and the Los Angeles RWQCB have issued permits for the Project governing construction-related dewatering and discharge operations. The Lahontan RWQCB permit regulates construction dewatering, diverted stream flows, dredge spoils dewatering and subterranean seepage dewatering among other activities. The Los Angeles RWQCB permit regulates construction-related dewatering discharges, and addresses discharges from temporary dewatering operations associated with construction and permanent dewatering operations associated with development. The location, extent of dewatering and discharges, and environmental impacts from these activities have not been described in the DEIR, nor have they been analyzed in regards to potential special status species and habitat impacts. Since these actions may impact special status species and their associated habitats and requires the submission of a Lake and Streambed Alteration Notification to CDFW for these activities, CDFW recommends the Biological Resources section of the DEIR be revised to further describe and analyze these potential activities and related biological impacts.

Project Design Feature (PDF) 4-2 in the Water Quality section of the DEIR describes the development of an Integrated Pest Management (IPM) and landscaping best management practices (BMP) that will be confirmed in a Landscaping Plan submitted to the County during the review and approval process for each tract map application. The Plan and BMPs will be consistent with Section 3.3 of the CSP. However, the CSP only provides a guideline to the development of the Plan and BMPs and is subject to change, and therefore, may not be incorporated into the Plan and BMPs. In addition, the DEIR does not include these guidelines as Mitigation Measures and therefore they are not enforceable. The deferred development of the BMPs and Landscaping Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of the Plan and BMPs are not required. In addition, the guidelines in the CSP are not included as Mitigation Measures in the DEIR, are not enforceable, and are subject to change during each tract map application. CDFW recommends the DEIR be revised to include the IPM BMPs, the landscaping BMPs, and the Landscaping Plan for CDFW review and comment.

B.5-1 (cont.)

CDFW also recommends the IPM prohibit the use of all rodenticides containing anticoagulants or other toxins that may result in secondary poisoning in non-target wildlife. This prohibition needs to be implemented via notification to homebuyers through their home purchase contracts and CC&Rs and as part of the larger natural area maintenance plan for the Project. If use of rodenticides that may result in secondary poisoning in non-target wildlife cannot feasibly be prohibited from use on the Project site, CDFW recommends regular monitoring of blood samples drawn from predator species on the Project site and within adjacent Tejon Ranch lands to document any indication of secondary toxicity health concerns. An adaptive management plan that includes: measures to remedy secondary toxicity problems, further enforcement, public awareness efforts, capture and treatment of infected wildlife with vitamin K supplements as directed by a veterinarian, and an established baseline for representative predator species in the Project area before Project related rodenticide pest control measures are likely to occur. All of these activities need to be incorporated into a Project resource management plan, included in the DEIR as a Mitigation Measure, and funded by the Project Applicant for the life of the Project. CDFW further recommends the DEIR be revised to include a Mitigation Measure for the above recommendations related to the IPM and BMP.

Land Resources (Section 5.5): PDF 5-1 in the Land Resources section states that grazing operations on portions of the Open Space preserve areas will be continued as a management tool for grassland conservation, subject to the specifications of the Native Perennial Grassland and Wildflower Field Mitigation Plan to be prepared as part of Project implementation. Several PDFs in the DEIR are not included as Mitigation Measures in the DEIR and are therefore not enforceable. PDF 5-1 is one of these measures. The lack of enforceability and the delayed development of this plan, which may have a significant role in potentially protecting and reducing impacts to several important biological resources on the site, does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of this plan is not required. CDFW recommends the DEIR be revised to include the Native Perennial Grassland and Wildflower Field Mitigation Plan for CDFW review and comment and the DEIR be further revised to incorporate all PDFs as enforceable Mitigation Measures.

B.5-1 (cont.)

Biological Resources (Section 5.7):

Tricolored Blackbird: Tricolored blackbird (TCBB) is a State endangered species. Breeding colonies of tricolored blackbird occur at Quail Lake and at a pond on the north central portion of the Project site. Oso Creek also provides additional onsite habitat for this species. In addition to breeding habitat, the Project site also provides foraging habitat for this species. The DEIR proposes a no-disturbance buffer of 400 feet for permanent impacts and the allowance of temporary impacts within 400 feet during non-breeding season for the Oso Creek TCBB colonies. A no-disturbance buffer is not identified in the DEIR for the TCBB colony at the pond location. The ecological rationale for instituting this size buffer is not discussed or supported by the reproductive, foraging, and habitat needs for all life stages of the species. Foraging habitat adjacent to and available in close proximity to nesting sites must be sufficient in size to support a robust population of insects and seed to sustain the colony year after year and preclude edge effects from the development to cause degradation of both nesting and foraging habitat. The invasion of rats, feral dogs and cats, pesticide use impacts on insect prey species and poisoning from development encroachment in close proximity to the breeding colonies needs to be fully

analyzed and subsequently utilized to inform and quantify all no-disturbance buffers in the DEIR.

CDFW does not concur that the no-disturbance buffers currently proposed in the DEIR are sufficient to fully avoid and preclude take (as defined under Section 86 of Fish and Game Code) of TCBB. Therefore, CDFW is recommending consultation and acquisition of an ITP pursuant to Fish and Game Code Section 2081 in advance of Project implementation.

California Condor: "Based upon the pre-historic range of the California condor and that of pronghorn antelope and other ungulates, the proximity of the Antelope Valley to the Tehachapi and San Gabriel Mountains probably meant that the west end of the Antelope Valley floor (including Centennial) was used for foraging by condors at least on an infrequent basis (Bloom 2009: DEIR Appendix)." Increasingly, condors are expanding their current flight paths to include more frequent flights over the west end of the Antelope Valley floor, including the Project site. United States Fish and Wildlife Service (USFWS) telemetry data has also documented an occurrence of a condor landing (possibly to feed on a carcass) on the Project site. In addition, condors released from captive breeding programs appear to be more curious and adaptive to human presence than those that were in the wild prior to 1987 (when the last condor was captured for captive breeding) (Bloom 2009: DEIR Appendix). "The presence of human structures, pets, and livestock can actually serve as an attractant to condors, particularly along the development/Open Space interface" (Bloom 2009: DEIR Appendix).

CDFW disagrees with the DEIR's conclusion that Project implementation is not expected to result in impacts to California condor due to "condor not occupying the low valley floor areas that are likely to incur the greatest level of disturbance from future development". Specifically, the *Environmental Assessment of the Centennial Specific Plan Project Site on the California Condor (Gymnogyps californianus)*, included as an appendix to the DEIR, determines that the Project site will result in direct impacts to condors in the loss of potential foraging habitat and indirect impacts to condors through increased human and domestic animal use of the Project site and within the Project vicinity (Bloom 2009: DEIR Appendix). CDFW recommends that the Measures to Avoid, Minimize, Mitigate Potential Impacts and the Measures to Contribute to the Conservation and Recovery of the Condor, within the *Environmental Assessment of the Centennial Specific Plan Project Site on the California Condor (Gymnogyps californianus)* be incorporated as Mitigation Measures into a revised DEIR; including the aforementioned measures related to microtrash, illegal shooting, and global positioning system (GPS) tracking. B.5-1 (cont.)

CDFW also disagrees with the DEIR's conclusion that the Tehachapi Uplands Multiple Species Habitat Conservation Plan (TUMSHCP) will provide for the long-term preservation of essential condor areas that would offset potential impacts from the Project. Projects impacts were not contemplated under the TUMSHCP and therefore, mitigation lands that have been preserved under the TUMSHCP to offset impacts to condor cannot be considered in the DEIR as additional available habitat that would aid in offsetting Project impacts. Similarly, the Ranchwide Agreement requires permanent protection of 178,000 acres within 30 years of receiving the first development entitlement, which was conferred to Tejon Mountain Village in 2009. The conservation of a portion of these mitigation lands is dependent on development milestones of Tejon Mountain Village and should not be considered as additional available adjacent habitat that may aid in offsetting Project impacts when to date, no lands have been conserved other than the 62,000 acres purchased by the State in 2010, and it is unknown when additional future

conservation will occur. Therefore, CDFW does not agree that impacts to habitat and some species, including the California condor, by the Project will be mitigated to less than significant because of their ability to use habitat lands included in the Ranchwide Agreement and the TUMSHCP. Moreover, the Ranchwide Agreement will allow some activities (e.g., hunting, filming, recreational use, etc.) that may be incompatible with species protection and recovery. In addition, the ability for the Project to develop energy production measures (e.g., solar and wind facilities, etc.) within the Open Space mitigation lands further reduces the quality of the proposed onsite mitigation lands and may have detrimental impacts on several special status species, including but not limited to, California condor.

As described above, California condor is a State and federal endangered and State fully protected species. The avoidance buffers listed in Mitigation Measure 7-6 for California condor are not sufficient to ensure full avoidance of this species. CDFW recommends the Project Applicant consult with CDFW and USFWS to determined appropriate avoidance buffers for California condors and these measures be included in a revised DEIR.

Burrowing Owl: BUOWs are known to occur on and adjacent to the Project site. CDFW recommends the Lead Agency require the *Staff Report on Burrowing Owl Mitigation* (dated March 7, 2012), be followed in its entirety and without modification, including the listed no-disturbance buffers, mitigation and relocation recommendations and that these measures be added to the DEIR as enforceable conditions. The staff report can be found on our website at www.dfg.ca.gov/wildlife/nongame/docs/BUOWStaffReport.pdf. CDFW recommends that a qualified biologist conduct a survey no more than 30 days before the onset of any Project activities in each construction area. If Project activities are delayed or suspended for more than 30 days, the area should be resurveyed.

B.5-1 (cont.)

As outlined in the *Staff Report on Burrowing Owl Mitigation* (CDFG 2012), burrow exclusion in and of itself will not always avoid or minimize and mitigate BUOW impacts to less than significant levels, and eviction of BUOWs is a potentially significant impact under CEQA. When temporary or permanent burrow exclusion and/or burrow closure is implemented, BUOWs should not be excluded from burrows unless or until:

1. A BUOW Exclusion Plan is developed and approved by the Lead Agency and CDFW;

2. Permanent loss of occupied burrow(s) and habitat and temporary exclusion is mitigated;

3. Site monitoring is conducted prior to, during and after exclusion of BUOWs from their burrows sufficient to ensure take is avoided; and

4. Excluded BUOWs are documented using artificial or natural burrows on an adjoining mitigation site.

Swainson's Hawk: SWHAs are known to occur on the Project site in a non-nesting capacity (DEIR 2017) and may nest on the Project site in the future. Because of the known site fidelity (repeated use of the same nest site annually) demonstrated by SWHA, CDFW considers any documented SWHA nest to be active unless it is demonstrated by protocol-level surveys

conducted during the nesting season (January 1 through September 15) to be unoccupied. Annual grasslands, alfalfa, fallow fields, dry-land and irrigated pasture, non-flooded rice land, cereal grain crops (including corn after harvest), as well as beet, tomato and other low-growing row or field crops are all considered SWHA foraging habitat (CDFG 1994). CDFW recommends the Lead Agency require surveys for nesting SWHA and that the surveys be conducted within a 0.5-mile buffer around each construction area, before starting any Project-related activities, following the survey methodology developed by the SWHA Technical Advisory Committee (SWHA TAC 2000). In the event that SWHA is detected within a 0.5 mile, consultation with CDFW is recommended to discuss how to implement the Project and avoid take (e.g., minimize impacts). CDFW also recommends the Lead Agency require the Project developer follow the measures outlined in the *Staff Report Regarding Mitigation for Impacts to Swainson's Hawks (Bueto swainsoni) in the Central Valley of California* (CDFG 1994). If take cannot be avoided, acquisition of an ITP would be warranted in advance of Project implementation for Project-related incidental take of SWHA. Please note, that encroachment within the 0.5-mile no-disturbance buffer is not recommended without prior acquisition of an ITP (since such encroachment has been demonstrated to cause nest failure).

Raptors and Migratory Birds: For the protection of raptors and migratory song birds and to assist in avoiding take of avian species as required by Fish and Game Code sections 3503, 3503.5 and 3513, if Project-related activities will occur during the breeding season (January through mid-September), CDFW recommends the Lead Agency require surveys be conducted by a qualified biologist no more than 14 days prior to the beginning of any Project-related activity likely to impact raptors and migratory song birds, for each construction area. If Project activities are delayed or suspended for more than 14 days during the breeding season, repeat the surveys. If nesting raptors and migratory song birds are identified, CDFW recommends the Lead Agency require the active nest be monitored by a qualified biologist for the first 24 hours prior to any construction related activities to establish a behavioral baseline. Once work commences, all nests should be continuously monitored to detect any behavioral changes as a result of the Project. If behavioral changes are observed, the work causing that change should cease and CDFW be consulted for additional avoidance and minimization measures. If monitoring of identified nests by a qualified biologist is not feasible, the following minimum no-disturbance buffers are advised to be implemented:

1. 250 feet around active passerine (perching birds and songbirds) nests,
2. 500 feet around active non-listed raptor nests and
3. 0.5 mile around active listed bird nests.

These buffers should be maintained until the breeding season has ended or until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival.

Other Avian Species: Since Project build-out will occur over many years, and avoidance of certain listed species is being assumed, we recommend repeating focused surveys (protocol-level where applicable) in all areas with potentially suitable habitat for species such as Least Bell's vireo and southwestern willow flycatcher, in the season prior to construction of any given construction area of the development.

B.5-1 (cont.)

American Badger: To minimize potential Project-related impacts to American badger, CDFW recommends mitigation measures be revised to require wintering surveys be conducted no more than 14 days prior to the initiation of construction related impacts in each construction area and within a 100-foot buffer. If Project activities are delayed or suspended for more than 14 days, repeat the surveys. Occupied dens should be clearly marked with fencing or flagging and a 100-foot no-disturbance buffer zone placed around the den in a manner that does not isolate the badger from intact adjacent habitat or prevent the badger from accessing the den. If den avoidance is infeasible, CDFW shall be contacted. Please note that trapping, flushing and/or collapsing of occupied badger dens would result in take as defined in Fish and Game Code Section 86. Similarly, CDFW recommends mitigation measures be included to require natal den surveys be conducted no more than 14 days prior to the initiation of construction-related impacts in each construction area and within a 200-foot buffer. Occupied natal dens should be clearly marked with fencing or flagging and a 200-foot no-disturbance buffer zone placed around the den in a manner that does not isolate the badger from intact adjacent habitat or prevent the badger from accessing the den. The 200-foot no-disturbance buffer shall remain in place until a qualified biologist has determined, and CDFW has agreed in writing, that young have left the den and are no longer reliant upon the den or parental care for survival.

Bats: The DEIR does not adequately describe the potential for impacts to bats, nor does the DEIR provide any alternative discussion or avoidance strategies to mitigate the loss of occupied bat habitat. The DEIR concludes the Project site contains suitable foraging habitat for several bat species. However, the DEIR incorrectly concludes no suitable maternity or hibernation roost locations are known to be present on or in the immediate vicinity of the site. As previously discussed above, the Project intends to permanently close an old mine shaft which could be currently utilized by bats. Tree cavities can also be used by bats for roosting and maternity habitat. Mitigation Measure 7-9 of the DEIR indicates a field survey for bats would occur no earlier than 20 days prior to any grading activity that would occur during the breeding season (April-August) to determine if active roosts of special status bats are present.

Bats are considered non-game mammals and are protected by state law from take and/or harassment (Fish and Game Code § 4150, CCR § 251.1). Several bat species are also considered Species of Special Concern, which meet the CEQA definition of rare, threatened, or endangered species (CEQA Guidelines §15065). CDFW considers adverse impacts to a Species of Special Concern, for the purposes of CEQA, to be significant without mitigation. Mitigation is more than avoiding maternity roosts, wintering sites, night roosts, mating roosts and foraging sites; mitigation is also providing similarly functioning habitat to replace what is impacted.

To minimize potential Project-related impacts to bat species, CDFW recommends the Lead Agency revise Mitigation Measure 7-9 to require the developer to conduct preconstruction surveys to establish areas of occupancy the year prior to the start of construction in each construction area and that surveys be conducted by a minimum of two CDFW-approved biologists and consist of:

- Two spring surveys (April through June) and two winter surveys (November through January)

B.5-1 (cont.)

- Each survey consists of one dusk emergence survey (start one hour before sunset and last for three hours), followed by one pre-dawn re-entry survey (start one hour before sunrise and last for two hours), and one daytime visual inspection of all potential roosting habitat on the Project site
- Conduct each survey within one 24-hour period
- Focus visual inspections on the identification of bat sign (i.e., individuals, guano, urine staining, corpses, feeding remains, scratch marks and bats squeaking and chattering)
- Use bat detectors, bat call analysis and visual observations during all dusk emergence and pre-dawn re-entry surveys

Data Collection for Each Survey:

- Whether bats are, or have been, present on the Project site
- Assemblage of species using the site
- Frequency of site use (including seasonal changes)
- Type of roost (i.e., maternity roost, day roost, night roost, feeding perch, mating roost, satellite roost, transitional roost or winter hibernaculum)
- Location, ambient temperature, internal dimensions and the aspect and orientation of the roost
- Spatial and temporal distribution of bat activity
- Flight paths, exit and entrance points
- Intensity of bat usage (i.e., number of bats, time and duration of use)
- Identification of any survey constraints

If bats are found to occupy the Project site, CDFW recommends the Lead Agency require the Project developer implement the general bat avoidance, minimization and mitigation measures outlined below. CDFW is available to discuss and refine these measures with the Lead Agency and the Project developer:

- Avoid direct and indirect impacts to roosting sites by establishing a no-disturbance buffer of 300 feet around roost sites.
- Prohibit clearing and grubbing adjacent to the roost site and lighting use near the roost site where it would shine on the roost or interfere with bats entering or leaving the roost. Prohibit the operation of internal combustion equipment, such as generators, pumps and vehicles within 300 feet of the roost site. Prohibit the use of bird netting.
- If avoidance of roost sites is infeasible, maintain portions of the features that provide naturalized habitat to the greatest extent possible and improve existing roost sites and/or provide new roost sites on buildings or on the Project site. Implement these measures only after consultation with CDFW.

B.5-1 (cont.)

- New roost sites must be in place prior to the initiation of Project-related activities to allow enough time for bats to relocate.
- Design and locate new and enhanced roost sites to be compatible with the bats' search image and habitat requirements (i.e., thermal regulation, interior size, ventilation, etc.). Design new and enhanced roost sites in consultation with CDFW.
- Exclude bats from directly affected work areas selectively and only to the extent necessary to prevent morbidity or mortality to the colony. Use one-way bat exclusion devices, installed in a bat-safe way, to exclude bats and then use expandable foam, steel wool or other method to block the entrance, after the bats have gone. Exclude bats only after consultation with CDFW, at a time that is compatible with the species' normal behavior patterns (i.e., breeding, feeding, hibernating, etc.). In general, exclusions shall not occur during the maternity/pup-rearing season nor during the hibernation season, as determined by conditions at the Project site.

Pronghorn (Antilocapra americana): Pronghorn numbers and habitat use of the Project site, as described in the DEIR, appear to be antidotal and potential Project impacts appear to minimize the status of pronghorn on the Project site and within the region. The DEIR states, "Although not classified as a special status species, the relatively small population of reintroduced pronghorn antelope on the Project site is considered of interest due to limited numbers and historical presence in the region. Project implementation would reduce the amount of available foraging habitat for this population. However, impacts on a reintroduced population of a non-special status species that may result from Project implementation would be considered adverse but less than significant under applicable CEQA significance thresholds. As part of the Ranchwide Management Plan, which is an implementation tool of the Ranchwide Agreement, the Project Applicant will work with the Tejon Ranch Conservancy to identify and implement potential enhancement measures that are also supported by CDFW. Potential measures could focus on enhancing pronghorn fawn survivorship with GPS-tracking devices and other measures to evaluate and minimize losses from coyote predation; completing further evaluation of modeling tools at a site-specific level (such as those used on the Carrizo Plain), and incorporating volunteer involvement with supportive activities such as fencing retrofits."

B.5-1 (cont.)

The presence of pronghorn on the Project site and within the region rises to a higher level of CEQA impact consideration than cited in the DEIR. This determination is based on the local and regional ecosystem value of pronghorn reintroduction into portions of Kern and Los Angeles Counties' Antelope Valley Region. This species once existed in the region, but was extirpated prior to reintroduction efforts in the 1980s on Tejon Ranch. CDFW recommends that unmitigated Project impacts to pronghorn be considered significant by the Lead Agency under CEQA. CEQA directs that a special emphasis be placed on environmental resources that are rare or unique to the region and would be affected by a proposed project (CEQA §15125 (c)). Lead Agencies have a duty under CEQA to avoid or minimize environmental damage where feasible (CEQA Section 15021).

CDFW recommends a revised DEIR be completed and a map included documenting pronghorn sighting data points and sighting dates on and adjacent to the Project site. The Department of Water Resources has documented pronghorn occurrences in grassland habitat that the DEIR currently describes as pronghorn having limited access to because of restrictions. CDFW also recommends the revised DEIR describe the most likely California Aqueduct crossing locations

used by pronghorn to gain habitat access and incorporate Mitigation Measures into the DEIR to enhance these crossing locations on the Project site and within Tejon Ranch lands to further facilitate access to existing grassland habitat for pronghorn.

The Pronghorn population has persisted in the region for decades and its small size places it in great peril of local extinction. CDFW concurs with the DEIR that any activity employed to improve habitat quality and fawn survival for pronghorn in the Project area would benefit this species. However, the Project will result in greater stressors to the pronghorn population because of loss of habitat, continued loss of already restricted movement opportunities for pronghorn to access habitat south of SR 138 and west of I5, increased threat from vehicle collision, and harassment and predation by domestic pets and humans. In July 2017, a pronghorn was observed on the Peterson Ranch Habitat Mitigation Bank approximately 25 miles southeast of the Project site in Los Angeles County which further demonstrates CDFW's concern for the persistence of this species in the region and providing for unrestricted movement across SR 138. Therefore, CDFW recommends further evaluation on the direct, indirect and cumulative effects of the Project, during and after full buildout, including use of habitat by pronghorn on the Project site and movement through the site and offsite habitats. This evaluation should be based on precise Pronghorn composition counts that can be replicated and serve as reliable estimates of population size and habitat use. The use of telemetry tracking of pronghorn individuals would further the understanding of habitat use, mortality factors, and movement trends on the Project site and within the region. Movement monitoring of pronghorn would have been invaluable in determining the movement route taken by the pronghorn individual observed on the Peterson Ranch Mitigation Bank in July 2017 to inform habitat movement pathway preservation and Project mitigation measures for this species.

Ring-tailed Cat: The Biological Resources section of the DEIR concludes that the Project site does not support habitat for the State fully protected ring-tailed cat (*Bassariscus astutus*). However, ring-tailed cat is a secretive, nocturnal species that can be easily missed in survey and impact assessment efforts. Therefore, CDFW recommends additional survey efforts for ring-tailed cat and avoidance of occupied habitat for this species since ring-tailed cat is a State fully protected species. Take of ring-tailed cat or any State fully protected species is prohibited and cannot be authorized by CDFW (Fish and Game Code Sections 3511, 4700, 5050, and 5515).

Western Pond Turtle: Western pond turtle (*Emys marmorata pallida*) has the potential to occur adjacent to Quail Lake and within several areas of the Project site. CDFW recommends a Mitigation Measure be incorporated into the DEIR to require protection for western pond turtle during their breeding season and require a no-disturbance buffer of 475 feet from the outside edge of Quail Lake into the Project site to protect nesting areas. CDFW is recommending a 475-foot buffer since female pond turtles can move overland for up to 325 feet to find suitable sites for egg-laying. In addition to avoiding a minimum of 325 feet from the edge of a water feature, CDFW recommends an additional 150 feet beyond the 325-foot overland travel range to protect nests and nesting sites from direct and indirect Project disturbance. CDFW also recommends focused surveys for western pond turtles be conducted in all areas of the Project site that provide potential habitat for western pond turtle and survey results be incorporate into a revised DEIR to allow CDFW to make specific recommendations and comments on additional mitigation measures proposed to minimize impacts to this species.

B.5-1 (cont.)

Western Spadefoot: Western spadefoot (*Spea hammondii*) aestivate underground in upland habitat and emerge during heavy rainfall events in order to migrate to nearby water bodies (including those that are ephemeral in nature) to breed. Western spadefoot may occur on the Project site. If breeding sites for western spadefoot are identified in the Project site during pre-construction surveys, CDFW recommends the Lead Agency require the Project developer consult with CDFW prior to the implementation of the Project to develop a plan to avoid impacts to western spadefoot, and obtain CDFW's written concurrence with the plan prior to plan implementation.

Argentine Ants: CDFW recommends revising Mitigation Measure 7-16 to establish argentine ant control "dry zones" of a minimum of 650 feet and encourage landscape plans to incorporate these same "dry zones" landscaping and require all nursery plant material within 700 feet of Open Space areas, preserved populations, and mitigation lands be inspected and certificated as being free of argentine ants. Irrigation of Open Space areas, preserved fauna populations, and mitigation lands are also strongly discouraged and plantings within these areas should be hand watered only if absolutely necessary. Restoration should be timed to take advantage of the natural rainy season.

Special Status Plants: Mitigation Measure 7-1 in the Biological Resources section of the DEIR relies on the future completion of focused plant surveys to confirm the proposed mitigation lands support populations of California androsace (*Androsace elongate* ssp. *acuta*), crownscale (*Atriplex coronate var. coronata*), round-leaved filaree, Mojave spineflower (*Chorizanthe spinosa*), sylvan scorzonella (*Microseris sylvatica*) and adobe yampah (*Perideridia pringlei*) to confirm compliance with the DEIR's proposed 2:1 mitigation ratio for impacts to these species.

The 2:1 replacement to impact ratio is not substantiated within the DEIR and does not describe nor demonstrate that successful rare plant mitigation is attainable. Scientific literature does not support the assertion that transplanting plants into areas of microhabitat where they do not occur is viable in assuring long-term persistence of the species. Therefore, CDFW does not support transplantation of rare plants as a mitigation strategy. CDFW recommends avoidance of rare plant populations by delineation and observation of a no-disturbance buffer from the outer edge of the plant population(s) or specific habitat type(s) required by special status plant species, including a sufficient buffer area that ensures habitat is available for pollinators, maintains the current topography and drainage conditions of existing plant populations, and minimizes anthropogenic impacts. Because the collection of seed and establishment of new sensitive status plant populations has not been substantiated in the literature, transplantation is experimental in nature, and CDFW is not aware of any long-term studies that document the viability and persistence of either transplanted or seeded populations of these particular special status plant species. If full avoidance of existing populations or clusters of individual plants cannot be achieved, CDFW recommends avoidance in combination with conservation, funding, and management of existing, healthy populations in perpetuity as the preferred mitigation method. Furthermore, mitigation for impacts to special status plant species need to be completed prior to the initiation of Project-related activities.

Mitigation Measure 7-1 also relies on the future development of a Special Status Plant Species Restoration Plan. The deferred development of the Special Status Plant Species Restoration Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of the Plan is not required. CDFW recommends

B.5-1 (cont.)

the DEIR be revised to include the Special Status Plant Species Restoration Plan for CDFW review and comment.

Eight populations of crownscale, totaling more than 16,000 plants, were identified during surveys on the Project site. The identifying characteristics exhibited on these plants were mixed between the more common crownscale and the federal endangered San Jacinto Valley crownscale (*Atriplex coronata var. notatior*) which is only known to occur 100 miles to the east of the Project. Based on distribution and on a single taxonomic verification, the DEIR determines the onsite occurrences are the more common crownscale species. However, CDFW recommends consulting multiple experts and conducting genetic work to determine if this is an unrecognized species, or an isolated occurrence of San Jacinto Valley crownscale in Los Angeles County before removing this population. Additionally, if this is an isolated population, outside of its known range, CDFW recommends conducting an additional analysis to determine how removal of this species potentially shrinks the species' range.

Piute Mountains navarretia is a CRPR 1B.1 species. Before surveys for the Project site were conducted this species was only reported to occur in Kern and Tulare Counties. To date, surveys on the Project site have identified three (3) populations of Piute Mountains navarretia with approximately 20,100 individuals. Known occurrences of Piute Mountains navarretia on the site are currently outside of the proposed impact area. CDFW recommends additional protocol surveys for this species be completed prior to Project implementation, for the entire site in potentially suitable habitat, following a good rain year, in an effort to detect additional populations. CDFW also recommends this species be fully avoided and managed to preserve these populations in perpetuity.

Federally Listed Species: CDFW also recommends consulting with the USFWS on potential impacts to federally listed species. Take under ESA is more broadly defined than CESA; take under ESA also includes significant habitat modification or degradation that could result in death or injury to a listed species by interfering with essential behavioral patterns such as breeding, foraging, or nesting. Consultation with the USFWS in order to comply with ESA is advised well in advance of Project implementation.

Significant Ecological Area: CDFW recommends that development south of SR 138 be removed from the Project. Introducing development to the area south of SR 138 will have negative impacts to the SEA, specifically creation of a large edge effect on the adjacent SEA, including light, noise, temperature increase, increased albedo, increased Argentine ant risk, increased fire risk, point source for invasive species introduction, and human disturbances (e.g., trash, dogs, loitering, etc.), thereby lowering its conservation value. In addition, by removing development south of SR 138, the Project will also avoid several special status plant occurrences.

Vegetation Mapping: The vegetation mapping units used in the DEIR were set at a scale of approximately 1 acre, and patches of vegetation smaller than 1 acre were generally not mapped except for observed seeps and ephemeral ponds. CDFW is concerned the smaller scale variation of vegetation assemblages are not accurately reflected in the DEIR vegetation mapping. CDFW recommends all unique stands or polygons be recorded, no matter the size. Providing detailed mapping enables CDFW to assess the value and the appropriateness of proposed mitigation accurately. CDFW recommends conducting vegetation mapping following the standards of mapping all unique, homogenous stands, no matter the size, and including this

B.5-1 (cont.)

revised information in the DEIR. CDFW is unable to accurately assess impacts or values of the vegetation assemblage within the Project area, nor the proposed mitigation lands until revised mapping is completed.

Oak Woodlands: The DEIR determines that significant impacts to oak tree resources would be reduced to less than significant levels with implementation of Mitigation Measures 7-11 and 7-19 through 7-20, in accordance with the County of Los Angeles Oak Tree Ordinance and in compliance with the Los Angeles County Oak Woodlands Conservation Management Plan. The DEIR analyzes impacts to oak trees over eight inches in diameter at breast height (DBH), proposes to use existing oak woodlands, counts planting within these areas as creation, only includes a five (5) year monitoring period, does not require grazing in all of these areas, and does not account for the acreage of oak woodland as a community with an existing density of trees.

CDFW recommends the DEIR be revised to reflect a 4-inch DBH when considering which oak trees, and trees in general, require mitigation. More importantly, the oak woodland community needs to be considered in its entirety when considering mitigation to replicate the habitat function. Oak trees are a dense, slow growing hardwood requiring decades to mature. CDFW recommends revising the mitigation measures to require monitoring oak trees/oak woodlands for a minimum of 15 years and up to 20 years to determine success. To reestablish the oak woodlands, CDFW recommends three planting seasons. The first planting season, year 0, being the acorn and sun tolerate ground covers; the second planting season occurring at approximately year 5, introducing sun/shade tolerate species; and the third planting season at year 10 with the introduction of more shade tolerate understory species. To determine the appropriate species and density of the oak woodlands, three representative oak woodland sites need to be analyzed for species composition, density, and richness. The created sites, once established, need to reflect the representative sites. Furthermore, CDFW recommends the creation site be deemed successful only after 10 contiguous years without irrigation. However, CDFW recommends irrigation be prohibited in establishing oak woodlands as the trees grow at an abnormal rate and establish a root system that will not optimally sustain the tree once irrigation has been removed. CDFW recommends a revision to Mitigation Measure 7-11 to reflect the temporal loss in creating oak woodlands. CDFW also recommends the creation of 18.6 acres to compensate for the loss of non-heritage oaks/oak woodlands and an additional 10:1 ratio for heritage oak trees. These areas should be protected against anthropogenic impacts for the life of the project.

B.5-1 (cont.)

Riparian, Wetland and Stream Features: The DEIR states that significant impacts to jurisdictional drainages, wetlands, and riparian vegetation from the Project would be reduced to less than significant levels with implementation of Mitigation Measure 7-12, which states that (1) all lost functional values shall be replaced; (2) appropriate regulatory agency permits and/or agreements shall be obtained; and (3) the mitigation measures stipulated in those permits/agreements shall be implemented. Mitigation Measure 7-12 also states that Functional Capacity Units (FCU) will be used to determine the mitigation level necessary to restore riparian functions. CDFW does not agree with the use of FCUs as the basis for determining mitigation requirements. FCUs do not guarantee that wetland/riparian habitat is mitigated to the level necessary to be called "in-kind". Plant species assemblages for each unique wetland/riparian patch need to be maintained to be considered in-kind mitigation. CDFW recommends full avoidance of both wetland features, as well as any lake, river, or stream under Section 1600 of

the Fish and Game Code. This would eliminate the need to create the proposed 78.4 acres of wetland/riparian habitat, the creation of which would in turn impact another vegetation community that would require mitigation. CDFW also recommends developing success criteria (Mitigation Measure 7-12) tied to on the ground species richness, abundance, percent cover, and diversity, by vegetation layer. Additionally, the monitoring period for replacement planting success should not start until all irrigation and weed control has been completed and removed. Irrigation and weed control are considered part of the establishment period and monitoring during these periods would provide data that is heavily skewed. Success criteria need to be based on trends; no positive trend in weed cover (weed control should be completed prior to planting and during the establishment period, nor during monitoring) and no negative trends of native vegetation over the monitoring period. This trend analysis provides a more thorough indication of the trajectory of the success of the restored habitat.

Refuse: To reduce urban wildlife conflicts that often result in mortality to bears and other wildlife species, CDFW recommends Mitigation Measure 7-15 in the DEIR be revised to require the use of bear-proof trash cans throughout the entire Project site, including during Project construction, after full Project build-out and for the life of the Project. CDFW also recommends Mitigation Measure 7-15 be revise to require the use of bear-proof trash cans at all individual homes and not limit use to common areas as specified in Mitigation Measure 7-15.

Fencing: CDFW recommends the DEIR be revised to include capping of all vertical open pipes used for fence posts, property line stakes, signs, roof ventilation, chimneys, vault toilets, and similar structures and metal fence stakes used on the Project. Capping can be accomplished using bolts or other materials to avoid raptor talons becoming entrapped within the bolt holes of metal fence stakes. Further information on this subject may be found at: http://kern.audubon.org/death_pipes.htm.

Grubbing and Grading: CDFW recommends the DEIR be revised to require that any grading/grubbing be done in phases in order to facilitate pushing wildlife of higher mobility towards intact adjacent habitat. Islands of habitat should not be created during site disturbance where wildlife will enter and then be subject to mortality when these areas are grubbed and/or graded. Attempts to salvage species of low mobility should be made prior to the initiation of ground disturbance activities. Salvaged species should be salvaged out of harm's way onto adjacent suitable habitat not disturbed by the project in areas with enough intact suitable habitat to support these species home range sizes.

Wildlife Movement Corridors: Mitigation Measure 7-14 of the DEIR describes a designated SR 138 underpass where the highway crosses the Project's western border. The proposed underpass will be 100 feet wide and will flare out on both sides of the highway to a 150 foot width in Project Open Space adjacent to the highway. The DEIR states that these design specifications are expected to allow some local wildlife to safely pass between Open Space areas on opposite sides of SR 138.

CDFW is unclear what the width of the underpass will be throughout the entire length of the underpass structure since the DEIR only specifies that the underpass will flare out where it meets SR 138. If the underpass does maintain the 150 foot width throughout the entire length of the structure, this would only allow for 25 feet of extra clearance on each side of the multi-use pathway that will go through the center of the structure to allow for wildlife movement. It is also

B.5-1 (cont.)

unclear if the additional 25 feet on each side will be dedicated to wildlife movement and if design features will be incorporated to limit human and domestic animal encroachment into these corridors and encourage species use. In addition, CDFW would like to note that such a limited corridor width would not be sufficient to serve as a wildlife movement corridor for the Project site. CDFW also recommends the other planned underpass and overpass bridge crossings that will be constructed across SR 138 to facilitate both pedestrian and bike access to employment centers be designed to also facilitate wildlife movement across the site. In addition, CDFW recommends the unnamed drainage that parallels SR 138 to the north be avoided by Project development so that it may continue to "serve as a valuable foraging resource" and wildlife movement area across the site.

A camera station study of wildlife movement observations along the I5 was conducted; however, a wildlife movement study throughout the remainder of the Project site has not been completed and wildlife movement information throughout the remainder of the Project site. Based on the information provided in the DEIR, this information appears to be anecdotal in nature. CDFW recommends the Lead Agency require a complete systematic, long-term wildlife movement study that encompasses the entire Project site and extends to offsite areas of existing wildlife habitat. CDFW recommends the study be conducted over a period of at least two years and consider all directions through and around the Project site. Camera stations and tracking medium should be used at each of the California Aqueduct, I5, and SR 138 crossings. CDFW also recommends the study consider species life histories, behavior, and an assessment of how the Project may modify species behavior and movement. Based on this study, a mitigation strategy should be developed that incorporates the study's findings, site specific information, and includes Open Space planning to enable wildlife to move safely through and around the entirety of the Project site.

B.5-1 (cont.)

Focused Protocol Surveys: CDFW recommends the DEIR incorporate an enforceable measure to require focused protocol surveys to be conducted in all areas of potentially suitable habitat for the entirety of the Project impact area, and a 500-foot buffer, prior to the initiation of construction-related activities for all special status species that have a potential to occur on the Project site. The surveys should be conducted in the year prior to disturbance for each construction area. This CDFW recommendation is necessary because previous surveys varied in their areas of coverage and levels of intensity and were not designed for maximum species detectability. For more information on species specific protocols see https://www.wildlife.ca.gov/Conservation/Survey-Protocols. .

Additional Mitigation Measure Comments: CDFW recommends Mitigation Measure 7-3 be revised to remove the following statement: "If a wildlife species is in harm's way and has not moved on its own, the Biologist will attempt to scare them away from the area. If wildlife does not move, and where feasible, the wildlife species will be relocated to suitable habitat." Implementation of this portion of the mitigation measure would result in take through harassment and direct mortality of wildlife species (if relocation is deemed not feasible) and is prohibited under Fish and Game Code.

Grazing: Grazing operations will be directed under the Grassland Mitigation Plan, which is a component of the Mitigation Preserve Management Plan and/or the Ranchwide Management Plan. The deferred development of this Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of this

plan is not required. CDFW recommends the DEIR be revised to include the Grassland Mitigation Plan for CDFW review and comment.

Jurisdictional Features: The Jurisdictional Delineation Report discloses that jurisdictional features were mapped to the extent of the Ordinary High Water Mark (OHWM) and edge of riparian vegetation, where applicable. The DEIR acknowledges that CDFW jurisdiction can extend beyond the OHWM to the edge of riparian habitat where this habitat type is present. However, at a minimum, CDFW jurisdiction extends to the back edge of the bank, includes associated riparian habitat, and may also include terracing and the adjacent floodplain, depending upon site indicators. The OHWM is a definition used by the United States Army Corps of Engineers to determine the extent of its jurisdiction under the federal Clean Water Act. CDFW jurisdiction is separate from, and unrelated to, that of the Clean Water Act, and in most cases extends beyond the OHWM. Therefore, the extent of impacts to CDFW jurisdictional features is likely greater than what is disclosed in the Jurisdictional Delineation Report and included in the DEIR. In addition, implementation of the restoration and enhancement activities proposed in the DEIR would also require notification pursuant to Fish and Game Code Section 1600 et seq. and may also require acquisition of an ITP because the proposed activities have the potential to impact State-listed species. Potential impacts to all special status species and habitats within the area of the proposed offsite activities also need to be evaluated in the DEIR for CEQA review.

CDFW also recommends Exhibit 5.7-9 in the Biological Resources section of the DEIR be revised. The jurisdictional features on this exhibit have been kept to scale and therefore the majority of CDFW jurisdictional features are not visible. CDFW cannot determine if these features are not visible because of the mapping scale or because they have been omitted.

B.5-1 (cont.)

Offsite Mitigation: The DEIR proposes a total of 23,547 acres of offsite mitigation lands, comprised of six separate Areas, as depicted on Exhibit 5.7-10 in the Biological Resources section. Area 1 contains 6,417 acres; Area 2 contains 2,556 acres; Area 3 contains 4,183 acres; Area 4 contains 7,319 acres; Area 5 contains 643 acres; and Area 6 contains 2,429 acres of proposed offsite mitigation lands. As noted in the DEIR, these lands are a part of the Ranchwide Agreement.

The lands in Areas 3, 4, and 5 (totaling 12,145 acres) have already been conserved through an agreement and purchase of a conservation easement using funds entirely provided by the State of California. The easement was conveyed to the State and is currently held by the Wildlife Conservation Board (WCB). The conservation easement precludes the use of the lands in Areas 3, 4, and 5 in baseline habitat condition from serving as mitigation for any proposed development projects, including Centennial. The lands in Areas 3, 4, and 5 may serve as mitigation only in the event that enhancement actions are implemented and performed in perpetuity that will add functional habitat value to the lands above baseline. Further, all enhancement actions are required to be reviewed and approved by WCB. As currently discussed and contemplated in the DEIR, Areas 3, 4, and 5 are not intended to undergo enhancement activities and are considered as mitigation in baseline condition. However, in accordance with the terms and conditions of the conservation easement conveyed over these areas, these lands cannot be used to offset impacts from the implementation of the Project. Therefore, with the removal of the offsite 12,145 acres that constitute Areas 3, 4, and 5 from consideration as compensatory mitigation for the Project, the remaining Areas (1, 2 and 6)

contain a total of only 11,402 acres. This effectively reduces the available compensatory habitat mitigation for the Project to a 2:1 mitigation ratio and cannot effectively reduce the loss of the varied and rare habitat types from Project impacts to a less than significant level.

Land Use, Entitlements and Planning (Section 5.8): This section of the DEIR includes the Antelope Valley Area Plan (AVAP) Consistency Analysis (Table 5.8-1). This analysis evaluates the Project's consistency with the requirements of the AVAP. CDFW disagrees with several statements of consistency in the aforementioned table. For example, Goal Land Use (LU) 2 of the AVAP is: "a land use pattern that protects environmental resources". The DEIR determines that the Project is consistent with this goal through the preservation of the SEA, biological mitigation lands, Tejon Ranch land preserved under the Tejon Ranch Land Use and Conservation Agreement and the Project's land use plan. The SEA is designated as Open Space in the DEIR and the CSP. As described in the DEIR and further detailed in the CSP, the Open Space land use designation allows for a variety of uses, including, but not limited to: golf courses; information centers; apiaries; fish hatcheries; nurseries (growth and sales); commercial greenhouses; stables; trails (bike, equestrian, pedestrian); helispots; helipads; monuments and interpretive sites; wineries; cemeteries; amusement rides: bike, motor scooter and boat rentals; campgrounds; lakes; swimming pools; photovoltaic panels; outdoor festivals and fairs; filming; crop production and agricultural uses; storage and maintenance yards; special events; model home complexes; and other accessory uses and structures. The continuation of hunting activities are also allowed in SEA 17 (as described in Noise section 5.12 of the DEIR) but not included in the land use designation table in the CSP.

Allowing these and similar uses within the Open Space lands does not preserve the value of these lands and in many cases would prohibit the use of these Open Space areas (including those Open Space areas within the center of the Project site) for use by special status species (plant and animals) that currently use the lands on the Project site. It would also impede the use of any potential wildlife movement corridors, across and in some cases, adjacent to the Project site. Furthermore, provisions in the CSP allow for the current land use designations to be changed. This would allow for the possibility that current Open Space areas may be changed to other designated uses, including but not limited to: residential, industrial, and commercial. This level of built-in flexibility, combined with the lack of detailed design plans and descriptions in the DEIR does not provide CDFW with enough information to determine what the Project impacts will be. As stated above, the allowed land uses in lands adjacent to Open Space areas may also impact the ability of wildlife to use and move through the Open Space areas. As one example, there is a recreation/entertainment and residential area located on the west side of the Project site, north of SR 138, directly adjacent to a potential wildlife movement corridor. The land uses in these development areas allow for amphitheaters; solar and renewable energy generation (including photovoltaic panels, microturbines, and associated facilities); and outdoor festivals and fairs among other uses, which may severely impact the ability of wildlife to continue to use this area of the Project site as a movement corridor.

The goal of Policy LU 2.1 in Table 5.8-1 is "to limit the amount of potential development in....wildlife corridors." The DEIR states that the Project preserves important regional wildlife corridors and biological connectivity of regional open space. However, the DEIR also states that cumulative impacts to regional wildlife movement will be significant with mitigation. Due to significant impacts in regional wildlife movement, and for the reasons outlined in the sections above, CDFW disagrees with the DEIR's determination that the Project is consistent with Policy

B.5-1 (cont.)

LU 2.1. Regional and local wildlife movement corridors occur on the Project site and are not sufficiently avoided and protected or replaced by the Project.

Policy LU 2.5 in Table 5.8-1 refers to limited development in riparian areas. The DEIR states that the Project is consistent with this policy by avoiding or minimally impacting riparian areas on the site by designating major drainage channels on the site as Open Space. While the Project has designated major drainage channels as Open Space, they have also allowed these channels to be reengineered, revegetated and altered to collect site runoff, mudflows, serve as recharge and retention basins and incorporated adjacent multi-use trails. Also, as mentioned above, Open Spaces have a variety of allowable land uses that are not all consistent with minimizing impacts to riparian areas. Therefore, CDFW does not agree with the DEIR's determination that the Project is consistent with Policy LU 2.5 with respect to riparian conservation.

The goal of Policy M 10.5 in Table 5.8-1 is to locate and design trail routes to minimize impacts to sensitive environmental resources and ecosystems. The DEIR states that trails will be located along roads and in greenways and have been designed to minimize impacts to sensitive environmental resources and ecosystems. The DEIR also states that signs will be posted along trails cautioning against disturbance and trails will be designed to discourage people and pets from entering sensitive drainages. As discussed above, trail design (e.g., lighting requirements, fencing, location, signage, etc.) is discussed in the DEIR and the CSP; however, all of these items are not included as Mitigation Measures in the DEIR and are only discussed as guidelines in the CSP, which are subject to change and/or omission during final site design. Therefore, CDFW does not agree with the DEIR's determination that the Project is consistent with Policy M 10.5. CDFW recommends wildlife friendly fencing be designed and included in a revised DEIR to minimize potential impacts to the SEA and other Open Space areas from human and pet-related disturbances and protect the sensitive resources and habitats that occur within these areas.

Goal COS 4 in Table 5.8-1 is a goal to protect sensitive habitat and species to promote biodiversity. The DEIR states that the Project will protect sensitive habitat and species through the protection of Open Space, authorized Open Space uses and measures. Policy COS 4.2 refers to limiting the amount of potential development in the SEA, wildlife corridors, and other sensitive habitat areas. The DEIR states that the Project is consistent with this policy by avoiding SEA development and protecting Open Space that protects wildlife corridors and other sensitive habitat areas, including SEAs. Policy COS 4.7 in Table 5.8-1 refers to development standards that maximize opportunities for wildlife movement. The DEIR states that no fencing that would restrict wildlife movement is proposed in Open Space areas, which serve as wildlife corridors. CDFW does not agree with the DEIR's determination that the Project is consistent with the aforementioned policies and goals. Please refer to the discussions above for further detail on land use within the SEA.

The goal of Policy COS 4.8 is to ensure ongoing habitat preservation by coordinating with CDFW to obtain the latest information regarding threatened and endangered species. The DEIR states that the Project is consistent with this policy by providing for ongoing habitat preservation within designated Open Space and states that the latest information regarding sensitive plant and wildlife species is incorporated in the Biological Resources section. CDFW would like to note that while discussions for the Project have occurred in the past, recent

B.5-1 (cont.)

discussions (within the last 3 years) have not occurred between CDFW and the Project Applicant, with the exception of two preliminary reviews of a draft jurisdictional report and one site visit to discuss jurisdictional features. In addition, CDFW also notes that the status of tricolored black bird (*Agelaius tricolor*), described in the Biological Resources section, has changed from State Candidate to State Endangered.

Noise (Section 5.12): The Noise section includes a statement that limits construction to the hours of 7:00 a.m. to 7:00 p.m., Monday through Saturday, in compliance with County code requirements. However, CDFW recommends that all Project-related activities be restricted to daylight hours and nightwork be prohibited throughout the entire Project site to reduce the potential to adversely affect special status species, their movement and their associated habitat use on and adjacent to the Project site. CDFW also recommends vehicle and equipment access within the Project site be restricted to existing roads and overland travel be minimized and confined to areas where development will occur. CDFW also recommends the DEIR be revised to incorporate these recommendations as Mitigation Measures in the DEIR.

Mitigation Measure 12-7 in the Noise section requires the preparation of a Blasting Plan. The Blasting Plan will include information such as a pre-blast survey, the location and hours of blasting and other additional items. Blasting has the potential to adversely affect special status species and their associated habitat on and adjacent to the Project site. The deferred development of the Blasting Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of the Plan is not required. CDFW recommends the DEIR be revised to include the Blasting Plan for CDFW review and comment.

Visual Resources (Section 5.13): Mitigation Measure 13-6 in the Visual Resources section of the DEIR requires the development of an Exterior Lighting Plan (also referred to as the Dark Sky Plan). This Plan applies to all proposed structures and development areas that border natural Open Space resources. Exterior lighting on the Project site has the potential to adversely affect special status species, their movement and their associated habitat on and adjacent to the Project site. The deferred development of the Exterior Lighting Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of the Plan is not required. CDFW recommends the DEIR be revised to include the Exterior Lighting Plan for CDFW review and comment.

Parks and Recreation (Section 5.14): The Parks and Recreation section of the DEIR requires the development of a Public Access Plan "to ensure significant, but well managed, public access into the Conservation Easement Areas." CDFW is unclear if this Plan will incorporate public access into both the SEA and the offsite mitigation lands since the Conservation Easement Areas are not clearly and consistently defined in the DEIR. The DEIR states that "there would be no disturbance or development within the designated SEA" (see page1-6 of the DEIR); however, allowing public access within the SEA would be considered a Project impact and would need to be analyzed in the Biological Resources section of the DEIR. In addition, impacts from public use of the mitigation lands should also be analyzed in the Biological Resources section of the DEIR. Furthermore, the deferred development of the Public Access Plan does not provide CDFW with an opportunity for review to assess potential species and habitat impacts since additional CEQA review of the Plan is not required. CDFW recommends

B.5-1 (cont.)

the DEIR be revised to include the Public Access Plan for CDFW review and comment and that public access, development and disturbance within the SEA be prohibited.

Cumulative Impacts (Section 7.0): The Cumulative Impacts section of the DEIR makes the determination that the Project will result in a cumulatively significant impact to native grasslands and regional wildlife movement. CDFW agrees with this determination. Based on the current design of the Project, CDFW has also determined that development of the Project will result in significant impacts to local wildlife movement and special status plant species. CDFW recommends the Project be redesigned to allow for local and regional wildlife movement through the site (including grassland and drainage areas east of the California Aqueduct) and avoid and preserve a significantly larger proportion of special status plant species occurring in the grassland areas of the Project site east of the California Aqueduct.

Centennial Specific Plan (CSP): Figure 3-2 in the CSP appears to indicate the presence of roads within the SEA. It is unclear from this map if these are existing or newly proposed roads since they are not labeled in the map legend. These roads have not been described in any other area of the DEIR or the CSP. The DEIR and CSP states that Project-related impacts will not occur within the SEA. Please clarify the presence and intended use of the roads within the SEA.

The CSP and DEIR include the Open Space lands to the east of the California Aqueduct as part of the Project's onsite mitigation. As previously discussed, these areas as currently designed, do not support species movement and/or use in these Open Space areas of the Project site, and therefore should be removed from the onsite mitigation acreages until the Project is redesigned to address these species issues.

B.5-1 (cont.)

The CSP leaves several items of enforcement and control under the responsibility of the Home Owners Association (HOA). These items include, but are not limited to, the maintenance of internal and transitional slopes, the maintenance of fuel modification zones, the control of Argentine ants, the enforcement of drought-tolerant planting and education, the enforcement of prohibited plant species and the eradication efforts of these species. It is unclear to CDFW where the funding, training and dedicated staffing will come from to enforce these policies. CDFW would also like to note that previous projects that have proposed and implemented similar measures have had mixed success with implementation of these measures. The failure to implement these measures may significantly impact sensitive biological resources on the Project site and needs to be evaluated in the DEIR.

The planting guidelines in the CSP allow for the use of ground covers and turf grasses. Because of their potential to quickly spread into adjacent native vegetation and Open Space areas, CDFW recommends prohibiting the use of ground covers and Bermuda grass in Open Space areas and areas adjacent to Open Space and native vegetation.

The CSP Hillside Design Guidelines (HDG) include a guideline to retain and incorporate 50 percent or more of the existing onsite trees and woodlands into the overall Landscaping Plan. It is unclear to CDFW if this percentage will include the lands within the SEA or if this requirement focuses on the remainder of the Project site. If this guideline includes the SEA area, CDFW would like to know what percentage of the SEA will be counted toward achieving the 50 percent success metric. The HDG also includes a guideline to use bridge design techniques that "allow easy wildlife migration" beneath the bridge with a minimum 6-foot vertical

and horizontal clearance. However, the details of the bridge design techniques are not provided in the CSP nor discussed in the DEIR. CDFW recommends the DEIR and Biological Resources section be revised to include information on the bridge design techniques and an analysis for potential wildlife movement. This is necessary to demonstrate the bridge design techniques will be functionally permeable and facilitate use by wildlife. As previously mentioned, the CSP is a guidance document and is subject to change; therefore, CDFW also recommends the bridge design techniques be included as a Mitigation Measure in the DEIR.

The Single Family Detached (SFD) Average Fee Lot figure in the Housing Glossary section of the CSP includes an Open Space designation, which is defined as the front yard, fenced side yard, rear yard and street parkway. CDFW requests clarification as to whether the acreages associated with the SFD Open Space designation are included in the Open Space acreage calculations for onsite mitigation lands.

B.5-1 (cont.)

Thank you for the opportunity to comment on the DEIR and CSP. If you have any questions regarding these comments, please contact Lori Bono, Senior Environmental Scientist (Specialist), at (559) 243-4014, extension 350, or lori.bono@wildlife.ca.gov.

Sincerely,

Julie A. Vance

Responses to Comment Letter B.5
Governor's Office of Planning and Research, State Clearinghouse and Planning Unit
July 12, 2017

Response to Comment B.5-1:

The comment is noted. No further response is required given that the comment does not address or question the content of the Draft EIR. The attachments to the Commenter's letters have already been incorporated into this Final EIR and have been addressed in responses to Comments B.3-1 through B.3-11, B.4-1 through B.4-82, and D.3-1 through D.3-22. This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Los Angeles County
Department of Regional Planning
320 West Temple Street
Los Angeles, CA 90012

Dear Mr. Sackett:

Response to DEIR for the Centennial Project

The Sanitation Districts of Los Angeles County (Districts) received a Draft Environmental Impact Report (DEIR) for the subject project on May 17, 2017. We offer the following comment:

- The project area is located outside the Districts' sphere of influence as adopted by the Local Agency Formation Commission. C.1-1

If you have any questions, please contact the undersigned at (562) 908-4288, extension 2717.

Very truly yours,

Adriana Raza
Customer Service Specialist

COUNTY OF LOS ANGELES

FIRE DEPARTMENT

1320 NORTH EASTERN AVENUE
LOS ANGELES, CALIFORNIA 90063-3294

2017 JUN 12 PM 4:52

DARYL L. OSBY
FIRE CHIEF
FORESTER & FIRE WARDEN

June 6, 2017

Jodie Sackett, AICP
Department of Regional Planning
Zoning Permits North
320 West Temple Street
Los Angeles, CA 90012

Dear Jodie Sackett:

NOTICE OF COMPLETION AND AVAILABILITY OF THE DRAFT ENVIRONMENTAL IMPACT REPORT, "THE CENTENNIAL PROJECT," INVOLVES THE DEVELOPMENT OF A NEW COMMUNITY WITH RESIDENTIAL, COMMERCIAL, BUSINESS PARK, RECREATIONAL/ENTERTAINMENT, AND INSTITUTIONAL/CIVIC USES, CITYWIDE, ANTELOPE VALLEY, FFER 201700062

The Notice of Completion and Availability of the Draft Environmental Impact Report has been reviewed by the Planning Division, Land Development Unit, Forestry Division, and Health Hazardous Materials Division of the County of Los Angeles Fire Department.

The following are their comments:

PLANNING DIVISION:

Under Section 1.6.16 Fire and Law Enforcement Services, Fire Services, we have the following correction:

The first paragraph should be corrected to state that Fire Station 77 is staffed with a three-person assessment engine company which is an engine company with some limited paramedic capabilities.

C.2-1

LAND DEVELOPMENT UNIT:

1. The development of this project must comply with all applicable code and ordinance requirements for construction, access, water mains, fire flows, and fire hydrants. Additional Fire Department comments will be addressed with further review of plans for the proposed development. C.2-2

2. This property is located within the area described by the Forester and Fire Warden as a Very High Fire Hazard Severity Zone. All applicable fire code and ordinance requirements for construction, access, water mains, fire hydrants, fire flows, brush clearance, and fuel modification plans must be met. C.2-3

3. Every building constructed shall be accessible to Fire Department apparatus by way of access roadways with an all-weather surface of not less than the prescribed width. The roadway shall be extended to within 150 feet of all portions of the exterior walls when measured by an unobstructed route around the exterior of the building. A minimum 5-foot wide approved firefighter access walkway leading from the Fire Department access road to all required openings in the building's exterior walls shall be provided for firefighting and rescue purposes. C.2-4

4. Public and/or private streets or private driveways serving single family detached homes within the development shall be provided with the following: C.2-5

    a) Provide 36 feet in-width on all streets where parking is allowed on both sides.

    b) Provide 34 feet in-width on cul-de-sacs up to 700 feet in-length. This allows parking on both sides of the street.

    c) Provide 36 feet in-width on cul-de-sacs from 701 to 1,000 feet in-length. This allows parking on both sides of the street.

    d) Note: In Appendix 4.0-a of The Centennial Specific Plan, Figure 3.8 "Collector with Median" the roadway width shall be increased to 26 feet when fire hydrants are required. The 26-foot width shall be maintained for a minimum of 25 linear feet on each side of the hydrant location.

5. For private driveways serving detached single family dwellings provide a minimum unobstructed width of 20 feet exclusive of shoulders and an unobstructed vertical clearance "clear to sky." Fire Apparatus Access Roads to within 150 feet of all portions of the exterior walls of the first story of the building, as measured by an approved route around the exterior of the building. The C.2-6

required 20-foot wide driving surface shall be increased to 26 feet when fire hydrants are required. The 26-foot width shall be maintained for a minimum of 25 linear feet on each side of the hydrant location. C.2-6 cont.

6. For multi-family, commercial/ industrial, and mixed used developments with buildings no greater than 30 feet to the top of the eave line or to the top of the parapet provide a minimum unobstructed width of 26 feet exclusive of shoulders and an unobstructed vertical clearance "clear to sky." Fire Department vehicular access to within 150 feet of all portions of the exterior walls of the first story of the building as measured by an approved route around the exterior of the building. C.2-7

7. For multi-family, commercial/ industrial, and mixed used developments with buildings greater than 30 feet to the top of the eave line or to the top of the parapet provide a minimum unobstructed width of 28 feet exclusive of shoulders and an unobstructed vertical clearance "clear to sky." Fire Department vehicular access to within 150 feet of all portions of the exterior walls of the first story of the building as measured by an approved route around the exterior of the building when the height of the building above the lowest level of the Fire Apparatus Access Road is more than 30 feet high or the building is more than three stories. C.2-8

   a) The access roadway shall be located a minimum of 15 feet and a maximum of 30 feet from the building and shall be positioned parallel to one entire side of the building. The side of the building on which the aerial Fire Apparatus Access Road is positioned shall be approved by the fire code official.

   b) The public street may be used for ladder truck access when the building wall is within 20 feet of the public street and there are no obstructions such as street parking, power and telephone lines, trees, etc.

8. Fire Apparatus Access Roads shall be provided with a 32-foot centerline turning radius. C.2-9

9. All proposals for traffic calming measures (speed humps/bumps/cushions, traffic circles, roundabouts, etc.) shall be submitted to the Fire Department for review prior to implementation. C.2-10

10. A Fire Department approved turning area shall be provided for all driveways exceeding 150 feet in-length and at the end of all cul-de-sacs. C.2-11

11. All fire hydrants shall measure 6"x 4"x 2-1/2" brass or bronze conforming to current AWWA standard C503 or approved equal and shall be installed in accordance with the County of Los Angeles Fire Department Regulation 8. C.2-12

12. All required public fire hydrants shall be installed, tested, and accepted prior to beginning construction and all private on-site fire hydrants shall be installed, tested, and approved prior to building occupancy. C.2-13

13. The required fire for the public fire hydrants for single family residential homes less than a total square footage of 3600 feet is 1250 gpm at 20 pounds psi residual pressure for two hours with one public fire hydrant flowing. Any single family residential home 3601 square feet or greater shall comply with Table B105.1 of the Fire Code in Appendix B. C.2-14

14. The fire hydrant spacing for single family detached homes shall be 600 feet and shall meet the following requirements: C.2-15

    a) No portion of lot frontage shall be more than 450 feet via vehicular access from a public fire hydrant.

    b) When cul-de-sac depth exceeds 450 feet on a residential street, hydrants shall be required at the corner and mid-block.

    c) Additional hydrants will be required if hydrant spacing exceeds specified distances.

15. The development may require fire flows up to 8,000 gallons per minute at 20 pounds per square inch residual pressure for up to a five-hour duration non-single family detached buildings. Final fire flows will be based on the size of buildings, types of construction used, and the installation of an approved automatic fire sprinkler system. C.2-16

16. The fire hydrant spacing for no-single family detached homes shall be 300 feet and shall meet the following requirements: C.2-17

    a) No portion of lot frontage shall be more than 200 feet via vehicular access from a public fire hydrant.

    b) No portion of a building shall exceed 400 feet via vehicular access from a properly spaced public fire hydrant.

    c) Additional hydrants will be required if hydrant spacing exceeds specified distances.

    d) Cul-de-sac depth exceeds 200 feet on a commercial street, hydrants shall be required at the corner and mid-block.

17. An approved automatic fire sprinkler system is required for the proposed buildings within this development. C.2-18

For any questions regarding the report please contact FPEA Wally Collins at (323) 890-4243 or Wally.Collins@fire.lacounty.gov.

FORESTRY DIVISION – OTHER ENVIRONMENTAL CONCERNS:

The statutory responsibilities of the County of Los Angeles Fire Department's Forestry Division include erosion control, watershed management, rare and endangered species, vegetation, fuel modification for Very High Fire Hazard Severity Zones or Fire Zone 4, archeological and cultural resources, and the County Oak Tree Ordinance. Potential impacts in these areas should be addressed. C.2-19

The County of Los Angeles Fire Department's Forestry Division has no further comments regarding this project.

HEALTH HAZARDOUS MATERIALS DIVISION:

The Health Hazardous Materials Division (HHMD) of the Los Angeles County Fire Department advises that environmental impacts identified in the draft Environmental Impact Report acquire environmental oversight by the appropriate authorized government agencies such as the Lahontan Regional Water Quality Control Board, the California Division of Oil Gas & Geothermal Resources, and the California Department of Toxic Substances Control (DTSC). Also, the construction of any new public schools at the project site would require environmental oversight specifically by the DTSC. C.2-20

If you have any additional questions, please contact this office at (323) 890-4330.

Very truly yours,

Michael Y. Takeshita

MICHAEL Y. TAKESHITA, ACTING CHIEF, FORESTRY DIVISION
PREVENTION SERVICES BUREAU

MYT:ac

Responses to Comment Letter C.2
Los Angeles County Fire Department
June 6, 2017

Response to Comment C.2-1:

In response to this comment, the following changes have been made to the Draft EIR.

The first sentence under Fire Services (sixth paragraph) on page 1-23 in Section 1.6.16, Fire and Law Enforcement Services, of the Draft EIR has been revised as follows:

> Fire services and emergency response for fire incidents during the initial development phases of the Project would be provided from Fire Station 77, located at 46833 Peace Valley Road in Gorman, which is currently staffed with a three-person assessment engine company, which is an engine company with some limited paramedic capabilities.

The first sentence under Fire Services (fourth paragraph) on page 5.16-1 in Section 5.16, Fire and Law Enforcement Services, of the Draft EIR has been revised as follows:

> Fire services and emergency response for fire incidents during the initial development phases of the Project would be provided from Fire Station 77, located at 46833 Peace Valley Road in Gorman, which is currently staffed with a three-person assessment engine company, which is an engine company with some limited paramedic capabilities.

The first sentence on page 5.16-12 in Section 5.16, Fire and Law Enforcement Services, of the Draft EIR has been revised as follows:

> Fire services and emergency response for fire incidents during the initial construction phases of the Project would be provided from LACFD Fire Station 77, located at 46833 Peace Valley Road in Gorman, which is currently staffed with a three-person assessment engine company.

The last column of second row in Table 5.16-1 on page 5.16-7 in Section 5.16, Fire and Law Enforcement Services, of the Draft EIR has been revised as follows:

> 3-person assessment engine company**

The last row in Table 5.16-1 on page 5.16-7 in Section 5.16, Fire and Law Enforcement Services, of the Draft EIR has been revised to add:

> ** an engine company with some limited paramedic capabilities

These changes do not alter the analysis or conclusions related to Project impacts on Fire Services.

Response to Comment C.2-2:

The Draft EIR reflects this comment and states that the Project will comply with all applicable LACFD code and ordinance requirements for construction, access, water mains, fire flows, and hydrants. Specifically, the Draft EIR discusses building construction requirements and states that "construction activities would be required to comply with all applicable building and fire code requirements for such items as roofing materials, building construction, brush clearance, water mains, fire hydrant flows, hydrant spacing, access and design, and other hazard-reduction programs…"[241] In addition, MM 3-7 requires the Project to prepare and implement an Emergency Response Plan that will be updated with each new tract map. As discussed on page 5.3-24, the Emergency Response Plan would be reviewed and approved by the Department of Regional Planning, which would facilitate review by the LACFD and the Sheriff's Department. This review would ensure a Project-specific comprehensive emergency response planning effort that does not conflict with or impair the *Los Angeles County Operational Area Emergency Response Plan*. Thus, development of the Project would comply with applicable County Fire Department codes and ordinances, which would be verified by the Fire Department during the individual plan check processes for all proposed development on the Project site.

Response to Comment C.2-3:

This comment states that the Project site is within a Very High Fire Hazard Severity Zone (VHFHSZ) area, and as such the Project must meet all applicable code and ordinance requirements for construction, access, water mains, fire hydrants, fire flows, brush clearance, and fuel modification plans. The Draft EIR reflects this comment. The second paragraph under "Environmental Setting" on page 5.3-33 states, "Portions of the Project site are designated as a VHFHSZ and portions are designated as a HFHSZ"; and the fourth paragraph on page 5.3-36 states, "The Project would comply with State law and with all County requirements related to development in a designated VHFHSZ or HFHSV. Specifically, as required by Section 4908.1 of the County of Los Angeles Code (Title 32, Fire Code), a Fuel Modification Plan would be submitted with any subdivision of land located in an area designated as a Fire Hazard Severity Zone in a State Responsibility Area, which includes the entirety of Project site". To further reduce potential wildfire hazards, "MM 3-9 requires that new property owners are informed of their individual responsibilities for maintaining fuel modification zones on their property, either via the Covenants, Conditions, and Restrictions (CC&Rs) or disclosure statements".[242] Also, please see response to Comment C.2-2 above. Thus, development of the Project would comply with applicable County Fire Department codes and ordinances related to location in VHFHSZ- and HFHSZ-designated areas, which would be verified by the Fire Department during the individual plan check processes for all proposed developments on the site.

241 DRP 2017, p. 5.16-11
242 *Id.,* p. 5.3-39

Response to Comment C.2-4:

This comment states that every building constructed shall be accessible to Fire Department apparatus by way of access roadways with an all-weather surface of not less than the prescribed width. This request describes the requirements of California Fire Code Sections 503.1.1, 503.2.3 and 504.1, which the Los Angeles County Code of Ordinances (County Code) adopts by reference. As stated in the Draft EIR, the Project is required to comply with all applicable requirements of the Los Angeles County Code of Ordinances.[243] Accordingly, the Project will be required to satisfy the roadway and access walkway specifications described in this comment. This includes compliance with County's requirements for firefighting apparatus and firefighter access to be verified by the Fire Department during the individual plan check processes for all proposed developments on the site.

Response to Comment C.2-5:

This comment states that public and/or private streets or private driveways serving single family detached homes within the development shall be provided with streets having widths ranging from 34 feet to 36 feet depending on the type of street and parking. Median streets shall have a minimum roadway width of 26 feet for a distance of 25 feet on either side of a fire hydrant. This request describes the requirements of County Code Title 32, Sections 503.2.1 and 503.4, and County Code Title 21, Section 21.24.090. As stated in the Draft EIR, the Project is required to comply with all applicable requirements of the County Code.[244] Accordingly, the Project is required to comply with all applicable County Code requirements regarding access and roadway design. This would include compliance with County's requirements for emergency ingress and egress to be verified by the Fire Department during the individual plan check processes for all proposed developments on the site.

Response to Comment C.2-6:

This comment states that private driveways serving detached single-family dwellings shall provide a minimum unobstructed width of 20 feet exclusive of shoulders and an unobstructed vertical clearance "clear to sky". Additionally, the driving surface shall be increased to 26 feet for a minimum distance of 25 feet either side of a fire hydrant. This comment describes the requirements of County Code Title 32, Section 503.2.1 and Title 32, Chapter 83, Appendix D, Section D103.3. As stated in the Draft EIR, the Project is required to comply with all applicable requirements of the County Code.[245] Accordingly, the Project will be required to comply with all applicable County Code requirements for access and roadway design. This would include compliance with County's requirements for emergency ingress and egress to be verified by the Fire Department during the individual plan check processes for all proposed developments on the site.

243 *Id.,* pp. 5.16-11, -12
244 *Id.,* p. 5.16-11
245 *Ibid*.

Response to Comment C.2-7:

This comment states that for multi-family, commercial/industrial, and mixed-use developments with buildings no greater than 30 feet to the top of the eave line or to the top of the parapet provide a minimum unobstructed width of 26 feet exclusive of shoulders and an unobstructed vertical clearance "clear to sky". This comment describes the requirements of County Code Title 32, Chapter 83, Appendix D, Section D103.2, as well as the requirements of California Fire Code Section 503.1.1, which the County Code adopts by reference. As stated in the Draft EIR, the Project will be required to comply with all applicable LACFD code and ordinance requirements for access and roadway design.[246] This would include compliance with County's requirements for emergency ingress and egress to be verified by the Fire Department during the individual plan check processes for all proposed developments on the site.

Response to Comment C.2-8:

This comment states that for multi-family, commercial/industrial, and mixed-use developments with buildings greater than 30 feet to the top of the eave line or to the top of the parapet provide a minimum unobstructed width of 28 feet exclusive of shoulders and an unobstructed vertical clearance "clear to sky". Additionally, the access roadway shall be located within prescribed distances from the building and aligned parallel to one entire side of the building. This comment describes the requirements of County Code Title 32, Chapter 83, Appendix D, Sections D103.2, D104.3 and D104.4, as well as the requirements of California Fire Code Section 503.1.1, which the County Code adopts by reference. As discussed in the Draft EIR, the Project will be required to comply with all applicable LACFD code and ordinance requirements for access and roadway design.[247] This would include compliance with County's requirements for emergency ingress and egress to be verified by the Fire Department during the individual plan check processes for all proposed developments on the site.

Response to Comment C.2-9:

This comment states that Fire Apparatus Access Roads shall be provided with a 32-foot centerline turning radius. This comment describes the requirements of County Code Title 32, Chapter 83, Appendix D, Section D103.5. As discussed in the Draft EIR, the Project will be required to comply with all applicable LACFD code and ordinance requirements for access and roadway design.[248] This would include compliance with County's requirements for emergency ingress and egress to be verified by the Fire Department during the individual plan check processes for all proposed developments on the site.

246 *Ibid*.
247 *Ibid*.
248 *Ibid*.

Response to Comment C.2-10:

This comment states that all proposal for traffic calming measures (speed humps/bumps/cushions, traffic circles, roundabouts etc.) shall be submitted to the Fire Department for review prior to implementation. This comment describes the requirements of California Fire Code Section 503.4.1, which the County Code adopts by reference. As discussed in the Draft EIR, the Project will be required to comply with all applicable LACFD code and ordinance requirements for access and roadway design.[249] This would include compliance with County's requirements for emergency ingress and egress to be verified by the Fire Department during the individual plan check processes for all proposed developments on the site.

Response to Comment C.2-11:

This comment states that a Fire Department approved turning area shall be provided for all driveways exceeding 150 feet in-length and at the end of all cul-de-sacs. This comment describes the requirements of County Code Title 21, Section 21.25.180 and Title 32, Chapter 83, Section D103.6. As discussed in the Draft EIR, the Project will be required to comply with all applicable LACFD code and ordinance requirements for access and roadway design.[250] This would include compliance with County's requirements for emergency ingress and egress to be verified by the Fire Department during the individual plan check processes for all proposed developments on the site.

Response to Comment C.2-12:

This comment states the County's fire hydrant requirements for size, material, and installation. This comment describes the requirements of County Code Title 20, Sections 20.16.140, 20.16.190 and 20.16.200 and the Los Angeles County Department of Public Works Standard Plans applicable to fire hydrants (e.g., LADPW Standard Plans W-8, W-9). As explained in the Draft EIR, the Project will be required to comply with all applicable LACFD code and ordinance requirements, including those regarding fire hydrant construction standards, among others.[251] This will include compliance with the County's fire hydrant requirements, to be verified by the Fire Department during the individual plan check processes for all proposed developments on the site.

Response to Comment C.2-13:

This comment states that all public and private fire hydrants shall be installed, tested and accepted by the Fire Department prior to construction or building occupancy. This comment describes the requirements of California Fire Code Sections 901.5 and 901.5.1, which the County Code incorporates by reference. As explained in the Draft EIR, the Project is required to comply with all applicable LACFD code and ordinance requirements, including those applicable to for fire hydrants, among others.[252] This will include compliance with the

249 *Ibid*.
250 *Ibid*.
251 *Ibid*.
252 *Ibid*.

County's fire hydrant requirements, to be verified by the Fire Department during the individual plan check and construction inspection processes for all proposed developments on the site.

Response to Comment C.2-14:

This comment states the County's fire flow requirements for single-family residential homes. This comment describes the requirements of County Code Title 20, Section 20.16.060. As described in the Draft EIR, the water system for the Project has been designed to meet peak demand and County-required fire flows, and the Project will be required to comply with all applicable LACFD code and ordinance requirements, including those regarding minimum fire flows, among others.[253] The fire flows for residential uses will be verified by the Fire Department during the individual plan check and construction inspection processes for all proposed residential developments on the site.

Response to Comment C.2-15:

This comment states the County's fire hydrant spacing requirements for single-family detached homes. This comment describes the requirements of County Code Title 32, Chapter 83, Appendix C, Sections C105.1, C105.2, C105.4 and C106.1. As described in the Draft EIR, the Project will be required to comply with all applicable LACFD code and ordinance requirements, including those regarding fire hydrant spacing requirements, among others.[254] This will include compliance with the County's fire hydrant spacing requirements, to be verified by the Fire Department during the individual plan check and construction inspection processes for all proposed residential developments on the site.

Response to Comment C.2-16:

This comment states the County's fire flow requirements for non-residential uses. This comment describes the requirements of County Code Title 20, Section 20.16.060. As stated in the Draft EIR, the water system for the Project has been designed to meet peak demand and County-required fire flows, and the Project will be required to comply with all applicable LACFD code and ordinance requirements, including those regarding minimum fire flows, among others.[255] The fire flows for non-residential uses will be verified by the Fire Department during the individual plan check and construction inspection processes for all proposed non-residential developments on the site.

Response to Comment C.2-17:

This comment states the County's fire hydrant spacing requirements for land uses other than single-family detached homes. This comment describes the requirements of County Code Title 32, Chapter 83, Appendix C, Sections C105.1, C105.3, C105.4 and C106.1. As described in the Draft EIR, the Project will be required to comply with all applicable LACFD code and

253 *Ibid*.
254 *Ibid*.
255 *Ibid*.

ordinance requirements, including those regarding fire hydrant spacing, among others.[256] This will include compliance with the County's fire hydrant spacing requirements, to be verified by the Fire Department during the individual plan check and construction inspection processes for all proposed non-residential developments on the site.

Response to Comment C.2-18:

This comment states that an automatic fire sprinkler system is required for the proposed buildings. This comment describes the requirements of County Code Title 32, Section 903.2.11.7. As discussed in the Draft EIR, the Project would be constructed to have the necessary fire alarm and sprinkler systems.[257] This will be verified by the Fire Department during the individual plan check and construction inspection processes for all proposed developments on the site.

Response to Comment C.2-19:

This comment states that the statutory responsibilities of the LACFD's Forestry Division include erosion control, watershed management, rare and endangered species, vegetation, fuel modification for Very High Fire Hazard Severity Zones (VHFHSZ) or Fire Zone 4, archaeological and cultural resources, and the County Oak Tree Ordinance. This comment requests that these topics be addressed in the Draft EIR.

Erosion Control and Watershed Management

Erosion control and watershed management is addressed in Section 5.2, Hydrology and Flood, and Section 5.4, Water Quality. As discussed in Section 5.2, the proposed Project has been designed to meet or exceed Los Angeles County Municipal Separate Storm Sewer System (MS4) Permit, LID Standards Manual and LID requirements hydromodification and hydrology (flood control) requirements for new development. The Project incorporates MMs 2-1 and 2-2 that require Project compliance with hydromodification and flood-control performance standards be confirmed in a Drainage System Engineering and Planning Report submitted to the County during the review and approval of each Project tract map. Project runoff will not exceed the planned storm drain capacity and will not require construction of additional drainage facilities not considered in the Draft EIR and that could have significant environmental effects.

As required by MM 2-3, portions of the Project site along the northern and eastern site boundaries located within a 100-year floodplain will be subject to a Specific Plan Floodplain Safety Overlay that precludes habitable residential, commercial, school and institutional structures in the floodplain. All applications for Project tract maps that would locate any structures not precluded by the Floodplain Safety Overlay in the floodplain must include a Drainage System Engineering and Planning Report that provides a detailed description of the floodplain boundaries and a description of applicable flood protection measures. This report must demonstrate that, after construction, structure designs and floodplain flows will

256 *Ibid*.
257 *Id.,* p. 5.16-14

comply with all applicable FEMA and County of Los Angeles floodplain flood flow and development standards. If required, a conditional letter of map revision (CLOMR) from FEMA will be obtained prior to any construction within a mapped 100-year floodplain. There will be no housing development in on-site floodplains, and no significant impacts will occur from placing structures within a floodplain.

Potential mudflow impacts will be reduced to less than significant levels by capturing debris flows in on-site basins and engineered and natural stream channels and by minimizing disturbance in on-site locations with slopes in excess of 25 percent that could generate mudflows. Storm water basins will be managed to avoid potential mosquito-borne health vectors by implementing California Department of Public Health (CDPH) recommendations and fully discharging captured storm water within 96 hours.

As discussed in Section 5.4, the Project will implement site-design, source-control, Low Impact Development (LID), and hydromodification-control Best Management Practices (BMP) requirements. The Project's water quality performance standard is consistent with County requirements for new development and is incorporated in MM 4-1. With mitigation, the Project would not have a significant impact on surface water or groundwater quality. Developed area runoff constituent concentrations would be below all water quality objectives and criteria. Qualitatively assessed constituents in post-development runoff would not occur at levels that would exceed water quality standards or adversely affect beneficial uses of receiving surface or ground waters. Implementation of the planned BMPs in compliance with the County MS4 Permit, LID Ordinance, and LID Standards Manual would meet or exceed the requirements of the federal, State, and County standards for water quality. The two proposed wastewater reclamation facilities (WRFs) will produce recycled water treated to unrestricted reuse standards under Title 22 of the *California Code of Regulations.* The WRFs will be issued Waste Discharge Requirements (WDRs) by the Lahontan Regional Water Quality Control Board (RWQCB) and will be operated in accordance with the WDRs to protect surface and groundwater quality and designated beneficial uses. MM 19-5 in Section 5.19, Wastewater Collection, requires that WRF compliance with Title 22 and WDR requirements be confirmed in documentation submitted to the County prior to the issuance of building permits for Project development.

Rare and Endangered Species and Vegetation

The Project's potential impacts related to rare and endangered species and vegetation are discussed in Section 5.7, Biological Resources. Development and implementation of the Project would result in significant direct and indirect impacts to special status plants; special status wildlife; nesting birds; native grasslands, wildflower fields, and other special status vegetation types; jurisdictional drainages, wetlands, and riparian vegetation; wildlife movement and wildlife habitat; and regulated oak trees. All of these direct and indirect impacts would be reduced to less than significant levels with implementation of the Project's mitigation measures and Mitigation Monitoring and Reporting Program (MMRP). Cumulative impacts would remain significant and unavoidable for regional wildlife movement and impacts to native grasslands, even after mitigation.

Fuel Modification and Fire Safety

The Project's potential impacts related to fire safety and fuel modification are discussed in Section 5.3, Hazards and Fire Safety, and Section 5.16, Fire and Law Enforcement. With adherence to requirements for fuel modification zone management (MM 3-9) and emergency access (MM 3-7), the Project's potential impact related to wildfires would be less than significant. MM 3-9 requires property owner notification of their responsibilities for maintaining the fuel modification zone(s) on their property. The Project would not result in significant impacts related to proximity of a land use representing a potential fire hazard.

The Project includes conceptual site locations for up to four new fire stations on the Project site. These new fire stations are projected to provide an average five-minute response time for the first arriving unit for fire and eight minutes for the advanced life support (paramedic) unit on the site at Project buildout. This is consistent with the County of Los Angeles Fire Department's (LACFD's) goals for response times in urban areas. Ultimately, the LACFD would approve the final station site locations, and the Project Applicant/Developer would construct and equip the fire stations (MM 16-3). The LACFD has indicated that the proposed fire stations on the site would provide adequate fire service to the Project.

The Project Applicant/Developer would also provide funding for the construction of fire protection facilities in accordance with the approved Project, in lieu of paying established developer fees at the time building permits are issued (MMs 16-1 through 16-3). Implementation of MMs 16-1 through 16-3 would provide for fire station sites and funding for fire protection services to serve the Project. Therefore, impacts on fire services would be reduced to a less than significant level.

Archaeological and Cultural Resources

The Project's potential impacts related to archaeological and cultural resources are analyzed in Section 5.6, Cultural Resources. California Register of Historical Resources (CRHR) cultural resources eligibility evaluations were completed in 2012 and 2015 for sites in areas where impacts associated with development were anticipated. CRHR-eligible resources in the development area (CA-LAN-3201, CA-LAN-3240 and CA-LAN-3242) were defined and MMs were developed to be implemented either prior to the issuance of grading permits or prior to the completion of construction activities. Excavated finds shall be offered to the County of Los Angeles and/or its designee (i.e., the Tejon Tribe) on a first refusal basis; the Tejon Tribe can then make a determination whether the find is a significant tribal cultural resource and opt to accept the resource for curation in its facility.

The Paleo Environmental Associates report has classified rock units on the Project site according to their likelihood of containing resources of paleontological importance, and geologic evidence from adjacent areas with similar sedimentary formations indicates a high likelihood of encountering such resources during Project development.[258] Impacts, should

[258] Paleo Environmental Associates (PEA). 2009 (April). Paleontologic Resource Inventory and Impact Assessment Technical Report prepared in support of Centennial Specific Plan, western Antelope Valley, northern Los Angeles County, California. Altadena, CA: PEA (Appendix 5.6-F).

they occur, would be reduced to a level considered less than significant through the application of MMs 6-5 through 6-9. There is no evidence for the presence of Native American burial sites and associated human remains within the Project area because none of the sites recorded and evaluated on the Project area were found to contain human remains, nor were there any data to suggest they were present. However, the presence of known cultural resources sites increases the likelihood that they may be present. MM 6-10 is provided to address these potential occurrences, should they be realized.

Oak Tree Ordinance

The Project's compliance with the County Oak Tree Ordinance is analyzed in Section 5.7, Biological Resources. Significant impacts to oak tree resources that would result from implementing the Project would be reduced to less than significant levels with implementation of MM 7-11 and MMs 7-19 through 7-20, in accordance with the County of Los Angeles Oak Tree Ordinance and in compliance with the Los Angeles County Oak Woodlands Conservation Management Plan. For the impacts to oak woodlands, mitigation is proposed in accordance with these County documents and California State law by creating, enhancing, and/or restoring oak habitats and by preserving existing oak woodlands.

Response to Comment C.2-20:

The Lead Agency agrees that responsible agencies with jurisdiction over the Project are important partners in ensuring the Project is implemented in accordance with applicable law and with appropriate regulatory oversight. As explained in the Draft EIR, Lahontan RWQCB and Los Angeles Region RWQCB approvals will be required for the following activities within their respective areas of the Project site: waste Discharge Requirements (WDRs) for the fill or alteration of "waters of the State" on the Project site located in Lahontan RWQCB's jurisdiction; WDRs and Wastewater Reclamation Requirements or a Master Reclamation Permit for approval and operation of the Project's proposed wastewater reclamation facilities; Water Quality Certifications under Section 401 of the Federal Clean Water Act. In addition, the Draft EIR explains that consultation with the Department of Toxic Substances Control (DTSC) and other applicable agencies may be required if hazardous materials are encountered on the Project Site.[259] The Draft EIR also explains that, per MM 3-4, any historic wells located on the Project site must be abandoned in accordance with the requirements of the California Division of Oil Gas & Geothermal Resources.[260]

With regards to new public schools that would be constructed on the site, these schools would be the responsibility of the Gorman Joint School District, Westside Union Elementary School District, and/or Antelope Valley Union High School District. The Developer will be providing the school sites and contributions to facilitate the financing, construction, and operation of new school facilities, in accordance with the School Facilities and Funding Agreements with the school districts. As stated in Section 5.15, Education, school site

259 DRP 2017, p. 5.3-20
260 *Id.,* p. 5.3-27

location, sizing, and other details would be subject to Title 5 of the *California Code of Regulations*, which requires school district coordination with DTSC.[261]

RE: Draft Environmental Impact Report (DEIR) for the Centennial Project, CUP No. 02-232

Mr. Sackett:

The Antelope Valley Air Quality Management District (District) has received the Notice of Completion and Availability of the DEIR for the proposed Centennial Project

We have reviewed the DEIR and based on the information available to us at this time, we have no comment. D.1-1

Thank you for the opportunity to review this planning document. If you have any questions regarding this letter, please contact me at (661) 723-8070 x2.

Sincerely,

Bret Banks
Executive Director/APCO

Eastern Kern
Air Pollution Control District

Glen E. Stephens, P.E.
Air Pollution Control Officer

June 1, 2017

Mr. Jodie Sackett, Senior Planner
Department of Regional Planning
320 West Temple St.
Los Angeles, CA 90012

SUBJECT: Comments for Draft EIR of Centennial Project at Tejon Ranch

Dear Mr. Sackett:

Eastern Kern Air Pollution Control District (District) has received your Notice of Hearing Examiner Public Hearing and Availability of the Draft Environmental Impact Report for the Centennial Project at Tejon Ranch. The Centennial Project seems to be well thought-out community with a variety of housing types and integrated shopping.

However, the District has concerns, in regards to the community proximity to an existing cement manufacturing plant, currently operating in compliance with District and the Environmental Protection Agency Rules and Regulations. Parts of the Centennial Project community are located within a mile of the cement manufacturing plant. Please be aware, a cement plant (different than a concrete batch plant) operates 24-hours a day and has associated truck traffic. Residences not familiar with this type of industry may be disappointed; thereby, leading to the NIMBY phenomenon, which is often developed by new residents moving into areas adjacent to industrial facilities. This proposed project creates a rather complex scenario where:

- The cement plant is located in Kern County, under the District jurisdiction; and
- Residences will be located in Los Angeles County, under the jurisdiction of South Coast Air Quality Management District or Antelope Valley Air Quality Management District

The District is not opposed to the project (in concept); however, we would like you to be aware of probable negative consequences of the project. If you have any questions or concerns, feel free to contact Samuel Johnson of my staff at (661) 862-5250 or johnsonsam@co.kern.ca.us.

D.2-1

Sincerely,

Glen E. Stephens, P.E.
Air Pollution Control Officer

GES:SJ:tf

Responses to Comment Letter D.2
Eastern Kern Air Pollution Control District
June 1, 2017

Response to Comment D.2-1:

The Draft EIR provides a thorough discussion of the National Cement plant, including potential traffic, air quality and hazards impacts. Facts concerning the Cement Plant and its environmental effects are disclosed throughout the Draft EIR.[262] In addition, the proximity of the Cement Plant to the Project site and Kern County boundaries is depicted on Draft EIR Exhibits 3-2, 3-3, and 5.3-1.

As disclosed in the Draft EIR, the Cement Plant manufactures cement and is located over one mile from the northern boundary of the Project site.[263] Residential uses within the Project site will be located even farther away from the Cement Plant, as can be seen by comparing Draft EIR Exhibits 3-2 and 4-1. The Cement Plant would be approximately 1.85 miles to the northwest from the edge of the nearest graded lot with proposed residential land uses. Moreover, the Cement Plant is separated from the Project site by the foothills of the Tehachapi Mountains.[264] Although this comment does not identify specific environmental effects associated with the Cement Plant that concern the Commenter, the Draft EIR determined that operation of the Cement Plant would have no impact, or a less than significant impact, with respect to the Project related to hazards and fire safety, land resources, land use, emergency access, air quality, noise, and visual resources.[265]

With respect to truck traffic along National Cement Plant Road, the Draft EIR explains that a portion of this road would be realigned within the Project boundaries to access State Route 138 from the western side of Quail Lake rather than from the current connection on the east side of the lake.[266] This realignment provides a shorter route of access for cement trucks to I-5, separates cement truck traffic form Project-generated vehicle trips, eliminates concrete truck travel over the bridge that crosses the west bank of the California Aqueduct, and eliminates cement truck traffic from traversing through one of the entrances to the Project site.[267] The realigned roadway would be a private-use facility with clearly marked signs prohibiting public access and would not be a part of the Project's circulation system and, therefore, potential direct conflicts with existing traffic on the National Cement Plan Road and future vehicular and other traffic (pedestrian, bicyclists) introduced by the Project would be eliminated because the two streams of traffic would be fully separated.[268] The

JSackett@planning.lacounty.gov

Comments - Draft Environmental Impact Report, Centennial Project, Los Angeles County, State Clearinghouse No. 2004031072

The California Regional Water Quality Control Board, Lahontan Region (Water Board) reviewed the Draft Environmental Impact Report (DEIR) for the Centennial Project (Project), received on May 17, 2017. The DEIR was prepared by BonTerra PSMOAS on behalf of Los Angeles County (County) and submitted in compliance with provisions of the California Environmental Quality Act (CEQA). Water Board staff, acting as a responsible agency, is providing these comments to specify the scope and content of the environmental information germane to our statutory responsibilities pursuant to CEQA Guidelines, California Code of Regulations (CCR), title 14, section 15096.

The Water Board is pleased that the County integrated "Low Impact Development" (LID) strategies into various elements of the Project Plan and encourages the County to take this opportunity to also integrate strategies that promote watershed management and groundwater sustainability. As a whole, the DEIR describes a project that incorporates many water quality protection features and sustainable water saving components necessary in the arid high desert with hydrologically closed groundwater basins. This letter contains general and specific comments that we request be addressed, primarily: (1) a jurisdictional determination regarding waters of the United States must be established; (2) long-term groundwater pumping to satisfy Project water supply demand should consider cumulative growth in the Antelope Valley as a whole; and (3) we recommend that Project Alternative E (discussed below) be selected as the preferred alternative.

Project Description

The Project is a planned new 12,323 acre community development with residential, commercial, business, recreation and civic uses in Kern and Los Angeles Counties.

The Project involves the development of nine villages that will each contain a mix of land uses. While not an exact description of the Project area, it is generally bounded to the south by the San Gabriel Mountains and the San Andreas Fault and to the north and west by the Tehachapi Mountains and the Garlock Fault. The West Branch of the State Water Project's (SWP) California Aqueduct bisects the Project. The East Branch of the SWP Aqueduct is along the northeast side of the Project. The Project site has historically been used for livestock grazing. The National Cement Plant is located approximately one mile north of the Project Site.

The Project would allow up to 19,333 dwelling units on approximately 4,987 acres of land. Project build-out will occur over a 20 year period through tracts and parcel maps approved by the County. Of the 5,624 acres designated Open Space, approximately 5,116 acres are intended to:

(1) Remain in their original natural condition;
(2) Be restored; and/or
(3) Be enhanced by native species planting, abatement and fencing.

Over 90% of the Project is within the Lahontan Water Board jurisdiction and less than 10% within the Los Angeles Water Board jurisdiction. The Project plan includes two wastewater reclamation facilities that will be constructed for the tertiary treatment of wastewater generated by the Project, both in the Lahontan Region. Produced recycled water will be used to reduce the Project's demand for imported water and groundwater resources to supply potable water needs.

The Project's water supply needs are not directly under the purview of the Water Board. However, the Project's water supply is from imported SWP water, groundwater, and 40% from recycled water. After EIR certification, it is anticipated that the Golden Valley Municipal Water District (currently serving the community of Gorman) will annex the Project into its service area and become responsible for providing water and wastewater treatment services.

Project development will occur within nine "villages," eight located east of the SWP Aqueduct, and one west of the Aqueduct. Over the Project life, 20 separate Tentative Tract Parcels will be separately vested, each having specific development conditions.

Water Board Authority

All groundwater and surface waters are considered waters of the State. All waters of the State are protected under California law. State law assigns responsibility for protection of water quality in the Lahontan Region to the Lahontan Water Board. Some waters of the State are also waters of the U.S. The Federal Clean Water Act (CWA) provides additional protection for those waters of the State that are also waters of the U.S.

The Water Quality Control Plan for the Lahontan Region (Basin Plan) contains policies that the Water Board uses with other laws and regulations to protect the quality of waters of the State within the Lahontan Region. The Basin Plan sets forth water quality

standards for surface water and groundwater of the Region, which include designated beneficial uses as well as narrative and numerical objectives which must be maintained or attained to protect those uses. The Basin Plan can be accessed via the Water Board's web site at: http://www.waterboards.ca.gov/lahontan/water_issues/programs/basin_plan/references.shtml.

General Comments

We recognize the effort put forth by the County to incorporate the policies and objectives of various state, regional and local and agencies into the Project plan and have the following general comments. The Project spans the jurisdiction of two Regional Boards, Lahontan and Los Angeles; our comments are germane only to that area of the Project within the Lahontan Region.

1. There may, or may not be, waters of the United States in the Project vicinity. *Before DEIR certification is considered by Los Angeles County, the proponent should establish with the United States Army Corps of Engineers and United States Environmental Protection Agency, Region VIX, whether or not waters of the United States are present in within the Project boundary.* This decision will dictate the applicable federal surface water protection requirements that may apply. D.3-1

2. The Project water demand will be supplied from numerous sources: (1) imported SWP water, (2) recycled water, (3) imported water return flow, and (4) groundwater pumped from the Antelope Valley groundwater aquifer, which is court adjudicated because of pumping overdraft. SWP water availability is subject to many variables. Imported water return flow amounts appear speculative. The DEIR estimates a constant annual groundwater demand of 1,634 acre-feet per year (Table 5.18-10). The cumulative groundwater demand from projected development across the Antelope Valley as a whole may not be sustainable into the long-term. While Water Board staff supports the Water Resources Mitigation Measures identified in section 5.18, we also believe the water supply impact may not be "less than significant after mitigation" as stated on page 5-18-76. The DEIR did not evaluate the cumulative impact from continuous groundwater aquifer pumping from all current and projected future groundwater withdrawals in the Antelope Valley considering projected growth. *Clarify how the Project water supply will be sustained in the long-term considering the cumulative groundwater demand from all current and projected future development activities.* D.3-2

3. The Water Board is encouraged by the foresight of Alternative E: Density Clustering East of the Aqueduct. This moves all of the developments to the east side of the aqueduct, thereby reducing the need for Village 9 and the small 0.34 million gallons per day (MGD) package plant that would service the development. This would prevent any threat to the drinking water conveyance and supply in the form of the State Water Project Aqueduct and Quail Lake. *The Water Board recommends Los Angeles County select Alternative E as the preferred Project alternative.* D.3-3

SPECIFIC COMMENTS

Water Board staff provides the following specific comments regarding the Project that should be addressed in the Final EIR.

4. Hydromodification – Water Board staff support that the Project proponents have considered hydromodification, hydrology and flood control, and mapping out the 100 year floodplain to ensure LID and Best Management Practices (BMP) are met in the design of the project, and in particular the following mitigation measures (MMs): MM 2-1 for Hydromodification and Drainage system engineering, MM 2-2 Hydrology and flood-control BMPs that will provide capital flood protection, capital storm event, and MM 2-3 Tentative Maps depicting the 100 year floodplain mapped by the Federal Emergency Management Agency (FEMA). D.3-4

5. Water Resources – Water Board staff believes that MM 18-2 (Water Use Reports) are a very important Project plan element that should be adhered to and modified only when development is not proceeding at the predicted rate. This measure should be coordinated with the zoned density and build-out milestones. We are pleased that for Water Resource MM 18-1 (Water Efficiency Measures) that the county has planned to meter water use, reduce potable water use with on-site recycled water, require water efficient appliances, require water efficient irrigation, and budget water based on water rates. D.3-5

6. Wastewater Collection - For Wastewater Collection mitigation measures MM 19-1 thru MM 19-3 and MM 19-5, the Water Board requests to remain notified through each stage of development in order to provide input as development proceeds and balance workload as water quality permit actions are requested. For MM 19-4 and MM 19-5 (West and East wastewater treatment plants, respectively), Water Board staff is concerned about the proximity of these plants to the SWP Aqueduct and protection of that invaluable resource to overall water supply for southern California. D.3-6

7. Page 3-5 – The text indicates that 90% of the Project is within Region 6 (Lahontan Region) and 10% is within Region 4 (Los Angeles Region). Page 5-54 states that 93% of the Project is within the Region 6. Elsewhere, the appendices state that 96% of the Project is within Region 6 and 4% in Region 4. *Clarify portions of the Project within each regional board jurisdiction consistently throughout the DEIR*. D.3-7

8. Page 5.2-25 and page 5.4-2 – The DEIR states that the Project must comply with the state General Construction Permit. *Clarify whether the entirety of the Project will comply with the state General Construction Permit whether or not federal receiving waters of the United States are present*. The Water Board requests the Project proponents to comply with the state General Construction Permit in the Antelope Valley regardless of whether federal waters are present and to implement appropriate construction and post-construction BMPs. D.3-8

9. Page 5.2-49 – Section 6.2.7 discusses Hydrology and Flood Mitigation Measures. The Water Board's November 4, 2015 letter providing comments on the Notice of Preparation (NOP) (item 5) indicated that maintenance of post-construction BMPs D.3-9

should encourage deep rooted plants that are trimmed, not eradicated. *Include a Mitigation Measure requiring BMP maintenance that encourages stabilized native grasses and/or deep rooting plants to minimize sediment transport.* D.3-9 cont.

10. Page 5.3-20 – The Homestead Area section indicates that there is an onsite historical well that will be destroyed in accordance with the California Well Standards. *Include a Mitigation Measure requiring destruction of this well in accordance with the California Well Standards.* We appreciate the Project proponent's intent to properly destroy this well. However, a mitigation measure should be added ensuring this activity is carried out to protect groundwater resources from possible contamination. D.3-10

11. Page 5.4-69 – Table 5.4-12 indicates there is no Lahontan Basin Plan groundwater quality objective for nitrate as nitrogen. While this is correct, it is also misleading. The Lahontan Basin Plan, page 3-13, indicates that groundwater quality objectives are based on state drinking water standards. The state drinking water standard for nitrate as nitrate is 45 milligrams per liter (mg/L), which is the equivalent of 10 mg/L nitrate as nitrogen. *Clarify the text and Table 5.4-12 with respect to the Lahontan Basin Plan nitrate groundwater quality objective.* D.3-11

12. Page 5.4-90 – Two Water Quality Mitigation Measures are identified, MM 4-1 to use BMPs and incorporate LID for Project construction and MM 4-2 to integrate integrated pest management measures. The Water Board is pleased that the Project will implement LID and water quality control BMPs that will retain storm water runoff, specifically permeable pavement. The Project will result in significant site grading as the various villages are developed. We request that an additional construction related BMP be specifically identified and utilized. During construction, native topsoil should be retained, temporarily stored, and used as top soil cover for disturbed areas to the maximum extent feasible. Efforts should be taken to ensure that native seeds contained within removed and temporarily stored native topsoil are appropriately nurtured to germinate disturbed areas. *Include as a Mitigation Measure the retention and reuse of native topsoil during grading to re-establish native plants for soil stabilization to the maximum extent feasible.* D.3-12

13. Page 5.4-90 – Water Board staff's November 4, 2015 letter on the NOP requested that a Restoration and Revegetation Monitoring Plan be prepared (item 10). The list of mitigation measures included with the Biological Resources section of the DEIR (chapter 5.7) does not include this plan intended to ensure that revegetation efforts are successful. *Include as a Mitigation Measure a Restoration and Revegetation Monitoring Plan to ensure successful revegetation efforts, along with metrics for success.* D.3-13

14. Page 5.4-91 – The DEIR does not seem to reference the Salt and Nutrient Management Plan for the Antelope Valley. This plan was developed as required by the State Board's Recycled Water Policy. See: http://www.ladpw.org/wwd/avirwmp/docs/saltplan/Salt%20and%20Nutrient%20Management%20Plan%20for%20Antelope%20Valley_May%202014.pdf D.3-14

Significant elements of that plan are monitoring (Section 5) and salt and nutrient source reduction implementation measures (Section 6). The monitoring section indicates that groundwater monitoring well information is limited in some parts of the Antelope Valley. Section 6.3 of that plan identifies additional implementation measures that should be considered, including, but not limited to, reducing salt/nutrient loading into the basin using ultrafiltration or reverse osmosis, and replacing chlorine disinfection with ultraviolet disinfection. The Project proponent should:

a. *Reference the Salt and Nutrient Management Plan for the Antelope Valley in the EIR.*

b. *Identify or install appropriate groundwater monitoring wells that will be incorporated into the Antelope Valley monitoring network to evaluate Project impacts over time, in conjunction with other Antelope Valley groundwater impacts.*

c. *Identify, evaluate, and incorporate specific best management practices that will be employed now and over the Project life to reduce salt and nutrient loading into the Antelope Valley groundwater basin.*

d. *Include in the EIR Mitigation Measures for an ongoing commitment to participate in collective groundwater basin monitoring efforts and reduce salt and nutrient loading over the Project life.*

D.3-14 cont.

15. Appendix 5.4-A (Centennial Project Water Quality Technical Report), about page 36 – While referenced on page 5.18-13, the State Board adopted general water recycling and waste discharge requirements for the use of recycled water that is managed by an administrator (Order WQ-2016-0068-DDW). This Order is an appropriate regulatory tool for the use of recycled water. *Include reference to the State Board Order WQ-2016-0068-DDW, Water Reclamation Requirements for Recycled Water Use.*

D.3-15

16. Appendix 5.19-B (Centennial Project Wastewater Treatment Report) – The Project at build-out will include two wastewater reclamation facilities (WRF) designed for an average daily flow as follows: WRF East a 4.28 MGD, and WRF West at 0.34 MGD. Both plants are projected to use membrane bioreactor technology to achieve tertiary effluent standards. Storage reservoirs will be constructed to temporarily store water prior to distribution in recycled water pipelines. The following comments relate to wastewater collection and treatment.

    a. NOP Comments - Water Board staff's November 4, 2015 letter on the NOP requested additional information regarding wastewater collection, treatment, and disposal (Item 13). The DEIR did not provide all of the information requested. *Include in the EIR the information requested in Item 13 of Water Board staff's November 4, 2015 letter.*

D.3-16

b. Wastewater collection and treatment – Page 4-60 indicates that eight sewer lift stations will be required. *Mitigation measures should be added requiring sewer lift stations, wastewater treatment, and effluent storage facilities to be equipped with emergency backup power sources and spill containment features in the event that power failure occurs*. This is especially critical for the Project features immediately up stream of the SWP Aqueduct and adjacent to streams. D.3-17

c. Nitrogen reduction – The text is silent on whether nitrogen reduction technology will be utilized. *Mitigation measures should be added indicating that the WRFs will be required to achieve total nitrogen levels of less than 10 mg/L to ensure that any incidental recharge from the use of recycled water will not adversely affect receiving groundwater*. D.3-18

d. Disinfection – The text indicates that chlorine disinfection will be used. There is no indication that alternative disinfection measures were evaluated. *Mitigation measures should be added requiring an evaluation of alternative disinfection including ultraviolet disinfection*. The Water Board strongly recommends ultraviolet disinfection to ensure that disinfection byproducts are not produced, incidental recharge from the use of recycled water will not adversely affect receiving groundwater, and effluent total dissolved solids concentrations are lower. D.3-19

e. Effluent storage – The text does not indicate the location, size, volume, or construction method for the storage reservoirs. *The EIR should include this information.* While the EIR states that storage reservoirs will be lined, *the EIR should specify the type of liner and method of construction*. Liners must be of appropriate materials to prevent degradation and/or pollution of receiving groundwater. *If all effluent is to be contained for recycled water use, then sufficient capacity must exist to store winter flow when recycled water demand decreases. If some effluent will be percolated, then a groundwater degradation analysis must be provided*. The proposed method of monitoring potential reservoir leakage, including groundwater monitoring, should be stated. D.3-20

f. Biosolids handing – To address greenhouse gas emissions and the effects of climate change, the digesters should be equipped with methane gas recovery used for onsite power generation needs. *The location and proposed construction method of onsite sludge drying beds should be discussed*. D.3-21

Permitting Requirements

A number of activities that will be implemented under the Project have potential to impact waters of the State and, therefore, may require permits issued by either the State Water Resources Control Board (State Water Board) or Lahontan Water Board. The required permits may include the following. D.3-22

17. Streambed alteration and/or discharge of dredge and/or fill material to a surface water, including water diversions, may require a CWA, section 401 water quality certification for impacts to federal waters (waters of the United States) or dredge and fill Waste Discharge Requirements for impacts to non-federal waters.

18. Land disturbance of more than 1 acre may require a CWA, section 402(p) storm water permit, including a National Pollutant Discharge Elimination System (NPDES) General Construction Storm Water Permit, Water Quality Order (WQO) 2009-0009-DWQ as amended by 2010-0014-DWQ and 2012-006-DWQ, obtained from the State Water Board, or an individual storm water permit obtained from the Lahontan Water Board.

19. Water diversion and/or dewatering activities may be subject to discharge and monitoring requirements under either NPDES General Permit, Limited Threat Discharges to Surface Waters, Board Order R6T-2014-0049 for diverted stream flows or dredge spoils dewatering, or General Waste Discharge Requirements for Discharges to Land with a Low Threat to Water Quality, WQO-2003-0003, both issued by the Lahontan Water Board.

20. Wastewater collection systems are subject to the Statewide General Waste Discharge Requirements for Sanitary Sewer Systems, Order 2006-0003-DWQ.

21. Wastewater treatment is subject to individual waste discharge requirements issued by the Water Board. This requires that a report of waste discharge be filed with the Water Board no less than 140 days before discharge occurs.

22. If waters of the United States are present at the wastewater treatment plant sites, then storm water runoff must be covered under the statewide General Permit for Storm Water Discharges Associated with Industrial Activities, Order 2014-0057-DWQ.

23. Recycled water use is subject to water reclamation requirements issued by the Water Board, after the State Board Division of Drinking Water approves an Engineering Report to satisfy Title 22, California Code of Regulations. Alternately, an Administrator may file for coverage under Statewide Water Reclamation Requirements for Recycled Water Use, Order WQ 2016-0068-DDW.

Project proponents should consult with Water Board staff early on should project implementation result in activities that trigger these permitting actions. Information and application forms for these permits can be found at http://www.waterboards.ca.gov/lahontan/.

D.3-22 cont.

Thank you for the opportunity to comment on the DEIR. If you have any questions regarding this letter, please contact me at (760-241-2434 (jehiel.cass@waterboards.ca.gov). Please send all future correspondence regarding this Project to the Water Board's email address at lahontan@waterboards.ca.gov and be sure to include the State Clearinghouse No. (2004031072) and Project name (Centennial Ranch) in the subject line.

Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Centennial Development Project, Los Angeles County, State Clearinghouse Number 2004031072

The Notice of Preparation of a Draft Environmental Impact Report (DEIR) for the above-referenced project (Project) was prepared by the County of Los Angeles Planning Department (County) and circulated for public comment in compliance with provisions of the California Environmental Quality Act (CEQA). As a responsible agency, the California Regional Water Quality Control Board, Lahontan Region (Water Board) is providing these comments to specify the scope and content of the environmental information germane to our statutory responsibilities pursuant to CEQA Guidelines, California Code of Regulations, title 14, section 15096. Based on our review of the proposed Project, we recommend that several issues be considered in the preparation of the Notice of Preparation (NOP), particularly: 1) established numerical and narrative water quality objectives and standards should be used when evaluating thresholds of significance for Project impacts; (2) post-construction best management practices (BMPs) for stormwater control are an essential part of project planning and should be discussed in the DEIR; and 3) all potential downstream impacts to hydrology and water quality must be evaluated as a result of Project implementation. Our comments on the Project are outlined below.

Project Overview

The Centennial Project is a large residential-commercial development that will include 19,333 dwelling units on an area of a total of 12,323 acres in western Antelope Valley, 36 miles west of Lancaster. Approximately 6,700 acres of land will be developed into a series of communities over a 20 year period, and approximately 5,600 acres of land will be preserved for open space for drainages and conservation. New infrastructure facilities including shopping centers, water treatment facilities, water banking facilities will be built on approximately 180 acres, while approximately 140 acres will be set aside for K-12 schools. Commercial buildings will occupy approximately 100 acres, hospitals, medical facilities, and higher education buildings will occupy approximately 110 acres, and recreational and entertainment facilities will occupy approximately 80 acres.

Water Board's Authority

All groundwater and surface waters are considered waters of the State. Surface waters include streams, lakes, ponds, and wetlands, and may be ephemeral, intermittent, or perennial. All waters of the State are protected under California law. State law assigns responsibility for protection of water quality in the Lahontan Region to the Lahontan Water Board. Some waters of the State are also waters of the U.S. The Federal Clean Water Act (CWA) provides additional protection for those waters of the State that are also waters of the U.S.

The *Water Quality Control Plan for the Lahontan Region* (Basin Plan) contains policies that the Water Board uses with other laws and regulations to protect the quality of waters of the State within the Lahontan Region. The Basin Plan sets forth water quality standards for surface water and groundwater of the Region, which include designated beneficial uses as well as narrative and numerical objectives which must be maintained or attained to protect those uses. The Basin Plan can be accessed via the Water Board's web site at http://www.waterboards.ca.gov/lahontan/water_issues/programs/basin_plan/references.shtml.

Specific Issues to be Considered in the NOP

Based on our review of the information provided, we recommend that the following issues be considered in preparation of the DEIR.

1. The DEIR should identify all the applicable water quality standards that pertain to this project and identify which standards could potentially be violated by Project alternatives and use these standards when evaluating thresholds of significance for impacts. Water quality objectives and standards, both numerical and narrative, for **all** waters of the State within the Lahontan Region, including surface waters and groundwater, are outlined in Chapter 3 of the Basin Plan. Water quality objectives and standards are intended to protect the public health and welfare, and to maintain or enhance water quality in relation to the existing and/or potential beneficial uses of the water.

2. The Project area is located within the Neenach Hydrologic Area of the Antelope Hydrologic Unit, 626.00. The Project area lies over the Antelope Valley groundwater basin (Department of Water Resources unit 6-44). We note that the NOP in section 3.e. does not include the Basin Plan in its list of relevant plans. The beneficial uses of minor surface waters and wetlands are listed in Chapter 2 of the Basin Plan. The DEIR should identify and list all the beneficial uses of the surface water and groundwater resources within the Project area, and include an analysis of the potential impacts to water quality and hydrology with respect to those beneficial uses.

3. Healthy watersheds are sustainable. Watersheds supply drinking water, provide for recreational uses, and support ecosystems. Watershed processes include the movement of water (i.e. infiltration and surface runoff), the transport of sediment, and the delivery of organic material to surface waters. These processes create and sustain the streams, lakes, wetlands, and other receiving waters of the Antelope Hydrologic Unit, including groundwater. The DEIR should discuss the project components and their potential impacts to watersheds on the project area.

4. The DEIR should describe a proposed long-term maintenance and monitoring plan that will be implemented to evaluate and maintain the established baseline conditions. Specific routine and non-routine activities should be identified, such as dredging/excavation and re-contouring, and the thresholds that will trigger when maintenance activities are warranted.

5. The DEIR should describe the long-term post-construction best management practices (BMPs) maintenance plan. It is understood that routine sediment removal is necessary to maintain the function of a basin, and the removal of accumulated sediments in the bottom of a basin would completely remove any vegetation that may have been present. However, we also recognize the benefits of vegetation for water quality by filtering sediments and constituents of concerns from water. We *strongly recommend* that the County proponent include in their long term maintenance plan provisions for mowing rather than eradication, so that vegetation can more easily reestablish itself post-maintenance. Maintaining healthy deep-rooted vegetation is crucial to soil stabilization. Re-contouring and vegetation grubbing should only be done on an as-needed basis.

6. The DEIR should describe the project design standards used for sizing and constructing hydraulic features. Surface waters support a variety of beneficial uses including municipal and agricultural uses, groundwater and fresh water recharge, habitat, flood attenuation, and water quality enhancement. To ensure that no net loss of function and value will occur as a result of Project implementation, we request that culverts be designed to (1) pass storm flows without impoundment upstream, (2) with sufficient energy dissipation provided at the outlet to reduce flow velocities to pre-Project conditions, and (3) sufficiently sized to allow for habitat connectivity across/beneath the roadway.

7. All rock slope protection and energy dissipation rip-rap placed within stream channels should be **ungrouted** and the minimum amount necessary to provide scour protection and energy dissipation to prevent erosion. The DEIR should describe channel design and energy dissipation to prevent erosion. The DEIR should describe channel design criteria.

8. Construction and post-construction storm water management must be considered a significant Project component, and BMPs that effectively treat storm water runoff should be included as part of the Project. The DEIR should specify those temporary and permanent long-term sediment and erosion control BMPs that will be implemented to mitigate potential water quality impacts related to stormwater. The temporary BMPs need to be implemented for the Project until such time that vegetation has been restored to pre-Project conditions. We request that vegetation clearing be kept to a minimum and, where feasible, existing vegetation be mowed so that vegetation could more readily reestablish post-construction. A long-term BMP maintenance plan should be included in the DEIR.

9. The DEIR should identify all impacts to water resources and describe how impacts were avoided, minimized, or proposed to be mitigated. The Water Board requires that impacts to water resources be avoided where feasible and minimized to the extent practical. Compensatory mitigation will be required for all unavoidable permanent impacts to surface water resources. Water Board staff coordinate all mitigation requirements with staff from other federal and state regulatory agencies,

including the USACE and the California Department of Fish and Wildlife. In determining appropriate mitigation ratios for impacts to waters of the State, Water Board staff considers Basin Plan requirements (minimum 1.5:1 mitigation ratio for impacts to wetlands) and utilizes *12501-SPD Regulatory Program Standard Operating Procedure for Determination of Mitigation Ratios*, published December 2012 by the USACE, South Pacific Division.

10. All temporary impacts to water resource and upland areas should be restored (recontoured and revegetated) to match pre-Project conditions. A Restoration and Revegetation Monitoring Plan should be prepared and described in the DEIR that requires monitoring for some period of time (usually no less than 3 years), outlines a schedule with performance measures to be met in order for the restoration/revegetation to be deemed successful, and contains adaptive management criteria in the event performance measures are not being met.

11. Equipment staging areas, excavated soil stockpiles, and hazardous materials (i.e. oils and fuels) should be sited in upland areas outside surface waters and adjacent flood plain areas. We recommend that a comprehensive Spill Prevention and Response Plan be prepared and described in the DEIR that outlines the site-specific monitoring requirements and lists the BMPs necessary to prevent hazardous material spills or to contain and cleanup a hazardous material spill, should one occur.

12. Buffer areas should be identified and exclusion fencing used to protect water resources and to prevent unauthorized vehicles or equipment from entering or otherwise disturbing the surface waters. Equipment should use existing roadways to the extent feasible. These features should be described in the DEIR.

13. The project plans to construct and operate a domestic wastewater treatment plant. The plant will produce recycled water for use within the project area. Onsite disposal of treated wastewater must not cause pollution and minimize degradation. Denitrification should be included in the plant design. The DEIR should fully describe the following.

    a. Treatment plant and disposal pond locations,
    b. Treatment plant design criteria,
    c. Storage and disposal pond design criteria,
    d. Expected wastewater quality,
    e. Receiving groundwater quality,
    f. Expected receiving groundwater degradation (nature and extent) resulting from the discharge according to State Board Resolution 68-16,
    g. Background receiving groundwater quality and direction of flow established from a statistically significant data set,
    h. Location and well construction design of monitoring wells installed to evaluate groundwater quality,
    i. Lift station locations and design,
    j. Backup power features,
    k. Recycled water storage, delivery, and use area design standards, and
    l. Entity responsible for owning and operating the treatment plant and recycled water infrastructure.

Permitting Requirements

A number of activities associated with the proposed Project have the potential to impact waters of the State and, therefore, may require permits issued by either the State Water Resources Control Board (State Water Board) or Lahontan Water Board. The required permits may include the following.

14. Streambed alteration and/or discharge of fill material to a surface water may require a CWA, section 401 water quality certification for impacts to federal waters (waters of the U.S.), or dredge and fill waste discharge requirements for impacts to non-federal waters, both issued by the Lahontan Water Board.

15. Land disturbance of more than 1 acre may require a CWA, section 402(p) storm water permit, including a National Pollutant Discharge Elimination System (NPDES) General Construction Storm Water Permit, Water Quality Order (WQO) 2009-0009-DWQ, obtained from the State Water Board, or individual storm water permit obtained from the Lahontan Water Board if water of the United States are affected. The DEIR should identify where waters of the United States are present with in the project area. The Water Board may establish individual waste discharge requirements to address stormwater impacts to state only waters.

16. New industrial operations may require coverage under the Industrial General Stormwater Permit (2014-0057-DWQ) if waters of the United States are affected. Information on the Industrial General Stormwater Permit is available on the State Water Board's web site at http://www.swrcb.ca.gov/water_issues/programs/stormwater/industrial.shtml. These permits must be obtained from the Lahontan Water Board.

17. Disposal from wastewater treatment facilities will require a waste discharge requirements which must be obtained from the Lahontan Water Board. Information on what information is needed in a report of waste discharge is available on the State Water Board's web site at http://www.waterboards.ca.gov/water_issues/programs/land_disposal/waste_discharge_requirements.shtml

18. Water diversion and/or dewatering activities may be subject to discharge and monitoring requirements under either NPDES General Permit, Limited Threat Discharges to Surface Waters, Board Order R6T-2014-0049, or General Waste Discharge Requirements for Discharges to Land with a Low Threat to Water Quality, WQO-2003-0003, both issued by the Lahontan Water Board. The DEIR should identify any and all proposed diversion or dewatering actions.

19. Recycled water uses are subject to water reclamation and waste discharge requirements issued by the Water Board. An Engineering Report must be submitted to the Water Board and State Division of Drinking Water, which also must approve the Engineering Report.

Please be advised of the permits that may be required for the proposed Project, as outlined above. The specific Project activities that may trigger these permitting actions should be identified in the appropriate sections of the NOP. The Project proponent should consult with Water Board staff early on should Project implementation result in activities that trigger

these permitting actions. Information regarding these permits, including application forms, can be downloaded from our web site at http://www.waterboards.ca.gov/lahontan/.

Thank you for the opportunity to comment on the NOP. If you have any questions regarding this letter, please contact me at (760) 241-7391 thomas.browne@waterboards.ca.gov or Jehiel Cass, Senior Water Resource Control Engineer, at (760) 241-2434 jehiel.cass@waterboards.ca.gov.

Please send all future correspondence regarding this Project to the Water Board's email address at Lahontan@waterboards.ca.gov and be sure to include the State Clearinghouse Number, when available, and Project name in the subject line.

Responses to Comment Letter D.3
Lahontan Regional Water Quality Control Board
July 11, 2017

Response to Comment D.3-1:

Thank you for your comment and your participation in this public process. This introductory comment does not raise any specific concerns regarding the Project's potential environmental effects or the adequacy of the Draft EIR. Therefore, no further response is required. This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment D.3-2:

The potential delivery reliability and variability of Project State Water Project supplies is discussed in Draft EIR Section 5.18, Water Resources.[269] The Draft EIR analysis of State Water Project supplies utilizes the 82-year model results for the Early Long Term delivery reliability scenario published by the California Department of Water Resources in the 2015 State Water Project Delivery Capability Report. The Early Long Term delivery reliability scenario is also utilized in the 2015 Urban Water Management Plan adopted by the Antelope Valley-East Kern Water Agency, the State Water Project contractor for Antelope Valley and for the Project. The Early Long Term scenario incorporates more significant assumptions regarding potential climate change impacts than the Delivery Capability Report base scenario, including 2025 emission levels and a 15-centimeter sea level rise. The average year State Water Project delivery rate in the Early Long Term scenario is lower than the Delivery Capability Report base scenario rate. Consistent with the Antelope Valley-East Kern Water Agency methodology, the Early Long Term scenario was further modified to more conservatively evaluate Project water supplies by using a lower single dry year delivery rate of 5 percent than identified in the Delivery Capability Report. Consequently, the Draft EIR includes a discussion of climate change effects on water supplies that is consistent with the conservative Early Long Term scenario developed in the Delivery Capability Report and the same scenario, with a reduced single dry year reliability level, used in the Antelope Valley-East Kern Water Agency's 2015 Urban Water Management Plan. The comment does not raise a specific concern regarding the discussion of the potential delivery reliability and variability of State Water Project supplies for the Project in the Draft EIR.

The volume of imported water return flows that would be used by Project is not speculative and is derived directly from the approved Antelope Valley Basin Adjudication Judgment and Physical Solution entered by the Superior Court in December 2015. The Adjudication Judgment and Physical Solution provides that imported water used to meet urban demand in the Antelope Valley Basin may be recovered by the importing party in an amount equal to 39 percent of the average imported water use over the prior five years.[270] The analysis of return flow supplies in the Draft EIR is conservative because the Adjudication Judgment and

269 DRP 2017, pp. 5.18-20 to -34, -36, -54 to -64
270 *Id.,* p. 5.18-64

Physical Solution allows for the additional production of return flows generated by urban imported water use in the Antelope Valley watershed as well as in the Basin with watermaster approval. The Project water supplies discussed in the Draft EIR do not include potential return flows supplies for watershed urban use because these have not yet been approved by the watermaster.

As discussed in Section 5.18 of the Draft EIR, all Project groundwater use, return flow production and water banking activities will be regulated by and comply with the Antelope Valley Basin Adjudication Judgment and Physical Solution.[271] The Adjudication Judgment and Physical Solution was approved by the Court to allocate rights to Antelope Valley Basin groundwater, imported water return flows and basin storage for the purpose of sustainably managing Antelope Valley groundwater resources over time. As a result, groundwater use, return flow production and water banking activities that are consistent with the Adjudication Judgment and Physical Solution also take account of and avoid potential long-term, cumulative impacts to the Antelope Valley Basin. Section 1.5 of the Adjudication Judgment and Physical Solution states that after the Phase 3 trial of the proceedings, the Court determined that the safe yield of the Antelope Valley Basin is 110,000 acre-feet per year. Section 3.5.43 of the Adjudication Judgment and Physical Solution defines safe yield to mean the amount of annual extractions of water from the Basin over time equal to the amount of water needed to recharge the Groundwater aquifer and maintain it in equilibrium, plus any temporary surplus. Section 3.4 of the Adjudication Judgement and Physical Solution states that the physical solution governs groundwater, imported water and Antelope Valley Basin storage space to ensure that the Antelope Valley Basin supports existing and future reasonable and beneficial uses. Exhibit 4 to the Adjudication Judgment and Physical Solution allocates overlying production rights in amounts consistent with the Basin's sustainable yield.[272] The Adjudication Judgment and Physical Solution provides that, after a seven-year rampdown period applicable to all basin groundwater users, the Tejon Ranch Company has an overlying production right of 1,634 acre feet per year, all of which will be provided to and utilized by the Project. The groundwater component of the Project's water supplies discussed in the Draft EIR is limited to the amount of the overlying production right of 1,634 acre feet per year allocated to Tejon Ranch Company in the adjudication. The fact that the Adjudication Judgment and Physical Solution, including the annual groundwater allocation to the Tejon Ranch Company, takes account of and avoids potential long-term and cumulative impacts to the Antelope Valley Basin is recognized in the 2014 California Sustainable Groundwater Management Act, which requires, for the first time in state history, that certain overdrafted or stressed state groundwater basins implement a plan to sustainably manage groundwater over time. Section 10720.8(b) of the Act specifically exempts the Antelope Valley from these requirements upon the approval of the Adjudication Judgment and Physical Solution. Section 10720.8 also exempts other adjudicated basins throughout the state. These exemptions demonstrate that an adjudication judgment, including the Antelope Valley Basin Adjudication Judgment and Physical Solution, accounts

271 *Id.,* Appendix 5.18-D
272 *Ibid*.

for and allocates water uses, avoids long term, cumulative groundwater impacts and ensures that cumulative groundwater use will be sustainable over time.

MM 18-2 requires implementation of water use monitoring and reporting, including the submission of water use reports to the County at the end of the 5th and 10th years or the occupancy of the 4,000th and 10,000th units, whichever occurs latest, to confirm that the water use efficiencies discussed in the Draft EIR are being achieved as the Project is built and that available water supplies are sufficient to meet future demand. If a report determines that water use is exceeding projected levels, the Project Water Purveyor must identify specific response measures to ensure that water supplies will meet future demand. Potential sources of additional supply, if necessary, are discussed on pages 5.18-68 to 5.18-71 of the Draft EIR and include potential groundwater transfers as allowed by the Adjudication Judgment and Physical Solution, supplemental surface water purchases and imports, and investments in additional recycled water use or storm water reuse in the Antelope Valley. No additional development will occur until sufficient supplies are identified. Consequently, if Project and other Basin user water supplies regulated by the Adjudication Judgment and Physical Solution were to be reduced by the watermaster in the future, MM 18-2 ensures that the Project's potential long-term, cumulative impacts to the Antelope Valley Groundwater Basin will be less than significant.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of utilities and service systems can be found in these documents: Section 5.17 of the AVAP EIR, and Section 3.18 of the RTP/SCS EIR.

Response to Comment D.3-3:

This comment does not raise any specific concerns regarding the Project's potential environmental effects or the adequacy of the Draft EIR. The project is designed to prevent impacts to the Aqueduct and State Water Project facilities through the management of drainage and the location of the West WRF, as well as compliance with the Waste Discharge Requirements that will be imposed on the design and operation of the West WRF by the Lahontan Regional Board. Therefore, no further response is required. This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment D.3-4:

This comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment D.3-5:

This comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment D.3-6:

As stated in MM 19-2 and summarized at the bottom of the third paragraph on page 5.19-1 in Section 5.19, Wastewater Collection, of the Draft EIR, the construction and operation of the proposed on-site wastewater reclamation facilities (WRFs) would be subject to waste discharge requirements (WDRs) and other applicable standards and regulations of the Lahontan RWQCB. The first paragraph on page 5.4-73 also states that "Each of the proposed WRFs will be required to obtain WDRs from the Lahontan RWQCB that include enforceable operational, treatment, conveyance, discharge, water quality, and monitoring requirements before wastewater treatment and recycled water operations may commence." This regulatory compliance will involve notification of the RWQCB during the consultation, coordination, permitting, and inspection of the WRFs.

With regard to the two WRFs proximity to the State Water Project (SWP) Aqueduct. As noted above, the construction and operation of the proposed WRFs would be subject to WDRs and other applicable standards and regulations of the Lahontan RWQCB. Pages 5.4-73 through 5.4-74 discuss the potential impacts of the WRFs to surface water bodies and the regulations and mitigation measures that would be implemented to prevent significant adverse impacts. The discussion includes the wastewater treatment processes at the WRFs, including compliance with Title 22 of the *California Code of Regulations* and the Porter-Cologne Act. Thus, the construction and operation of the WRFs will meet the Lahontan Basin Plan's surface and groundwater quality objectives. The Lahontan RWQCB is expected to require the Project to include design features, such as berms, levees, spill containment features, and other topographical elevation features, to protect the WRFs during large flood events and to protect adjacent properties under any emergency conditions.

As shown on Exhibit 4-14, Centennial Project – Conceptual Wastewater System, in the Draft EIR, there are no sewer pipelines or force mainlines that would cross over the SWP Aqueduct; therefore, there is no risk of sewer line rupture over the SWP Aqueduct. In addition, the SWP Aqueduct contains a levee system that protects its waters from stormwater flooding or other surface flows. Thus, the WRFs are not expected to have any adjacency impacts to the SWP Aqueduct, or any other sensitive resources or land uses.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the

topic of utilities and service systems can be found in these documents: Section 5.17 of the AVAP EIR, and Section 3.18 of the RTP/SCS EIR.

Response to Comment D.3-7:

In response to this comment, the following changes have been made to the Draft EIR to match the numbers in Appendix 5.2-B:

The fourth and fifth sentences in the third paragraph on page 3-5 of the Draft EIR have been revised to read:

> Approximately 4.2 ~~ten~~ percent of the Project site is within the Gorman Drainage Area and the Los Angeles RWQCB (Region 4). However, ~~90~~ 95.8 percent of the Project site is located within the jurisdiction of the Lahontan Regional Water Quality Control Board (Lahontan RWQCB), which has been designated "Region 6" by the SWRCB (see Exhibit 5.2-1, Regional Water Quality Control Board Boundaries).

The first and second sentences in the third paragraph on page 4-54 have been revised to read:

> Approximately ~~93~~ 95.8 percent of the Project site is within the jurisdiction of the Lahontan Regional Water Quality Control Board (Lahontan RWQCB); this area is not covered by an MS4 Permit due to the lack of development in the area. The remaining approximately ~~7~~ 4.2 percent of the Project site is within the jurisdiction of the Los Angeles Regional Water Quality Control Board (Los Angeles RWQCB); an MS4 permit has been approved by the Los Angeles RWQCB and is applicable to the portion of the site under the Los Angeles RWQCB's jurisdiction.

These changes do not alter the analysis or conclusions related to Project impacts on Hydrology.

Response to Comment D.3-8:

Project compliance with the California General Construction Permit issued by the State Water Resources Control Board (CAR000002, Order 2009-0009-DWQ as amended by Order 2010-0014-DWQ and Order 2012-0006-DWQ) is discussed in the second paragraph of page 5.2-2 and the first full paragraph on page 5.2-26, in Section 5.2, Hydrology and Flood, and in the second full paragraph on page 5.4-2 of Section 5.4, Water Quality. MM 2-4 is hereby added to the Draft EIR in response to this comment:

MM 2-4 The Project shall comply with the California General Construction Permit issued by the State Water Resources Control Board (CAR000002, Order 2009-0009-DWQ as amended by Order 2010-0014-DWQ and Order 2012-0006-DWQ) during all Project construction activity that meets or exceeds the applicable levels of land disturbance and other applicable coverage criteria in the California General Construction Permit notwithstanding the potential absence or presence of Waters of the United States in any Project construction location.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of hydrology and water quality can be found in these documents: Section 5.9 of the AVAP EIR, and Section 3.10 of the RTP/SCS EIR.

Response to Comment D.3-9:

This comment addresses the use of Best Management Practice (BMP) maintenance measures that encourage stabilized native grasses and/or deep rooting plants to minimize sediment transport. MM 2-5 is hereby added to the Draft EIR in response to this comment:

MM 2-5 The Project shall implement maintenance measures in consultation with a qualified biologist that encourage stabilized native grasses and/or deep rooting plants to minimize sediment transport within applicable post-construction facilities that incorporated Best Management Practices for hydrology and flood control facilities.

Response to Comment D.3-10:

With regard to the Project's proposed destruction of an historic water well on the site in compliance with California Department of Water Resources (DWR) Well Standards, as described on page 5.3-20, the DWR has responsibility under the Water Code for developing well construction, alteration, and destruction standards for the purpose of protecting groundwater quality. MM 3-10 is hereby added to the Draft EIR in response to this comment:

MM 3-10 The Project Applicant/Developer shall be responsible for ensuring the destruction of the historic water well associated with the former homestead in the central portion of the site is

> completed in full compliance with the requirements of the California Department of Water Resources' Water Well Standards, including Chapter II, Part III, Section 23 (Requirements for Destroying Wells). The applicable Local Enforcement Agency for implementation of the DWR's Well Standards is the Los Angeles County Department of Health Services, Drinking Water Program (LACDHS). The Project Applicant/Developer shall present documentation that is has complied with the DWR Well Standards to the LACDHS.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of hazards and hazardous materials can be found in these documents: Section 5.8 of the AVAP EIR, and Section 3.9 of the RTP/SCS EIR.

Response to Comment D.3-11:

The following modifications to the Draft EIR are hereby made in response to this comment:

Table 5.4-9 on page 5.4-62 of the Draft EIR is hereby revised as follows:

TABLE 5.4-9
COMPARISON OF NUTRIENT CONCENTRATIONS WITH WATER QUALITY CRITERIA FOR THE PROJECT

Parameter	Predicted Average Annual Concentration (mg/L)	Los Angeles Basin Plan Surface Water Quality Objectives (mg/L)	Lahontan Basin Plan Surface Water Quality Objectives (mg/L)
Total Phosphorus	0.3	Waters shall not contain biostimulatory substances in concentrations that promote aquatic growth to the extent that such growth causes nuisance or adversely affects beneficial uses.	Waters shall not contain biostimulatory substances in concentrations that promote aquatic growth to the extent that such growths cause nuisance or adversely affect the water for beneficial uses whereby discharges are not to cause excessive algae growth in receiving waters.
Total Nitrogen	3.2		
Nitrate-N + Nitrite-N	0.7	10[a]	10[b]
Total Ammonia	0.4	1.24[~~c~~b]	8.5[d~~e~~]

mg/L: milligrams per liter; ELS: early life stage; pH: hydrogen potential; C: degrees Celsius; F: degrees Fahrenheit

[a] Waters shall not exceed 10 mg/L nitrogen as nitrate-nitrogen plus nitrite-nitrogen (NO3-N + NO2-N), 45 mg/L as nitrate (NO3), 10 mg/L as nitrate-nitrogen (NO3-N), or 1 mg/L as nitrite-nitrogen (NO2-N).

[b] Waters designated as MUN shall not contain concentrations of chemical constituents in excess of the maximum contaminant level (MCL) or secondary maximum contaminant level (SMCL) based upon drinking water standards specified in Title 22 of the California Code of Regulations. Waters shall not exceed 10 mg/L nitrogen as nitrate-nitrogen plus nitrite-nitrogen (NO3-N + NO2-N), 10 mg/L as nitrate-nitrogen (NO3-N), or 1 mg/L as nitrite-nitrogen (NO2-N).

[~~c~~b] 30-day average, ELS present, based on average pH (7.97) and average temperature of 25 °C.

[d~~e~~] Total Ammonia Water Quality Objective calculated using pH = 7.5 (log mean pH) and Temperature = 30°C (86°F), which is very conservative.

Source: Geosyntec Consultants 2016b

Table 5.4-12 on page 5.4-69 of the Draft EIR is hereby revised as follows:

> As discussed in Section 5.4.5, chloride and nitrate have a greater potential for infiltration because these constituents are more mobile and could reach groundwater by infiltration. Table 5.4-12 compares the predicted average annual nitrate-N and chloride concentrations in Project post-development runoff with applicable groundwater quality objectives from the Los Angeles and Lahontan Basin Plans. As shown in Table 5.4-12, under developed conditions and including the proposed regional and distributed or parcel-specific LID BMPs, predicted average annual nitrate-N and chloride concentrations in Project runoff would be significantly below the nitrate-N groundwater quality objective in the Los Angeles Basin Plan ~~(no nitrate-N groundwater objective is included in the Lahontan Basin Plan)~~ and the Lahontan Basin Plan and the chloride groundwater objectives in both Basin Plans.

TABLE 5.4-12
COMPARISON OF ~~PREDICTED~~ NITRATE-N AND CHLORIDE CONCENTRATIONS WITH WATER QUALITY CRITERIA ~~GROUNDWATER QUALITY OBJECTIVES~~ FOR THE PROJECT SITE

Predicted Average Annual Concentration in Storm Water (mg/L)		Los Angeles Basin Plan Water Groundwater Quality Objectives (mg/L)		Lahontan Basin Plan Groundwater Quality Objectives (mg/L)[a]	
Nitrate-N	Chloride	Nitrate-N	Chloride	Nitrate-N	Chloride
0.7	17.3	10	~~100~~ 50	~~N/A~~ 10	250

mg/L: milligrams per liter~~; N/A: not applicable~~

[a] Waters designated as MUN shall not contain concentrations of chemical constituents in excess of the maximum contaminant level (MCL) or secondary maximum contaminant level (SMCL) based upon drinking water standards specified in Title 22 of the California Code of Regulations. Waters shall not exceed 10 mg/L nitrogen as nitrate-nitrogen plus nitrite-nitrogen (NO3-N + NO2-N), 10 mg/L as nitrate-nitrogen (NO3-N), or 1 mg/L as nitrite-nitrogen (NO2-N). ~~There is no Lahontan Basin Plan surface water quality objective for chloride in the Project site's receiving waters.~~

Source: Geosyntec Consultants 2016b.

Response to Comment D.3-12:

This comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. MM 4-3 is hereby added to the Draft EIR in response to this comment:

MM 4-3 The Project shall, to the maximum extent feasible, retain, temporarily store and use native topsoil as topsoil cover in disturbed areas of the Project, and shall, in consultation with a qualified plant biologist, implement measures to encourage the germination of native plants in locations where native topsoil is used as a topsoil cover within the Project.

Response to Comment D.3-13:

With regard to the use of a restoration and revegetation monitoring plan in conjunction with Project revegetation efforts, MM 4-4 is hereby added to the Draft EIR:

MM 4-4 The Project Applicant/Developer shall prepare, in consultation with a qualified biologist, a Restoration and Revegetation Monitoring Plan for the Project. The Restoration and Revegetation Monitoring Plan shall include appropriate metrics, as determined by the qualified biologist, for determining the success of Project revegetation efforts, including revegetation implemented in compliance with the approved Mitigation and Monitoring Plan for the Project. The Restoration and Revegetation Monitoring Plan shall be submitted to the County

and updated as appropriate during the review and approval process for each tract map application.

Response to Comment D.3-14:

The following text is hereby added after the fourth paragraph on page 5.4-70 of the Draft EIR in response to this comment to address the Antelope Valley Salt and Nutrient Plan:

A Salt and Nutrient Management Plan (SNMP) was developed for the Antelope Valley Groundwater Basin in May 2014. The baseline water quality analyses for the Antelope Valley Groundwater Basin included in the SNMP indicates that overall groundwater quality with respect to the SNMP constituents of concern is below the SNMP water quality management goals. These goals are consistent with the Regional Board's Basin Plan to protect the beneficial uses of the water. The analysis of future water quality (through 2035) indicates slowly increasing trends in the overall basin groundwater salt and nutrient quality that will remain below the SNMP water quality management goals. Therefore, no new implementation measures as part of the SNMP process are recommended at this time. Nevertheless, existing measures or practices are already in place to manage water quality, and frequent monitoring is recommended to assess trends in water quality.

The SNMP developed for the Antelope Valley Groundwater Basin in May 2014 proposes a monitoring plan to track the water quality in the basin. Results will be used to determine whether the concentrations of salt and nutrients over time are consistent with the SNMP predictions and the applicable SNMP water quality management goals. The monitoring program includes 32 municipal water supply wells that are currently monitored by the California Department of Public Health. The results from these existing monitoring programs will be downloaded from the State Board's Geotracker Groundwater Ambient Monitoring and Assessment (GAMA) database and included in the monitoring report prepared by the SNMP stakeholders or the appointed Antelope Valley Groundwater Basin Watermaster, if applicable. Imported, recycled, and treated potable water supply to the region will also be monitored and results included in the report. The Project must comply with all applicable requirements of the SNMP, including the identification or installation of appropriate groundwater monitoring wells in consultation with the SNMP stakeholders or the appointed Antelope Valley Groundwater Basin Watermaster, if applicable, to supplement the Antelope Valley SNMP monitoring program as necessary to implement the SNMP monitoring program in the Project area.

Salt and nutrient management implementation measures that are incorporated into the Project include:

- Municipal wastewater management. The proposed wastewater reclamation facilities (WRFs) s will incorporate tertiary treatment

processes that include nitrification-denitrification treatment processes to control nitrate concentration in the effluent and recycled water. The WRFs will use ultraviolet light (UV) disinfection to reduce chloride concentrations as opposed to chlorination disinfection processes consistent with the Lahontan RWQCB and Title 22 requirements (see MM 19-2).

- Industrial waste management. The WRFs will implement industrial waste management measures (i.e., pretreatment program, educational outreach, and coordination with customers).

- Recycled water irrigation management. The implementation of recycled water is regulated by the Title 22 California Code of Regulations. Numerous BMPs and operating procedures will be followed when using recycled water for irrigation as required by Regional Board permits. These BMPs and operating procedures include water quality monitoring at the treatment plant; applying irrigation water at a rate that does not exceed the demand of the plants, with respect to water and nutrients; a site supervisor will be responsible for regulatory and permit compliance at all times; irrigation will not be allowed to occur at any time when unauthorized runoff may occur, such as during times of rainfall or very low evapotranspiration, and any excessive overspray must be controlled.

- Low impact development techniques. As stormwater has low to no concentrations of salt and nutrients, the Project incorporates low impact development stormwater management techniques that promote groundwater recharge (see MM 4-1).

- Landscaping BMPs to limit nutrients in runoff. The Project will implement integrated pest management (IPM) and landscaping BMPs consistent with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program. The IPM and landscaping BMPs will be confirmed in a Landscaping Plan submitted to the County during the review and approval process for each tract map application (see MM 4-2).

Results of the monitoring will be used to determine whether additional implementation measures are necessary to maintain the SNMP water quality management goals. Monitoring report results that indicate ambient groundwater quality exceeding 50 percent of the baseline assimilative capacity or significant increases may require additional modeling and/or evaluation to determine what mitigation action, if any, is necessary and

appropriate. Such measures, which would be implemented by appropriate regional authorities in conjunction with the SNMP, may include:

- Reducing the amount of salts added to groundwater via source water – modified wastewater treatment processes such as increased retention time or blending prior to use for irrigation.

- Reducing the amount of salts and nutrients added to water via anthropogenic sources – BMPs, public outreach, and land management guidelines.

- An ordinance or ban on water softeners that uses salts may result in reduced chloride and slightly reduced TDS concentrations in the wastewater and ultimately reduced concentrations in the recycled water produced.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of utilities and service systems can be found in these documents: Section 5.17 of the AVAP EIR, and Section 3.18 of the RTP/SCS EIR.

Response to Comment D.3-15:

As noted in this comment the Draft EIR discusses Order WQ-2016-0068-DDW in the first full paragraph of page 5.18-13 in Section 5.18, Water Resources, and includes the Order as a reference in Draft EIR Section 5.18.9, References. The comment does not raise a specific concern regarding the discussion content of Order WQ-2016-0068-DDW in the Draft EIR. The comment indicates that a discussion of the Order should also be included in Appendix 5.4-A of the Draft EIR. In response to this comment, the following text is hereby added immediately before the italicized heading, "*Municipal Recycled Water Landscape Irrigation Use Permit*" on page 36 of Appendix 5.4-A of the Draft EIR:

Water Reclamation Requirements for Recycled Water Use

In June 2016, the State Water Resources Control Board adopted General Order No. 2016-0068-DDW. The Order provides a streamlined Notice of Applicability process for the beneficial, non- potable use of recycled water consistent with the California Uniform Statewide Recycling Criteria, except recycled water use to replenish groundwater resources, the disposal of treated wastewater in percolation ponds, and excessive hydraulic loading of recycled water in use areas where the primary purpose of the activity is disposal of

> treated wastewater and direct potable reuse. General Order No. 2016-0068-DDW encourages recycled water use and reduced demand on potable water supplies by (1) maintaining a streamlined approach in permitting new recycled water users through a water recycling program and (2) providing the option for a single recycled water use permit coverage for larger users that typically need permit coverage from multiple Regional Water Boards. The Order is applicable to recycled water projects where recycled water is used or transported for non-potable uses, such as landscape irrigation, irrigation of crops and pasture land, construction, fire suppression, and hydrostatic testing. The Order does not regulate the treatment of wastewater, and compliance with the Order does not relieve producers or distributors from the obligation to comply with applicable Waste Discharge Requirements (WDRs) for discharges from wastewater treatment plants, other than the recycled water uses described in the Order.
>
> An applicant must submit a notice of intent (NOI) to obtain coverage under the Order. The applicant must declare responsibility for the administration of the water recycling program authorized pursuant to the Order and describe a program the applicant will administer to ensure that recycled water use complies with the requirements of the Uniform Statewide Recycling Criteria and the Order. Once coverage is authorized, the applicant then becomes the administrator for the covered water recycling program. The Order includes specific recycled water recycling administration requirements and other reporting and monitoring requirements.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of utilities and service systems can be found in these documents: Section 5.17 of the AVAP EIR, and Section 3.18 of the RTP/SCS EIR.

Response to Comment D.3-16:

The referenced November 4, 2015 comment letter was reviewed and considered in the preparation of the Draft EIR and is included in Appendix B of this Final EIR. Item 13 in the NOP comment letter lists the wastewater reclamation facility (WRF) design and features related to this comment. The table below identifies the information provided in the Draft EIR that provides the requested information in Item 13 of the Lahontan RWQCB NOP comment letter.

Items Listed in Comment 13 From Lahontan RWQCB Letter	Draft EIR Location and Response
Treatment plant and disposal pond locations	Exhibit 4-14 and Figures 5 and 6 of Appendix 5.19-B provide the WRF locations and the pond locations within the plants, respectively.
Treatment plant design criteria	Section 5.19 discusses the proposed WRFs, with more details provided in Section 3.0 of Appendix 5.19-B, which discusses the wastewater flow estimates, and Section 4.0, which addresses the locations, peak flows, sizes, water quality objectives, treatment, solids handling, disinfection and other considerations used for plant design.
Storage and disposal pond design criteria	Sections 4.3, 4.4, and 4.5 of Appendix 5.19-B discusses wastewater design and treatment processes; Section 4.6 discusses solids handling; and 4.8 discusses recycled water storage.
Expected wastewater quality	Section 4.2 of Appendix 5.19-B addresses water quality objectives; Section 4.3 discusses treatment processes; and Section 4.7 discusses disinfection.
Receiving groundwater quality	Pages 5.4-26 through 5.4-29 discusses water quality in the Antelope Valley Groundwater Basin, including monitoring data conducted in 2007 and 2010. Detailed information is provided in Appendix 5.4-A.
Expected receiving groundwater degradation (nature and extent) resulting from the discharge according to State Board Resolution 68-16	Page 4-61 discusses the treated wastewater's use for outdoor irrigation at community-wide landscaped areas. Page 4-59 states the wastewater would be treated at the WRFs to unrestricted reuse standards under Title 22 of the California Code of Regulations, prior to reuse. The WDRs would also include wastewater treatment requirements that would have to be implemented to protect groundwater quality, as stated on page 5.19-11.
Background receiving groundwater quality and direction of flow established from a statistically significant data set	Pages 5.4-26 through 5.4-29 discusses water quality in the Antelope Valley Groundwater Basin, including monitoring data conducted in 2007 and 2010, with more detailed information in Appendix 5.4-A.
Location and well construction design of monitoring wells installed to evaluate groundwater quality	Figure 2-1 of the groundwater sample results in Appendix 5.4-A shows the approximate well locations. These were existing wells on/near the site, with two wells owned by the Tejon Ranch Company and one well owned by the Department of Water Resources.
Lift station locations and design	The lift stations are discussed in the 5th paragraph on page 4-60 and shown in Exhibit 4-14. A total of 8 small sewer lift stations would pump wastewater from development areas. Section 4.0 in Appendix 5.19-B discusses lift station design.
Backup power features	The 5th paragraph on page 4-60 and the 3rd paragraph on page 5.19-10 state that backup emergency power generators would be provided.

Items Listed in Comment 13 From Lahontan RWQCB Letter	Draft EIR Location and Response
Recycled water storage, delivery, and use area design standards	Pages 4-61 through 4-62 discuss the proposed recycled water system and Exhibit 4-15 shows the conceptual recycled water system.
Entity responsible for owning and operating the treatment plant and recycled water infrastructure.	As stated on pages 4-51, 4-55 and 4-109, the GVMWD or other Public Utility District would become the operator of the potable and recycled water systems, wastewater system, and storm water facilities servicing the Project.

The locations of sewer main lines, pump stations, force mains, WRF sites and capacities, and general treatment processes that would be implemented to serve future development under the Specific Plan and as general information on the construction and operation of these WRFs are discussed on pages 4-59 through 4-61 in Section 4.0, Project Description, of the Draft EIR. Appendix 5.19-B is the Wastewater Treatment Report, which estimates wastewater flow generation from the anticipated development and proposed sewer system and facilities to serve development. As stated on pages 4-63 and 4-108, WDRs/permits from the Lahontan RWQCB would be obtained for the proposed WRFs. As stated in MM 19-2 and summarized at the bottom of the third paragraph on page 5.19-1 in Section 5.19, Wastewater, of the Draft EIR, the construction and operation of the proposed on-site WRFs would be subject to waste discharge requirements (WDRs) and other applicable standards and regulations of the Lahontan RWQCB. The bulleted list in Item 13 will be included in the engineering design of the sewer system and WRFs that would then be presented to the Lahontan RWQCB for review and approval prior to the start of construction activities on the site.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of utilities and service systems can be found in these documents: Section 5.17 of the AVAP EIR, and Section 3.18 of the RTP/SCS EIR.

Response to Comment D.3-17:

In Section 4.0, Project Description, the fifth paragraph on page 4-60 states that "Pump stations would be sized to accommodate peak flows and would be equipped with backup emergency power generators" and the first paragraph on page 4-61 states that the pump stations would have "an emergency generator and automatic transfer switch to provide continued operation in the event of an electrical power failure". The third paragraph on page 5.19-10 in Section 5.19, Wastewater, states that generators would be provided for stand-by power.

The third paragraph on page 5.19-1, the fifth paragraph on 5.19-11, and MM 19-2 on page 5.19-14 state that the Project would have to comply with applicable regulations of the Lahontan Regional Water Quality Control Board (Lahontan RWQCB). Thus, it is anticipated that waste discharge requirements issued by the Lahontan RWQCB for the WRFs would include enforceable operational, treatment, conveyance, discharge, water quality, and monitoring requirements, including any required emergency backup power sources and spill containment features for sewer lift stations, wastewater treatment, and effluent storage facilities. Per the Commenter's request, MM 19-2 has been augmented to include these requirements.

MM 19-2 The Project Applicant/Developer shall demonstrate that the Project has either been annexed into an existing qualified public utility district (e.g. Golden Valley Municipal Water District) or that a new public utility district (e.g. Project Water Purveyor) has been created to serve the Project. The Project Water Purveyor or alternate qualified public utility district shall be responsible for the design, construction, and operation of the wastewater facilities, and shall ensure compliance with all applicable standards and regulations, including all Lahontan RWQCB and Title 22 requirements of the California Code of Regulations.

Wastewater treatment facilities, effluent facilities, and sewer lift stations shall be designed with emergency backup power sources and spill containment features, which shall be provided to the satisfaction of the Lahontan RWQCB.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of utilities and service systems can be found in these documents: Section 5.17 of the AVAP EIR, and Section 3.18 of the RTP/SCS EIR.

Response to Comment D.3-18:

PDF 19-1 and MM 19-2 in the Draft EIR state the WRFs would be constructed in accordance with Title 22 of the *California Code of Regulations*. In response to this comment, MM 19-6 has been added to ensure the achievement of appropriate nitrogen levels in recycled water generated by the Project.

MM 19-6 Recycled water from Project Wastewater Reclamation Facilities that is used in a manner that could accidentally recharge groundwater shall meet the groundwater quality objectives in the Lahontan Basin Plan for nitrate as nitrogen, or 10 milligrams per liter based on the California state drinking water standard as referenced in the Lahontan Basin Plan for groundwater quality objectives of 45 milligrams per liter of nitrate as nitrate.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of utilities and service systems can be found in these documents: Section 5.17 of the AVAP EIR, and Section 3.18 of the RTP/SCS EIR.

Response to Comment D.3-19:

Page 4-9 of Section 4-7 of Appendix 5.19-B, Wastewater Treatment Report, proposes the use of chlorine for disinfection, as well as the option of using UV disinfection. Chlorine was initially proposed for disinfection because the recycled water system and reservoirs should maintain residual levels of chlorine to prevent development of bacteria and to manage potential odors. As stated in MM 19-2 and summarized at the bottom of the third paragraph on page 5.19-1 in Section 5.19, Wastewater, of the Draft EIR, the construction and operation of the proposed on-site wastewater reclamation facilities would be subject to waste discharge requirements (WDRs) and other applicable standards and regulations of the Lahontan Regional Water Quality Control Board. In response to this comment, MM 19-7 has been added to include these requirements.

MM 19-7 The Project Applicant/Developer shall provide an evaluation of alternate disinfection measures, including the use of ultraviolet disinfection, for water treatment at the eastern wastewater reclamation facility (WRF East) and the western wastewater reclamation facility (WRF West), and provide a recommendation regarding the most efficient and effective means of disinfection to the Lahontan Regional Water Quality Control Board (Lahontan RWQCB) for review. The WRF East and WRF West shall be designed to the satisfaction of the Lahontan RWQCB, with appropriate disinfection measures to ensure that any incidental recharge from the use of recycled water will not adversely affect receiving groundwater.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of utilities and service systems can be found in these documents: Section 5.17 of the AVAP EIR, and Section 3.18 of the RTP/SCS EIR.

Response to Comment D.3-20:

MM 19-4 states that wastewater reclamation facility (WRF) West would be located on a 3-acre site near National Cement Plant Road and WRF East would be located on a 33-acre site at the northeastern edge of the site.[273] WRF West would have a 0.34 million gallon daily capacity and WRF East would have a 4.28 million gallon daily capacity. A conceptual layout of the WRF East site, including the general locations of storage ponds and recharge basin, is provided in Figure 5 of Appendix 5.19-B, Wastewater Treatment Report. A conceptual layout of the WRF West site, including the location of the emergency storage pond, is provided in Figure 6 of the same Appendix 5.19-B.

Page 4-10 of Appendix 5.19-B also provides seasonal analysis of the recycled water supply and demand to determine the volume of seasonal storage required to be contained within the storage ponds and system-wide recycled water storage reservoirs. Page 4-11 of Appendix 5.19-B states the WRF site layouts will be refined during the preliminary design stage "to include all components of the WRFs and facility sizes based on the design flow rates" and the "preliminary design process will be reviewed and approved by the eventual operator (Water Agency) and the Lahontan Regional Board".

With regard to the type of liners proposed at the storage reservoirs, the following changes have been made to the Draft EIR:

The fourth paragraph on page 5.19-11 of the Draft EIR has been revised to read:

> As discussed in Section 5.19.2, Title 22 of the California Code of Regulations establishes criteria for recycled water, treatment, conveyance, and water quality testing and is administered by the SWRCB Division of Drinking Water. State surface and groundwater quality, including discharge from the WRFs, is further regulated by the Lahontan RWQCB under the Porter Cologne Act. Each of the proposed WRFs will be required to obtain WDRs from the Lahontan RWQCB that include enforceable operational, treatment, conveyance, discharge, water quality and monitoring requirements before wastewater treatment and recycled water operations may commence. <u>The engineering design and permitting process for the WRF East will include details related to</u>

[273] DRP 2017, Exhibits 4-14 and 5.19-1

> the size, volume, liners, and construction methods for the storage reservoirs, which will be determined at the start of the design process in consultation with the Lahontan RWQCB. Details regarding the type of impervious liner required to prevent infiltration of recycled water and prevent the degradation of the groundwater, including any required monitoring systems to detect leakage in the seasonal storage pond liners, will be provided to the satisfaction of the Lahontan RWQCB, as required through the permitting process. The WDRs issued by the Board will be consistent with the RWQCB's wastewater treatment requirements (Psomas 2017b).

The storage ponds would be fully lined to elimination percolation of effluent; therefore, no groundwater degradation analysis is required. As stated in the third paragraph on page 5.19-1 and PDF 19-3, "…storage ponds would be provided at the WRF East site to temporarily store recycled water during periods of lower demand..." Page 4-10 of Appendix 5.19-B says that 1,000 acre-feet of storage will be constructed to balance seasonal demand and supply, which is the approximate amount of excess supply during the winter months and the difference in demand in warmer months. The last sentence of the second paragraph on page 4-10 of Appendix 5.19-B states "The recycled water supply will be managed so it is all utilized to achieve a balance in supply and demand." Thus, percolation of effluent is not proposed, and sufficient storage capacity for winter flows would be provided, subject to review and approval by the Lahontan Regional Water Quality Control Board.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of utilities and service systems can be found in these documents: Section 5.17 of the AVAP EIR, and Section 3.18 of the RTP/SCS EIR.

Response to Comment D.3-21:

MM 21-9 in the Draft EIR states that the Project wastewater reclamation facilities (WRFs) shall include equipment to capture and reuse biogas for energy production. This issue is further discussed in the Draft EIR with PDF 19-1 on page 5.19-8 and MMs 19-4 and 19-5 on pages 5.19-14 and 5.19-15, which state that "Biosolids shall be hauled to a suitable landfill or used for conversion into fertilizer products."

Page 4-9 of Section 4.6 of Appendix 5.19-B states that "disposal truck trips could be reduced by using onsite sludge drying beds to increase the solids content of the sludge; thus, reducing the hauling volume." Details on sludge processing, handling, storage, and disposal, including methane gas recovery systems and sludge drying beds, would be developed during the engineering design and permitting processes for the WRFs, as reviewed and approved by the

Lahontan Regional Water Quality Control Board (Lahontan RWQCB). Other sludge dewatering techniques, such as centrifuges or belt filter presses, could also be evaluated for appropriate use on the Project at the start of the design process, in consultation with the Lahontan RWQCB.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of utilities and service systems can be found in these documents: Section 5.17 of the AVAP EIR, and Section 3.18 of the RTP/SCS EIR.

Response to Comment D.3-22:

The Draft EIR discloses that the Project may be subject to a variety of state and federal permitting requirements relating to waters of the State and Waters of the United States and implements mitigation requiring Project compliance with all such permitting requirements. For example, as discussed in Section 5.7, Biological Resources, MM 7-12 requires, among other things, that prior to any fill of or alteration to drainage tributaries, wetlands, and/or riparian vegetation on the Project site, the Project Applicant/Developer must obtain the appropriate regulatory agency permits and/or agreements from the U.S. Army Corps of Engineers (USACE), the California Department of Fish and Wildlife (CDFW), and the applicable Regional Water Quality Control Board (RWQCB). The Project Applicant/Developer must also comply with all mitigation measures specified in the regulatory agency permits and/or agreements. Pursuant to the permit requirements, the Project Applicant/Developer will develop a Storm Water Pollution Prevention Plan (SWPPP) that incorporates Best Management Practices (BMPs) for reducing or eliminating construction-related pollutants in the site runoff.

Similarly, as discussed in Section 5.19, Wastewater, MMs 19-1 through 19-5 require that the proposed Project's wastewater and recycled water systems comply with all the wastewater treatment and recycling waste discharge requirements (WDRs) issued by the Lahontan RWQCB prior to the Project's operation of any wastewater recycling facility (WRF). With mitigation, Project implementation would not exceed the wastewater treatment requirements of the Lahontan RWQCB and potential impacts would be less than significant.

As discussed in Section 5.4, Water Quality, the Project will implement a comprehensive system of site design, source control, low impact development, and hydromodification BMPs that meet or exceed the water quality and hydrology (storm water runoff) standards for new development in the County Low Impact Development (LID) Ordinance, the LID Standards Manual, and the MS4 Permit. All water quality controls, including regional, distributed and parcel-specific measures, are designed to meet or exceed the LID performance standards

consistent with the requirements of the MS4 Permit, the LID Ordinance, and the LID Standards Manual. The Project will also implement integrated pest management and landscaping BMPs consistent with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program. Compliance with the LID performance standards and integrated pest management and landscaping BMP requirements will be reconfirmed in drainage and landscape plans to be submitted to the County in conjunction with each Project tract map review and approval process. These requirements are incorporated in MMs 4-1 and 4-2. During construction, the Project will comply with the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit, and it will implement BMPs that comply with all applicable waste discharge requirements and applicable water quality standards. With implementation of MMs 4-1 and 4-2 and with compliance with applicable laws and regulations (including the state Construction General Permit and the Lahontan RWQCB Limited Threat Discharge Permit), the Project will not otherwise degrade water quality; impacts will be less than significant with mitigation.

As further discussed in Section 5.4, Water Quality, and in Section 5.19, Wastewater Collection, the Project's two WRFs will be operated in conformance with all Lahontan RWQCB and Title 22 requirements, which will be reconfirmed in documentation and to be submitted to the County prior to the issue of building permits. These requirements are incorporated into MM 19-5. During construction, the Project will comply with the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit. Potential surface water quality impacts are discussed in Section 5.4 and will be less than significant after mitigation. With implementation of MMs 4-1, 4-2, and 19-5 as well as compliance with applicable laws, regulations, and WRF permits, potential Project impacts from construction or post-construction runoff that would violate applicable storm water NPDES permits or that would otherwise significantly affect groundwater quality would be less than significant.

This comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Draft Environmental Impact Report (Draft EIR) for the Centennial Project ("Proposed Project") (SCH No. 2004031072)

The South Coast Air Quality Management District (SCAQMD) staff appreciates the opportunity to comment on the above-mentioned document. The following comment is meant as guidance for the Lead Agency and should be incorporated into the Final EIR.

On March 3, 2017, the SCAQMD's Governing Board adopted the 2016 Air Quality Management Plan (2016 AQMP), which was later approved by the California Air Resources Board of Directors on March 23rd. The 2016 AQMP[1] is a regional blueprint for achieving air quality standards and healthful air in the South Coast Air Basin (Basin). Built upon the progress in implementing the 2007 and 2012 AQMPs, the 2016 AQMP provides a regional perspective on air quality and lays out the challenges facing the Basin. The most significant air quality challenge in the Basin is to achieve an additional 45 percent reduction in nitrogen oxide (NOx) emissions in 2023 and an additional 55 percent NOx reduction beyond 2031 levels for ozone attainment. Achieving NOx emission reductions in a timely manner is critical to attaining the National Ambient Air Quality Standard (NAAQS) for ozone before the 2023 and 2031 deadlines. SCAQMD is committed to attaining the ozone NAAQS as expeditiously as practicable. D.4-1

SCAQMD staff understands that one of the project objectives is to create a healthy and sustainable community by integrating alternative transportation choices, including transit use, renewable energy, water conservation, community wellness, and other green development features to the proposed project's designs. The proposed project will provide a broad range of residential (including affordable housing), commercial, institutional, recreational, and employment-generating land use types[2], which will make nearly half of daily vehicular trips occur within the proposed project area[3]. Additionally, the Centennial Green Development Program encompasses a broad range of sustainable development practices for all development phases of the proposed project and deploys innovative and green technologies over time[4]. This project exemplifies the County of Los Angeles's (County or Lead Agency) leadership in promoting sustainable communities development – a commitment that is reassured by the County in its Strategic Plan 2015-2020[5]. SCAQMD staff believes that the proposed project supports the goals of the 2016 AQMP and will help reduce emissions from mobile sources, protect public health from air pollution, and achieve healthful air in the Basin. D.4-2

Project Description and Project Location

The Lead Agency proposes to develop land use strategies to allow the future development of 19,333 residential units, 7,363,818 square feet of office and warehousing uses, 1,034,550 square feet of commercial uses, 1,568,160 square feet of education and medical uses, and 5,624 acres of open space on 12,323 acres[6]. The proposed project is located near the northeast corner of State Route 138 (SR-138) and Interstate Highway 5 (I-5) in the vicinity of Quail Lake south of the Kern County and Los Angeles County boundary line. The Lead Agency will also prepare a Centennial Specific Plan to create a planning framework, development standards and design guidelines[7]. The proposed project will be developed in phases over a 20-year period[8]. Construction "was assumed to begin in 2016, with buildout complete in 2035, although the actual start of construction and buildout are likely to occur later than 2016 and 2035, respectively"[9]. "As construction progresses, it is likely that various construction stages would occur at the same time"[10]. D.4-3

The proposed project is under the jurisdiction of two different air districts. "Approximately 91 percent of the site is within the boundaries of the Antelope Valley Air Quality Management District (AVAQMD), while approximately 9 percent of the southwest portion of the Project site is within the jurisdiction of the South Coast Air Quality Management District (SCAQMD).[11]" Additionally, "there are two Not a Part (NAP) areas shown within the southwestern portion of the Project area, encompassing 25.2 and 1.9 acres"[12]. Based on a review of Exhibit 4-1, *Conceptual Land Use Plan* and Exhibit 4-3, *Villages and Core Areas* of the Draft EIR, SCAQMD staff found that the portion within the SCAQMD's jurisdiction will include commercial uses and open space, and is within the Centennial Specific Plan Village 9 planning areas[13].

Air Quality and Health Risk Assessment Analyses

The Lead Agency quantified the propose project's construction and operational emissions and compared them to SCAQMD's and AVAQMD's air quality CEQA significance thresholds to determine the significance of air quality impacts. The Lead Agency found that the construction emissions would exceed SCAQMD's regional air quality CEQA significance thresholds for VOCs and NOx after incorporating Mitigation Measure (MM) 11-2 and MM 11-3[14], and that the localized construction impacts could be significant and unavoidable since construction activities in one or several planning areas may affect already-established sensitive uses within the proposed project area[15]. The Lead Agency also found that at buildout, in 2035, the proposed project's long-term operational emissions of VOCs, NOx, CO, PM10, and PM2.5 would exceed SCAQMD's air quality CEQA significance thresholds[16]. After mitigation, these impacts would remain significant and unavoidable[17]. For the proposed project's long-term health risks, the Lead Agency found that the highest estimated cancer risk for a 30-year exposure would be 0.2 in a million[18]. D.4-4

General Comments

SCAQMD staff has comments on the proposed project's Mitigation Measures for Air Resources. These comments are intended to further reduce construction and operational emissions. Additionally, SCAQMD staff recommends that the Lead Agency revise the health risk assessment (HRA) to disclose the potential health risks to the people who will live and work at the proposed project. Additional details are included in the attachment. D.4-5

Conclusion

In closing, SCAQMD staff encourages the County to continue creating livable, sustainable, and healthy communities that can benefit air quality and ensure that the Basin is on track to attain the NAAQS. Pursuant to the Public Resources Code Section 21092.5 and the CEQA Guidelines Section 15088, the Lead Agency is required to provide SCAQMD with written proposed responses to all comments contained herein prior to the certification of the Final EIR. SCAQMD staff is available to work with the Lead Agency to address any other air quality and health risk questions that may arise. Please contact me at (909) 396-3308 or lsun@aqmd.gov, if you have any questions regarding these comments. D.4-6

Sincerely,

Lijin Sun

ATTACHMENT

SCAQMD's Air Quality CEQA Thresholds of Significance

1. Based on the proposed project's construction schedule[19], construction and operation activities are expected to overlap during a 20-year development period. The Lead Agency combined the construction and operational emissions and disclosed the calculations in the Draft EIR for information. In the case of overlapping construction and operation activities, SCAQMD staff recommends adding the construction and operational emissions and comparing those emissions to SCAQMD's air quality CEQA significance thresholds for operation[20] to determine the level of significance. D.4-7

Health Risk Assessment from Mobile Sources

2. Notwithstanding the court rulings, SCAQMD staff recognizes that the Lead Agencies that approve CEQA documents retain the authority to include any additional information they deem relevant to assessing and mitigating the environmental impacts of a project. Because of SCAQMD's concern about the potential public health impacts of siting sensitive populations within close proximity of freeways, SCAQMD staff recommends that, prior to approving the project, Lead Agencies consider the impacts of air pollutants on people who will live in a new project and provide mitigation where necessary.

   The goal of an EIR is to inform government agencies and the public of the environmental impacts of a proposed project (CEQA Guidelines Section 15003(c)). Based on a review of the Project Description, SCAQMD staff found that the proposed project is located in proximity to I-5 and SR-138. Although the small portion of the proposed project that is within the SCAQMD's jurisdiction includes only open space and commercial uses (no residential homes), to facilitate the purpose and goal of CEQA on public disclosure, SCAQMD staff recommends that the Lead Agency consider the impacts of air pollutants on people who will live at the proposed project by revising the HRA to place additional receptors at future residential development to disclose the potential health risks to the people who will live and work at the proposed project in the Final EIR. D.4-8

Guidance Regarding Residences Sited Near a High-Volume Freeway

3. Numerous health studies have demonstrated potential adverse health effects associated with living near highly travelled roadways. In traffic-related studies, the additional non-cancer health risk attributable to proximity is seen within 1,000 feet and is strongest within 300 feet[21]. California freeway studies show about a 70% drop off in particulate pollution levels at 500 feet[22]. As a result of these studies, the California Air Resources Board (CARB) developed the Air Quality and Land Use Handbook[23] that recommends avoiding new sensitive land uses (such as housing) within 500 feet of a freeway. Additional research has shown that the near roadway environment also contains elevated levels of many pollutants that adversely affect human health, including some pollutants that are unregulated (e.g., ultrafine particles) and whose potential health effects are still emerging[24]. Enforceability of Existing Mitigation Measures for Air Resources: MM 11-1 through MM 11-11

4. CEQA requires that mitigation measures must be fully enforceable through permit conditions, agreements, or other legally binding instruments (California Public Resources Code Section 21081.6 (b) and CEQA Guidelines Section 15126.4 (a)(2)). Based on a review of the Air Resources section, SCAQMD staff found that the Lead Agency is committed to eleven mitigation measures. SCAQMD staff recommends that the Lead Agency provide more details in the Final EIR such as the Mitigation Monitoring and Reporting Program (MMRP) for the proposed project to ensure that these mitigation measures are fully enforceable. In the event that any mitigation measure is later found or proved to be infeasible after the Final EIR is certified, this constitutes substantial changes that require a new environmental assessment by the Lead Agency to determine if there will be a substantial increase in the severity of the air quality impacts triggering the preparation of a supplement to the EIR (CEQA Guidelines Sections 15162 and 15163). D.4-10

Recommended Changes to Existing Mitigation Measure: MM 11-10

5. In MM 11-10, the Lead Agency requires that "[…] any land uses involving the public congregation of sensitive receptors (e.g. residential, schools, hospital, daycare center) are not within 150 feet of the near edge of the SR-138 traffic lanes"[26]. As described above in Comment No. 3, CARB recommends avoiding new sensitive land uses (such as housing) within 500 feet of a freeway. Therefore, SCAQMD staff recommends that the Lead Agency revise MM 11-10 as follows: D.4-11

   MM 11-10 The Project's plans and specifications shall demonstrate that any land uses involving the public congregation of sensitive receptors (e.g. residential, schools, hospital, daycare center) are not within ~~150~~ 500 feet of the near edge of the SR-138 traffic lanes.

Consideration of Limits to Enhanced Filtration Units: MM -11

6. Many strategies are available to reduce exposure, including, but are not limited to, building filtration systems, sounds walls, vegetation barriers, etc.[27] Because of the potential adverse health risks involved with siting housing near a freeway, it is essential that any proposed strategy must be carefully evaluated before implementation. When enhanced filtration units on housing residents are proposed, the Lead Agency should consider the limitations of the enhanced filtration. For example, in a study that SCAQMD conducted to investigate filters,[28] costs were expected to range from $120 to $240 per year to replace each filter. In addition, because the filters would not have any effectiveness unless the HVAC system is running, there may be increased energy costs to the resident. It is typically assumed that the filters operate 100 percent of the time while residents are indoors, and it does not account for the times when the residents have their windows or doors open or are in common space areas of the project. These filters also have no ability to filter out any toxic gases from vehicle exhaust. The presumed effectiveness and feasibility of any filtration units should therefore be D.4-12

[25] In April 2017, CARB published a technical advisory, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*, to supplement CARB's Air Quality and Land Use Handbook: A Community Health Perspective. This Technical Advisory is intended to provide information on strategies to reduce exposures to traffic emissions near high-volume roadways to assist land use planning and decision-making in order to protect public health and promote equity and environmental justice. Accessed at: https://www.arb.ca.gov/ch/landuse.htm.

[26] Draft EIR. Section 5.11. Page 5.11-82.

[27] CARB. April 2017. *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*.

[28] This study evaluated filters rated MERV 13+ while the proposed mitigation calls for less effective MERV 12 or better filters. Accessed at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/aqmdpilotstudyfinalreport.pdf. Also see also 2012 Peer Review Journal article by SCAQMD: http://d7.iqair.com/sites/default/files/pdf/Polidori-et-al-2012.pdf.

evaluated in more detail prior to assuming that they will sufficiently alleviate near roadway exposures. D.4-12 cont.

Additional Recommended Mitigation Measures to Further Reduce Operational Emissions

7. CEQA requires that all feasible mitigation measures go beyond what is required by law to minimize any significant impacts. In addition to the MM-4, MM-5, and MM-6 that proposed in the Draft EIR starting on page 5.11-79, SCAQMD staff recommends that the Lead Agency include additional mitigation measures for residential buildings in the Final EIR to further reduce the significant operational impacts.
   a) Vehicles that can operate at least partially on electricity have the ability to substantially reduce the significant NOx impacts from this project. It is important to make this electrical infrastructure available when the project is built so that it is ready when this technology becomes commercially available. The cost of installing electrical charging equipment onsite is significantly cheaper if completed when the project is built compared to retrofitting an existing residence or a common electrical charging area. Therefore, SCAQMD staff recommends the Lead Agency require the residential buildings of the proposed project to be constructed with the appropriate infrastructure to facilitate sufficient electric charging for vehicles to plug-in. For residences, SCAQMD staff recommends that homes be appropriately wired from the electrical panel to later allow residents to install electrical chargers, if desired. At a minimum, residential electrical panels should appropriately-sized to allow for future expanded use. D.4-13
   b) Residential parking shall include community electric vehicle charging station(s). Recommend 5% of parking spaces

Permits

8. The Lead Agency stated that the proposed project will include stationary sources, including, but not limited to, "boilers, emergency generators, spray booths, restaurant broilers, gasoline service stations, solvent storage tanks, small source PM-generators, and dry cleaners"[29]. In the event that a permit from SCAQMD is required, SCAQMD should be identified as a responsible agency for the proposed project in the Final EIR. Should there be any questions on permits, please contact the SCAQMD's Engineering and Permitting staff at (909) 396-3385. For more general information on permits, please visit the SCAQMD webpage, at: http://www.aqmd.gov/home/permits. D.4-14

Other Comment

9. Based on a review of the information on Pages 5.11-54 through 56, SCAQMD staff found that there were inconsistencies in terms the year representing the reasonable worst-case scenario for combined construction and operational emissions during development. The Lead Agency stated that "as a reasonable worst-case scenario, it is assumed that the Project would be 90 percent operational in Year 18 and consequently 90 percent of operational phase emissions were combined with construction emissions occurring in Year 18.[30]" However, as shown in Table 1 below, Year 11 was included as the worst-case scenario for SCAQMD. Therefore, it is recommended that the Lead Agency correct the inconsistency or provide additional clarifications in the Final EIR. D.4-15

Responses to Comment Letter D.4
South Coast Air Quality Management District
July 13, 2017

Response to Comment D.4-1:

Thank you for your comment and your participation in this public process. This introductory comment does not raise any specific concerns regarding the Project's potential environmental effects or the adequacy of the Draft EIR. Therefore, no further response is required. This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment D.4-2:

The Lead Agency acknowledges that the proposed Project supports the goals of the South Coast Air Quality Management District's 2016 Air Quality Management Plan. The County also agrees that the proposed Project will help reduce emissions from mobile sources, protect public health from air pollution, and achieve healthful air in the South Coast Air Basin. This introductory comment does not raise any specific concerns regarding the Project's potential environmental effects or the adequacy of the Draft EIR. Therefore, no further response is required. This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment D.4-3:

The Lead Agency acknowledges this comment's summary of the Project description. This comment does not raise any specific concerns regarding the Project's potential environmental effects or the adequacy of the Draft EIR. Therefore, no further response is required. This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment D.4-4:

The Lead Agency acknowledges this brief summary of certain conclusions of the Draft EIR's air quality analysis. This introductory comment does not raise any specific concerns regarding the Project's potential environmental effects or the adequacy of the Draft EIR. Therefore, no further response is required. This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment D.4-5:

This comment does not raise any specific concerns regarding the Project's potential environmental effects or the adequacy of the Draft EIR. Therefore, no further response is required. This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration. With respect to this comment's request that the Draft EIR's Health Risk Assessment be revised, please see response to Comment D.4-8. Please also see response to Comments D.4-7 through D.4-15.

Response to Comment D.4-6:

This comment's offer of cooperation is noted with appreciation. This closing comment does not raise any specific concerns regarding the Project's potential environmental effects or the adequacy of the Draft EIR. Therefore, no further response is required. This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment D.4-7:

As suggested by this comment, the Draft EIR evaluated concurrent construction and operations phase emissions on pages 5.11-54 through 5.11-56. As shown in Table 5.11-21, the Year 18 combined construction and operations daily emissions would exceed the SCAQMD significance thresholds for the operations phase. The Draft EIR explains that the exceedance of the SCAQMD threshold for operations is due to the larger proportion of emissions generated during the operations phase, and the finding of a significant impact for the combined construction and operation phases is consistent with the finding of a significant impact for emissions occurring for solely the operations phase of the Project.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of utilities and service systems can be found in these documents: Section 5.17 of the AVAP EIR, and Section 3.18 of the RTP/SCS EIR.

Response to Comment D.4-8:

As the Commenter correctly notes, in *CBIA v. BAAQMD*,[274] the California Supreme Court held that CEQA generally does not require the Draft EIR to analyze how existing environmental conditions (*e.g.*, existing air pollutants generated by non-Project-related traffic traveling along SR-138) might impact the Project's future users or residents. Nevertheless, as recommended by this comment, at pages 5.11-63 through 5.11-74, the Draft EIR does consider the impacts of air pollutants on people who will live at the proposed Project. Though not legally required to do so, per *CBIA v. BAAQMD*, in the interest of full disclosure, the Draft EIR evaluates the potential adverse impacts of toxic air contaminants (TACs) and diesel particulate matter exposure generated by existing off-site sources at pages 5.11-71 through 5.11-74. In addition, Draft EIR Appendix 5.11-C includes an HRA that assesses the potential health risks for new and existing sensitive receptors near SR-138.

The HRA used the Centennial Specific Plan's land use plan to determine the Project-site location of all future sensitive receptors that would be located within 500 feet of SR-138, and

274 *CBIA v. BAAQMD* at 269

evaluated cancer risk from diesel exhaust using a receptor grid with 40 meter spacing.[275] The 500 foot buffer was selected on the basis of the California Air Resources Board's (CARB) 2005 guidance manual on land use development, *Air Quality and Land Use: A Community Perspective*.[276] The CARB guidance manual recommends a 500 foot buffer between freeways and sensitive receptors, indicating that further analysis may be in order if the proposed sensitive receptor is located within this buffer.[277] Since the HRA evaluated all future sensitive receptors generated by the Project with the potential to be located within the CARB-recommended 500 foot buffer area, there is no need to revise the HRA as the Commenter suggests. We note, however, that the text of the Draft EIR inaccurately states that the HRA only evaluated future sensitive receptors that could located within 150 feet of the SR-138 travel lanes, rather than the greater 500-foot buffer area actually analyzed in HRA included as Draft EIR Appendix 5.11-C. Accordingly, to correct this typographical error, the first sentence of the second full paragraph on Draft EIR page 5.11-73 is hereby revised as follows:

> Because the Project would generate traffic on SR-138, the receptors evaluated included 3 existing residences within 500 feet of SR-138, as well as the proposed residential and institutional areas that could be located within ~~150~~ 500 feet of the freeway.

With respect to diesel particulate matter exposure from vehicles traveling on SR-138, the HRA shows that incremental cancer risks for the 70-year exposure duration are below 10 in 1 million at locations greater than 150 feet from the travel lanes and thus would not exceed applicable thresholds of significance.[278,279] The estimated hazard index for all proposed sensitive receptors would be significantly less than one at locations greater than 150 feet from the SR-138 travel lanes and thus would not exceed applicable thresholds of significance.[280] This determination is consistent with the Antelope Valley Area Plan EIR, which concluded that potential adverse effects to sensitive receptors located in proximity to SR-138 would be less than significant with mitigation.[281] Moreover, as more stringent vehicular greenhouse gas emission and criteria air pollution standards take effect, and as transportation fuels and vehicles become cleaner over time, the number of diesel powered vehicles on roadways as well as emissions from remaining newer diesel engines are expected to further reduce diesel-related health risks at the Project site.[282]

To address the potential impact to sensitive receptors located within 150 feet of the SR-138 travel lanes, MM 11-10 imposes a 150-foot buffer from such travel lanes within which the Project will be prohibited from siting new sensitive receptor uses. As an added layer of protection, MM 11-11 further requires that prior to future tract map approvals, if any sensitive receptors (e.g. residential, day care, schools, hospitals) would be located within 500 feet of the SR-138, an additional dispersion modeling study must be conducted to estimate

275 DRP 2017, Appendix 5.11-C, pp. 2, 3
276 *Id.*, Appendix 5.11-C, p. 1
277 *Ibid*.
278 *Id.*, p. 5.11-73
279 *Id.*, Appendix 5.11-C, p. 3
280 *Ibid*.

282 DRP 2017, pp. 5.21-7, -8, -23

diesel PM air concentrations. If the study finds that diesel PM TAC emissions would be significant at the location of a proposed sensitive receptor, then effective TAC reduction measures must be implemented to mitigate for interior air quality, such as filtration technologies or equivalent protections against TACs from vehicle emissions.

In addition, MM 11-11 has been revised in response to this comment to further insure that sensitive receptors are protected at the Project site from emissions generated by high-volume roadways:

MM 11-11 Prior to the approval of any tract map that includes an air quality sensitive receptor (e.g. residential, day care, schools, hospital) located within 500 feet of the SR-138 and/or any "high volume roadway" (i.e., a roadway with an average daily traffic volume that equals or exceeds 50,000 vehicles), the Project Applicant/Developer shall provide to the Air Pollution Control District(s) with jurisdiction over the mapped area a dispersion analysis prepared in accordance with each applicable Air District's methodological requirements to calculate the health risks from vehicle emissions from SR-138 and/or high volume roadway, as relevant. If the study concludes that ~~health risks would be significant at the location of a proposed sensitive receptor~~ any sensitive receptor exposure would equal or exceed 20 in 1 million for cancer risk or 1.0 for non-cancer indices (or future more stringent thresholds as may be adopted by the applicable Air District(s) and approved by the County for use on projects subject to the County's lead agency authority under the California Environmental Quality Act)(District TAC Thresholds), then the applicant shall submit a Toxic Air Contaminant (TAC) Emission Reduction Plan to the applicable Air District(s) for review and concurrence. Following review and concurrence by the applicable Air District(s), a copy of the TAC Emission Reduction Plan, confirming that no sensitive receptors on the Project site will be exposed to TAC risks in excess of District TAC Thresholds, shall be provided to the Los Angeles County Department of Regional Planning, prior to County approval of the tentative tract map. In the TAC Emission Reduction Plan, TAC exposure reduction measures shall be implemented to assure that no sensitive receptors are exposed to TAC-related health impacts that equal or exceed District TAC Thresholds. TAC exposure reduction measures include, but are not limited to, setbacks, vegetative barriers, heating, ventilation and air conditioning (HVAC) system filtration technologies, etc., and shall be required as a condition of approval for the tentative tract map, and/or required as a condition prior to issuance of a building permit approval for future sensitive use(s) included in the tentative tract map. ~~effective design measures must be~~

~~implemented into the structures to mitigate for interior air quality, such as ventilation systems that include MERV13 filters or equivalent protections against TACs from vehicle emissions. Confirmation of compliance shall be provided to the County prior to occupancy that include sensitive receptors within 500 feet of the SR-138.~~

As shown above, MM 11-11 has been revised to, among other things, require preparation of a dispersion analysis to calculate the health risks from vehicle emissions whenever the Project proposes a tentative map that would locate sensitive receptors within 500 feet of a "high-volume" roadway (i.e., a roadway with an average daily traffic volume that equals or exceeds 50,000 vehicles), in addition to SR-138.

The Project site is located approximately one mile east of Interstate 5 (I-5).[283] Thus the Project site falls well beyond the outer boundary of every buffer area recommended by CARB to protect sensitive receptors from existing sources of emissions, including but not limited to the CARB-recommended 500-foot buffer for high-volume roadways.[284] Accordingly, emissions associated with vehicle travel on I-5 would not pose a significant health risk to sensitive receptors within the Project site.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of air quality can be found in these documents: Section 5.3 of the AVAP EIR, and Section 3.3 of the RTP/SCS EIR.

Response to Comment D.4-9:

As disclosed in the Draft EIR at page 5.11-72, CARB's *Air Quality and Land Use Handbook* recommends a 500-foot buffer between freeways and sensitive receptors, indicating that further analyses may be necessary if the proposed sensitive land use is located within this recommended buffer. As discussed in this comment and in the Draft EIR, the basis for CARB's recommendation include epidemiological studies demonstrating additional cancer and non-cancer health risks associated with proximity to roadways, and attributing the risk to diesel PM. Consistent with this comment, and as disclosed in the Draft EIR, the highest concentration of pollutants emitted from freeways dissipates rapidly within the first 300 feet of a freeway, and California studies show an approximate 70 percent drop off in particulate pollution levels at 500 feet, and lifetime cancer risk from exposure to diesel PM is expected

283 DRP 2017, p. 1-2

284 California Air Resources Board (CARB). 2005 (April). *Air Quality and Land Use Handbook: A Community Health Perspective* (p. 4, Table 1-1). Sacramento, CA: CARB. http://www.arb.ca.gov/ch/handbook.pdf.

to be lowered proportionately. The CARB guidance manual does not provide a quantitative acceptable threshold of risks from diesel PM from freeways in its recommendations of buffer distances between freeways or high traffic roadways and sensitive land uses, nor does it discuss the important factor of meteorology, which substantially affects pollutant concentrations if receptors are upwind or downwind of a freeway.

Consistent with this comment, and as discussed in more detail in response to Comment D.4-8, an HRA was prepared for the Project that assesses the potential health risks for new and existing sensitive receptors near SR-138. The HRA demonstrates that incremental cancer risks for the 70-year exposure duration are below 10 in 1 million at locations greater than 150 feet from the SR-138 travel lanes and thus would not exceed applicable thresholds of significance.[285,286] The estimated hazard index for all proposed sensitive receptors would be significantly less than one at locations greater than 150 feet from the SR-138 travel lanes and thus would not exceed applicable thresholds of significance.[287] As further discussed in response to Comment D.4-8, the Project would be required to implement MMs 11-10 and 11-11 to ensure that Project sensitive receptors are not exposed to TAC emissions generated by high-volume roadways in excess of applicable thresholds of significance.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of air quality can be found in these documents: Section 5.3 of the AVAP EIR, and Section 3.3 of the RTP/SCS EIR.

Response to Comment D.4-10:

This comment concerns the need to ensure that Project mitigation measures are enforceable and it accurately describes the requirements of California *Public Resources Code* Section 21081.6(b) and CEQA Guidelines Section 15126.4(a)(2). The Project will be required to implement an extensive list of feasible air quality mitigation measures, as set forth in Draft EIR pages 5.11-78 through 5.11-82. All mitigation measures identified in the Draft EIR will be incorporated into an enforceable Mitigation Monitoring and Reporting Program (MMRP) and meet the requirements of CEQA. A copy of the Project's MMRP, which includes every mitigation measure identified in the Draft EIR, is set forth in Final EIR Appendix 2.0-C.Rev. Moreover, all mitigation measures will be made conditions of approval of the Project and will be fully enforceable as required by California *Public Resources Code* Section 21081.6(b) and CEQA Guidelines Section 15126.4(a)(2). This comment does not raise any specific concerns

285 DRP 2017, p. 5.11-73
286 *Id.,* Appendix 5.11-C, p. 3
287 *Ibid*.

about the Project or the adequacy of the Draft EIR. Therefore, no further response is required. This comment is noted and will be provided to the Planning Commission and Board of Supervisors for consideration. Please also see response to Comment D.4-14.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of air quality can be found in these documents: Section 5.3 of the AVAP EIR, and Section 3.3 of the RTP/SCS EIR.

Response to Comment D.4-11:

The proposed revision to MM 11-10 to increase its mandatory buffer between State Route 138 (SR-138) and any land uses involving the public congregation of sensitive receptors from 150 feet to 500 feet is unnecessary, in light of MM 11-11, as revised by response to Comment D.4-8.

As discussed in the Draft EIR, MM 11-11 requires that prior to future tentative map approvals, if any sensitive receptors (e.g. residential, day care, schools, hospitals) would be located within 500 feet of the SR-138 or any high-volume roadway, an additional dispersion modeling study must be conducted to estimate diesel PM air concentrations. Per MM 11-11, if the study finds that diesel PM TAC emissions would be significant at the location of a proposed sensitive receptor, then the applicant must submit a TAC Emission Reduction Plan to the applicable Air District(s) for review and concurrence. Following review and concurrence by the applicable Air District(s), a copy of the TAC Emission Reduction Plan, confirming that no sensitive receptors on the Project site will be exposed to TAC risks in excess of applicable thresholds, must be provided to the Los Angeles County Department of Regional Planning, prior to County approval of the tentative tract map. In the TAC Emission Reduction Plan, TAC exposure reduction measures must be implemented to assure that no sensitive receptors are exposed to TAC-related health impacts that equal or exceed applicable thresholds. TAC exposure reduction measures include, but are not limited to, setbacks, vegetative barriers, heating, ventilation and air conditioning (HVAC) system filtration technologies, etc., and shall be required as a condition of approval for the tentative tract map, and/or required as a condition prior to issuance of a building permit approval for future sensitive use(s) included in the tentative tract map. Accordingly, the Draft EIR identifies mitigation measures sufficient to mitigate potential impacts related to diesel particulate matter exposure from vehicles traveling on SR-138 or other high-volume roadways. Therefore, County disagrees with the necessity for this comment's proposed revision to MM 11-10.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of air quality can be found in these documents: Section 5.3 of the AVAP EIR, and Section 3.3 of the RTP/SCS EIR.

Response to Comment D.4-12:

As noted in the footnotes cited in this comment, in April 2017, CARB published a technical advisory, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*, which is intended to provide information on strategies to reduce exposures to traffic emissions near freeways and other high-volume roadways. In the technical advisory, CARB explains that the scientific literature supports various effective strategies including but not limited to: indoor high efficiency filtration that removes pollution from the air; solid barriers such as sound walls; urban design that promotes air flow and reduces the concentration of pollution along street corridors; vegetation that reduces the concentration of pollution.

To reduce the impact of diesel particulate matter (PM) emissions from existing State Route 138 (SR-138), MM 11-10 requires the Project's plans and specifications to demonstrate that any land uses involving the public congregation of sensitive receptors are not located within 150 feet of the near edge of the SR-138 traffic lanes. Furthermore, MM 11-11, as revised by response to Comment D.4-8, requires that, prior the approval of any tentative map that includes an air quality sensitive receptor (e.g. residential, day care, schools, hospital) located within 500 feet of the SR-138 or other high-volume roadway, the Project Applicant/Developer shall provide a dispersion analysis to calculate the health risks from vehicle emissions from SR-138. If the study concludes that health risks would be significant at the location of a proposed sensitive receptor, then the applicant must submit a TAC Emission Reduction Plan to the applicable Air District(s) for review and concurrence. Following review and concurrence by the applicable Air District(s), a copy of the TAC Emission Reduction Plan, confirming that no sensitive receptors on the Project site will be exposed to TAC risks in excess of applicable thresholds, must be provided to the Los Angeles County Department of Regional Planning, prior to County approval of the tentative tract map. In the TAC Emission Reduction Plan, TAC exposure reduction measures must be implemented to assure that no sensitive receptors are exposed to TAC-related health impacts that equal or exceed applicable thresholds. TAC exposure reduction measures include, but are not limited to, setbacks, vegetative barriers, heating, ventilation and air conditioning (HVAC) system filtration technologies, etc., and shall be required as a condition of approval for the tentative tract map, and/or required as a condition prior to issuance of a building permit approval for future sensitive use(s) included in the tentative tract map.

As revised, MM 11-11 permits HVAC filtration devices, which may include MERV 13 or better filters, as one type TAC exposure reduction measure that may be included a TAC Emission Reduction Plan and implemented by the Project, if required. As this comment correctly notes, air filters are most effective in removing particulate matter, rather than toxic gases, are most effective when windows and doors are closed, must be replaced over time, and have energy costs associated with their operation. Nevertheless, the SCAQMD study cited in footnote 28 of this comment concludes that the installation of air filtration devices is an important mitigation measure to minimize exposure to indoor pollutants of outdoor origin. The CARB technical advisory discussed above also recommends the use of such filters to mitigate the impact of locating sensitive receptors in the vicinity of high-volume roadways. However, given their current limitations and associated costs, MM 11-11, as revised, does not mandate the use of air filters, but allow any required TAC Emission Reduction Plan to incorporate other effective reduction measures, such as those described in the CARB technical advisory discussed above. Please see response to Comment D.4-8.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of air quality can be found in these documents: Section 5.3 of the AVAP EIR, and Section 3.3 of the RTP/SCS EIR.

Response to Comment D.4-13:

The Lead Agency agrees with the Commenter that it is important that the Project provide adequate infrastructure to support and encourage the use of electric vehicles and other alternative fuel vehicles to reduce emissions associated with fossil fuel powered vehicles. To that end, the Project's Green Development Program, set forth in Appendix 2-A of the Centennial Specific Plan,[288] encompasses a range of sustainable development practices that have been incorporated into the Project at all phases of site development (i.e., from land use planning to long-term resource conservation) and it encourages environmentally sustainable development in two ways. First, in addition to satisfying all mandatory measures of the California Green Building Standards (CALGreen) Code, all residential and non-residential development within the *Centennial Specific Plan* shall be required to satisfy the measures necessary to achieve CALGreen Tier 1 applicable at the time of development. Second, the Specific Plan's Green Development Program includes additional measures for Centennial that exceed applicable State, regional, and local requirements, including but not limited to exceeding 2016 CALGreen Tier 1 standards. With this approach, Project development will meet and exceed the mandatory standards of the CALGreen Code,

[288] Final EIR Appendix 4.0-A.Rev

CALGreen Tier 1, and the requirements of the County's "Green Building Ordinances" that exist on the date of adoption of the *Centennial Specific Plan.*

Among other requirements, the Green Development Program requires the Project Master Developer to establish a Transportation Management Association (TMA) to develop linkages with other Antelope Valley/Santa Clara Valley TMAs or like organizations in order to maximize transit efficiencies and services. As described it the Green Development Program, the TMA's purpose is to coordinate and facilitate transit and rideshare usage to serve as many Project riders as possible, to promote multi-modal transportation services and options, and to reduce resident and employee use of single-occupancy automobiles for offsite commuting and internal travel within the Specific Plan. In addition, the Green Development Program requires the TMA to cooperate with automotive dealers to help promote alternative fuel vehicles.

With respect to Project infrastructure to support the use of alternative fuel vehicles, the Green Development Program requires the Project Applicant/Developer to provide plans and specifications to the County demonstrating that alternative energy fueling stations and other parking requirements commensurate with this comment's recommendations are implemented as follows:

- Business Park and Institutional land use designations will provide a minimum of one alternative energy fueling station (i.e., a 208/240 VAC electrical vehicle charging station or station providing another new or improved technology, such as compressed natural gas or hydrogen fuel cell) on-site for the first 50,000 square feet of usable floor space and an additional alternative energy fueling station for each additional 50,000 square feet of usable floor space thereafter;
- Loading docks will provide a 240 kV outlet in the vicinity of the loading dock;
- The Town Center and each Village Center will provide a minimum of one alternative energy fueling station with multiple outlets;
- Designated transit hubs will provide a minimum of one alternative energy vehicle fueling station;
- Parking structures and parking lots with 20 or more parking spaces will include a minimum of five percent preferentially located parking spaces for alternative-fueled vehicles. In addition, the parking facility will include at least one alternative energy fueling station and electric lines that are designed and sized to add additional fueling stations for up to three percent of the total parking spaces when a demand is demonstrated;
- Each multi-family projects will provide a minimum of 10 percent of total site parking places dedicated to shared vehicles and or alternative fuel vehicles. Additionally, each multi-family project will provide a minimum of one alternative energy fueling station for the first 17 residential units and an additional alternative energy vehicle fueling station for each additional 17 residential units thereafter;

- Each single-family residential unit will include one 208/240 kV outlet suitable for use for electric vehicles;
- A refueling facility for alternative fuels will be installed to meet demand once the TMA has determined that 5 percent of residential or employment vehicles are powered by fuels other than petroleum and electricity.

As explained in the Specific Plan's Green Development Program, technological advances and emerging practices related to sustainable community development and green building are rapidly advancing. The Green Development Program is designed to adapt to this changing landscape and assumes flexibility to respond to future technological advances and sustainable community opportunities. The Green Development Program recognizes that Green legal standards, as well as the sustainability measures identified in the Green Development Program's Table 2-A-1, may be superseded by changing legal standards, changing technologies, and evolving work, home, and transportation patterns.

Changes to legal standards, for example, are likely to include additional requirements to reduce greenhouse gas emissions. Advances in technology are inherently difficult to predict and account for; it is, for example, possible that predicted advances in autonomous vehicle technology make private ownership of cars less prevalent among homeowners and employees, which could reduce the need for parking at residential and commercial buildings while increasing the need for centralized parking and autonomous vehicle servicing facility. The Green Development Program is intended to address potential changes in laws, technologies, and practices by allowing development pursuant to the Specific Plan to continue to comply with applicable legal standards, and to adapt to changing technologies and practices by substituting alternate measures ("Innovation and Adaption Measures") for those measures identified in Table 2-A-1 of the Green Development Program, provided the Innovation and Adaption Measures achieve equal or greater environmental benefits of the Table 2-A-1 measures and do not result in any new significant adverse environmental impacts.

The master developer will be responsible for implementing the applicable provisions of the Green Development Program in the tentative tract and site planning process, as well as in the "horizontal construction" phase (i.e., rough grading; road construction; pubic infrastructure construction). Developers constructing residential and nonresidential buildings will be responsible for implementing Green Development Program measures applicable to the "vertical construction" phase (i.e., fine grading, building construction, development of parking facilities, etc.). The requirements at the horizontal construction phase will be assured through conditions of approval prepared at the time of tentative tract map and site plan approvals, and for other applicable infrastructure permit approvals. The requirement at the vertical construction phase, including CALGreen Tier 1 requirements, will be assured through verification mechanisms at the time of building permit or site plan review, and with occupancy approvals. Innovation and Adaption Measures may be proposed by the Master Developer or horizontal construction developer in the same development review process steps included in the corresponding measures identified in Table 2-A-1.

In addition, the Project will be required to comply with all applicable legal requirements regarding the provision of alternative energy fueling stations and related infrastructure to serve` alternative fuel vehicles.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of air quality can be found in these documents: Section 5.3 of the AVAP EIR, and Section 3.3 of the RTP/SCS EIR.

In response to this comment, page 14 of Appendix 2-A, Green Development Program in Draft EIR Appendix 4.0-A is hereby revised as follows to correct inadvertent typographical errors:

> **Alternative Fuels Including Electric Vehicle Infrastructure.**
>
> The Applicant/Developer shall provide plans and specifications to the County demonstrating that "alternative energy fueling stations" and other parking requirements shall be installed as follows. An "alternative energy vehicle fueling station" is a 208/240 VAC electrical vehicle charging station or a station providing another new or improved technology (e.g. compressed natural gas (CNG) and hydrogen fuel cell) that provides refueling for vehicles that do not use fossil fuel.
>
> - Business Park and Institutional land use designations shall provide a minimum of one alternative energy vehicle fueling station on-site for the first 50,000 square feet of usable floor space and additional alternative energy vehicle fueling stations for each additional 50,000 square feet of usable floor space thereafter.
> - Loading docks shall provide a 240 kV outlet in the vicinity of the loading dock.
> - The Town Center and each Village Center shall provide a minimum of one alternative energy vehicle ~~charging~~ fueling station with multiple outlets.
> - Designated Transit Hubs shall provide a minimum of one alternative energy vehicle ~~charging~~ fueling station.
> - Parking structures and parking lots with 20 or more parking spaces shall include a minimum of 5 percent preferentially located parking spaces for alternative-fueled (electric, natural gas, or similar low-emitting technology) vehicles, at least one of which shall be equipped

with alternative energy vehicle fueling station. Electrical lines shall be designed and sized to add additional ~~charging~~ alternative energy vehicle fueling stations for up to 3 percent of the total parking spaces when a demand is demonstrated. The design and installation shall be consistent with Section A4.106.8.2, Residential Voluntary Measures, of the CALGreen Code.

- For multi-family projects, provide a minimum of 10 percent of total site parking places dedicated to shared vehicles and/or alternative fuel vehicles. Additionally, projects with ~~provide~~ at least ~~20~~ 17 residential shall provide a minimum of one alternative energy vehicle fueling station for the first ~~twenty (20)~~ 17 residential units and an additional alternative energy vehicle fueling station for each additional ~~twenty (20)~~ 17 residential units thereafter.
- Installation shall be consistent with Section A5.106.5.3, Nonresidential Voluntary Measures (Tier 1), of the CALGreen Code.
- Each single-family residence shall include one 208/240 kV outlet, suitable for use for electric vehicles. The installation shall comply with requirements of the ~~2013~~ 2016 CALGreen Code Section 4.106.4.1, or the most applicable code at the time of construction.
- The TMA shall encourage the use of the best feasible alternative fuel technology to be used in transit, solid waste management, HOA, CFD, fleet and other community service vehicles.
- A refueling facility for alternative fuels shall be installed to meet demand once the TMA has determined that 5 percent of residential or employment vehicles are powered by fuels other than petroleum and electricity.

In response to this comment, the last full paragraph on page 1 of Appendix 2-A to Draft EIR Appendix 4.0-A is hereby revised as follows to correct inadvertent typographical errors:

Centennial's Green Development Program encourages environmentally sustainable development in two additional ways:

- First, in addition to satisfying all mandatory measures of the CALGreen Code, all residential and non-residential development within the Specific Plan shall be required to satisfy the required measures necessary to achieve 2016 CALGreen Tier 1 ~~then are currently applicable~~.
- Second, this Green Development Program includes additional measures for Centennial that exceed applicable state, regional and local requirements, including but not limited to exceeding ~~2013~~ 2016 CALGreen Tier 1.

> With this approach, development within the Specific Plan will meet and exceed the standards of ~~2013~~ 2016 CALGreen Tier 1 as well as the requirements of the County's Green Building Ordinances.

In response to this comment, the last partial paragraph on page 8 and the first partial paragraph on page 9 of Appendix 2-A to Draft EIR Appendix 4.0-A is hereby revised as follows to correct inadvertent typographical errors:

> Notwithstanding the foregoing, in order to recognize equivalent programs, any residential development project that achieves certification by Build it Green provided for a Green Point Rated certification, the National Association of Home Builders for compliance with the National Green Building Standard, or certification by the U.S. Green Building Council for performance under the Leadership in Energy and Environmental Design (LEED) will be considered consistent with the intent of the Centennial Green Development Program for the proposed development project, so long as such certification otherwise exceeds ~~both~~ the mandatory requirements of the CALGreen Code in effect on the date of application for a building permit and the voluntary measures required to achieve CALGreen Tier 1 as described in the 2016 version of the CALGreen Code.~~, which exceed required CALGreen measures.~~ Any commercial project (as defined within a business park, light industrial or commercial land use designation), that is awarded LEED Silver Certification or better will be considered consistent with the Program, so long as such certification otherwise exceeds the mandatory nonresidential requirements of the CALGreen Code in effect on the date of application for a building permit and the measures required to achieve CALGreen Tier 1 as described in the 2016 version of the CALGreen Code. The comprehensiveness of these certification programs guarantees, for their respective types of development, the achievement of a high minimum standard equivalent to CALGreen Tier 1 and the unique measures otherwise required by Table 2-A-1.

Response to Comment D.4-14:

Consistent with this comment, SCAQMD is identified as a responsible agency on Draft EIR page 4-110. Moreover, Draft EIR pages 5.11-4 and 5.11-56 disclose that stationary sources are typically required to obtain permits to construct and to operate from the applicable air pollution control agencies, which would include SCAQMD with respect to qualifying Project stationary sources proposed within SCAQMD's jurisdictional boundary. Finally, MM-1 provides that the Project's plans and specifications shall require stationary sources to comply with the parameters stated in Stationary Source Types, Size Limits, and Quantity Estimates, which is included as Attachment A to the Project's Mitigation Monitoring and Reporting Program. Should there be a need for a stationary source exceeding the prescribed limits, the Project Applicant/Developer must apply for source-specific permit from the Antelope Valley Air Quality Management District (AVAQMD) or SCAQMD, as applicable. This comment's provision of pertinent contact information and its offer of assistance are noted with appreciation.

In response to this comment page C-78 of Final EIR Appendix 2.0-C.Rev, Mitigation Monitoring and Reporting Program, is hereby revised to include AVAQMD and SCAQMD as responsible agencies for purposes of MM 11-1, as follows:

5.11	**Air Resources**	**MM 11-1** The Project's plans and specifications shall require stationary sources to comply with the parameters stated in Stationary Source Types, Size Limits, and Quantity Estimates, which is included as Attachment A to the Project's Mitigation Monitoring and Reporting Program. Should there be a need for a stationary source exceeding the prescribed limits, the Project Applicant/Developer shall apply for source-specific permit from the Antelope Valley Air Quality Management District (AVAQMD) or South Coast Air Quality Management District (SCAQMD), as applicable.	Require stationary sources to comply with the parameters stated in Attachment A	Prior to issuance of applicable construction permits	Project Applicant/ Developer, AVAQMD and SCAQMD	County Department of Regional Planning

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of air quality can be found in these documents: Section 5.3 of the AVAP EIR, and Section 3.3 of the RTP/SCS EIR.

Response to Comment D.4-15:

This comment correctly identifies a typographical error in Table 5.11-21 of the Draft EIR. Page 5.11-54 of the Draft EIR accurately describes its assumed reasonable worst-case impact scenario as occurring in Year 18 of the Project. However, some rows in Table 5.11-21 of the Draft EIR are mislabeled as "Year 11," rather than "Year 18" (note that this error is not shown in Table 5.11-20 of the Draft EIR). The correct "Year 18" emission quantities are shown on the mislabeled rows, as confirmed by reference to Section 2.0 of Draft EIR Appendix 5.11-A. Thus, to correct this typo, all references to "Year 11" on Table 5.11-21 need only be revised to read "Year 18." None of the table's listed emission quantities are inaccurate and they were all included in Draft EIR Appendix 5.11-A. Table 5.11-21 is hereby revised with the corrected text as follows:

TABLE 5.11-21
ESTIMATED ANNUAL MID-PROJECT COMBINED EMISSIONS
(SCAQMD UNITS [LBS/DAY])

Source	Emissions (lbs/day)					
	VOC	**NOx**	**CO**	**SOx**	**PM10**	**PM2.5**
Unmitigated Emissions

Exceeds Threshold	**Yes**	**Yes**	**Yes**	No	**Yes**	**Yes**

lbs/day: pounds per day; VOC: volatile organic compounds; NOx: nitrogen oxides; CO: carbon monoxide; SOx: sulfur oxides; PM10: respirable particulate matter with a diameter of 10 microns or less; PM2.5: fine particulate matter with a diameter of 2.5 microns or less.

Note: Totals may not add due to rounding.

Bold indicates emissions exceeding threshold

Sources: SCAQMD 2015 (thresholds). Emissions calculations can be found in Appendix 5.11-A

The above revision to Table 5.11-21 merely clarifies the Draft EIR analysis and does not constitute significant new information.

The Project is within the boundaries of and is consistent with the Antelope Valley Area Plan Environmental Impact Report (AVAP EIR) (SCH# 2014061043). The AVAP is an area plan that is a subset of the County of Los Angeles General Plan. The Project is also within the boundaries of and is consistent with the Southern California Association of Governments 2016-2040 RTP/SCS Environmental Impact Report (RTP/SCS EIR) (SCH# 2015031035), the metropolitan planning organization for the region. As these documents contain the environmental analyses for the planning documents applicable to the Project area and considered on a program level, additional information that is relevant to the Project on the topic of air quality can be found in these documents: Section 5.3 of the AVAP EIR, and Section 3.3 of the RTP/SCS EIR.

August 10, 2017

Mr. Jodie Sackett
County of Los Angeles
Department of Regional Planning
Hall of Records, 13th Floor, Room 1348
Los Angeles, CA 90012

Dear Mr. Sackett,

Subject: Comments on Notice of Completion and Availability of the Draft Environmental Impact Report (DEIR) for the Centennial project

Thank you for the opportunity to review and comment on the above referenced Notice of Completion and Availability.

The Centennial project would consist of new residential, commercial, recreational/entertainment, business park, and institutional/civic uses on a 12,323-acre site in the northwestern portion of the Antelope Valley in unincorporated Los Angeles County (County), approximately 35 miles north of the City of Santa Clarita (City). The project would allow for up to 19,333 dwelling units, 7,363,818 square feet of business park uses, approximately 1,034,550 square feet of commercial uses, and 1,568,160 square feet of institutional/civic uses. Additional facilities contemplated in the conceptual site plan include locations for up to four new fire stations and a new Sheriff's station. Further, the project would preserve 5,624 acres of on-site open space. E.1-1

The City requests additional specific discussion and/or particular analytic emphasis in the following areas:

Traffic Analysis and Mitigation

1. The traffic study indicates that 60% of project trips will be internal to Centennial at buildout of the project. More information should be provided regarding the derivation of this figure. E.1-2
2. Even with the proposed improvements along I-5, many segments will remain LOS E/F. The applicant should provide additional analysis as to whether Centennial will cause additional traffic to divert from I-5 onto SCV roads and the degree of impact, if any. E.1-3

Jobs/Housing Balance

The topic of jobs/housing balance has been an important issue addressed by the County in the Santa Clarita General Plan and the Santa Clarita Valley Area Plan. The existing jobs/housing imbalance within the Santa Clarita Valley results in existing impacts to traffic, air quality, and greenhouse gas emissions. Due to the proximity of the project to the Santa Clarita Valley, the E.1-4

City has concerns regarding the projected jobs/housing balance for the project. Section 5.9, Population, Housing, and Employment, of the DEIR includes a discussion regarding the 2012 and 2040 projected jobs/housing ratios for the project, the North Los Angeles County Subregion, and the County as a whole. The anticipated jobs/housing ratio for the Centennial project is 1.22 to 1. Although no State, regional, County, or local requirements exist at the present time for the project area, the City of Santa Clarita strongly encourages consideration be given to modify the project to achieve a 1.5 to 1 jobs/housing balance as required within the Santa Clarita Valley Area Plan, or at minimum a 1.3 to 1 jobs/housing balance as required within the Antelope Valley Area Plan.

E.1-4 cont.

Water Supply Assessment

Section 5.18, Water Resources, of the DEIR includes a summary of the Water Supply Assessment prepared pursuant to Senate Bill (SB) 610 for the project. Key principles of the Centennial Water Supply/Demand element of the Management Strategy are:

- To comply with SB 610
- To maximize water conservation
- To maximize use of recycled water
- To minimize use of State Water Project supplies
- To incorporate water banking to provide supplies for project demand during single and multiple dry-year conditions
- To provide water supplies from multiple sources, including local groundwater, recycled water, Antelope Valley-East Kern Water Agency (AVEK) water, banked water, return flows, and other purchased water supplies from outside the AVEK service area in order to increase water supply reliability in years of normal or average hydrology, as well as single and multiple dry year conditions

The City of Santa Clarita strongly encourages that the project be developed and managed in a manner consistent with these key principles, and that significant efforts be made to adopt and implement additional strategies that may accomplish the stated goals of the management strategy into the future.

E.1-5

Thank you again for the opportunity to comment on the DEIR. The City looks forward to reviewing the FEIR when it is available. If you have any additional questions, please contact me at (661) 255-4305.

E.1-6

Sincerely,

Thomas B. Cole
Director of Community Development

Responses to Comment Letter E.1
City of Santa Clarita
August 10, 2017

Response to Comment E.1-1:

Thank you for your comment and for your participation in this public process. No further response is required given that the comment does not raise a specific concern regarding the content of the Draft EIR.

Response to Comment E.1-2:

This comment addresses the derivation of the estimated percentage of total trips that will be internal to the Project area. As discussed on pages 5.10-49 to 5.10-51 of the Draft EIR, the Project analysis includes a discussion of internal and external "tripends" and "trips." A "trip end" refers to a trip start or destination point. An internal tripend is a trip that starts or begins in the Project site, such as from a residence. A "trip" includes a starting tripend and ending tripend. An internal trip is a trip that both starts and ends within the Project site. An external trip is a trip with either a starting or ending point outside of the Project site.

As discussed on Draft EIR pages 5.10-2 to 5.10-5, the Draft EIR uses the most recent version of the North County Sub-Area Model to evaluate traffic conditions in north Los Angeles County, including the Project site. This version of the model was updated by Los Angeles County to reflect the Antelope Valley Area Plan (AVAP) approved by the County in June 2015. The updated North County Sub-Area Model provides the estimates of Project internal trips and tripends utilized in the Draft EIR. As shown in Table 5.10-19 of the Draft EIR, the model projects that about 48 percent of the Project's total average daily trips (ADT) at buildout will be internal, and 52 percent will be external to the Project site. The model also projects that about 65 percent of the Project's full buildout total average daily tripends (the start or ending of a trip) will be internal to the site, and 35 percent will be external to the site.

The proportion of trips and tripends that are projected to be internal and external to the Project site by the North County Sub-Area Model updated by the County are based on model parameters such as population, employment and the relative distances between areas for which Project trips will be made. As discussed on Draft EIR page 5.10-50, the Project includes schools, parks, and retail shopping areas within the Project site located and sized to meet the Project's residential and workforce needs. The Project site is relatively isolated and most of the trips generated by travel to and from these locations will be internal to the Project area. In addition, at buildout, the Project will include approximately 10.1 million square feet (sf) of commercial office, shopping/retail, and industrial land uses that will provide approximately 23,675 jobs, many of which would be filled by future Centennial residents. In comparison, applicable traffic models for the Lancaster/Palmdale area, which is larger than the Project but also relatively isolated, project that 70 percent of all tripends are internal to

the region.[289] Similarly, traffic models indicate that 74 percent of the total tripends in the Santa Clarita Valley will be internal when the region is built out.[290]

The North County Sub-Area Model estimates of the Project's average daily internal and external trips and tripends at buildout is consistent with available census bureau data of the percentage of residents who work within or outside of their places of residence for communities with similar locational characteristics as the Project. The table below summarizes the 2011-2015 American Community Survey (ACS) 5-Year Estimates of the percentage of all workers aged 16 or older working in their own community, or internal to 11 communities that are relatively isolated from other locations and that have approximately the same average total workforce as the Project at full buildout.

	Total Workforce Over 16 Years of Age	**Percent Working in Own Community**
Santa Maria California	43,861	60%
El Centro California	15,368	57%
Tehachapi California	3,343	54%
Porterville California	18,810	53%
Barstow California	7,927	51%
Paso Robles California	14,771	48%
Madera California	18,525	46%
Lancaster California	53,503	46%
Watsonville California	22,271	45%
Santa Clarita California	84,987	37%
Palmdale California	55,867	32%
AVERAGE	**30,839**	**48%**
Source: U.S. Census Bureau, 2011-2015 American Community Survey 5-Year Estimates, Table S0810		

The ACS data indicates that the percentage of workers that are employed within their own community ranges from 60 percent in Santa Maria, California to 46 percent in Lancaster, California and 32 percent in Palmdale, California. The average percentage of residents who work within their communities is 48 percent. As discussed on Draft EIR page 5.10-50, most of the Project trips will be generated by residential land uses, and an average single-family residential unit generates approximately nine home-based trips per day. About two of these nine trips are home-based work trips related to travel directly to and from work. The remaining trips are related to travel between residential units for a non-work activity such as school, shopping, or recreation, which may be trips that are entirely local or may represent one leg of a journey between home and the workplace. The percentage of internal trips and tripends for non-work activity in locations such as the Project which provide schools, recreational facilities and shopping opportunities that are relatively far from other options is generally higher than for work-related trips. Residents in relatively isolated locations are more willing to utilize local school, shopping, and recreational facilities than to modify or

289 Enhanced Antelope Valley Transportation Analysis Model Version 2.0, City of Palmdale
290 Santa Clarita Valley Consolidated Traffic Model Version 4.1, City of Santa Clarita and the County of Los Angeles

change employment even if the desired work requires a significant daily commute. The internal trip rate for the Project that results from the North County Sub-Area Model is approximately the same as the average internal trip rate for work commutes in similarly isolated communities in California (48 percent). Since more daily trips in a community are related to non-work purposes, and the percentage of non-work internal trips is typically higher than for employment purposes, these data indicate that the North County Sub-Area Model internal and external trip estimates for the Project are reasonable. The Lead Agency is entitled to rely on expert traffic model estimates as substantial evidence of a project's likely traffic impacts, including the air emissions associated with such traffic trips.[291] This comment does not question the accuracy of the North County Sub-Area Traffic Model, or provide evidence that the model is unreliable.

Response to Comment E.1-3:

This comment concerns the possibility that the Project will divert additional traffic from Interstate 5 (I-5) to local Santa Clarita Valley roads. With the exception of The Old Road, which extends from the now-closed former Ridge Route south and to the west and east of I-5 to the intersection of I-5 with State Route (SR) 14, Santa Clarita Valley roadways do not provide practical alternatives to I-5. All of the major arterials connecting with I-5 in the region, such as Newhall Ranch Road, Valencia Boulevard, Magic Mountain Parkway, McBean Parkway and Lyons Canyon Road, extend east and west from I-5 through traffic-controlled intersections and urbanized areas with relatively low speed limits.

At present, the most significant congestion in the Santa Clarita Valley along the I-5 corridor is related to travel to and from locations to the south of the region in the greater Los Angeles area. Development of the Project provides a new origin and destination to the north, in the opposite direction from the currently congested southern routes, for trips generated in the Santa Clarita Valley. The net effect of the Project in the region will be to shift a portion of the current Santa Clarita Valley average daily trips (ADT) from more-congested southern to less congested northern I-5 facilities. The Project will not result in an increase in the number of trips generated in the Santa Clarita Valley. Instead, the total number of Santa Clarita Valley trips using the northern portions of I-5 towards the Project will increase from a projected level of 11,000 ADT without the Project to 52,000 ADT with the Project.[292] As a result, the Project will benefit Santa Clarita residents and employers by providing new options for employment north of the Santa Clarita Valley, shifting trips from the highly-traveled Newhall Pass and more congested southern portions of I-5 to the less congested areas to the north.

Response to Comment E.1-4:

The AVAP does not require the Project to achieve a jobs/housing balance of 1.3 jobs for every Project household. Rather, the AVAP provides for a jobs-to-household ratio of approximately 1.3 jobs for every household across the entire AVAP planning area, which is a fair improvement from the 0.2:1 jobs-to-household ratio provided by the previous 1986

[291] Laurel Heights Improvement Ass'n v. Regents of Univ. of Cal (1988) 47 Cal.3d 376, 410; National Parks & Conserv. Ass'n v. County of Riverside (1999) 71 Cal.App.4th 1341, 1362

[292] Enhanced Antelope Valley Transportation Analysis Model Version 2.0, City of Palmdale

Antelope Valley Areawide General Plan.[293] The AVAP focuses future development in Economic Opportunity Areas (EOA) to allow for the preservation of ecological resources in open space conservation areas. The Economic Development Element of the AVAP designates areas along major transportation corridors for light and heavy industrial uses and a concentration of skilled labor force in EOAs. The Project would be located in the West EOA and is consistent with the land use designations in the AVAP Land Use Policy Map. The Project would have an on-site jobs-housing ratio at buildout of 1.22. Thus, it would be contributing to the attainment of the approximately 1.3 jobs/housing ratio for the entire AVAP planning area, as envisioned in the AVAP.

Moreover, the projected 1.22 jobs/housing balance for the Project is a conservative estimate as it does not include Project residents who don't work for an on-site employer, but do work from home for off-site employers. According to published reports, in 2016, 43 percent of Americans spent some time telecommuting, which represents a four percent increase since 2012.[294] In addition, those who do telecommute do so more frequently.[295] From 2012 to 2016, the segment of telecommuters that worked a day or less per week from home fell to 25 percent from 34 percent.[296] During the same period, the segment of telecommuters that worked from home increased from 24 percent to 31 percent.[297] These national trends are also evident locally. According to the Southern California Association (SCAG) of Governments, telecommuting is growing in the region.[298] This appears to be particularly true among younger generations. According to SCAG, in 1983, 19 year olds were a bigger percentage of all drivers than those 70 or older but, by 2008, 19 year olds were less than half the percentage of the driving population age 70 or older.[299] Also, in 1980, only 1.3 percent of workers age 25 to 34 telecommuted from home but, by 2010, that number rose to 3.2 percent.[300] These numbers are likely to increase because SCAG's *2016-2040 Regional Transportation Plan/Sustainable Communities Strategy* commits $6.9 billion to regional Transit Demand Management strategies that expressly include incentives for telecommuting.[301]

Based on SCAG's growth forecast, as presented in the 2016-2040 RTP/SCS, the jobs-to-housing ratio for the region in 2015 was 1.35 and the projected ratio for 2040 is 1.33.[302] With changing workforce patterns, such as an increase in home-based workers for all portions of

Response to Comment E.1-5:

The Commenter correctly notes the Project's key water principles. As a condition of approval of all qualifying tentative subdivision maps, the Project will also be required to provide a written verification pursuant to California Government Code § 66473.7 stage to confirm that the total water supplies available during normal, single-dry, and multiple-dry years within a 20-year projection will meet the projected demand associated with the proposed subdivision. This written verification process provides an additional opportunity to integrate water management improvements that may become available in the future.

The Project's water supplies are discussed in Section 5.18, Water Resources. The Draft EIR found that the Project's water supplies will sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet after buildout has been achieved. The Project has been designed to achieve the key principles noted in the comment. Water conservation measures are required by MM 18-1 and include: monitoring all non-construction potable and non-potable water use using appropriate metering equipment throughout the site; the use of on-site wastewater treatment and conveyance facilities that provide recycled water to reduce potable water demand; installation of water-efficient major appliances; installation of irrigation equipment with a minimum 0.80 irrigation efficiency for all public and private park, recreation and entertainment land use, arterial roadway, and slope irrigation uses; the use of water smart/evapotranspiration-based controllers and low water use plants and shrubs in all irrigated slope areas; the implementation of water budget based rates in compliance with all applicable legal requirements, including indoor residential water use of 55 gallons per capita per day

consistent with proposed state indoor water conservation objectives; and outdoor residential water use of 55 percent and outdoor commercial, industrial, and institutional outdoor use of 45 percent of the reference evapotranspiration rate for the Project site. These measures are discussed on pages 5.18-40 to 5.18-50 of the Draft EIR and will ensure that the Project will achieve higher levels of water use efficiency than in most existing Antelope Valley developed areas.

Project recycled water use is discussed on page 5.18-67 of the Draft EIR and in Section 5.19, Wastewater Collection, and will be generated by the treatment of indoor wastewater in onsite facilities to California Title 22 standards. As shown in Draft EIR Table 5.18-10, at buildout these facilities will produce approximately 4,577 acre feet per year of recycled water and will meet 40 percent of total Project water demand. The Project's use of State Water Project (SWP) supplies is discussed on pages 5.18-62 to 5.18-64, and the delivery reliability of these supplies is discussed on pages 5.18-20 to 5.18-28 and 5.18-54 to 5.18-64 of the Draft EIR. Other water supplies that will be used by the Project include recycled water, groundwater and return flows from urban use in the Antelope Valley Basin in accordance with the Adjudication Judgment and Physical Solution entered by the Superior Court in December 2015, certain supplies from the Antelope Valley-East Kern Water Agency to be provided as repayment for water provided to the Agency in prior years. As shown in Table 5.18-10, taking account of the anticipated average annual delivery reliability of SWP supplies to the Antelope Valley[303], on average SWP water will be used to meet 37 percent of total Project buildout demand and 63 percent of Project water demand will be met by using other water supplies.

Draft EIR Tables 5.18-10 to 5.18-12 analyze the sufficiency of Project water supplies, including water banking in wetter years for use in drier years, during average, single dry and multiple dry years in accordance with California Water Code Requirements. The tables and analysis show that the Project's supplies are sufficient to meet demand in all such years and on a sustainable basis over time while maintaining a significant water reserve in the two water banking facilities that will serve the Project. MM 18-2 requires implementation of water use monitoring and reporting, including the submission of water use reports to the County at the end of the 5th and 10th years or the occupancy of the 4,000th and 10,000th units, whichever occurs latest, to confirm that the water use efficiencies discussed in the Draft EIR are being achieved as the Project is built and that available water supplies are sufficient to meet future demand. If a report determines that water use is exceeding projected levels, the Project Water Purveyor must identify specific response measures to ensure that water supplies will meet future demand. Potential sources of additional supply, if necessary, are discussed on pages 5.18-69 to 5.18-72 of the Draft EIR and include potential groundwater transfers as allowed by the Adjudication Judgment and Physical Solution, supplemental surface water purchases and imports, and investments in additional recycled water use or storm water reuse in the Antelope Valley. No additional development will occur until sufficient supplies are identified. MM 18-2 ensures that the Project water supplies and demand will be managed in accordance with the key principles summarized in the comment,

303 DRP 2017, pp. 5.18-20 to -28, -54 to -64

including the implementation of additional strategies to accomplish the Project's water supply and demand management goals as may be required in the future.

Please also see Section 5.17 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.18 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment E.1-6:

The comment is noted. No further response is required given that the comment does not address or question the content of the Draft EIR.

Subject: Centennial Project Draft EIR, Antelope Valley, Unincorporated Los Angeles County, CA

Dear Mr. Sackett:

On May 20, 2017, the Cultural Resources Management Department for San Manuel Band of Mission Indians (SMBMI) received your correspondence regarding the Draft EIR for the Centennial Project (County Project No. 02-232) located in the northwestern portion of the Antelope Valley in unincorporated L.A. County. I am writing today to inform you and the Los Angeles County Department of Regional Planning that the above-referenced project exists outside of Serrano ancestral territory and, as such, SMBMI will not be requesting consulting party status under CEQA nor requesting to participate in the scoping, development, and/or review of documents created pursuant to these legal and regulatory mandates. F.1-1

Should you have any questions about the content of this communication, please do not hesitate to contact Ms. **Lee Clauss** at your convenience.

Respectfully,

Diane Versaggi on Behalf of
Lee Clauss

Re: *Centennial Project DEIR, SCH No. 2004031072*

Dear Mr. Dea and the County of Los Angeles:

On behalf of the Golden State Environmental & Social Justice Alliance, a California Social Purpose Corporation, Entity #4017878, we hereby submit comments under the California Environmental Quality Act ("CEQA") on the Draft Environmental Impact Report ("DEIR") for the Centennial Project (the "Project").

I. Failure to Implement All Feasible Mitigation Measures to Reduce Emissions

The DEIR determines that emissions generated during Project construction would exceed the Antelope Valley Air Quality Management District's (AVAQMD) significance threshold for annual NO_x emissions (Table 5.11-9, p. 5.11-44), and would exceed the South Coast Air Quality Management District's (SCAQMD) significance thresholds for mass daily VOC and NO_x emissions, resulting in a significant air quality impact (Table 5.11-10, p. 5.11-45). Even after applying mitigation to the Project's construction emissions in an effort to reduce emissions to less than significant levels, the DEIR concludes that the Project would result in a significant and unavoidable air quality impact. The DEIR states, F.2-1

> "Based on the AVAQMD annual thresholds and SCAQMD mass daily thresholds, construction-related emissions of VOC and NOx would result in significant impacts. MM 11-1 and MM 11-2 would be implemented to reduce emissions; however, the impacts would remain significant and unavoidable." (p. 5.11-58).

While it is true that the proposed Project would result in significant construction-related VOC and NO_x impact, the DEIR's conclusion that these impacts are "significant and unavoidable" is entirely incorrect. According to CEQA, and as stated by the San Joaquin Valley Air Pollution Control District (SJVAPCD):

> "CEQA requires Lead Agencies to mitigate or avoid significant environmental impacts associated with discretionary projects. Environmental documents for projects that have any significant environmental impacts must identify all feasible mitigation measures or alternatives to reduce the impacts below a level of significance. If after the identification of all feasible mitigation measures, a project is still deemed to have significant environmental impacts, the Lead Agency can approve a project, but must adopt a Statement of Overriding Consideration to explain why further mitigation measures are not feasible and why approval of a project with significant unavoidable impacts is warranted."[1]

F.2-1 cont.

Therefore, an impact can only be labeled as significant and unavoidable after all available, feasible mitigation is considered. Review of the Project's VOC and NO_x mitigation measures, however, demonstrates that not all feasible mitigation is being implemented. As a result, additional mitigation measures should be identified and incorporated in order to reduce the Project's air quality impact to the maximum extent possible. Until all feasible mitigation is reviewed and incorporated into the Project design, impacts from construction-related VOC and NO_x emissions cannot be considered as significant and unavoidable.

In the sections below, we identify several additional mitigation measures that the DEIR can incorporate to reduce the Project's VOC and NO_x emissions, potentially to less than significant levels.

Use of Zero-VOC Emissions Paint

The DEIR states that the Project will use paints with an average VOC content that "would not exceed 50 grams per liter (g/L) for all interior surfaces, 100 g/L for residential exterior surfaces, and 150 g/L for non-residential exterior surfaces" (p. 5.11-43). However, the Project Applicant should consider the use of low VOC coatings. The use of zero-VOC emission paint has been required for numerous projects that have undergone CEQA review. Zero-VOC emission paints are commercially available. Other low-VOC

F.2-2

---

1 http://www.valleyair.org/transportation/GAMAQI_3-19-15.pdf, p. 115 of 125.

standards should be incorporated into mitigation including use of "super-compliant" paints, which have a VOC standard of less than 10 g/L.[2]

F.2-2 cont.

Use of Material that do Not Require Paint
Using materials that do not require painting is a common mitigation measure where VOC emissions are a concern. Interior and exterior surfaces, such as concrete, can be left unpainted.

F.2-3

Use of Spray Equipment with Greater Transfer Efficiencies
Various coatings and adhesives are required to be applied by specified methods such as electrostatic spray, high-volume, low-pressure (HVLP) spray, roll coater, flow coater, dip coater, etc. in order to maximize the transfer efficiency. Transfer efficiency is typically defined as the ratio of the weight of coating solids adhering to an object to the total weight of coating solids used in the application process, expressed as a percentage. When it comes to spray applications, the rules typically require the use of either electrostatic spray equipment or HVLP spray equipment. The SCAQMD is now able to certify HVLP spray applicators and other application technologies at efficiency rates of 65 percent or greater.[3]

F.2-4

The following mitigation measures can be implemented to reduce NO_x emissions generated by Project construction. NO_x is a byproduct of diesel fuel combustion, and is emitted by on-road vehicles and by off-road construction equipment. Mitigation for NO_x emissions should include consideration of the following measures in an effort to reduce construction emissions:

Use of Tier 3 Construction Equipment and Selective Catalyst Reduction Systems
As stated above, after concluding that the Project's construction-related VOC and NO_x emissions would exceed the AVAQMD and SCAQMD's significance thresholds, the DEIR applies mitigation to the Project's emissions. Specifically, the DEIR models the Project's emissions for the average construction year and peak grading year assuming that the Project's entire construction fleet would be equipped with Tier 4 Final engines (p. 5.11-48). Based off of the emission estimates provided in Tables 5.11-14, 5.11-15, 5.11-16, and 5.11-17 of the DEIR (p. 5.11-48 - 5.11-50), which estimates the Project's criteria air pollutant emissions after implementation of Tier Final 4 engines, the DEIR states the following:

F.2-5

---

2 http://www.aqmd.gov/home/programs/business/business-detail?title=super-compliant-coatings

3 http://www.aqmd.gov/home/permits/spray-equipment-transfer-efficiency

> "As shown in Table 5.11-15 and Table 5.11-17, the use of all Tier 4 Final construction equipment would reduce daily NOx emissions to less than the SCAQMD significance threshold for both the average grading years and the peak grading year. VOC emissions reductions resulting from the use of Tier 4 Final equipment would exceed the SCAQMD thresholds for both the average and peak grading years. In summary, construction emissions of VOC would be significant and would be unavoidable because (1) it cannot be known if Tier 4 Final construction equipment could be feasibly and reasonably provided for enough construction equipment to result in emissions less than AVAQMD thresholds for all years and (2) even if Tier 4 Final construction equipment would be available, the SCAQMD daily VOC emissions threshold may be exceeded in some average years" (p. 5.11-50 - 5.11-51).

As a result, the DEIR determines that because there is limited availability of Tier 4 Final off-road construction equipment, the Project would result in a significant and unavoidable VOC and NO_x impact (p. 5.11-58). However, as previously stated, the DEIR cannot state that impacts are significant and unavoidable without first implementing all available, feasible mitigation. While we agree that the availability of Tier 4 Final engines is limited and that it is unlikely that the Project Applicant would be able to obtain Tier 4 Final engines for all 75 pieces of off-road construction equipment that the Project proposes to use throughout Project construction (Appendix 5.11-A, pp. 27, pp. 214, pp. 372), we believe that the use of Tier 3 engines in conjunction with the use of engine exhaust retrofit devices would reduce emissions to less than significant levels.

F.2-5 cont.

Engine exhaust retrofit devices are installed in vehicle exhaust systems to reduce emissions, and therefore do not impact engine or vehicle operation.[4] Selective catalytic reductions (SCR), for example, are air pollution control devices that reduce NO_x emissions through use of a reductant, such as urea, which is commercially available as Diesel Exhaust Fluid (DEF).[5] According to the Environmental Protection Agency (EPA), SCRs are capable of reducing NO_x emissions by approximately 70% - 90%.[6] The use of SCR devices require DEF to be replenished regularly by the vehicle operator. For light-heavy duty vehicles,

---

4 http://www3.epa.gov/otaq/diesel/technologies/index.htm

5 "Draft Final Off-Road Equipment White Paper" SCAQMD, September 2015, available at: http://www.aqmd.gov/docs/default-source/Agendas/aqmp/white-paper-working-groups/wp-offroad-draftfinal.pdf?sfvrsn=2

6 "Air Pollution Control Technology Fact Sheet," United States Environmental Protection Agency, *available at*: https://www3.epa.gov/ttncatc1/dir1/fscr.pdf

DEF refills are required around the same time as an oil change. In heavy-duty vehicles, the DEF refill requirement is dependent upon operating conditions, usage, miles traveled, etc.[7] When DEF supplies in a vehicle equipped with a SCR device reach near-empty levels, the vehicle's operating system becomes locked, preventing the user from starting the vehicle without adequate levels of DEF.[8] This ensures that vehicles equipped with SCR devices do not emit higher NO_x levels when DEF levels – which the device relies on to reduce NO_x emissions – are too low. In addition to reducing NO_x emissions, SCRs have also been found to moderately reduce particulate emissions.[9]

F.2-5 cont.

Use Electric and Hybrid Construction Equipment

CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures*[10] report also proposes the use of electric and/or hybrid construction equipment as a way to mitigate emissions. When construction equipment is powered by grid electricity rather than fossil fuel, direct emissions from fuel combustion are replaced with indirect emissions associated with the electricity used to power the equipment. Furthermore, when construction equipment is powered by hybrid-electric drives, emissions from fuel combustion are also greatly reduced. Electric construction equipment is available commercially from companies such as Peterson Pacific Corporation,[11] which specialize in the mechanical processing equipment like grinders and shredders. Construction equipment powered by hybrid-electric drives is also commercially available from companies such as Caterpillar[12]. For example, Caterpillar reports that during an 8-hour shift, its D7E hybrid dozer burns 19.5 percent fewer gallons of fuel than a conventional dozer while achieving a 10.3 percent increase in productivity. The D7E model burns 6.2 gallons per hour compared to a conventional dozer which burns 7.7 gallons per hour.[13] Fuel usage and savings are dependent on the make and model of the construction equipment used. The Project

13 http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf

Applicant should calculate project-specific savings and provide manufacturer specifications indicating fuel burned per hour.

F.2-6 cont.

When combined together, these measures offer a feasible way to effectively reduce the Project's construction-related VOC and NO_x emissions, potentially to less than significant levels. As such, an updated DEIR must be prepared to include additional mitigation measures to ensure that the necessary mitigation measures are implemented to reduce construction emissions. Furthermore, the Project Applicant needs to demonstrate commitment to the implementation of these measures prior to Project approval to ensure that the Project's emissions are reduced to the maximum extent possible.

F.2-7

II. Artificially Reduced Particulate Matter Construction Emissions

The DEIR artificially reduces the Project's PM10 and PM2.5 emissions during Project construction, without providing any sort of justification as to why these reductions were applied. As a result, the Project's construction-related air quality impacts are underestimated.

The DEIR relies upon the California Emissions Estimator Model Version CalEEMod.2016.3.1 ("CalEEMod")[14] to estimate the Project's construction and operational emissions (p. 1-27). The CalEEMod output files, provided in Appendix 5.11-A of the DEIR, indicate that the Project's construction activities would produce a maximum of approximately 125 tons per year (tons/yr) of PM10 emissions and a maximum of approximately 58 tons/yr of PM2.5 emissions (see excerpt below) (Appendix 5.11-A, pp. 19).

F.2-8

	ROG	NOx	CO	SO2	Fugitive PM10	Exhaust PM10	PM10 Total	Fugitive PM2.5	Exhaust PM2.5	PM2.5 Total	Bio- CO2	NBio- CO2	Total CO2	CH4	N2O	CO2e
Year	tons/yr										MT/yr					
2034	9.8303	7.3901	14.0823	0.0376	1.8364	0.1351	1.9715	0.4915	0.1345	0.6260	0.0000	3,335.6863	3,335.6863	0.1153	0.0000	3,338.5687
2035	9.7373	6.7438	13.9369	0.0375	1.8364	0.0841	1.9206	0.4915	0.0835	0.5750	0.0000	3,320.2469	3,320.2469	0.1079	0.0000	3,322.9447
Maximum	14.7171	62.9666	51.1797	0.0866	121.8430	2.8836	124.6540	55.3606	2.6747	58.0160	0.0000	8,064.6856	8,064.6856	1.7094	0.0000	8,072.6545

Because the DEIR relies upon the emission estimates provided above to determine the significance of the Project's VOC, NO_x, and CO-related air quality impact (Table 5.11-9, p. 5.11-44), the DEIR should have also used the PM10 and PM2.5 emission estimates demonstrated in the table to determine the significance of the Project's PM-related air quality impact. The emissions estimates provided in Table 5.11-9 of the DEIR, however,

14 CalEEMod website, *available at*: http://www.caleemod.com/

indicate that annual PM emissions generated during Project construction would produce a maximum of approximately 12 tons/yr of PM10 emissions and approximately 7 tons/yr of PM 2.5 emissions, not 125 tons/yr and 58 tons/yr, as estimated by the DEIR's air pollution model (see excerpt below) (DEIR, p. 5.11-44).

TABLE 5.11-9
AVERAGE YEAR ESTIMATED ANNUAL CONSTRUCTION EMISSIONS (AVAQMD THRESHOLDS)

	Emissions (tons/year)					
Year	VOC	NOx	CO	SOx	PM10	PM2.5
Year 1	1	14	9	<1	9	5
Year 2	5	**56**	40	<1	12	7
Year 3	13	**63**	51	<1	12	6
Year 4	15	**58**	49	<1	12	6
Year 5	14	**53**	46	<1	11	6
Year 6	14	**48**	43	<1	11	6
Year 7	13	**43**	41	<1	11	5
Year 8	13	**39**	40	<1	11	5
Year 9	13	**37**	39	<1	10	5
Year 10	12	**32**	36	<1	10	5
Year 11	12	**32**	35	<1	10	5
Year 12	12	**31**	35	<1	10	5
Year 13	12	**31**	35	<1	10	5
Year 14	12	**31**	35	<1	10	5
Year 15	12	18	27	<1	9	4

AVAQMD Thresholds (Table 5.11-6)	***25***	***25***	***100***	***25***	***15***	***12***
Exceeds AVAQMD Thresholds?	**No**	**Yes**	**No**	**No**	**No**	**No**

lbs/day: pounds per day; VOC: volatile organic compound; NOx: nitrogen oxides; CO: carbon monoxide; SOx: sulfur oxides; PM10: respirable particulate matter with a diameter of 10 microns or less; PM2.5: fine particulate matter with a diameter of 2.5 microns or less; AVAQMD: Antelope Valley Air Quality Management District

Bold indicates emissions exceeding threshold

Source: AVAQMD 2016b (thresholds). Emissions calculations can be found in Appendix 5.11-A

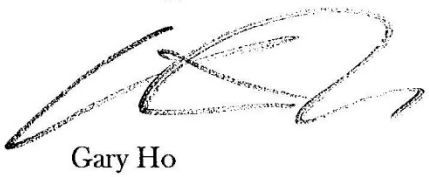
As demonstrated above, the DEIR relies upon a PM10 emissions estimate of 12 tons/yr – which is approximately 10 times lower than what was estimated in CalEEMod – and upon a PM2.5 emissions estimate of 7 tons/yr – which is approximately 8 times lower than what was estimated in CalEEMod – to determine Project significance. The DEIR fails to provide any evidence to demonstrate the origin of these emissions reductions, and as a result, we find the significance determination provided in the DEIR to be incorrect, as it artificially reduces the Project's construction PM10 and PM2.5 emissions to avoid a finding of significance. Because the DEIR fails to provide substantial evidence that indicates the origin of these reductions, the DEIR's reduced PM emissions cannot and should not be relied upon to determine Project significance. Therefore, additional mitigation measures

F.2-8 cont.

should be identified and incorporated in an updated DEIR to adequately address and mitigate the Project's potential air quality impacts.

F.2-8 cont.

Sincerely,



Gary Ho
Blum | Collins, LLP

Responses to Comment Letter F.2
Blum Collins, LLP on behalf of
Golden State Environmental & Social Justice Alliance
June 30, 2017

Response to Comment F.2-1:

This introductory comment is noted and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. The Project has committed to an extensive list of feasible air quality mitigation measures, as set forth Draft EIR pages 5.11-78 through 5.11-82. The mitigation measures will be incorporated into a Mitigation Monitoring and Reporting Program (MMRP) and meet the requirements of CEQA. All mitigation measures will be made conditions of approval of the Project and will be fully enforceable as required by CEQA section 21081.6(b). In response to comments received on the Draft EIR, MM 5.11-2 has been revised as discussed in responses to Comments F.2-2 and F.2-5 to further reduce the Project's VOC and NOx emissions. However, even with implementation of the revised MM 11-2, the Project's potential impacts related to VOC and NOx emissions remain significant and unavoidable based on quantitative emissions thresholds established by the South Coast Air Quality Management District (SCAQMD). The size of the Project is a major factor in the Project's exceedance of these quantitative thresholds, which apply to both large and small projects. However, in its comment letter on the Draft EIR, SCAQMD determined that the Project's proposed mix of land uses and Green Development Program "exemplifies the [County's] leadership in promoting sustainable communities development" and confirmed its view "that the proposed project supports the goals of the 2016 [Air Quality Management Plan] and will help reduce emissions from mobile sources, protect the public health from air pollution, and achieve healthful air in the [South Coast Air] Basin." (See Comment D.4-2.)

The Air quality impacts of associated with development and operation of the Project and related cumulative development were also considered in Section 5.3 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.3 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035). Please refer to those documents for additional information on the topic.

Response to Comment F.2-2:

In regard to the comment's request that the Project be required to utilize low VOC coatings, this comment misstates the text of the Draft EIR. The Draft EIR does not state that "the Project will use paints with an average VOC content that 'would not exceed 50 grams per liter (g/L) for all interior surfaces, 100 g/L for residential exterior surfaces, and 150 g/L non-residential exterior surfaces.'" Rather, the Draft EIR explains that its air quality analysis assumed that the VOC content of the Project's architectural coatings would not exceed such stated amounts.[304] Furthermore, as recommended by this comment, the Draft EIR explains

[304] DRP 2017, p. 5.11-43

that the Project is required to use architectural coatings that are compliant with Antelope Valley Air Quality Management District Rule 1113 and South Coast Air Quality Management District (SCAQMD) Rule 1113, which impose strict restrictions on the VOC content of architectural coatings used within each district. Reducing the VOC content of architectural coatings is among many ongoing regulatory and scientific undertakings to reduce VOC emissions, but until these materials have been approved by the appropriate expert regulatory agencies it is not legally feasible for the Lead Agency to mandate use of only those architectural coatings with the lowest VOC content. Although VOC emissions remain significant and unavoidable, given the limited jurisdiction and control of the Lead Agency in regulating the VOC content of architectural coatings, mitigation measures mandating use of architectural coatings with "Zero-VOC" content is not required by CEQA.

However, as noted by the Commenter, the SCAQMD has published a list of companies that have informed SCAQMD that they manufacture one more "Super-Compliant Architectural/Industrial (AIM) Coatings" with VOC contents well below the regulatory limits of SCAQMD Rule 1113.[305] The SCAQMD website clarifies, however, that "[t]he SCAQMD's listing of these manufactures does not constitute or imply an endorsement by the SCAQMD nor does it certify their ability to meet the requirements of Rule 1113 Architectural Coatings." In light of SCAQMD's acknowledgement that there may be "Super-Compliant Architectural/Industrial (AIM) Coatings" on the market with VOC contents well below the regulatory limits of SCAQMD Rule 1113, the use of which could further reduce the Project's VOC emissions, MM 11-2 is hereby revised to add the following bullet point to its existing list:

- <u>Construction contractors shall use Super-Compliant Architectural/Industrial (AIM) Coatings to the extent that they are commercially available and certified to meet the applicable requirements of Antelope Valley Air Quality Management District Rule 1113 and South Coast Air Quality Management District Rule 1113.</u>

In response to this comment, the following documents are added to the administrative record:

South Coast Air Quality Management District (SCAQMD). 2017 (August). Super-Compliant Architectural Coatings Manufactures and Industrial Maintenance Coatings List. http://www.aqmd.gov/home/regulations/compliance/architectural-coatings/super-compliant-coatings.

South Coast Air Quality Management District (SCAQMD). 2017 (August). Super-Compliant Coating Manufactures. http://www.aqmd.gov/docs/default-source/planning/architectural-coatings/super-compliant-manf-list.pdf?sfvrsn=19.

[305] South Coast Air Quality Management District (SCAQMD). 2017 (August). Super-Compliant Coating Manufactures. http://www.aqmd.gov/docs/default-source/planning/architectural-coatings/super-compliant-manf-list.pdf?sfvrsn=19.

Response to Comment F.2-3:

In regard to construction materials that do not require painting, construction at the Project site must comply with all applicable legal requirements, including Building Codes and other standards that specify required building materials. Reducing the VOC content of building materials is among many ongoing regulatory and scientific undertakings to reduce VOC emissions, but until these materials have been approved by the appropriate regulatory agencies it is not legally feasible for the Lead Agency to mandate use of only those construction materials with the lowest VOC content. Likewise, mitigation measures that mandate interior and exterior surfaces be left unpainted are not feasible, as explained below.

CEQA Guidelines section 15364 defines the term "feasible" to mean "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, legal, social, and technological factors." As explained in Draft EIR section 5.13, *Visual Resources*, the Project's impact on visual resources will be minimized by implementing the Design Principles as outlined in Appendix 2-B of the Specific Plan.[306] At buildout of the Project, it is anticipated that the full range of building architecture, colors, and roofing materials would be represented on the Project site and that all buildings will be designed in a manner consistent with the Deign Principles. The ultimate building materials and colors would be determined at the time individual elements of the Project are submitted for building permits.

As discussed and depicted in Section 2-B of the Specific Plan, the Design Principles are founded on traditional and timeless American town planning principles that respect the natural setting by using resource efficient materials and a variety of earth tone colors. A mitigation measure that mandates that exterior surfaces be left unpainted would conflict with the Design Principles and undermine their mitigating effect with respect to the Project's visual impact, thus exacerbating the Project's significant and unavoidable aesthetic impact. The social and environmental benefits of the Design Principles would be lost with implementation of a mitigation measure that prohibits painting exterior Project surfaces. Moreover, it is unlikely that a mitigation measure that mandates that interior surfaces be left unpainted would be effective or quantifiable because future residents and business owners would likely decorate the interiors of their homes and business according to their personal tastes. Moreover, such a mandate would be unenforceable because the Lead Agency lacks the resources and legal authority to regulate the manner in which individual homeowners and business owners decorate the interior of their private properties using paints and coatings legally available on the commercial market. Accordingly, this comment's recommended mitigation measure is not required by CEQA because it is infeasible, taking into account legal, environmental and social factors.

See, also, Section 5.3 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.3 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

306 DRP 2017, p. 5.13-24

Response to Comment F.2-4:

This comment requests that the Draft EIR include a new mitigation measure regarding coating and adhesive spray equipment. As this comment correctly notes, the current air district regulations already require the Project developer to use a specific type of spray equipment that has been certified by the air district. For example, South Coast Air Quality Management District (SCAQMD) Rule 481(c)(2) prohibits persons from operating any spray painting or coating equipment unless coatings are applied with high-volume, low-pressure (HVLP) spray, electrostatic and/or equipment that has been certified by SCAQMD. As this comment also notes, since 1989, SCAQMD authorizes the manufactures or users of spray equipment that has not been certified by SCAQMD as compliant with Rule 481 to apply for such certification, which certification will be granted if the equipment has an efficiency rate that is equivalent to SCAQMD standards (i.e., 65 percent or greater).[307] The Project, however, does not propose to use spray equipment that has not already been certified by the air district as compliant with applicable air district regulations. Accordingly, this comment's proposed mitigation is unnecessary, as it would not offer substantial environmental benefits beyond those that will already occur with the Project's adherence to all applicable air district regulations.

Response to Comment F.2-5:

This comment summarizes that Draft EIR's determinations regarding certain Project effects related to VOC and NOx emissions and concerns related mitigation measures identified in the Draft EIR. The Project has committed to an extensive list of feasible air quality mitigation measures, as set forth Draft EIR pages 5.11-78 through 5.11-82. The mitigation measures will be incorporated into a Mitigation Monitoring and Reporting Program (MMRP) and meet the requirements of CEQA. All mitigation measures will be made conditions of approval of the Project and will be fully enforceable as required by CEQA section 21081.6(b).

MM 11-2 requires that all off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 4 final emission standards to the extent that equipment is available, and if Tier 4 equipment is not available the applicant must provide the County with documentation that demonstrates the reasons for non-availability. In cases of documented shortage of Tier 4 equipment, Tier 3 equipment may be used, but only in accordance with the County's Green Construction Policy

In regards to this comment's identification of certain selective catalytic reduction (SCR) retrofit devices that are purportedly available for use in conjunction with Tier 3 engines in the event an insufficient number of Tier 4 vehicles can be obtained to serve the Project, the Lead Agency notes that MM 11-2 provides that "all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by the California Air Resources Board (CARB.)"[308] Accordingly, the Project would be required to use SCR devices on construction equipment, to the extent they have been certified by CARB. Moreover, MM 11-2 requires that any emissions-control device used by the contractor must achieve

307 SCAQMD 2017b
308 DRP 2017, p. 5.11-78

emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

To date, CARB has not certified any SCR devices for construction equipment for NOx reduction, however, some SCR devices for construction equipment have been certified by the Environmental Protection Agency for NOx reduction.[309] In response to this comment, the text following the first and second bullet points set forth in MM 11-2 is hereby revised as follows:

- All off-road diesel-powered construction equipment greater than 50 horsepower shall meet U.S. Environmental Protection Agency (USEPA) Tier 4 Final emission standards to the extent that the equipment is available. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by the California Air Resources Board (CARB) or the U.S. Environmental Protection Agency (USEPA). Any emissions-control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. If Tier 4 Final equipment is not available, the Project Applicant/Developer shall provide the County with documentation showing the reasons for non-availability.
- Alternatively, construction equipment may be selected according to the Green Construction Policy used by the Los Angeles County Metropolitan Transportation Authority or the ports of Los Angeles/Long Beach. These policies include provisions to 'step down' from Tier 4 equipment to Tier 3 or Tier 2 if specified criteria are met. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by the California Air Resources Board (CARB) or the U.S. Environmental Protection Agency (USEPA).

In response to this comment, the following documents are added to the administrative record:

California Air Resources Board (CARB). 2017b (August 13, 2017, last accessed). Verification Procedure – Currently Verified Diesel Emission Control Strategies. Sacramento, CA: CARB. https://www.arb.ca.gov/diesel/verdev/vt/cvt.htm.

U.S. Environmental Protection Agency (USEPA). 2017b (August 13, 2017, last accessed). Verified Technologies List for Clean Diesel. Washington, D.C.: USEPA. https://www.epa.gov/verified-diesel-tech/verified-technologies-list-clean-diesel.

Response to Comment F.2-6:

As discussed in response to Comment F.2-5, MM-2 requires that all off-road diesel-powered construction equipment greater than 50 horsepower used at the Project site must meet U.S.

[309] CARB 2017b; USEPA 2017b

Environmental Protection Agency Tier 4 Final emission standards to the extent that the equipment is available. In addition, all construction equipment shall be outfitted with Best Available Control Technology devices certified by the California Air Resources Board or the U.S. Environmental Protection Agency. The performance standard described in MM 11-2 already accommodates the Project's use electric and hybrid engine construction equipment of the type recommended by this comment. Accordingly, further revision is unwarranted. As confirmed by CARB's 2016 Mobile Source Strategy, technological innovation in the field of low-NOx and low-emission engines across multiple weight classes is rapidly evolving, spurred in large part by California regulatory policy that mandates steep emission reductions in all sectors of the economy, including construction.[310] In light of this fast changing field, and taking into account the Project's 20-year buildout horizon, MM 11-2 is designed to be agnostic with respect to any particular technology that must be used during Project construction in order to accommodate the use of new technologies as they may become available over the life of the Project's construction period. This comment's recommendations regarding the Project's use of electric powered, and electric hybrid, construction equipment is noted and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment F.2-7:

This comment requests that the proposed mitigation measures described in Comments F.2-1 through F.2-6 be added to the EIR. Please see responses to Comments F.2-1 through F.2-6. With respect to this comment's assertion that the Project demonstrate a commitment to implementation of the mitigation measures identified in the Draft EIR, all such mitigation measures will be made enforceable conditions of Project approval and will be included in the enforceable Mitigation Monitoring and Reporting Program adopted for the Project, as required by CEQA.

Response to Comment F.2-8:

The Project's annual PM10 and PM2.5 emissions were adjusted in the EIR to account for an error within the CalEEMod modeling. At the time the EIR was prepared, the CalEEMod model overestimated the annual emissions from fugitive dust proportional to the number of years of the construction period. While annual construction emissions for vehicle exhaust were calculated correctly, the calculation of fugitive dust emissions was flawed. This flaw is easily demonstrated with test runs using the same inputs for the quantity and types of equipment. The only variation to these test runs would be the duration of construction of phase. If sensitivity runs are conducted for a full year, 5-year and 10-year periods, the fugitive dust emissions provided within the CalEEMod output was erroneously calculated as a cumulative total of all analyzed years instead of emissions for a single year. For instance, the fugitive dust emissions for a 1-year period would be the same while emissions for a 5 and 10 years would be 5 and 10 times higher on an annual basis than that calculated for a 1-year period even for the same level of annual equipment activity. The AVAQMD emissions thresholds are based on annual emissions for a single year and not a cumulative total of all analyzed years. As such, the analysis of potential air quality impacts related to PM10 and PM2.5 for the

[310] CARB 2016

Project were not underestimated, as stated by the Commenter, but were appropriately adjusted to account for the error within the CalEEMod modeling. An email was sent by Psomas to Barbara Radlein of the SCAQMD on August 8, 2017 with a description of the identified error. On August 15, 2017, Sam Wang of the SCAQMD confirmed by telephone that there is an issue with the CalEEMod model related to error identified by Psomas. The SCAQMD has contacted the program developer Trinity Consultants to identify the cause of the issue. This error in the CalEEMod model has been corrected, as can be verified by reviewing the list of revisions and additions included in CalEEMod version 2016.3.2, which is available under the "FAQ" tab on the CalEEMod website[311] and includes the following entry: "Fixed miscalculation of the annual fugitive dust emissions for PM10 and PM2.5 (bug caused emissions to be overestimated for projects with multiple construction years)." Accordingly, this comment's claim that construction air quality impacts are underestimated in the EIR to avoid a finding of significance as stated by the Commenter is inaccurate.

In response to this comment, the following is hereby added to the administrative record:

TriCounty Watchdogs PO Box 6407 Frazier Park, CA 93222

13 July 2017

Mr. Jodie Sackett
County of Los Angeles Department of Regional Planning Hall of Records, 13th Floor Room 1348
320 West Temple Street Los Angeles, California 90012
JSackett@planning.lacounty.gov

Re: Comments on the Centennial Project Draft Environmental Impact Report of May 2017
State Clearinghouse No. 2004031072

Dear Mr. Sackett,

The Tri-County Watchdogs, an organization that focuses on promoting responsible growth in the Mountain Communities where Kern, Los Angeles and Ventura Counties meet, thanks you for the opportunity to comment on the Centennial Draft Environment Impact Report. F.3-1

We must, however, begin by saying that it was extremely difficult to access the information in this large report since CDs were not sent out and internet access in our rural mountain area has low bandwidth. It was impossible for our group to thoroughly read through the 2000 pages of the report, not to speak of the thousands of pages of appendices. We asked in writing for an extension only to learn that you were out of your office until two days ago. It seems to us that perhaps Los Angeles County Planning Department did not truly desire informed community feedback. Otherwise, another month's extension would have been granted when it was orally requested on June 29. The meeting on June 29, which surprised everyone by being a hearing rather than an information session, would have been better noticed. Tejon Ranchcorp (TRC) would have been asked to pay for the sending of hundreds of CDs. F.3-2

Nevertheless, we shall persevere. We must, for we are alarmed by the huge size of a proposed development in an area where **water** is scarce, where healthy **air** is already threatened by a cement plant as well as pollution drifting over from **traffic** on the I-5 recent and recent developments in the Santa Clarita valley, and where many precious species of wildlife share an endangered **bioregion** of native California grassland. Furthermore, as experienced Californians living in an adjacent area whose geology we did not know when we bought homes here, we cannot forget the **earthquake** danger to new human residents living en masse in a fault-ridden zone. F.3-3

WATER

Creating a new city of nearly 60,000 residents is a bad idea in an arid area that is likely to suffer severe drought conditions for many years, if not permanently. We note that very many people and communities in our adjacent region (Frazier Park area) are suffering because of dry wells, and that sag ponds in Gorman were dry by June.

Over the past 14 years, Tejon Ranch Company/Tejon RanchCorp (TRC) has scrambled to cobble together enough sources of water to make it through the 20 year span required by Senate Bill 221 [ref page 5.18.11]. On paper it appears to have done so, assuming normal--that is, a repetition of the past 20 year history-- cycles of wet and dry years. However, as Climate Change wreaks havoc with weather patterns all over the world, our idea of normal is today highly contested. What if Southern California endures another ten-year (or longer) drought period on top of the one that has recently lowered groundwater levels all over the state? Where will the thirsty residents of the Antelope Valley get their water when there are 547,000 of them as opposed to the roughly 400,000 there now? F.3-4

In this worst-case scenario, even the DEIR expresses some doubt both within and after the 20-year period (which actually ends in 2035 since the preparation of the DEIR has taken two years).

1634 acre feet per year (afy), or roughly 25% of the potable water needed at buildout (6788 afy) is expected to come from groundwater from the eastern Antelope Valley Groundwater Basin, to which TRC is now entitled because of the Judgment and Physical Solution of December 2015. The DEIR presumes that this 1634 afy will be constant through wet and dry and multiple-year drought years. However, as the Peer Review of Kennedy Jenks Consultants points out, "It is not clear from the Judgment and Physical Solution whether this is a sound assumption even though the allocation is related to the safe yield determination for the Basin and should be confirmed by the Watermaster Engineer" [App 5.18.G. p.17]. F.3-5

As we noted in our comments on the Hauled Water Initiative last fall, the Antelope Valley Basin and the small Acton Basin are already pumped to capacity, and the Santa Clara River Basin, which might have surplus to pump, has been contaminated by perchlorate. There is a risk in all three basins that increased pumping will increase concentrations of dissolved solids as well as other dangerous elements (Hauled Water Initiative WSA pp.7-9). F.3-6

Extended droughts could affect not only the groundwater but also the SWP surface water that the DEIR counts on. What would ten years of a 5% allocation do to the Project's calculations? I would hope that the County will employ the services of a trained hydrologist to tell them. F.3-7

The Antelope Valley Regional Integrated Water Management Plan (AVIRWMP), which hopes to accomodate the updated Antelope Valley Area Plan, discusses *potential* (not actual) extra sources of water on 5.18 pp.36-7, but concludes that "The General Plan Update Final EIR determined that the lower residential and related development associated with the AVAP update would reduce future water demand, but that the plan's water supply impacts would F.3-8

nevertheless remain *significant and unavoidable* (DRP 2015c). In other words, there will not be enough water for a projected 405,410 population (General Plan) much less the 547,000 projected if the Centennial Project is approved.

F.3-8 cont.

If we assume that in worst case multiple-year drought conditions water will be purchased from well outside the area, for example, northern California (which has just emerged from drought), Washington State, or eastern Nevada, southern Idaho, or some part of the United States that is experiencing flood instead of drought, the cost will be prohibitive. If rates double, triple, quadruple over twenty or thirty years, middle class home owners will be left with unsellable property that they cannot afford to live in. The needs of current and future residents must come ahead of profits for out-of-state investors like the east-coast consortium that owns Tejon Ranchcorp.

F.3-9

In addition, the DEIR's Water Supply Analysis (WSA) does not take fully into account the amount of water that will be needed for fire suppression. According to DEIR 3.0 [p.3-14] and 5.3.3, The Los Angeles County Fire Department has designated the Antelope Valley area, including the Project site, as a VHFHSZ, that is "highly vulnerable to wildfire." Drought has extended the fire season by a couple of months, and so far this year wildfires havc consumed twice as much acreage as last year. Earlier this week, CNBC reported that 6000 firefighters were battling 14 wildfires in California, three major ones in southern California. Studies need to be done on the volume of water that would be needed for this purpose. (We also note that fire fighters are already stressed to their limits fighting fires, and a significant amount of tax money would need to be invested in new hires and equipment.)

F.3-10

BIOLOGICAL RESOURCES

Grasslands:

The Centennial City Project, which is not an expansion of nearby urban or suburban cities or towns but rather the intrusion of almost 20,000 homes and more industry and commerce into natural and rural lands, proposes to destroy over 9,000 acres of California grassland. Native perennial bunch grasses of several species are found throughout the grasslands, up to over 30% coverage, which is very high for present California grasslands. This grassland harbors many native grassland-dependent animals and plants: it is home to pronghorns, elk, badger, burrowing owls, grasshopper sparrow, California condor and many other native wildlife, several of them endangered already.

F.3-11

The DEIR indicates that depredation of these grasslands will be reduced to insignificant levels by on-site and off-site designations of mitigation lands. However, the lands mentioned include lands already marked as green belts within the projects and lands previously set aside in the Tejon Conservancy agreement. The reality is that this Project, when built-out, will result in the permanent loss of some of California's last and best grassland habitat, including major stands of native bunchgrass species.

F.3-12

Burrowing owl: Section 5.7 (Special Status Wildlife Species Observations with Impact boundary - after page 142):

The above-referenced map in the DEIR indicates one location within the Project footprint with evidence of burrowing owl presence. This is very difficult to believe.

One of the members of TCW worked as a biological monitor on Tejon Ranch property immediately north of the project representing DWR during the construction of the Tehachapi East Afterbay(TEA) in 2005. One of the pre-construction activities involved the location of burrowing owl activity, installation of one-way doors in active burrows outside the nesting season and construction of artificial burrows in nearby locations off the construction site.

During the field activity, many indications of burrowing owl activity were noted, including sightings of birds, and various evidences of recent activity at burrows. California ground squirrel activity was concentrated around wild cucumber vines. Burrowing owls were also found in these locations.

The majority of the Centennial City footprint consists of grasslands of the type found at the TEA site. We find that only one location for burrowing owl in the entire 12, 000+ acres of the Project site is incredible. We suggest that thorough field surveys be conducted for burrowing owl so that appropriate measures can be taken.

The paucity of burrowing owl records for the Project site suggests that field surveys for other wildlife species may also not have been adequate.

F.3-13

Tri-colored blackbird Section 5.7 [pages 149 -150]:

The DEIR acknowledges that this species is presently a Candidate State-listed species that receives the same legal protection afforded to an endangered or threatened species.

The DEIR acknowledges that Project's biological surveys determined that tri-colored blackbirds have been nesting at four nearby off and on-site locations whose foraging ranges would include the Project lands.

The DEIR acknowledges that tri-colored blackbirds are known to forage as much as five miles from the nesting colonies.

The DEIR states that analysis has produced a figure of 8% reduction in suitable foraging area for the above four potential nesting locations.

For the Quail Lake colony and the one on-Project-site colony, analysis given in the DEIR indicates a potential loss of 20% foraging for these two colonies.

The DEIR's claim that Mitigation Measure 7.7 (enhancement and preservation of existing wetlands) will reduce the Project's impact on the tri-colored blackbird to a "less than significant" level is untrue.

F.3-14

TCW has developed considerable knowledge of the Quail Lake tri-colored blackbird (TCBL) nesting colonies. Up to 1000 and possibly 2000 adults have nested at Quail Lake during 2015, 16 and 17. We have no information prior to 2015. Most of the colonies have been on the north side next to the Centennial City Project. Observations indicate that TCBL adults conduct

F.3-15

most of their foraging during nesting season northwards into Tejon Ranch within the Centennial City proposed project land. We have a collection of photographs to support these observations. F.3-15 cont.

Tri-colored blackbirds are intensely colonial. The females in each colony are known to ovulate simultaneously. The males who are feeding the females and young forage in tight flocks. The males at the Quail Lake colonies have been observed flying from the colonies on the north shore northwards through Tejon Ranch fields over the first ridge 1/3 mile north of the lake, then returning all together from an unknown destination in a few minutes with insects in their mouths. It is apparent from the time lapse that foraging was taking place within Village #9 location of Centennial City Plans. F.3-16

The DEIR indicates a percentage of foraging reduction based based on a five-mile hypothetical radius of 8% (20% for Quail Lake colonies). This figure is very dubious. Our impression is that the Quail Lake colonies probably do most of their foraging on the fields that are to be bulldozed by the Project. F.3-17

It is very likely that the build-out of Village #9 north of Quail Lake will permanently destroy the colonies of tri-colored blackbirds at Quail Lake. This is in direct violation of the California Fish & Wildlife requirement to protect existing breeding colonies of this species. F.3-18

Mitigation Measure 7.7 indicates that any disruption of nesting caused by the Project will be mitigated by the enhancement and preservation of existing wetlands. There is no assurance that this activity will create a replacement for the destroyed nesting colonies. Therefore, the DEIR proposes to destroy the colonies first, then hopefully the colonies will accept adjacent wetlands. This is not a reasonable plan for the protection of a listed species. F.3-19

Implementation of MM 7.7 would **not** reduce the negative impact on nesting of tri-colored blackbird immediately adjacent to the Project to a level considered less than significant. F.3-20

Furthermore, the Project's proposal to move the National Cement Plant road [DEIR 4-39] may also damage foraging areas of the breeding tri-colored population.Specifics and a map showing the proposed new route would be essential in order to evaluate the environmental affects, are missing. Our guess is that the new route would either traverse open space north and west of Village #1 or run south of Village #1 just north of Quail Lake. Either way, this realignment will increase the disturbance of natural grassland and tri-colored blackbird foraging area. F.3-21

Mitigation: Before moving the National Cement Plant road TRC needs to provide a map, and it needs to calculate the negative affects on the open space, the grasslands and and various flora and fauna. It then needs to submit its calculations for public input. F.3-22

Bioregion connectivity

Section 5.7 (See Exhibit 5.7-15 after page 172):

Significant Ecological Area 17 (SEA 17), as shown on Exhibit 5.7-15, would form a coherent polygon if not interrupted by the footprint of Centennial City Project Plan. Most of the area within the Centennial City footprint is consistent with the biotic communities of the adjacent SEA 17 lands. F.3-23

Centennial City Project will seriously disrupt the connectivity of major bioregions between Tehachapi Mountains and the San Gabriel mountains (Liebre Mountain) to the south. This location represents the intersection of more bioregions than any other location in California: San Joaquin Valley, Tehachapi Mountains(southern end of Sierra Nevada), Mojave Desert, Transverse Ranges, Coast Ranges, and the Southern California Coastal Plains.

The DEIR has not adequately considered this major disruption of California's natural bioregions.

F.3-23 cont.

In addition, although the Centennial City Project has been designed with open spaces, most of these open spares are narrow polygons that run east-to-west (see Exhibit 4-6, page 4-29). This allignment is exactly the opposite alignment needed to facilitate connectivity between the sections of SEA 17 north and south of the Project location. The placement of green belt open spaces should have been aligned in connection with existing natural conditions. This issue needs to be revisited.

F.3-24

The DEIR does describe an underpass at Highway 138 which is designed to accomodate some wildlife. However, this feature does not provide true connectivity in this region.

F.3-25

Bird Migration:

The DEIR fails to mention the possible affects of the Centennial City project on local bird migration.

F.3-26

Local observers and photographers have documented the regular seasonal passage of many species of native birds in the Quail Lake regions. These experienced observers, photographers and other chroniclers of birdlife have determined that there is a regular seasonal migration of landbirds and waterbirds through the location of the Centennial City Project. In the opinion of these observers, there is a migratory route that passes northward from Mexico past Salton Sea, through Antelope Valley, past Quail Lake, through the Grapevine Canyon into San Joaquin Valley and on northwards. This route is used both during the spring and fall migration periods.

F.3-27

The final EIR needs to address the affect of the build-out of the project, including the subsequent widening of Highway 138 and the proposed shifting of the National Cement Road, on migration movements of birdlife. This study needs to include the affects of lights, sounds, habitat destruction and alteration and other features.

F.3-28

AIR

Valley Fever:

The DEIR states that the risk of VALLEY FEVER (which is discussed in 5.3, pp. 14-15, and 5.11 pp 65-67) will be controlled by measures that include" watering exposed surfaces and haul roads three times daily; replacing ground cover in disturbed areas quickly; covering stock piles with tarps; and limiting speeds on unpaved roads to 15 miles per hour." In addition, near-by "residents would be provided with a notice disclosing this potential risk and describing strategies to avoid potential exposure to Valley Fever spores during construction or other earth-moving

F.3-29

activities prior to sale, lease, or rental of any property." This is not enough, for there is new evidence that spores can travel farther than the DEIR assumes.. F.3-29 cont.

We therefore suggest that in addition to the above **mitigation** measures, the following be adopted:
1. Tent construction areas with mesh of the kind TRC is currntly using to keep dust and winds off berries in Bakersfield area east of the 99.
2. Extend the radius of notification to include Gorman school and all schools in Lebec and Frazier Park F.3-30

Furthermore, measures to protect construction workers beyond "requiring that respirators or masks be worn" must be specified. We suggest the following **mitigations**:
1.provide workers with either on-site showers and laundry facilities so that they do not carry spores home on clothing or
2. provide hazmat suits F.3-31

Construction workers: MM 3-2 describes measures such as; and completing other means of reducing the spread and/or inhalation of Valley Fever spores, if present.
While construction workers would be at highest risk, on-site populations would also be at risk for exposure during interim phases of development, depending on the proximity to on-site construction activities. As described in PDF 3-1 and ensured by MM 3-3, all Therefore, with implementation of PDF 3-1 and MMs 3-1 through MM 3-3, the potential for exposure to Valley Fever spores from construction of the Project would be less than significant. [p.5.3-15] F.3-32

Air Quality

It is clear from the discussions in 5.11 [Air Resources] and 5.3-41-2 [Level of Significance after Mitigation] that during construction and after build-out of the proposed project, levels of air pollution would rise to unacceptable levels, causing illness, disability and premature death to the inhabitants of the Antelope Valley. As the DEIR states, no mitigation exists that can bring to levels required by the South Coast Air Quality Management District and the Antelope Valley Air Quality Management District the daily emissions of VOC [Volatile Organic Compounds that lead to the formation of ozone, which triggers chest pain, coughing, throat irritation, and congestion, worsens bronchitis, emphysema, and asthma, and can inflame the linings of the lungs and even, with repeated exposure permanently scar lung tissue], NOX [Nitrogen Oxides that cause airway inflammation and increase asthma], CO [Carbon Monoxide, which deprives tissues of oxygen], PM10 and PM2.5 [inhalable coarse and fine Particulate Matter that aggravate asthma, cause heart attacks and decreased lung function, cause premature death in people with weakened hearts or lungs]. F.3-33

Faced with this disaster, which will also accelerate Climate Change [see 5.21] we request an additional **mitigation**[to those in 5.11.8 pp, 78-82] :
1. require solar panels on all residential and commercial buildings F.3-34

We note that this is also a mitigation to 5.20 [Dry Utilities/ Electricity] F.3-34 cont.

Contra the statement on p. 5.3.21 that, " there is no evidence that either historic or regular operations at the NATIONAL CEMENT PLANT or on the realigned National Cement Plant Road have or would adversely impact the Project," we believe that Cement plant dust will harm new residents.
We therefore request another **mitigation**: TRC must reduce and control the blasting and particulate matter before large numbers of new homes are built only one or two miles away. F.3-35

Traffic:

1. Widening the 138 will be a disaster to biological resources. The northwestern part of the Antelope Valley has been designated a very Significant Ecological Area, and it would be difficult not to leave a major impact on these important lands even with the mitigations TRC has proposed. F.3-36

2. Moving the National Cement Plant road [DEIR 4-39] may also be a disaster to biological resources.

We cannot find a map of the proposed new route in the DEIR. which would be essential in order to evaluate the environmental affects. Our guess is that the new route would either traverse open space north and west of Village #1 or run south of Village #1 just north of Quail Lake. Either way, this realignment will increase the disturbance of natural grassland and tri-colored blackbird foraging area. F.3-37

TRC needs to provide a map, and it needs to calculate the negative affects on the open space, the grasslands and and various flora and fauna.

3.. As a **mitigation** of expected traffic in Antelope Valley and the I-5, we request the TRC contribute a fair share to repair the Ridge Route from Castaic to the 138 so that it becomes a viable alternative to the 5. F.3-38

Earthquake: We point out the obvious: it is unwise to build on top of so many faults.
If building must occur, we request the following **mitigation**:
1.Sellers of lots and home must be required to notify new owners of nearness to Garlock,San Andreas, and the two newly discovered unnamed faults. F.3-39

The proposed Centennial project would unleash significant and unavoidable impacts on F.3-40

aesthetics, air, biological resources, archeological and paleontological resources, greenhouse gases and the quality of water (which is likely to be degraded by dense septic tanks and pollutants in storm run-off). All of these impacts, which the DEIR describes so well, should be enough to make Supervisors think long and hard–about their neighbors, their non-corporate constituents, and their own grandchildren–before approving this project.

Given all of the above, we ask the Supervisors *not* to make *an irretrievable commitment of water and biological resources*. Do not approve a project of 19,333 housing units that will create a lasting need for water that must nearly all be imported, that will necessitate paving precious grasslands in asphalt and concrete, and endanger with pollutants all nearby human, animal, and plant life

F.3-40 cont.

For the Tri-County Watchdogs:

Terry Kelling, President (Frazier Park, CA)
Katherine King, Secretary (Venice and Frazier Park, CA)
Lynn Stafford, Board member (Pine Mountain Club)

*Tri-County Watchdogs is a local grassroots organization based in the Frazier park area, whose mission is to protect natural and cultural resources, to promote ecotourism, and foster responsible growth in the local Mountain Communities. We formed to respond to concerns about our water supply, air quality, our cultural and historical heritage, economic opportunities, and the neglect of our area by the counties and state.

Responses to Comment Letter F.3
Tri-County Watchdogs
July 13, 2017

Response to Comment F.3-1:

The comment is an introduction to the commenting organization. No further response is required given that the comment does not raise a specific concern regarding the content of the Draft EIR.

Response to Comment F.3-2:

In addition to the hard copy of the Notice of Availability sent via overnight mail to residents and agencies, which contained a link to access the Draft EIR on the County's website, a hard copy of the Draft EIR was also available for review at the following libraries.

Lancaster Regional Library
601 West Lancaster Boulevard
Lancaster, California 93534

Quartz Hill Library
5040 West Avenue M-2

The Frazier Park Library (Kern County) and the Castaic Library (Los Angeles County) are located in the rural areas of the Tehachapi Mountains.

Additionally, the County extended the official review period by 30 days to end on August 16, 2017, making the Draft EIR response period a total of 90 days. The notice of time extension

was posted online[312] and emailed to all persons and parties who specifically requested a time extension.

The Hearing Examiner Staff Summary for the public hearing on June 29, 2017 was posted online on June 15, 2017.[313] The June 29, 2017 public hearing was also advertised in the local newspapers (*The Signal* and *Antelope Valley Press*) on May 17, 2017, and a public notice was posted on the Project site on May 25, 2017. The Hearing Examiner public hearing meeting was duly noticed.

Response to Comment F.3-3:

The Commenter's opinions are noted. The Applicant has the water required to serve the Project. The source of the water is discussed in Section 5.18, Water Resources. Air quality is discussed in Section 5.11, Air Resources. Traffic on the I-5 and the surrounding region is discussed in Section 5.10, Traffic. Wildlife species and native grassland are discussed in Section 5.7, Biological Resources. Seismic issues are discussed in Section 5.1, Geology. Greater detailed comments on these issues are more specific further in this letter and are responded to in much greater detail below.

Please also see Sections 5.3 (Air Quality), 5.6 (Geology and Soils), 5.9 (Biology), 5.16 (Transportation and Traffic) and 5.17 (Utilities and Service Systems) of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Sections 3.3 (Air Quality), 3.4 (Biology), 3.7 (Geology and Soils), 3.17 (Transportation and Traffic), and 3.18 (Utilities and Service Systems) of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment F.3-4:

This comment expresses an opinion about regional future water supplies and potential climate change impacts to water supplies. The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project. The comment does not address or question the content of the Draft EIR, and no further response is required. The following information summarizes the analysis of regional water supplies and climate change impacts to water supplies in the Draft EIR. Long term, cumulative regional water supplies are discussed in Draft EIR Section 7.0, Cumulative Impacts, pages 7-26 to 7-28 and in Section 5.18, Water Resources. The Draft EIR found that the Project's water supplies will sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet after buildout has been achieved. This surplus would persist over time based on an 82-year hydrologic period of record, including single dry and multiple dry years, and taking account of potential climate change impacts, prepared by the California Department of

312 Los Angeles, County of. 2017 (July 13). Notice of Time Extension of Public Comment Period for the Centennial Project Draft Environmental Impact Report. Los Angeles, CA: County of. http://planning.lacounty.gov/assets/upl/case/sp_02-232_pm060022-hearing-time-extension.pdf.

313 Los Angeles, County of. 2017 (June 15). Hearing Examiner Staff Summary: "Centennial Specific Plan Project." Los Angeles, CA: County of. http://planning.lacounty.gov/assets/upl/case/sp_02-232_pm060022-staff-report.pdf.

Water Resources in the State Water Project Delivery Capability Report (see Draft EIR, Appendix 5.18-C). As discussed in Draft EIR Sections 5.18 and 7.0, the Antelope Valley Area Plan and General Plan EIRs, prepared by the County, the EIRs concluded that current water supplies within the Antelope Valley would be sufficient to meet demand up to 2035 during average water years. The EIRs further noted that available water plans and projections, including the 2013 Antelope Valley Integrated Regional Water Management Plan, indicated that current supplies would not sufficient to meet dry and multiple-dry year demand by 2035. The EIRs found that while potential buildout of the Antelope Valley Area Plan and General Plan in the Antelope Valley region after 2035 could further increase regional water demand, there were no water supply projections extending after 2035. Consequently, the environmental impact reports found that cumulative impacts to regional water supplies would be significant and unavoidable because of the lack of projections for analyzing regional water supply sufficiency after 2035. The Draft EIR determined that the Project would help to reduce the water supply cumulative impact identified in the Antelope Valley Area Plan and General Plan EIRs because it would achieve water use efficiencies above existing average rates in the region and would ensure that the Project-related increment of future regional growth considered in the Antelope Valley Area Plan and General Plan EIRs would occur with a high level of water conservation, including state-of-the art household and irrigation installations and significantly enhanced recycled water use. Nevertheless, consistent with the Antelope Valley Area Plan and General Plan EIRs, the Draft EIR determined that potential cumulative water supply impacts would be significant and unavoidable.

The Project's water supplies are discussed in Section 5.18, Water Resources, of the Draft EIR and are separate from, and will not affect, the Frazier Park and Gorman area water supplies referenced in this comment. Climate change is discussed in Draft EIR Section 5.21, Climate Change; Section 1.6.21, Climate Change; Section 7.3.21, Climate Change; and in other topical sections of the Draft EIR, including Section 5.18, Water Resources. The analysis of Project water supplies utilizes the Early Long Term delivery reliability scenario published by the California Department of Water Resources in the 2015 State Water Project Delivery Capability Report. The Early Long Term delivery reliability scenario is utilized in the 2015 Urban Water Management Plan adopted by the Antelope Valley-East Kern Water Agency, the State Water Project contractor for Antelope Valley and for the Project. As discussed in Draft EIR Section 5.18, in contrast with the base scenario in the Delivery Capability Report, the Early Long Term scenario incorporates significant assumptions regarding potential climate change impacts, including 2025 greenhouse gas emission levels and a 15-centimeter sea level rise. As a result, the average year State Water Project delivery rate in the Early Long Term scenario is more conservative and lower than the Delivery Capability Report base scenario rate. Consistent with the Antelope Valley-East Kern Water Agency methodology used in the Agency's 2015 Urban Water Management Plan, the Early Long Term scenario is further modified to incorporate a single dry year delivery rate of 5 percent, lower than used in the Delivery Capability Report, to reflect delivery levels during the recent California drought. The Urban Water Management Plan was reviewed and determined to meet all California Water Code requirements by the California Department of Water Resources in March 2017. Consequently, the Draft EIR includes a discussion of climate change effects on water supplies that is consistent with the conservative Early Long Term scenario developed

in the Delivery Capability Report and the same scenario, with a reduced single dry year reliability level, used in the Antelope Valley-East Kern Water Agency's 2015 Urban Water Management Plan.

Response to Comment F.3-5:

The Project's use of 1,634 acre-feet per year of Antelope Valley Basin groundwater is consistent with the Antelope Valley Basin Adjudication Judgment and Physical Solution, which allocates rights to Antelope Valley Basin groundwater to sustainably manage the Basin's groundwater resources over time. Exhibit 4 to the Adjudication Judgment and Physical Solution allocates overlying production rights in amounts within the Basin's sustainable yield.[314] The Adjudication Judgment and Physical Solution provides that, after a 7-year rampdown period applicable to all basin groundwater users, the Tejon Ranch Company has an overlying production right of 1,634 acre feet per year, all of which will be provided to and utilized by the Project. The groundwater component of the Project's water supplies discussed in the Draft EIR is limited to the amount of the overlying production right of 1,634 acre feet per year allocated to Tejon Ranch Company in the adjudication. As discussed on page 5.18-20 of the Draft EIR, the 2013 Antelope Valley Integrated Regional Water Management Plan found that groundwater is considered to be a very reliable supply for the Antelope Valley region even in short-term and during multiple-year droughts. MM 18-2 requires implementation of water use monitoring and reporting, including the submission of water use reports to the County at the end of the 5th and 10th years or the occupancy of the 4,000th and 10,000th units, whichever occurs latest, to confirm that the water use efficiencies discussed in the Draft EIR are being achieved as the Project is built and that available water supplies are sufficient to meet future demand. If a report determines that water use is exceeding projected levels, the Project Water Purveyor must identify specific response measures to ensure that water supplies will meet future demand. Potential sources of additional supply, if necessary, are discussed on pages 5.18-69 to 5.18-72 of the Draft EIR and include potential groundwater transfers as allowed by the Adjudication Judgment and Physical Solution, supplemental surface water purchases and imports, and investments in additional recycled water use or storm water reuse in the Antelope Valley. No additional development will occur until sufficient supplies are identified. Consequently, if Project and other Basin groundwater use were to be reduced by the watermaster in the future, MM 18-2 ensures that the Project's potential long-term, cumulative impacts to the Antelope Valley Groundwater Basin groundwater supplies will be less than significant.

Response to Comment F.3-6:

The Project will not pump groundwater from, discharge to, or impact groundwater quality in the Acton or Santa Clara River Basins. The Project's use of 1,634 acre-feet per year of groundwater, production of imported water return flows from urban water use in the Antelope Valley Basin, and water banking operations in the Antelope Valley will comply with the Antelope Valley Basin Adjudication Judgment and Physical Solution, which was approved by the Superior Court in December 2015 to sustainably manage Antelope Valley

314 DRP 2017, Appendix 5.18-D

groundwater resources over time.[315] A watermaster will be appointed under the supervision of the Court to implement the Adjudication Judgment and Physical Solution. The Adjudication Judgment and Physical Solution prohibits water use that causes material injury, which is defined in Section 3.5.18 of the Judgment to mean impacts to the Basin caused by pumping or storage of groundwater that cause material physical harm to the Basin, any Basin subarea, or any producer, party or production right under the Adjudication Judgment and Physical Solution including degradation of water quality by introducing contaminants to the aquifer and/or transmission introduced contaminants through the aquifer. Section 18.5.8 requires that the Watermaster take all reasonable steps to assist and encourage appropriate regulatory agencies to enforce reasonable water quality regulations affecting the Basin. As a result, groundwater use, return flow production and banking/storage activities in the Antelope Basin, including by the Project will occur under the auspices of the Adjudication Judgment and Physical Solution and must protect groundwater quality as necessary to sustainably use and maintain the Basin. Project impacts to groundwater quality are discussed in Section 5.4, Water Quality, and would be less than significant with mitigation.

Response to Comment F.3-7:

This comment addresses the reliability of imported water supplies for the Project. The potential delivery reliability and variability of Project State Water Project supplies is discussed in Draft EIR Section 5.18, Water Resources.[316] The Draft EIR analysis of State Water Project supplies utilizes the 82-year model results for the Early Long Term delivery reliability scenario published by the California Department of Water Resources in the 2015 State Water Project Delivery Capability Report.[317] The Early Long Term delivery reliability scenario is also utilized in the 2015 Urban Water Management Plan adopted by the Antelope Valley-East Kern Water Agency, the State Water Project contractor for Antelope Valley and for the Project. The Early Long Term scenario incorporates more significant assumptions regarding potential climate change impacts than the Delivery Capability Report base scenario, including 2025 emission levels and a 15-centimeter sea level rise. The average year State Water Project delivery rate in the Early Long Term scenario is lower than the Delivery Capability Report base scenario rate. Consistent with the Antelope Valley-East Kern Water Agency methodology, the Early Long Term scenario was further modified to more conservatively evaluate Project water supplies by using a lower single dry year delivery rate of 5 percent than identified in the Delivery Capability Report. Consequently, the Draft EIR includes a discussion of climate change effects on water supplies that is consistent with the conservative Early Long Term scenario developed in the Delivery Capability Report and the same scenario, with a reduced single dry year reliability level, used in the Antelope Valley-East Kern Water Agency's 2015 Urban Water Management Plan. The comment does not address or question the discussion of the potential delivery reliability and variability of State Water Project supplies for the Project in the Draft EIR. The comment does not cite to any available information suggesting that State Water Project delivery levels could average 5 percent over a 10-year period. Table 6.4 in the Delivery Capability Report summarizes the average State Water Project delivery rates during the worst 2-, 4-, and 6-year droughts

315 *Ibid*.
316 *Id.,* 5.18-20 to -28, -54 to -64
317 *Id.,* Appendix 5.18-C

within the 82-year historical record for California maintained by the California Department of Water Resources. Table 6.4 shows that annual deliveries during these worst-case conditions ranged from an average of 28 percent (2-year drought) to 33 percent (4- and 6-year droughts). Consequently, the most severe drought-period delivery levels identified by the Department of Water Resources in the Delivery Capability Report for periods up to 6 years are substantially higher the 5 percent annual average suggested in the comment. No drought has persisted for longer than six years in the California Department of Water Resources historical record. The analysis of Project imported water supplies using the Early Long Term scenario in the Delivery Capability Report incorporates the effects of the most severe droughts during the 82-year historical record, plus additional adjustments to account for potential climate change effects and the 5 percent single dry year delivery level used by the Antelope Valley-East Kern Water in the Agency's 2015 Urban Water Management Plan. Consequently, the Draft EIR includes a discussion of State Water Project delivery reliability that is consistent with the conservative Early Long Term scenario developed in the Delivery Capability Report and the same scenario, with a reduced single dry year reliability level, used in the Antelope Valley-East Kern Water Agency's 2015 Urban Water Management Plan.

Response to Comment F.3-8:

This comment addresses long-term regional water supplies. Long term, cumulative regional water supplies are discussed in Draft EIR Section 7.0, Cumulative Impacts, pages 7-26 to 7-28 and in Section 5.18, Water Resources. The Draft EIR found that the Project's water supplies will sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet after buildout has been achieved. This surplus would persist over time based on an 82-year hydrologic period of record, including single dry and multiple dry years, and taking account of potential climate change impacts, prepared by the California Department of Water Resources in the State Water Project Delivery Capability Report.[318] As discussed in Draft EIR Sections 5.18 and 7.0 the Antelope Valley Area Plan and General Plan EIRs, prepared by the County, the EIRs concluded that current water supplies within the Antelope Valley would be sufficient to meet demand up to 2035 during average water years. The EIRs further noted that available water plans and projections, including the 2013 Antelope Valley Integrated Regional Water Management Plan, indicated that current supplies would not sufficient to meet dry and multiple-dry year demand by 2035. The EIRs also concluded that while potential buildout of the Antelope Valley Area Plan and General Plan in the Antelope Valley region after 2035 could further increase regional water demand, there were no water supply projections extending after 2035. Consequently, the EIRs found that cumulative impacts to regional water supplies would be significant and unavoidable because of the lack of projections for analyzing regional water supply sufficiency after 2035. The Draft EIR determined that the Project would help to reduce the water supply cumulative impact identified in the Antelope Valley Area Plan and General Plan EIRs because it would achieve water use efficiencies above existing average rates in the region and would ensure that the Project-related increment of future regional growth considered in the Antelope Valley Area Plan and General Plan EIRs would occur with a high level of water conservation,

318 *Ibid*.

including state-of-the art household and irrigation installations and significantly enhanced recycled water use. Nevertheless, consistent with the Antelope Valley Area Plan and General Plan EIRs, the Draft EIR determined that potential cumulative water supply impacts would be significant and unavoidable. Neither the Antelope Valley Area Plan and General Plan EIRs nor the Draft EIR found that there would not be enough water to serve future regional demand. The analyses found that impacts would be significant and unavoidable because of the lack of pertinent information and uncertainty regarding such supplies.

Response to Comment F.3-9:

This comment expresses an opinion regarding the possible costs of obtaining hypothetical water supplies, some of which include out of state sources that are not known to have provided significant municipal or other water supplies to California. The comment does not cite to any available information substantiating the feasibility and costs of obtaining these supplies, and further analysis of these issues would be speculative. The comment does not address or question the content of the Draft EIR and no further response is required. As discussed in Draft EIR Section 5.18, Water Resources, the Project's available water supplies would sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet after buildout has been achieved. None of the Project water supplies would be obtained from any of the sources included in the comment. The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project.

Response to Comment F.3-10:

This comment discusses water supplies for fire suppression. Fire flows are considered to be intermittent water uses that are accounted for in a project's water system losses or non-revenue water. As shown in Draft EIR Table 5.18-7, the Project demand includes a potable water system loss of 327 acre-feet per year at buildout, or just under 105 million gallons per year. The volume of fire flows for the Project is discussed on pages 5.3-35 and 5.3-36 of Section 5.3, Hazards and Fire Safety, in the Draft EIR. The Project's water system will provide water supplies to support proposed land uses and provide adequate fire flows and pressure to support any fire-suppression activity in the event of wildland or structural fires. The proposed water system includes water mains, water tanks, pump stations (where necessary), and fire hydrants to ensure sufficient fire flows and water pressure to meet County of Los Angeles Department of Public Works' and the Los Angeles County Fire Department's fire-suppression standards for improved property and development. These requirements must be met prior to the approval of building permits by the County. The fire flow demand for the Project is conservatively assumed to be 4,000 gallons per minute for a duration of 4 hours (approximately 1.0 million gallons) in each of the four water system pressure zones within the site. The system losses shown in Draft EIR Table 5.18-7 are several times greater in magnitude than the required fire flow volumes for the Project. In addition, water reserves to ensure that supplies are available to meet fire suppression demand when needed will be maintained in the onsite water bank and the offsite existing, adjacent water

bank that will serve the Project.[319] The Draft EIR found that the Project's water supplies would sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet, or more than 25.6 billion gallons. This level of reserve water supplies significantly exceeds the maximum fire flow demands for the Project area. Consequently, potential fire suppression water demand is accounted for in the Draft EIR analysis of Project water supplies.

Response to Comment F.3-11:

The grasslands, and the plant and wildlife species that compose them, as well as their regional value, are described in the Draft EIR on pages 5.7-25 through 5.7-27, 5.7-40 through 5.7-47, 5.7-62, 5.7-67, 5.7-107, 5.7-111, 5.7-113 through 5.7-118, 5.7-121, 5.7-126 and 5.7-127. Mitigation has been included in the Draft EIR to reduce impacts to these biological resources to a less than significant level (MM 7-10).[320] Cumulatively considerable significant impacts are acknowledged for the biological issues of native perennial grasslands and regional wildlife movement, as discussed on pages 7-15 through 7-17 in Section 7.0, Cumulative Impacts, of the Draft EIR. Please see responses to Comments B.4-34, B.4-35, B.4-36, B.4-37, B.4-56, B.4-57, and B.4-60 for further information.

Response to Comment F.3-12:

The Commenter is correct that the mitigation lands are within Tejon Ranch, for which a proactive mitigation agreement – the Tejon Ranch Land Use and Conservation Agreement (Ranch-Wide Agreement or TRCRWA) – was voluntarily agreed to by the Ranch and the State's leading environmental advocacy groups, including the Sierra Club, Natural Resource Defense Council, Audubon Society California, Endangered Habitats League, and the Planning and Conservation League.[321] Representatives of the State's principal environmental agencies, including, but not limited to, those charged with the protection of Biological Resources within the Resources Agency and the California Department of Fish and Wildlife (CDFW), also expressly recognize the mitigation value of preserved lands on Tejon Ranch and endorsed use of these lands to mitigate the planned Ranch development projects, including the Centennial Project. Exhibit R to the TRCRWA was a letter executed contemporaneously by the leaders of six State environmental and resource agencies, including the California Department of Fish and Game (now Fish and Wildlife) and the Resources Agency. That letter recognizes the unique value of Tejon's voluntary and proactive preservation agreement, agrees that lands preserved pursuant to the Agreement are allowed to be mitigation lands of future permitting of Tejon Ranch development projects, including the Centennial Project, and recognizes that land for which conservation easements are acquired via public funds may also be used as mitigation under designated circumstances. The letter provides in pertinent part:

[319] *Id.,* Appendix 5.19-A, p. 8-2
[320] *Id.,* p. 5.7-180 to -182
[321] *Id.,* pp. 4-45 to -46, 5.7-16

> *[W]e understand that of the approximately 270,000 acres comprising the Ranch, the Ranchwide Agreement would provide for the permanent preservation of at least 18,000 acres and for the option to preserve an additional 62,000 acres through the purchase of conservation easements, or potentially fee title, for an anticipated total of approximately 240,000 acres, or approximately 90 percent of the total Ranch acreage. Because of the many unique factors noted above, including the sheer magnitude of this conservation effort and the significant resource values attributed to this property, and in viewing the 240,000 acres in the Conserved Areas in a holistic manner, we expect that TRC will be allowed to use those Conserved Areas and corresponding natural resource values associated with these Conserved Areas to meet the land conservation and corresponding natural resources mitigation requirements for and the planned development and other activities within the Developed Areas, including the designated planned development projects of Tejon Mountain Village, Centennial and Grapevine, subject to potential limitations for Conserved Areas acquired using public funds as described below.* (TRCRWA, Exhibit R, page 2, bullet 1)
>
> ****
>
> *For portions of the Conserved Areas that are permanently preserved by conservation easements, or potentially fee title, acquired using public funds, the use of these lands for mitigation purposes would not be allowed unless the potential mitigation use of these lands is taken into account in the price paid and unless mitigation uses are allowed by applicable laws including those governing the public finding source(s) used to fund the acquisition.* (TRCRWA, Exhibit R, page 2, bullet 3)

Other CEQA lead agencies, responsible agencies (including CDFW), and the USFWS, have all accepted Tejon Ranch lands designated for open space conservation in the TRCRWA as mitigation lands for Tejon development projects. (See, e.g., TMV EIR, MSHCP, and Grapevine EIR.) In the absence of an agency-imposed mitigation obligation to preserve such lands, the open space preservation for areas identified for conservation in the TRCRWA are enforceable only by private party agreement with the signatories to the TRCRWA, and are not legally enforceable by any other party including any public agency. The acquisition areas identified in the TRCRWA are subject to a Conservation Easement enforceable by the State Wildlife Conservation Board, but those easements likewise expressly allow for future mitigation use of these lands for enhancement above conditions existing as of the required implementation of any mitigation activities, which will be implemented pursuant to the Ranch-wide Management Plan (RWMP) described in the revised MM 7-10 and as further described in response to Comment F.8-173. MM 7-10 expressly requires the continued open space preservation of the lands designated in the Draft EIR for grasslands mitigation, including preservation of all identified mitigation lands as well as optional enhancement of WCB easement lands, and accordingly will create a new legal mitigation obligation imposed and enforceable by Los Angeles County, as part of the required MMs to be imposed as

conditions of approval for the Centennial Project.[322] Finally, the overall open space value of all conserved lands in the region, including public lands such as the Angeles National Forest and Tejon Ranch lands conserved under agency mitigation and permit requirements such as the Tejon Uplands Multi-Species Habitat Conservation Plan, is described and its Biological Values recognized in the Draft EIR as well as other certified EIRs completed for the Project vicinity such as the Antelope Valley Area Plan EIR and the SR-138 EIR/EIS. Also, please see response to Comment B.4-63.

It should also be noted that commenter CBD was initially among the environmental groups working toward completion of the TRCRWA but withdrew before the Agreement was executed and is not a signatory to the Agreement. CBD sued to block the Tejon Mountain Village Project, raising similar biological resource objections to development of even less than 10 percent of Tejon Ranch acreage that the other environmental groups agreed could be developed without compromising the biological value of Tejon Ranch and the surrounding ecosystems. As set forth in the Agreement, the State's leading environmental advocacy groups agreed with Tejon Ranch that:

> Tejon Ranch is the largest contiguous property under single, private ownership in the State of California. It has been owned by the Tejon Ranch Co. since its incorporation in 1936. The Tejon Ranchcorp is a wholly owned subsidiary of the Tejon Ranch Co. that holds title to the lands comprising Tejon Ranch except those owned by TIC Corp., which owned the lands comprising the Tejon Industrial Complex. TRC will continue its historic ranch uses including farming, grazing, wildlife management and filming under this Agreement together with oil drilling and sand and gravel mining within defined areas all consistent with a Ranch-wide Management Plan. TRC has formed Centennial LLC to pursue development in the Centennial Development Area and TMV LLC to pursue development in the Tejon Mountain Village Development Area. **This Agreement allows TRC to pursue development plans in defined development areas without opposition from the Resource Organizations while enabling a conservancy the preserve Tejon Ranch's natural resource values for future generations.**
>
> The long-term conservation of Tejon Ranch has been one of the highest priorities of the Resource Organizations. **This unique property lies at the confluence of four major ecological region – the Sierra Nevada, Mojave Desert, Coastal Range and San Joaquin Valley. This Agreement follows many years of scientific analysis of conservation values on Tejon Ranch by TRC and others, including the Resource Organizations. By comprehensively addressing the entire Tejon Ranch, this Agreement avoids fragmentation of many of the environmentally sensitive areas on Tejon Ranch. The conserved lands will be managed in accordance with a comprehensive Ranch-wide Management Plan[323] that will identify the**

322 *Id.,* p. 5.7-180

323 The approved Ranch-wide Management Plan is available on the Tejon Ranch Conservancy's website at http://www.tejonconservancy.org/rwmp.htm.

> **natural resources and conservation values of the conserved lands as well as opportunities to protect, enhance and restore identified resources and values and establish best management practices for continued use of the conserved lands for existing ranch uses.**
>
> (TRCRWA Recitals, subsections B and D, emphasis added.)

The Commenter's opinion that development should not be allowed on Tejon Ranch, including but not limited to the Project site, is noted for the record.

Response to Comment F.3-13:

Single pairs or individual burrowing owls have been observed on or in the vicinity of the Project site during multiple bird surveys performed between March 2000 and July 2015.[324] Focused burrowing owl surveys have also been conducted.[325,326] Specifically, qualified wildlife biologists conducted protocol-level focused surveys for the western burrowing owl in 2003 and 2006.[327] One pair was observed in the eastern portion of the site in 2001 and one pair was observed just off the site to the north in 2006 using an abandoned irrigation standpipe; this species was not detected on site since 2001.[328] Additionally, as part of a comprehensive grassland quality survey conducted on the Project site in April 2006, a search for evidence of burrowing owl presence on the site, as well as a habitat and occurrence record evaluation using geographic information system (GIS) databases and analytical tools, was conducted by Natural Resource Consultants (NRC). Through these methods, NRC determined that burrowing owls are likely to be present on the Project site but are locally distributed and uncommon. During at least 1,044 man-hours of fieldwork over three weeks, two individual burrowing owls were observed, both of which were slightly off-site to the east. NRC concluded that though grassland habitats preferred by burrowing owls are present on the site, burrowing owls are uncommon and/or locally distributed.[329] The Project site is at the edge of the known range of the species as shown by the CDFW's California Wildlife Habitat Relationships Database.[330] Although not focused protocol-level surveys for burrowing owl, the biologists conducting special status plant survey transects for the Project in 2015 and 2016 also searched for, but did not find, the burrowing owl or burrowing owl sign during the surveys. Suitable burrowing owl habitat consists of relatively short vegetation with only sparse shrubs and taller vegetation combined with the presence of burrows for roosting and nesting.[331] In California, burrowing owls are largely dependent on California ground squirrels (*Spermophilus beecheyi*) to dig their burrows[332], although burrows from less common burrowing wildlife such as kit fox may also be used. The surveys have found the California ground squirrel, as well as kit fox or other suitably sized burrows,

332 *Ibid*.

to be largely absent from the Project site; as a result, the Project site's grasslands lack suitable burrows for the burrowing owl and is generally unsuitable for that species. The Draft EIR ultimately uses a conservative approach by requiring specific burrowing owl mitigation.

Response to Comment F.3-14:

The County notes that on April 19, 2018, the California Fish and Game Commission authorized the listing of tricolored blackbird as a "threatened" species.[333] However, it is noted that Candidate species are afforded the same legal protections as State-listed species. Therefore, consultation with CDFW will be required. The relevant analysis therefore remains the same under CEQA, and no mitigation measure updates are required. The Commenter's statements to reiterate points made in the Draft EIR are otherwise correct. However, these facts do not indicate potentially significant impacts to tricolored blackbird. The species is complex and its biology must be considered closely. For example, there has been no evidence that tricolored blackbird have bred in the same year at the on-site location (in the north end of the Project site) and Quail Lake sites. In addition, the on-site breeding area has not been used since the first time it was detected and the habitat has substantially diminished in recent years due to drought. However, in order to further clarify the Draft EIR text regarding the reduction of impacts to less than significant, additional language will be added to the impact assessment. In response to this comment, the following addition has been made to the first paragraph on page 5.7-113 of Section 5.7.3, Environmental Setting:

> The tricolored blackbird was observed nesting in large numbers along the north-central edge of the Project site and was also observed in Oso Creek (BonTerra Consulting 2008; Impact Sciences 2004a). These populations have not been incidentally detected during focused surveys since the original observations, possibly due to habitat degradation. Most recently, focused surveys for tricolored blackbird were conducted in 2015 and they were observed nesting off site along the northern shore of Quail Lake and at Holiday Lake, and these birds were observed foraging on the Project site (BonTerra Psomas 2015d).

Additionally, in response to this comment, the following addition has been made to the first paragraph on page 5.7-149 of Section 5.7.6, Environmental Impacts:

> The results of this focused survey documented relatively heavy use of the Project site for foraging purposes by tricolored blackbirds nesting off site at Quail Lake, and to a much lesser degree, Holiday Lake. No breeding was detected at Oso Creek or along the north-central edge of the Project site. Breeding has not been observed in either location since 2008, likely due to habitat degradation. In an effort to determine the Project's potential effect on tricolored blackbird nesting colony foraging lands of the region, an assessment of each of four known colonies was conducted (BonTerra Psomas 2015c).

[333] FGC 2018; Nossaman 2018

With respect to foraging habitat, the Draft EIR indicated that loss of foraging habitat could interrupt breeding if both Quail Lake and the north pond were used for breeding at the same time. As noted above, it has been nine years since any tricolored blackbird were found at the north pond, the habitat has become severely degraded, and the area is not likely to become suitable in the future. The species routinely shifts breeding locations, and there are also existing suitable breeding locations within the Mitigation Preserve, so the likelihood that both areas will be used for breeding at the same time is extremely low. Nevertheless, MM 7-7 has been modified to require a ¼ mile setback during breeding season, which will protect the existing foraging habitat for that season during construction, and the land use adjacent to Quail Lake up to approximately ½ mile is almost entirely open space recreation and, therefore, will be permeable and available for foraging. Furthermore, MM 7-10 has been modified to preserve additional mitigation lands, which includes preservation and management of 15,258 acres of suitable foraging habitat for tricolored blackbird and the Mitigation Preserve includes 1.1 acres of existing breeding habitat. Finally, MM 7-12 will preserve and enhance riparian areas, which will provide more breeding habitat. Thus, with mitigation, there is sufficient foraging habitat to support the existing colonies in the Project vicinity and provide additional breeding and foraging opportunities in the Mitigation Preserve. This preservation of breeding and foraging habitat in a diversity of areas allows for this nomadic species to continue to persist in the region.

Therefore, the following edits are hereby made to the third full paragraph on page 5.7-149 of the Draft EIR:

> Due to the shifting of tricolored blackbird nesting locations from year to year, a subset of two or three of the available nesting locations may represent the entire regional breeding population. A substantial reduction of foraging lands surrounding this subset of nesting locations could result in considerable reduction of nesting success. A review of the Quail Lake and the on-site colony subset identified a potential post-Project reduction of approximately 20 percent of potentially suitable foraging habitat at each location. In a given year, if these two areas were used for nesting, the reduced availability of suitable foraging land could result in substantial reduction in nesting success. <u>However, the north pond has become unsuitable habitat, so the likelihood of its future use by tricolored blackbird is very low. Additionally, the species shifts breeding locations between sites, and there are also existing potentially suitable breeding locations within the Mitigation Preserve, so the likelihood that both areas will be used for breeding at the same time is extremely low. Nevertheless, MM 7-7 has been modified to require a ¼ mile setback during breeding season, which will protect the breeding colony for that season during construction. Furthermore, MM 7-10 has been modified to preserve additional mitigation lands, which includes preservation and management of 15,258 acres of suitable foraging habitat for tricolored blackbird and the Mitigation Preserve includes 1.1 acres of existing breeding habitat. Finally, MM 7-12 will preserve and enhance wetland areas, which will provide more breeding habitat. Thus, with mitigation, there is sufficient foraging habitat to support the existing colonies in the Project vicinity and provide additional breeding</u>

> and foraging opportunities in the Mitigation Preserve. This preservation of breeding and foraging habitat in a diversity of areas allows for this wide forage ranging species to continue to persist in the region. Based on the revised MMs 7-7, 7-10, and 7-12, the impacts to foraging habitat are less than significant.

In response to this comment and others, the following edits are hereby made to MM 7-7 on pages 5.7-178 and 5.7-179:

> The Project shall incorporate avoidance and additional open space buffer features for each of the two ~~this~~ known tricolored blackbird nesting areas on and adjacent to the Project site ~~area~~. Permanent impacts will be restricted to a distance of 400 feet from the nesting area excluding small impact areas associated with infrastructure and utilities along SR-138 immediately south of Quail Lake. The nesting area will be delineated by a qualified Ornithologist based on all available data (three years of site-specific data shall be used). Temporary impacts (i.e., construction noise) within a ¼ mile ~~400 feet~~ of active nesting areas shall be restricted to the non-breeding season. The breeding season for this species shall be considered April 1 through July 1. The applicant shall consult with CDFW and may obtain an Incidental Take permit if determined appropriate.
>
> ~~The Project shall include enhancement, restoration, and/or preservation of potentially suitable tricolored blackbird breeding and foraging habitat. Potentially suitable areas for enhancement and preservation include lower Oso Canyon proximate to Cement Plant Road, as well as any other created water bodies as part of the Project Drainage Plan, where feasible. Enhancement factors shall include the creation of bulrush marsh habitat or other substrate known to support breeding tricolored blackbirds; a persistent nearby standing water during the breeding season; and available adjacent foraging habitat with an appropriate food source.~~

See other applicable responses for more information, including responses to Comments B.4-18, B.4-19, F.3-15, F.3-16 F.3-17, F.3-18, F.3-19, F.3-20, F.3-21, F.8-156, and F.8-158.

Response to Comment F.3-15:

Comment noted. The Draft EIR also discussed that focused tricolored blackbird surveys conducted for the Project in 2015 found nesting colonies at Quail Lake and found that foraging occurred on the Project site as well as elsewhere. See response to Comment F.3-14.

Response to Comment F.3-16:

As noted in the response to Comment F.3-15, focused tricolored blackbird surveys conducted for the Project in 2015 produced the same results mentioned here (nesting colonies at Quail Lake were observed foraging on the Project site), which were then used to extrapolate Project impacts in the Draft EIR.

Response to Comment F.3-17:

The analysis of potential foraging grounds for the tricolored blackbird in the Project area was based on available potentially suitable habitat and the best available information on the ecology of this species. The tricolored blackbirds were observed foraging in scrub as well as grassland habitat.

Response to Comment F.3-18:

The Commenter's opinion regarding the Project's impacts on tricolored blackbird is noted. The Project will comply with the California Fish and Game Code requirements including consulting with CDFW. The Project would not directly impact the Quail Lake and Holiday Lake (the latter approximately 3.4 miles east of the site[334], which are both outside the Project site boundary, and sufficient foraging habitat is maintained. See response to Comment F.3-14. Please refer to response to Comment B.4-29 regarding applicable mitigation measures requiring pre-construction surveys, and to Applicant's independent legal obligation to secure all required permits (including where applicable ITP permits). Please also refer to responses to Comments B.4-18 and B.4-78 regarding the modified buffer distance, and further clarification regarding elevation change and Specific Plan development restrictions.

Response to Comment F.3-19:

Please refer to response to Comment F.3-18. The Project does not propose to destroy or disrupt any nesting colonies. All nesting colonies are avoided with the addition of a buffer as well as reduced activities within during the breeding season (MM 7-7). The mitigation measure also includes preservation of areas that have already been shown to be used by tricolored blackbirds within the mitigation lands. Therefore, the mitigation measure is expected to mitigate the potential impacts to this species to a less than significant level. Please refer to responses to Comments B.4-29 regarding applicable mitigation measures requiring pre-construction surveys, and to Applicant's independent legal obligation to secure all required permits (including where applicable ITP permits). Please also refer to responses to Comments B.4-18 and B.4-78 regarding the modified buffer distance, and further clarification regarding elevation change and Specific Plan development restrictions.

Response to Comment F.3-20:

The Commenter's opinion regarding the Project's impacts on tricolored blackbird is noted. As described in the Draft EIR[335] and in responses to Comments F.3-14 through F.3-19 above, the Draft EIR concludes that the Project's potential impacts on the tricolored blackbird are mitigated to a less than significant level. Please refer to response to Comment B.4-29 regarding applicable mitigation measures requiring pre-construction surveys, and to Applicant's independent legal obligation to secure all required permits (including where applicable ITP permits). Please also refer to responses to Comments B.4-18 and B.4-78

334 DRP 2017, p. 5.7-113
335 *Id.,* pp. 5.7-148 to -150

regarding the modified buffer distance, and further clarification regarding elevation change and Specific Plan development restrictions.

Response to Comment F.3-21:

The new alignment of Cement Plant Road will run to the west of Village #9, as shown on Exhibit 5.12-3, On-site Circulation System and as graphically depicted on each Draft EIR graphic that shows the proposed roadway network. This roadway alignment is fully within the impact footprint analyzed throughout the Draft EIR. As stated in Section 5.7.6, Environmental Impacts, "although the Project includes a new road along its western edge (Cement Plant Road), the road's use would be limited to infrequent daytime truck traffic to and from the Cement Plant, functioning the same as the existing Cement Plant Road to the east. Nighttime use will be prohibited except for emergency. This new Cement Plant Road would connect to SR-138 via a Gorman Post Road extension, and a new intersection in this area will be avoided."[336] The Draft EIR acknowledges impacts to foraging habitat, inclusive of the realignment of Cement Plant Road, and mitigation efforts are included to lessen those impacts. See responses to Comments B.4-18, B.4-19, F.3-15, F.3-16 F.3-17, F.3-18, F.3-19, F.3-20, F.8-156, and F.8-158, among other applicable responses, for further information.

Response to Comment F.3-22:

All required biological studies, as well as the Project's impact assessment, have included the National Cement Plant Road realignment; therefore, the road re-alignment is fully within the impact footprint analyzed throughout the Draft EIR. The realignment of the National Cement Plant Road is described fully in Section 4.0, Project Description, on page 4-39, and illustrated on Exhibit 4-7. As discussed on page 4-39, "A portion of the [National Cement Plant] roadway within the project boundaries is planned to be re-aligned through the Project site to access the SR-138 from the western side of Quail Lake rather than from the current connection on the east side of Quail Lake." "Intersection improvements (e.g., deceleration lane, an acceleration lane, turn pocket) would be constructed within the Caltrans right-of-way to allow for safe ingress/egress to the re-aligned National Cement Plant Road from SR-138, as discussed in Section 4.8, Off-Site Project Features." As a Project component described in Section 4.0, both the on-site and off-site features associated with the National Cement Plant Road realignment are addressed in all topical analyses in the Draft EIR, including biological resources. As such, the calculation of impacts associated with this Project component has been submitted for public input via the Draft EIR.

Response to Comment F.3-23:

The Project does not encroach on SEA 17, and would, therefore, not disrupt the footprint of the SEA. Further, State CEQA Guidelines require the Draft EIR to assess potential impacts to wildlife movement. In the wildlife movement assessment, connectivity between the Tehachapi Mountains and the San Gabriel Mountains, from a biological perspective, was considered in detail.[337] The assessment, which used various scientific studies, including site-

[336] *Id.,* p. 5.7-165
[337] *Id.,* pp. 5.7-50 to -64, -164 to -170

specific studies listed in Table 5.7-2[338], concluded that although maintaining baseline connectivity between the two regions is essential, development of the Project would not significantly impact movement between these regions.[339] Although direct impacts on regional and local wildlife movement would be considered less than significant, and no mitigation is required, in order to lessen Project impacts on wildlife movement, MMs 7-13 through 7-19[340] are proposed, which incorporate planning and construction methods to reduce potential indirect impacts to wildlife movement. Please also refer to responses to Comments F.3-24, F.3-25, F.3A-32, F.3A-33, F.3A-34, B.4-34, B.4-35, B.4-36, B.4-37, F.8-165, F.8-165A, F.8-166, F.8-167, B.4-56, B.4-57, F.5-2, F.8-168, and F.7-22 for a more detailed discussion of responses on wildlife movement within the Project site.

A discussion of regional wildlife movement, beginning on page 5.7-6, is provided in the Draft EIR. The section acknowledges the importance of movement in the region where several major bio regions come together stating that various recent reports that discuss the biotic resources in the vicinity of the Tehachapi Mountains (including the Project region) describe the importance of these mountains as a landscape linkage between the Sierra Nevada and the Coast Ranges.[341] Typically, landscape linkages facilitate wildlife movement between large areas of similar terrain, vegetation types, or habitats. Because of the unique adaptations required of wildlife species that inhabit the low elevations of the San Joaquin Valley to the north of the Tehachapi Mountains and the Antelope Valley and adjacent Mojave Desert to the south of the mountain range, most species that occupy these geographically separate and distinct ecosystems do not venture south or north, into or over, the Tehachapi Mountains. As noted above, wildlife species within the mountains surrounding the Project site are expected to move freely within the mountains to satisfy their life history requirements. Accordingly, most wildlife movement in the mountains probably occurs within large landscape areas in upland portions of the Tehachapi range, and to the south of the Centennial property within the western extent of the San Gabriel Mountains much more than between these areas. The same can be expected of movement on the valley floor and surrounding low foothills, where the proposed Project is located.

The Draft EIR goes on to discuss the long-term sustainability of regional linkages beginning on page 5.7-62. The section describes two regional conservation plans, which although not providing mitigation for Centennial, would act in concert with the Centennial mitigation preserves to help sustain the functionality of the regional landscape linkage for future wildlife populations. These plans offer elements for long-term sustainability and management of a Tehachapi Mountains landscape linkage: the Tejon Ranch Conservation and Land Use Agreement (Ranch-Wide Agreement [TRCRWA]) and the Tehachapi Upland Multiple Species Habitat Conservation Plan (TUMSHCP).

Under the TRCRWA, the Tejon Ranch Conservancy will adopt, update, monitor and enforce implementation of the Ranch-wide Management Plan (RWMP) on dedicated conservation areas and option areas subject to conservation, preservation, mitigation, and enhancement

338 *Id.,* p. 5.7-23
339 *Id.,* p. 5.7-166
340 *Id.,* pp. 5.7-190 to -193
341 *Id.,* Exhibit 5.7-6

measures, as required under applicable law or imposed by federal, State or local agencies as part of any permit or approval for the Ranch or projects within the Ranch. The TRCRWA also provides that the Conservancy, or an alternate conservation entity as identified in the TRCRWA, will manage long-term mitigation obligations for open space lands used for mitigation to comply with federal and state agency permit requirements imposed in relation to the development activities allowed in the TRCRWA, including development of the Project. While the TRCRWA is not itself an agency-imposed mitigation measure for Centennial or other Ranch activities, the TRCRWA does provide the overarching legal, management, and funding framework for the open space lands used as mitigation lands in local, state, and federal land use entitlements and permits. It also voluntarily conserves 170,000 contiguous acres of open space Ranch lands, even if preservation of such lands is not required by agency mitigation measures. Resource agency support of the TRCRWA is included in an appendix to the TRCRWA. Maintenance of the open space or conserved lands will be the responsibility of the Conservancy, funded in large part by a fee based on a portion of the purchase price for each residential parcel on Tejon Ranch. Since Centennial constitutes over 75 percent of the currently planned residential units on the Ranch, it will bear the substantial costs of funding the Conservancy and maintaining wildlife movement corridor areas through the Ranch. As mentioned in Section 5.7.2, Relevant Plans, Policies and Regulations, of the Draft EIR, no public agency is a party to the TRCRWA, although the federal and State agencies responsible for administering biological protection laws and regulations confirmed that lands under the RWMP continue to be eligible mitigation lands.

In addition, the TUMSHCP ensures the persistence of covered species, including sustaining viable populations of those species, providing for (within property dispersal) and protecting current opportunities for wildlife movement beyond the Ranch by preserving existing landscape linkages. Lands to be conserved as part of the TUMSHCP are adjacent to other lands within Tejon Ranch ownership and are also slated to be protected as part of the TRCRWA. The sum of these interconnected open space commitments, development restrictions, and mitigation measures is a conservation commitment that is, by design, consistent with conservation biology principles calling for large, interconnected blocks of habitat that support the life history requirements of Covered Species and other resident wildlife. The TUMSHCP, if fully implemented, will sustain crucial landscape linkages in the Project region.

The TUMSHCP will be a major contributor to ensuring the viability of the Tehachapi Landscape linkage into the future. Through the various conditions and measures stipulated by the TUMSHCP for the various covered species, habitat for these and many additional species will be preserved and enhanced, which will promote healthy plant and wildlife communities throughout the region. Although the focus of the TUMSHCP is on the California condor and other species of the montane upland communities, many of the same species occur in the foothills and lowland areas as well, including the Centennial site. These species will benefit from the TUMSHCP in addition to the Centennial Mitigation Preserve program described in this document.

The wildlife movement impact analysis beginning on page 5.7-164 of the Draft EIR concludes that development of the Project site will result in some losses of areas that may be used for

foraging and/or breeding for these species. Pathways to or from foraging or breeding grounds on the Project site, such as along ridge-lines or canyon bottoms, may become "dead ends" to through dispersal. However, these sorts of impacts are not expected to destabilize the regional population dynamics of these species, especially given the substantial amount of similar terrain in the northwestern Antelope Valley area. Multi-generational gene flow among wildlife populations in the region is expected to be sustained in the open spaces on and off the site that will remain following Project implementation. The direct impacts of Project development, therefore, are considered less than significant.

Lastly, the Project design is consistent with the Antelope Valley Area Plan (AVAP) inclusive of open space designations, SEA protection, and preservation of habitat linkages. The AVAP is a community-based plan that is a subset of the County of Los Angeles General Plan, which includes the Project area. The AVAP EIR provides an analysis of all potential, reasonably foreseeable environmental impacts related to the implementation of the AVAP "to indicate possible ways to reduce or avoid environmental damage and to identify alternatives" to the AVAP.[342] Additionally, the AVAP EIR discloses "significant environmental impacts that cannot be avoided; growth inducing impacts; effects not found to be significant; and significant cumulative impacts of all past, present and reasonably foreseeable future projects."[343]

Response to Comment F.3-24:

Please see response to Comment F.3-23. The open space areas within the Project impact footprint are consistent with existing drainage patterns (east-west), which currently facilitate local wildlife movement through the area. As stated in Section 5.7.6, Environmental Impacts, these open space areas "facilitate the local movement of wildlife and dispersal and gene flow between populations of small organisms (particularly insects, amphibians, reptiles, small mammals)".[344] The purpose of these areas is not to facilitate movement through the Project down to SEA 17. However, implementation of MM 7-14, which designates a SR-138 wildlife underpass (along with a 50-foot open space buffer) where the current intersection with National Cement Plant Road exists, is intended to allow for local wildlife movement to pass through the Project area down to SEA 17.

Response to Comment F.3-25:

The size of the proposed undercrossing is expected to support movement of many wildlife species potentially moving through the area. Most of these animals, such as raccoon, opossum, and skunks, have been identified using much smaller crossings than the proposed crossing's dimensions; therefore, there is no reason to believe that the large crossing proposed would not support crossing of many species. In addition, current crossings either do not exist in the area or consist of much smaller drainage culverts. The proposed crossing is expected to improve crossing conditions for most wildlife in the region compared to the existing condition. The exiting condition is inclusive of SR-138, which does not represent a

342 DRP 2014a, p. 2-1
343 *Ibid*.
344 DRP 2017, p. 5.7-166

barrier for all species but is problematic due to vehicular traffic and lack of vegetative cover. The Project proposal improves the crossing by allowing at least some individuals of some species to utilize a more protected pathway to access habitat on either side of the highway. In addition, the crossings included in the Project design are consistent with the Antelope Valley Area Plan (AVAP). The AVAP EIR provided an analysis of the regional habitat linkages to be retained, inclusive of development of other areas including the Project development area. The County's AVAP EIR analysis concludes that such impacts are less than significant. The Project Draft EIR supports this AVAP EIR conclusion, and the wildlife movement impact analysis beginning on page 5.7-164 of the Draft EIR provides evidence indicating these local connections may support local movement but are not required to sustain regional wildlife populations in the area, which primarily occur in the foothill areas north of the Project site. The Project undercrossing at SR-138 is expected to facilitate more localized wildlife movement but is not critical to regional wildlife linkages. For additional discussion, please see response to Comment F.3-23, the wildlife movement sections of the AVAP EIR,[345] and the Caltrans SR-138 EIR.[346]

Response to Comment F.3-26:

The Commenter is correct in that a separate discussion on local bird migration is not included in the Draft EIR; instead, migration was discussed on a species-specific level: southwestern willow flycatcher,[347] California condor,[348] yellow-breasted chat,[349] and yellow warbler.[350] The use of some on-site vegetation types by a variety of bird species is disclosed on page 5.7-49 of the Draft EIR: "During spring and fall migration, a variety of migratory birds are expected to use these vegetation types on the site. Some migrants include the pacific-slope flycatcher (*Empidonax difficilis*), warbling vireo (*Vireo gilvus*), Cassin's vireo (*Vireo cassinii*), yellow warbler, black-throated gray warbler (*Setophaga nigrescens*), Townsend's warbler (*Setophaga townsendi*), MacGillivray's warbler (*Geothlypis tolmiei*), and Wilson's warbler (*Cardellina pusilla*)."

As stated in Section 5.7.3, Environmental Setting, the Biological Assessment of SEA 17 prepared by PCR et al. (2000) "suggest[s] that lands within SEA 17 may be an important topographic reference for migrating birds, with essential high elevation foraging grounds along the route".[351] Project implementation would not impact these important migrating lands which occur in SEA 17. Also, the Project area, specifically, has not been shown to be a major thoroughfare for bird migration.

Response to Comment F.3-27:

The Commenter's report regarding seasonal use of Quail Lake by migrating birds is noted. The Project does not modify Quail Lake. Use of Quail Lake by water birds would continue with Project implementation. As the Commenter notes, landbirds also use the region during migration, particularly Grapevine Canyon, which lies to the west of the Project. As demonstrated by the avian species observed and documented in the Plant and Wildlife Compendium in Appendix 5.7-A of the Draft EIR, landbirds do use the Project site during migration. Project surveys identified specific parts of the Project site as particularly valuable to migrant landbirds. As a result, PDF 7-3 was designed to protect these Project features and minimize potential impacts on migratory landbirds. Approximately 5,624 acres of the Project site would be included in the Open Space land use designation. Of the 5,624 acres of designated Open Space, approximately 5,116 acres (42 percent of the total Project site) are intended to (1) remain in their original natural condition; (2) be restored; and/or (3) be enhanced by weed abatement, fencing, and native species planting, among other means. Of this amount, approximately 3,866 acres are designated as SEA 17 to be preserved in perpetuity within the site boundaries.[352] The on-site open space areas would provide continued foraging habitat in addition to the approximately 39,213 acres of off-site open space acres that would be set aside for preservation to mitigation impacts to biological resources.[353] Also, although birds do stop to forage on the Project site, it is reasonable to assume that the majority of birds migrating through this area are attracted to the habitats surrounding the Project (SEA 17) that provide greater shelter and food and water sources. These areas will remain open to migrating birds that pass through the vicinity of the Project. Finally, Quail Lake and the Project site is not located at a bottleneck or choke point for aerial migration, such as due to topography or resources (i.e., food, water, shelter), and therefore, Project implementation would not block or otherwise be an obstacle to bird migration through the western Antelope Valley area.

Response to Comment F.3-28:

The SR-138 widening project is an existing Caltrans project, approved in 2017 following completion of an Environmental Impact Report/Environmental Impact Statement by Caltrans. The new alignment of Cement Plant Road will run to the west of Village #9, as shown on Exhibit 5.12-3, On-site Circulation System, and as graphically depicted on each Draft EIR graphic that shows the proposed roadway network. This roadway alignment is fully within the impact footprint analyzed throughout the Draft EIR. As stated in Section 5.7.6, Environmental Impacts, "although the Project includes a new road along its western edge (Cement Plant Road), the road's use would be limited to infrequent daytime truck traffic to and from the Cement Plant, functioning the same as the existing Cement Plant Road to the east. Nighttime use will be prohibited except for emergency. This new Cement Plant Road would connect to SR-138 via a Gorman Post Road extension, and a new intersection in this area will be avoided."[354] Because the Cement Plant Road realignment is

352 *Id.,* p. 4-44
353 *Ibid*.
354 *Id.,* p. 5.7-165

part of the Project, as defined in Section 4.0, Project Description,[355] this component is fully within the impact footprint analyzed throughout the Draft EIR and was considered when assessing potential direct (e.g., habitat modification) and indirect (e.g., light, noise, dust) impacts to biological resources. All focused biological surveys included the impact area for the realignment of Cement Plant Road. The proposed location of the Cement Plant Road would not be a barrier to bird migration any more than the existing road alignment, as there are no tall structures, upward-facing light sources, transmission lines, or other design features that can be a deterrent to bird flight paths, and the roadway would continue "to be limited to infrequent daytime truck traffic to and from the Cement Plant".[356]

Response to Comment F.3-29:

To clarify, the Draft EIR does not specify an assumed distance that the spores would be limited to; however, it is expected that the majority of fugitive dust and associated spores (if present) would settle out of the wind before leaving the Project site due to both the physical properties of entrained sediment and the large size of the site.[357] Evidence that these statements are in error is not provided. Regardless, to ensure concerned parties can be aware of earth-moving activities on the Project site during the construction period, MM 3-11 is hereby added to the Draft EIR in response to this comment:

> **MM 3-11** The Project Applicant/Developer shall be responsible for the creation of a website on the proposed Centennial community internet that provides public information regarding dust-generating activities, to be maintained and updated as appropriate throughout the Centennial Project construction period. The purpose of the website would be to enable interested parties both on- and off-site to easily access information relevant to potential Valley Fever risk. The Project Applicant/Developer shall also be responsible for the preparation and one-time distribution to surrounding communities and to all schools located in the communities of Gorman, Lebel, and Frazier Park of a notice describing the availability of this website to provide awareness of the site and its contents.

Please also see Section 5.3 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.3 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment F.3-30:

Regarding the first suggested mitigation measure, the use of mesh or netting such as used on stationary objects like fruit trees and bushes to protect against dust and/or birds is not

355 *Id.,* p. 4-39
356 *Id.,* p. 5.7-165
357 *Id.,* p. 5.3-18

practical for use on construction sites. This is due both to the scale of the Project site and the associated construction area(s) and because the construction activity would be regularly moving. Consistent with Rule 403 requirements, the suppression of dust before it reaches a project's boundaries is both feasible and more effective in reducing the risk of Valley Fever spores being spread due to ground-disturbing activity. In addition to fully implementing Rule 403 (per MM 3-1), the Project Applicant/Developer has committed to several actions for prevention of Valley Fever exposure for construction workers consistent with the recommendations of the California Department of Public Health (CDPH), cited as CDPH 2013b (English language) and CDPH 2013c (Spanish language) in MM 3-2.[358] The encapsulation or other dust barrier to limit the spread of Valley Fever is not suggested by the CDPH. Regarding the second suggested mitigation measure, it is assumed that "notification" refers to the notification described in Draft EIR MM 3-3, wherein each purchaser or tenant reads and signs a notice regarding the Valley Fever risk during the construction period. Please refer to response to Comment F.3-29 discussing new MM 3-11 requiring creation of a website with regularly updated information on ground-disturbing activities and the notification of off-site persons to the presence of this website to seek out information, if desired.

Please also see Section 5.3 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.3 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment F.3-31:

As discussed in response to Comment F.3-30, in addition to fully implementing Rule 403 (per MM 3-1), the Project Applicant/Developer has committed to several actions for prevention of Valley Fever exposure for construction workers consistent with the recommendations of the California Department of Public Health (CDPH), cited as CDPH 2013b (English language) and CDPH 2013c (Spanish language) in MM 3-2.[359] In addition to preventing direct exposure, the CDPH includes action to prevent transport of the spores, if present. These actions include the provision of Tyvek™ coveralls/suits daily. Therefore, the following MM 3-2 in the Draft EIR is hereby augmented in response to this comment:

MM 3-2 To aid in the prevention of Valley Fever among construction crews on the Project site, the following measures shall be implemented by the Construction Contractor during all construction activities:

- Have Tyvek™ coveralls/suits available in a range of sizes for construction worker use upon request. If used, require the worker to remove the Tyvek™ suit at the work site at the end of the day.

358 *Id.,* p. 5.3-26
359 *Ibid.*

Please also see Section 5.3 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.3 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment F.3-32:

This comment includes segments of sentences, or full sentences, from the first three paragraphs on page 5.3-18 of the Draft EIR. As such, it is unclear the intent of this comment. Please refer to responses to Comments F.3-29 through F.3-31 related to Valley Fever.

Please also see Section 5.3 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.3 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment F.3-33:

This comment misstates the Draft EIR's determinations regarding the Project's potential air quality impacts. As explained at Draft EIR page 5.11-1, the northern 91 percent of the Project site lies within the boundaries of the Antelope Valley Air Quality Management District (AVAQMD), while the remaining 9 percent lies within the South Coast Air Quality Management District (SCAQMD). As an initial matter, under *existing* pre-Project conditions, the AVAQMD and SCAQMD are both in federal and state nonattainment for ozone (O_3), the SCAQMD is in federal and state nonattainment for particulate matter (PM10 and PM2.5), and the AVAQMD is in state nonattainment for PM10.[360] Thus, these pollutants already exceed applicable air quality standards irrespective of whether the Project is approved and constructed.

Moreover, as explained on Draft EIR pages 5.11-9 and 5.11-10, toxic air contaminants (TACs) are those air pollutants that are known or suspected to cause cancer or other serious health effects (e.g., reproductive effects or birth defects). With respect to the Project's potential to expose sensitive receptors (e.g., residences, schools, day care facilities, hospitals) to substantial pollution concentrations, the Draft EIR determined that this impact would be less than significant with implementation of MM 11-2. With respect to TAC emissions associated with the Project's proposed on-site stationary sources, the Draft EIR determined that impacts from these sources would be less than the incremental cancer risk of and non-cancer health index thresholds with implementation of MMs 11-1, 11-7, 11-8, and 11-9 and, therefore, this impact would be less than significant.[361] With respect to TAC emissions from existing off-site stationary sources (i.e., the National Cement Plan), the Draft EIR determines that TAC risks from such sources would be less than the applicable AVAQMD and SCAQMD thresholds and, therefore, this impact would be less than significant.[362] Finally, with respect to TAC emissions from vehicles on State Route 138, the Draft EIR determined that impacts from these sources would be less than the incremental cancer risk of and non-cancer health

360 *Id.,* pp, 5.11-22 to -28
361 *Id.,* p. 5.11-71
362 *Id.,* p. 5.11-72

index thresholds with implementation of MMs 11-10 and 11-11 and, therefore, this impact would be less than significant.[363]

The air quality analyses in Section 5.11, Air Resources, of the Draft EIR was conducted based on the methods recommended by the SCAQMD for criteria pollutants and TACs, as discussed on pages 5.11-18 through 5.11-22. Descriptions of health effects for each of the analyzed air pollutants were provided to inform the public of potential health effects as required by the disclosure requirements under the CEQA.[364] Project related air pollutant emissions were evaluated both in terms of contributions to regional air quality and localized impacts to uses proximate to the Project site.[365] The Draft EIR disclosed that there would be significant and unavoidable air quality impacts related to construction emissions in the jurisdiction of the AVAQMD as well as the SCAQMD.[366] Long-term operational emissions were also found to exceed the AVAQMD and SCAQMD thresholds of significance for regional emissions.[367] On Draft EIR pages 5.11-58 through 5.11-63, localized impacts to existing residential uses were also evaluated and found to result in exceedance of the ambient air quality standards developed by the State of California and the federal government to determine air pollutant concentrations that would affect human health.

In terms of air pollutant emissions from construction of Project components that may affect the health risk to residents of the Project, this issue was evaluated on pages 5.11-63 and 5.11-64 of the Draft EIR. This discussion explains that, "although construction of the Project would occur over a period of many years, use of diesel-powered construction equipment in any single area would likely occur for no more than a few months and would cease when construction completed in that area. Further, there will be limited periods when construction would be near adjacent residences." The Draft EIR concludes that, "[b]ased on the relatively short exposure time, diesel PM generated by Project construction would not create conditions where the probability for the MEI (Maximum Exposed Individual) to contract cancer is greater than ten in one million, which is the threshold the AVAQMD and SCAQMD uses for cancer risk. Likewise, the probability of construction or operations to generate ground-level concentrations of non-carcinogenic TACs that exceed a Hazard Index greater than one for the MEI is very low. Additionally, with ongoing implementation of federal and State requirements for cleaner-burning fuels, diesel engine retrofits, and new low-emission diesel engine types, the diesel PM emissions of individual equipment would be substantially reduced over future years as Project construction is implemented. This impact would be less than significant; no mitigation is required."

Draft EIR Appendix 5.11-B, Air Quality Analysis for Stationary Sources, further evaluates Project air quality impacts of stationary sources of emissions that are permitted to be located on the Project in accordance with the Centennial Specific Plan. This analysis addressed

363 *Id.,* p. 5.11-74
364 *Id.,* pp. 5.11-3 to -10
365 *Id.,* pp. 5.11-40 to -74; *Id.,* Appendices 5.11-B and 5.11-C
366 *Id.,* p. 5.11-40 to -58
367 *Ibid*.

health risks associated with TACs and characterizes the sources of criteria pollutants to quantify their emissions.[368]

This study included the following components:

- An evaluation of the Project's TAC emissions to ensure that the health risks posed to sensitive receptors by stationary sources located in the Project's Business Park area are not in excess of applicable significance thresholds;
- An evaluation of the Project's TAC emissions to ensure that the health risks posed to sensitive receptors by discrete stationary sources that may located in the Project's Commercial and Institutional areas are not in excess of applicable significance thresholds;
- An evaluation of the TAC emissions that would be generated by the Project's two wastewater reclamation facilities (WRF) to ensure that the health risks posed to adjacent stationary sources are not in excess of applicable thresholds; and
- An evaluation of stationary sources that emit criteria pollutants having ambient air quality standards to assess the potential of violating these standards.

As explained in the Draft EIR[369], modeling described in Appendix 5.11-B confirms that none of the sensitive receptors located adjacent to the Project's Business Park areas would be exposed to TAC emissions that exceed a cancer of risk of 10 in 1 million or have a chronic non-cancer hazard index of 1.0, provided there is minimum buffer area between the sensitive receptor and the Business Park area. In order to ensure that the Project's future tract maps incorporate this required buffer area, MM 11-7 requires the establishment of buffer areas in the Project equivalent to those used for the TAC modeling. Moreover, per MM 11-8, no sensitive use (e.g., school, hospital, day care center) may be located within a Business Park area unless the Project Applicant/Developer provides written evidence to the County that sensitive use would not be exposed to TAC with pollutant concentrations resulting in a cancer risk greater than or equal to 10 in 1 million for health risks and 1.0 for non-cancer chronic and acute hazard indices.

There are several discrete types of equipment with TAC emissions levels less than those described previously for stationary sources that would be permitted in the Commercial and Institutional areas on the Project site, including natural gas-fired boilers, emergency generators, gas stations, spray booths, storage tanks, dry cleaners, and small-source particulate matter (PM) generators.[370] The Appendix 5.11-B modeling analysis confirms that the aggregate risk from these TAC-emitting sources would be below significance thresholds with implementation of MM 11-1, which requires all such stationary sources to comply with the parameters stated in the Stationary Source Types, Size Limits, and Quantity Estimates set forth on Draft EIR Table 5.11-5 and which is included as Attachment A to the Project's Mitigation Monitoring and Reporting Program.[371] Should there be a need or request for a

368 *Id.,* Appendix 5.11-B, p. 4
369 *Id.,* p. 5.11-69
370 *Id.,* p. 5.11-70
371 *Ibid*.

stationary source exceeding the prescribed limits, MM 11-1 requires the Project Applicant/Developer to apply for a source-specific permit from the AVAQMD or the SCAQMD, as applicable.

Appendix 5.11-B also includes a screening health risk assessment conducted to evaluate the air concentration at the nearest sensitive receptors to the WRFs. The results of the screening analysis demonstrate that the estimated incremental cancer risk, chronic and acute health indexes from all WRFs would be less than the significance thresholds at the maximally exposed sensitive receptor location and thus impacts from TAC emissions generated by the WRFs would be less than significant.[372]

In addition, Draft EIR Appendix 5.11-C, Centennial Supplemental Air Quality Analysis, further evaluates in detail potential localized air quality impacts related to both criteria and toxic emissions generated by the Project, with a focus on how sensitive residential land uses would be affected by mobile emissions and stationary sources proximate to the Project site.

This study included the following components:

- An evaluation of the potential health risks resulting from mobile emissions generated by increased traffic due to the project for new and existing residences located near California State Route 138;
- An evaluation of ambient air quality impacts resulting from construction and comparison to the South Coast Air Quality Management District (SCAQMD) Localized Source Thresholds;
- A review of a health risk assessment for the National Cement facility located north of the Project site; and
- A review of consistency with air district plans and California Air Resources Board (CARB) land use guidelines.

Specifically, Appendix 5.11-C and the Draft EIR[373] evaluates the potential adverse impacts of toxic air contaminants (TACs) and diesel particulate matter exposure generated by traffic traveling along SR-138 and the offsite National Cement factory.

To assess the health risks associated with SR-138 mobile emissions, Appendix 5.11-C used the Centennial Specific Plan's land use plan to determine the Project-site location of all future sensitive receptors that would be located within 500 feet of SR-138, and evaluated cancer risk from diesel exhaust using a receptor grid with 40-meter spacing.[374] The 500-foot buffer was selected on the basis of the California Air Resources Board's (CARB) 2005 guidance manual on land use development, *Air Quality and Land Use: A Community Perspective*.[375] The CARB guidance manual recommends a 500-foot buffer between freeways and sensitive receptors, indicating that further analysis may be in order if the proposed sensitive receptor

372 *Ibid.*; *Id.,* Appendix 5.11-B, pp. 19-22
373 *Id.,* pp. 5.11-71 to -74
374 *Id.,* Appendix 5.11-C, pp. 2, 3
375 *Id.*, Appendix 5.11-C, p. 1

is located within this buffer.[376] The Appendix 5.11-C modeling confirms that incremental cancer risks for the 70-year exposure duration are below 10 in 1 million at locations greater than 150 feet from the travel lanes and thus would not exceed applicable thresholds of significance.[377] The estimated hazard index for all proposed sensitive receptors would be significantly less than one at locations greater than 150 feet from the SR-138 travel lanes and thus would not exceed applicable thresholds of significance.[378] This determination is consistent with the Antelope Valley Area Plan EIR, which concluded that potential adverse effects to sensitive receptors located in proximity to SR-138 would be less than significant with mitigation.[379] Moreover, as more stringent vehicular greenhouse gas emission and criteria air pollution standards take effect, and as transportation fuels and vehicles become cleaner over time, the number of diesel powered vehicles on roadways as well as emissions from remaining newer diesel engines are expected to further reduce diesel-related health risks at the Project site.[380]

To address the potential impact to sensitive receptors located within 150 feet of the SR-138 travel lanes, MM 11-10 imposes a 150-foot buffer from such travel lanes within which the Project will be prohibited from siting new sensitive receptor uses. As an added layer of protection, MM 11-11 further requires that prior to future tract map approvals, if any sensitive receptors (e.g. residential, day care, schools, hospitals) would be located within 500 feet of the SR-138, an additional dispersion modeling study must be conducted to estimate diesel PM air concentrations. If the study finds that diesel PM TAC emissions would be significant at the location of a proposed sensitive receptor, then effective TAC reduction measures must be implemented to mitigate for interior air quality, such as filtration technologies or equivalent protections against TACs from mobile emissions.

In addition, MM 11-11 has been revised in this Final EIR to further insure that sensitive receptors are protected at the Project site from emissions generated by high-volume roadways. Specifically, MM 11-11 has been revised to, among other things, require preparation of a dispersion analysis to calculate the health risks from mobile emissions whenever the Project proposes a tentative map that would locate sensitive receptors within 500 feet of a "high-volume" roadway (i.e., a roadway with an average daily traffic volume that equals or exceeds 50,000 vehicles), in addition to SR-138.

Although not required by CEQA, as confirmed by the Supreme Court in *California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369, Appendix 5.11-C also evaluates the estimated cancer risks and chronic and acute non-cancer hazard indices at the future Project residences and other sensitive uses (after Centennial Buildout) caused by emissions generated by offsite National Cement Lebec Plant and determined that any related health risk are below the AVAQMD's and SCAQMD's thresholds if significance (i.e., 10 in 1 million for cancer risk and 1.0 for HI). The cancer risk at the northernmost portion of the Project site was estimated to be 0.15 in 1 million; the chronic

376 *Ibid*.
377 *Id.*, p. 5.11-73; *Id.*, Appendix 5.11-C, p. 3
378 *Ibid*.
379 DRP 2014a, p. 5.3-43
380 DRP 2017, pp. 5.21-7, -8, -23

and acute non-cancer hazard indices estimated for this location were 0.01 and 0.12, respectively. Based on the results presented in the Appendix 5.11-C, the Draft EIR determined that the cement plant is not expected to cause unacceptable risks to future residents at Centennial.[381]

As demonstrated by the EIR analysis summarized above, this comment's claim that the Project's potential TAC emissions would "rise to unacceptable levels, causing illness, disability and premature death" is not supported by the facts.

Response to Comment F.3-34:

The Commenter made a substantively identical comment in Letter F.3A, which comment as been designated as Comment F.3A-46 in this Final EIR. Please see response to Comment F.3A-46 for a response to this comment.

Response to Comment F.3-35:

Particulate matter is considered in the Draft EIR as PM10 and PM2.5 – particulate matter with a diameter of 10 and 2.5 microns or less, respectively.

The analysis and conclusion of Threshold 3-4 in Section 5.3, Hazards and Fire Safety, including the quoted sentence in this comment, pertains to hazardous materials/wastes at the Cement Plant that have resulted in soil and groundwater contamination, and potential conflicts between Project-related vehicular and alternative traffic introduced by the Project and existing traffic on the realigned National Cement Plant Road.

Air emissions from operations at the National Cement Plant are discussed in Section 5.11, Air Resources. The existing air quality, which is the baseline for the proposed Project's air quality analysis, is presented beginning on page 5.11-25 under the header "Monitored Air Quality". As shown in Table 5.11-4 beginning on page 5.11-26, PM10 and PM2.5 are monitored at the applicable monitoring stations.

As discussed in Section 5.11, "Particulate matter in the AVAQMD tends to be primarily fugitive dust. This dust appears to be generated by both local sources and by region-wide dust during moderate to high wind episodes. These regional episodes tend to be multi-district and sometimes interstate in scope. The AVAQMD has identified the local sources of fugitive dust to be primarily unpaved road travel; construction and local disturbed areas of soil concentrated in the urban populated areas in the district; and seasonal agricultural operations";[382] and "Particulate levels in the area are due to natural sources (such as wind), grading operations, and motor vehicles".[383] As such, the contribution of National Cement Plant operations to the particulate matter in the Mojave Desert Air Basin is not as dominant as dust (from wind and grading) and vehicles, and these emissions are represented in the existing monitored air quality data.

381 *Id.,* p. 5.11-71; *Id.*, Appendix 5.11-C, p. 9
382 *Id.*, p. 5.11-6
383 *Id.,* p. 5.11-26

In Section 5.11, Threshold 11-2 – Would the proposed project expose sensitive receptors to substantial pollutant concentrations – the National Cement Plant is acknowledged as a source of toxic air contaminants (TACs) in the area.[384] Accordingly, a health risk analysis (HRA) was completed to evaluate the human health impacts; the HRA concluded the risks at the future Project residences and other sensitive uses are below the applicable thresholds.[385] Based on the analysis of the technical report, the Draft EIR concludes that the TAC risks [which include risks from particulate matter] from the National Cement Plant at Lebec to the Project site would be less than the applicable AVAQMD and SCAQMD [Southern California Air Quality Management District] CEQA significance thresholds," and that, "The impact would be less than significant".[386]

Further, CEQA does not require an analysis of the environment on the project but rather whether a project "may cause either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment."[387] According to the California Supreme Court in *California Building Industry Association v. Bay Area Air Quality Management District* (2015) (62 Cal.4th 369), "CEQA analysis is concerned with a project's impact on the environment, rather than with the environment's impact on a project and its users or residents."[388] Thus, CEQA does not require the Project to mitigate for emissions generated by current operations of the National Cement Plant.

Please see responses to Comments F.3-21 and F.3-22.

Response to Comment F.3-38:

The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project. The comment appears to refer to the segments of the Ridge Route roadway constructed prior to, and located generally to the east of, Interstate (I) 5 extending from the community of Castaic north to State Route (SR) 138. As recently discussed in published reports,[389] portions of the Ridge Route have been closed for several years due to storm damage; easements for portions of the route have been vacated and are currently held by

389 See, e.g., http://www.latimes.com/business/autos/la-fi-hy-old-ridge-route-20160502-story.html.

private landowners; portions of the route were listed on the National Register of Historic Places in 1997; and much of the route traverses through the Angeles National Forest and is subject to the planning and conservation oversight of the U.S. Forest Service. Due to these factors, the use of the Ridge Route to mitigate impacts on I-5 would be infeasible.

Potential Project impacts to I-5 are discussed in Section 5.10, Traffic, Access, and Circulation, of the Draft EIR, including the text and tables on pages 5.10-56 to 5.10-119. The analysis compares the applicable Level of Service (LOS) standards for I-5 freeway segments and on-ramps and off-ramps located north and south of the Project site using well-established analysis methodologies under existing conditions, existing conditions with the Project, and under future (cumulative) with Project conditions based on future I-5 traffic projections prepared by applicable transportation and transit planning agencies for Los Angeles and Kern Counties. The Draft EIR determined that no significant impacts to freeway segments or interchange ramps would occur under existing plus Project conditions, and that the Project could contribute to an exceedance of capacity on the westbound SR-138 to southbound I-5 ramp. The Draft EIR determined that, under cumulative plus Project conditions, the Project could contribute to impacts at six mainline segments along I-5 and to the interchange connector ramps from westbound SR-138 to southbound I-5 and from I-5 to eastbound SR-138. The Draft EIR found that all potentially affected I-5 segments and ramps under existing plus Project and cumulative plus Project conditions would operate within acceptable performance criteria with the implementation of mitigation measures and found that compliance with these mitigation measures and the fair share contributions towards the improvements described above would reduce potential Project impacts to I-5 freeway segments and ramps to less than significant levels.

The Draft EIR also discusses the Northwest State Route 138 Corridor Improvement Project ("NW SR-138 project"), including SR-138 improvement alternatives, design, purpose and how the alternatives related to the Project's proposed circulation system in Section 4.0, Project Description, pages 4-39 to 4-41, Section 5.10, Traffic, Access, and Circulation, pages 5.10-34 to 5.10-36, and Section 7.0, Cumulative Impacts, pages 7-8 to 7-9. This information was based on the Draft EIR/EIS for the NW SR-138 project which was circulated for public review and comment in July 2016. A Notice of Completion and Availability for the Draft EIR was filed by the County on May 15, 2017 and the 60-day comment period began on May 17, 2017. As noted on Draft EIR page 4-41, the NW SR-138 project Draft EIR/EIS, Transportation Analysis Report (TAR) and Intersection Control Evaluation report (ICE Report) deferred the selection of a preferred SR-138 improvement alternative until the NW SR-138 project Final EIR/EIS ("NW SR-138 FEIR") was published. In June 2017, during the comment period for the Draft EIR, Caltrans issued the NW SR-138 FEIR and identified Alternative 2 (Expressway/Highway) ("Alt 2") as the preferred alternative for the SR-138 improvements. In July 2017 Caltrans submitted a comment letter requesting that the Project traffic analysis discuss and incorporate the Alt 2 facilities to be consistent with the NW SR-138 FEIR. In response, a Supplemental Traffic Study (STS) was prepared to incorporate Alt 2 with the Project traffic analysis. The STS is attached as Appendix 5.10-C of the Final EIR.

The STS compares the Project's potential impacts identified in the Draft EIR for I-5, SR-14, and SR-99 facilities using the volume-to-capacity methodology specified by the Congestion

Management Plan for Los Angeles County and the Project's potential impacts using the Caltrans' recommended HCM methodology. HCM calculations were prepared for 62 locations within the Draft EIR study area consisting of freeway segments in advance of and after major system interchanges as well as representative locations between major system interchanges. The analyzed locations provide a comprehensive coverage of the Draft EIR study area because they include the freeway facilities with the greatest potential to be affected by congestion. Under existing plus Project conditions, the Draft EIR and the STS show that all applicable highway segments, intersections and ramps would operate at acceptable LOS levels.[390] Under cumulative plus Project conditions with mitigation, the Draft EIR and the STS show that almost all applicable highway segments, intersections and ramps would operate at acceptable LOS levels.[391] The STS indicates that certain study locations, such as the Grapevine grade segment of I-5, would not meet HCM-based LOS standards because topographic conditions, lane and speed controls and other localized conditions would result in higher traffic densities. As shown in STS Table A-5, however, LOS conditions would be worse under cumulative without Project conditions, and LOS conditions improve under cumulative with Project conditions with the implementation of the Project MMs.[392] Consequently, the STS demonstrates that, using the HCM methodology, the Project will not result in any new or more severe significant impacts to applicable highway segments, intersections and ramps than considered in the Draft EIR.

Please also see Section 5.16 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.3 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment F.3-39:

The presence of on-site, nearby, and regional faults is clearly disclosed in Section 5.1, Geotechnical. As discussed on pages 5.1-16 and 5.1-17, consistent with State regulations, there would no building on or within the required setback of the Alquist-Priolo Earthquake Fault Zone for the San Andreas Fault. The setback zone for the San Andreas Fault is incorporated into the Geologic Safety Zone, which also establishes building setbacks for the two unnamed on-site faults. Building setbacks are related to the risk of adverse effects of surface rupture on a fault during an earthquake. The Project would not expose people or structures to potential adverse effects from surface rupture of a known fault with implementation of PDF 1-1 (i.e., the Geologic Safety Zone). However, the risks from surface rupture of a fault are a different issue than the risks from strong seismic ground shaking during an earthquake. As stated on page 5.1-15 of the Draft EIR, "…the overall seismic risk at the Project site is the same as Southern California in its entirety." In other words, because of the extremely high seismicity throughout Southern California, the nearness of one or more active faults does not have a direct correlation to risk of a seismic event and the magnitude of the event in a certain area. In any case, for properties located in a seismic hazard zone, California *Public Resources Code* § 2694 requires that the seller's agent, or the seller if acting without an agent, but disclose that the property is located in a seismic hazard zone.

390 DRP 2017, Appendix 5.10-C, Table 4-1
391 *Id.,* Appendix 5.10-C, Table 4-2
392 *Id.,* Appendix 5.10-C, Section 5

Therefore, the notification requirement proposed by this comment is already a requirement of existing law. Since the Project is required to comply with existing law, and since the proposed notification requirement would not mitigate a physical impact on the environment, it is not an appropriate mitigation measure under CEQA.

Please also see Section 5.6 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.7 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment F.3-40:

This comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. The significant unavoidable issues are listed in the comment are not those noted in the Draft EIR, which are the following, as stated in Table 1-1, Centennial Specific Plan Impact Summary, on page 1-36:

> The following environmental factors would result in cumulatively significant and unavoidable impacts:
>
> - Land Resources (loss of Prime Farmland)
> - Biological Resources (regional wildlife movement, loss of native grasslands)
> - Population, Housing, and Employment (substantial relative to existing conditions)
> - Traffic, Access, and Circulation (without pending improvements by Caltrans)
> - Air Resources (construction and operational emissions in the AVAQMD and the SCAQMD)
> - Noise (traffic noise along segments of SR-138)
> - Visual Resources (change to long range views from public land and nighttime light and glare)
> - Solid Waste (contribution to municipal solid waste disposal)
> - Water Resources (water supplies)
> - Climate Change (greenhouse gas emissions)

More specifically, septic tanks will not be a part of the Project which will include a new sewer treatment plant as part of the Project development.

Subject: - CENTENNIAL DEIR PUBLIC COMMENT PERIOD
Attachments: Centennial DEIR response Aug 2017.pdf

Dear Mr Sackett,

Attached please find the revised Centennial DEIR comment letter that is to replace the one submitted by the Tri-County Watchdogs before the deadline was extended.

We look forward to reading the responses to our questions and requests in the FEIR.

F.3A-1

Best wishes,

Katherine King,
Secretary, Tri-County Watchdogs

TriCounty Watchdogs PO Box 6407 Frazier Park, CA 93222

17 August 2017

Mr. Jodie Sackett
County of Los Angeles Department of Regional Planning Hall of Records, 13th Floor Room 1348
320 West Temple Street Los Angeles, California 90012
JSackett@planning.lacounty.gov

Re: Comments on the **Centennial Project Draft Environmental Impact Report of May 2017**
State Clearinghouse No. 2004031072

Dear Mr. Sackett,

The Tri-County Watchdogs, an organization that focuses on promoting responsible growth in the Mountain Communities where Kern, Los Angeles and Ventura Counties meet, thanks you for the opportunity to comment on the Centennial Draft Environment Impact Report. F.3A-2

We must, however, begin by saying that until July 13 it was extremely difficult to access the information in this large report since CDs were not sent out and internet access in our rural mountain area has low bandwidth. It was impossible for our group to thoroughly read through the 2000 pages of the report, not to speak of the thousands of pages of appendices before the original deadline of July 17. We asked in writing for an extension only to learn that you were out of your office until July 11. It seemed to us that perhaps Los Angeles County Planning Department did not truly desire informed community feedback. Otherwise, another month's extension would have been granted when it was orally requested on June 29. The meeting on June 29, which surprised everyone by being a hearing rather than an information session, would have been better noticed. Tejon Ranchcorp (TRC) would have been asked to pay for the sending of hundreds of CDs. F.3A-3

Nevertheless, we submitted a comment letter on July 13, just before the extension was granted and the document was made more accessible. This letter replaces that earlier one. F.3A-4

We are deeply alarmed by the huge size of a proposed development in an area where **water** is scarce, where **Valley Fever** is rampant, where healthy **air** is already threatened by a cement plant as well as pollution drifting over from **traffic** on the I-5 recent, and where many precious species of wildlife share an endangered **bioregion** of native California grassland. Furthermore, as experienced Californians living in an adjacent area whose geology we did not know when we F.3A-5

bought homes here, we cannot forget the **earthquake** danger to new human residents living en masse in a fault-ridden zone. F.3A-5 cont.

WATER RESOURCES

Creating a new city of nearly 60,000 residents is a bad idea in an arid area that is likely to suffer severe drought conditions for many years, if not permanently. We note that very many people and communities in our adjacent Frazier Park region are suffering because of dry wells, and that sag ponds in Gorman were dry by June. F.3A-6

Over the past 14 years, Tejon Ranch Company/Tejon RanchCorp (TRC) has scrambled to cobble together enough sources of water to make it through the 20 year span required by Senate Bill 221 [ref page 5.18.11]. On paper TRCappears to have done so, but only if one assumes "normal" cycles--that is, a repetition of the past 20 year history-- of wet and dry years. However, as Climate Change wreaks havoc with weather patterns all over the world, teh very idea of "normal" has become highly contested. What if Southern California endures another ten-year (or longer) drought period on top of the one that has recently lowered groundwater levels all over the state? Where will the thirsty residents of the Antelope Valley get their water when there are 547,000 of them as opposed to the roughly 400,000 there now? F.3A-7

In this worst-case scenario, even the DEIR expresses some doubt both within and after the 20-year period (which ends in 2035 since the preparation of the DEIR has taken two years). F.3A-8

1634 acre feet per year (afy), or roughly 25% of the potable water needed at buildout (6788 afy), is expected to come from groundwater from the eastern Antelope Valley Groundwater Basin, to which TRC is now entitled because of the Judgment and Physical Solution of December 2015. The DEIR presumes that this 1634 afy will be constant through wet and dry and multiple-year (3) drought years. Howevcr, as the Peer Review of Kennedy Jenks Consultants points out, "It is not clear from the Judgment and Physical Solution whether this is a sound assumption even though the allocation is related to the safe yield determination for the Basin and should be confirmed by the Watermaster Engineer" [App 5.18.G. p.17]. What if another decade of drought changes the "safe yield determination"? **Please supply a more realistic assessment that takes climate change and a repetition of the past ten years as the new "normal."** F.3A-9

As we noted in our comments on the Hauled Water Initiative last fall, the Antelope Valley Basin and the small Acton Basin are already pumped to capacity, and the Santa Clara River Basin, which might have surplus to pump, has been contaminated by perchlorate. There is a risk in all three basins that increased pumping will increase concentrations of dissolved solids as well as other dangerous elements (Hauled Water Initiative WSA pp.7-9). F.3A-10

Extended droughts could affect not only the groundwater but also the SWP surface water that the DEIR counts on. What would ten years of a 5% allocation do to the Project's calculations? We F.3A-11

request that before taking action on this Project the County employ the services of a trained hydrologist to tell them and us. F.3A-11 cont.

It is ominous that 26,627 acre feet (AF) of CEntennial's reserve supply of water is due to amounts owed to TRC by AVEK precisely because of previous droughts: namely, 13,595 AF that TRC loaned to AVEK in 2008 and 2009 "to help alleviate the critical water shortage that was emerging in the Antelope Valley;" and 13,032 AF that AVEK is required to supply "in future wetter years in exchange for TRC... foregoing SWP deliveries in prior dry years" [5.18-61]. Again, **we ask for a realistic plan that includes a decade of *future* "dry years," *future* "critical water shortage."** F.3A-12

Indeed, the Antelope Valley Regional Integrated Water Management Plan (AVIRWMP), which hopes to accomodate the updated Antelope Valley Area Plan, discusses *potential* (not actual) extra sources of water on 5.18 pp.36-7, but concludes that "The General Plan Update Final EIR determined that the lower residential and related development associated with the AVAP update would reduce future water demand, but that the plan's water supply impacts would nevertheless remain *significant and unavoidable* (DRP 2015c). In other words, there will not be enough water for a projected 405,410 population (General Plan) much less the 547,000 projected if the Centennial Project is approved. F.3A-13

If we assume that in worst case multiple-year drought conditions water will be purchased from well outside the area, for example, northern California (which has just emerged from drought), Washington State, or eastern Nevada, southern Idaho, or some part of the United States that is experiencing flood instead of drought, the cost will be prohibitive. If rates double, triple, quadruple over twenty or thirty years, middle class home owners will be left with unsellable property that they cannot afford to live in. *The needs of current and future residents must come ahead of profits for out-of-state investors* like the east-coast consortium that owns Tejon Ranchcorp. F.3A-14

In addition, the DEIR's Water Supply Analysis (WSA) does not take fully into account the amount of water that will be needed for fire suppression. According to DEIR 3.0 [p.3-14] and 5.3.3, The Los Angeles County Fire Department has designated the Antelope Valley area, including the Project site, as a VHFHSZ, that is "highly vulnerable to wildfire." Drought has extended the fire season by a couple of months, and so far this year wildfires havc consumed three times as much acreage as last year. Last month, CNBC reported that 6000 firefighters were battling 14 wildfires in California at the same time, including three major ones in southern California. **Before the county approves any part of this project, studies need to be done on the volume of water that would be needed for fire suppression in this era of climate change.** F.3A-15

We note that Kern CopuntyPlanning Department Director Oviatt responded to the 2015 revised NOP with a similar request for a more realistic water study that takes into account already permitted development in Kern County as well as growing Los Angeles County areas served by AVEK [Revised NOP: Agency Comments pp. 151-2]. In addition, we would now add, Los F.3A-16

Angeles County supervisors must take into account the recently approved housing developments in Santa Clarita. F.3A-16 cont.

Mitigation: Do new, more realistic water studies that take into account climate change that has happened and will continue to happen despite the greenhouse gases measures that are featured in later sections of the DEIR. Issue permits for a limited number of new houses and buildings only in accordance with these new studies. Issue no permits until these new studies show how much water will be available for current as well as new residents of the Antelope Valley. F.3A-17

BIOLOGICAL RESOURCES

Grasslands:

The Centennial City Project, which is not an expansion of nearby urban or suburban cities or towns but rather the intrusion of almost 20,000 homes and more industry and commerce into natural and rural lands, proposes to destroy over 9,000 acres of California grassland. Native perennial bunch grasses of several species are found throughout the grasslands, up to over 30% coverage, which is very high for present California grasslands. This grassland harbors many native grassland-dependent animals and plants: it is home to pronghorns, elk, badger, burrowing owls, grasshopper sparrow, California condor and many other native wildlife, several of them endangered already. F.3A-18

The DEIR indicates that depredation of these grasslands will be reduced to insignificant levels by on-site and off-site designations of mitigation lands. The reality is that this Project, when built-out, will result in the permanent loss of some of California's last and best grassland habitat, including major stands of native bunchgrass species. F.3A-19

We note that the off-set mitigation preserves mentioned include lands already marked as green belts within the projects and lands previously set aside in the "Tejon Ranch Conservation and Land Use Agreement" (both "dedicated" and "acquisition" areas). We further note that the Tejon Conservancy is now struggling to secure the monetary support that TRC will cease supplying after 2021. This support, currently $800,000 per year, is needed in order to pay the salaries of the "experienced staff with expertise in land trust administration, conservation biology, environmental education, outdoor recreation and open space land management" that is promised in the "Agreement." Therefore, although we greatly respect the staff of the Conservancy, we have little confidence in the promise that Tejon Ranchcorp will voluntarily fulfill its responsibility to mitigate through preserved lands the significant and unavoidable depredations that its development plans entail. F.3A-20

We therefore ask that as a further **mitigation, TRC must commit to continuing its current support of $800,000 per annum for the Conservancy through 2031**. F.3A-21

Burrowing owl: Section 5.7 (Special Status Wildlife Species Observations with Impact boundary - after page 142):

The above-referenced map in the DEIR indicates one location within the Project footprint with evidence of burrowing owl presence. This is very difficult to believe.

One of the members of TCW worked as a biological monitor on Tejon Ranch property immediately north of the project representing DWR during the construction of the Tehachapi East Afterbay(TEA) in 2005. One of the pre-construction activities involved the location of burrowing owl activity, installation of one-way doors in active burrows outside the nesting season and construction of artificial burrows in nearby locations off the construction site.

During the field activity, many indications of burrowing owl activity were noted, including sightings of birds, and various evidences of recent activity at burrows. California ground squirrel activity was concentrated around wild cucumber vines. Burrowing owls were also found in these locations.

The majority of the Centennial City footprint consists of grasslands of the type found at the TEA site. We find that only one location for burrowing owl in the entire 12, 000+ acres of the Project site is incredible. We suggest that thorough field surveys be conducted for burrowing owl so that appropriate measures can be taken.

The paucity of burrowing owl records for the Project site suggests that field surveys for other wildlife species may also not have been adequate.

F.3A-22

Tri-colored blackbird Section 5.7 [pages 149 -150]:

The DEIR acknowledges that this species is presently a Candidate State-listed species that receives the same legal protection afforded to an endangered or threatened species.

The DEIR acknowledges that Project's biological surveys determined that tri-colored blackbirds have been nesting at four nearby off and on-site locations whose foraging ranges would include the Project lands.

The DEIR acknowledges that tri-colored blackbirds are known to forage as much as five miles from the nesting colonies.

The DEIR states that analysis has produced a figure of 8% reduction in suitable foraging area for the above four potential nesting locations.

For the Quail Lake colony and the one on-Project-site colony, analysis given in the DEIR indicates a potential loss of 20% foraging for these two colonies.

The DEIR's claim that Mitigation Measure 7.7 (enhancement and preservation of existing wetlands) will reduce the Project's impact on the tri-colored blackbird to a "less than significant" level is untrue.

F.3A-23

TCW has developed considerable knowledge of the Quail Lake tri-colored blackbird (TCBL) nesting colonies. Up to 1000 and possibly 2000 adults have nested at Quail Lake during 2015, 16 and 17. We have no information prior to 2015. Most of the colonies have been on the north side next to the Centennial City Project. Observations indicate that TCBL adults conduct

F.3A-24

most of their foraging during nesting season northwards into Tejon Ranch within the Centennial City proposed project land. We have a collection of photographs to support these observations. F.3A-24 cont.

Tri-colored blackbirds are intensely colonial. The females in each colony are known to ovulate simultaneously. The males who are feeding the females and young forage in tight flocks. The males at the Quail Lake colonies have been observed flying from the colonies on the north shore northwards through Tejon Ranch fields over the first ridge 1/3 mile north of the lake, then returning all together from an unknown destination in a few minutes with insects in their mouths. It is apparent from the time lapse that foraging was taking place within Village #9 location of the Centennial project. F.3A-25

The DEIR indicates a percentage of foraging reduction based on a five-mile hypothetical radius of 8% (20% for Quail Lake colonies). This figure is very dubious. Our impression is that the Quail Lake colonies probably do most of their foraging on the fields that are to be bulldozed by the Project. F.3A-26

It is very likely that the build-out of Village #9 north of Quail Lake will permanently destroy the colonies of tri-colored blackbirds at Quail Lake. This is in direct violation of the California Fish & Wildlife requirement to protect existing breeding colonies of this species. F.3A-27

Mitigation Measure 7.7 indicates that any disruption of nesting caused by the Project will be mitigated by the enhancement and preservation of existing wetlands. There is no assurance that this activity will create a replacement for the destroyed nesting colonies. Therefore, the DEIR proposes to destroy the colonies first, then hopefully the colonies will accept adjacent wetlands. This is not a reasonable plan for the protection of a listed species. F.3A-28

Implementation of MM 7.7 would **not** reduce the negative impact on nesting of tri-colored blackbird immediately adjacent to the Project to a level considered less than significant. F.3A-29

Furthermore, the Project's proposal to move the **National Cement Plant road** [DEIR 4-39] may also damage foraging areas of the breeding tri-colored population.Specifics and a map showing the proposed new route, which would be essential in order to evaluate the environmental affects, are missing. Our guess is that the new route would either traverse open space north and west of Village #1 or run south of Village #1 just north of Quail Lake. Either way, this realignment will increase the disturbance of natural grassland and tri-colored blackbird foraging area. F.3A-30

Mitigation: Before moving the National Cement Plant road **TRC needs to provide a map, and it needs to calculate the negative affects on the open space, the grasslands and and various flora and fauna**. It then needs to submit its calculations for public input. F.3A-31

Bioregion connectivity

Section 5.7 (See Exhibit 5.7-15 after page 172):

Significant Ecological Area 17 (SEA 17), as shown on Exhibit 5.7-15, would form a coherent polygon if not interrupted by the footprint of Centennial Project Plan. Most of the area within the Centennial footprint is consistent with the biotic communities of the adjacent SEA 17 lands. F.3A-32

The Centennial Project will seriously disrupt the connectivity of major bioregions between Tehachapi Mountains and the San Gabriel mountains (Liebre Mountain) to the south. This location represents the intersection of more bioregions than any other location in California: San Joaquin Valley, Tehachapi Mountains(southern end of Sierra Nevada), Mojave Desert, Transverse Ranges, Coast Ranges, and the Southern California Coastal Plains. F.3A-32 cont.

The DEIR has not adequately considered this major disruption of California's natural bioregions.

In addition, although the Centennial Project has been designed with open spaces, most of these open spares are narrow polygons that run east-to-west (see Exhibit 4-6, page 4-29). This allignment is exactly the opposite alignment needed to facilitate connectivity between the sections of SEA 17 north and south of the Project location. The placement of green belt open spaces should have been aligned in connection with existing natural conditions. This issue needs to be revisited. F.3A-33

The DEIR does describe an underpass at Highway 138 which is designed to accomodate some wildlife. However, this feature does not provide true connectivity in this region. F.3A-34

Bird Migration:

The DEIR fails to mention the possible affects of the Centennial project on local bird migration. F.3A-35

Local observers and photographers have documented the regular seasonal passage of many species of native birds in the Quail Lake regions. These experienced observers, photographers and other chroniclers of birdlife have determined that there is a regular seasonal migration of landbirds and waterbirds through the location of the Centennial Project. In the opinion of these observers, there is a migratory route that passes northward from Mexico past Salton Sea, through Antelope Valley, past Quail Lake, through the Grapevine Canyon into San Joaquin Valley and on northwards. This route is used both during the spring and fall migration periods. F.3A-36

The final EIR needs to **address the effect of the build-out of the project, including the subsequent widening of Highway 138 and the proposed shifting of the National Cement Road, on migration movements of birdlife.** This study needs to include **the effects of lights, sounds, habitat destruction and alteration** and other features. F.3A-37

AIR

Valley Fever:
Los Angeles County Dept of Public Health reported on July 21, 2017 that Valley Fever is on the rise in the county and in the Antelope Valley in particular. It warns that "people who live in the Antelope Valley are almost 9-times as likely to be diagnosed with Valley Fever compared with persons who live elsewhere in the county." It boggles the mind that Tejon RanchCorp is asking approval to bring 55,000 more people into this area, many of them to endure multiple years of ground upheaval. F.3A-38

The DEIR states that the risk of VALLEY FEVER (which is discussed in 5.3.2, pp. 13-14, and 5.11.7 pp 65-67) will be controlled by measures that include "watering exposed surfaces and haul roads three times daily; replacing ground cover in disturbed areas quickly; covering stock piles with tarps; and limiting speeds on unpaved roads to 15 miles per hour." In addition, near-by "residents would be provided with a notice disclosing this potential risk and describing strategies to avoid potential exposure to Valley Fever spores during construction or other earth-moving activities prior to sale, lease, or rental of any property." F.3A-39

These measures are not enough, for there is evidence (1) that watering increases the number of spores in the following season and (2) that spores can travel much farther than the DEIR assumes. For example, in 1977, a dust storm in Bakersfield carried dust and spores all the way to Sacramento. D. Pappagianis and H. Einstein wrote a scientific article about the result: "Tempest From Tehachapi Takes Toll or Coccidioides Conveyed Aloft and Afar."Western Journal of Medicine. 129, 6 (1978): 527–530. F.3A-40

A *New Yorker* article by Dana Goodyear, "Death Dust," described what happened as follows:

> "The Tempest from Tehachapi, as one researcher called it, spread dirt over an area the size of Maine. Twenty hours afterward, the dust reached Sacramento, four hundred miles north of Bakersfield, in the form of a murky haze that hung in the air for another day, stinging the eyes and noses of the residents. On the twenty-first, it started raining in Sacramento, which turned the dust to mud, coating the cars and sidewalks, and marked the end of the drought.
> Over the next several weeks, Sacramento County recorded more than a hundred cases of coccidioidomycosis, otherwise known as valley fever, or cocci, a disease caused by inhaling the microscopic spores of Coccidioides immitis, a soil-dwelling fungus found in Bakersfield. (In the previous twenty years, there had never been more than half a dozen cases a year.) Six of the victims died."
> [http://www.newyorker.com/magazine/2014/01/20/death-dust] F.3A-41

In addition, the Center for Disease Control website states that up to 40% of Valley Fever patients require hospitalization, and it posts an average cost of almost $50,000 per hospitalized patient. F.3A-42

We therefore suggest that in addition to the **mitigation** measures listed in the DEIR, the following be adopted:

1. **Tent construction areas** with mesh of the kind TRC is currently using to keep dust and winds off berries in Bakersfield area east of the 99.
2. **Extend the radius of notification** to include Gorman school and all schools in Lebec and Frazier Park
3. Mandate **soil-testing of every property** with the results to be provided **to every prospective buyer or renter** before a contract or lease may be signed.
4. **Post signs** on all roads within and adjacent to the project stating "CLOSE WINDOWS: VALLEY FEVER AREA"
4. Create an **endowment in advance to cover medical costs** of those people caught in the inevitable upsurge in Valley Fever cases. F.3A-43

5. The County should prepare for lawsuits and factor in that cost as they weigh the costs and benefits of this Project.

F.3A-43 cont.

Furthermore, construction workers, who, as the DEIR states, "would be at highest risk," need protective measures beyond education and "requiring that respirators or masks be worn" [5.11-66]. We think that their families and neighbors also need more protection, since there is evidence that a car originating in a Valley Fever area passed spores on to its new owner in Michigan after some one drove it there (*op cit*). We therefore suggest that the following **mitigations** be specified **for construction workers**:

1. Require workers to wear **respirators** without the secondary option of masks.
1. Provide workers with **either on-site showers and laundry facilities** so that they do not carry spores home on clothing or
2. Provide **hazmat suits**

F.3A-44

Air Quality

It is clear from the discussions in 5.11 [Air Resources] and 5.3-41-2 [Level of Significance after Mitigation] that during construction and after build-out of the proposed project, levels of air pollution would rise to unacceptable levels, causing illness, disability and premature death to the inhabitants of the Antelope Valley. As the DEIR states, no mitigation exists that can bring to levels required by the South Coast Air Quality Management District and the Antelope Valley Air Quality Management District the daily emissions of VOC [Volatile Organic Compounds that lead to the formation of ozone, which triggers chest pain, coughing, throat irritation, and congestion, worsens bronchitis, emphysema, and asthma, and can inflame the linings of the lungs and even, with repeated exposure permanently scar lung tissue], NOX [Nitrogen Oxides that cause airway inflammation and increase asthma], CO [Carbon Monoxide, which deprives tissues of oxygen], PM10 and PM2.5 [inhalable coarse and fine Particulate Matter that aggravate asthma, cause heart attacks and decreased lung function, cause premature death in people with weakened hearts or lungs].

F.3A-45

Faced with this disaster, which will also accelerate Climate Change [see 5.21], we request additional **mitigations** to those in 5.11.8 pp, 78-82 (which mysteriously do not include solar) and in Climate Action Plan Table 5.21.11 p.5.21.75 (which does include solar)] :

1) Require rooftop solar collection on *all* residential and commercial buildings

We note with approval that rooftop solar is planned for 100% of single-family detached residential units, but would like to see the 30% requirement for multi-family units and 60% requirement for commercial buildings be increased to 100%. Air quality and climate change demand it!

2) Double the number of required electric vehicle charging stations in multi-family residential projects and commercial buildings to 1 per 10 residential units and 1 per 25,000 sf of commercial space.

We note with approval the requirement to build electric charging stations in every single-family garage.

F.3A-46

Contra the statement on p. 5.3.21 that, " there is no evidence that either historic or regular operations at the **National Cement Plant** or on the realigned National Cement Plant Road have or would adversely impact the Project," we believe that Cement plant dust will harm new residents.
We therefore request another **mitigation**: **TRC must reduce and control the blasting** and particulate matter before large numbers of new homes are built only one or two miles away. F.3A-47

Traffic:

Widening the 138 to six lanes will be a disaster to biological resources. The northwestern part of the Antelope Valley has been designated a very Significant Ecological Area, and it would be difficult not to leave a major impact on these important lands even with the mitigations TRC has proposed. F.3A-48

As a **mitigation** of expected traffic in Antelope Valley and the I-5, we request the TRC contribute a fair share to **repair the Ridge Route from Castaic to the 138** so that it becomes a viable alternative to the 5 for local residents. F.3A-49

PUBLIC SERVICES [1.6.15-1.6.17; 5.15-5.17]

Library Services

There is no time line as to when the library services promised by the developer will be functional. Please give us start and completion dates. Please posts agreements, whatever stage they are at, with the Los Angeles County Public Library system as to provision of books, electronic facilities, and staffing. F.3A-50

Solid Waste Disposal

We question where precisely solid wastes will be disposed of. The document is murky, appearing to give a lot of information but saying little. The time horizon given is 15 years. What happens then? After 2030, seven strategies compared, agree on the underlying fact that no new landfills willl be permitted. We are drowning in garbage and available landfills are reaching capacity. Proposed solutions do not inspire confidence, much less credibility. F.3A-51

What are the assurances that these options comply with federal, state, and local statues and regulations related to solid waste? F.3A-52

How is TRC going to dispose of the 25% of operational waste that doesn't go to landfill F.3A-53

disposal? As usual, the expense and effort involving this disposal falls on property owners. Developers leave a mess and expect homeowners to pay the cost! With additional unavoidable impacts on the County. Caveat emptor.

F.3A-53 cont.

Hazardous Materials

As the DEIR acknowlwdges, transportation of hazardous materials is dangerously precarious. Kettleman City is not without its own problems and it is 105 miles NWof the project. McKittrick is 60 miles away. Please show agreements that these locations are willing and able to accept Centennial's hazardous materials until 2035 at least. Since 2035 is not that many years away, what long-term alternatives are there to these limited dump sites?

F.3A-54

PARKS, Road Maintenance, Flood-control.

Although the planned villages appear to be private communities (HOAs or POAs), the developer appears to be relying on county services for parks, facility maintenance, county-owned road maintenance, public right of way maintenance, flood control infrastructure maintenance and maintenance of other facilities. These services will be paid for not only by fees and taxes by the buyers into this development, but by current residents. This is quite a giveaway on the part of the county.

F.3A-55

The developer benefits and walks away with the profits while the tax burden falls upon the county and property owners. How do you justify this? For example, the Golden Valley water district, a small water company with 20 subscribers and one small building is being asked to create a huge infrastructure for 1500 new homes in the start up phase. Who will pay for this? Not the 20 subscribers. Luckily, Golden Valley can say no, but what then?

F.3A-56

Mitigations: 1) **clarify** what designated **open spaces** will be **parks** and make sure that all parks are available to the general public.

F.3A-57

2) **clarify costs and payers for the initial water services**

F.3A-58

Fire and Law Enforcement [5.16]

The early phases of creating infrastructure and the building of a new city will invite theft of building materials and equipment and create the need for security and fire protection. Who is paying for this security? The prison in Lancaster releases inmates into the community. A less than secure job site with expensive equipment and supplies might prove tempting to newly released prisoners. (We would, of course, not be writing this sentence if a major goal of California prisons was actually rehabilitation.)

F.3A-59

Yet not until Phase III is the construction of a store front new LASD station planned. In the meantime law enforcement will be provided by a LASD station 28 miles distant. CHP comes

F.3A-60

from more than 10 miles distant. An 8 minute response time for "emergency" issues appears wildly optimistic. In the middle of the night when there is no other vehicle on the road perhaps. F.3A-60 cont.

We draw your attention to the worried responses of law enforcement to the NOP of 2004. Captain Conley, Commander of the Newhall area Highway Patrol, wrote that increased traffic on the I-5 and 138 would cause "delays in emergency response time." The Los Angeles Sherif's Department anticipates that response times from the nearest station (Valencia) would be 1 hour (non-emergency), 50 minutes (priority), and 45 minutes (emergency) [2.0b NOP and Comment letters pp.77, 125-6]. F.3A-61

We also are aware of a recent incident in the Tri-corners area (adjacent to the Project area) in which the emergency response time --in summer with decent traffic conditions-- was 20 minutes. F.3A-62

Instead of giving estimated response time in terms of minutes and miles, we as residents ask you to **provide a more realistic assessment of how long it actually takes to get there**, allowing for winter weather and frequent road closures in the area of the development. Wildfires routinely create massive, miles long traffic jams on the I-5 and roads within or leading to the project area. F.3A-63

Please cite mitigation measures for these frequent occurrences. The statement that the Project will have impact on fire and law enforcement at a less than significant level is laughable. Please restate how levels of significance have been determined. Is this term in the sense of statistical significance? F.3A-64

Fire fighters are already stressed to their limits fighting fires. If current services are siphoned off to this new development, how will this affect residents who already feel that our fire and law enforcement services are inadequate? F.3A-65

Medical services:

Kern CountyPlanning Department Director Oviatt's response to the 2015 revised NOP included concern over the lack of medical facilities in proximity to the proposed Centennial development. She writes that there is "no major hospital within immediate transport of the Project site," and that "Accidents on Interstate 5, as well as icy roads on State Highway 138, could make access to off-site hospital facilities difficult or impossible." She and we would like to know how increased need for emergency and medical services will impact current residents. F.3A-66

The area needs a Level 1 Trauma Hospital We could tell you one terrible story after another of people who desperately need major and immediate medical care. For major medical events we have a choice of Henry Mayo in Valencia or any number of subpar hospitals in Bakersfield. What ambulance service will go that far to service this community? Please justify how there is no medical facility, no urgent care, no small clinics proposed when a new city is created. F.3A-67

The area also needs a Valley Fever specialty clinic like the ones in Arizona, e.g. the Valley Fever Center for Excellence and the Mayo Clinic Cocci Clinic. F.3A-68

Mitigations: 1) specify firm time line for building a **trauma center**.

2) Commit to building a **Valley Fever medical center** in Los Angeles County immediately.

F.3A-69

Earthquake: We point out the obvious: it is unwise to build a city on top of so many faults. If building must occur, we request the following

Mitigations: 1) Sellers of lots and home must be required to **notify new owners of nearness to Garlock,San Andreas, and the two newly discovered unnamed faults**.

2) In addition to the strictest building codes to withstand a 7 point earthquake, we would like to see additional measures to deal with **the effect of a breach of the aqueduct** on a much greater population than now exists in the area.

F.3A-70

CLIMATE CHANGE [5.21]

We applaud the commitment to install rooftop solar on 100% of single-family detached homes and the banning of utility scale solar plants within the project. We regret, however, that only 30% of multi-family residential units and 60% of commercial buildings are required to have rooftop solar. We are dismayed, too, that only 10% of single-family homes must have energy efficient water heater. We request the following **mitigations**:

1) **100% of multi-family residential units and commercial buildings must have rooftop solar.** 2) **100% of residential units and commercial building must have energy efficient water heaters** (including solar and tankless).

F.3A-71

ALTERNATIVES

The proposed Centennial project would unleash significant and unavoidable impacts on aesthetics, air, biological resources, archeological and paleontological resources, greenhouse gases and the quantity and quality of water (which is likely to be degraded by dense septic tanks and pollutants in storm run-off). All of these impacts, which the DEIR describes so well, should be enough to make Supervisors think long and hard–about the well-being of their neighbors, their non-corporate constituents, and their own grandchildren–before approving this project.

F.3A-72

Given all of the above, we ask the Supervisors *not* to make *an irretrievable commitment of water and biological resources*. Do not approve a project of 19,333 housing units (or even of 19,241, which is the reduced figure of Alternative C) that will create a lasting need for water that must nearly all be imported, that will necessitate paving precious grasslands in asphalt and concrete, and endanger with pollutants all nearby human, animal, and plant life.

F.3A-73

Until Tejon Ranchcorp comes up with a more reasonable alternative project, we ask that you choose Alternative A: No Project.

F.3A-74

For the Tri-County Watchdogs:

Terry Kelling, President (Frazier Park, CA)

Katherine King, Secretary (Venice and Frazier Park, CA)

*Tri-County Watchdogs is a local grassroots organization based in the Frazier park area, whose mission is to protect natural and cultural resources, to promote ecotourism, and foster responsible growth in the local Mountain Communities. We formed to respond to concerns about our water supply, air quality, our cultural and historical heritage, economic opportunities, and the neglect of our area by the counties and state.

F.3A-75

Responses to Comment Letter F.3A
Tri-County Watchdogs
August 17, 2017

Response to Comment F.3A-1:

Thank you for your comment and for your participation in this public process. The comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. No further response is required given that the comment does not address or question the content of the Draft EIR.

Response to Comment F.3A-2:

The comment is an introduction to the commenting organization. No further response is required given that the comment does not address or question the content of the Draft EIR.

Response to Comment F.3A-3:

In addition to the hard copy of the Notice of Availability sent via overnight mail to residents and agencies, which contained a link to access the Draft EIR on the County's website, a hard copy of the Draft EIR was also available for review at the following libraries.

Lancaster Regional Library
601 West Lancaster Boulevard
Lancaster, California 93534

Quartz Hill Library
5040 West Avenue M-2
Quartz Hill, California 93536

Castaic Library
27971 Sloan Canyon Road
Castaic, California 91384

Canyon Country JoAnne Darcy Library
18601 Soledad Canyon Road
Santa Clarita, California 91351

Valencia Public Library
23743 West Valencia Boulevard
Santa Clarita, California 91355

San Fernando Library
217 North Maclay Avenue
San Fernando, California 91340

Old Town Newhall Library
24500 Main Street
Santa Clarita, California 91321

Bakersfield Library, Southwest Branch
8301 Ming Avenue
Bakersfield, California 93311

Frazier Park Library
3732 Park Drive
Frazier Park, California 93225

Stevenson Ranch Library
25950 The Old Road
Stevenson Ranch, CA 91381

Additionally, the County extended the official review period by 30 days to end on August 16, 2017, making the Draft EIR response period a total of 90 days. The notice of time extension

was posted online[393] and emailed to all persons and parties who specifically requested a time extension.

A summary of the Hearing Examiner public hearing on June 29, 2017 was posted online on June 15, 2017.[394] Upon request, at the June 29, 2017 Hearing Examiner public hearing, the Lead Agency distributed several CD copies of the Draft EIR to meeting attendees. Prior to the June 29, 2017 meeting, the Lead Agency also uploaded the Draft EIR to its public website, and, after the meeting, upon request, further arranged the online materials to be more accessible by breaking the Draft EIR into its individual sections for faster downloading and review.

Response to Comment F.3A-4:

The comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. No further response is required given that the comment does not address or question the content of the Draft EIR.

Response to Comment F.3A-5:

The Commenter's opinions are noted. The Applicant has the water required to serve the Project. The source of the water is discussed in Section 5.18, Water Resources. Air quality is discussed in Section 5.11, Air Resources. Traffic on the I-5 and the surrounding region is discussed in Section 5.10, Traffic. Wildlife species and native grassland are discussed in Section 5.7, Biological Resources. Seismic issues are discussed in Section 5.1, Geology. The Commenter provides more detailed comments on these issues further in this letter. As such, please see responses to Comments F.3A-6 through F.3A-17 with regard to water supply, F.3A-38 through F.3A-44 with regard to valley fever, F.3A-45 through F.3A-47 with regard to air quality, F.3A-48 and F.3A-49 with regard to traffic, F.3A-18 through F.3A-21 with regard to native grassland and F.3A-22 through F.3A-37 with regard to other special-status species, and F.3A-70 with regard to earthquakes.

Please also see Section 5.17 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.18 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment F.3A-6:

The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project. The comment does not address or question the content of the Draft EIR, and no further response is required. The following information summarizes the analysis of regional water supplies and climate change impacts to water supplies in the Draft EIR. Long term,

393 Los Angeles, County of. 2017 (July 13). Notice of Time Extension of Public Comment Period for the Centennial Project Draft Environmental Impact Report. Los Angeles, CA: County of. http://planning.lacounty.gov/assets/upl/case/sp_02-232_pm060022-hearing-time-extension.pdf.

394 *Id.* 2017 (June 15). Hearing Examiner Staff Summary: "Centennial Specific Plan Project." Los Angeles, CA: County of. http://planning.lacounty.gov/assets/upl/case/sp_02-232_pm060022-staff-report.pdf.

cumulative regional water supplies are discussed in Draft EIR Section 7.0, Cumulative Impacts, pages 7-26 to 7-28 and in Section 5.18, Water Resources. The Draft EIR found that the Project's water supplies will sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet after buildout has been achieved. This surplus would persist over time based on an 82-year hydrologic period of record, including single dry and multiple dry years, and taking account of potential climate change impacts, prepared by the California Department of Water Resources in the State Water Project Delivery Capability Report.[395] As discussed in Draft EIR Section 5.18 and 7.0 the Antelope Valley Area Plan and General Plan EIRs, prepared by the County, the EIRs concluded that current water supplies within the Antelope Valley would be sufficient to meet demand up to 2035 during average water years. The EIRs further noted that available water plans and projections, including the 2013 Antelope Valley Integrated Regional Water Management Plan, indicated that current supplies would not sufficient to meet dry and multiple-dry year demand by 2035. The EIRs found that while potential buildout of the Antelope Valley Area Plan and General Plan in the Antelope Valley region after 2035 could further increase regional water demand, there were no water supply projections extending after 2035. Consequently, the EIRs found that cumulative impacts to regional water supplies would be significant and unavoidable because of the lack of projections for analyzing regional water supply sufficiency after 2035. The Draft EIR determined that the Project would help to reduce the water supply cumulative impact identified in the Antelope Valley Area Plan and General Plan EIRs because it would achieve water use efficiencies above existing average rates in the region and would ensure that the Project-related increment of future regional growth considered in the Antelope Valley Area Plan and General Plan EIRs would occur with a high level of water conservation, including state-of-the art household and irrigation installations and significantly enhanced recycled water use. Nevertheless, consistent with the Antelope Valley Area Plan and General Plan EIRs, the Draft EIR determined that potential cumulative water supply impacts would be significant and unavoidable.

The Project's water supplies are discussed in Section 5.18, Water Resources, of the Draft EIR and are separate from, and will not affect, the Frazier Park and Gorman area water supplies referenced in this comment. Climate change is discussed in Draft EIR Section 5.21, Climate Change; Section 1.6.21, Climate Change; Section 7.3.21, Climate Change; and in other topical sections of the Draft EIR, including Section 5.18, Water Resources. The analysis of Project water supplies utilizes the Early Long Term delivery reliability scenario published by the California Department of Water Resources in the 2015 State Water Project Delivery Capability Report. The Early Long Term delivery reliability scenario is utilized in the 2015 Urban Water Management Plan adopted by the Antelope Valley-East Kern Water Agency, the State Water Project contractor for Antelope Valley and for the Project. As discussed in Draft EIR Section 5.18, in contrast with the base scenario in the Delivery Capability Report, the Early Long Term scenario incorporates significant assumptions regarding potential climate change impacts, including 2025 greenhouse gas emission levels and a 15-centimeter sea level rise. As a result, the average year State Water Project delivery rate in the Early Long Term scenario is more conservative and lower than the Delivery Capability Report base

[395] DRP 2017, Appendix 5.18-C

scenario rate. Consistent with the Antelope Valley-East Kern Water Agency methodology used in the Agency's 2015 Urban Water Management Plan, the Early Long Term scenario is further modified to incorporate a single dry year delivery rate of 5 percent, lower than used in the Delivery Capability Report, to reflect delivery levels during the recent California drought. The Urban Water Management Plan was reviewed and determined to meet all California Water Code requirements by the California Department of Water Resources in March 2017. Consequently, the Draft EIR includes a discussion of climate change effects on water supplies that is consistent with the conservative Early Long Term scenario developed in the Delivery Capability Report and the same scenario, with a reduced single dry year reliability level, used in the Antelope Valley-East Kern Water Agency's 2015 Urban Water Management Plan.

Response to Comment F.3A-7:

The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors to a final decision on the proposed Project. The comment does not address or question the content of the Draft EIR, and no further response is required. The following information summarizes the analysis of regional water supplies and climate change impacts to water supplies in the Draft EIR. Long-term, cumulative regional water supplies are discussed in Draft EIR Section 7.0, Cumulative Impacts, pages 7-26 to 7-28 and in Section 5.18, Water Resources. The Draft EIR found that the Project's water supplies will sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet after buildout has been achieved. This surplus would persist over time based on an 82-year hydrologic period of record, including single dry and multiple dry years, and taking account of potential climate change impacts, prepared by the California Department of Water Resources in the State Water Project Delivery Capability Report.[396] As discussed in Draft EIR Sections 5.18 and 7.0 the Antelope Valley Area Plan and General Plan EIRs, prepared by the County, the EIRs concluded that current water supplies within the Antelope Valley would be sufficient to meet demand up to 2035 during average water years. The EIRs further noted that available water plans and projections, including the 2013 Antelope Valley Integrated Regional Water Management Plan, indicated that current supplies would not sufficient to meet dry and multiple-dry year demand by 2035. The EIRs found that while potential buildout of the Antelope Valley Area Plan and General Plan in the Antelope Valley region after 2035 could further increase regional water demand, there were no water supply projections extending after 2035. Consequently, the EIRs found that cumulative impacts to regional water supplies would be significant and unavoidable because of the lack of projections for analyzing regional water supply sufficiency after 2035. The Draft EIR determined that the Project would help to reduce the water supply cumulative impact identified in the Antelope Valley Area Plan and General Plan EIRs because it would achieve water use efficiencies above existing average rates in the region and would ensure that the Project-related increment of future regional growth considered in the Antelope Valley Area Plan and General Plan EIRs would occur with a high level of water conservation, including state-of-the art household and irrigation

396 *Ibid.*

installations and significantly enhanced recycled water use. Nevertheless, consistent with the Antelope Valley Area Plan and General Plan EIRs, the Draft EIR determined that potential cumulative water supply impacts would be significant and unavoidable.

The Project's water supplies are discussed in Section 5.18, Water Resources. Climate change is discussed in Draft EIR Section 5.21, Climate Change; Section 1.6.21, Climate Change; Section 7.3.21, Climate Change; and in other topical sections of the Draft EIR, including Section 5.18, Water Resources. The analysis of Project water supplies utilizes the Early Long Term delivery reliability scenario published by the California Department of Water Resources in the 2015 State Water Project Delivery Capability Report. The Early Long Term delivery reliability scenario is utilized in the 2015 Urban Water Management Plan adopted by the Antelope Valley-East Kern Water Agency, the State Water Project contractor for Antelope Valley and for the Project. As discussed in Draft EIR Section 5.18, in contrast with the base scenario in the Delivery Capability Report, the Early Long Term scenario incorporates significant assumptions regarding potential climate change impacts, including 2025 greenhouse gas emission levels and a 15-centimeter sea level rise. As a result, the average year State Water Project delivery rate in the Early Long Term scenario is more conservative and lower than the Delivery Capability Report base scenario rate. Consistent with the Antelope Valley-East Kern Water Agency methodology used in the Agency's 2015 Urban Water Management Plan, the Early Long Term scenario is further modified to incorporate a single dry year delivery rate of 5 percent, lower than used in the Delivery Capability Report, to reflect delivery levels during the recent California drought. The Urban Water Management Plan was reviewed and determined to meet all California Water Code requirements by the California Department of Water Resources in March 2017. Consequently, the Draft EIR includes a discussion of climate change effects on water supplies that is consistent with the conservative Early Long Term scenario developed in the Delivery Capability Report and the same scenario, with a reduced single dry year reliability level, used in the Antelope Valley-East Kern Water Agency's 2015 Urban Water Management Plan.

MM 18-2 requires implementation of water use monitoring and reporting, including the submission of water use reports to the County at the end of the 5th and 10th years or the occupancy of the 4,000th and 10,000th units, whichever occurs latest, to confirm that the water use efficiencies discussed in the Draft EIR are being achieved as the Project is built and that available water supplies are sufficient to meet future demand. If a report determines that water use is exceeding projected levels, the Project Water Purveyor must identify specific response measures to ensure that water supplies will meet future demand. Potential sources of additional supply, if necessary, are discussed on pages 5.18-69 to 5.18-72 of the Draft EIR and include potential groundwater transfers as allowed by the Adjudication Judgment and Physical Solution, supplemental surface water purchases and imports, and investments in additional recycled water use or storm water reuse in the Antelope Valley. No additional development will occur until sufficient supplies are identified for the Project.

Response to Comment F.3A-8:

The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed

Project. The comment does not address or question the content of the Draft EIR, and no further response is required. The following information summarizes the analysis of regional water supplies discussed in Draft EIR Section 7.0, Cumulative Impacts, pages 7-26 to 7-28 and in Section 5.18, Water Resources. The Draft EIR found that the Project's water supplies will sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet after buildout has been achieved. This surplus would persist over time based on an 82-year hydrologic period of record, including single dry and multiple dry years, and taking account of potential climate change impacts, prepared by the California Department of Water Resources in the State Water Project Delivery Capability Report[397] and using the same methodology adopted by the Antelope Valley-East Kern Water Agency in the agency's current Urban Water Management Plan, which includes the project. The analysis also incorporates the lower single dry year delivery rate of 5 percent used by AVEK to provide a more conservative analysis of State Water Project supplies and to reflect the lowest delivery level during the most recent drought. MM 18-2 requires implementation of water use monitoring and reporting, including the submission of water use reports to the County at the end of the 5th and 10th years or the occupancy of the 4,000th and 10,000th units, whichever occurs latest, to confirm that the water use efficiencies discussed in the Draft EIR are being achieved as the Project is built and that available water supplies are sufficient to meet future demand. If a report determines that water use is exceeding projected levels, the Project Water Purveyor must identify specific response measures to ensure that water supplies will meet future demand. Potential sources of additional supply, if necessary, are discussed on pages 5.18-69 to 5.18-72 of the Draft EIR and include potential groundwater transfers as allowed by the Adjudication Judgment and Physical Solution, supplemental surface water purchases and imports, and investments in additional recycled water use or storm water reuse in the Antelope Valley. No additional development will occur until sufficient supplies are identified for the Project.

Response to Comment F.3A-9:

The Project's use of 1,634 acre-feet per year of Antelope Valley Basin groundwater is consistent with the Antelope Valley Basin Adjudication Judgment and Physical Solution, which allocates rights to Antelope Valley Basin groundwater to sustainably manage the Basin's groundwater resources over time. Exhibit 4 to the Adjudication Judgment and Physical Solution allocates overlying production rights in amounts within the Basin's sustainable yield.[398] The Adjudication Judgment and Physical Solution provides that, after a seven-year rampdown period applicable to all basin groundwater users, the Tejon Ranch Company has an overlying production right of 1,634 acre feet per year, all of which will be provided to and utilized by the Project. The groundwater component of the Project's water supplies discussed in the Draft EIR is limited to the amount of the overlying production right of 1,634 acre feet per year allocated to Tejon Ranch Company in the adjudication. As discussed on page 5.18-20 of the Draft EIR, the 2013 Antelope Valley Integrated Regional

397 DRP 2017, Appendix 5.18-C
398 *Id.,* Appendix 5.18-D

Water Management Plan found that groundwater is considered to be a very reliable supply for the Antelope Valley region even in short-term and during multiple-year droughts.

All Project groundwater use will comply with the Antelope Valley Basin Adjudication Judgment and Physical Solution.[399] The Adjudication Judgment and Physical Solution was approved by the Court to sustainably manage Antelope Valley groundwater resources over time. As a result, groundwater use consistent with the Adjudication Judgment and Physical Solution also takes account of and avoids potential long-term, cumulative impacts to the Antelope Valley Basin. Section 1.5 of the Adjudication Judgment and Physical Solution states that after the Phase 3 trial of the proceedings, the Court determined that the safe yield of the Antelope Valley Basin is 110,000 acre-feet per year. Section 3.5.43 of the Adjudication Judgment and Physical Solution defines safe yield to mean the amount of annual extractions of water from the Basin over time equal to the amount of water needed to recharge the groundwater aquifer and maintain it in equilibrium, plus any temporary surplus. Section 3.4 of the Adjudication Judgment and Physical Solution states that the physical solution governs groundwater, imported water and Antelope Valley Basin storage space to ensure that the Antelope Valley Basin supports existing and future reasonable and beneficial uses. Exhibit 4 to the Adjudication Judgment and Physical Solution allocates overlying production rights in amounts consistent with the Basin's sustainable yield and provides that, after a seven-year rampdown period applicable to all basin groundwater users, the Tejon Ranch Company has an overlying production right of 1,634 acre feet per year, all of which will be provided to and utilized by the Project. The groundwater component of the Project's water supplies discussed in the Draft EIR is limited to the amount of the overlying production right of 1,634 acre feet per year allocated to Tejon Ranch Company in the adjudication. The fact that the Adjudication Judgment and Physical Solution, including the annual groundwater allocation to the Tejon Ranch Company, takes account of and avoids potential long-term and cumulative impacts to the Antelope Valley Basin is recognized in the 2014 California Sustainable Groundwater Management Act, which requires, for the first time in state history, that certain medium and high priority groundwater basins implement a plan to sustainably manage groundwater over time. Section 10720.8(b) of the Act specifically exempts the Antelope Valley from these requirements upon the approval of the Adjudication Judgment and Physical Solution. Section 10720.8 also exempts other adjudicated basins throughout the state. These exemptions demonstrate that an adjudication judgment, including the Antelope Valley Basin Adjudication Judgment and Physical Solution, accounts for and allocates water uses, avoids long term, cumulative groundwater impacts and ensures that cumulative groundwater use will be sustainable over time.

MM 18-2 requires implementation of water use monitoring and reporting, including the submission of water use reports to the County at the end of the 5th and 10th years or the occupancy of the 4,000th and 10,000th units, whichever occurs latest, to confirm that the water use efficiencies discussed in the Draft EIR are being achieved as the Project is built and that available water supplies are sufficient to meet future demand. If a report determines that water use is exceeding projected levels, the Project Water Purveyor must identify specific response measures to ensure that water supplies will meet future demand. Potential

399 *Ibid*.

sources of additional supply, if necessary, are discussed on pages 5.18-69 to 5.18-72 of the Draft EIR and include potential groundwater transfers as allowed by the Adjudication Judgment and Physical Solution, supplemental surface water purchases and imports, and investments in additional recycled water use or storm water reuse in the Antelope Valley. No additional development will occur until sufficient supplies are identified. Consequently, if Project and other Basin groundwater use were to be reduced by the Watermaster in the future, MM 18-2 ensures that the Project's potential long-term, cumulative impacts to the Antelope Valley Groundwater Basin groundwater supplies will be less than significant.

Response to Comment F.3A-10:

The Project will not pump groundwater from, discharge to or impact groundwater quality in the Acton or Santa Clara River basins. The Project's use of 1,634 acre-feet per year of groundwater, production of imported water return flows from urban water use in the Antelope Valley Basin, and water banking operations in the Antelope Valley will comply with the Antelope Valley Basin Adjudication Judgment and Physical Solution, which was approved by the Superior Court in December 2015 to sustainably manage Antelope Valley groundwater resources over time.[400] A watermaster will be appointed under the supervision of the Court to implement the Adjudication Judgment and Physical Solution. The Adjudication Judgment and Physical Solution prohibits water use that causes material injury, which is defined in Section 3.5.18 of the Judgment to mean impacts to the Basin caused by pumping or storage of groundwater that cause material physical harm to the Basin, any Basin subarea, or any producer, party or production right under the Adjudication Judgment and Physical Solution including degradation of water quality by introducing contaminants to the aquifer and/or transmission introduced contaminants through the aquifer. Section 18.5.8 requires that the Watermaster take all reasonable steps to assist and encourage appropriate regulatory agencies to enforce reasonable water quality regulations affecting the Basin. As a result, groundwater use, return flow production and banking/storage activities in the Antelope Basin, including by the Project will occur under the auspices of the Adjudication Judgment and Physical Solution and must protect groundwater quality as necessary to sustainably use and maintain the Basin. Project impacts to groundwater quality are discussed in Section 5.4, Water Quality, and would be less than significant with mitigation.

Response to Comment F.3A-11:

The potential delivery reliability and variability of Project State Water Project supplies is discussed in Draft EIR Section 5.18, Water Resources.[401] The Draft EIR analysis of State Water Project supplies utilizes the 82-year model results for the Early Long Term delivery reliability scenario published by the California Department of Water Resources in the 2015 State Water Project Delivery Capability Report.[402] The Early Long Term delivery reliability scenario is also utilized in the 2015 Urban Water Management Plan adopted by the Antelope Valley-East Kern Water Agency, the State Water Project contractor for Antelope Valley and for the Project. The Early Long Term scenario incorporates more significant assumptions

400 *Ibid*.
401 *Id.,* pp. 5.18-20 to -28, -54 to -64
402 *Id.,* Appendix 5.18-C

regarding potential climate change impacts than the Delivery Capability Report base scenario, including 2025 emission levels and a 15-centimeter sea level rise. The average year State Water Project delivery rate in the Early Long Term scenario is lower than the Delivery Capability Report base scenario rate. Consistent with the Antelope Valley-East Kern Water Agency methodology, the Early Long Term scenario was further modified to more conservatively evaluate Project water supplies by using a lower single dry year delivery rate of 5 percent than identified in the Delivery Capability Report. Consequently, the Draft EIR includes a discussion of climate change effects on water supplies that is consistent with the conservative Early Long Term scenario developed in the Delivery Capability Report and the same scenario, with a reduced single dry year reliability level, used in the Antelope Valley-East Kern Water Agency's 2015 Urban Water Management Plan. The comment does not address or question the discussion of the potential delivery reliability and variability of State Water Project supplies for the Project in the Draft EIR. The comment does not cite to any available information suggesting that State Water Project delivery levels could average 5 percent over a 10-year period. Table 6.4 in the Delivery Capability Report summarizes the average State Water Project delivery rates during the worst 2-, 4-, and 6-year droughts within the 82-year historical record for California maintained by the California Department of Water Resources. Table 6.4 shows that annual deliveries during these worst-case conditions ranged from an average of 28 percent (2-year drought) to 33 percent (4- and 6-year droughts). Consequently, the most severe drought-period delivery levels identified by the Department of Water Resources in the Delivery Capability Report for periods up to 6 years are substantially higher the 5 percent annual average suggested in the comment. No drought has persisted for longer than six years in the California Department of Water Resources historical record. The analysis of Project imported water supplies using the Early Long Term scenario in the Delivery Capability Report incorporates the effects of the most severe droughts during the 82-year historical record, plus additional adjustments to account for potential climate change effects and the 5 percent single dry year delivery level used by the Antelope Valley-East Kern Water in the Agency's 2015 Urban Water Management Plan. Consequently, the Draft EIR includes a discussion of State Water Project delivery reliability that is consistent with the conservative Early Long Term scenario developed in the Delivery Capability Report and the same scenario, with a reduced single dry year reliability level, used in the Antelope Valley-East Kern Water Agency's 2015 Urban Water Management Plan.

Response to Comment F.3A-12:

The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project. The comment does not address or question the content of the Draft EIR, and no further response is required. The following information summarizes the discussion of Antelope Valley-East Kern (AVEK) water supplies that are available to the project under specific single-year loan and in-lieu use agreements between the Tejon Ranch Company (TRC) and AVEK, including the discussions on Draft EIR pages 3-7, 5.18-61, and 5.18-62. These water supplies, collectively referred to a "AVEK Call Water" in the Draft EIR, are derived from transactions in 2008 and 2009 under which TRC purchased certain available water supplies from a third-party seller, and provided these supplies to AVEK in exchange for an agreement to repay the supplied water at 1.5 times the volumes transferred to AVEK.

The total remaining volume of water that AVEK is required to supply TRC as repayment under the 2008 and 2009 agreements, is 13,595 acre-feet. TRC has also participated in an in-lieu program administered by AVEK under which AVEK provides surface supplies in future wetter years in exchange for TRC using groundwater and foregoing SWP deliveries in prior dry years. The amount of water that AVEK is required to supply to TRC under the in-lieu program is 13,032 acre-feet. Finally, in 2007 and 2008, TRC purchased 2,362 acre-feet of water from AVEK for future delivery in wetter years. The total amount of AVEK Call Water the AVEK is contractually obligated to supply to TRC, all of which will be made available by TRC for Project use is 28,989 acre-feet. As shown in Draft EIR Table 5.18-10, the AVEK Call Water is used as part of the Project's reserve supply, and delivery is assumed to occur on a pro-rata basis over 20 average water years. The actual delivery timing can be flexibly arranged with AVEK to reflect the agency's available supplies from year to year. The water supply and demand projections assume that no AVEK Call Water would be supplied in either a single-dry year or during multiple-dry year droughts.[403] Documentation concerning the AVEK Call Water is included in Appendices J, O, and P of Draft EIR Appendix 5.18-A. The fact that TRC voluntarily entered into agreements with AVEK to supply water to the agency during relatively dry years, from 2007 to 2009, in exchange for future repayment in of water in wetter years does not affect the analysis of Project water supplies or the conclusion of the Draft EIR.

AVEK has developed significant new water banking and groundwater production rights since the last of the AVEK Call Water agreements with TRC was executed in 2009. As discussed on Draft EIR page 5.18-29, under the Antelope Valley Basin Adjudication Judgment and Physical Solution, AVEK has an overlying pre-rampdown production right of 4,000 acre-feet per year (afy) and an overlying production right of 3,550 afy at the end of the 7-year production rampdown period. The Adjudication Judgment and Physical Solution also provides AVEK with the right to produce an amount of imported water return flows in any year equal to 34 percent of agricultural imported water use and 39 percent of municipal and industrial imported water use multiplied by the average amount of imported water used by AVEK in the preceding 5-year period. AVEK has also developed groundwater banking programs to increase the reliability of the Antelope Valley region's water supplies by storing excess water available from the SWP during wet periods and recovering these supplies for delivery to customers during dry and high demand periods or in the event the SWP system is disrupted. AVEK's Water Supply Stabilization Project No. 2 (Westside Water Bank) started operations in 2010, and currently includes approximately 400 acres of groundwater recharge basins and 9 groundwater recovery wells. Up to 20 new wells may be constructed as a part of the Westside Water Bank project. Five irrigation wells existing on the property at the time of development may also be used in the program. AVEK meters the water delivery and recovery amounts for the banking program and will not recover more than 90 percent of the amount recharged to account for evapotranspiration, other losses during recharge and conveyance, and metering accuracy. The Eastside Water Banking and Blending Project started operations in 2016 and includes three 2-acre recharge basins and three groundwater wells. This project allows for recharge of raw water that is later recovered and blended for delivery to the Eastside Water Treatment Plant. The maximum recharge and recovery

[403] DRP 2017, Tables 5.18-11 and 5.18-12

volumes for the Westside Water Bank are estimated to be approximately 36,000 afy. AVEK can also recover groundwater from the Eastside Water Bank (5,700 afy total estimated capacity) and from 3 potable groundwater wells in the Bench Ranch Well Field (total capacity of about 3,700 afy). The current AVEK Urban Water Management Plan projects that AVEK will recover up to 36,000 afy from groundwater banking facilities during single-dry and multiple-dry years.

Response to Comment F.3A-13:

Long-term, cumulative regional water supplies are discussed in Draft EIR Section 7.0, Cumulative Impacts, pages 7-26 to 7-28 and in Section 5.18, Water Resources. The Draft EIR found that the Project's water supplies will sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet after buildout has been achieved. This surplus would persist over time based on an 82-year hydrologic period of record, including single dry and multiple dry years, and taking account of potential climate change impacts, prepared by the California Department of Water Resources in the State Water Project Delivery Capability Report.[404] As discussed in Draft EIR Sections 5.18 and 7.0 the Antelope Valley Area Plan and General Plan EIRs, prepared by the County, the EIRs concluded that current water supplies within the Antelope Valley would be sufficient to meet demand up to 2035 during average water years. The EIRs further noted that available water plans and projections, including the 2013 Antelope Valley Integrated Regional Water Management Plan, indicated that current supplies would not sufficient to meet dry and multiple-dry year demand by 2035. The EIRs also concluded that while potential buildout of the Antelope Valley Area Plan and General Plan in the Antelope Valley region after 2035 could further increase regional water demand, there were no water supply projections extending after 2035. Consequently, the EIRs found that cumulative impacts to regional water supplies would be significant and unavoidable because of the lack of projections for analyzing regional water supply sufficiency after 2035. The Draft EIR determined that the Project would help to reduce the water supply cumulative impact identified in the Antelope Valley Area Plan and General Plan EIRs because it would achieve water use efficiencies above existing average rates in the region and would ensure that the Project-related increment of future regional growth considered in the Antelope Valley Area Plan and General Plan EIRs would occur with a high level of water conservation, including state-of-the art household and irrigation installations and significantly enhanced recycled water use. Nevertheless, consistent with the Antelope Valley Area Plan and General Plan EIRs, the Draft EIR determined that potential cumulative water supply impacts would be significant and unavoidable. Neither the Antelope Valley Area Plan and General Plan EIRs nor the Draft EIR found that there would not be enough water to serve future regional demand. The analyses found that impacts would be significant and unavoidable because of the lack of pertinent information and uncertainty regarding such supplies.

404 *Id.,* Appendix 5.18-C

Response to Comment F.3A-14:

This comment expresses an opinion regarding the possible costs of obtaining hypothetical water supplies, some of which include out of state sources that are not known to have provided significant municipal or other water supplies to California. The comment does not cite to any available information substantiating the feasibility and costs of obtaining these supplies, and further analysis of these issues would be speculative. The comment does not address or question the content of the Draft EIR and no further response is required. As discussed in Draft EIR Section 5.18, Water Resources, the Project's available water supplies would sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet after buildout has been achieved. None of the Project water supplies would be obtained from any of the sources included in the comment. The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project.

Response to Comment F.3A-15:

Fire flows are considered to be intermittent water uses that are accounted for in a project's water system losses or non-revenue water. As shown in Draft EIR Table 5.18-7, the Project demand includes a potable water system loss of 327 acre-feet per year at buildout, or just under 105 million gallons per year. The volume of fire flows for the Project is discussed on pages 5.3-35 and 5.3-36 of Section 5.3, Hazards and Fire Safety, in the Draft EIR. The Project's water system will provide water supplies to support proposed land uses and provide adequate fire flows and pressure to support any fire-suppression activity in the event of wildland or structural fires. The proposed water system includes water mains, water tanks, pump stations (where necessary), and fire hydrants to ensure sufficient fire flows and water pressure to meet County of Los Angeles Department of Public Works' and the Los Angeles County Fire Department's fire-suppression standards for improved property and development. These requirements must be met prior to the approval of building permits by the County. The fire flow demand for the Project is conservatively assumed to be 4,000 gallons per minute for a duration of 4 hours (approximately 1.0 million gallons) in each of the four water system pressure zones within the site. The system losses shown in Draft EIR Table 5.18-7 are several times greater in magnitude than the required fire flow volumes for the Project. In addition, water reserves to ensure that supplies are available to meet fire suppression demand when needed will be maintained in the onsite water bank and the offsite existing, adjacent water bank that will serve the Project.[405] The Draft EIR found that the Project's water supplies would sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet, or more than 25.6 billion gallons. This level of reserve water supplies significantly exceeds the maximum fire flow demands for the Project area. Consequently, potential fire suppression water demand is accounted for in the Draft EIR analysis of Project water supplies.

[405] *Id.,* Appendix 5.19-A, p. 8-2

The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project. The comment does not address or question the content of the Draft EIR, and no further response is required. The following information summarizes the analysis of regional water supplies and climate change impacts to water supplies in the Draft EIR. Long-term, cumulative regional water supplies are discussed in Draft EIR Section 7.0, Cumulative Impacts, pages 7-26 to 7-28 and in Section 5.18, Water Resources. The Draft EIR found that the Project's water supplies will sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet after buildout has been achieved. This surplus would persist over time based on an 82-year hydrologic period of record, including single dry and multiple dry years, and taking account of potential climate change impacts, prepared by the California Department of Water Resources in the State Water Project Delivery Capability Report.[406] As discussed in Draft EIR Sections 5.18 and 7.0 the Antelope Valley Area Plan and General Plan EIRs, prepared by the County, the EIRs concluded that current water supplies within the Antelope Valley would be sufficient to meet demand up to 2035 during average water years. The EIRs further noted that available water plans and projections, including the 2013 Antelope Valley Integrated Regional Water Management Plan, indicated that current supplies would not sufficient to meet dry- and multiple-dry year demand by 2035. The EIRs found that while potential buildout of the Antelope Valley Area Plan and General Plan in the Antelope Valley region after 2035 could further increase regional water demand, there were no water supply projections extending after 2035. Consequently, the EIRs found that cumulative impacts to regional water supplies would be significant and unavoidable because of the lack of projections for analyzing regional water supply sufficiency after 2035. The Draft EIR determined that the Project would help to reduce the water supply cumulative impact identified in the Antelope Valley Area Plan and General Plan EIRs because it would achieve water use efficiencies above existing average rates in the region and would ensure that the Project-related increment of future regional growth considered in the Antelope Valley Area Plan and General Plan EIRs would occur with a high level of water conservation, including state-of-the art household and irrigation installations and significantly enhanced recycled water use. Nevertheless, consistent with the Antelope Valley Area Plan and General Plan EIRs, the Draft EIR determined that potential cumulative water supply impacts would be significant and unavoidable.

The Project's water supplies are discussed in Section 5.18, Water Resources. Climate change is discussed in Draft EIR Section 5.21, Climate Change; Section 1.6.21, Climate Change; Section 7.3.21, Climate Change; and in other topical sections of the Draft EIR, including Section 5.18, Water Resources. The analysis of Project water supplies utilizes the Early Long Term delivery reliability scenario published by the California Department of Water Resources in the 2015 State Water Project Delivery Capability Report. The Early Long Term delivery reliability scenario is utilized in the 2015 Urban Water Management Plan adopted by the Antelope Valley-East Kern Water Agency, the State Water Project contractor for Antelope Valley and for the Project. As discussed in Draft EIR Section 5.18, in contrast with the base scenario in the Delivery Capability Report, the Early Long Term scenario

406 *Id.,* Appendix 5.18-C

incorporates significant assumptions regarding potential climate change impacts, including 2025 greenhouse gas emission levels and a 15-centimeter sea level rise. As a result, the average year State Water Project delivery rate in the Early Long Term scenario is more conservative and lower than the Delivery Capability Report base scenario rate. Consistent with the Antelope Valley-East Kern Water Agency methodology used in the Agency's 2015 Urban Water Management Plan, the Early Long Term scenario is further modified to incorporate a single dry year delivery rate of 5 percent, lower than used in the Delivery Capability Report, to reflect delivery levels during the recent California drought. The Urban Water Management Plan was reviewed and determined to meet all California Water Code requirements by the California Department of Water Resources in March 2017. Consequently, the Draft EIR includes a discussion of climate change effects on water supplies that is consistent with the conservative Early Long Term scenario developed in the Delivery Capability Report and the same scenario, with a reduced single dry year reliability level, used in the Antelope Valley-East Kern Water Agency's 2015 Urban Water Management Plan. The project water supplies are sufficient to meet fire flow requirements under these analytical conditions, including climate change.

MM 18-2 requires implementation of water use monitoring and reporting, including the submission of water use reports to the County at the end of the 5th and 10th years or the occupancy of the 4,000th and 10,000th units, whichever occurs latest, to confirm that the water use efficiencies discussed in the Draft EIR are being achieved as the Project is built and that available water supplies are sufficient to meet future demand. If a report determines that water use is exceeding projected levels, the Project Water Purveyor must identify specific response measures to ensure that water supplies will meet future demand. Potential sources of additional supply, if necessary, are discussed on pages 5.18-69 to 5.18-72 of the Draft EIR and include potential groundwater transfers as allowed by the Adjudication Judgment and Physical Solution, supplemental surface water purchases and imports, and investments in additional recycled water use or storm water reuse in the Antelope Valley. No additional development will occur until sufficient supplies are identified for the Project.

Response to Comment F.3A-16:

The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project. The comment does not address or question the content of the Draft EIR, relevant comments received during the Notice of Preparation period were incorporated into the Draft EIR, and no further response is required. The following information summarizes the analysis of regional and Antelope Valley-East Kern (AVEK) water agency supplies in the Draft EIR. Consistent with applicable law, the referenced agency statement in the comment requested that an "analysis of the realistic availability of water over the next 20 years on cumulative basis should be included in the EIR." The Draft EIR includes this analysis. Long-term, cumulative regional water supplies are discussed in Draft EIR Section 7.0, Cumulative Impacts, pages 7-26 to 7-28 and in Section 5.18, Water Resources. The Draft EIR found that the Project's water supplies will sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet after buildout has been achieved. This

surplus would persist over time based on an 82-year hydrologic period of record, including single dry and multiple dry years, and taking account of potential climate change impacts, prepared by the California Department of Water Resources in the State Water Project Delivery Capability Report.[407] As discussed in Draft EIR Sections 5.18 and 7.0, the Antelope Valley Area Plan and General Plan EIRs, prepared by the County, the EIRs concluded that current water supplies within the Antelope Valley, including AVEK supplies, would be sufficient to meet demand up to 2035 during average water years. The EIRs further noted that available water plans and projections, including the 2013 Antelope Valley Integrated Regional Water Management Plan, indicated that current supplies would not be sufficient to meet dry and multiple-dry year demand by 2035. The EIRs also concluded that while potential buildout of the Antelope Valley Area Plan and General Plan in the Antelope Valley region after 2035 could further increase regional water demand, there were no water supply projections extending after 2035. Consequently, the EIRs found that cumulative impacts to regional water supplies would be significant and unavoidable because of the lack of projections for analyzing regional water supply sufficiency after 2035. The Draft EIR determined that the Project would help to reduce the water supply cumulative impact identified in the Antelope Valley Area Plan and General Plan EIRs because it would achieve water use efficiencies above existing average rates in the region and would ensure that the Project-related increment of future regional growth considered in the Antelope Valley Area Plan and General Plan EIRs would occur with a high level of water conservation, including state-of-the art household and irrigation installations and significantly enhanced recycled water use. Nevertheless, consistent with the Antelope Valley Area Plan and General Plan EIRs, the Draft EIR determined that potential cumulative water supply impacts would be significant and unavoidable. Neither the Antelope Valley Area Plan and General Plan EIRs nor the Draft EIR found that there would not be enough water to serve future regional demand. The analyses found that impacts would be significant and unavoidable because of the lack of pertinent information and uncertainty regarding such supplies.

In 2016, after the agency comment referenced above was submitted to the County, AVEK adopted its current Urban Water Management Plan (UWMP) in accordance with state law.[408] The Urban Water Management Plan was reviewed and determined to meet all California Water Code requirements by the California Department of Water Resources in March 2017. Consistent with the County's findings in the EIRs for the Antelope Valley Area Plan and General Plan, the AVEK UWMP found that normal year supplies would be sufficient to meet demand, but that shortfalls could occur in dry and multiple dry years. Section 7.4 of the UWMP states that AVEK "AVEK is committed to maintaining the reliability of the region's water supplies and will continue to explore options to maximize available water supplies for the benefit of the region" and to achieve the goal of providing "a level of regional water reliability that supports customers' water needs." The further development of local groundwater banking water conservation to reduce local demand is identified as an element of the AVEK reliability objective. Consistent with this goal, the Project includes a substantial

407 *Ibid.*
408 *Id.,* Appendix 5.18-F

water banking program and will result in water use levels that are substantially lower than current demand for comparable uses in the region.

Response to Comment F.3A-17:

The following information summarizes the analysis of regional water supplies and climate change impacts to water supplies in the Draft EIR. Long-term, cumulative regional water supplies are discussed in Draft EIR Section 7.0, Cumulative Impacts, pages 7-26 to 7-28 and in Section 5.18, Water Resources. The Draft EIR found that the Project's water supplies will sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply in the two Project water banking facilities of more than 79,000 acre-feet after buildout has been achieved. This surplus would persist over time based on an 82-year hydrologic period of record, including single dry and multiple dry years, and taking account of potential climate change impacts, prepared by the California Department of Water Resources in the State Water Project Delivery Capability Report.[409] As discussed in Draft EIR Sections 5.18 and 7.0 the Antelope Valley Area Plan and General Plan EIRs, prepared by the County, the EIRs concluded that current water supplies within the Antelope Valley would be sufficient to meet demand up to 2035 during average water years. The EIRs further noted that available water plans and projections, including the 2013 Antelope Valley Integrated Regional Water Management Plan, indicated that current supplies would not sufficient to meet dry and multiple-dry year demand by 2035. The EIRs found that while potential buildout of the Antelope Valley Area Plan and General Plan in the Antelope Valley region after 2035 could further increase regional water demand, there were no water supply projections extending after 2035. Consequently, the EIRs found that cumulative impacts to regional water supplies would be significant and unavoidable because of the lack of projections for analyzing regional water supply sufficiency after 2035. The Draft EIR determined that the Project would help to reduce the water supply cumulative impact identified in the Antelope Valley Area Plan and General Plan EIRs because it would achieve water use efficiencies above existing average rates in the region and would ensure that the Project-related increment of future regional growth considered in the Antelope Valley Area Plan and General Plan EIRs would occur with a high level of water conservation, including state-of-the art household and irrigation installations and significantly enhanced recycled water use. Nevertheless, consistent with the Antelope Valley Area Plan and General Plan EIRs, the Draft EIR determined that potential cumulative water supply impacts would be significant and unavoidable.

Climate change is discussed in Draft EIR Section 5.21, Climate Change; Section 1.6.21, Climate Change; Section 7.3.21, Climate Change; and in other topical sections of the Draft EIR, including Section 5.18, Water Resources. The analysis of Project water supplies utilizes the Early Long Term delivery reliability scenario published by the California Department of Water Resources in the 2015 State Water Project Delivery Capability Report. The Early Long Term delivery reliability scenario is utilized in the 2015 Urban Water Management Plan adopted by the Antelope Valley-East Kern Water Agency, the State Water Project contractor for Antelope Valley and for the Project. As discussed in Draft EIR Section 5.18, in contrast

409 *Id.,* Appendix 5.18-C

with the base scenario in the Delivery Capability Report, the Early Long Term scenario incorporates significant assumptions regarding potential climate change impacts, including 2025 greenhouse gas emission levels and a 15-centimeter sea level rise. As a result, the average year State Water Project delivery rate in the Early Long Term scenario is more conservative and lower than the Delivery Capability Report base scenario rate. Consistent with the Antelope Valley-East Kern Water Agency methodology used in the Agency's 2015 Urban Water Management Plan, the Early Long Term scenario is further modified to incorporate a single dry year delivery rate of 5 percent, lower than used in the Delivery Capability Report, to reflect delivery levels during the recent California drought. The Urban Water Management Plan was reviewed and determined to meet all California Water Code requirements by the California Department of Water Resources in March 2017. Consequently, the Draft EIR includes a discussion of climate change effects on water supplies that is consistent with the conservative Early Long Term scenario developed in the Delivery Capability Report and the same scenario, with a reduced single dry year reliability level, used in the Antelope Valley-East Kern Water Agency's 2015 Urban Water Management Plan. The project water supplies are sufficient to meet fire flow requirements under these analytical conditions, including climate change.

MM 18-2 requires implementation of water use monitoring and reporting, including the submission of water use reports to the County at the end of the 5th and 10th years or the occupancy of the 4,000th and 10,000th units, whichever occurs latest, to confirm that the water use efficiencies discussed in the Draft EIR are being achieved as the Project is built and that available water supplies are sufficient to meet future demand. If a report determines that water use is exceeding projected levels, the Project Water Purveyor must identify specific response measures to ensure that water supplies will meet future demand. Potential sources of additional supply, if necessary, are discussed on pages 5.18-69 to 5.18-72 of the Draft EIR and include potential groundwater transfers as allowed by the Adjudication Judgment and Physical Solution, supplemental surface water purchases and imports, and investments in additional recycled water use or storm water reuse in the Antelope Valley. No additional development will occur until sufficient supplies are identified for the Project.

Response to Comment F.3A-18:

The grasslands, and the plant and wildlife species that compose them, as well as their regional value, are described in the Draft EIR on pages 5.7-25 through 5.7-27, 5.7-40 through 5.7-47, 5.7-62, 5.7-67, 5.7-107, 5.7-111, 5.7-113 through 5.7-118, 5.7-121, 5.7-126 and 5.7-127. Mitigation has been included in the Draft EIR to reduce impacts to these biological resources to a less than significant level (MM 7-10).[410] Cumulatively considerable significant impacts are acknowledged for the biological issues of native perennial grasslands and regional wildlife movement, as discussed on pages 7-15 through 7-17 in Section 7.0, Cumulative impacts of the Draft EIR. Also, please see responses to Comments F.3-11, F.3-12, F.3-19, B.4-22, B.4-25, B.4-60, B.4-17, B.4-63, and B.4-81 for additional information on this topic.

[410] *Id.,* p. 5.7-180 to -182

Response to Comment F.3A-19:

Please see responses to Comments F.3-12 and F.3A-18. As stated in MM 7-10 in the Draft EIR in Section 5.7, Biological Resources, mitigation ratios of at least 2:1 are required for grasslands.[411] The ratio of 2:1 was developed over multiple years of discussion and grassland studies, as listed in Table 5.7-2 on page 5.7-19 of the Draft EIR. The grassland studies conducted on the site and in portions of the mitigation lands provide a detailed understanding of the botanical composition of grasslands within these areas as summarized on pages 5.7-25 to 5.7-27, 5.7-42 to 5.7-47, and 5.7-158 to 5.7-160. These studies indicate roughly 26 percent of the grasslands on site would be considered native grasslands and 74 percent would be considered non-native grasslands based on the most common definitions. The 2:1 ratio was applied to all 6,415 acres of impacted grasslands, rather than to the smaller native grassland acreages scattered on the Project site and surrounded by non-native grassland, as a way to provide for a greater total grassland mitigation obligation as well as a more like-for-like mitigation scenario by avoiding preservation of many small patches of widely distributed native grasslands, as discussed in the first paragraph on page 5.7-160. Furthermore, sampling studies and assessments of the 14,908 acres of preserved grasslands indicate a high degree of similarity to that of the impacted grasslands.[412]

Grassland and wildflower studies of mitigation areas (including on-site mitigation lands, the offsite mitigation lands included in the Draft EIR, and the additional offsite mitigation lands included in this Final EIR (see response to Comment B.4-63), indicate an acceptable degree of similarity in vegetation species composition at varying degrees consistent with Project impact areas.[413] Furthermore, the 14,375 acres are preserved as part of a contiguous open space area inclusive of 28,171 additional acres of other vegetation types in a mosaic of regional biological resources. Impacts to non-native grasslands have traditionally been considered less than significant and have not required any mitigation. The Centennial Project approach to grassland mitigation is progressive, conservative and results in more meaningful mitigation for grasslands as well as regional biological values as a whole than would result from a more traditional and less conservative approach. In addition, the 14,375 of preserved grasslands is actually greater than the 12,832 acres of grasslands which would be required with the 2:1 resulting in 2,076 additional acres of grassland preservation. The additional acreage provides still greater assurance of full mitigation for the Project's grassland impacts.

Response to Comment F.3A-20:

Please see response to Comment F.3-12. The Conservancy's funding sources from Tejon Ranch are described in the TRCRWA[414]. The Conservancy's initial years of operations were funded by Tejon Ranch, and pursuant to the TRCRWA finding will be provided in perpetuity through the payment of transfer fees on designated property transactions within the planned development projects of Centennial, Tejon Mountain Village, and Grapevine.

411 *Id.,* p. 5.7-180
412 *Id.,* pp. 5.7-135 to -138, PDFs 7.1 and 7.2
413 *Id.,* Appendix 5.7-B, Plant-8
414 Final EIR Appendix 5.7-E

Lawsuits by commenter CBD have caused some development project delays, which will in turn delay the Conservancy's access to transfer fees from these future development projects. Commenters cannot cause a consequence (project delay from lawsuit challenges that in turn delay Conservancy funding from development area transfer fees) and then convert their conduct into an alleged deficiency in CEQA compliance.[415]

Response to Comment F.3A-21:

Please see response to Comment F.3-12. The Conservancy's funding sources from Tejon Ranch are described in the Ranch-Wide Agreement (TRCRWA).[416] The Conservancy's initial years of operation were funded by Tejon Ranch, and, pursuant to the TRCRWA finding, will be provided in perpetuity through the payment of transfer fees on designated property transactions within the planned development projects of Centennial, Tejon Mountain Village, and Grapevine. Lawsuits by commenter CBD have caused some development project delays, which will in turn delay the Conservancy's access to transfer fees from these future development projects. Commenters cannot cause a consequence (project delay from lawsuit challenges that in turn delay Conservancy funding from development area transfer fees) and then convert their conduct into an alleged deficiency in CEQA compliance.[417] The Commenter's request that Tejon Ranch continue to fund the Conservancy under terms that deviate from the TRCRWA falls outside the scope of CEQA. The TRCRWA includes specific requirements regarding the funding of project-related mitigation activities, which are not triggered until or unless such projects are fully approved and the need for mitigation is triggered.

Response to Comment F.3A-22:

Single pairs or individual burrowing owls have been observed on or in the vicinity of the Project site during multiple bird surveys performed between March 2000 and July 2015.[418] Focused burrowing owl surveys have also been conducted.[419] Specifically, qualified wildlife biologists conducted protocol-level focused surveys for the western burrowing owl in 2003 and 2006.[420] One pair was observed in the eastern portion of the site in 2001 and one pair was observed just off the site to the north in 2006 using an abandoned irrigation standpipe; this species was not detected on site since 2001.[421] Additionally, as part of a comprehensive grassland quality survey conducted on the Project site in April 2006, a search for evidence of burrowing owl presence on the site, as well as a habitat and occurrence record evaluation using geographic information system (GIS) databases and analytical tools, was conducted by Natural Resource Consultants (NRC). Through these methods, NRC determined that burrowing owls are likely to be present on the Project site but are locally distributed and uncommon. During at least 1,044 man-hours of fieldwork over three weeks, two individual

418 DRP 2017, p. 5.7-19 to -23, Table 5.7-2
419 *Id.,* Appendix 5.7-B, Birds-4; *Id.,* Appendix 5.7-B, Gen-6
420 *Id.,* p. 5.7-22, Table 5.7-2
421 *Id.,* p. 5.7-115

burrowing owls were observed, both of which were slightly off-site to the east. NRC concluded that though grassland habitats preferred by burrowing owls are present on the site, burrowing owls are uncommon and/or locally distributed.[422] The Project site is at the edge of the known range of the species as shown by the CDFW's California Wildlife Habitat Relationships Database.[423] Although not focused protocol-level surveys for burrowing owl, the biologists conducting special status plant survey transects for the Project in 2015 and 2016 also searched for, but did not find, the burrowing owl or burrowing owl sign during the surveys. Suitable burrowing owl habitat consists of relatively short vegetation with only sparse shrubs and taller vegetation combined with the presence of burrows for roosting and nesting.[424] In California, burrowing owls are largely dependent on California ground squirrels (*Spermophilus beecheyi*) to dig their burrows,[425] although burrows from less common burrowing wildlife such as kit fox may also be used. The surveys have found the California ground squirrel, as well as kit fox or other suitably sized burrows, to be largely absent from the Project site; as a result, the Project site's grasslands lack suitable burrows for the burrowing owl and is generally unsuitable for that species. The Draft EIR ultimately uses a conservative approach by requiring specific burrowing owl mitigation. Also see response to Comment F.3-13.

Response to Comment F.3A-23:

The County notes that on April 19, 2018, the California Fish and Game Commission authorized the listing of tricolored blackbird as a "threatened" species.[426] However, it is noted that Candidate species are afforded the same legal protections as State-listed species. Therefore, consultation with CDFW will be required. The relevant analysis therefore remains the same under CEQA, and no mitigation measure updates are required. The Commenter's statements to reiterate points made in the Draft EIR are otherwise correct. However, these facts do not indicate potentially significant impacts to tricolored blackbird. The species is complex and its biology must be considered closely. For example, there has been no evidence that tricolored blackbird have bred in the same year at the on-site location (on the north end of the Project site) and Quail Lake sites. In addition, the on-site breeding area has not been used since the first time it was detected and the habitat has substantially diminished in recent years due to drought. However, in order to further clarify the Draft EIR text regarding the reduction of impacts to less than significant, additional language will be added to the impact assessment. In response to this comment, the following addition has been made to the first partial paragraph, beginning with the first full sentence, on page 5.7-113 of Section 5.7.3, Environmental Setting:

> The tricolored blackbird was observed nesting in large numbers along the north-central edge of the Project site and was also observed in Oso Creek (BonTerra Consulting 2008; Impact Sciences 2004a). These populations have not been incidentally detected during focused surveys since the original

422 *Id.,* Appendix 5.7-B, Birds-4
423 Zeiner, et al. 1990
424 Gervalis et al. 2008
425 *Ibid.*
426 FGC 2018; Nossaman 2018

> observations, possibly due to habitat degradation. Most recently, focused surveys for tricolored blackbird were conducted in 2015 and they were observed nesting off site along the northern shore of Quail Lake and at Holiday Lake, and these birds were observed foraging on the Project site (BonTerra Psomas 2015d).

Additionally, in response to this comment, the following addition has been made to the second full paragraph, beginning with the third sentence, on page 5.7-149 of Section 5.7.6, Environmental Impacts:

> The results of this focused survey documented relatively heavy use of the Project site for foraging purposes by tricolored blackbirds nesting off site at Quail Lake, and to a much lesser degree, Holiday Lake. No breeding was detected at Oso Creek or along the north-central edge of the Project site. Breeding has not been observed in either location since 2008, likely due to habitat degradation. In an effort to determine the Project's potential effect on tricolored blackbird nesting colony foraging lands of the region, an assessment of each of four known colonies was conducted (BonTerra Psomas 2015c).

With respect to foraging habitat, the Draft EIR indicated that loss of foraging habitat could interrupt breeding if both Quail Lake and the north pond were used for breeding at the same time. As noted above, it has been nine years since any tricolored blackbird were found at the north pond, the habitat has become severely degraded, and the area is not likely to become suitable in the future. The species routinely shifts breeding locations, and there are also existing suitable breeding locations within the Mitigation Preserve, so the likelihood that both areas will be used for breeding at the same time is extremely low. Nevertheless, MM 7-7 has been modified to require a ¼ mile setback during breeding season, which will protect the existing foraging habitat for that season during construction, and the land use adjacent to Quail Lake up to approximately ½ mile is almost entirely open space recreational parkland as depicted in the Specific Plan and, therefore, will be permeable and available for foraging. Finally, there is a significant increase in elevation between Quail Lake and the higher ground within the Specific Plan park area which also adds to the effectiveness of the buffer distance. Furthermore, MM 7-10 has been modified to preserve additional mitigation lands, which includes preservation and management of 15,258 acres of suitable foraging habitat for tricolored blackbird and the Mitigation Preserve includes 1.1 acres of existing breeding habitat. Finally, MM 7-12 will preserve and enhance riparian areas, including wetlands, which will preserve and enhance breeding habitat. Thus, with mitigation, there is sufficient foraging habitat to support the existing colonies in the Project vicinity and provide additional breeding and foraging opportunities in the Mitigation Preserve. This preservation of breeding and foraging habitat in a diversity of areas allows for this nomadic species to continue to persist in the region.

Therefore, the following edits are hereby made to the third full paragraph on page 5.7-149 of the Draft EIR:

Due to the shifting of tricolored blackbird nesting locations from year to year, a subset of two or three of the available nesting locations may represent the entire regional breeding population. A substantial reduction of foraging lands surrounding this subset of nesting locations could result in considerable reduction of nesting success. A review of the Quail Lake and the on-site colony subset identified a potential post-Project reduction of approximately 20 percent of potentially suitable foraging habitat at each location. In a given year, if these two areas were used for nesting, the reduced availability of suitable foraging land could result in substantial reduction in nesting success. However, the north pond has become unsuitable habitat, so the likelihood of its future use by tricolored blackbird is very low. Additionally, the species shifts breeding locations between sites, and there are also existing potentially suitable breeding locations within the Mitigation Preserve, so the likelihood that both areas will be used for breeding at the same time is extremely low. Nevertheless, MM 7-7 has been modified to require a ¼ mile setback during breeding season, which will protect the breeding colony for that season during construction. Furthermore, MM 7-10 has been modified to preserve additional mitigation lands, which includes preservation and management of 15,258 acres of suitable foraging habitat for tricolored blackbird and the Mitigation Preserve includes 1.1 acres of existing breeding habitat. Finally, MM 7-12 will preserve and enhance wetland areas, which will provide more breeding habitat. Thus, with mitigation, there is sufficient foraging habitat to support the existing colonies in the Project vicinity and provide additional breeding and foraging opportunities in the Mitigation Preserve. This preservation of breeding and foraging habitat in a diversity of areas allows for this wide forage ranging species to continue to persist in the region. Based on the revised MMs 7-7, 7-10, and 7-12, the impacts to foraging habitat are less than significant.

In response to this comment and others, the following edits are hereby made to MM 7-7 on pages 5.7-178 and 5.7-179:

MM 7-7 The Project shall incorporate avoidance and additional open space buffer features for each of the two ~~this~~ known tricolored blackbird nesting areas on and adjacent to the Project site ~~area~~. Permanent impacts will be restricted to a distance of 400 feet from the nesting area excluding small impact areas associated with infrastructure and utilities along SR-138 immediately south of Quail Lake. The nesting area will be delineated by a qualified Ornithologist based on all available data (three years of site-specific data shall be used). Temporary impacts (i.e., construction noise) within a ¼ mile ~~400 feet~~ of active nesting areas shall be restricted to the non-breeding season. The breeding season for this species shall be considered April 1 through July 1. The applicant shall consult with CDFW and may obtain an Incidental Take permit if determined appropriate.

~~The Project shall include enhancement, restoration, and/or preservation of potentially suitable tricolored blackbird breeding and foraging habitat.~~ ~~Potentially suitable areas for enhancement and preservation include lower Oso Canyon proximate to Cement Plant Road, as well as any other created water bodies as part of the Project Drainage Plan, where feasible. Enhancement factors shall include the creation of bulrush marsh habitat or other substrate known to support breeding tricolored blackbirds; a persistent nearby standing water during the breeding season; and available adjacent foraging habitat with an appropriate food source.~~

Response to Comment F.3A-24:

Comment noted. The Draft EIR also discussed that focused tricolored blackbird surveys conducted for the Project in 2015 found nesting colonies at Quail Lake and found that foraging occurred on the Project site as well as elsewhere. See response to Comment F.3-14.

Response to Comment F.3A-25:

As noted in the response to Comment F.3-15, focused tricolored blackbird surveys conducted for the Project in 2015 produced the same results mentioned here (nesting colonies at Quail Lake were observed foraging on the Project site), which were then used to extrapolate Project impacts in the Draft EIR.

Response to Comment F.3A-26:

The analysis of potential foraging grounds for the tricolored blackbird in the Project area was based on available potentially suitable habitat and the best available information on the ecology of this species. The tricolored blackbirds were observed foraging in scrub as well as grassland habitat.

Response to Comment F.3A-27:

The Commenter's opinion regarding the Project's impacts on tricolored blackbird is noted. The Project will comply with the California Fish and Game Code requirements including consulting with CDFW. The Project would not directly impact the Quail Lake and Holiday Lake (the latter approximately 3.4 miles east of the site[427], which are both outside the Project site boundary, and sufficient foraging habitat is maintained. See response to Comment F.3-14.

Response to Comment F.3A-28:

Please refer to response to Comment F.3-18. The Project does not propose to destroy or disrupt any nesting colonies. All nesting colonies are avoided with the addition of a buffer as

[427] DRP 2017, p. 5.7-113

well as reduced activities within during the breeding season (MM 7-7). The MM also includes preservation of areas that have already been shown to be used by tricolored blackbirds within the mitigation lands. Therefore, MM 7-7 is expected to mitigate the potential impacts to this species to a less than significant level.

Response to Comment F.3A-29:

The Commenter's opinion regarding the Project's impacts on tricolored blackbird is noted. As described in the Draft EIR[428] and in responses to Comments F.3-14 through F.3-19 above, the Draft EIR concludes that the Project's potential impacts on the tricolored blackbird are mitigated to a less than significant level.

Response to Comment F.3A-30:

The new alignment of Cement Plant Road will run to the west of Village #9, as shown on Exhibit 5.12-3, On-site Circulation System, and as graphically depicted on each Draft EIR graphic that shows the proposed roadway network. This roadway alignment is fully within the impact footprint analyzed throughout the Draft EIR. As stated in Section 5.7.6, Environmental Impacts, "although the Project includes a new road along its western edge (Cement Plant Road), the road's use would be limited to infrequent daytime truck traffic to and from the Cement Plant, functioning the same as the existing Cement Plant Road to the east. Nighttime use will be prohibited except for emergency. This new Cement Plant Road would connect to SR-138 via a Gorman Post Road extension, and a new intersection in this area will be avoided."[429] The Draft EIR acknowledges impacts to foraging habitat, inclusive of the realignment of Cement Plant Road, and mitigation efforts are included to lessen those impacts.

Response to Comment F.3A-31:

The new alignment of Cement Plant Road will run to the west of Village #9, as shown on Exhibit 5.12-3, On-site Circulation System, and as graphically depicted on each Draft EIR graphic that shows the proposed roadway network. This roadway alignment is fully within the impact footprint analyzed throughout the Draft EIR. As stated in Draft EIR Section 5.7.6, Environmental Impacts, "although the Project includes a new road along its western edge (Cement Plant Road), the road's use would be limited to infrequent daytime truck traffic to and from the Cement Plant, functioning the same as the existing Cement Plant Road to the east. Nighttime use will be prohibited except for emergency. This new Cement Plant Road would connect to SR-138 via a Gorman Post Road extension, and a new intersection in this area will be avoided."[430] The Draft EIR acknowledges impacts to foraging habitat, inclusive of the realignment of Cement Plant Road, and mitigation efforts are included to lessen those impacts.

Response to Comment F.3A-32:

The Project does not encroach on SEA 17, and would, therefore, not disrupt the footprint of the SEA. Further, State CEQA Guidelines require the Draft EIR to assess potential impacts to wildlife movement. In the wildlife movement assessment, connectivity between the Tehachapi Mountains and the San Gabriel Mountains, from a biological perspective, was considered in detail.[431] The assessment, which used various scientific studies, including site-specific studies listed in Table 5.7-2,[432] concluded that although maintaining baseline connectivity between the two regions is essential, development of the Project would not significantly impact movement between these regions.[433] Although direct impacts on regional and local wildlife movement would be considered less than significant, and no mitigation is required, in order to lessen Project impacts on wildlife movement, MMs 7-13 through 7-19 are proposed, which incorporate planning and construction methods to reduce potential indirect impacts to wildlife movement. Please also see responses to Comments F.3-24, F.3-25, F.3A-32, F.3A-33, F.3A-34, B.4-56, B.4-57, F.5-2, F.8-168, and F.7-22.

A discussion of regional wildlife movement, beginning on page 5.7-6, is provided in the Draft EIR. The section acknowledges the importance of movement in the region where several major bio regions come together stating that various recent reports that discuss the biotic resources in the vicinity of the Tehachapi Mountains (including the Project region) describe the importance of these mountains as a landscape linkage between the Sierra Nevada and the Coast Ranges.[434] Typically, landscape linkages facilitate wildlife movement between large areas of similar terrain, vegetation types, or habitats. Because of the unique adaptations required of wildlife species that inhabit the low elevations of the San Joaquin Valley to the north of the Tehachapi Mountains and the Antelope Valley and adjacent Mojave Desert to the south of the mountain range, most species that occupy these geographically separate and distinct ecosystems do not venture south or north, into or over, the Tehachapi Mountains. As noted above, wildlife species within the mountains surrounding the Project site are expected to move freely within the mountains to satisfy their life history requirements. Accordingly, most wildlife movement in the mountains probably occurs within large landscape areas in upland portions of the Tehachapi range, and to the south of the Centennial property within the western extent of the San Gabriel Mountains much more than between these areas. The same can be expected of movement on the valley floor and surrounding low foothills, where the proposed Project is located.

The Draft EIR goes on to discuss the long-term sustainability of regional linkages beginning on page 5.7-62. The section describes how two regional conservation plans will assist in sustaining the functionality of the regional landscape linkage for future wildlife populations. These plans offer elements for long-term sustainability and management of a Tehachapi Mountains landscape linkage: the Tejon Ranch Conservation and Land Use Agreement

431 *Id.,* pp. 5.7-50 to -64, -164 to -170
432 *Id.,* p. 5.7-23
433 *Id.,* p. 5.7-166
434 *Id.,* Exhibit 5.7-6

(Ranch-Wide Agreement [TRCRWA]) and the Tehachapi Upland Multiple Species Habitat Conservation Plan (TUMSHCP).

Under the TRCRWA, the Tejon Ranch Conservancy will adopt, update, monitor and enforce implementation of the Ranch-wide Management Plan (RWMP) on dedicated conservation areas and option areas subject to conservation, preservation, mitigation, and enhancement measures, as required under applicable law or imposed by federal, State or local agencies as part of any permit or approval for the Ranch or projects within the Ranch. The TRCRWA also provides that the Conservancy, or an alternate conservation entity as identified in the TRCRWA, will manage long-term mitigation obligations for open space lands used for mitigation to comply with federal and state agency permit requirements imposed in relation to the development activities allowed in the TRCRWA, including development of the Project. While the TRCRWA is not itself an agency-imposed Mitigation Measure for Centennial or other Ranch activities, the TRCRWA does provide the overarching legal, management, and funding framework for the open space lands used as mitigation lands in local, state, and federal land use entitlements and permits. It also voluntarily conserves 170,000 contiguous acres of open space Ranch lands even if preservation of such lands is not required by agency Mitigation Measures. Resource agency support of the TRCRWA is included in an appendix to the TRCRWA. Maintenance of the open space or conserved lands will be the responsibility of the Conservancy, funded in large part by a fee based on a portion of the purchase price for each residential parcel on Tejon Ranch. Since Centennial constitutes over 75 percent of the currently planned residential units on the Ranch, it will bear the substantial costs of funding the Conservancy and maintaining wildlife movement corridor areas through the Ranch. As mentioned in Section 5.7.2, Relevant Plans, Policies and Regulations, of the Draft EIR, no public agency is a party to the TRCRWA, although the federal and State agencies responsible for administering biological protection laws and regulations confirmed that lands under the RWMP continue to be eligible mitigation lands.

In addition, the TUMSHCP ensures the persistence of covered species, including sustaining viable populations of those species, providing for (within property dispersal) and protecting current opportunities for wildlife movement beyond the Ranch by preserving existing landscape linkages. Lands to be conserved as part of the TUMSHCP are adjacent to other lands within Tejon Ranch ownership and are also slated to be protected as part of the TRCRWA. The sum of these interconnected open space commitments, development restrictions, and mitigation measures is a conservation commitment that is, by design, consistent with conservation biology principles calling for large, interconnected blocks of habitat that support the life history requirements of Covered Species and other resident wildlife. The TUMSHCP, if fully implemented, will sustain crucial landscape linkages across cismontane Southern California.

The TUMSHCP will be a major contributor to ensuring the viability of the Tehachapi Landscape linkage into the future. Through the various conditions and measures stipulated by the TUMSHCP for the various covered species, habitat for these and many additional species will be preserved and enhanced, which will promote healthy plant and wildlife communities throughout the region. Although the focus of the TUMSHCP is on the California condor and other species of the montane upland communities, many of the same species

occur in the foothills and lowland areas as well, including the Centennial site. These species will benefit from the TUMSHCP in addition to the Centennial Mitigation Preserve program described in this document.

The wildlife movement impact analysis beginning on page 5.7-164 of the Draft EIR concludes that development of the Project site will result in some losses of areas that may be used for foraging and/or breeding for these species. Pathways to or from foraging or breeding grounds on the Project site, such as along ridge-lines or canyon bottoms, may become "dead ends" to through dispersal. However, these sorts of impacts are not expected to destabilize the regional population dynamics of these species, especially given the substantial amount of similar terrain in the northwestern Antelope Valley area. Multi-generational gene flow among wildlife populations in the region is expected to be sustained in the open spaces on and off the site that will remain following Project implementation. The direct impacts of Project development, therefore, are considered less than significant.

Lastly, the Project design is consistent with the Antelope Valley Area Plan (AVAP) inclusive of open space designations, SEA protection, and preservation of habitat linkages. The AVAP is a community-based plan that is a subset of the County of Los Angeles General Plan, which includes the Project area. The AVAP EIR provides an analysis of all potential, reasonably foreseeable environmental impacts related to the implementation of the AVAP "to indicate possible ways to reduce or avoid environmental damage and to identify alternatives" to the AVAP.[435] Additionally, the AVAP EIR discloses "significant environmental impacts that cannot be avoided; growth inducing impacts; effects not found to be significant; and significant cumulative impacts of all past, present and reasonably foreseeable future projects."[436]

Response to Comment F.3A-33:

Please see response to Comment F.3-23. The open space areas within the Project impact footprint are consistent with existing drainage patterns (east-west), which currently facilitate local wildlife movement through the area. As stated in Section 5.7.6, Environmental Impacts, these open space areas "facilitate the local movement of wildlife and dispersal and gene flow between populations of small organisms (particularly insects, amphibians, reptiles, small mammals)".[437] The purpose of these areas is not to facilitate movement through the Project down to SEA 17. However, implementation of MM 7-14, which designates a SR-138 wildlife underpass (along with a 50-foot open space buffer) where the current intersection with National Cement Plant Road exists, is intended to allow for local wildlife movement to pass through the Project area down to SEA 17.

Response to Comment F.3A-34:

The size of the proposed undercrossing is expected to support movement of many wildlife species potentially moving through the area. Most of these animals, such as raccoon,

435 DRP 2014a, p. 2-1
436 *Ibid.*
437 DRP 2017, p. 5.7-166

opossum, and skunks, have been identified using much smaller crossings than the proposed crossing's dimensions; therefore, there is no reason to believe that the large crossing proposed would not support crossing of many species. In addition, current crossings either do not exist in the area or consist of much smaller drainage culverts. The proposed crossing is expected to improve crossing conditions for most wildlife in the region compared to the existing condition. The exiting condition is inclusive of SR-138, which does not represent a barrier for all species but is problematic due to vehicular traffic and lack of vegetative cover. The Project proposal improves the crossing by allowing at least some individuals of some species to utilize a more protected pathway to access habitat on either side of the highway. In addition, the crossings included in the Project design are consistent with the Antelope Valley Area Plan (AVAP). The AVAP EIR provided an analysis of the regional habitat linkages to be retained, inclusive of development of other areas including the Project development area. The County's AVAP EIR analysis concludes that such impacts are less than significant. The Project Draft EIR supports this AVAP EIR conclusion, and the wildlife movement impact analysis beginning on page 5.7-164 of the Draft EIR provides evidence indicating these local connections may support local movement but are not required to sustain regional wildlife populations in the area, which primarily occur in the foothill areas north of the Project site. The Project undercrossing at SR-138 is expected to facilitate more localized wildlife movement but is not critical to regional wildlife linkages. For additional discussion, please see response to Comment F.3A-32, the wildlife movement sections of the AVAP EIR,[438] and the Caltrans SR-138 EIR.[439]

Response to Comment F.3A-35:

Please refer to response to Comment F.3-26. The Commenter is correct in that a separate discussion on bird migration specifically is not included in the Draft EIR, instead migration was discussed on a species-specific level: southwestern willow flycatcher[440], California condor[441], yellow-breasted chat[442], and yellow warbler[443]. The use of some on-site vegetation types by a variety of bird species is disclosed on page 5.7-49: "During spring and fall migration, a variety of migratory birds are expected to use these vegetation types on the site. Some migrants include the pacific-slope flycatcher (*Empidonax difficilis*), warbling vireo (*Vireo gilvus*), Cassin's vireo (*Vireo cassinii*), yellow warbler, black-throated gray warbler (*Setophaga nigrescens*), Townsend's warbler (*Setophaga townsendi*), MacGillivray's warbler (*Geothlypis tolmiei*), and Wilson's warbler (*Cardellina pusilla*)."

As stated in Section 5.7.3, Environmental Setting, the Biological Assessment of SEA 17 prepared by PCR et al. (2000) "suggest[s] that lands within SEA 17 may be an important topographic reference for migrating birds, with essential high elevation foraging grounds along the route".[444] Project implementation would not impact these important migrating

438 DRP 2014a, pp. 5.4-67, -70, -85
439 Caltrans 2017b, pp. 73-76, 100-101
440 DRP 2017, p. 5.7-118
441 *Ibid.*
442 *Id.,* p. 5.7-121
443 *Id.,* p. 5.7-122
444 *Id.,* p. 5.7-57

lands which occur in SEA 17. Also, the Project area, specifically, has not been shown to be a major thoroughfare for bird migration.

Response to Comment F.3A-36:

Please refer to response to Comment F.3-27. The Commenter's report regarding seasonal use of Quail Lake by migrating birds is noted. The Project does not modify Quail Lake. Continued foraging habitat would be available on large portions of the site with Project implementation, as approximately 5,624 acres of the Project site would be included in the Open Space land use designation.[445] Also, the Project lands are not located at a bottleneck or chokepoint, and Project implementation would not block or stop bird migration. Although birds do stop to forage on the Project site, it is reasonable to assume that the majority of birds migrating through this area are attracted to the habitats surrounding the Project that provide greater shelter and food and water sources (SEA 17). These areas will remain open to migrating birds that pass through the vicinity of the Project.

Response to Comment F.3A-37:

Please refer to response to Comment F.3-28. The SR-138 widening project is an existing Caltrans project, approved in 2017 following completion of an Environmental Impact Report/Environmental Impact Statement by Caltrans. The new alignment of Cement Plant Road will run to the west of Village #9, as shown on Exhibit 5.12-3, On-site Circulation System and as graphically depicted on each Draft EIR graphic that shows the proposed roadway network. This roadway alignment is fully within the impact footprint analyzed throughout the Draft EIR. As stated in Section 5.7.6, Environmental Impacts, "although the Project includes a new road along its western edge (Cement Plant Road), the road's use would be limited to infrequent daytime truck traffic to and from the Cement Plant, functioning the same as the existing Cement Plant Road to the east. Nighttime use will be prohibited except for emergency. This new Cement Plant Road would connect to SR-138 via a Gorman Post Road extension, and a new intersection in this area will be avoided."[446] Because the Cement Plant Road realignment is part of the Project defined in Section 4.0, Project Description, this component is fully within the impact footprint analyzed throughout the Draft EIR and was considered when assessing potential direct (e.g., habitat modification) and indirect (e.g., light, noise, dust) impacts to biological resources. All focused biological surveys included the impact area for the realignment of Cement Plant Road. The proposed location of the Cement Plant Road would not be a barrier to bird migration any more than the existing road alignment, as there are no tall structures, upward-facing light sources, or other design features that can be a deterrent to bird flight paths, and the roadway would continue "to be limited to infrequent daytime truck traffic to and from the Cement Plant".[447]

447 *Ibid.*

Response to Comment F.3A-38:

The potential for Valley Fever spores to be found in soils of the Antelope Valley, and the effects of contracting Valley Fever, is fully disclosed in the Draft EIR. The risks from possible exposure of both construction workers and the Project-related population to Valley Fever spores is comprehensively analyzed in Section 5.3, Hazards and Fire Safety, and Section 5.11, Air Resources, of the Draft EIR. The Draft EIR concludes there would be less than significant impacts associated with Valley Fever with implementation of mitigation measures. In responses to Comments F.3-29 through F.3-31, the Draft EIR has been augmented with revised MM 3-2 and additional MM 3-11:

MM 3-2 To aid in the prevention of Valley Fever among construction crews on the Project site, the following measures shall be implemented by the Construction Contractor during all construction activities:

- Have Tyvek™ coveralls/suits available in a range of sizes for construction worker use upon request. If used, require the worker to remove the Tyvek™ suit at the work site at the end of the day.

MM 3-11 The Project Applicant/Developer shall be responsible for the creation of a website on the proposed Centennial community internet that provides public information regarding dust-generating activities, to be maintained and updated as appropriate throughout the Centennial Project construction period. The purpose of the website would be to enable interested parties both on- and off-site to easily access information relevant to potential Valley Fever risk. The Project Applicant/Developer shall also be responsible for the preparation and one-time distribution to surrounding communities and to all schools located in the communities of Gorman, Lebec, and Frazier Park of a notice describing the availability of this website to provide awareness of the site and its contents.

Response to Comment F.3A-39:

These are accurate statements derived from the Draft EIR. The dust control measures quoted in the comment[448] are examples of typical Antelope Valley Air Quality Management District (AVAQMD) and South Coast Air Quality Management District (SCAQMD) Rule 403 practices. The following sentence states "The rules [403] include comprehensive sets of best available control measures that reduce fugitive dust generation and are required for all projects within the AVAQMD's and SCAQMD's jurisdictions".[449] Therefore, the example practices identified

[448] *Id.,* p. 5.11-65
[449] *Ibid.*

are not all of the available control measures that would be among those utilized to effectively control dust emissions, which "is the key to preventing exposure to Valley Fever spores during ground-disturbing construction activities."[450] The on-site risk of Valley Fever exposure during earth-moving activities is fully disclosed in the Draft EIR and this risk is the purpose behind Project Design Feature (PDF) 3-1, quoted in this comment. In response to Comment F.3-30, the Draft EIR has been augmented with MM 3-11 to ensure concerned parties can be aware of earth-moving activities on the Project site during the construction period.

Response to Comment F.3A-40:

To clarify, the Draft EIR does not specify an assumed distance that the spores would be limited to; however, it is expected that the majority of fugitive dust and associated spores (if present) would settle out of the wind before leaving the Project site due to both the physical properties of entrained sediment and the large size of the site.[451] As noted in response to Comment F.3A-39, "The control of fugitive dust is the key to preventing exposure to Valley Fever spores during ground-disturbing construction activities."[452] In the existing condition, dust from the Project site can become airborne due to wind and be carried off the site. However, this occurs in the absence of dust control measures. Although there would be greater earth disturbance during Project implementation than in the existing condition, as discussed in the Draft EIR, there would also be a suite of dust control measures enacted to ensure that fugitive dust does not leave the Project site boundaries, consistent with Rule 403 requirements. As such, the results of a 1977 Bakersfield dust storm without control measures is not equivalent to earth-disturbing construction activity with dust control. Regardless, to ensure concerned parties can be aware of earth-moving activities on the Project site during the construction period, MM 3-11 has been added to the Draft EIR (refer to response to Comment F.3A-38).

Response to Comment F.3A-41:

Please refer to response to Comment F.3A-40. The potential for Valley Fever spores to be found in soils of the Antelope Valley, and the effects of contracting Valley Fever, is fully disclosed in the EIR.

Response to Comment F.3A-42:

Research into this data cited from the Centers for Disease Control (CDC) located the CDC documentation[453] with this information as well as the source cited in the CDC documentation.[454] The figure for the percent of persons hospitalized was based on interviews by the authors of "every tenth case-patient with coccidioidomycosis reported

450 *Ibid.*
451 *Id.,* p. 5.3-18
452 *Id.,* p. 5.11-65
453 Centers for Disease Control (CDC). 2012 (December). *Fungal Pneumonia: A Silent Epidemic, Coccidioidomycosis (valley fever)*. Atlanta, GA: CDC. https://www.cdc.gov/fungal/pdf/cocci-fact-sheet-sw-us-508c.pdf.
454 U.S. National Library of Medicine, National Institutes of Health (NIH). 2010 (November). *Enhanced Surveillance of Coccidioidomycosis, Arizona, USA, 2007–2008.* Emerging Infectious Diseases.2010 November; Volume 16(11): 1738–1744: PubMed Central® 3294516. Bethesda, MD: NIH. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3294516/.

during January 2007-February 2008."[455] As such, the number of people reporting hospitalization in this particular survey represent a portion of the subset (approximately 40 percent per CDPH 2013 cited in the Draft EIR on page 5.3-13) of those exposed to Valley Fever spores that develop any symptoms. As such, this literature does not support the indication that 40 percent of persons exposed to Valley Fever spores will require hospitalization.

The Draft EIR makes no attempt to minimize or otherwise obscure the presence of Valley Fever in the Antelope Valley, its potential effects, and the rate of the disease in the region. As previously stated, the on-site risk of Valley Fever exposure during earth-moving activities is fully disclosed in the Draft EIR. It is assumed to be present in the soils on the Project site, although it may not be, for purposes of the Draft EIR analysis and to analyze the associated precautions for construction workers and residents that should be taken.

In response to this comment, the following documents are added to the administrative record:

Centers for Disease Control (CDC). 2012 (December). *Fungal Pneumonia: A Silent Epidemic, Coccidioidomycosis (valley fever)*. Atlanta, GA: CDC. https://www.cdc.gov/fungal/pdf/cocci-fact-sheet-sw-us-508c.pdf.

U.S. National Library of Medicine, National Institutes of Health (NIH). 2010 (November). *Enhanced Surveillance of Coccidioidomycosis, Arizona, USA, 2007–2008.* Emerging Infectious Diseases.2010 November; Volume 16(11): 1738–1744: PubMed Central® 3294516. Bethesda, MD: NIH. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3294516/.

Response to Comment F.3A-43:

Regarding the first suggested measure, the use of mesh or netting such as used on stationary objects like fruit trees and bushes to protect against dust and/or birds in not practical for use on construction sites. This is due both to the scale of the Project site and the associated construction area(s) and because the construction activity would be regularly moving. This would be potentially feasible for a small, discrete site and/or a stationary construction setting such as single home. The suppression of dust, consistent with Rule 403 requirements, before it reaches a project's boundaries is both feasible and more effective in reducing the risk of Valley Fever spores being spread due to ground-disturbing activity. In addition to fully implementing Rule 403 (per MM 3-1), the Project Applicant/Developer has committed to several actions for prevention of Valley Fever exposure for construction workers consistent with the recommendations of the California Department of Public Health (CDPH), cited as CDPH 2013b (English language) and CDPH 2013c (Spanish language) in MM 3-2.[456] The encapsulation or other dust barrier to limit the spread of Valley Fever is not suggested by the CDPH.

455 NIH 2010
456 DRP 2017, p. 5.3-26

Regarding the second suggested measure, it is assumed that "notification" refers to the notification described in Draft EIR MM 3-3, wherein each purchaser or tenant reads and signs a notice regarding the Valley Fever risk during the construction period. Please refer to responses to Comments F.3-29 and F.3A-38 discussing new MM 3-11 requiring creation of a website with regularly updated information on ground-disturbing activities and the notification of off-site persons to the presence of this website to seek out information, if desired.

Regarding the third suggested measure, the CDPW states there is no reliable way to test the soil for spores before working in a particular place.[457]

Regarding the fourth suggested measure, as discussed in response to Comment F.3-31 and F.3A-38, the Draft EIR has been augmented with MM 3-11 to ensure concerned parties can be aware of earth-moving activities on the Project site during the construction period. Further, because much of the land throughout the Antelope Valley is undeveloped, these areas are also potential sources of Valley Fever spores through spread by wind. Placing warning signs along the Project site during construction would elicit fear without reasonable basis, as the Project's construction activities would involve dust control measures, and as such is considered arbitrary and unwarranted.

Regarding the fifth suggested measure (also labeled "4"), as discussed in responses to Comments F.3A-40 through F.3A-42, the presence of Valley Fever spores in the soils of the Antelope Valley does not directly lead to an increase in cases of the disease because of ground-disturbing construction activity on any one site. Further, there is no feasible way to determine whether any given case of Valley Fever is based on exposure to spores from a specific location, particularly given the wide prevalence of the fungus in Southern California. As such, tying payment of medical costs to implementation of the proposed Project is considered unreasonable.

Regarding the sixth suggested measure (labeled "5"), this comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment F.3A-44:

As discussed in responses to Comments F.3-30 and F.3A-43, in addition to fully implementing Rule 403 (per MM 3-1), the Project Applicant/Developer has committed to several actions for prevention of Valley Fever exposure for construction workers consistent with the recommendations of the California Department of Public Health (CDPH), cited as CDPH 2013b (English language) and CDPH 2013c (Spanish language) in MM 3-2.[458] In addition to preventing direct exposure, the CDPH includes action to prevent transport of the spores, if present. These actions include the provision of Tyvek™ coveralls/suits daily. Therefore, the Draft EIR has been augmented with MM 3-2 (refer to response to Comment F.3A-38). Regarding the suggested measure to require workers to wear respirators only,

457 (CDPH 2013 as cited in Draft EIR)
458 *Ibid.*

construction workers would be notified of Valley Fever risk and respirators would be among the safety equipment provided daily to the workers. However, it would be up to each individual to make the decision whether or not to wear a respirator instead of a mask.

Response to Comment F.3A-45:

The Commenter made an identical comment in Letter F.3, which comment has been designated as Comment F.3-33 in this Final EIR. Please see response to Comment F.3-33 for a response to this comment.

Response to Comment F.3A-46:

The Project's potential climate change impacts related to greenhouse gas (GHG) emissions were fully disclosed and analyzed in Section 5.21 of the Draft EIR. As discussed in Section 5.21, Climate Change, the Project takes a very aggressive approach to reducing GHG emissions arising from the Project. Among other things, the Project has been situated and designed to promote regional "smart growth" planning principles established by the Southern California Association of Governments (SCAG) 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy and the county's Antelope Valley Area Plan (AVAP) for the purpose of sustainability accommodating regional growth projections in a manner that reduces criteria air pollutant and greenhouse gas emissions and promotes public health while protecting regional open space, Sensitive Ecological Areas and agricultural areas consistent with the AVAP's Rural Preservation Strategy. Indeed, the South Coast Air Quality Management District (SCAQMD) has determined that the Project's Centennial Specific Plan "exemplifies [the County's] leadership in promoting sustainable communities development" and "will help reduce emissions from mobile sources, protect the public health from air pollution, and achieve healthful air in the [South Coast Air] Basin" (*see* Comment D4-2). See also response to Comment F.8-20 for further discussion.

Consistent with Smart Growth principles, Medium- to Very High-Density development is generally included in the central area of each Village, and the density of development progressively lowers with increased distances from core areas, called the Village Core, Town Center or Neighborhood Center.[459] The Town Center of the Project is located in Village 3, and is the "downtown" area of the Project; Villages 1, 2, 5, and 7 each have a Village Core, and Villages 6, 8, and 9 each have a Neighborhood Center.[460] An 80 percent average, but not less than 50 percent of all residential units will be located within ½ mile of a Village Core or the Town Center.[461] Moreover, to reduce vehicle miles traveled, the Project includes an integrated network of roadways, walking and biking trails to reduce automobile use and facilitate safe and efficient travel. An extensive network of sidewalks, greenway trails (about 13 miles), and community trails (about 60 miles) would link residential, schools, shopping, and employment areas.[462] One hundred percent (100 percent) of all residential development will be located within ¼ miles walking distance of a park, trailhead, club house or other

459 *Id.,* p. 4-16
460 *Ibid.*
461 *Id.,* p. 4-16, -17
462 *Id.,* p. 4-6

public amenity, and an 80 percent average, but not less than 50 percent of all residential units will be located within ½ mile of a Village Core or the Town Center.[463]

Moreover, the EIR includes mitigation measures which require compliance with a non-exclusive list of laws and regulations requiring GHG reductions in equipment, activities, facilities and services associated with the Project (MM 21-20). The EIR also includes 45 additional mitigation measures to reduce GHG emissions from project operations and/or construction activities (MMs 10-1, 10-25, 10-26, 11-1 through 11-7, 13-6, 14-1, 17-9, 17-10, 18-1, 18-2, 19-1 through 19-5, 20-2.1, 20-2.2, 20-3.1 through 20-3.3, 21-1 through 21-19). In addition, the Specific Plan includes additional commitments to sustainable design and operational practices which minimize GHG emissions, as detailed in response to Comment 4.8-204, and mitigation measures have been revised in response to comments on the Draft EIR to further reduce the Project's GHG emissions.

As described in *Center for Biological Diversity v. California Department of Fish and Wildlife* ("*Newhall*") (2015) 62 Cal.4th 204, 229-30, compliance with laws and regulations, along with compliance with Sustainable Communities Strategies adopted by regional transportation agencies such as the Southern California Council of Governments (SCAG) pursuant to SB 375 plan, are both appropriate pathways for assessing the significance of project-related GHG emissions. As described in the EIR, the Project must comply with regulatory requirements and complies with the Los Angeles County Community Climate Action and the CARB-approved SCAG RTP/SCS.[464] However, because the jurisdiction and control for continuing to implement many of these laws and regulations falls to agencies other than Los Angeles County (including other state and federal agencies), and because climate change is a global challenge that requires action by the international community as a whole, the County is unable to conclude that County-enforced mitigation requirements are sufficient to reduce GHG emissions to less than significant levels for CEQA purposes, as discussed on Draft EIR pages 5.21-86 and 5.21-94.

In *Newhall*, the California Supreme Court (Court) considered how GHG emissions should be addressed in an EIR for a large-scale development project in Los Angeles County. The Court identified "potential pathways to compliance" pursuant to which such an analysis could be adequate.[465] "[A] lead agency might assess consistency with A.B. 32's goal in whole or part by looking to compliance with regulatory programs designed to reduce greenhouse gas emissions from particular activities."[466] An agency may also make use of adopted "metropolitan regional 'sustainable communities strategies'" authorized by SB 375 to streamline analysis.[467] Jurisdictions may "develop 'climate action plans' . . . for their geographic areas . . . as tools for CEQA streamlining."[468] Finally, "a lead agency may rely on existing numerical thresholds of significance for greenhouse gas emissions."[469]

---

463 *Id.,* p. 4-16, -17
464 *Id.,* pp. 5.21-48 to -86
465 *Newhall* at page 229
466 *Ibid.*
467 *Id.*, at page 230
468 *Ibid.*
469 *Ibid.*

The "compliance with laws and regulations" CEQA compliance pathway was generally addressed in the EIR under Threshold 1 of the State CEQA Guidelines for GHG (whether the project "would generate greenhouse gas emissions, either directly or indirectly, that may have a significant effect on the environment."), which is designated as Threshold 21-1 by the EIR. In addition to laws and regulations already approved, California is a global leader in adopting laws and regulations that have substantially reduced per capita GHG and, as the CARB has concluded in its most recent approved Scoping Plan under AB 32 (California Air Resources Board, First Update to the Climate Change Scoping Plan: Building On the Framework ("CARB Scoping Plan"), approved by CARB in May, 2014), place us on a trajectory of ongoing substantial reductions in GHG including achievement of Executive Order goals of reducing GHG from the transportation sectors and the overall economy (CARB Scoping Plan at page ES1). California's global leadership role in mandating GHG reductions with prescriptive new legal mandates was again confirmed in 2016, when the state enacted SB 32 (established a GHG reduction mandate to be achieved by 2030) and AB 197 (directing that priority in GHG reduction efforts be directed to industrial facilities and vehicles). This new SB 32 2030 GHG reduction mandate is the same as the GHG reduction target included in Executive Order B-30-15 of 40 percent below 1990 levels by 2030. The current CARB Scoping Plan included a framework for setting the 2030 target,[470] which is now being used by CARB in establishing the GHG reduction measures to be included in a second update to the Scoping Plan.[471]

The "compliance with SB 375 plan" CEQA compliance pathway was generally addressed in the Draft EIR and accompanying Appendix E.1 technical report under Threshold 2 of the State CEQA Guidelines for GHG (whether the project would "conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gas"). Although there is no legal mandate that cities or counties prepare local climate action plans, Los Angeles County has nevertheless adopted such a plan, the Los Angeles County Community Climate Action Plan (CCAP). The Project consistency with the CCAP was therefore also addressed in the EIR under Threshold 2.

As with BAAQMD thresholds cited favorably by the Court, in this case the expert air agencies for this project area has recommended use of a GHG significance threshold and analytical methodology for land use projects that is based on AB 32 compliance. Thus, for informational purposes, the EIR evaluates the Project's estimated GHG emissions as compared to the Antelope Valley Air Quality Management District (AVAQMD) significance thresholds for impacts related to the GHG emissions, as well as certain significance thresholds for impacts related to GHG emissions proposed by staff of the South Coast Air Quality Management District (SCAQMD), but not adopted by the SCAQMD board.

Information and analysis included in the Draft EIR and accompanying Draft EIR Appendix E.1 has been organized into each of these three compliance pathways to help clarify how the EIR analysis complies with the Court's *Newhall* decision.

---

470 California Air Resources Board (CARB). 2017 (November). California's 2017 Climate Change Scoping Plan (pp. ES5, 34, 44). Sacramento, CA: CARB. https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf.

471 See CARB's Scoping Plan website, available at: https://www.arb.ca.gov/cc/scopingplan/scopingplan.htm.

Compliance with GHG Reduction Laws and Regulations Threshold

This first pathway is based on describing how various components of the project are required to reduce GHG emissions based on adopted laws and regulations designed to achieve emissions reductions required under AB 32 and under other greenhouse gas reduction laws and regulations.

As the *Newhall* Court noted:

> "[A] lead agency might assess consistency with A.B. 32's goal in whole or part by looking to compliance with regulatory programs designed to reduce greenhouse gas emissions from particular activities…To the extent a project's design features comply with or exceed the regulations outlined in the Scoping Plan and adopted by the Air Board or other state agencies, a lead agency could appropriately rely on their use as showing compliance with "performance based standards" adopted to fulfill "a statewide…plan for reduction or mitigation of greenhouse gas emissions."
>
> (*Newhall*, 62 Cal. 4th, at pages 264-265.)

The following table summarizes laws and regulations requiring GHG reductions that affect project greenhouse gas emissions at the construction or operational phases. Legal mandates to reduce greenhouse gas emissions from vehicles, for example, reduce project-related vehicular emissions. Legal mandates to reduce greenhouse gas emissions from the energy production sector that will serve the project likewise reduce project-related GHG emissions from electricity consumption. Legal mandates to reduce per capita and per household water consumption, improve household and appliance energy efficiency, and impose waste management standards to reduce methane and other greenhouse gases from solid wastes, are all examples of greenhouse gas reduction mandates that reduce greenhouse gas emissions below what would have been required under the laws and regulations in effect as of 2008 ("business as usual"). The following table identifies laws and regulation currently in effect that reduce GHG emissions from project-related GHG emissions:

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
Building Components/Facility Operations		
Roofs/Ceilings/Insulation	CALGreen Building Code (Title 24, Part 11, "CALGreen") Building Energy Efficiency Standards (Title 24, Part 6)	The Project must comply with efficiency standards regarding roofing, ceilings, and insulation. For example: Roofs/Ceilings: New construction must reduce roof heat island effects per CALGreen Building Code section 106.11.2, which requires use of roofing materials having a minimum aged solar reflectance, thermal emittance complying with section A5.106.11.2.2 and A5.106.11.2.3 or a minimum aged Solar Reflectance Index (SRI) as specified in Tables A5.106.11.2.2, or A5.106.11.2.3. Roofing materials must also meet solar reflectance and thermal emittance standards contained in Title 20 Standards. Roof/Ceiling Insulation: There are also requirements for the installation of roofing and ceiling insulation. (See Title 24, Part 6 Compliance Manual at Section 3.2.2.)
Flooring	CALGreen	The Project must comply with efficiency standards regarding flooring materials. For example, for 80 percent of floor area receiving "resilient flooring," the flooring must meet applicable installation and material requirements contained in CALGreen section 5.504.4.6.
Window and Doors (Fenestration)	Title 24, Part 6	The Project must comply with fenestration efficiency requirements. For example, the choice of windows, glazed doors, and any skylights for the Project must conform to energy consumption requirements affecting size, orientation, and types of fenestration products used. (See Title 24, Part 6 Compliance Manual, Section 3.3.)
Building Walls/Insulation	CALGreen California Energy Code Title 24, Part 6	The Project must comply with efficiency requirements for building walls and insulation. Exterior Walls: Must meet requirements in current edition of California Energy Code, and comply with sections A5.106.7.1 or A5.106.7.2 of CALGreen Building code for wall surfaces, as well as section 5.407.1, which required weather-resistant exterior wall and foundation envelope as required by California Building Code section 1403.2. Construction must also meet requirements contained in Title 24, Part 6, which vary by material of the exterior walls. (See Title 24, Part 6 Compliance Manual, Part 3.2.3.) Demising (Interior) Walls: Mandatory insulation requirements for demising walls (which separate

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		conditioned from non-conditions space) differ by the type of wall material used. (*Id.,* at 3.2.4.) Door Insulation: There are mandatory requirements for air infiltration rates to improve insulation efficiency; they differ according to the type of door. (*Id.,* at 3.2.5.) Flooring Insulation: There are mandatory requirements for insulation that depend on the material and location of the flooring. (*Id.,* at 3.2.6.)
Finish Materials	CALGreen	The Project must comply with pollutant control requirements for finish materials. For example, materials including adhesives, sealants, caulks, paints and coatings, carpet systems, and composite wood products must meet requirements in CALGreen to ensure pollutant control. (CALGreen section 5.504.4.)
Wet Appliances (Toilets/Faucets/Urinals, Dishwasher/Clothes Washer, Spa and Pool/Water Heater)	CALGreen California Energy Code Title 24, Part 6 Appliance Efficiency Regulations ("Title 20 Standards")	Wet appliances associated with the Project must meet various efficiency requirements. For example: Spa and Pool: Use associated with the Project is subject to appliance efficiency requirements for service water heating systems and equipment, spa and pool heating systems and equipment. (Title 24, Part 6, Sections 110.3, 110.4, 110.5; Title 20 Standards, Sections 1605.1(g), 1605.3(g); see also California Energy Code.) Toilets/Faucets/Urinals: Use associated with the Project is subject to new maximum rates for toilets, urinals, and faucets effective January 1, 2016: • Showerheads maximum flow rate 2.5 gpm at 80 psi • Wash fountains 2.2 x (rim space in inches/20) gpm at 60 psi • Metering faucets 0.25 gallons/cycle • Lavatory faucets and aerators 1.2 gpm at 60 psi • Kitchen faucets and aerators 1.8 gpm with optional temporary flow of 2.2 gpm at 60 psi • Public lavatory faucets 0.5 gpm at 60 psi • Trough-type urinals 16 inches length • Wall mounted urinals 0.125 gallons per flush • Other urinals 0.5 gallons per flush (Title 20 Standards, Sections 1605.1(h),(i) 1065.3(h),(i).) Water Heaters: Use associated with the Project is subject to appliance efficiency requirements for

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		water heaters. (Title 20 Standards, Sections 1605.1(f), 1605.3(f).) Dishwasher/Clothes Washer: Use associated with the Project is subject to appliance efficiency requirements for dishwashers and clothes washers. (Title 20 Standards, Sections 1605.1(o), (p), (q), 1605.3(o), (p), (q).)
Dry Appliances (Refrigerator/Freezer, Heater/Air Conditioner, Clothes Dryer)	Title 20 Standards CALGreen	Dry appliances associated with the Project must meet various efficiency requirements. For example: Refrigerator/Freezer: Use associated with the Project is subject to appliance efficiency requirements for refrigerators and freezers. (Title 20 Standards, Sections 1605.1(a), 1605.3(a).) Heater/Air Conditioner: Use associated with the Project is subject to appliance efficiency requirements for heaters and air conditioners. (Title 20 Standards, Sections 1605.1(b),(c),(d),(e), 1605.3(b),(c),(d),(e) as applicable.) Clothes Dryer: Use associated with the Project is subject to appliance efficiency requirements for clothes dryers. (Title 20 Standards, Section 1605.1(q).)
	CALGreen	Installations of HVAC, refrigeration and fire suppression equipment must comply with CALGreen Sections 5.508.1.1 and 508.1.2, which prohibits CFCs, halons, and certain hydrochlorofluorocarbons and hydrofluorocarbons.
Lighting	Title 20 Standards	Lighting associated with the Project will be subject to energy efficiency requirements contained in Title 20 Standards. General Lighting: Indoor and outdoor lighting associated with the Project must comply with applicable appliance efficiency regulations (Title 20 Standards, Sections 1605.1(j),(k),(n), 1605.3(j),(k),(n).) Emergency lighting and self-contained lighting associated with the Project must also comply with applicable appliance efficiency regulations (Title 20 Standards, Sections 1605.1(l), 1605.3(l).) Traffic Signal Lighting: For any necessary Project improvements involving traffic lighting, traffic signal modules and traffic signal lamps will need to comply with applicable appliance efficiency

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		regulations (Title 20 Standards, Sections 1605.1(m), 1605.3(m).)
	Title 24, Part 6	Lighting associated with the Project will also be subject to energy efficiency requirements contained in Title 24, Part 6, which contains energy standards for non-residential indoor lighting and outdoor lighting. (See Title 24 Part 6 Compliance Manual, at Sections 5, 6.) Mandatory lighting controls for indoor lighting include, for example, regulations for automatic shut-off, automatic daytime controls, demand responsive controls, and certificates of installation. (*Id.,* at Section 5.) Regulations for outdoor lighting include, for example, creation of lighting zones, lighting power requirements, a hardscape lighting power allowance, requirements for outdoor incandescent and luminaire lighting, and lighting control functionality. (*Id.,* at Section 6.)
	Assembly Bill 1109	Lighting associated with the Project will be subject to energy efficiency requirements adopted pursuant to AB 1109. Enacted in 2007, AB 1109 required the CEC to adopt minimum energy efficiency standards for general purpose lighting, to reduce electricity consumption 50 percent for indoor residential lighting and 25 percent for indoor commercial lighting.
Bicycle and Vehicle Parking	CALGreen	The Project will be required to provide compliant bicycle parking, fuel-efficient vehicle parking, and electric vehicle charging spaces (CALGreen Sections 5.106.4, 5.106.5.1, 5.106.5.3)
	Title 24, Part 6	The Project is also subject to parking requirements contained in Title 24, Party 6. For example, parking capacity is to meet but not exceed minimum local zoning requirements, and the Project should employ approved strategies to reduce parking capacity (Title 24, Part 6, Section 106.6.)
Landscaping	CALGreen	The CALGreen Building Code requires and has further voluntary provisions for: • A water budget for landscape irrigation use; • For new water service, separate meters or submeters must be installed for indoor and outdoor potable water use for landscaped areas of 1,000- 5,000 square feet; • In, non-residential projects with 1,000-2,000 square feet of landscaped areas, install

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		irrigation controllers and sensors that follow specified criteria; • Provide water-efficient landscape design that reduces use of potable water beyond initial requirements for plant installation and establishment.
	Executive Order B-29-15	The Project is also subject to emissions reduction requirements to be achieved by implementation of Executive Order B-29-15. This emergency executive order directs the Department of Water Resources to lead a statewide initiative to replace 50 million square feet of lawns and ornamental turf with drought tolerant landscapes. The order also directed the departments to update the Model Water Efficient Landscaping Ordinance, which they did in 2015.
	Model Water Efficient Landscaping Ordinance	The model ordinance promotes efficient landscaping in new developments and establishes an outdoor water budget for new and renovated landscaped areas that are 500 square feet or larger. (California Code of Regulations, Title 23, Division 2, Chapter 2.7.)
	Cap-and-Trade Program	Transportation fuels used in landscape maintenance equipment (e.g., gasoline) would be subject to the Cap-and-Trade program. (See "Energy Use," below.)
Refrigerants	CARB Management of High Global Warming Potential Refrigerants for Stationary Sources	Any refrigerants associated with the Project will be subject to CARB standards. CARB's Regulation for the Management of High Global Warming Potential Refrigerants for Stationary Sources 1) reduces emissions of high-Global Warming Potential refrigerants from leaky stationary, non-residential refrigeration equipment; 2) reduces emissions resulting from the installation and servicing of stationary refrigeration and air conditioning (R/AC) appliances using high-GWP refrigerants; and 3) requires verification of greenhouse gas (GHG) emission reductions. (California Code of Regulations, Title 17, Division 3, Chapter 1, Subchapter 10, Article 4, Subarticle 5.1, Section 95380 et seq.)

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
Consumer Products	CARB High-Global Warming Potential Greenhouse Gases in Consumer Products	All consumer products associated with the project will be subject to CARB standards. CARB's consumer products regulations set volatile organic compound (VOC) limits for numerous categories of consumer products, and limits the reactivity of the ingredients used in numerous categories of aerosol coating products (California Code of Regulations, Title 17, Division 3, Chapter 1, Subchapter 8.5.)
Construction		
Use of Off-Road Diesel Engines, Vehicles, and Equipment	CARB In-Use Off-Road Diesel Vehicle Regulation	Any relevant vehicle or machine use associated with the Project will be subject to CARB standards. The CARB In-Use-Off-Road Diesel Vehicle Regulation applies to certain off-road diesel engines, vehicles, or equipment greater than 25 horsepower. The regulations: 1) imposes limits on idling, requires a written idling policy, and requires a disclosure when selling vehicles; 2) requires all vehicles to be reported to CARB (using the Diesel Off-Road Online Reporting System, DOORS) and labeled; 3) restricts the adding of older vehicles into fleets starting on January 1, 2014; and 4) requires fleets to reduce their emissions by retiring, replacing, or repowering older engines, or installing Verified Diesel Emission Control Strategies, VDECS (i.e., exhaust retrofits). The requirements and compliance dates of the Off-Road regulation vary by fleet size, as defined by the regulation.
	Cap-and-Trade Program	Transportation fuels (e.g., gasoline) used in equipment operation would be subject to the Cap-and-Trade Program. (See "Energy Use," below.)
Pollutant Control	CALGreen	If an HVAC system is used during construction, the Project must use return air filters with a MERV of 8, based on ASHRAE 52.2-1999, or an average efficiency of 30 percent based on ASHRAE 5.2.1-1992. All filters must be replaced immediately prior to occupancy. (CALGreen Section A5.504.1.3.)
Greening New Construction	CALGreen	All new construction, including the Project, must comply with the California Green Building Code, or "CALGreen", as discussed in more detail throughout this table. Adoption of the mandatory CALGreen standards for commercial construction has been essential for improving the overall environmental performance of new commercial buildings; it also sets voluntary targets for builders to exceed the mandatory requirements.

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
Construction Waste	CALGreen	The Project will be subject to CALGreen requirements for construction waste reduction, disposal, and recycling, such as a requirement to recycle and/or salvage for reuse a minimum of 50 percent of the non-hazardous construction waste in accordance with Section 5.408.1.1, 5.408.1.2, or 5.408.1.3; or meet a local construction and demolition waste management ordinance, whichever is more stringent.
Worker, vendor and truck vehicle trips (on-road vehicles)	Cap-and-Trade Program	Transportation fuels (e.g., gasoline) used in worker, vendor and truck vehicle trips would be subject to the Cap-and-Trade Program. (See "Energy Use," below.)
Solid Waste		
Solid Waste Management	Landfill Methane Control Measure	Waste associated with the Project will be disposed per state requirements for landfills, material recovery facilities, and transfer stations. Per the statewide GHG emissions inventory, the largest emissions from waste management sectors come from landfills, and are in the form of methane. In 2010, CARB adopted a regulation that reduces emissions from methane in landfills, primarily by requiring owners and operators of certain uncontrolled municipal solid waste landfills to install gas collection and control systems, and requires existing and newly installed gas and control systems to operate in an optimal manner. The regulation allows local air districts to voluntarily enter into a memorandum of understanding with CARB to implement and enforce the regulation and to assess fees to cover costs of implementation.
	Mandatory Commercial Recycling (AB 341)	AB 341 will require the Project, if it generates four cubic yards or more of commercial solid waste per week, to arrange for recycling services, using one of the following: self-haul; subscribe to a hauler(s); arranging for pickup of recyclable materials; subscribing to a recycling service that may include mixed waste processing that yields diversion results comparable to source separation. The Project will also be subject to local commercial solid waste recycling program required to be implemented by each jurisdiction under AB 341.
	CALGreen	The Project will be subject to CALGreen requirement to provide areas that serve the entire building and are identified for the depositing, storage and collection of nonhazardous materials for recycling (CALGreen Section 5.410.1.)

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
Energy Use		
Electricity/Natural Gas Generation	Cap-and-Trade Program	Electricity and natural gas usage associated with the Project will be subject to the Cap-and-Trade Program. The rules came into effect on January 1, 2013, applying to large electric power plants and large industrial plants. In 2015, importers and distributors of fossil fuels were added to the Cap-and-Trade program in the second phase. Specifically, on January 1, 2015, cap-and-trade compliance obligations were phased in for suppliers of natural gas, reformulated gasoline blendstock for oxygenate blending (RBOB), distillate fuel oils, and liquefied petroleum gas that meet or exceed specified emissions thresholds. The threshold that triggers a cap-and-trade compliance obligation for a fuel supplier is 25,000 metric tons or more of CO2e annually from the GHG emissions that would result from full combustion or oxidation of quantities of fuels (including natural gas, RBOB, distillate fuel oil, liquefied petroleum gas, and blended fuels that contain these fuels) imported and/or delivered to California.
Energy Efficiency	Zero Net Energy Buildings (Title 24, Part 6)	The Project will be subject to net energy construction requirements contained in Title 24, Part 6. California revised building energy efficiency requirements contained in Title 24 in 2014 to require that all residential buildings be Zero Net Energy by 2020, and all commercial buildings must follow suit by 2030. MMs 21-2 and 21-3 further obligate the Project to comply with CALGreen voluntary measure A5.203.1.2.1, which requires newly constructed low-rise residential buildings to exceed the 2016 Title 24 energy efficiency requirements by 15 percent, and newly constructed nonresidential buildings to exceed the 2016 Title 24 energy efficiency requirements by 10 percent.
Renewable Energy	California Renewable Portfolio Standards (RPS) (Senate Bill X1-2 and 350)	Energy providers associated with the Project will be required to comply with Renewable Portfolio Standards set by SB X1-2 and 350. SB X1-2 requires IOUs, POUs, and ESPs to increase purchases of renewable energy such that at least 33 percent of retail sales are procured from renewable energy resources by December 31, 2020. In the interim each entity was required to procure an average of 20 percent of renewable

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		energy for the period of January 1, 2011 through December 31, 2013; and will be required to procure an average of 25 percent by December 31, 2016, and 33 percent by 2020. Senate Bill 350 requires retail sellers and publicly owned utilities to procure 50 percent of their electricity from eligible renewable energy resources by 2030.
	Million Solar Roofs Program (Senate Bill 1)	The Project will participate in California's energy market, which is affected by implementation of the Million Solar Roofs Program. As part of Governor Arnold Schwarzenegger's Million Solar Roofs Program, California has set a goal to install 3,000 megawatts of new, solar capacity by 201. The Million Solar Roofs Program is a ratepayer-financed incentive program aimed at transforming the market for rooftop solar systems by driving down costs over time.
	California Solar Initiative - Thermal Program	The Project will participate in California's energy market, which is affected by implementation of the California Solar Initiative -Thermal Program. The program offers cash rebates of up to $4,366 on solar water heating systems for single-family residential customers. Multifamily and Commercial properties qualify for rebates of up to $800,000 on solar water heating systems and eligible solar pool heating systems qualify for rebates of up to $500,000. Funding for the CSI-Thermal program comes from ratepayers of PG&E, SCE, SoCalGas, and SDG&E. The rebate program is overseen by the California Public Utilities Commission as part of the California Solar Initiative.
	Waste Heat and Carbon Emissions Reduction Act (AB 1613, AB 2791)	The Project will participate in California's energy market, which is affected by implementation of the Waste Heat and Carbon Emissions Reduction Act. Originally enacted in 2007 and amended in 2008, this act directed the CEC, PUC, and CARB to implement a program that would encourage the development of new combined heat and power systems in California with a generating capacity of not more than 20 megawatts, to increase combined heat and power use by 30,000 GWh. The CPUC publicly owned electric utilities, and CEC duly established policies and procedures for the purchase of electricity from eligible combined heat and power systems. CEC guidelines require combined heat and power systems to be designed to reduce waste energy;

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		have a minimum efficiency of 60 percent; have NOx emissions of no more than 0.07 pounds per megawatt-hour; be sized to meet eligible customer generation thermal load; operate continuously in a manner that meets expected thermal load and optimizes efficient use of waste heat; and be cost effective, technologically and feasible, environmentally beneficial.
Vehicular/Mobile Sources		
General	SB 375 and SCAG RTP/SCS	The Project complies with, and is subject to, the SCAG adopted RTP/SCS, which CARB approved as meeting its regional GHG targets in 2016.
Fuel	Low Carbon Fuel Standard (LCFS)/ Executive Order S-01-07	Auto trips associated with the Project will be subject to LCFS (Executive Order S-01-07), which requires a 10 percent or greater reduction in the average fuel carbon intensity by 2020 with a 2010 baseline for transportation fuels in California regulated by CARB. The program establishes a strong framework to promote the low carbon fuel adoption necessary to achieve the Governor's 2030 and 2050 greenhouse gas goals.
	Cap-and-Trade Program	Use of gasoline associated with the Project will be subject to the Cap-and- Trade Program. The rules came into effect on January 1, 2013, applying to large electric power plants and large industrial plants. In 2015, importers and distributors of fossil fuels were added to the Cap-and-Trade program in the second phase. Specifically, on January 1, 2015, cap-and-trade compliance obligations were phased in for suppliers of natural gas, reformulated gasoline blendstock for oxygenate blending (RBOB), distillate fuel oils, and liquefied petroleum gas that meet or exceed specified emissions thresholds. The threshold that triggers a cap-and-trade compliance obligation for a fuel supplier is 25,000 metric tons or more of CO2e annually from the GHG emissions that would result from full combustion or oxidation of quantities of fuels (including natural gas, RBOB, distillate fuel oil, liquefied petroleum gas, and blended fuels that contain these fuels) imported and/or delivered to California.
Automotive Refrigerants	CARB Regulation for Small Containers of Automotive Refrigerant	Vehicles associated with the project will be subject to CARB's Regulation for Small Containers of Automotive Refrigerant. (California Code of Regulations, Title 17, Division 3, Chapter 1, Subchapter 10, Article 4, Subarticle 5, Section

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		95360 et seq.) The regulation applies to the sale, use, and disposal of small containers of automotive refrigerant with a GWP greater than 150. The regulation achieves emission reductions through implementation of four requirements: 1) use of a self-sealing valve on the container, 2) improved labeling instructions, 3) a deposit and recycling program for small containers, and 4) an education program that emphasizes best practices for vehicle recharging. This regulation went into effect on January 1, 2010 with a one-year sell-through period for containers manufactured before January 1, 2010. The target recycle rate is initially set at 90 percent, and rises to 95 percent beginning January 1, 2012.
Light-Duty Vehicles	Assembly Bill 1493 (or the Pavley Standard)	Cars that drive to and from the Project will be subject to AB 1493, which directed the Air Resources Board (CARB) to adopt a regulation requiring the maximum feasible and cost-effective reduction of greenhouse gas (GHG) emissions from new passenger vehicles. Pursuant to AB 1493, CARB adopted regulations that establish a declining fleet average standard for carbon dioxide (CO2), methane (CH4), nitrous oxide (N2O), and hydrofluorocarbons (air conditioner refrigerants) in new passenger vehicles and light-duty trucks beginning with the 2009 model year and phased-in through the 2016 model year. These standards are divided into those applicable to lighter and those applicable to heavier portions of the passenger vehicle fleet. The regulations will reduce "upstream" smog-forming emissions from refining, marketing, and distribution of fuel.
	Advanced Clean Car and Zero Emissions Vehicle (ZEV) Programs	Cars that drive to and from the Project will be subject to the Advanced Clean Car and Zero Emissions Vehicle Programs. In January 2012, the Air Resources Board approved a new emissions-control program for model years 2017 through 2025. The program combines the control of smog, soot and global warming gases and requirements for greater numbers of zero-emission vehicles into a single package of standards called Advanced Clean Cars. By 2025, new automobiles will emit 34 percent fewer global warming gases and 75 percent fewer smog-forming emissions. The ZEV program will act as the focused technology of the Advanced Clean Cars program by requiring

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		manufacturers to produce increasing numbers of ZEVs and plug-in hybrid electric vehicles in the 2018-2025 model years.
	Tire Inflation Regulation	Cars that drive to and from the Project will be subject to the CARB Tire Inflation Regulation, which took effect on September 1, 2010, and applies to vehicles with a gross vehicle weight rating (GVWR) of 10,000 pounds or less. Under this regulation, automotive service providers must, inter alia, check and inflate each vehicle's tires to the recommended tire pressure rating, with air or nitrogen, as appropriate, at the time of performing any automotive maintenance or repair service, and to keep a copy of the service invoice for a minimum of three years, and make the vehicle service invoice available to the CARB, or its authorized representative upon request.
	EPA and NHTSA GHG and CAFE standards.	Mobile sources that travel to and from the project would be subject to EPA and NHTSA GHG and CAFE standards for passenger cars, light-duty trucks, and medium-duty passenger vehicles. (75 FR 25324–25728 and 77 FR 62624–63200.)
Medium- and Heavy-Duty Vehicles	CARB In-Use On-Road Heavy-Duty Diesel Vehicles Regulation (Truck and Bus Regulation)	Any heavy-duty trucks associated with the Project will be subject to CARB standards. The regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Newer heavier trucks and buses must meet PM filter requirements. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent. The regulation applies to nearly all privately and federally owned diesel fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds.
	CARB In-Use Off-Road Diesel Vehicle Regulation	Any relevant vehicle or machine use associated with the Project will be subject to CARB standards. The CARB In-Use-Off-Road Diesel Vehicle Regulation applies to certain off-road diesel engines, vehicles, or equipment greater than 25 horsepower. The regulations: 1) imposes limits on idling, requires a written idling policy, and requires a disclosure when selling vehicles; 2) requires all vehicles to be reported to CARB (using the Diesel Off-Road Online Reporting System, DOORS) and

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		labeled; 3) restricts the adding of older vehicles into fleets starting on January 1, 2014; and 4) requires fleets to reduce their emissions by retiring, replacing, or repowering older engines, or installing Verified Diesel Emission Control Strategies, VDECS (i.e., exhaust retrofits). The requirements and compliance dates of the Off-Road regulation vary by fleet size, as defined by the regulation.
	Heavy-Duty Vehicle Greenhouse Gas Emission Reduction Regulation	Any relevant vehicle or machine use associated with the Project will be subject to CARB standards. The CARB Heavy-Duty Vehicle Greenhouse Gas Emission Reduction Regulation applies to heavy-duty tractors that pull 53-foot or longer box- type trailers. (California Code of Regulations, Title 17, Division 3, Chapter 1, Subchapter 10, Article 4, Subarticle 1, Section 95300 et seq.) Fuel efficiency is improved through improvements in tractor and trailer aerodynamics and the use of low rolling resistance tires.
	EPA and NHTSA GHG and CAFE standards.	Mobile sources that travel to and from the project would be subject to EPA and NHTSA GHG and CAFE standards for medium- and heavy-duty vehicles. (76 FR 57106–57513.)
Water Use		
Water Use Efficiency	Emergency State Water Board Regulations	Water use associated with the Project will be subject to recent emergency regulations. On May 18, 2016, partially in response to Executive Order B-27-16, the State Water Board adopted emergency water use regulations (California Code of Regulations, title 23, section 864.5 and amended and re-adopted sections 863, 864, 865, and 866). The regulation directs the State Water Board, Department of Water Resources, and Public Utilities Commission to implement rates and pricing structures to incentivize water conservation, and calls upon water suppliers, homeowners' associations, California businesses, landlords and tenants, and wholesale water agencies to take stronger conservation measures.
	Executive Order B-37-16	Water use associated with the Project will be subject to Emergency Executive Order B-37-16, issued May 9, 2016, which directs the State Water Resources Control Board to adjust emergency water conservation regulations through the end of January 2017 to reflect differing water supply conditions across the state.

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		The Water Board must also develop a proposal to achieve a mandatory reduction of potable urban water usage that builds off the mandatory 25 percent reduction called for in Executive Order B-29-15. The Water Board and Department of Water Resources will develop new, permanent water use targets to which the Project will be subject. The Water Board will permanently prohibit water-wasting practices such as hosing off sidewalks, driveways, and other hardscapes; washing automobiles with hoses not equipped with a shut-off nozzle; using non- recirculated water in a fountain or other decorative water feature; watering lawns in a manner that causes runoff, or within 48 hours after measurable precipitation; and irrigating ornamental turf on public street medians.
	Executive Order B-40-17	Executive Order B-40-17 lifted the drought emergency in all California counties except Fresno, Kings, Tulare, and Tuolumne. It also rescinds Executive Order B-29-15, but expressly states that Executive Order B-37-16 remains in effect and directs that State Water Resources Control Board to continue development of permanent prohibitions on wasteful water use to which the Project will be subject.
	Senate Bill X7-7	Water provided to the Project will be affected by Senate Bill X7-7's requirements for water suppliers. Senate Bill X7-7, or the Water Conservation Act of 2009, requires all water suppliers to increase water use efficiency. It also requires, among other things, that the Department of Water Resources, in consultation with other state agencies, develop a single standardized water use reporting form, which would be used by both urban and agricultural water agencies.
	CALGreen	The Project is subject to CALGreen's water efficiency standards, including a required 20 percent mandatory reduction in indoor water use. (CALGreen, Division 4.3.)
	California Water Code, Division 6, Part 2.10, Sections 10910–10915.	Development and approval of the project requires the development of a project-specific Water Supply Assessment.
	Kern County Landscaping	The project would be subject to Kern County's Landscaping Requirements and Water Efficient

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
	Requirements and Water Efficient Landscaping.	Landscaping ordinances. (Kern County Code of Ordinances, Title 19, Chapter 19.86, Sections 19.86.050 and 19.86.060.)
	Cap-and-Trade Program	Electricity usage associated with water and wastewater supply, treatment and distribution would be subject to the cap-and-trade program.
	California Renewable Portfolio Standards (RPS) (Senate Bill X1-2 and 350)	Electricity usage associated with water and wastewater supply, treatment and distribution associated with the Project will be required to comply with Renewable Portfolio Standards set by SB X1-2 and 350.
Water Recycling	Water Reclamation Requirements for Recycled Water Use. SWRCB Order WQ 2016-0068- DDW	These requirements replace 2014-0090-DWQ General Waste Discharge Requirements for Recycled Water Use, and establish standard conditions for recycled water use and conditionally delegates authority to an Administrator to manage a Water Recycling Program and issue Water Recycling Permits to recycled water users. Only treated municipal wastewater for non-potable uses can be permitted, such as landscape irrigation, crop irrigation, dust control, industrial/commercial cooling, decorative fountains, etc. Potable reuse is not covered.
	Regulations for Groundwater Replenishment Using Recycled Water	This emergency rulemaking by the California Department of Public Health (California Title of Regulations, Title 22, Sections 60301.050 et seq.), effective June 18, 2014, applied to Groundwater Replenishment Reuse Projects (GRRPs) utilizing surface application, which received initial permits from the Regional Board. The regulations address permitting and plan approval, sampling requirements, operation requirements, and ongoing reporting requirements.
	Policy for Water Quality Control for Recycled Water. SWRCB Resolution No. 2009-, as amended by Resolution No. 2013-0003	The project would be subject to the State Water Resources Control Board statewide mandate to increase recycled water usage by 0.2 million acre-feet per year by 2020.

As described above, the project's GHG emissions (both on and off-site) are regulated by scores of GHG emission reduction mandates. Compliance with these GHG reduction legal requirements is appropriately assumed to occur under CEQA. *Oakland Heritage Alliance v.*

City of Oakland (2011) 195 Cal. App. 4th 884, 906; *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 234 Cal. App. 4th 214, 244-45. Under this threshold, project-level GHG emissions are considered in the EIR to be less than significant impacts under CEQA; however, because implementation of many of these measures falls largely outside of the jurisdiction and control of Kern County, the EIR also concludes that this impact remains significant and unavoidable at both a project and cumulative level.

Compliance with Plan Threshold

The *Newhall* Court also recommended evaluating a project's compliance with GHG reduction plans and acknowledged that global climate change caused by greenhouse gas emissions was ultimately a cumulative impact.[472] As the Governor's Office of Planning and Research has noted:

> Although climate change is ultimately a cumulative impact, not every individual project that emits GHGs must necessarily be found to contribute to a significant cumulative impact on the environment. CEQA authorizes reliance on previously approved plans and mitigation programs that have adequately analyzed and mitigated GHG emissions to a less than significant level as a means to avoid or substantially reduce the cumulative impacts of a project.
>
> (Office of Planning and Research, June 19, 2008[473])

This EIR considers the project's compliance with the applicable GHG reduction plan for the region, the RTP/SCS adopted pursuant to SB 375, Stats. 2008, ch. 728, by SCAG and approved by CARB in 2016. SB 375 was enacted after AB 32, and includes regional targets established by CARB for greenhouse gas reductions from the transportation and land use sectors that are not constrained by the GHG reduction mandates set forth in AB 32, and are estimated by CARB to result in additional GHG reductions from the land use and transportation sectors.[474] The approved RTP/SCS designates the Project site for future urbanized development, and the EIR describes the project's consistency with the RTP/SCS in Section 5.8, Land Use,[475] Section 5.9, Population, Housing and Employment,[476] Section 5.11, Air Resources,[477] and Section 5.21, Climate Change.[478]

This EIR also considers the Project's compliance with the applicable climate action plan, the Los Angeles County Community Climate Action Plan (Los Angeles CCAP). The Los Angeles CCAP is designed to support the State's overall GHG reduction goals for 2020 under AB 32. The Project's consistency with the CCAP is shown in Table 5.21.11.[479] Since the Project is

473 Office of Planning and Research (OPR). 2008 (June 19). Technical Advisory, CEQA AND CLIMATE CHANGE: Addressing Climate Change Through California Environmental Quality Act (CEQA) Review (p. 6). Sacramento, CA: OPR. https://www.opr.ca.gov/docs/june08-ceqa.pdf.

474 California Government Code § 65080(b)(2)

475 DRP 2017, p. 5.8-73

476 *Id.,* pp. 5.9-23 to -32

477 *Id.,* pp. 5.11-74 to -75

478 *Id.,* pp. 5.21-85 to -86

479 *Id.,* pp. 5.21-73 to -83

consistent with the Los Angeles CCAP, it would not have significant GHG emissions relative to the CCAP's 2020 planning horizon and the AB 32 reduction target. Since the Project has a phased implementation schedule with full buildout beyond the CCAP's 2020 planning horizon, consistency with the CCAP is only one Newhall compliance pathway used to assess the Project's GHG impacts in Section 5-21, Climate Change.

Since the Project would be consistent with the Los Angeles CCAP, which meets the requirements for a programmatic climate action plan specified in Section 15183.5 of the State CEQA Guidelines, as well as the SCAG 2016 RTP/SCS, the Project's GHG emissions could be considered less than significant under the "compliance with SB 375" and "compliance with a climate action plan" pathways identified by the *Newhall* court, as discussed in Section 5.21 under Threshold 21-2.

The Project has been specifically designed to significantly reduce its reliance on fossil fuel and to promote energy efficiency and the use of renewable energy sources, as discussed in response to Comment F.8-204. Specifically, regarding renewable energy production, MM 21-1 requires the Project Applicant/Developer to provide the County with plans and specifications that demonstrate 50 percent of the Project's anticipated electrical energy demand at buildout shall be satisfied from on-site renewable energy generation.

With respect to this comment's recommended mitigation measures regarding renewable energy production, the EIR includes functionally equivalent measures. Specifically, MM 21-1 requires the Project Applicant/Developer to provide the County with plans and specifications that demonstrate 50 percent of the Project's anticipated electrical energy demand at buildout shall be satisfied from on-site renewable energy generation, which may include, but is not limited to, solar, geothermal, biofuel and hydroelectric systems in a manner consistent with the Specific Plan. In addition, MM 21-5 requires the Project to equip a minimum of 70 percent of public and community pools and spas with active solar water heating systems where heating is necessary or desired, and MM 21-2 requires the Project Applicant/Developer to provide all single-family homebuyers the option to include a photovoltaic array system as a home design feature. MM 21-2 requires the Project to comply with CALGreen Code voluntary measure A4.203.1.2.1 Tier 1 for newly-constructed low-rise residential buildings, thus ensuring that these buildings will exceed the 2016 Title 24 energy efficiency requirements by 15 percent. Similarly, mitigation measure 21-2 requires the Project to comply with CALGreen Code voluntary measure A5.203.1.2.1 Tier 1 for nonresidential buildings, thus ensuring that these buildings will exceed the 2016 Title 24 energy efficiency requirements by 10 percent.

In addition, the Specific Plan's Green Development Program requires the installation of onsite solar panel systems on roof areas for a minimum of 30 percent of all single-family detached and attached residential units; a minimum of 30 percent of all multi-family residential units, and a minimum of 60 percent of buildings located within Business Park land use designations.

This comment's assertion that the electric vehicle (EV) charger should be more widely available is noted for the record and will be provided the Regional Planning Commission and

Board of Supervisors for consideration. The EIR includes several mitigation measures to ensure an appropriate amount of EV charging stations will be available to Project residents and visitors. In response to this comment, the relevant mitigation measures have been revised to clarify their application, as follows:

MM 11-4 The Project's plans and specifications for non-residential buildings shall demonstrate that the following features have been incorporated into the building designs. Proof of compliance shall be provided to the County prior to the issuance of occupancy permits.

- For buildings with over 10 tenant-occupants, changing/shower facilities shall be provided as specified in Section A5.106.4.3, Nonresidential Voluntary Measures, of the CALGreen Code as follows: for 11 to 50 tenant-occupants, one unisex shower and two 2-tier lockers; for 51 to 100 tenant-occupants, one unisex shower and three 2-tier lockers; for 101 to 200 tenant-occupants, one shower per gender and four 2-tier lockers; and for over 200 tenant-occupants, one shower per gender for each 200 additional tenant-occupants and one 2-tier locker for each 50 additional tenant-occupant.
- Preferential parking for low-emitting, fuel-efficient, and carpool/van vehicles shall be provided as specified in Section A5.106.5.1, Nonresidential Voluntary Measures, of the CALGreen Code as follows: two for 10 to ~~1~~25 spaces; four for 26 to 50 spaces; six for 51 to 75 spaces; nine for 76 to 100 spaces; eleven for 101 to 150 spaces; 18 for 151 to 200 spaces; and at least 10 percent of total for 201 and more spaces.
- ~~Facilities~~ Electric Vehicle Charging Spaces (EV Space), as defined by CALGreen Code Section 202, shall be installed to support future installation of ~~e~~Electric ~~v~~Vehicle Supply Equipment (EVSE), as defined by CALGreen Code Section 202, ~~charging~~ at each non-residential building with ~~3~~10 or more parking spaces. Installation of each EV Space shall be consistent with Sections A5.106.5.3 and A5.106.5.3.1, Nonresidential Voluntary Measures (Tier 1), of the CALGreen Code. The EV Space facilities shall meet Section 406.9 (Electric Vehicle) of the *California Building Code* and as follows:

Total Number of Actual Parking Spaces	Tier 1 Number of Required EV Spaces
0-9	0
10-25	2
26-50	3
51-75	5
76-100	7
101-150	10
151-200	14
≥200	8 percent of total spaces rounded up to nearest whole number

~~**Single charging space requirements.** When only a single charging space is required, install a listed raceway capable of accommodating a dedicated branch circuit. The raceway shall not be less than trade size 1. The raceway shall be securely fastened at the main service or subpanel and shall terminate in close proximity to the proposed location of the charging system into a listed cabinet, box or enclosure.~~

Multiple charging spaces required. When multiple EV Spaces are required, plans shall include the location(s) and type of ~~electrical vehicle supply equipment (~~EVSE~~)~~, raceway method(s), wiring schematics and electrical calculations to verify that the electrical system has sufficient capacity to charge simultaneously all the electric vehicles (EV) at all designated EV ~~charging s~~Spaces at their full rated amperage. Plan design shall be based on Level 2 EVSE at its maximum operating ampacity. Provide raceways from the electrical service panel to the designated parking areas which are required to be installed at the time of construction.

MM 11-6 The Project's plans and specifications for parking structures and parking lots with 20 or more parking spaces that serve uses other than residential or nonresidential buildings (e.g., trailhead, park), and parking structures and parking lots that serve multifamily residential buildings with 17 or more multifamily units, shall demonstrate that the following features have been incorporated into the parking facility.

- The parking facility shall include a minimum of five percent preferentially located parking spaces for

alternative-fueled (electric, natural gas, or similar low-emitting technology) vehicles.

- Five percent of ~~T~~the total number of parking spaces provided in the parking facility, but in no case less than one, shall be Electric Vehicle Parking Spaces (EV Spaces), as defined in CALGreen Code Section 202, capable of supporting future Electric Vehicle Supply Equipment (EVSE), as defined in CALGreen Code Section 202~~include at least one electric vehicle charging station. Electrical lines shall be designed and sized to add additional charging stations when a demand is demonstrated~~. Calculations for the required number of EV Spaces shall be rounded up to the nearest whole number and ~~T~~the design and installation of each EV Space shall be consistent with Section A4.106.8.2, Residential Voluntary Measures, and Section 4.106.4.2, of the CALGreen Code as follows:

  Single charging space requirements. When only a single EV ~~charging s~~Space is required, install a listed raceway capable of accommodating a dedicated branch circuit. The raceway shall not be less than trade size 1 (nominal 1-inch inside diameter). The raceway shall be securely fastened at the main service or subpanel and shall terminate in close proximity to the proposed location of the charging system into a listed cabinet, box or enclosure.

  Multiple charging spaces required. When multiple EV ~~charging s~~Spaces are required, plans shall include the location(s) and type of ~~electrical vehicle supply equipment (~~EVSE~~)~~, raceway method(s), wiring schematics and electrical calculations to verify that the electrical system has sufficient capacity to charge simultaneously all the electric vehicles at all designated EV ~~charging s~~Spaces at their full rated amperage. Plan design shall be based on Level 2 EVSE at its maximum operating ampacity. Only underground raceways and related underground equipment are required to be installed at the time of construction.

- For residential parking facilities, bicycle parking shall be provided as specified in Section A4.106.9, Residential Voluntary Measures, of the CALGreen Code, or as

required by County Code Section 22.52.1225B, whichever is more stringent.

MM 21-15 The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that one 208/240 VAC receptacle that may be used for charging electric vehicles, shall be installed in each detached and attached single-family residence in a manner consistent with 2016 CALGreen Code Voluntary Tier 1 Section A4.106.4.1. The installation shall comply with requirements of the 2016 CALGreen Code Section 4.106.4.1, or the most applicable code at the time of construction.

MM 21-16 The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that "alternative energy fueling stations" shall be installed as follows. An "alternative energy vehicle fueling station" is a 208/240 VAC electrical vehicle charging station or a station providing another new or improved technology (e.g. compressed natural gas (CNG) and hydrogen fuel cell) that provides refueling for vehicles that do not use fossil fuel. An electric charging station shall allow for simultaneous charging of two electric vehicles.

- Business Park and Institutional land use designations shall provide a minimum of one alternative energy vehicle fueling station on site for the first 50,000 square feet of usable floor space and additional alternative energy vehicle fueling stations for each additional 50,000 square feet of usable floor space thereafter.
- Multi-family residential buildings of at least seventeen ~~20~~ (17) residential units shall provide a minimum of one alternative energy vehicle fueling station for the first ~~twenty~~ seventeen (~~20~~ 17) residential units and an additional alternative energy vehicle fueling station for each additional ~~twenty~~ seventeen (~~20~~ 17) residential units thereafter.
- The Town Center and each Village Center shall provide a minimum of one alternative energy vehicle charging station.
- Designated Transit Hubs shall provide a minimum of one alternative energy vehicle charging station.

MM 21-19 For parking structures and parking lots with 20 or more parking spaces that serve uses other than residential or nonresidential buildings (e.g., trailhead, park), and parking structures and

parking lots that serve multifamily residential buildings with 17 or more multifamily units, the Project Applicant/Developer shall provide plans and specifications to the County demonstrating that the following features have been incorporated into the parking facility:

- The parking facility shall include a minimum of five percent preferentially located parking spaces for alternative-fueled (electric, natural gas, or similar low-emitting technology) vehicles.
- Five percent of ~~T~~the total number of parking spaces provided in the parking facility, but in no case less than one, shall be Electric Vehicle Parking Spaces (EV Spaces), as defined in CALGreen Code Section 202, capable of supporting future Electric Vehicle Supply Equipment (EVSE), as defined in CALGreen Code Section 202 ~~include at least one electric vehicle charging station. Electrical lines shall be designed and sized to add additional charging stations for up to three percent of the total parking spaces when a demand is demonstrated.~~ Calculations for the required number of EV Spaces shall be rounded up to the nearest whole number and ~~T~~the design and installation of each EV space shall be consistent with Section A4.106.8.2, Residential Voluntary Measures, and Section 4.106.4.2, of the CALGreen Code as follows:

  Single charging space requirements. When only a single EV Space is required, install a listed raceway capable of accommodating a dedicated branch circuit. The raceway shall not be less than trade size 1 (nominal 1-inch inside diameter). The raceway shall be securely fastened at the main service or subpanel and shall terminate in close proximity to the proposed location of the charging system into a listed cabinet, box or enclosure.

  Multiple charging spaces required. When multiple EV Spaces are required, plans shall include the location(s) and type of EVSE, raceway method(s), wiring schematics and electrical calculations to verify that the electrical system has sufficient capacity to charge simultaneously all the electrical vehicles at all designated EV Spaces at their full rated amperage. Plan design shall be based on Level 2 EVSE at its maximum operating ampacity. Only underground

raceways and related underground equipment are required to be installed at the time of construction.

- For residential parking facilities, bicycle parking shall be provided as specified in Section A4.106.9, Residential Voluntary Measures, of the CALGreen Code, or as required by County Code Section 22.52.1225B, whichever is more stringent.

The above mitigation measures go well beyond the mandatory regulatory requirements with respect to the provision of EV charging infrastructure. For example, MM 11-4 requires all Project nonresidential building with 10 or more parking spaces to install Electric Vehicle Charging Spaces (EV Spaces) in accordance with CALGreen Code Section A.5.106.5.3, Nonresidential Voluntary Measures (Tier 1). This normally voluntary commitment is made a requirement of the Project by MM 11-4, thus ensuring that the Project will substantially exceed the CALGreen Code's mandatory requirements for the provision EV Spaces at nonresidential buildings, as shown by the following chart:

Nonresidential Building Parking Space Total	Legally Required Number of EV Spaces (CALGreen § 5.106.5.3)	MM 11-4 Required Number of EV Spaces (CALGreen § A5.106.5.3)
0-9	0	0
10-25	1	2
26-50	2	3
51-75	4	5
76-100	5	7
101-150	7	10
151-200	10	14
>200	6% of total	8% of total

MM 11-4 also requires the Project to exceed mandatory regulatory requirements with respect to the Project's provision of preferential parking for low-emitting, fuel efficient, and carpool vehicles at nonresidential, and with respect to the provision of onsite showers and lockers at nonresidential buildings to encourage workforce occupants to walk and bike to their jobs.

Under existing law, three percent, but in no case less than one, of the parking spaces provided for multifamily residential buildings with 17 units or more must be constructed as EV Spaces. MMs 11-6 and 21-19 expands on this requirement by requiring the Project to ensure that five percent of such spaces are constructed EV Spaces in accordance with the CALGreen Code Tier 1 Residential Voluntary Measures. Indeed, MMs 11-6 and 21-19 go even farther that the CALGreen Code Tier 1 voluntary measures by requiring the Project to also ensure that five percent of the total number of parking spaces in parking structures and parking lots that serve uses other than residential or nonresidential buildings, such as parks or trailheads, and which have 20 or more total spaces, are constructed as EV Spaces. Finally, MMs 11-6 and 21-19 go beyond applicable law by also requiring that bike parking be provided in residential

parking facilities consistent with the requirements of CALGreen Code Residential Voluntary Measure A4.106.9.

In addition, MM 21-15 goes beyond the requirements of applicable law by requiring the Project to install a EV charging receptacle in ever detached and attached single-residence in a manner consistent with 2016 CALGreen Code Voluntary Tier 1 Section A.4.106.4.1. Existing law – i.e., CALGreen Code Section 4.106.4.1 - merely requires that detached and attached single-family residences be wired to accommodate a EV charging receptacle to be install by the homeowner, if installed at all. Finally, existing law does not require any residential or nonresidential projects to provide electric vehicle charging stations or other form of alternative energy fueling station for low-emission or alternative fueled vehicles. The Project, however, will be required to go beyond the requirements of existing law by requiring the installation of alternative energy vehicle fueling stations (EVFS) (i.e., an electrical vehicle charging station or a station providing another new or improved technology) in the amounts set forth in MM 21-16, as revised above. In response to this comment, MM 21-16 has been revised to (i) lower the threshold size of multi-family residential buildings that will qualify for at least one EVFS from 20 units to 17 units, and (ii) increasing the number EVFS that must be installed in a qualifying multi-family residential building by requiring one EVFS per every 17 units, rather than one EVFS per every 20 units. The combination of these measures, all of which go well beyond the requirements of existing law will ensure that EVFS will be widely available to residents of multi-family residential units and people traveling to the Project site.

It has been California policy that all new residential buildings will be zero net energy (ZNE) by 2020 and new commercial buildings will be ZNE by 2030, as described in the 2008 California Public Utilities Commission (CPUC) long-term energy efficiency strategic plan. In 2013, the California Energy Commission (CEC), in coordination with the CPUC, commenced a process to update the California Building Energy Efficiency Standards (Title 24) and, in 2016, the CEC updated the Title 24 Building Energy Efficiency Standards to establish building design and construction requirements that move closer to achieving California's ZNE goals, with the next update scheduled for 2019. As part of 2019 Building Energy Efficiency Standards rulemaking process, CEC staff has currently determined that ZNE cannot be achieved by 2020 within the confines of existing net energy metering and life cycle costing rules.[480, 481] CEC staff has also determined that the State's ZNE goals cannot be achieved until California develops and implements electric grid harmonization strategies that maximize self-utilization of photovoltaic array output and minimize renewable energy exports back to the grid, such as commercially viable battery storage, demand response, thermal storage

480 California Energy Commission, 2019 Building Energy Efficiency Standards PreRulemaking Presentation - Proposed 2019 Building Energy Efficiency Standards ZNE Strategy (Aug. 24, 2017), http://docketpublic.energy.ca.gov/PublicDocuments/17-BSTD-01/TN220876_20170824T105443_82217_ZNE_Strategy_Presentation.pdf.

481 Electric Power Research Institute (Jan. 2017) – Grid Integration of Zero Net Energy Communities, California Energy Commission Docket Number 17 –BSTD-02: http://docketpublic.energy.ca.gov/PublicDocuments/17-BSTD-02/TN223207_20180417T082650_Final_Project_Report_Grid_Integration_of_Zero_Net_Energy_Commun.pdf

technologies.[482,483] California has, however, continued to make substantial progress toward achieving its ZNE policy, including most recently the CEC's decision to require solar panels on rooftops of most types of new residential buildings.[484] These and additional future building code standards updates, which must also take into account all applicable statutory building code standards mandates, such as consumer cost effectiveness, are expected to continue the State's trajectory toward achieving its ZNE policy.

Although the Draft EIR adequately addresses the Project's potential impacts related GHG emissions, this comment's recommendations are noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment F.3A-47:

The analysis and conclusion of Threshold 3-4 in Draft EIR Section 5.3, Hazards and Fire Safety, including the quoted sentence in this comment, pertains to hazardous materials/wastes at the National Cement Plant that have resulted in soil and groundwater contamination, and potential conflicts between Project-related vehicular and alternative traffic introduced by the Project and existing traffic on the realigned National Cement Plant Road.

Air emissions from operations at the National Cement Plant are discussed in Draft EIR Section 5.11, Air Resources. The existing air quality, which is the baseline for the proposed Project's air quality analysis, is presented beginning on Draft EIR page 5.11-25 under the header "Monitored Air Quality". As shown in Table 5.11-4 beginning on Draft EIR page 5.11-26, PM10 and PM2.5 are monitored at the applicable monitoring stations. Particulate matter is considered in the Draft EIR as PM10 and PM2.5 – particulate matter with a diameter of 10 and 2.5 microns or less, respectively.

As discussed in Section 5.11, "Particulate matter in the AVAQMD tends to be primarily fugitive dust. This dust appears to be generated by both local sources and by region-wide dust during moderate to high wind episodes. These regional episodes tend to be multi-district and sometimes interstate in scope. The AVAQMD has identified the local sources of fugitive dust to be primarily unpaved road travel; construction and local disturbed areas of soil concentrated in the urban populated areas in the district; and seasonal agricultural operations"[485]; and "Particulate levels in the area are due to natural sources (such as wind), grading operations, and motor vehicles"[486]. As such, the contribution of National Cement Plant operations to the particulate matter in the Mojave Desert Air Basin is not as dominant

482 *Ibid*.

483 Electric Power Research Institute (Jan. 2017) – Grid Integration of Zero Net Energy Communities, California Energy Commission Docket Number 17 –BSTD-02: http://docketpublic.energy.ca.gov/PublicDocuments/17-BSTD-02/TN223207_20180417T082650_Final_Project_Report_Grid_Integration_of_Zero_Net_Energy_Commun.pdf

484 California Energy Commission Initial Statement of Reasons for Proposed Building Standards of the California Energy Commission Regarding Code of Regulations, Title 24, Part 1, Chapter 10 and Part 6 (2010 California Energy Code) Docket Number 17-BSTD-02

485 DRP 2017, p. 5.11-6

486 *Id.,* p. 5.11-26

as dust (from wind and grading) and vehicles, and these emissions are represented in the existing monitored air quality data.

In Section 5.11, the analysis under Threshold 11-2, which asks whether the proposed project would expose sensitive receptors to substantial pollutant concentrations, acknowledges that the National Cement Plant is a source of toxic air contaminants (TACs) in the area.[487] Accordingly, a health risk analysis (HRA) was completed to evaluate the human health impacts; the HRA concluded the risks at the future Project residences and other sensitive uses are below the applicable thresholds.[488] Based on the analysis of the technical report, the Draft EIR concludes that the TAC risks (which include risks from particulate matter) from the National Cement Plant at Lebec to the Project site would be less than the applicable AVAQMD and SCAQMD [Southern California Air Quality Management District] CEQA significance thresholds, and that, "The impact would be less than significant."[489]

Further, CEQA does not require an analysis of the environment's impacts on the project but rather whether a project "may cause either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment." [490]According to the California Supreme Court in *California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369, 378, "CEQA analysis is concerned with a project's impact on the environment, rather than with the environment's impact on a project and its users or residents." Thus, CEQA does not require the Project to mitigate for emissions generated by current operations of the National Cement Plant.

Response to Comment F.3A-48:

The comment states that the SR-138 widening project will have impacts to biological resources. As stated in the response to Comment F.3-28, the SR-138 widening project is not associated with the Centennial Specific Plan. The Commenter's opinion will be noted for the record and provided to the Planning Commission and Board of Supervisors. Because this comment does not question the content of the Draft EIR, no further response is required.

Response to Comment F.3A-49:

The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project. The comment appears to refer to the segments of the Ridge Route roadway constructed prior to, and located generally to the east of, Interstate (I) 5 extending from the community of Castaic north to State Route (SR) 138. As recently discussed in published reports,[491] portions of the Ridge Route have been closed for several years due to storm damage; easements for portions of the route have been vacated and are currently held by private landowners; portions of the route were listed on the National Register of Historic Places in 1997; and much of the route traverses through the Angeles National Forest and is

487 *Id.,* p. 5.11-29
488 *Id.,* pp. 5.11-71 and -72
489 *Id.,* p. 5.11-72
490 PRC § 21065
491 See, e.g., http://www.latimes.com/business/autos/la-fi-hy-old-ridge-route-20160502-story.html.

subject to the planning and conservation oversight of the U.S. Forest Service. Due to these factors, the use of the Ridge Route to mitigate impacts on I-5 would be infeasible.

Potential Project impacts to I-5 are discussed in Section 5.10, Traffic, Access, and Circulation, including the text and tables on pages 5.10-56 to 5.10-119. The analysis compares the applicable Level of Service (LOS) standards for I-5 freeway segments and on-ramps and off-ramps located north and south of the Project site using well-established analysis methodologies under existing conditions, existing conditions with the Project, and under future (cumulative) with Project conditions based on future I-5 traffic projections prepared by applicable transportation and transit planning agencies for Los Angeles and Kern Counties. The Draft EIR determined that no significant impacts to freeway segments or interchange ramps would occur under existing plus Project conditions, and that the Project could contribute to an exceedance of capacity on the westbound SR-138 to southbound I-5 ramp. The Draft EIR determined that, under cumulative plus Project conditions, the Project could contribute to impacts at six mainline segments along I-5 and to the interchange connector ramps from westbound SR-138 to southbound I-5 and from I-5 to eastbound SR-138. The Draft EIR found that all potentially affected I-5 segments and ramps under existing plus Project and cumulative plus Project conditions would operate within acceptable performance criteria with the implementation of mitigation measures and found that compliance with these mitigation measures and the fair share contributions towards the improvements described above would reduce potential Project impacts to I-5 freeway segments and ramps to less than significant levels.

The Draft EIR also discusses the Northwest State Route 138 Corridor Improvement Project ("NW SR-138 project"), including SR-138 improvement alternatives, design, purpose and how the alternatives related to the Project's proposed circulation system in Section 4.0, Project Description, pages 4-39 to 4-41, Section 5.10, Traffic, Access, and Circulation, pages 5.10-34 to 5.10-36, and Section 7.0, Cumulative Impacts, pages 7-8 to 7-9. This information was based on the Draft EIR/EIS for the NW SR-138 project which was circulated for public review and comment in July 2016. A Notice of Completion and Availability for the Draft EIR was filed by the County on May 15, 2017 and the 60-day comment period began on May 17, 2017. As noted on Draft EIR page 4-41, the NW SR-138 project Draft EIR/EIS, Transportation Analysis Report (TAR) and Intersection Control Evaluation report (ICE Report) deferred the selection of a preferred SR-138 improvement alternative until the NW SR-138 project Final EIR/EIS ("NW SR-138 FEIR") was published. In June 2017, during the comment period for the Draft EIR, Caltrans issued the NW SR-138 FEIR and identified Alternative 2 (Expressway/Highway) ("Alt 2") as the preferred alternative for the SR-138 improvements. In July 2017 Caltrans submitted a comment letter requesting that the Project traffic analysis discuss and incorporate the Alt 2 facilities to be consistent with the NW SR-138 FEIR. In response, a Supplemental Traffic Study (STS) was prepared to incorporate Alt 2 with the Project traffic analysis. The STS is attached as Appendix 5.10-C of the Final EIR.

The STS compares the Project's potential impacts identified in the Draft EIR for I-5, SR-14, and SR-99 facilities using the volume-to-capacity methodology specified by the Congestion Management Plan for Los Angeles County and the Project's potential impacts using the Caltrans' recommended HCM methodology. HCM calculations were prepared for 62 locations

within the Draft EIR study area consisting of freeway segments in advance of and after major system interchanges as well as representative locations between major system interchanges. The analyzed locations provide a comprehensive coverage of the Draft EIR study area because they include the freeway facilities with the greatest potential to be affected by congestion. Under existing plus Project conditions, the Draft EIR and the STS show that all applicable highway segments, intersections and ramps would operate at acceptable LOS levels.[492] Under cumulative plus Project conditions with mitigation, the Draft EIR and the STS show that almost all applicable highway segments, intersections and ramps would operate at acceptable LOS levels.[493] The STS indicates that certain study locations, such as the Grapevine grade segment of I-5, would not meet HCM-based LOS standards because topographic conditions, lane and speed controls and other localized conditions would result in higher traffic densities. As shown in STS Table A-5, however, LOS conditions would be worse under cumulative without Project conditions, and LOS conditions improve under cumulative with Project conditions with the implementation of the Project MMs.[494] Consequently, the STS demonstrates that, using the HCM methodology, the Project will not result in any new or more severe significant impacts to applicable highway segments, intersections and ramps than considered in the Draft EIR.

Please also see Section 5.16 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.3 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment F.3A-50:

No specific timeline has been set for the construction and operation of the on-site library. Rather, page 5.17-9 of the Draft EIR states that the Project proposes a public library that would be on an approximate 2.5-acre site at the Town Core. The library would be completed and operational on a date mutually agreed to between the County Librarian and the Applicant, taking into account the demands on library services within and adjacent to the Project site.

MMs 17-1 through 17-8 on Draft EIR pages 5.17-10 through 5.17-14 were developed in consultation with the County Library and includes the location and size of the land to be dedicated for construction of the library. Draft EIR page 5.17-8 states that the County Library's current service level planning guidelines are 2.75 items (including books, magazines, movies, etc.) per capita for the collection and 1.0 computer per 1,000 people served. The current planning guideline for library facility space is a minimum of 0.5 square foot per capita and 2.0 square feet of land per capita. Draft EIR page 5.17-9 states that based on the County Library service level planning guideline of 0.5 square foot per capita and an anticipated Centennial population of approximately 57,150 people, the Project could generate a demand for up to a 28,575 gross square foot library. Based on the 2.0 square feet of land per capita standard, an 114,300-square-foot site (2.62 acres) would be needed to serve the Project. MM 17-4 requires that the sizing, design and programming of the

492 Final EIR Appendix 5.10-C, Table 4-1
493 *Id.,* Appendix 5.10-C, Table 4-2
494 *Id.,* Appendix 5.10-C, Section 5

Permanent Library Facility, including the influence of technology on library services, would be agreed upon by representatives from County Library and the Project Applicant/Developer.

Response to Comment F.3A-51:

With regard to the planning timeline for solid waste disposal, analysis in the Draft EIR is based on available County information. The Los Angeles County Department of Public Works (LACDPW) has evaluated and planned the County's solid waste disposal needs over a 15-year time frame and included strategies for maintaining adequate disposal capacity from 2015 to 2030. While the County updates this report annually, at this time, they have only evaluated solid waste disposal to 2030 and determine adequacy of existing landfills. However, as annual updates are completed, it is expected that updated waste projections, facility capacities, diversion rates, and alternative technologies would be developed to meet the future waste disposal needs of the County. As stated on Draft EIR page 5.17-18, the Los Angeles County Countywide Siting Element establishes goals and policies for the siting of solid waste transformation and land disposal facilities to serve the solid waste generation and disposal needs of the County for the next 15 years. The County is in the process of updating the Countywide Siting Element, which will include goals and strategies through which current and future solid waste management infrastructure needs can be met; potential landfill expansion sites; and out-of-County disposal opportunities. Thus, evaluation and planning by the LACDPW is expected to be updated continuously to identify strategies for maintaining adequate disposal capacity into the future.

However, permitted Class III landfill capacity cannot be guaranteed at the time of Project buildout and through the life of the Project, which are beyond the LACDPW's 15-year planning horizon for disposal. Therefore, while the County is committed to handling all solid wastes generated within the County now and into the future, to be conservative, the Draft EIR concludes that the Project buildout would result in a significant impact on the County's anticipated Class III landfill capacity.[495] PDFs 17-2 and 17-3, and MMs 17-9 and 17-10, reflect all feasible measures to reduce and divert the Project's municipal solid waste generation. Therefore, the Draft EIR concludes that the Project would conservatively result in significant and unavoidable impacts related to municipal solid wastes during long-term operation of the Project.[496]

With regard to the selection of landfills to serve the Project, Table 5.17-3 on Draft EIR page 5.17-23 lists the major landfills that serve the Project area. However, solid waste haulers and landfills operate in a free enterprise system in the Antelope Valley area that allows the use of any waste hauler and any landfill. Draft EIR page 5.17-29 states that construction wastes are likely to be disposed at the nearest landfills, the Antelope Valley Public Landfill and the Lancaster Landfill and Recycling Center, but may be disposed at any of the available facilities, as selected by the individual contractors. Draft EIR page 5.17-31 also states that long-term

495 DRP 2017, p. 5.17-2
496 *Ibid.*

solid wastes from the Project after diversion may ultimately be disposed of at any in-County facility and out-of-County facilities.

Response to Comment F.3A-52:

With regard to Project compliance, as disclosed in the Draft EIR, solid waste disposal is subject to State plans, policies, and regulations including the California Integrated Waste Management Act (AB 939), California Health and Safety Code, Section 25218, California Solid Waste Reuse and Recycling Access Act of 1991, Solid Waste Disposal Measurement Act of 2008 (SB 1016), Governor Brown's 75 Percent Initiative (AB 341), and the Mandatory Commercial Organics Recycling Bill (AB 1826).[497] At the County level, solid waste disposal is subject to the requirements of the Los Angeles County Roadmap for a Sustainable Waste Management Future, the Countywide Integrated Waste Management Plan (CIWMP), the County of Los Angeles Solid Waste Ordinance, the Construction and Demolition Debris Recycling and Reuse Ordinance, the County Green Building Standards Code, and the County of Los Angeles General Plan and Antelope Valley Area Plan requirements.[498] The Project is required to and shall comply with the requirements of the above-identified plans, policies, and regulations.

With regard to County planning, the LACDPW planning endeavors related to the update of the County Siting Element discussed in response to Comment F.3A-51 and the annual update of the County of Los Angeles Countywide Integrated Waste Management Plan are being conducted in compliance with the California Integrated Waste Management Act, the CIWMP, and other State and County regulations, as discussed on Draft EIR pages 5.17-14 through 5.17-20.

Response to Comment F.3A-53:

With regard to the diversion of operational wastes from landfills, the Project has committed to diverting 75 percent of such waste, not 25 percent.[499] The method of such diversion can be found in PDF 17-3, as follows:

> The Project includes a Solid Waste Management Plan to achieve the goal of diverting 75 percent of operational solid waste generated from Project requiring landfill disposal. Property Owners shall process on-site, contract with a waste management company and/or recyclers, and/or self-haul to waste and recycling facilities to properly recycle, divert, and dispose of solid wastes generated on-site, such as metals, paper, household plastics, glass, cardboard, food waste, and green waste. Throughout the Project's operation, the waste hauler shall be required by contract to maintain records showing the diversion of not less than 75 percent of the operational waste generated

497 *Id.,* pp. 5.17-14 to -17
498 *Id.,* pp. 5.17-17 to -20
499 *Id.,* p. 5.17-26

by the Project. The Solid Waste Management Plan has many interrelated components, including, but not limited to:

- Implementation of a "three bin system" for waste collection and recycling for both residential (both single-family and multi-family uses) and commercial businesses. The three-bin system for residential areas will require separate receptacles for yard, such as leaves and tree trimmings (and possibly food waste, per property's hauler) into the green bin, recyclables into the blue bin, and permitted, non-recyclable and non-compostable solid waste into the third bin. The mandatory recycling for businesses will require that businesses divert from landfill disposal the recyclables that they generate, including food and green waste. Each non-residential building owner shall implement a recycling program including food and green waste recycling, where applicable. Businesses will provide appropriate number and placement of trash and recycling receptacles for visitor use in public areas and provide an easily accessible area that serves the entire building and is dedicated to the collection and storage of nonhazardous materials for recycling, including but not limited to: paper, food waste, green waste, corrugated cardboard, glass, plastic, and metals. Each owner of a commercial property, including multi-family residence, school, and place of worship, shall submit to the County a site plan of the property that depicts how solid wastes would be collected and stored for on-site processing, curbside collection, and/or self-hauling. Prior to sale, lease, or rental of commercial property, including portions of a multi-family residential structure, each owner shall provide to each prospective purchaser or tenant a notice explaining how that property collects and stores recyclables, compostables, universal waste, hazardous waste, and electronic waste for on-site processing, curbside collection, and/or self-hauling.
- The waste management contract will establish dedicated cans for green waste and a Green Waste Recycling Plan that must be adhered to by landscape maintenance companies as part of the Covenants, Conditions, and Restriction (CC&Rs). The CC&Rs will require the use of mulching mowers or mowers with mulching blades for common lawn areas and placing three to five inches of mulch in common areas' planting beds each year as part of the Landscape Maintenance Plan for all non-residential and multi-family buildings.
- All landscaping companies shall utilize California Air Resources Board-(CARB) approved or electric mowing equipment (e.g., mowers, string trimmers, leaf blowers) and shall divert organic wastes to a mulching and composting facility or anaerobic digestion facility. The CC&Rs shall describe the residential recycling program to facilitate recycling and reuse and to educate residents and consecutive buyers (i.e., buyers

after the initial home buyer) regarding the availability of and requirements for using the recycling program.

- Household hazardous wastes and less commonly disposed materials (such as electronics and appliances) would have seasonal pickup (at least two times a year) and residents would be notified of upcoming events.
- Semi-annual "exchange days" would be organized, publicized, and paid for by the Master Homeowners Association (HOA). Community members would be able to exchange with their neighbors items they no longer want. Homeowners would then be encouraged to do spring cleaning and major yard trimming and deliver usable items to a central location where they could be displayed for the weekend and picked up by others who are interested. As part of the event, large dumpsters, including green waste dumpsters, could also be brought for trash and green waste that cannot be reused. Neighborhood volunteers would monitor the dumpsters to make sure they are used efficiently and that only authorized waste is discarded in them.
- The Project Applicant/Master Developer shall set aside a minimum of 5 acres for a future Materials Recovery Facility/Transfer Station (MRF/TS) that includes a household hazardous waste permanent collection and reuse center and allows for mulching/composting operations. The site shall be located in a suitable location with the capacity to manage the nonhazardous solid waste and household hazardous waste generated by the Centennial Development Project at buildout. The Project Applicant/Master Developer shall prepare and grade the site, and install basic mainline infrastructure fronting the property prior to the issuance of any occupancy permits associated with the first phase of project implementation. The Master Developer shall continually encourage a waste management company to build these facilities on this build ready site. The CC&R for the future MRF/TS site shall require the land to be set aside for the MRF/TS in perpetuity.
- A seasonal collection and/or a mulching and composting facility could be included in the MRF/TS to allow for most green waste to be diverted from landfill disposal with the goal of a 100 percent green waste diversion from landfills. The landscape concept and turf limits are, in part, designed to reduce the amount of green wastes generated by the Project and to reduce the demand for irrigation water.
- A MRF/TS can include organics processing equipment to allow for the recycling of food and green waste.

(DRP 2017, pp. 5.17-25 to -28)

Response to Comment F.3A-54:

The disposal of hazardous materials is addressed in Draft EIR Section 5.17, Other Public Services. While the Draft EIR does analyze both the on-site handling of hazardous materials (including transport)[500] and the risk of an accident involving a hazardous materials transporter due to increased traffic on State Route (SR) 138 and Interstate (I) 5[501], the Draft EIR does not state that transport of hazardous materials is "dangerously precarious".

As indicated on page 5.17-24 of the Draft EIR, in the same description with the approximate distance and direction of the Kettleman Hills Landfill and McKittrick Waste Treatment Site identified in this comment, these facilities have a combined daily permitted capacity of 11,500 tons per day (tpd) and a combined remaining capacity of approximately 6.8 million cubic yards (cy). Based on the range of proposed land uses, which would not include industrial uses handling acutely hazardous materials, the amount of hazardous materials generated by the Project would be a small proportion of the total waste stream requiring landfill disposal (approximately 13,849 tons per year, or 44.4 tpd)[502] and this would largely involve common hazardous wastes such as household cleaners, paints and thinners, batteries, electronic equipment, and motor oil.[503] The small proportion, less than one percent by weight, as applied for the construction phase[504] of the total waste stream that would be considered hazardous would equate to approximately 0.44 tpd. This would represent approximately 0.004 percent[505] of the daily permitted capacity of these two facilities. Common sense indicates that a volume of waste equal to less than one one-thousandth of a percent would not result in a significant impact to the capacity of hazardous waste disposal locations. In summary, there is no nexus between the impacts of the proposed Project and the need for mitigation such as a written agreement to demonstrate available capacity for the nominal hazardous waste stream that would require disposal (i.e., would not be reused or recycled).

Response to Comment F.3A-55:

As stated under PDF 14-3 on Draft EIR page 5.14-16, the Project includes 163 acres of public Park Overlay, which includes acreage to meet the County's Parkland Dedication Ordinance requirement. In addition, the Applicant would fund the cost of constructing and equipping the public parks on the Project site, pursuant to a park development agreement; statutory development agreement pursuant to Section 65864 et seq. of the California Government Code; or other condition of approval. Private recreational facilities would be maintained by Property Owners Association (POAs) or Homeowners Association (HOAs).

Roadways and other infrastructure and public facilities would be built by the Project and dedicated to the County for long-term maintenance. Section 4.6.2 on Draft EIR page 4-92 states that the most likely method of financing the construction of infrastructure would be

500 DRP 2017, pp. 5.3-15 and -16
501 *Id.,* p. 5.3-38
502 *Id.,* p. 5.17-31
503 *Id.,* p. 5.17-32
504 *Id.,* p. 5.17-30
505 Calculated as [0.44 / 11,500] * 100 = 0.00382

through the establishment of a Community Facilities District (CFD). As required under the provisions of the Mello-Roos Communities Facilities Act, the CFD would only include properties that receive the services defined in the CFD. The Commenter's opinion with regard to the funding of maintenance is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment F.3A-56:

The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project. The comment does not address or question the content of the Draft EIR, and no further response is required.

With respect to the costs for the initial water and wastewater services, the second to last sentence of the first paragraph on page 5.18-52 of the Draft EIR states, "All of the projects water supplies and the design, permitting, financing and construction of all treatment, collection and distribution infrastructure will be provided by the Project Applicant/Developer". Draft EIR MM 19-2 requires that the Project Applicant/Developer demonstrate that the Project has either been annexed into an existing qualified public utility district (e.g. Golden Valley Municipal Water District) or that a new public utility district (e.g. Project Water Purveyor) has been created to serve the Project. The final form of entity that will provide and manage water resources for the project will be determined at the time MM 19-2 is satisfied. MM 19-1 requires that the Project Applicant/Developer provide documentation to the County that it has completed all required procedures and has paid all applicable fees associated with establishing the Project Water Purveyor, or an alternate qualified public utility district. MM 19-4 requires the Project Applicant/Developer to provide the County with plans and specifications that have been prepared in accordance with the Project Water Purveyor or alternate qualified public utilities district requirements and standards to demonstrate that water reclamation facility (WRF) West will serve the Project site west of the west branch of the California Aqueduct. MM 19-5 requires the Project Applicant/Developer to provide the County with plans and specifications that have been prepared in accordance with the Project Water Purveyor or alternate qualified public utilities district requirements and standards to demonstrate that the WRF East will serve the Project site east of the west branch of the California Aqueduct.

MM 18-1 requires that the Project Applicant/Developer implement several measures, including installing, maintaining and monitoring all non-construction potable and non-potable water use using appropriate metering equipment throughout the site, and installing, maintaining and operating on-site wastewater treatment and conveyance facilities that provide recycled water treated to California Title 22 unrestricted reuse standards from on-site wastewater. Additionally, MM 18-1 requires that the Water Purveyor must implement water budget-based rates in compliance with all applicable legal requirements and in a manner consistent with the use of such rates by other water districts in California (e.g., Irvine Ranch Water District). The water budget-based rates shall incorporate and be designed to ensure that Project potable water use meets or exceeds the following standards and adjusted as may be required to meet more stringent standards that may be adopted by the State or

Los Angeles County. As discussed on Draft EIR page 5.18-41, water budget-based rates for indoor and outdoor residential, commercial, industrial, and other uses have be used throughout California, including the Irvine Ranch Water District, the Rancho California Water District, the Eastern Municipal Water District, and the Western Municipal Water District. The rates are based on the costs associated with water consumption for specific uses, such as residential indoor; outdoor residential yard; and commercial, industrial, and institutional indoor and outdoor use. The costs of supplying water increase with the volume of use because a supplier must utilize more expensive supplies to meet progressively higher marginal water demands. As a result, water-budget based rates incorporate lower rates for use below the applicable indoor and outdoor budgets, and higher rates for use above the budgeted levels to reflect the marginal costs of supplying additional water. As in numerous other California districts, this rate structure will allow for the financing of required water supplies and infrastructure by the Project Water Purveyor in manner that also encourages significant water conservation and reduces demand.

As discussed on Draft EIR page 5.2-32, the Project Water Purveyor could also operate and maintain non-construction hydromodification best management practices (BMPs) on the site, and would be responsible for BMP inspections, monitoring, maintenance and enforcement. Until the Project Water Purveyor or similar BMP management agency is established, the Project Applicant/Developer will be responsible for all hydromodification BMPs, including design, permitting, construction, operations, and maintenance.

As discussed on Draft EIR page 4-92, several other methods are available to fund the construction and ongoing maintenance of infrastructure needed to serve the Project, including the establishment of a Community Facilities District under the provisions of the Mello-Roos Communities Facilities Act of 1982. Such a district is formed to finance designated public services and capital facilities by levying special taxes in a project area. In this case, the special tax lien recorded on each individual property on the Project site could be used to fund capital costs. Other sources of Project-generated revenue include but are not limited to property taxes, sales tax, gasoline taxes, other district assessments, and business license fees. Consequently, Project water and other infrastructure will be funded and maintained by water budget-based rates and other funding mechanisms commonly used throughout the state to successfully support new and established communities.

Response to Comment F.3A-57:

The proposed Project includes approximately 163 acres of Park Overlay, which includes parks that would be dedicated to the County of Los Angeles in a developed condition. Parks dedicated to the County are public parks and would be maintained by the County. Private parks and other recreation amenities would be maintained by the Homeowner's Association or other private entity. Based on the types and amounts of recreation amenities proposed, and providing the public parks in a developed condition, the proposed Project would meet and exceed both the County of Los Angeles Parkland Dedicated Ordinance/Quimby Act requirement and the County's General Plan parkland standard.[506] Regarding making all parks available to the public, as noted, this is not necessary because the Project would meet

[506] DRP 2017, p. 5.14-1

and exceed County standards for provision of public parkland/recreation features. Including private parks and other amenities, such as commercial recreation facilities, community recreation facilities (e.g., in multi-family complexes), and pocket parks, is a routine characteristic of development projects, provided adequate public parkland has also been provided.

Response to Comment F.3A-58:

The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project. The comment does not address or question the content of the Draft EIR, and no further response is required.

With respect to the costs for the initial water and wastewater services, the second to last sentence of the first paragraph on page 5.18-52 of the Draft EIR states, "All of the projects water supplies and the design, permitting, financing and construction of all treatment, collection and distribution infrastructure will be provided by the Project Applicant/Developer". Draft EIR MM 19-2 requires that the Project Applicant/Developer demonstrate that the Project has either been annexed into an existing qualified public utility district (e.g. Golden Valley Municipal Water District) or that a new public utility district (e.g. Project Water Purveyor) has been created to serve the Project. The final form of entity that will provide and manage water resources for the project will be determined at the time MM 19-2 is satisfied. MM 19-1 requires that the Project Applicant/Developer provide documentation to the County that it has completed all required procedures and has paid all applicable fees associated with establishing the Project Water Purveyor, or an alternate qualified public utility district. MM 19-4 requires the project applicant/developer to provide the County with plans and specifications that have been prepared in accordance with the Project Water Purveyor or alternate qualified public utilities district requirements and standards to demonstrate that the water reclamation facility (WRF) West will serve the Project site west of the west branch of the California Aqueduct. MM 19-5 requires the Project Applicant/Developer to provide the County with plans and specifications that have been prepared in accordance with the Project Water Purveyor or alternate qualified public utilities district requirements and standards to demonstrate that the WRF East will serve the Project site east of the west branch of the California Aqueduct.

MM 18-1 requires that the Project Applicant/Developer implement several measures, including installing, maintaining and monitoring all non-construction potable and non-potable water use using appropriate metering equipment throughout the site, and installing, maintaining and operating on-site wastewater treatment and conveyance facilities that provide recycled water treated to California Title 22 unrestricted reuse standards from on-site wastewater. Additionally, MM 18-1 requires that the Project Water Purveyor must implement water budget-based rates in compliance with all applicable legal requirements and in a manner consistent with the use of such rates by other water districts in California (e.g., Irvine Ranch Water District). The water budget-based rates shall incorporate and be designed to ensure that Project potable water use meets or exceeds the following standards and adjusted as may be required to meet more stringent standards that may be adopted by

the State or Los Angeles County. As discussed on Draft EIR page 5.18-41, water budget-based rates for indoor and outdoor residential, commercial, industrial, and other uses have be used throughout California, including the Irvine Ranch Water District, the Rancho California Water District, the Eastern Municipal Water District, and the Western Municipal Water District. The rates are based on the costs associated with water consumption for specific uses, such as residential indoor; outdoor residential yard; and commercial, industrial, and institutional indoor and outdoor use. The costs of supplying water increase with the volume of use because a supplier must utilize more expensive supplies to meet progressively higher marginal water demands. As a result, water-budget based rates incorporate lower rates for use below the applicable indoor and outdoor budgets, and higher rates for use above the budgeted levels to reflect the marginal costs of supplying additional water. As in numerous other California districts, this rate structure will allow for the financing of required water supplies and infrastructure by the Project Water Purveyor in manner that also encourages significant water conservation and reduces demand.

As discussed on Draft EIR page 5.2-32, the Project Water Purveyor could also operate and maintain non-construction hydromodification best management practices (BMPs) on the site, and would be responsible for BMP inspections, monitoring, maintenance and enforcement. Until the Project Water Purveyor or similar BMP management agency is established, the Project Applicant/Developer will be responsible for all hydromodification BMPs, including design, permitting, construction, operations, and maintenance.

As discussed on Draft EIR page 4-92, several other methods are available to fund the construction and ongoing maintenance of infrastructure needed to serve the Project, including the establishment of a Community Facilities District under the provisions of the Mello-Roos Communities Facilities Act of 1982. Such a district is formed to finance designated public services and capital facilities by levying special taxes in a project area. The formation of a district would be subject to further action by the County and by the Local Agency Formation Commission. In this case, the special tax lien recorded on each individual property on the Project site could be used to fund capital costs. Other sources of Project-generated revenue include but are not limited to property taxes, sales tax, gasoline taxes, other district assessments, and business license fees. Consequently, Project water and other infrastructure will be funded and maintained by water budget-based rates and other funding mechanisms commonly used throughout the state to successfully support new and established communities.

Response to Comment F.3A-59:

As stated on Draft EIR page 5.16-21, security fencing and private security would be provided and paid for by the Applicant at construction sites and would reduce the need for police protection services. The Los Angeles Sheriff's Department (LASD) would be responsible for providing general law enforcement services to the Project site during construction, including response to calls for service in the cases of trespassing, theft, and vandalism. With security fencing and private security at construction sites, the Project's short term, construction related impacts would be less than significant.

The comments regarding the prison in Lancaster and California prisons are noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment F.3A-60:

The location for the permanent LASD Station is in the Business Park area along SR-138, which is anticipated to be developed during Phase 3. However, as stated on Draft EIR page 5.16-21, prior to the development of the permanent Los Angeles Sheriff's Department (LASD) Station, the LASD could operate out of a "store front" substation at the first development area – Village 1 (MM 16-4). This temporary substation would become operational before the first certificate of occupancy for the Project is issued.

MM 16-1 on Draft EIR page 5.16-16 sets the response times to the site for the Los Angeles County Fire Department (LACFD) at 5 minutes for fire service responses and 8 minutes for advanced life support. These response times do not apply to the LASD. Draft EIR page 5.16-19 states that the generally accepted response times for law enforcement agencies are 10 minutes or less for emergency situations; 20 minutes or less for priority incidents; and 60 minutes or less for routine or non-emergency situations. With the addition of the "store front" LASD substation during the first phase of development and the permanent LASD Station on the Project site by buildout, response times to the Project site for emergency and non-emergency calls would improve over existing response times due to the decreased distance from the site to the station.[507]

Response to Comment F.3A-61:

Section 5.10, Traffic, Access and Circulation, of the Draft EIR discusses increases in traffic volumes on SR-138 and I-5. The discussion under Threshold 10-5 addresses emergency access[508] and concludes that impacts to emergency access would be less than significant with implementation of the proposed roadway improvements at intersections with SR-138 and compliance with existing regulations and implementation of mitigation measures. In Section 5.3, Hazards and Fire Safety, the discussion under Threshold 3-7 addresses emergency response and evacuation[509] and states that traffic generation by the Project would not adversely affect emergency access or evacuation routes, with the Project Applicant/Developer continually updating the Emergency Response Plan prepared for the Project (MM 3-7) and the Project Applicant/Developer preparing a California MUTCD-compliant Traffic Control Plan for County and Caltrans approval for emergency access and circulation during activities in the roadways (MM 3-8). Page 5.3-25 states that impacts on emergency response or evacuation activities would be less than significant after mitigation.

With the addition of the store front LASD substation during the first phase of development and the permanent LASD station on the Project site by buildout, response times to the Project

507 DRP 2017, p. 5.16-22
508 *Id.,* pp. 5.10-140 and -141
509 *Id.,* pp. 5.3-23 to -25

site for emergency and non-emergency calls would improve over existing response times due to the decreased distance from the site to the station.[510]

Response to Comment F.3A-62:

This comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. Please see responses to Comments F.3A-63 and F.3A-64 for more information about response times.

Response to Comment F.3A-63:

The Draft EIR has appropriately considered response times. Draft EIR page 5.16-19 states that the Santa Clarita Valley LASD Station's anticipated response times to the Project site for emergency, priority, and routine incidents are 1 to 10 minutes; 1 to 20 minutes; and 1 to 60 minutes, respectively. The response times are variable because the responding patrol units may be deployed elsewhere within the Station's service area and not necessarily dispatched from the Station itself.

Draft EIR page 5.16-22 states that the addition of the store front LASD substation during the first phase of development and the permanent LASD Station on the Project site by buildout would improve existing response times for emergency and non-emergency calls due to the decreased distance from the site to the station. The LASD has indicated that optimal response times to the site can be met with the proposed temporary store front substation and permanent on-site LASD Station and that that the proposed on-site facilities would adequately serve the Project. Under circumstances when winter weather, road closures, wildfires, and traffic jams affect traffic flows on the I-5 and SR-138, response to the Project from the on-site temporary store front and permanent LASD station would not be affected.

Response to Comment F.3A-64:

Traffic jams on the I-5 would not affect Sheriff's services to the Project since the Sheriff's officers would be stationed at the on-site storefront substation or permanent LASD Station. Traffic jams on SR-138 would also not affect Sheriff's services to the area north of the SR-138 since the temporary substation and permanent LASD station would be located north of SR-138 and need not use SR-138 to reach the majority of development on the site. Areas south of the SR-138 would be accessible from the temporary substation and permanent LASD station through two underpasses and one overpass bridge crossing over SR-138 would be constructed as part of the Project. Prior to the construction of these crossings, at grade intersections at SR-138 would provide emergency access to the area south of the SR-138.

Draft EIR Section 5.16, Fire and Law Enforcement Services, acknowledges that the Project would create demands for fire protection and law enforcement services. The analysis in Section 5.16 discusses the existing regulations and environmental conditions at the site, along with the thresholds of significance used to determine the impacts of the Project. The Project would include the construction of up to four on-site fire stations (MMs 16-1 through

[510] *Id.,* p. 5.16-22

16-3). These fire stations would provide the necessary fire protection services to the Project and thus, impacts on fire protection services would be less than significant after mitigation. Similarly, the Project includes the construction of an on-site temporary store front substation prior to the first certificate of occupancy and a permanent LASD station by buildout (MM 16-4). The on-site station would provide the necessary law enforcement services to the Project. Thus, impacts on law enforcement services would be less than significant after mitigation.

Because there are various factors that determine the potential for fire incidents and criminal activity at the Project site and these cannot be readily quantified, the analysis is not based on statistical measures but, instead, was based on direct consultations with the LACFD and the LASD. The LACFD has indicated that up to four fire stations would be required to serve the Project and four fire station locations have been proposed in the Land Use Plan for the Project. The LASD has indicated that optimal response times to the site can be met with the proposed temporary store front substation and permanent on-site LASD station and that the proposed on-site facilities would adequately serve the Project. These were the main bases for the conclusions that impacts on fire and law enforcement services would be less than significant.

Response to Comment F.3A-65:

There is no intention to siphon off fire fighters to serve this new development. As stated on Draft EIR page 5.16-5, the County's Developer Fee Program was adopted specifically to fund the purchase of fire station sites; the construction of new stations and facility improvements; and the purchase of equipment. Prior to the construction of the first on-site fire station, the Project would pay developer fees, which may be used for the construction of facility improvements and the purchase of equipment needed at Fire Station 77. MM 16-2 on page Draft EIR page 5.16-16 allows the Applicant to enter into a program where the Applicant provides the land and constructs and equips the fire stations in exchange for credit towards the fee payments. MM 16-3 states that the Applicant would provide the land for, and construct and equip, up to four new fire stations to serve the Project. The fire station operating and staffing costs would be funded by property tax revenues from the Project. Impacts on fire protection services would be less than significant after mitigation.

This comment on the use of existing firefighting personnel versus the hiring of additional firefighters and the perception that fire and law enforcement services in the area are inadequate are noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment F.3A-66:

The LACFD provides advanced life support (paramedic) services and MM 16-1 requires that response times to the Project site shall be 5 minutes or less for fire service responses and 8 minutes or less for the advanced life support (paramedic) unit responses.

Medical service demand would depend on the insurance coverage of individual persons, individual medical needs, and the site of medical emergencies. Also, personal preference on

the use of facilities for medical services and physicians would affect demand for medical services from future residents, employees, and visitors of the Project. Therefore, the demand for medical services could not be readily quantified or determined with any degree of certainty.

However, the demand for emergency medical services is more location-dependent and would likely be served by nearby facilities, including the Antelope Valley Hospital in Lancaster; Palmdale Regional Medical Center in Palmdale; Henry Mayo Newhall Hospital in Valencia; Northridge Hospital Medical Center in Northridge; Olive View UCLA Medical Center in Sylmar; and the Providence Holy Cross Medical Center in Mission Hills. These hospitals and medical centers are private facilities and service provision or expansion would be in response to demand. As such, increased demand for medical services at any one facility would likely lead to expanded services and facilities. The Institutional/Civic land use designation of the Project allows for the future development of a hospital and other public and institutional uses on 110 acres of the site. Project and area demands may make this hospital a viable investment.

Prior to the on-site hospital development or if no hospital is built on the site, medical or other incidents at the Project site that require emergency services may cause ambulances or paramedic units to utilize SR-138 and I-5 to reach the nearest emergency room. Section 5.10, Traffic, Access and Circulation, of the Draft EIR discusses increases in traffic volumes on SR-138 and I-5. The discussion under Threshold 10-5 addresses emergency access[511] and concludes that impacts to emergency access would be less than significant with implementation of the proposed roadway improvements at intersections with SR-138 and compliance with existing regulations and implementation of mitigation measures. The roadway improvements would maintain acceptable levels of service and facilitate both emergency access and egress. In Section 5.3, Hazards and Fire Safety, the discussion under Threshold 3-7 addresses emergency response and evacuation[512] and states that traffic generation by the Project would not adversely affect emergency access or evacuation routes, with the Project Applicant/Developer continually updating the Emergency Response Plan prepared for the Project (MM 3-7) and the Project Applicant/Developer preparing a California MUTCD-compliant Traffic Control Plan for activities in the roadway (MM 3-8). Draft EIR page 5.3-25 states that impacts on emergency response or evacuation activities would be less than significant after mitigation. Under extreme circumstances where accidents on the I-5 or icy roads on SR-138 prevent emergency vehicles to reach the site and/or travel to the nearest hospital, helicopter transport services may be utilized as an alternative.

Response to Comment F.3A-67:

The need for a Level I Trauma hospital would be dependent on the number and types of emergency service needs of the area. The comments regarding stories of people needing immediate medical care, nearby hospitals, and ambulance services to these hospitals are

511 DRP 2017, pp. 5.10-140 and -141
512 *Id.,* pp. 5.3-23 to -25

noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

The Institutional/Civic land use designation of the Project allows for the future development of a hospital/medical center and other public and institutional uses on 110 acres of the site. The decision to build a hospital or that the hospital be a Level I Trauma hospital would be dependent on the organization or entity that proposes to build the facility, with consideration of the emergency medical needs of the Project area.

Health services (doctor, dentist, and clinics), medical facilities and centers, and medical/dental offices are permitted in areas designated as Commercial, Business Park, Mixed Use, and Institutional/Civic. Urgent care centers are conditionally permitted in these same land use designations.

Response to Comment F.3A-68:

Valley Fever is discussed on Draft EIR pages 5.11-28 through 5.11-29 and 5.11-64 through 5.11-67 in Section 5.11, Air Resources, and on pages 5.3-13 through 5.3-14 and 5.3-17 through 5.3-19 in Section 5.3, Hazards and Fire Safety. Implementation of fugitive dust control measures required by AVAQMD and SCAQMD and MMs 3-2 and 3-3 on Draft EIR pages 5.3-26 through 5.3-27 would mitigate impacts related to Valley Fever to be less than significant. Please also see responses to Comments F.3A-38 through F.3A-44 regarding Valley Fever and Project mitigation for its potential impacts.

The comment regarding the need for a Valley Fever specialty clinic is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment F.3A-69:

The Project would comply with pertinent public health and safety regulations and would not create hazardous conditions or medical emergencies that would generate a need for a trauma center in the area. However, the Institutional/Civic land use designation of the Project allows for the future development of a hospital/medical center and other public and institutional uses on 110 acres of the site. The time frame for construction of a hospital or other public and institutional use would be dependent on the organization or entity that proposes to build the facility, with consideration of the medical service demand and needs of the Project area.

As discussed above in response to Comment F.3A-68, Section 5.11, Air Resources, and Section 5.3, Hazards and Fire Safety, of the Draft EIR discuss potential impacts related to Valley Fever and conclude that compliance with existing regulations and implementation of MMs 3-2 and 3-3 would mitigate impacts related to Valley Fever to be less than significant. Please also see responses to Comments F.3A-38 through F.3A-44 with regard to Valley Fever and Project mitigation for its potential impacts. Thus, the Project does not create a need for a Valley Fever medical center. However, medical facilities and centers are permitted in areas designated as Commercial, Business Park, Mixed Use, and Institutional/Civic on the site. The

decision to build a Valley Fever medical center on the site would be dependent on the organization or entity that proposes to build the facility, with consideration of the Valley Fever medical needs of the Project area.

Response to Comment F.3A-70:

The presence of on-site, nearby, and regional faults is clearly disclosed in Draft EIR Section 5.1, Geotechnical. As discussed on Draft EIR pages 5.1-16 through 5.1-17, consistent with State regulations, there would no building on or within the required setback of the Alquist-Priolo Earthquake Fault Zone for the San Andreas Fault. The setback zone for the San Andreas Fault is incorporated into the Geologic Safety Zone, which also establishes building setbacks for the two unnamed on-site faults. Building setbacks are related to the risk of adverse effects of surface rupture on a fault during an earthquake. The Project would not expose people or structures to potential adverse effects from surface rupture of a known fault with implementation of PDF 1-1 (i.e., the Geologic Safety Zone). However, the risks from surface rupture of a fault are a different issue than the risks from strong seismic ground shaking during an earthquake. As stated on page 5.1-15 of this Draft EIR, "…the overall seismic risk at the Project site is the same as Southern California in its entirety." In other words, because of the extremely high seismicity throughout Southern California, the nearness of one or more active faults does not have a direct correlation to risk of a seismic event and the magnitude of the event in a certain area. Therefore, the notification of the future population on the Project site about fault proximity would unnecessarily raise fears that are not based on accurate information. Because there is not a scientific basis for this notification, the Commenter's suggested mitigation measure will not be included in the Mitigation Monitoring and Reporting Program for the Project.

In 2008, BonTerra Consulting (now Psomas) conferred with the California Department of Water Resources (DWR) regarding seismic safety of the West Branch of the California Aqueduct. In summary, DWR reported that based on both construction design combined with engineering features and processes to respond to any event that affects the flow of water, the proposed Project's location adjacent to a portion of the California Aqueduct does not represent a substantial risk. Specifically, staff at DWR indicated that pumping plants along the Aqueduct, like the Oso Pumping Plant, shut off automatically from any source of vibration. This can include vibration from a seismic event, motor vibration, or low oil. Additionally, check structures in the canals limit pools and are managed remotely to control flow. These check structures can be "stair stepped" to control flow without use of pumps. If something occurs to alter the flow, such as pooling, sensors on the check stations and other canal features send a signal to the area control center to which an attendant responds. The DWR facilities, except storage reservoirs, maintain an Emergency Action Plan under FERC Guidelines and reservoirs maintain plans in non-FERC formats called OES to be implemented in an emergency, such as a seismic event. Regarding seismic risk, DWR reported that based on seismic design criteria used at the time of construction and any subsequent improvements, catastrophic failure is not anticipated for any portion of the California Aqueduct. It was acknowledged that some portions would be expected to experience distress more than other portions, such as where the Aqueduct crosses over a fault line. However, it was reiterated that for the West Branch that bifurcates the Project site, in a seismic event the

Oso Pumping Plant would automatically shut down flows and emergency plans would be enacted.[513] Accordingly, because there would not be a significant risk involving breach of the California Aqueduct during a seismic event, the impact would be less than significant, and no mitigation is required.

In response to this comment, the following document is added to the administrative record:

Royer, J. 2008 (May 1). Personal communication. Telephone conversation between J. Royer (California Department of Water Resources, Division of Engineering, Geotechnical and Structures Branch, Dams and Canals Section) and J. Neary (BonTerra Consulting [now Psomas]) regarding seismic safety at West Branch of California Aqueduct.

Response to Comment F.3A-71:

This comment's recommendations regarding rooftop solar and energy efficient water heaters are noted and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. Please see response to Comment F.3A-46 which discusses the various mitigation measures and project design features incorporated into the Project to reduce the Project's overall GHG emissions as well as the Project's consistency with the regional RTP/SCS and the County's Community Climate Action Plan, as well as the Project's compliance with applicable regulatory programs for the reduction of greenhouse gas (GHG) emissions.

Although this comment correctly notes that the Project does not propose development of utility-scale solar plants within the Project site, it should be noted that the Project does not propose to install rooftop solar on 100 percent of single-family detached homes. As explained in this response, MM 21-2 requires the Project Applicant/Developer to provide all single-family homebuyers the option to include a photovoltaic array system as a home design feature, and the CALGreen Code requires that all residential houses be constructed with "solar ready" roofs that can accommodate solar collection systems. However, the Specific Plan's Green Development Program requires the installation of onsite solar panel systems on roof areas for a minimum of 30 percent of all single-family detached and attached residential units; a minimum of 30 percent of all multi-family residential units, and a minimum of 60 percent of buildings located within Business Park land use designations.

In addition, MM 21-5 requires the Project to equip a minimum of 70 percent of public and community pools and spas with active solar water heating systems where heating is necessary or desired, and MM 21-2 requires the Project to comply with CALGreen Code voluntary measure A4.203.1.2.1 Tier 1 for newly-constructed low-rise residential buildings, thus ensuring that these buildings will exceed the 2016 Title 24 energy efficiency requirements by 15 percent. Similarly, MM 21-2 requires the Project to comply with CALGreen Code voluntary measure A5.203.1.2.1 Tier 1 for nonresidential buildings, thus

[513] Royer, J. 2008 (May 1). Personal communication. Telephone conversation between J. Royer (California Department of Water Resources, Division of Engineering, Geotechnical and Structures Branch, Dams and Canals Section) and J. Neary (BonTerra Consulting [now Psomas]) regarding seismic safety at West Branch of California Aqueduct.

ensuring that these buildings will exceed the 2016 Title 24 energy efficiency requirements by 10 percent.

It is noted that Draft EIR Table 5.21-11 inaccurately states that a minimum of 100 percent of all single-family detached residential units will be constructed with solar energy collection equipment. This statement is a typographical error. To correct this and other typographical errors, Draft EIR Table 5.21-11 is hereby revised as follows:

TABLE 5.21-11
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY COMMUNITY CLIMATE ACTION PLAN

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
CATEGORY 1: GREEN BUILDING AND ENERGY	
Existing County Initiatives	
Energy Upgrades to Existing Structures provides rebates and incentives for energy retrofit efficiency projects.	Because Centennial will be a new community, energy efficiency is required for buildings, infrastructure (e.g., outdoor irrigation), and appliances. The Project does not include any existing structures, and thus this CCAP action is not applicable.
Los Angeles County Code (Title 31) requires implementation of sustainable policies for new building design.	The Project is consistent with Title 31 of the County Code ~~applies to the Project,~~ and ~~is~~ implement~~ed through~~ a variety of measures including, for example (1) landscape design restrictions related to minimizing turf grass and the use of non-invasive and drought tolerant plants and tree species; (2) recycling and/or salvaging a minimum of 75% of the non-hazardous construction and demolition debris, and 100% of soils during grading; and (3) compliance with a water budget for landscape irrigation use conforms to the California Department of Water Resources Model Water Efficient Landscape Ordinance.
Commercial Building Performance Partnership provides financial mechanisms for energy conservation upgrades to existing buildings.	Energy conservation is required for new structures, and no retrofits of existing structures are included in the Project and thus this CCAP action is not applicable.
Renewable Energy and Clean Fuels Program implements projects to accelerate the use of compressed natural gas as an alternative fuel.	Renewable energy produced within the Project will be primarily rooftop solar, and at minimum 50% of the Project's anticipated electricity demand will be satisfied from on-site renewable energy generation. It is anticipated that the dominant alternative transportation fuel will be electricity (e.g., electric and hybrid-electric vehicles); however, compressed natural gas (CNG) will also be made available as a transportation fuel to the extent consistent with then-applicable recommendations and/or requirements from the California Air Resources Board (CARB) and County.

TABLE 5.21-11
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY COMMUNITY CLIMATE ACTION PLAN

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
New CCAP Actions	
BE-1: Green Building Development encourages energy reductions in new development through voluntary reductions that exceed the minimum standards set forth in the State's CALGreen Building Code (Title 24).	The Project exceeds the CALGreen Building Code minimum requirements in several ways, including: 1. Compliance with CALGreen voluntary measure A4.203.1.2.1 for low-rise residential buildings, resulting in buildings that would exceed 2016 Title 24 requirements by 15% (PDF 21-1). 2. Compliance with CALGreen voluntary measure A5.203.1.2.1 for nonresidential buildings and residential buildings taller than 4 stories, resulting in buildings that would exceed 2016 Title 24 requirements by 10%. 3. Owners of all single-family units and multi-family residential structures are required, upon resale, to present to the buyer a written energy audit checklist at the time the seller provides the buyer with the Real Estate Transfer Disclosure Statement required by Section 1102 et seq. of the *California Civil Code.* The energy audit checklist shall certify that all heating, ventilation, and air conditioning (HVAC) systems, thermostats, appliances, windows, and swimming pools are either the same as originally installed or otherwise comply with the Green Development Program. 4. For nonresidential buildings, within 90 days after the end of the first full calendar year following the issuance of the certificate of occupancy, and within 90 days after each 5-year period thereafter, the owner or tenant in possession thereof shall submit to the master commercial owners association or other applicable association a report prepared by the owner or a qualified, independent third party that evaluates whether all major building systems such as a heat furnace, air conditioner, and other energy-consuming mechanical fixtures are working within the design standards established by the manufacturer of such equipment. 5. Residential appliances offered by builders shall consist ~~exclusively~~ of low-energy and/or low-water consuming appliances that are Energy-Star compliant for each appliance that is rated by

TABLE 5.21-11
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY COMMUNITY CLIMATE ACTION PLAN

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
	Energy Star (e.g., refrigerator, clothes washer, dishwasher, and room air conditioner). These project design features meet and exceed the requirements of ~~Section 22.52.2130~~ Title 31 of the County Code (Green Building).
BE-2: Energy Efficiency retrofits will be further encouraged for existing buildings and structures.	The Project does not include any existing buildings, so this measure is not applicable.
BE-3: Solar Installations are encouraged for new and existing buildings	Renewable energy produced within the Project would ~~be generated~~ provide ~~at~~ a minimum of 50% of the Project's anticipated electricity demand ~~would be satisfied from on-site renewable energy generation~~. Specific metrics to achieve this goal include: 1. A minimum of 100% of all single-family detached residential units at buildout shall ~~have~~ be pre-wired to support solar energy collection equipment and a minimum of 30% of all single-family detached residential units at buildout shall have solar energy collection equipment installed on roof areas or on top of other structures on the site (e.g., patio covers or pergolas). 2. Single-family detached residential units with roof areas that are within 30 degrees of true south shall include plumbing appropriate for a solar water heating running from the installed water heater to the solar-ready roof areas, and those with roof areas that are not within 30 degrees of true south shall be plumbed to accommodate an on-demand tankless water heater. 3. A minimum of 10% of all single-family detached residential units at buildout shall either include an installed solar water heater, tankless water heater, or other energy efficient water heater technology approved by the County. 4. A minimum of 30% of all multi-family residential units at buildout shall have solar energy collection equipment, which shall be installed on roof areas facing within 30 degrees of true south. 5. A~~ll~~ minimum of 70% of public and community swimming ~~s~~pools constructed within the Project shall be heated by a solar water heating system or renewable power system that provides electricity for water heating.

TABLE 5.21-11
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY COMMUNITY CLIMATE ACTION PLAN

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
	6. A minimum of 60% of buildings located within Business Park land use designations at buildout shall have solar panel systems installed on roof and parking areas. Such systems shall be installed on roof areas facing within 30 degrees of true south.
BE-4: Alternative Renewable Energy Programs are designed to encourage the use of non-solar renewable energy technology such as wind, hydropower, and geothermal resources, as feasible.	The Project site does not have hydropower or geothermal resources. Utility-scale wind plants present a potential hazard to sensitive biological resources such as the California Condor, and utility-scale solar plants are not an authorized use on the Project site or vicinity under the Antelope Valley Area Plan. However, the Specific Plan states that renewable energy systems shall be installed in connection with the development of one or more of the following: residential units, non-residential buildings, public buildings, or Specific Plan utility facilities located either within the Specific Plan area or within its immediate vicinity.
BE-5: Wastewater Treatment Plant Biogas recovery and reuse	The Project's wastewater reclamation facilities (WRF) will include equipment to capture and reuse biogas for energy production.
BE-6: Energy Efficiency Retrofits of Wastewater Equipment promotes efficient treatment equipment	There is no existing wastewater treatment facility at the Project site, so this measure is not applicable.
BE-7 Landfill Biogas encourages renewable biogas projects at regional landfills.	There is no existing or proposed landfill at the Project site, so this measure is not applicable.
CATEGORY 2: LAND USE AND TRANSPORTATION	
Existing County Initiatives	
Healthy Design Ordinance (Ordinance 2013-001, amending Title 21 (Subdivisions) and Title 22 (Planning and Zoning)) is designed to require projects to have better walking environments (e.g., with wider sidewalks and more shade trees), encourage more bicycling (e.g., by requiring bike parking), improve access to healthy foods (e.g., with weekly farmer's markets and permissible community gardens), and enhance project review requirements to provide an opportunity to review healthy design features such as landscaping, lighting, street furniture and bike parking spots.	The Project design ~~complies~~ is consistent with all of the substantive standards of the Healthy Design Ordinance, including but not limited to requirements for right-of-way widths; pedestrian crossings; tree plantings in lot frontages; and bicycle parking facilities. The Project allows community gardens as legally permitted uses in residential, ~~and~~ mixed-use, park, recreation/entertainment, and institutional/civic areas of the Project. The Project Transportation Demand Management (TDM) Program includes bicycle program metrics, discussed below.

TABLE 5.21-11
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY COMMUNITY CLIMATE ACTION PLAN

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
Bicycle Master Plan promotes bicycle ridership and bike-friendly designs throughout the County.	The Project includes a safe and aesthetically pleasing dedicated bicycle network and pedestrian system into all development designs, and distributes community uses such as neighborhood parks, elementary schools, and neighborhood-scale retail in key locations throughout the Project to reduce single-occupancy automobile travel for these neighborhood-scale destinations. The Mobility Plan of the Specific Plan ~~Project TDM Program~~ includes bicycle program metrics, discussed below.
Sustainable Transportation Programs to increase the efficiency of the transportation network.	The Project includes the following measures to reduce single-occupancy commuter travel to and from the Project site: 1. Land use planning principles that create a balanced master-planned community that includes: A. Mixed-use neighborhoods where residential, commercial, and other employment-generating uses and institutional/public uses are proximate to each other and connected by a network of walkable streets, bikeways and trails to reduce reliance on automobile use within the Project site. B. A diverse range of residential product types, including dedication of a minimum of 10 percent of residential units as affordable housing, to compliment the diverse range of employment opportunities within the Project and help minimize the off-site employment commuter trips. 2. Establishment of a Transportation Management Association (TMA) that develops strategic linkages with other Antelope Valley/Santa Clarita Valley TMAs or like organizations in order to maximize transit efficiencies and services. The TMA's purpose is also to coordinate and facilitate transit and rideshare usage to serve as many riders as possible, and to reduce the volume of automobile trips within and from the Project site, as described in more detail in the ~~Project TDM Program~~ Mobility Plan below.
New CCAP Actions	
LUT-1: Bicycle Programs and Supporting Facility improvements to expand the County's existing bicycle network.	As a new community, the Project includes a network of bikeways and multi-purpose trails, as well as community trails, in addition to the greenways and paseos. The Project trail system will

TABLE 5.21-11
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY COMMUNITY CLIMATE ACTION PLAN

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
	connect to the Pacific Crest Trail (PCT), which is designated as a National Scenic Trail that traverses approximately 2,650 miles through 3 states (California, Oregon, and Washington) will be relocated to the west side of 300th Street West, which travels through the Project site. This realignment is not a part of the Project, but is assumed to be the future alignment for evaluation purposes in this EIR. The Project requires bicycle parking facilities for 5% of the minimum required vehicle parking spaces for nonresidential land uses or as required by County Code Section 22.52.1225B, whichever is more stringent, to encourage and support bicycle use.
LUT-2: Pedestrian Network improvements to expand the County's existing pedestrian network.	As a new community, the Project implements a Complete Streets design approach that includes sidewalks and dedicated bicycle network and pedestrian system incorporated into all development designs and throughout the community to reduce single-occupancy automobile travel for neighborhood-scale destinations.
LUT-3: Transit Expansion to create priority bus lanes and improve the existing efficiency of the transportation network.	As a new community, the Project implements a ~~TDM Program~~ Mobility Plan that includes strategic linkages with other Antelope Valley/Santa Clarita Valley TMAs or like organizations in order to maximize transit efficiencies and services. The TMA's purpose is to coordinate and facilitate transit and rideshare usage to serve as many riders as possible. The Project also includes a transit easement running North-South through the center of the development, connecting its most housing-dense areas with the business park, accommodating future internal commuting within the Project site.
LUT-4: Travel Demand Management to encourage ride-sharing and employer-sponsored vanpools to reduce peak-period vehicle trips.	The Project ~~TDM Program~~ Mobility Plan encourages ride-sharing and employer-sponsored vanpools, as well as other measures to reduce automobile trips within and from the Project site. The TDM will be managed by the TMA.
LUT-5: Car-Sharing Program promotes the shared use of private and employer-owned vehicles.	The Project ~~TDM Program~~ Mobility Plan includes formation of strategic partnerships with car sharing services (e.g., Uber or Lyft) and other innovation/technology approaches to increase transportation efficiency, as described in more detail below.

TABLE 5.21-11
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY COMMUNITY CLIMATE ACTION PLAN

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
LUT-6: Land Use Design and Density targets land use patterns to support mobility, and improve the diversity of urban and suburban developments	The Project includes a balanced mix of housing, employment, and community uses including schools, retail, and public services, to minimize off-site trips. The Project design also encourages pedestrian and bicycle use through the use of walkable communities planning and design techniques, and includes a diverse range of housing types.
LUT-7: Transportation Signal Synchronization Program Improve the network of traffic signals on the major streets throughout Los Angeles (LA) County.	The Project site does not include any existing traffic signals, but the Project will use synchronized traffic signals to ensure the efficient use of future Project roadways.
LUT-8: Electric Vehicle Infrastructure. Install EV charging facilities at County-owned public venues and ensure that at least one-third of these charging stations will be available for visitor use.	The Project requires electric vehicle infrastructure, specifically: 1. Builders will be required to install one 240 volt of alternating current (VAC) outlet available for use to charge electric vehicles in the garage or other suitable location for each single-family home. 2. For business park and institutional land uses, a minimum of 1 electric vehicle charging station (consisting of a 208/240 VAC or alternative electric charging technology approved by the County, serving 2 adjacent parking spaces) will be installed for the first 50,000 square feet (sf) of building space, and an additional fueling station will be installed for each subsequent 50,000 sf of building space. 3. For multi-family residential projects that include at least ~~20~~ 17 units, a minimum of 1 alternative energy ~~electric~~ vehicle fueling ~~charging~~ station be installed for the first 17~~20~~ units and an additional ~~charging~~ alternative energy vehicle fueling station will be installed for each subsequent ~~20~~ 17 units. 4. Preferential parking for low-emitting, fuel-efficient, and carpool/van vehicles shall be provided for nonresidential structures ~~larger than 20,000 sf and made available for employees and visitors~~ as specified in Section A5.106.5.1, Nonresidential Voluntary Measures, of the CALGreen Code as follows: two for 10 to 25 spaces; four for 26 to 50 spaces; six for 51 to 75 spaces; nine for 76 to 100 spaces; eleven for 101 to 150 spaces; 18 for 151 to 200

TABLE 5.21-11
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY COMMUNITY CLIMATE ACTION PLAN

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
	spaces; and at least 10% of total for 201 and more spaces. 5. For parking facilities and parking lots with more than 20 spaces, the parking facility or lot must include: A. A minimum of 5% preferentially located parking spaces for alternative-fueled vehicles. B. Electrical lines designed and sized to provide electric vehicle charging stations for up to 3% of parking space when demand is demonstrated.
LUT-9: Idling Reduction Goal. Encourage idling limits of 3 minutes for heavy-duty construction equipment as feasible within manufacturer's specifications.	The Project includes as a mandatory contract specification for all construction contractors a restriction to limit unnecessary construction equipment idling to 3 minutes, and include methods to encourage equipment operators to achieve the 3-minute goal.
LUT-10: Efficient Goods Movement is designed to improve cargo transport on existing roadways and transportation infrastructure.	The Project includes contributions to California Department of Transportation (Caltrans) to avoid any adverse Project-related impact to goods movement on Interstate (I) 5 and State Route (SR) 138. Contributions are described in mitigation measures in Section 5.10, Traffic, Access and Circulation.
LUT-11: Sustainable Pavements Program is designed to improve the resiliency of, and reduce the GHG emissions associated with, existing paved roadways.	The Project will use durable roadway paving materials that will be determined upon consideration of aggregates, asphalt materials, cementitious materials, recycled materials, and other roadway materials that are commonly used in pavement construction in order to assess from a life-cycle perspective the role they play in contributing to the sustainability of the Project's pavement system. "Cool" pavements will be used to reduce heat island effects.
LUT-12: Electrify Construction and Landscaping Equipment. Utilize electric equipment wherever feasible for construction projects. Reduce the use of gas-powered landscaping equipment.	All landscape maintenance equipment at Centennial will be CARB-approved or electric. The Project will incorporate an outreach and education program for the Centennial property owners, in collaboration of SCAQMD, to reduce the use of gasoline-or diesel-powered landscaping equipment.

TABLE 5.21-11
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY COMMUNITY CLIMATE ACTION PLAN

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
CATEGORY 3: WATER CONSERVATION AND WASTEWATER	
Existing County Initiatives	
Conservation rebates, smart gardening workshops and stormwater controls provide water and wastewater improvements in existing communities	This measure does not apply to new communities. The Project includes compliance with drought-response State measures including the Model Water Efficient Landscape Ordinance (MWELO), which are more stringent than required by CALGreen (DWR 2015). The Project includes 2 WRFs that will provide a reliable supply of recycled water for landscaping, to reduce reliance on potable water supplies.
New CCAP Actions	
WAW-1: Per Capita Water Use Reduction Goal. Meet the State established per capita water use reduction goal as identified by Senate Bill (SB) X7-7 for 2020. The State goal is a 20 percent reduction in per capita water use compared to baseline levels.	The final EIR for the Antelope Valley Area Plan (AVAP) update utilized the Antelope Valley Integrated Regional Water Management Plan (AVIRWMP) average Antelope Valley estimate of per capita water use (199 gallons per capita per day [gpcd]) to evaluate the water demand growth that could occur from the implementation of the AVAP. At full buildout, the Project's total per capita water use would be approximately 177.5 gpcd. The Project would reduce water demand by approximately 10% below the per capita average consumption in the Antelope Valley. The analysis compared the Project to the baseline per capita consumption in the Project vicinity since the Project site is undeveloped there is not an established baseline of water consumption on the Project site.
WAW-2: Recycled Water, Water Supply Improvement Programs, and Stormwater Runoff. Promote the use of wastewater and gray water to be used for agricultural, industrial, and irrigation purposes. Manage stormwater, reduce potential treatment, and protect local groundwater supplies.	The Project includes a comprehensive water resources management program, including: 1. *Recycled Water.* The Project includes water recycling facility to recycle, and reuse, wastewater piped to the Project WRF. All nonresidential and multi-family development must install recycled water infrastructure to irrigate common areas for these facilities (except where prohibited by law), and all available recycled water shall be used for such irrigation uses. 2. *Potable Water Conservation.* The Project includes numerous potable water conservation measures, including: A. Establishing maximum available water allocations for each residential and commercial parcel, and monitoring and enforcing such allocations through a

TABLE 5.21-11
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY COMMUNITY CLIMATE ACTION PLAN

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
	metering system and rate structure and/or penalty structure for those exceeding their water allocations. B. Restricting outdoor landscaping planting in private yards to a designated low-water plant pallets to minimize use of potable water for private landscaping, ~~prohibiting~~ mandating that only recycled water be used to irrigate turf in commercial areas ~~projects~~, and restricting turf to 25% of landscaped areas on private residential projects. C. Requiring the ~~exclusive~~ use of Energy Star or equivalent major appliances, as described above, that use less water (as well as less energy). D. Requiring the exclusive use of kitchen and bathroom faucets that comply with 2013 CALGreen code residential voluntary measures specified in Sections A4.303.1 and A4.303.3 of the Code. 3. *Storm Water Management.* The Project's integrated water resources management approach will comply with County requirements related to hydrology and flood control considerations through compliance with Low Impact Development (LID) standards and best management practices (BMPs) for sediment management through hydromodification techniques. The Project includes 2 WRFs that will provide a reliable supply of recycled water for landscaping, to reduce reliance on potable water supplies. The Project provides a reliable water supply through use of an integrated water resources management approach that incorporates water conservation measures; uses recycled water for non-potable uses; uses multiple sources of water supply to ensure that the Project's water needs are met without the need to solely rely on the annual delivery of a fixed amount of imported water; provides a high degree of water supply reliability for each stage of Project buildout; and minimizes the impacts of additional water demand on the state's water supply.

TABLE 5.21-11
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY COMMUNITY CLIMATE ACTION PLAN

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
CATEGORY 4: WASTE REDUCTION, REUSE AND RECYCLING	
Existing Initiatives	
Community waste diversion programs to redirect 50 percent of solid wastes to recycling or re-use instead of landfills	The Project will exceed this existing measure by implementing a 100 percent diversion of soil during grading activities, and at least ~~70~~ 75 percent of non-hazardous construction and demolition waste. The Project will also divert 75 percent of operational solid waste.
New CCAP Action	
SW-1: Waste Diversion Goal. For the County's unincorporated areas, adopt a waste diversion goal to comply with all State mandates to divert at least 75 percent of waste from landfill disposal by 2020.	The Project includes both a construction and operational waste reduction measures. 1. The Project must implement a plan and monitoring program to ensure recycle or reuse of a minimum of 75% by weight of construction and demolition debris, exclusive of soil, rock, and gravel. This quantity exceeds the 50% requirement of Section 20.87.040 of the County Code and the 75% target proposed in the CCAP. 2. The Developer must provide the County with a contract establishing an on-site waste recycling and composting program, including the collection of metals, paper, household plastics, glass, cardboard, green waste and food waste. The waste hauler should be required by contract to maintain records showing the diversion of not less than 75% of the operational waste generated by the Project. The Project will include a minimum of five acres for a Materials Recovery Facility/Transfer Station (MRF/TS), which may include mulching and composting operations and a Household Hazardous Waste Permanent Collection Center. An MRF/TS could be privately or publicly operated. The MRF/TS would allow for all materials that are recyclable to be sorted and compacted for shipment to an off-site recycling processing facility. The Developer shall encourage a waste management company to build these facilities within the Project site by grading, improving, and providing utility hookups by the end of the first phase of construction. The CC&R for the MRF/TS will require that the lot provided within the site remain as a Non-Disposal Solid Waste Processing Facility.

TABLE 5.21-11
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY COMMUNITY CLIMATE ACTION PLAN

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
CATEGORY 5: LAND CONSERVATION AND TREE PLANTING	
Existing Initiatives	
Implementation of the urban forestry plan and oak woodlands conservation management plan.	The Project's Natural Resources/Open Space Management Plan includes both on-site and off-site preserve areas. Approximately 5,116 acres of open space are available for use as on-site mitigation and off-site mitigation areas total ~~23,547~~ 39,213 acres, for a combined total of ~~28,663~~ 44,329 acres of preserved open space resulting from Project implementation. The Project avoids development within established Significant Ecological Areas, minimizes disturbance of high-value biological resources, including native grasslands, oak savannas, and oak woodlands, and preserve contiguous open space areas in order to keep its viability as wildlife habitat. Open spaces will be provided within the Business Park that allow for wildlife movement between the southern portion of the Project site through to the drainage located on the northern side of SR 138.
New CCAP Actions	
LC-1: Develop Urban Forests. Support and expand urban forest programs within the unincorporated areas.	The Project's Natural Resources/Open Space Management Plan includes both on-site and off-site preserve areas. Approximately 5,116 acres of open space are available for use as on-site mitigation and off-site mitigation areas total ~~23,547~~ 39,213 acres, for a combined total of ~~28,663~~ 44,329 acres of preserved open space resulting from Project implementation. The Project avoids development within established Significant Ecological Areas, minimize disturbance of high-value biological resources, including native grasslands, oak savannas, and oak woodlands, and preserve contiguous open space areas in order to keep its viability as wildlife habitat. The planting of an estimated 35,123 new trees, as required by the County Tree Planting Ordinance would result in an estimated long-term sequestration of 24,867 metric tons of carbon dioxide equivalent ($MTCO_2e$). This is a conservative analysis, as it is likely that many more trees would be planted than the minimum required by the County ordinance.

TABLE 5.21-11
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY COMMUNITY CLIMATE ACTION PLAN

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
LC-2: Create New Vegetated Open Space. Restore and revegetate previously disturbed land and/or unused urban and suburban areas.	This action is not directly applicable to new development projects. However, the Project's Natural Resources/Open Space Management Plan includes both on-site and off-site preserve areas. Approximately 5,116 acres of open space are available for use as on-site mitigation and off-site mitigation areas total ~~23,547~~ 39,213 acres, for a combined total of ~~28,663~~ 44,329 acres of preserved open space resulting from Project implementation. The Project avoids development within established Significant Ecological Areas, minimize disturbance of high-value biological resources, including native grasslands, oak savannas, and oak woodlands, and preserve contiguous open space areas in order to keep its viability as wildlife habitat. Additionally, the Project would plant an estimated 35,123 new trees, as required by the County Tree Planting Ordinance. This would result in an estimated long-term sequestration of 24,867 $MTCO_2e$. This is a conservative analysis, as it is likely that many more trees would be planted than the minimum required by the County ordinance
LC-3: Promote the Sale of Locally Grown Foods and/or Products. Establish local farmers markets and support locally grown food.	The Project will include a weekly Farmer's Market sponsored by the homeowners association (HOA) or other entity selected by the Master Applicant/Developer, and will allow for community gardens as a permitted use in ~~commercial and~~ residential, mixed use, park, recreation/entertainment, and institutional/civic areas. The Project also accommodates a total of 50-acres for on-site food-growing and agriculture-related uses in places such as community gardens, orchards, groves, and greenhouses.
LC-4: Protect Conservation Areas. Encourage the protection of existing land conservation areas.	The Project's Natural Resources/Open Space Management Plan includes both on-site and off-site preserve areas. Approximately 5,116 acres of open space are available for use as on-site mitigation and off-site mitigation areas total ~~23,547~~ 39,213 acres, for a combined total of ~~28,663~~ 44,329 acres of preserved open space resulting from Project implementation. The Project avoids development within established Significant Ecological Areas, minimize disturbance of high-value biological resources, including native grasslands, oak savannas, and oak woodlands, and preserve contiguous open space areas in order to keep its viability as wildlife habitat.

Response to Comment F.3A-72:

This comment's general opposition to the Project is noted and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. The Lead Agency concurs with this comment's assertion that the Draft EIR comprehensively and adequately discloses the Project's potentially significant and unavoidable impacts to visual resources, air resources, biological resources, cultural resources, climate change, air quality, and water quality. Though the Draft EIR identifies all feasible mitigation to reduce the Project's significant impacts, a project the size of the Centennial Specific Plan cannot completely avoid all of its potentially significant impacts through mitigation. This comment's recommendation that County decision makers consider all of the Project's significant and unavoidable impacts prior to Project approval is also noted and will be provided to the Regional Planning Commission and Board of Supervisors for their consideration.

Response to Comment F.3A-73:

This comment's general opposition to the Project is noted and will be provided to the Regional Planning Commission and Board of Supervisors for their consideration.

Response to Comment F.3A-74:

This comment's stated preference that the County adopt Alternative A, the required "No Project" alternative, is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment F.3A-75:

The comment is a summary of the responsibilities of the commenting organization. The comment is noted for the record and will provided to the Regional Planning Commission and Board of Supervisors for consideration. No further response is required given that the comment does not address or question the content of the Draft EIR.

Mr. Jodie Sackett
County of Los Angeles Dept. of Regional Planning
Hall of Records, 13th Floor, Room 1348
320 West Temple Street
Los Angeles, CA 90012

Re: Comments regarding Draft Environmental Impact Report (DEIR) for the Centennial Project, State Clearinghouse No. 2004031072

Dear Mr. Sackett:

We are submitting this response regarding the Draft Environmental Impact Report for the Centennial Project, on behalf of the 12,300 member Pacific Crest Trail Association (PCTA). The Pacific Crest Trail Association is the primary private partner in the management of the Pacific Crest National Scenic Trail (PCT). PCTA is part of a long-standing partnership with the USDA Forest Service, California State Parks, the National Park Service, and the Bureau of Land Management that is formalized in a Memorandum of Understanding (15-MU-11132424-003). With the main office in Sacramento, California, and five regional offices along the length of the trail, PCTA works alongside agency partners at the national, regional, and local levels to ensure the PCT is protected, preserved, and promoted as one of America's premier long-distance trails. In 2016 PCTA organized more than 98,000 hours of volunteer work and raised $2,400,000 to support these efforts. F.4-1

Background:

When the PCT was designated by Congress as a National Scenic Trail through the National Trails System Act of 1968, there was a requirement for publication of a route for the PCT in the Federal Register. This process was completed in 1973. At that time, a route approximately matching the route currently being discussed today by Tejon Ranch Company (TRC), the Tejon Ranch Conservancy (Conservancy), the U.S. Forest Service (USFS) and PCTA was selected as the route for the PCT. The USFS approached TRC about a purchase of this route, but at that time the TRC was not interested in a public route through their holdings in that location. So, in the late 1980s and early 1990s, USFS acquired rights for public passage around the eastern edge of the Ranch as an Interim Location in order to complete the PCT as a continuous route for public use. F.4-2

PCTA and USFS were approach by TRC in 2004 regarding their potential willingness to donate a right of way for public use and a conservation easement meant to protect the PCT experience in an agreed upon location on the ridgelines and Antelope Valley contained within the Ranch. Since that time, PCTA and our agency partners have been involved in discussions and fieldwork regarding a trail route, improved overnight use sites and management of the surrounding lands

PACIFIC CREST TRAIL ASSOCIATION

F
and public use on the PCT. The route through the Ranch would be approximately 38 miles in length including the Centennial project along 300th Street West.
Those discussions have resulted in a grant of a conservation viewshed easement on 10,000 acres of TRC lands in 2014 primarily to the Conservancy with third party enforcement rights held by USFS. PCTA and the USFS continue to work with TRC and the Conservancy to complete the last step – a public use easement held directly and managed by the USFS. It is hoped that we might be able to complete the next step in that process by the end of 2017.

The completion of the easement is complicated in that the USFS cannot expend funds for NEPA compliance without having rights in hand, and at the same time the NEPA analysis might result in changes in the route covered. The result is a plan for TRC to sign with USFS an agreement to transfer a public use easement once the analysis work is completed. This is that next step to which we refer. It is PCTA's determination that TRC has been negotiating with all parties in good faith and that we all share this goal of a substantially improved PCT experience for the public in the Tejon Ranch area.

F.4-2 cont.

Comments:
The PCTA provides the following comments to be considered and reviewed in the Projects Final Environmental Impact Report (FEIR).

- DEIR 5.13 Visual Resources page 5.13-10 (2nd to last paragraph) states that Exhibit 5.14-2 depicts the existing (interim) PCT alignment which it does not. The Exhibit only depicts the new proposed PCT alignment along 300th Street West in a straight line north and south. An Exhibit map in the FEIR should depict the existing interim PCT location approximately 1.75 miles east of the project along 270th Street West and its current connections to the Angles Forest southward and Tehachapi Mts. to the northeast.

F.4-3

- DEIR 5.14 Parks & Recreation page 5.14-13 (2nd to last paragraph) also states Exhibit 5.14-2 depicts the existing PCT alignment, which it does not. FEIR should include a corrected map.

F.4-4

- In conjunction with the above "Bullet points", the DEIR in several places only describes the existing interim PCT route east of the Project. Including an Exhibit Map of the interim PCT located approximately 1.75 miles east of the Project along 270th Street West and its current northeastern route around Tejon Ranch would improve depictions of existing conditions. And then for comparison purposes, include another Exhibit map (back to back) depicting the new proposed 38 mile PCT Trail Alignment and/or 10,000 acre conservation viewshed easement connecting Tejon Ranch's other conserved lands north and south to the Centennial Project. This would help FEIR reviewers to analyze/understand the significance of the PCT as a regional trail connection, plus convey the potential improvement of the PCT experience by moving it from its existing location on the floor of Antelope Valley to the crest of the Tehachapi Mountains.

F.4-5

The DEIR tries to explain the relocation of the PCT along 300th Street West and the potential impacts of the Centennial development on that location, including mitigating measures to be taken. We agree with the Mitigation Measure MM13-4 which states a block wall shall be installed along the rear of structures abutting the trail and a 34 ft. landscaped setback along 300th

F.4-6

Street West. However, we would also like to clarify PCTA's view of the visual analysis of proposed adjacent developments from south to the north along proposed PCT route along 300th Street West. F.4-6 cont.

- The PCT will come out of the cover of the hills between Pine Canyon Road and Hwy 138 and will be in view of the residential development across 138. Also visible as you get closer to Hwy 138 is a light industrial park adjacent to and west of the PCT, on the south side of Hwy 138 with intersection of 300th Street West (see simulation exhibit 5.13-4 is an example, but is located further southwest along Hwy 138). This is also the general location of a proposed public trail parking lot on the south side of Hwy 138 outside of the Centennial Project. F.4-7
- Exhibit 5.14-2 map indicates an underpass under Hwy 138 west of the intersection with 300th Street West. However, there is not a discussion/description of this underpass as it may or may not relate to the PCT. The FEIR should clarify and expand this potential feature. For instance Figure 3-40 of the Centennial Specific Plan depicts a conceptual 10 ft. wide x 12 ft. high Trail Underpass, but is not included in this section of the DEIR. The USFS minimum standard for an underpass with equestrian use is 10 ft. wide x 12 ft. high. We support the idea of the PCT alignment passing through such an underpass to safely navigate crossing Hwy 138. If practical, we would encourage expanding the width and height especially if the alignment is shared with the county trail system and bicyclists. The PCT prohibits bicycle use directly on the trail, therefore some type of separation between user groups would need to be established. F.4-8
- A commercial site is located on the north west corner of Hwy138/300th Street West with the PCT between the business and 300th Street (see exhibit 5.13-5). The PCT would then proceed north along the west side of 300th Street West in a set back from the street that would include a wall screening structure/residential development, the PCT, a paved bike path and vegetation plantings. To the east of the commercial site are a community park and a school site. Providing a Figure in the FEIR depicting a typical cross section of the PCT along 300th Street West with set-back measurements, screening wall, vegetation plantings and separate bike path would help to analyze visual impacts. For instance Figure 3-39 of Centennial Specific Plan depicts a typical cross section of the PCT, but is not included in this section of the DEIR. F.4-9
- The PCT and 300th Street West then passes through an inholding within Centennial and then enters a second area of residential development, which extends to the east side of 300th Street West. Before you reach the aqueduct on the west side of the PCT is another school and beyond that a community park. On the east side of 300th Street, across from the school is another small commercial site.
- Before you cross the aqueduct there is the waste water treatment plant to serve the majority of the entire community. At this point there is no information that details the impact of this utility on the PCT in terms of sight, smell and noise. We would imagine those same impacts would be a concern for the school, park and commercial site. The FEIR should clarify these potential impacts from the waste water treatment plant. F.4-10

- The DEIR states an area will be reserved for the PCT along the west side of 300th Street West through the Centennial project. As previously stated, USFS will need to hold easement rights prior to funds being expended for NEPA compliance and trail construction. The FEIR should discuss the mechanism and or dedication of an easement to USFS for the PCT to be realigned and completed in this location. F.4-11

To further clarify our view of this situation, it is necessary to look at the entire proposed PCT route across the Ranch which provides an experience for public users that is greatly superior to the current trail route. Sections of this relocation are of superlative quality with outstanding scenic and natural qualities. To be able to take advantage of this potential, we are rightfully willing to deal with the impacts of adjacent development in proximity to Hwy 138, which is already compromised by the road crossing and currently under planning for expansion. Make no mistake, the impacts of this development proposal are substantial, however the mitigation being offered is important and the resulting rural transition zone along the PCT is substantially outweighed by the improvement in the public value of the overall trail route proposed within the existing 10,000 acre conservation viewshed easement north and south of the Centennial project The location of schools in proximity to the PCT as well as trail system connections to the PCT from other schools, public facilities and the residential neighborhoods, gives us an opportunity to use the PCT as a public health and education resource at a scale not often reached by a trail as remote as the PCT. It gives us the opportunity to draw the public into the spectacular backcountry settings of the Ranch and spurs an appreciation for nature and scenery. We look forward to a long and robust relationship with this community. F.4-12

Comments continued:

- The 10,000 acre conservation viewshed easement TRC dedicated in 2014 appears to overlap onto Area 1 of the proposed Off-Site Mitigation Preserves south of Hwy 138. Where the rest of the 10,000 acre conservation easement to the north of the project appears to be outside of the proposed Preserves (Areas 2-6). The FEIR should clarify/discuss the compatibility of the Trail easement inside Preserve Area #1. We believe the off-site mitigation preserves found in exhibit 4-12 are critical to the quality of key areas of the PCT relocation, with substantial public value. F.4-13
- Where 300th Street West and the potential PCT alignment traverse through the inholding we have concerns as to whether the trail will be included or accommodated somehow (even temporarily) possibly within the street right-of-way. The FEIR should discuss what street improvements will be made to 300th Street West through this inholding area connecting back to the Centennial Project to the north. We hope that information addressing the PCT and its connection to the north would also be included. F.4-14
- We do have concerns regarding the impact of the waste water treatment facility proposed, and are surprised by the location, adjacent to a National Scenic Trail, as well as water transmission and management facilities such as the aqueduct, as well as a school and park. We hope that utilization of the alternative utility location in Alternative D would be considered closely and that the impact on the PCT experience would be further analyzed and given weight in the FEIR. F.4-15

Lastly, and possibly in conjunction with the county or community trail system, the FEIR should consider some type of rest stop with shade and water available somewhere along the 300th St. West PCT alignment. F.4-16

We look forward to working with TRC, the Conservancy, our agency partners and LA County in using this process and other related efforts to provide a world class experience to the public along the Pacific Crest Trail. F.4-17

Respectively Submitted,

Liz Bergeron
Executive Director and CEO

Responses to Comment Letter F.4
Pacific Crest Trail Association
July 13, 2017

Response to Comment F.4-1:

Thank you for your comment and for your participation in this public process. The comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. No further response is required given that the comment does not address or question the content of the Draft EIR.

Response to Comment F.4-2:

The Draft EIR includes a complete description of the Pacific Crest National Scenic Trail (PCT), its existing alignment, proposed alignment, and its federal designation as a National Scenic Trail.[514] Consistent with this comment, the Draft EIR further explains that the Forest Service, the Pacific Coast Trail Association (PCTA), the Tejon Ranch Conservancy (Conservancy), and the Tejon Ranch Company (TRC) are in ongoing discussions regarding an alternative realignment for the PCT. Specifically, the Forest Service, the PCTA, the Conservancy, and the Tejon Ranch Company are discussing the relocation of the existing segment of the PCT that currently crosses Lancaster Road at 270th Street West approximately two miles east-southeast of the Project site so that it is generally aligned along 300th Street West between SR-138 and the northeastern corner of the Project site, as shown on Draft EIR Exhibit 5.14-2.[515] A portion of the western right-of-way of 300th Street West has been reserved for the conceptual PCT realignment where this conceptual realignment is contiguous with a portion the Project site and where it bisects the northeastern corner of the site.[516] An appropriate buffer would be a buffer between the easement and Project development in the easternmost areas of the site.[517]

To facilitate the PCT realignment described in the Draft EIR, TRC has granted to the Conservancy two conservation easements that would preserve in perpetuity the conservation values of those portions of Tejon Ranch land located outside of the Project boundary and through which the proposed PCT alignment would extend.[518] Both conservation easements expressly acknowledge that the Forest Service, the Conservancy, and TRC are in ongoing discussions regarding an alternative realignment for the PCT, and that TRC intends to convey to the Forest Service a perpetual trail easement for the construction, maintenance, and use of the PCT on the property covered by the conservation easements.[519] This comment confirms the Commenter's impression that TRC has been participating in these discussion in good faith.

514 DRP 2017, pp. 5.14-13, -14

516 *Ibid.*
517 *Id.,* Exhibit 4-10a
518 See Kern County Official Records Document Nos. 214047995, 20140445960 ("Conservation Easements")
519 Conservation Easements, Recital G

As explained in the Draft EIR, the proposed realignment of the PCT to the west side of 300th Street West through the Project site is not part of the Project, as it is not being proposed by the Project Applicant/Developer.[520] Indeed, the PCT realignment will be subject to a separate permitting and environmental review process prior to its implementation. However, construction of the trail within the 300th Street West right of way is considered a component of the Project development for purposes of this EIR.[521] Thus, the proposed PCT realignment, as depicted on Draft EIR Exhibit 4-10a, is assumed to be the future alignment through the Project site for evaluation purposes in the Draft EIR and is depicted on the Project's Recreation and Trails Plan.[522] Moreover, the Draft EIR analysis includes consideration of the Project's potential impacts on the PCT and its users.[523] The Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043) (AVAP EIR) also considered the environmental effects on the PCT associated with buildout of the Project site in accordance with the Antelope Valley Area Plan.[524]

As discussed in Section 4.0 of the proposed Specific Plan, tentative subdivision maps and tentative map process will be used to establish the precise location of land use designations and street locations, and all map applications must include a detailed site plan depicting the use, location, and size of all improvements included in the mapped area, including streets and trails.[525] It is anticipated that the full 300th Street West right-of-way, inclusive of the PCT and Project multi-purpose path alignments, will be offered for dedication to the County as part of future tentative map applications, subject to a PCT trail easement, license or comparable property interest in favor of the Forest Service and/or PCTA encumbering the PCT alignment depicted on such tentative maps.

This comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

Response to Comment F.4-3:

Exhibit 5.14-1 shows the current alignment of the PCT. In response to this comment, the following text change has been made to the Draft EIR:

The third sentence in the fourth paragraph on page 5.14-13 of Section 5.14, Parks and Recreation, has been revised to state:

> Exhibit 5.14-1~~2~~ depicts the existing alignment of the PCT.

Any other references in the Draft EIR to the PCT being illustrated on Exhibit 5.14-2 are similarly revised to refer to Exhibit 5.14-1.

520 DRP 2017, p. 4-39
521 *Ibid.; Id.,* Exhibit 5.7-11b
522 *Id.,* Exhibit 4-10a
523 *Id.,* pp. 5.7-138; 5.8-73; 5.12-20; 5.13-1, -8, -10 to -30; 5.14-3, -8, -10 to -22; 5.21-77
524 DRP 2014a, pp. 3-2; 4-15; 5.15-6, -11 to -16; 5.16-5; *Id.,* Figure 5.15-1
525 DRP 2017. Appendix 4.0-A, pp. 4-7, -12

Response to Comment F.4-4:

Exhibit 5.14-1 shows the existing location of the PCT, and references to Exhibit 5.14-2 were in error. The following revision has been made to the third sentence in the third full paragraph on page 5.14-12:

> Exhibit 5.14-~~2~~1 depicts the existing alignment of the PCT.

Any other references in the Draft EIR to the PCT being illustrated on Exhibit 5.14-2 are similarly revised to refer to Exhibit 5.14-1.

Response to Comment F.4-5:

As discussed in response to Comment F.4-2, the proposed realignment of the PCT to the west side of 300th Street West through the Project site is not part of the Project, as it is not being proposed by the Project Applicant/Developer.[526] Indeed, the PCT realignment will be subject to a separate permitting and environmental review process prior to its implementation. However, construction of the trail within the 300th Street West right of way is considered a component of the Project development for purposes of this EIR.[527] Thus, the proposed PCT realignment, as depicted on Draft EIR Exhibit 4-10a, is assumed to be the future alignment through the Project site for evaluation purposes in the Draft EIR and is depicted on the Project's Recreation and Trails Plan in order to help the public and County Decision makers understand the relationship between the proposed Project and the proposed PCT trail alignment through the Project site.[528] Exhibit 4.10a also depicts the PCT trail alignment as it extends north and south of the Project site to provide additional locational context. Since the PCT trail realignment project is a separate project that will be subject to a separate environmental review and permitting process, and since the trail realignment is not being proposed by the Project Applicant/Developer, the EIR is not required to depict the entire 38-mile trail realignment, the vast majority of which will occur outside of the Project site boundary.

The proposed PCT trail realignment is also discussed in Section 5.15 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.16 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035). Please see those documents for further information on this topic.

Response to Comment F.4-6:

This comment is noted and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. See responses to Comments F.4-4 through F.4-11. Thus, no further response is required. Please see response to Comment F.4-2.

526 *Id.,* p. 4-39
527 *Ibid.*; *Id.,* Exhibit 5.7--116
528 *Id.,* Exhibit 4-10a

Response to Comment F.4-7:

In response to this comment, the following text, which would not alter the visual impacts discussion or conclusion in the Draft EIR, has been added after the fourth sentence of the third paragraph on page 5.13-21 to read as follows:

> The conceptual realignment of this segment of the PCT has broad views of flat-lying areas developed with rural/agricultural and older suburban land uses. As the PCT comes out of the cover of the hills between Pine Canyon Road and SR 138, trail users will have views of the proposed residential development across SR 138. Closer to SR 138 and at the proposed public trail parking lot just outside the Project site, trail users will see the Business Park adjacent to and west of the PCT on the south side of SR 138 at the intersection of 300th Street West. The visual simulation in Exhibit 5.13-4 provides an example of the views of the Business Park located south of the SR-138.

Please see response to Comment F.4-2.

Response to Comment F.4-8:

This comment confirms that the conceptual trail underpass depicted on Figure 3-40 of the Appendix 4.0-A complies with the USFS minimum standard for an underpass with equestrian use. The request regarding the scale of the underpass is acknowledged and will be taken into consideration in the future design process. The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project.

The PCT trail alignment is also discussed in Section 5.15 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and in Section 3.16 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035). Please consult those documents for additional information germane to this topic.

Response to Comment F.4-9:

The comment provides a summary of anticipated views on the PCT on 300th Street West and requests that Figure 3-39 in the Specific Plan be included as a typical cross section of the Pacific Crest Trail along 300th Street West. Figure 3.39 of the Specific Plan has been inserted into Section 5.13, Visual Resources, of the Draft EIR as Exhibit 5.13-6. New exhibits are included in Section 3.0, Draft EIR Clarifications and Revisions, of this Final EIR.

The suggested text, which would not alter the visual impacts discussion or conclusion in the Draft EIR, has been added after the fifth sentence of the third paragraph on page 5.13-21 to read as follows:

> Development on the eastern section of the site would present trail users with views of residential, commercial, and business park structures along 300th

> Street West for a distance of approximately 1½ miles. A proposed commercial site will be located on the northwest corner of SR 138 and 300th Street West, with the PCT running between the commercial use and 300th Street West. The PCT would proceed north in a setback area along the street that would include a wall between the trail and residential development, a paved bike path and landscaped area. Visible to the east of the future commercial site would be a community park and a school site. A typical cross section of the PCT is provided in Exhibit 5.13-6.

Response to Comment F.4-10:

In response to this comment, the following text, which would not alter the visual impacts discussion or conclusion in the Draft EIR, has been added prior to the fourth paragraph on page 5.13-21 to read as follows:

> The PCT and 300th Street West then pass through a privately-owned inholding within Centennial and then enter a second area of residential development, which extends to the east side of 300th Street West. Before the PCT reaches the SWP Aqueduct, on the west side of the PCT is another school and beyond that, a community park. As shown on Exhibit 4-14, the property for the WRF East is adjacent to 300th Street West, just south of the SWP Aqueduct. On the east side of 300th Street West, across from the school, is another small commercial site.

The potential odor impacts associated with the WRFE are analyzed in Draft EIR Section 5.11, *Air Quality*, page 5.11-76, which discloses that the most likely potential nuisance odors would be from industrial or utility sources, including the WRFE. The Draft EIR further discloses anaerobic microbial decomposition of material in the wastewater and solid waste stream could generate emissions of hydrogen sulfide, ammonia, and other odorous compounds. The Draft EIR concludes that the WRFE's potential to emit objectionable odors would be less than significant because, prior to construction and operation, the WRFE would be required to obtain construction and operation permits from the Antelope Valley Air Quality Management District (AVAQMD), including its regulations that prohibit off-site nuisance odors generated by any source. As explained on Draft EIR page 5.11-76, to mitigate odors from the WRFE, state-of-the art design and odor-control measures would be implemented where necessary to comply with AVAQMD permitting requirements. Examples of such technology include covering and/or enclosing odorous processes, applying negative air pressure with blowers, and installing odor-control devices such as biofilters, chemical scrubbers, or activated carbon filters. MM 19-5 requires the Project to provide the County with plans and specifications for the WRFE that have been prepared in compliance with Title 22 and WDR requirements and be confirmed in documentation submitted to the County prior to the issuance of building permits for Project development.

Regarding views of the WRFE, pages 4-59 through 4-61 of the Draft EIR discusses the Wastewater Service Plant, which states that the WRFs would be constructed of concrete and steel materials that would generally be at or below grade, with a few structures (e.g.,

administrative/lab facilities, secondary treatment digesters, sludge centrifuges, and filtration facilities) having maximum heights of approximately 30 to 40 feet. Security fencing, night lighting, and landscape screening, if needed, would be provided along the perimeter of the WRF East site. The WRF East site would consist of open ponds, equipment, sheds, and small buildings (as shown in the Conceptual layout in Figure 5 of Appendix 5.19-B), which would be similar to typical industrial and utility facilities. However, the fencing and screening around the WRF would obscure views of the facilities from trail users and other adjacent uses into the WRF.

In addition, noise from the WRFs would have to comply with the County's Noise Ordinance as required under MM 12-2 in Section 512, Noise, which would require the completion of an acoustical analysis for each proposed business park use, school, community use area, park and recreation area, transportation center, animal control facility, utility, commercial development, and manufacturing/industrial development to verify the facility has been properly designed to comply with the noise ordinance. The design features required to achieve the noise standard include one or more of the following elements, as verified by the Acoustical Study: building setbacks from the sensitive receptors; noise barriers; building orientation relative to the sensitive receptor; sound-rated windows; and upgraded exterior wall and/or roof construction.

Response to Comment F.4-11:

This comment is noted and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. Please see response to Comment F.4-2 regarding the Project Applicant's proposed dedication of an easement or similar mechanism to the Forest Service to accommodate PCT realignment on the Project site.

Please also see Section 5.15 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.16 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035).

Response to Comment F.4-12:

It is noted the Centennial Project accommodates a request from the PCTA made after Centennial Specific Plan preparation began, and as such it is assumed the PCTA was aware that a large master-planned community was proposed along a section of 300th Street West at the time the request to include space for the realigned PCT was made. Your comments are acknowledged, and as this comment does not address or question the content of the Draft EIR no further response is required. The comment will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project.

Response to Comment F.4-13:

The comment correctly states that a portion of the proposed Pacific Crest Trail (PCT) realignment overlaps Area 1 of the Mitigation Preserve. The proposed realignment will shift the PCT from its current location along the eastern boundary of Area 1 to a more southerly

position running from 300th street southward through the Mitigation Preserve then continuing southward. The Draft EIR shall be modified to include specific language indicating that the goals of the Mitigation Preserve and the Pacific Crest Trail are compatible, and that applicable mitigation measure minimizing impacts of trails shall specifically identify the PCT.

In response to this comment, the following text is hereby added immediately following the last full paragraph on Draft EIR page 5.7-136:

> The resources preserved in the reserve area, when supplemented by individual programs for special-status resources, would mitigate all significant impacts to biological resources on the Project site.
>
> The Mitigation Preserve contains existing uses such as trails and access roads, as well as the proposed realignment of the Pacific Crest Trail. The uses mentioned here are consistent with the goals of the mitigation preserve. MM 7-17 includes a public awareness program which includes signage denoting sensitive areas. These project requirements are expected to minimize disturbances associated with trail usage and human activity within and adjacent to the Mitigation Preserve.

Additionally, the following text is hereby added to MM 7-17 on Draft EIR page 5.7-193:

> This program shall include signs that identify the boundaries of ecologically sensitive areas (including the avoided special status plant populations described in MM 7-1); the use of temporary, wildlife-friendly fencing around sensitive areas that appear to be receiving a high level of disturbance until the disturbance is reversed; and promotion of public education and awareness of such areas. In addition to signage being located along the boundaries of the Mitigation Preserve, signage denoting the boundaries of ecologically sensitive areas and other pertinent information shall be included along the Pacific Crest Trail where it overlaps the Mitigation Preserve.

The proposed PCT trail realignment is also discussed in Section 5.15 of the Antelope Valley Area Plan Environmental Impact Report (SCH# 2014061043), and Section 3.16 of the Southern California Association of Governments' 2016-2040 RTP/SCS Environmental Impact Report (SCH# 2015031035). Please see those documents for further information on this topic.

Response to Comment F.4-14:

As this comment correctly notes, the 300th Street West alignment through the Project site is bisected by inholding property that is not a part of the Project site and is owned by a third party (Inholding Property), as shown on Draft EIR Exhibit 4-7, Centennial Project – Circulation Plan. As discussed in response to Comment F.4-2, the proposed realignment of the PCT to the west side of 300th Street West through the Project site is not part of the Project,

as it is not being proposed by the Project Applicant/Developer.[529] However, construction of the trail within the site's 300th Street West right of way is considered a component of the Project development for purposes of this EIR and the 300th Street West alignment through the Project site was included in the Project impact area assumed by the EIR.[530]

In February 2007, the owner of the "inholding area" described in this comment granted to the Project Applicant/Developer an easement encumbering a portion of inholding area adjacent to 300th Street West for the purpose of constructing, repairing, maintaining a pedestrian and equestrian trail for the use and enjoyment of the general public, which easement was recorded in the Official Records of Recorder's Office of Los Angeles County as document number 20070330445 (Inholding Trail Easement). The Inholding Trail Easement expressly provides that it may be conveyed by the Project Applicant/Developer to the Forest Service and shall become part of the PCT. It is anticipated that the Project Applicant will convey the Inholding Trail Easement to the Forest Service in conjunction with its conveyance of the PCT trail easement within the Project site in accordance with the ongoing discussions between the Project Applicant/Developer and the Forest Service discussed in response to Comment F.4-2.

As discussed in response to Comment F.4-2, tentative subdivision maps and tentative map process will be used to establish the precise location of land use designations and street locations, and all map applications must include a detailed site plan depicting the use, location, and size of all improvements included in the mapped area, including streets and trails.[531] A typical cross-section of the PCT along 300th Street West showing proposed improvements is depicted on Figure 3-39 of the proposed Specific Plan.[532] As shown on Specific Plan Figure 3-39, the PCT alignment along 300th Street West would be separated from the street by a landscaped Project multi-purpose path that would accommodate pedestrians and bicyclists in order to avoid conflicts with hiking and equestrian uses on the PCT alignment.

Response to Comment F.4-15:

This comment will be provided to the Regional Planning Commission and Board of Supervisors for consideration. Although this comment does not raise any specific concerns regarding the eastern water reclamation facility's (WRFE's) proposed on-site location in relation to the location of the off-site California Aqueduct, as explained on Draft EIR page 5.19-12, the WRFE and related conveyance pipelines, pump stations, and seasonal storage ponds would be located entirely within the Project site. No wastewater discharges, including recycled water use, will occur off-site and, therefore, operation of the WRFE would not involve any off-site impacts. Moreover, as explained on Draft EIR page 5.19-4, the planning, design, construction and operation of all wastewater reclamation facilities are regulated under the provisions of Title 22 of the California Code of Regulations to ensure that applicable water quality objectives and standards are not exceeded. The Lahontan Regional

529 DRP 2017, p. 4-19
530 *Id.,* Exhibit 5.7-11b
531 *Id.,* Appendix 4.0-A, pp. 4-7, -12
532 *Id.,* Appendix 4.0-A, pp. 3-90, -91

Water Quality Control board would issue Waste Discharge Requirements to the WRFE prior to commencing operations.

Response to Comment F.4-16:

As shown on Draft EIR Exhibit 4-10a, Centennial Project – Centennial Recreation and Trails Plan, the PCT alignment through the Project site will connect with the Project's network of Community Trails and Regional Trails, which will be accessible by the public. As shown on the Trails Plan, the Project's trail system will link to regional, community and neighborhood parks that will be developed by the Project. As shown on Exhibit 4-10a, there are multiple Project parks proposed within close proximity to the PCT and they will be improved potable water facilities, shade structures and other amenities, as depicted on Draft EIR Appendix 4.0-A, Figures 3-34 through 3-36. Accordingly, it is anticipated that PCT users will have meaningful access to water and shade when traversing the Project site, as recommended by this comment.

Response to Comment F.4-17:

This concluding comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. No further response is required given that the comment does not address or question the content of the Draft EIR.

Centennial Project Draft Environmental Impact Report Comments
County Project No. 02-232 --- SCH No. 2004031072

Jodie Sackett
County of Los Angeles
Department of Regional Planning
Hall of Records, 13th Floor, Room 1348
320 West Temple Street
Los Angeles, California 90012

Dear Mr. Sackett:

The Santa Monica Mountains Conservancy commented on the subject project in 2004 (attached) and incorporates those comments by reference in this letter. Since those 2004 comments, the project has not been demonstrably modified to avoid or minimize direct regionally significant impacts to the ecological sustainability of Southern California ecosystems located south of Highway 138 and east of Interstate 5. F.5-1

Failure to Analyze North-South Habitat Linkage Across Highway 138

In fact, the proposed project, and all of its Draft Environmental Impact Report (DEIR) development alternatives, would sever the most optimal five-mile-wide habitat linkage across Highway 138 between I5 and State Route 14. The DEIR is massively flawed for totally failing to analyze the project's potential impacts on habitat connectivity from the Tehachapi Mountains south (across Highway 138) into the portion of the Angeles National Forest located just east of I5. Habitat connectivity into this portion of the National Forest is vital for wildlife to connect to the Castaic Creek and Soledad Canyon areas that cross into the Rim of the Valley Trail Corridor Zone. F.5-2

The DEIR is deficient for not comparing how Metro and Caltrans have or have not provided Highway 138 under or over-crossings in the Northwest 138 Corridor Improvement Project EIS/EIR where the proposed project straddles the highway. The DEIR is further deficient for not analyzing how the proposed project, and all of its DEIR alternative projects, would eliminate virtually all wildlife movement across Highway 138 within the project boundary. Not even the slightest contiguous band of habitat or open land is proposed from the northern project area to Highway 138 or the proposed project open space south of Highway 138. Even DEIR Alternative E: Density Clustering/East of F.5-3

Aqueduct totally eliminates any wildlife movement potential across Highway 138 because west of the Aqueduct there is no north-south movement permeability. F.5-3 cont.

The approximately five-mile-wide section of Highway 138 overlapped by the project has prime wildlife crossing conditions compared to any section of the highway between I5 and the State Route 14. In all cases wildlife must find a way over the aqueduct. The attached figure shows how wildlife can cross the aqueduct on multiple, wide earth-covered bridges from the core habitat of the Tehachapi Mountains into the multi-thousand-acre portion of the project area located east of the west branch of the aqueduct that serves Quail Lake. These overcrossings are in remote areas free from traffic particularly at night. The aqueduct overcrossings between the project area and State Route 14 are generally narrow (less wildlife friendly) two-lane roads that are part of the public road network. The DEIR analysis fails to address the constraints of the California aqueduct components on north-south habitat connectivity between I5 and State Route 14. F.5-4

Other than the project area, there is no location along Highway 138 between I5 and State Route 14 where wildlife can cross from core habitat to core habitat without having to cross an additional paved road or encounter existing development. The DEIR is inadequate for not addressing the uniqueness of the project site for unimpeded wildlife movement across Highway 138. It is further deficient for not addressing the long term biological implications of permanently eliminating the only Tehachapi Mountains core habitat to core habitat connection for the soon to be created habitat island bound by Highway 138, State Route 14, and I5. The proposed project and all of its DEIR alternatives would sever this connection regardless of whether or not the Northwest 138 Corridor Improvement Project is constructed all or in part. The EIS/EIR for that said project is clearly inadequate for addressing and mitigating new wildlife movement barriers across Highway 138. The subject DEIR cannot hide behind the EIS/EIR process because the draft EIS/EIR was circulated many months ago and the Final EIS/EIR is now in circulation. F.5-5

The other factors that make the subject project section of Highway 138 prime for a north-south wildlife crossing zone is that development and road density increase dramatically from that section eastward to State Route 14. There are additional paved roads and small ranches at a minimum in every area. The odds of those areas facing increased development (creating more animal movement barriers) are higher over time than in the project area. F.5-6

The DEIR makes no attempt and flatly refuses to consider impact avoidance to maintain habitat connectivity from the Tehachapi Mountains through the project site and across F.5-7

Highway 138 to the Angeles National Forest. To maintain that connectivity it is imperative to have wide contiguous strip of open land in the main project area (but wholly east of the west aqueduct branch) that connects to at least two of the earth-covered aqueduct overcrossings and to Highway 138. The attached figure shows a conceptual permanent habitat linkage that could mitigate the above-described impact which must be considered an unmitigated significant impact for the proposed project and all of the development alternatives. Ideally such a north-south habitat linkage would tie in with a planned under or overcrossing on the proposed six-lane section of Highway 138. Even if it does not tie in, such a habitat linkage must be required in the project design and future efforts can lead to the construction of a dedicated animal over pass over Highway 138. Good and responsible planning efforts would have Los Angeles County, Metro, and Caltrans devising a solution for this issue starting today. F.5-7 cont.

The core project area is littered with USGS blueline streams and USGS distinct springs. The DEIR states that American badger and Pronghorn antelope have been identified in the project area east of the aqueduct. Surely black bears, mule deer, foxes, bobcats, long-tailed weasels, and mountain lions commonly use the main development area. F.5-8

The DEIR concludes that there is no need to consider any less ecologically damaging development alternative than Alternative E: Density Clustering/East of Aqueduct because any less of a project scale would be in conflict with Antelope Valley Area Plan (AVAP). The premise of that conclusion is that Alternative E (as well as C and D) would not achieve enough housing and employment levels anticipated in the AVAP and growth projections. The County is not required to max out the AVAP limits and "growth projections" are vague. F.5-9

The DEIR is deficient for rigidly using a flexible planning document to dictate that no substantial biological impact avoidance should even be attempted. Alternatives C and D provide window dressing at best as far as meaningful habitat impact avoidance. The proposed project all of its development alternatives do not benefit the public of Los Angeles County and in many ways would cause permanent irreparable environmental harm. F.5-10

The Conservancy questions how the County Board of Supervisors can consider a Statement of Overriding Considerations to approve a project so detrimental to the greater public and the County's environment. The DEIR is deficient for not including the least damaging alternative that it can conclude achieves enough housing and employment levels anticipated in the AVAP and growth projections. That threshold otherwise remains arbitrary. The same argument can be made for the DEIR dismissal of all less damaging alternatives that are "not consistent with the goals and policies of the F.5-11

AVAP within the West EOA or are supportive of the project objectives. The dismissal is arbitrary without addressing a quantitative threshold of what minimum size and shape project would be consistent. The DEIR is further deficient and arbitrary for not providing any quantitative or government regulation back-up in its conclusion that in regards to the Public Input Alternative (develops 4,990 acres), that the project area does not include enough acres to include both the land uses and onsite natural open space areas. What is that based on? F.5-11 cont.

The DEIR is deficient for categorically dismissing the avoidance or substantially lessening of biological (and visual) impacts because of need for housing and employment for 57,000 people on the San Andreas fault, in core habitat, with no public transit connection, along a scenic highway miles from any services. The project turns SMART growth on its head. F.5-12

The DEIR must be re-circulated with at least one alternative that maintains a contiguous habitat linkage from project-adjacent aqueduct overcrossings to Highway 138 and to open space south of the highway, or it shall be deficient in presenting an adequate range of alternatives to decision makers. Such an alternative can meet every Project Objective hands down. F.5-13

The proposed project would cause irreparable public and environmental harm in Los Angeles County but the project makes no provision for public access to thousands of acres of proposed open space that is greatly found in Kern County. The DEIR is deficient for not including mechanisms for public access to land proposed to be protected to specifically mitigate dozens of permanent significant impacts to numerous public resources. In the case of the hunt club at the southern end of the project, the DEIR calls for the protection of private land for exclusive private use to mitigate irreparable permanent impacts to public resources. F.5-14

Please feel free to contact me with any questions at 310-589-3200, ext. 128, or by e-mail at edelman@smmc.ca.gov. You may also send correspondence to me at the above letterhead address. Thank you for your consideration. F.5-15

Sincerely,

PAUL EDELMAN
Deputy Director
Natural Resources and Planning

Impact Analysis Section, Room 1348
320 West Temple Street
Los Angeles, California 90012

Notice of Preparation Centennial Specific Plan
Project No. 02-232, SCH No: 2004031072

Dear Dr. Koutnik:

The Santa Monica Mountains Conservancy (Conservancy) offers the following comments on the Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the Centennial Specific Plan. The Conservancy is concerned with the direct relationship of the project site to the ecological sustainability of the major Southern California bioregion including the maintenance of regional habitat linkages. As part of the Conservancy's mission, the Conservancy strives to preserve, protect, and restore an interlinking system of wildlife habitats in Southern California through direct action, alliances, partnerships, and joint powers authorities. The Conservancy is actively involved in protecting key habitat linkages in and between such areas as the San Gabriel Mountains, Los Padres National Forest, Angeles National Forest, Santa Susana Mountains, Simi Hills, Verdugo Mountains, and Santa Monica Mountains. The Conservancy emphasizes that if major habitat linkages and wildlife hubs, such as those found on and in the vicinity of the project site, are not adequately preserved, then the functionality of the other key habitat linkages will be lost.

F.5-16

Adverse environmental impacts of Statewide significance, specifically to biological resources, would result from implementation of the proposed project. The DEIR must include a comprehensive and regional analysis of impacts to environmental resources, specifically biological resources, and an adequate analysis of less damaging project alternatives. A major fee simple dedication of open space land must be a requirement of any approved project.

The proposed project includes a Specific Plan with a maximum of 23,000 dwelling units and 14 million total square feet of non-residential development to be built over 20 years. This

includes subdivision entitlements, including General Plan and zoning amendments, tract maps, and conditional use permits. The NOP states that of the approximately 12,000-acre project site, about 4,961 acres of the project would be open space, and of that, 3,829 acres would remain as Natural Open Space. The NOP states that it is assumed that the project will develop generally from the west to east. The California Aqueduct runs through roughly the center of the site. The NOP states that portions of two Significant Ecological Areas (SEAs) occur on the project site. Based on a preliminary staff analysis, it appears that almost the entire project lies within the San Andreas Rift Zone SEA, proposed as part of the County's General Plan Update. The project overlays, or is in close vicinity to, several Missing Linkages, as identified by the South Coast Wildlands Project (SCWP 2000, 2003).

The proposed development would adversely impact habitat linkages as identified by the South Coast Wildlands Project. To avoid such impacts, substantially more acres of open space must be preserved by this project, and they must be situated in an ecologically sustainable configuration. Also, Figure 4 shows that the development would surround, and thus smother, many of the existing streams onsite. While this may facilitate the permitting process for the project proponent, this approach will severely compromise the ecological viability of these drainages as a result of direct and indirect impacts (e.g., fuel modification, lighting, change in quality and quantity of runoff, substantially increased human access). (Also, as animals often travel along drainages, this approach can funnel them into the developed areas , rendering them more vulnerable to additional risks.) Although the NOP (p. 20) states that about 33 percent of the total site would remain as Natural Open Space, the proposed configuration (as shown on Figure 4), would severely diminish the ecological values of that proposed remnant open space.

F.5-16 cont.

Regional and comprehensive approach to analysis of impacts, including cumulative impacts

There are several areas on the larger approximately 270,000 Tejon Ranch either already developed or anticipated to be developed. These include, but are not limited to, the Tejon Industrial Project and the Mountain Village Project. The only appropriate approach for planning would be a comprehensive approach for the entire ranch. This means that all of the development projects for Tejon Ranch must be addressed in one California Environmental Quality Act (CEQA) document. A comprehensive approach would lead to a more effective design of areas to protect as natural open space. Obtaining permits and environmental approvals for each project separately results in piece-mealing of the analysis of environmental impacts and this makes it more difficult for the public to comprehend the overall impacts from all of these developments. The Conservancy underscores the

importance of including future, planned projects for Tejon Ranch in a single CEQA document. If the Tejon Ranch representatives withhold information regarding proposed projects for the ranch, this is clearly contrary to the spirit and intent of CEQA.

If the project applicant and County decide not to take a comprehensive approach to planning for the ranch, the DEIR must address the rationale for not analyzing all these developments on Tejon Ranch in one CEQA document. If this approach is taken, at the very least, the CEQA document for the Centennial Specific Plan must include these other projects on Tejon Ranch (both on Los Angeles County and Kern County) in the cumulative impacts section. This analysis must include future, planned projects for Tejon Ranch.[1] The Conservancy emphasizes that this comprehensive cumulative impacts analysis must specifically address impacts to biological resources, including wildlife movement.

The NOP (p. 7) states that the project will include construction of excess infrastructure capacity (i.e., to meet needs for existing unmet demands or to provide excess capacity for future demands beyond those demands of the project itself). These utilities clearly meet the definition of growth-inducing. These additional projects are expected and their impacts must be analyzed thoroughly in the subject DEIR. The DEIR must include figures showing expected project footprints of these future projects. The DEIR will be inadequate if it only addresses the direct impacts of installing the subject utilities without addressing the environmental impacts from expected future development associated with those utilities.[2]

F.5-16 cont.

Any analysis of environmental impacts, specifically impacts to biological resources, must include a regional perspective. The approximately 270,000-acre Tejon Ranch plays a significant role in connecting the Los Padres National Forest, Angeles National Forest, and

---

[1]The CEQA guidelines (Section 15355) state that the cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects [underlining added for emphasis).

[2]Section 15126.2(d) of the CEQA guidelines state that evaluating impacts includes discussing the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Included in this are projects which would remove obstacles to population growth (a major expansion of a waste water treatment plant might, for example, allow for more construction in service areas). Also included in this discussion is the characteristic of some projects which may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively.

the Sequoia National Forest. The analysis of impacts to biological resources, including to wildlife movement, must not only address impacts to wildlife movement on the project site, but how this project will affect wildlife movement from both Statewide and regional perspectives.

Other impacts to biological resources

The DEIR should address impacts to habitat linkages as discussed in the South Coast Wildlands Project reports (SCWP 2000, 2003). The DEIR must include a color aerial showing the project footprint, proposed open space, and adjacent protected open space, and it must address how these habitat linkages will be sustained. The document must also clearly show which adjacent parcels are also owned by Tejon Ranch, or any related business subsidiaries. This analysis should address the full suite of species utilizing those linkages, their life history requirements, and how the project will protect those species. The impact analysis must address impacts including, but limited to, lighting, increased domestic pets, and increased roadkill (of mammals, reptiles, amphibians, and birds). Project modifications and mitigation measures must effectively reduce any significant adverse biological impacts to a less than significant level.

The DEIR should analyze impacts to biological resources in the context of the Conservation Assessment of Tejon Ranch (Conservation Biology Institute, 2003). That study assessed conservation values of the larger Tejon Ranch (including the Centennial Specific Plan project site) with respect to habitat connectivity; listed and endemic species; watershed integrity; unique, diverse, and under-conserved vegetation communities, and roadless areas. The DEIR should address impacts to these biological values.

The DEIR must address how the project will preserve the ecological values of the existing SEAs and proposed SEAs over which the project overlaps.

The DEIR must include at least one figure depicting vegetation communities overlain on the proposed project. The "proposed project" on this figure must include all project elements with measurable biological impacts, including project footprint, roads, fuel modification areas, utilities, etc.

The DEIR must include tables with acres for all vegetation communities to be impacted and preserved. Open space to be preserved must have a separate classification for "Natural, Contiguous Open Space." The classification of Natural Open Space in the NOP is deficient because the approximately 3,829 acres of "Natural Open Space" includes "open space"

F.5-16 cont.

which is almost entirely surrounded by development. These isolated open space areas will significantly diminish in ecological value and should be considered in a separate category separate from "Natural, Contiguous Open Space." The following should not be included in the "Natural, Contiguous Open Space" category: isolated open space, lawns, manicured greenways, fuel modification zones, roads, lakes, and aqueduct. It is critical, particularly because of the project size and the presence of valuable biological resources on the site, that the acres of natural open space be accurately presented in the DEIR.

Environmentally superior project alternatives

Given the magnitude and complexity of the subject property, the DEIR must include several alternatives that substantially reduce the level of impacts to environmental resources, particularly to biological resources. The Conservancy emphasizes that for this alternatives analysis to be meaningful, at least four alternatives must result in substantially fewer environmental impacts, including fewer impacts to biological resources. This means that for at least four alternatives, the impact footprint must be substantially less.

The DEIR should include one project alternative that is consistent with the existing zoning, General Plan (including the Antelope Valley Areawide General Plan designation and the Hazards and Resources Map), and Highway Master Plan. The alternative should include only one golf course (compared to two golf courses in the proposed project), and the acres designated for the one golf course that are deleted should be counted towards undisturbed open space. (The Conservancy is concerned with adverse environmental impacts associated with golf courses [e.g., extent of land needed, water needs, changes in quality of runoff, etc.], and there appears no adequate justification to support two golf courses.)

Another alternative should be presented in the DEIR that mimics the following proposed footprint. If significant biological resources are present within this proposed development footprint (which have not yet been disclosed in the NOP), then a slightly different alternative should be analyzed in the DEIR that results in no greater environmental impacts than those resulting from this proposed alternative. This alternative would limit the development footprint to the northeast portion of the project site, east of the California Aqueduct, and north of State Route (SR)-138. The development footprint of this alternative would be limited to the following Planning Areas, as identified in Figure 4: 23-28, 30-32, and 35. The aqueduct is an appropriate demarcation for the project development footprint (i.e., by limiting the project to the east of the aqueduct).

F.5-16 cont.

This above-described alternative would result in significantly fewer biological and aesthetic impacts. This alternative would avoid many direct impacts to existing SEAs (on the south side of SR-138, and western portion of the project site). It would provide a greater likelihood of protecting the "Tehachapi Connection linkage" (identified by the South Coast Wildlands Project) on the west side of the project site. It would protect the integrity of substantially more streams. The rich biological resources and blue line streams east of the aqueduct would be protected. The rich biological resources south of SR-138 would be retained, and many blue line streams located north and south of SR-138 would be preserved. The key viewshed as seen to the north and south of SR-138 would be better preserved. It appears that this proposed development footprint would be located primarily within annual grasslands.

All alternatives must include the construction or funding of underpasses beneath SR-138.

Dedication and management of open space

The DEIR must include for the proposed project, and every alternative, the requirement of a major fee simple dedication of ungraded open space to an appropriate public entity capable of managing open space for resource protection and recreational use, to guarantee that the biological resources in the dedication areas are not adversely affected in the future. The Mountains Recreation and Conservation Authority (MRCA) is one appropriate agency to accept this dedication. In all cases, a CEQA mitigation measure must require that every acre of the open space dedication remain as natural open space in perpetuity, to prevent future land use changes for active park uses. To ensure adequate protection of any fee title dedication, a mitigation measure must specify that fee title shall be legally transferred to such agency prior to vegetation clearing or grading on the site. Figures in the DEIR must clearly depict the location of this dedication of open space.

F.5-16 cont.

The DEIR must include for the proposed project, and all alternatives, a requirement for a Community Facilities District (CFD), Landscape Maintenance District, or sufficient funds from the developer (e.g., in the form of a non-wasting endowment), to permanently fund maintenance of the open space. Open space dedications are a form of mitigation. For such mitigation to stand the test of time, it must be protected and in some cases actively managed. A complete open space mitigation package must include maintenance funding. The proposed project and every CEQA alternative must require that the funding mechanism be established prior to grading or vegetation removal.

If the project is phased, it may be appropriate to require portions of the fee simple dedication and the establishment of a proportional amount of the endowment, for example, prior to grading or vegetation removal for each respective phases. Likewise, a series of CFDs may be required. The DEIR must present the phasing plan for these mitigation measures. If later phases of project are delayed, at least the initial dedication must be able to stand-alone as an ecologically-viable sub-unit that is adjacent to other open space.

F.5-16 cont.

Thank you for your serious consideration of these comments. Please direct any questions or future correspondence to Paul Edelman of our staff at (310) 589-3200 ext. 128 or Judi Tamasi at (310) 589-3200 ext. 121, or to the address listed on the letterhead.

Sincerely,

Jerome C. Daniel

Responses to Comment Letter F.5
Santa Monica Mountains Conservancy
July 17, 2017

Response to Comment F.5-1:

Thank you for your comment and for your participation in this public process. The comments on the NOP are addressed in response to Comment F.5-16.

Response to Comment F.5-2:

Numerous studies on wildlife movement[533] have been conducted on the Project site as well as throughout the Project region, and were used to inform the wildlife movement discussions in Sections 5.7.3, Environmental Setting, and Section 5.7.6, Environmental Impacts.[534] Studies on wildlife movement in the Project region have generally shown the Project area as a whole to be largely outside the critical regional corridor linking the Sierra Nevada-Cascade Cordillera with the Sierra Madre-Transverse-Peninsular Range Cordillera. Although the Tehachapi Linkage area, which represents the connection between these two mountain systems, occurs just to the west of the Project, the Project lands have generally not been included as part of this regional corridor. The primary resources in SEA 17, which surrounds the Project to the west and south and will remain unimpacted by the Project, are wildlife movement and the mosaic of associated habitats.[535] Additionally, as described on Draft EIR pages 5.7-62 and 5.7-63, two regional conservation plans will assist in sustaining the functionality of the regional landscape linkage for future wildlife populations. These plans offer elements for long-term sustainability and management of a Tehachapi Mountains landscape linkage: the Tejon Ranch Conservation and Land Use Agreement and the Tehachapi Upland Multiple Species Habitat Conservation Plan. Please see Linkage Analysis for the Southernmost Portion of the Linkage from Sierra Madre to Sierra Nevada and Draft Interim Wildlife Movement Corridor Assessment, Centennial Project Site, Tejon Ranch in Draft EIR Appendix 5.7-B for more details and graphics. Also see the following responses to Comments for additional discussion of wildlife movement: F.3-24, F.3-25, F.3A-32, F.3A-33, F.3A-34, B.4-56, B.4-57, F.5-2, F.8-168, F.7-22, F.3A-34, F.3A-32, and F.3A-33.

Response to Comment F.5-3:

Please see response to Comment F.5-2.

There is no requirement or standard of practice under CEQA for comparison of components amongst EIRs and/or EISs prepared by either the same, or, as in this case, different lead agencies. It would be permissible for the County of Los Angeles to have provided comment on Caltrans' EIR/EIS for the Northwest 138 Corridor Improvement Project during its public

533 DRP 2017, Table 5.7-2
534 *Id.,* Table 5.7-2; Beier 2003; Penrod et al. 2003, 2004, and 2005; Pioneer Environmental Services 2004; Trust for Public Lands 2004
535 DRP 2017, p. 5.7-8

review period. As such, the assertion that the Draft EIR is deficient for not including this comparison is erroneous.

Regardless, the Draft EIR addresses wildlife movement extensively in Section 5.7, Biological Resources, and Section 8.0, Alternatives, where wildlife movement is a relevant comparative issue for an alternative. It is noted that the majority of the Project site only abuts SR-138, with solely the southeastern portion of the site including areas both to the north and south of the roadway. State CEQA Guidelines require the Project Draft EIR to assess potential impacts to wildlife movement. Consistent with this requirement, in the wildlife movement assessment, connectivity between the Tehachapi Mountains and the San Gabriel Mountains, from a biological perspective, was considered. The assessment, which used various scientific studies, concluded that although maintaining baseline connectivity between the two regions is essential, development of the Project would not significantly impact movement between these regions.

However, in order to lessen Project impacts on wildlife movement, mitigation measures are proposed. Specifically, MM 7-14, described on pages 5.7-190 and 5.7-191, designates a SR-138 wildlife underpass (along with a 50-foot open space buffer) at the current intersection of the California Aqueduct and Cement Plant Road. The width of the underpass shall be 100 feet and shall flare out on both sides of the highway to a 150-foot width in the Project open space adjacent to the highway. These specifications are expected to allow some local wildlife to safely pass between open space areas on opposite sides of the highway. The passage is intended for local wildlife usage within the area and infrequent regional movement that may traverse from areas northwest of the Project site to areas south of the Project site. In addition, the additional underpass to be constructed under SR-138 further to the east is expected to provide some local movement for animals within the Project area. This undercrossing is consistent with the Antelope Valley Area Plan, and both undercrossings provide for connectivity for local wildlife movement across SR-138. As such, the assertion that the Project, and its alternatives, eliminates any wildlife movement potential across SR-138 is erroneous.

Response to Comment F.5-4:

Although the earthen crossings depicted in the comment letter may be used by wildlife to some degree, it is expected that because most wildlife species prefer some amount of vegetative cover as a source of shelter. The riparian habitat along Oso Canyon and its tributaries, as well as the oak woodland communities that occur in the western portion of the Project site and further to the west of the site, are expected to support more regional wildlife movement as described in detail in the Draft EIR from page 5.7-50 to 5.7-62. Indicator species are not likely to frequently use the earthen crossings depicted in order to move eastward, where the habitat is mostly grassland with few trees or tall shrubs. Those species moving from the Tehachapi's southward, are most likely intersecting with the SR-138 west of the Aqueduct, at which point the Aqueduct runs underground—a crossing that will not be impacted by the Project. The Commenter's statement that the Project overlaps prime crossing areas along the SR-138 is not consistent with the most current and widely accepted literature regarding this linkage zone: *Linkage Analysis for the Southernmost*

Portion of the Linkage from Sierra Madre to Sierra Nevada (please see Appendix 5.7-B for details and graphics). As described in the Draft EIR, this study clearly identifies the critical regional linkage to the west of the Project site (see Exhibit 5.7-6 on page 5.7-56 of the Draft EIR). Please also see responses to Comments F.3-24, F.3-25, F.3A-32, F.3A-33, F.3A-34, B.4-56, B.4-57, F.5-2, F.8-168, F.7-22, F.3A-34, F.3A-32, F.3A-33, B.4-34, B.4-35, B.4-36, B.4--37, F.8-165, F.8-165A, F.8-166, and F.8-167 for additional discussion of wildlife movement, crossings, and pronghorn.

Response to Comment F.5-5:

The comment states that the Draft EIR fails to address the wildlife movement unique to the Project site, and that the Project will permanently eliminate the only linkage from Tehachapi Mountain core habitat to core habitat. The claim made in the comment that the Project will permanently eliminate the only Tehachapi Mountains core habitat to core habitat connection is unfounded. The wildlife movement studies conducted in the Project region[536] do not support the notion that the Project site is situated within a crucial wildlife movement corridor. Local movement is mostly retained through the open space corridors scattered throughout the site, and regional wildlife movement largely occurs, based on the literature, west of the Project site.[537] The Project site itself does not represent high quality long-range movement habitat due to the existing California Aqueduct barrier and the overall lack of cover. Wildlife are not drawn to the Project site as it generally lacks attractive resources, topography, and cover.[538] Wildlife movement occurring from the Tehachapi Mountains to the San Gabriel Mountains south of the Project is much more likely to cross west of the Project site.

Response to Comment F.5-6:

According to the Antelope Valley Plan, the community of Neenach to the east of the Project site has been designated as Rural Land 5, with a maximum density of 1 residential unit for each 5 gross acres of land. This designation is intended to reflect the existing density of the rural town areas and is not intended to promote further land divisions. The claim that road density increases dramatically east of the Project is an overemphasis of the actual conditions. These areas will not likely experience increased development over time based on the land designations. As stated in the response to Comment F.5-5, the Project site itself does not represent high quality long-range movement habitat due to the existing California Aqueduct barrier, and the overall lack of cover.[539] Furthermore, it should be noted that the cumulative impacts on wildlife movement are considered potentially significant as discussed in Draft EIR Section 7.0, Cumulative Impacts.

Response to Comment F.5-7:

The Commenter states that the Draft EIR fails to consider impact avoidance to maintain habitat connectivity from the Tehachapi Mountains through the Project site and across the

536 DRP 2017. Table 5.7-2; *Id.,* pp. 5.7-23, -55, -56
537 *Id.,* pp. 5.7-56 to -64, -164 to -166
538 *Id.,* pp. 5.7-63, -64
539 *Ibid.*

SR-138 to the Angeles National Forest. The Project design has been dramatically reduced over time. The impact area in the west is significantly smaller than previously proposed. In redesigning the Project design west of the California Aqueduct, the intention was to lessen impacts on regional wildlife movement. The current impact footprint avoids the most high-quality wildlife movement corridor habitat. Wildlife is most likely to pass from the Tehachapi Mountains in the north to the Angeles National Forest in the south (and vice versa) west of the California Aqueduct, where the habitat provides greater cover.[540]

Additionally, the Commenter states that the earthen crossing over the California Aqueduct north of the Project is considered an important factor for a north-south linkage from the Tehachapi Mountains in the north, through the Project site, southward to the Angeles National Forest (and vice versa). As stated in the Draft EIR, "wildlife that cross the Aqueduct at this location would have to traverse open areas to reach the crossing from the north or east, then traverse over three miles of relatively open grassland and cross SR-138 to reach cover provided by woodlands south of SR-138. As a result, this crossing is likely to provide occasional wildlife movement opportunities for a subset of species of the region typical of grassland dominated landscapes similar to the project site". To summarize, the Project area does not represent an important habitat linkage for wildlife looking to move from the Tehachapi Mountains to the San Gabriel Mountains as it consists of a wholly different habitat type and generally lacks sufficient cover. The Draft EIR thoroughly analyzes potential Project impacts to wildlife movement (see Draft EIR Section 5.7.3, Environmental Setting, and Section 5.7.6, Environmental Impacts). The conclusion that Project impacts to wildlife movement are considered not potentially significant per State CEQA Guidelines is founded on various wildlife movement studies conducted on the Project site and in the Project region. Although impacts on local wildlife movement are considered less than significant and no mitigation is required, MM 7-14 is proposed to reduce impacts on local wildlife movement and to provide for habitat connectivity in the Quail Lake area.[541] Implementation of MMs 13-2 and 13-6 from Section 5.13, Visual Resources, which require the Project Applicant to develop a Lighting Plan to reduce potential impacts to biological resources caused by light and glare, would also reduce the level of the impact.[542] Implementation of MM 7-17 is also expected to further reduce impacts by requiring a public awareness program to restrict public access to the riparian and open space areas.[543] It should also be noted that the cumulative impacts on wildlife movement are considered potentially significant as discussed in Section 7.0 of the Draft EIR.

Response to Comment F.5-8:

The vast majority of the blueline streams on the Project site are ephemeral in nature and only contain water for a few days following a large storm.[544] There are ponded areas that hold water most of the year, and only drying up in the middle of summer, such as stock/cattle ponds but they are few and very small.[545] The Project site contains water troughs for cattle,

540 *Id.,* p. 5.7-57

542 *Id.,* p. 5.7-167
543 *Id.,* pp. 5.7-192, -193
544 *Id.,* pp. 5.7-11, -48
545 *Id.*, pp. 5.7-10, -21, -39, -130

although most of them are placed out in the open as shown in Exhibit 5.7-17. The species mentioned in the comment (i.e. black bears, mule deer, foxes, bobcats, long-tailed weasels, and mountain lions) have relatively large home ranges, and would not be expected to occur in concentrated numbers in any area. Although tracks of black bear, bobcat, and mountain lion have been seen on the Project site, they are unlikely to be a common occurrence except for the potential home range of a bobcat, as discussed on pages 5.7-50 and 5.7-51 of the Draft EIR.

Response to Comment F.5-9:

As explained in the Draft EIR, one aspect of land use planning considered under CEQA is the consistency of the Project with relevant land use plans and regional growth projections.[546] In this case, the Project is located within the planning boundaries of the Southern California Association of Governments' (SCAG) 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS).[547] SCAG is the Metropolitan Planning Organization (MPO) for six counties, including Los Angeles County.[548] As the designated MPO, the federal government mandates that SCAG research and draw up plans for, among other topics, population growth management.[549] Therefore, two of SCAG's primary responsibilities are (i) developing demographic growth projections for the region, and (ii) preparing the Regional Housing Needs Assessment (RHNA) for review and approval by the State, including planning for future population, housing, and employment growth throughout the SCAG region, including the Antelope Valley Area Plan's (AVAP) planning area.[550]

SCAG divides the entire region into traffic analysis zones (TAZs) as a basic geographic unit for its population, household, and employment growth projections.[551] The 2016 RTP/SCS includes growth projections for the region through year 2040, which are set forth in TAZ maps.[552] These are the "growth projections" described in the Draft EIR. Where applicable, California Department of Finance regional population forecasts are also provided in the Draft EIR.[553] Although the County is not legally obligated to issue building permits for every residential unit or square foot of commercial or industrial use allowed under the AVAP on the Project site (i.e., "max out the AVAP," in the Commenter's words), it is legally obligated to implement and regularly update the long-term comprehensive General Plan capable of accommodating its allocated share of the RHNA, and to set forth the standards of population density and building intensity that the County recommends for the various land uses covered by such plan.[554] The AVAP is a component of the County's General Plan.[555]

554 California Government Code §§ 65302(a), 65580 *et seq*.
555 DRP. 2015 (June). *Antelope Valley Area Plan: Town & Country* (p. 1-2). Los Angeles, CA: DRP. http://planning.lacounty.gov/tnc.

Contrary to this comment's claim, the Draft EIR did not conclude that "Alternative E (as well as C and D) would not achieve enough housing and employment levels anticipated in the AVAP and growth projections." Rather, the Draft EIR expressly determined that "Alternatives C, D, and E would … meet the objective for an environmentally and economically sustainable master-planned community *while also being largely consistent with the land use designations for the site*" (emphasis added).[556] However, the Draft EIR also concluded that, under Alternative C, "the County would not be able to achieve the housing and employment levels anticipated by the AVAP and associated with the adopted growth projections unless development occurs in excess of projections in other areas of the Antelope Valley" because this alternative "would provide less development than the Project".[557] Alternative C would provide 92 fewer dwelling units on 35 fewer acres than would the Project.[558] Alternative C would also provide 200,000 fewer square feet of commercial, business park and employment areas on 21 fewer acres than would the Project.[559]

For an explanation of why it is appropriate for the Draft EIR to reject Project alternatives that would reduce land use densities below development levels assumed by Alternative C, please see response to Comment F.5-11. Nevertheless, the Draft EIR determined that Alternative C could attain the Project objective of implementing the AVAP policies applicable to the West EOA.[560]

The Commenter is correct that Draft EIR Table 8-3 mistakenly states that Alternative D would provide less development than the Project. In fact, as explained on Draft EIR page 8-51, Alternative D proposes the same development on the site as proposed by the Project. In response to this comment, the last paragraph in Table 8-3, row one, column two, is revised to correct a typographical error as follows:

> However, Alternative~~s~~ C ~~and D~~ would provide less development than the Project. Under thi<u>s</u>~~ese~~ alternative, the County would not be able to achieve housing and employment levels anticipated by the AVAP and associated with the adopted growth projections unless development occurs in excess of projections in other areas of the Antelope Valley.

Response to Comment F.5-10:

This comment states that the Draft EIR is "deficient for rigidly using a flexible planning document to dictate that no substantial biological impact avoidance should even be attempted". Contrary to this comment's claim, however, the Draft EIR does include alternatives that would accomplish substantial biological impact avoidance. In addition to preserving thousands of acres of contiguous natural open space and important biological resources, Alternative E would disturb approximately 656 fewer acres than the proposed Project, and would increase the ratio of acreage of open space and preserved lands to total

556 DRP 2017, p. 8-69
557 *Ibid*.
558 *Id.,* p. 8-15, Table 8-1
559 *Ibid*.
560 *Id.,* p. 8-69

site acreage by approximately 4 percent compared to the Project.[561] The reduced impact area would result in a comparable reduction in impacts to various biological resources, including vegetation types, habitat for special status plant and wildlife species, and jurisdictional drainages.[562]

The County disagrees with this comment's assertion that Alternatives C and D provide mere "window dressing" with respect to reduced biological impacts. Alternative C would reduce significant impacts to biological resources by reducing the Project's development footprint so as to avoid approximately 37 jurisdictional drainages that indirectly function as wildlife movement corridors and serve important ecological functions.[563] Whereas, Alternative D would relocate two of the Project's proposed water tanks and its proposed water treatment plant (WTP) to avoid impacts within the Oso Creek drainage, a sensitive habitat.[564] Like Alternative E, these two alternatives would also preserve thousands of acres of contiguous natural open space and important biological resources.[565]

The County also disagrees with this comment's assertion the Project and its alternatives do not benefit the public. Among other important benefits, the Project and its alternatives would all provide an economically sustainable master-planned community with housing and employment opportunities needed to accommodate regional growth projections while preserving thousands of acres of contiguous natural open space and important biological resources.[566]

Please also see response to Comment F.5-11.

Response to Comment F.5-11:

This comment claims that the Draft EIR's alternatives analysis "is deficient for not including the least damaging alternative it can conclude achieves enough housing and employment levels anticipated in the AVAP and growth projections." The County disagrees with the Commenter for the reasons stated below.

The Commenter misstates the legal standard for an adequate alternatives analysis under CEQA. CEQA does not require the EIR to include "the least damaging alternative it can conclude achieves enough housing and employment levels anticipated in the AVAP and growth projections," or to establish "a quantitative threshold of what minimum size and shape project would be consistent with the AVAP." Rather, CEQA requires the EIR to identify a reasonable range of feasible alternatives that could reduce or avoid some of the Project's significant environmental effects while attaining most of the Project objectives.[567] For purposes of CEQA, "feasible" means "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and

561 *Id.,* p. 8-54
562 *Ibid*.
563 *Id.,* p. 8-17
564 *Ibid*.
565 *Id.,* p. 8-70
566 *Id.,* pp. 8-69, -70
567 PRC §§ 21002, 21002.1(a), 21100(b)(4); CEQA Guidelines § 15126.6

technological factors." The Lead Agency has the discretion to determine how many Project alternatives constitute a reasonable range.[568]

Moreover, as recognized by the California Supreme Court, "the statutory requirements for consideration of alternatives must be judged against a rule of reason" (internal citations omitted).[569] "CEQA establishes no categorical legal imperative as to the scope of alternatives to be analyzed in the EIR. Each case must be evaluated on its facts[.]"[570] Thus, the adequacy of the EIR's alternatives analysis should be considered in light of the Project's potential environmental effects, the nature of the Project, relevant County policies, and other pertinent facts.[571]

The Draft EIR analyzes four on-site alternatives and one off-site Project alternative, in addition to the statutorily required "No Project" alternative (designated by the Draft EIR as "Alternative A"). All of the alternatives would be consistent with, and are designed to promote the policies of the Antelope Valley Area Plan (AVAP) and its Rural Preservation Strategy, with the exception of Alternative B.

Alternative B, the Previously Proposed Project alternative, is larger than the proposed Project and is based on the original Centennial Project application submitted in 2002, prior to the County's adoption of the AVAP. Alternative B covers approximately 11,676 acres and would permit development of 7,847 acres with a maximum of 22,998 dwelling units, approximately 12.2 million square feet (sf) of employment-generating uses, approximately 2 million sf of retail-serving centers, and approximately 943 acres of civic and institutional uses. Alternative B would exceed the approved population, housing, and employment projections included in the AVAP for the area.[572]

Alternative C, the Additional Drainage Avoidance alternative, would reduce significant biological resource impacts by reducing the Project's development footprint so as to avoid approximately 37 acres that would otherwise be impacted by the Project and preserve it as open space. The primary environmental benefit of Alternative C is that it would reduce impacts to jurisdictional drainages that indirectly function as wildlife movement corridors and serve important ecological functions.[573] Alternative C would reduce the number of residential units to 19,241, as compared to the Project's proposed 19,333 dwelling units.[574] Alternative C would also provide 200,000 fewer square feet of commercial uses as compared to the Project.[575]

Alternative D, the Infrastructure Relocation alternative, would relocate two of the Project's proposed water tanks and its proposed water treatment plant (WTP) to other areas on the Project site. This relocation would reduce the WTP's potential impacts within the Oso Creek

568 *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 566 (Goleta)
569 *Id.,* at 562
570 *Id*., at 566
571 *Mira Mar Mobile Community v. City of Oceanside* (2004) 119 Cal.App.4th 447, 487

573 *Id.,* p. 8-17
574 *Id.,* p. 8-15
575 *Ibid*.

drainage, a sensitive habitat, would reduce the Project energy demand and would reduce certain visual and air quality impacts. No change in development capacity would occur under this alternative.[576]

Alternative E, the Density Clustering/East of Aqueduct alternative, would relocate proposed land use development from the east and west portions of the Project site to the central portion of the site, while maintaining the same number of dwelling units, employment generating uses, and other land uses, in a higher density cluster development pattern.[577] Alternative E would disturb approximately 656 fewer acres than the proposed Project, and would increase the ratio of acreage of open space and preserved lands to total site acreage by approximately 4 percent compared to the Project.[578] The reduced impact area would result in a comparable reduction in impacts to various biological resources, including vegetation types, habitat for special status plant and wildlife species, and jurisdictional drainages.[579]

Finally, Alternative F, the Central Economic Opportunity Area Development alternative, would relocate the Project from the AVAP's West Economic Opportunity Area (EOA) to its Central Economic Opportunity Area. This alternative assumes the same types of land uses, amount of development, public facilities, and other amenities as the proposed Project.[580] As compared to the Project, this alternative would likely have reduced biological impacts because the off-site location is expected to contain fewer jurisdictional drainages due to flatter terrain with fewer topographical variations and fewer oak woodland resources.[581] This alternative is also expected to have a reduced impact on wildlife movement and a reduced cumulative impact on special status vegetation types compared to the Project.[582]

Thus, in accordance with CEQA, the Draft EIR presents a reasonable range of potentially feasible on-site and off-site alternatives to the Project that would reduce and/or avoid some of the Project's potentially significant environmental effects. The selected alternatives promote informed decision making and public participation by providing for consideration a range of alternative land use patterns and siting options that will reduce and/or avoid some of the Project's significant environmental effects and attain most of the Project objectives. Accordingly, the alternatives analysis complies with the requirements of *Public Resources Code* §§ 21002, 21002.1(a).

The Draft EIR does not analyze any reduced density alternatives other than Alternative C. As explained in the Draft EIR, such alternatives were rejected for consideration because substantial reductions in the Project's proposed unit count and commercial square footage below levels assumed by Alternative C would result in a development proposal that is not

582 *Ibid*.

consistent with the goals and policies of the AVAP related to development within the West EOA, or supportive of the Project's objectives.[583]

The AVAP was adopted by the Board of Supervisors in June 2015 and is a component of the Los Angeles County General Plan 2035 (General Plan).[584] As explained in the AVAP's vision statement (Vision), "at the heart of the County's approach to community planning is the idea that the AVAP is an adopted version of the communities' aspirations for the future" which collectively "amount to a community vision, based on shared values and common goals".[585] At its core, the Vision is intended to ensure that "[t]he growing population's need for additional housing and employment opportunities is balanced against the need to respect historical heritage and preserve the natural environment".[586]

In preparing the AVAP, the County undertook an extensive and inclusive 8-year community participation program that commenced in the fall of 2007 and included a series of 23 community meetings.[587] At these community meetings, area residents and other stakeholders worked with County planners to develop a shared vision for the future that prioritized the participant recommendations, forming the foundation of the AVAP.[588] This community vision is embodied in the AVAP's "Rural Preservation Strategy".

"The AVAP's Rural Preservation Strategy addresses issues of Valleywide significance in a manner that builds upon the communities' vision statement."[589] The Rural Preservation Strategy is based on four types of environments that serve different purposes but collectively "preserve the rural character of the region, conserve environmental resources, and protect residents from potential hazards while allowing for additional growth and development".[590] These four environments include: Rural Town Centers; Rural Town Areas; Rural Preserve Areas; and Economic Opportunity Areas.[591]

Pursuant to the Rural Preservation Strategy, Rural Town Centers serve as the focal point of low-density communities served by locally-oriented public facilities and new locally-oriented commercial uses.[592] Rural Town Areas serve as transition area between Rural Town Centers and Rural Preserve Areas and are occupied by a mix of low-density residential and light agricultural uses.[593] Rural Preserve Areas are located outside of Rural Town Centers and are largely undeveloped, are generally unserved by existing or planned infrastructure and public facilities, and contain environmental resources, including Significant Ecological Areas, Scenic Resource Areas, and Agricultural Resource Areas.[594]

591 *Ibid*.
592 *Ibid*.
593 *Ibid*.
594 *Ibid*.

The Project site is located entirely within the AVAP's West EOA.[595] Per the Rural Preservation Strategy, Economic Opportunity Areas are defined clusters of land located along two new proposed major infrastructure projects in the AVAP planning area – the High Desert Corridor and the Northwest 138 Corridor Improvement Project.[596] During the AVAP community planning process, EOAs "were identified as having tremendous potential for economic growth" and, per the Rural Preservation Strategy, major development in the AVAP "should be guided to these areas so that the areas around them can be preserved and maintained at low density, or agricultural uses".[597]

Thus, the community vision embodied in the AVAP "necessitates a 'trade-off' between preserving rural character and developing additional infrastructure".[598] As stated by the AVAP's Rural Preservation Strategy, this "trade-off" entails "maximiz[ing]" development in EOAs so as to generate property tax revenues and developer fees needed to help fund new infrastructure and public facilities needed to serve the AVAP planning area without sacrificing the rural character of Rural Town Centers, Rural Town Areas, and Rural Preserve Areas.[599] To ensure that this strategy is implemented, the AVAP specifies that "[t]he interpretation of [AVAP] policy should be governed by the Vision and Rural Preservation Strategy of the Antelope Valley Area Plan".

To promote implementation of the AVAP's Rural Preservation Strategy, the AVAP's Land Use Goals and Policies direct the majority of the Antelope Valley's projected growth to EOAs. (*See* AVAP Policies LU 1.1, 4.1.) Indeed, while it is a goal of the AVAP to ensure a land use pattern that protects environmental resources (*see* AVAP Goal LU 2), the AVAP policies adopted to implement such goal expressly exclude EOAs, as do all other AVAP land use policies that affirmatively limit or otherwise restrict the amount of potential development within the AVAP. (*See* AVAP Policies LU 2.2 through LU 2.2, and LU 3.1 through 3.7.) All of these AVAP policies thus promote the Rural Preservation Strategy's expressly stated "trade-off" that requires "maximiz[ing]" opportunities for development within EOAs so as to preserve the rural character of the Antelope Valley outside of the EOAs.

Thus, contrary to the Commenter's claim, the Draft EIR's determination to reject alternatives that would not support the AVAP's recommended distribution of population density and building intensity within the West EOA is far from arbitrary. Rather, it is a reasonable and appropriate criterion when considered in the context of the AVAP's Vision and Rural Preservation Strategy.

In *Goleta*, the California Supreme Court discussed the importance of long-term comprehensive land use planning. In that case, the Court explained that land use plans like the AVAP "embody fundamental policy decisions that guide future growth and development" and that, when preparing such plans, "[l]ocal governments must confront, evaluate and resolve competing environmental, social and economic interests."[600] According to the Court,

595 DRP 2017, p. 4-4
596 DRP 2015, p. I-8
597 *Ibid*.
598 *Ibid*.
599 *Ibid*.
600 *Goleta,* at 571

such comprehensive planning processes "necessarily compels cities and counties to consider *alternate* land-use goals, policies and implementation measures" (emphasis in original).[601] "The process, moreover, is structured to transcend the provincial. Public participation and hearings are required at every stage, in order to obtain an array of viewpoints."[602] Because of this, the Court held, a project-level EIR, such as the Draft EIR in this case, "is not ordinarily an occasion for the reconsideration or overhaul of fundamental land use policy."[603]

As discussed above, the AVAP is the product of 23 public meetings conducted over the course of 8 years to "develop a shared vision for the future, identify community issues, draft proposals for the future, and prioritize their recommendations, forming the foundation of the Area Plan".[604] In addition, County planners "partnered with other County departments to explore the recommendations, refine the proposed goals and policies, plan for program implementation, and gather support to ensure success."[605] Indeed, development of the AVAP was "an iterative process, and in this case, the communities were included in the earliest steps of development and subsequent rounds of review".[606]

Not only were alternative land use visions for the AVAP debated and refined by the public and County over the course of the AVAP's eight-year planning process, they were also subject to environmental review in accordance with CEQA. The Antelope Valley Area Plan Draft EIR (AVAP EIR) analyzed a Reduced Intensity Alternative that would have reduced the number of dwelling units, population, and employment permitted under the AVAP by 23 percent.[607] The AVAP EIR also analyzed an Alternative Land Use Policy Map alternative that would have reduced the number of dwelling units permitted under the AVAP by 36 percent, the population by 39 percent and employment by 66 percent.[608] Thus the public has had ample opportunity to review and comment on the proposed use of the Project site with a building density and intensity comparable to the proposed Project. The fact that the applicant has proposed a project that is consistent with the AVAP's Rural Preservation Policy should not prompt reconsideration of the AVAP's planning policies in the Draft EIR.

In the words of the *Goleta* court:

> Informed and enlightened regional planning [does] not demand a project EIR dedicated to defining optimal alternative[s] … without regard to feasibility. Indeed, such ad hoc reconsideration of basic planning policy [is] not only unnecessary, but would [be] in contravention of the legislative goal of long-term comprehensive planning. … [T]he keystone of regional planning is consistency – between the general plan, its internal elements, subordinate ordinances, and all derivative land use decisions. Case-by-case reconsideration of regional land-use policies, in the context of a project-

> specific EIR, is the very antithesis of that goal. … [A]n EIR is not ordinarily an occasion for the reconsideration or overhaul of fundamental land use policy.
>
> (*Goleta*, at 572-573)

Therefore, it is appropriate for the Draft EIR to reject Project alternatives that would require substantial reductions in the Project's proposed unit count and/or commercial square footage below levels assumed by Alternative C because such alternatives would result in a development proposal that is not consistent with the goals and policies of the AVAP.

Finally, the County's reasons for rejecting the so-called Public Input Alternative are set forth on Draft EIR page 8-13. First, this proposed alternative was recommended by the Conservation Biology Institute and South Coast Wildlands in 2006, well before the County's adoption of the AVAP. Second, this proposed alternative would include the development of approximately 4,990 acres of land located east and northeast of the Project within 5 separate and noncontiguous areas (much in Kern County) and would not be consistent with the Land Use Policy Map of the AVAP (e.g., portions of the alternative site are designated by the AVAP as Open Space Conservation, which does not support urban development). Third, this alternative would reflect an approximate 33 percent decrease in developable acreage and does not provide enough acreage to include both Project-proposed land use and on-site natural open space areas. Fourth, this alternative would also lead to the unavoidable loss of agricultural land, similar to the Project. Therefore, this alternative is infeasible and was not carried forward for consideration in the Draft EIR.

Response to Comment F.5-12:

The purpose of an EIR is "to identify the significant effects on the environment of a project, to identify alternatives to the project, and to indicate the manner in which those significant effects can be mitigated or avoided".[609] As such, an EIR neither accepts nor dismisses impacts, but discloses the impacts to the public and decision makers. This comment could apply to a decision on a project, but not to the CEQA documentation prepared for that project.

Consistent with CEQA and the State CEQA Guidelines, the Draft EIR for the Centennial Project fully discloses the environmental impacts of the Project and its alternatives, with implementation of all feasible mitigation measures, for consideration by the County of Los Angeles Board of Supervisors as part of its decision-making process. This includes analysis of geotechnical (Section 5.1), biological resources (Section 5.7), visual resources (Section 5.13), transportation (Section 5.10), and land use planning (Section 5.8). Specifically, the analysis of the Project site's proximity to the San Andreas Fault is presented under Threshold 1-1 beginning on page 5.1-16; the analysis of habitat modification is presented primarily under Threshold 7-1 beginning on page 5.7-142; the analysis of public transit is presented on under Threshold 10-6 beginning on page 5.10-141; and the analysis of scenic highways is presented under Threshold 13-3 beginning on page 5.13-23. The Project site is not presently served by public transit given the absence of transit ridership; however, the Project's planned transportation and transit features are included in MM 10-

609 CEQA Guidelines, Section 21002.1(a)

25 (i.e., construction of two transit hubs and implementation of a Transportation Management Association [TMA] to implement ongoing transportation improvements and programs). Regarding the second part of the comment regarding the Project's location and land use principles, this will be included as part of the record and made available to the Regional Planning Commission and Board of Supervisors prior to a final decision on the proposed Project. However, because the comment does not address or question the content of the Draft EIR, no further response is required.

Response to Comment F.5-13:

This comment proposes a Project alternative that would maintain a contiguous habitat linkage from Project-adjacent aqueduct overcrossings to State Route (SR) 138 and open space south of SR-138. The County disagrees with this comment.

First, as discussed in response to Comment F.5-11, the Draft EIR already presents a reasonable range of potentially feasible on-site and off-site alternatives to the Project that would reduce and/or avoid some of the Project's potentially significant environmental effects. The selected alternatives promote informed decision making and public participation by providing for consideration a range of alternative land use patterns and siting options that will reduce and/or avoid some of the Project's significant environmental effects and attain most of the Project objectives. Accordingly, the alternatives analysis complies with the requirements of CEQA.

Second, as discussed in the Draft EIR, areas providing wildlife movement connectivity—specifically, adjacent areas of similar habitat were generally available to a greater degree outside the Project's proposed development footprint, than within the footprint.[610] The area of the Project site that provides the greatest cover and is nearest to the regional wildlife corridor, located on the western edge of the Project site, is largely included in permanent open space that would be protected by the Project and all of the alternatives considered in the Draft EIR, with the exception of Alternative F, the off-site alternative.[611]

Moreover, although large areas of open space occur in and adjacent to the vicinity of the Project site, the California Aqueduct and Interstate (I) 5 substantially limit the site's ability to contribute to regional wildlife movement.[612] In particular, as shown in Draft EIR Exhibit 5.7-6, Regional Wildlife Movement, the Aqueduct presents a barrier to the regional movement of wildlife to and from the site in the east-west and north-south directions.[613] The Aqueduct's West Branch extends north to south through the center of the Project site to Quail Lake and is a barrier to east-west movement across the site.[614] The East Branch runs close to the northern boundary of the site and is a barrier to north-south movement in that area.[615] Underpasses and culverts located on I-5, north of its intersection with SR-138, do facilitate

610 DRP 2017, p. 5.7-60
611 *Id.,* p. 5.7-164
612 *Ibid*.
613 *Ibid*.
614 *Ibid*.
615 *Ibid*.

east-west movement of some species across this freeway.[616] Wildlife access to these would not be hindered by the Project or the alternatives considered in the Draft EIR.

Although the four identified potential wildlife crossings of the West Branch of the Aqueduct would remain intact, the feasibility of their use as such would become further reduced with Project buildout.[617] This reduction would result from increased barriers to access as well substantial increases in truck traffic at the SR-138 crossing due to the realignment of Cement Plant Road to intersect with SR-138 immediately adjacent to the potential local wildlife crossing point at the SR-138 (Location 4 on Draft EIR Exhibit 5.7-6). However, new dispersal impediments would only affect portions of populations of small organisms that are not considered to be of conservation concern, and these impediments are not expected to substantially affect the likelihood of the regional population persistence of those species.[618] Impacts on local wildlife dispersal are considered to be less than significant at the project level.[619] Thus, the Commenter's proposed alternative would not offer significant environmental advantages with respect to the Project's potential impact on wildlife movement corridors at the project level.

The Draft EIR conservatively concludes that the Project may contribute to a cumulative significant impact on *regional* wildlife movement, but that impact would not be reduced by this comment's proposed alternative. As explained in the Draft EIR, because most of the larger wildlife species in the region do not typically cross large expanses of sparsely vegetated landscape (such as the majority of the Project site), the central and eastern portions of the Project site are not likely to be used by wildlife to move between and within the regional open space areas in the site vicinity.[620] Thus, the Commenter's proposed alternative would not offer significant environmental advantages with respect to the Project's potential impact on wildlife movement corridors at the cumulative level.

Since this comment's proposed alternative would not offer significant environmental advantages as compared to the Project or with the alternatives that are presented in the Draft EIR, its analysis is not required by CEQA.[621]

Response to Comment F.5-14:

Regarding the first sentence of this comment, the "thousands of acres of proposed open space" in Kern County is assumed to be referring to the off-site portions of the proposed Mitigation Preserve. This is currently private land and would remain private land and is not part of the Project site. There is no connection between the environmental impacts identified in the Draft EIR and the need for public access to these areas. Regarding the second sentence of this comment, the Mitigation Preserve is proposed to reduce impacts to biological resources only. If the Commenter's use of the phrase "public resources" is intended to be a

616 Pioneer Environmental Services. 2004 (July). FINAL Evaluation of Potential Population Isolation for Wildlife at Tejon Ranch, Lebec, California (Prepared for Tejon Ranch Company). Logan, UT: Pioneer Environmental Services.
617 DRP 2017, 5.7-166
618 *Ibid*.
619 *Ibid*.
620 *Id.,* p. 7-17
621 CEQA Guidelines § 15126.6(b); *Tracy First v. City of Tracy* (2009) 177 Cal.App.4th 912, 929

synonym for biological resources, the provision for public access to the proposed Mitigation Preserve would not reduce this impact regardless. On the contrary, public access to the Mitigation Preserve is inappropriate because it would interfere with habitat restoration activities. Further, the proposed Project facilitates public access to on-site parks, trails, and other recreation activities (i.e., wildflower viewing, birdwatching) on land which is currently private and situated in an area of the County that has little local parkland.[622] As discussed in Section 5.14 of the Draft EIR, the Project would meet, and exceed, the parkland requirements of the County's Parkland Dedication Ordinance/Quimby Act and the General Plan standard. Regarding the third sentence of this comment, the lands constituting the High Desert Hunt Club are currently private and would remain private with Project implementation. The maintenance of this current use if the Project were implemented is not mitigation, nor is it presented as such in the Draft EIR. Therefore, the statement that the EIR calls for protection of this land for private use to mitigate impacts to public resources is erroneous.

Response to Comment F.5-15:

The comment is noted for the record and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. No further response is required given that the comment does not raise a specific concern regarding the content of the Draft EIR.

Response to Comment F.5-16:

A revised NOP was distributed on October 2, 2015. The Scoping process is described in the Draft EIR on pages 2-3 through 2-5.

The NOP describes the Project as it was then proposed, which has been changed considerably, as noted in Comment F.5-1. The NOP comment letter states that there will be impacts to habitat linkages. These issues are fully addressed in the Draft EIR. The term is defined as Landscape Linkages on page 5.7-52. It is also discussed under Home Range on pages 5.7-52 to 5.7-55 and under Regional Wildlife Movement on pages 5.7-56 to 5.7-64. The sustainability of the linkages is addressed on pages 5.7-62 and 5.7-63. Impacts to regional movement are addressed on pages 5.7-164 to 5.7-166.

The SMMC also requested that all the development on the entire Ranch be addressed in one CEQA document. Although this would be a comprehensive approach, it is not a reasonable approach. The subject Project is a Specific Plan as defined by the State of California and this Draft EIR is analyzing the Plan per state requirements.

The Project's infrastructure would not be sized to accommodate growth beyond that which is proposed by the Project.[623] Moreover, the County is not responsible for analyzing development beyond the borders of the Specific Plan, except in the growth-inducing and cumulative analysis impacts sections, which were prepared and included in the Draft EIR.

622 DRP 2017, p. 5.14-1
623 *Id.,* p. 5.8-22

The Growth-Inducing analysis is in Section 6.0 of the Draft EIR and the Cumulative analysis is in Section 7.0 of the Draft EIR.

The biological analysis did include a regional analysis (Section 5.7) as requested. This section includes details on the Project footprint, linkages, adjacent land uses, as well as impacts to the onsite and surrounding resources. The section also looks at habitat values. The Project has been revised to avoid the SEA almost entirely. There are exhibits depicting vegetation communities as well as sensitive communities and resources, such as grasslands. Tables with vegetation acres are included in the Draft EIR.[624]

There are six alternatives included in the Draft EIR, all reducing significant impacts, but usually at the cost of increasing impact to other features.

The Draft EIR also incorporates conservation on thousands of acres of open space with the requirement for ongoing management. The Specific Plan requires ongoing management through establishment of Districts or similar mechanisms; however, this is not an environmental issue.

The Project is planned to be phased over many years and the mitigation, where appropriate, will be phased as well.

Dear Mr. Sackett and Centennial Project Planners,

Subject: Centennial Draft Environmental Review, Project Number 02-232

Our town council appreciates the opportunity to participate in the review of the Draft Environmental Impact Review (DEIR), for the Centennial Project (Project). First let us state we have been forcefully and unequivocally opposed to this project for since its inception for a long list of reasons identified in this letter. The number of significant unmitigated impacts to our town council area, *our community* are unacceptable. If Regional Planning approves the Project's specific plan with "overriding considerations" describing housing, economic benefits, and selected instances of compliance with planning documents' policies, goals and objectives; instead, choosing to overlook the impacts to residents *already here* for residents of a planned, but not yet built, *city,* which fits description of "leapfrog development" (new development separated from existing development by substantial vacant land, alias for--sprawl), then Regional Planning and the County of Los Angeles have failed in implementing "Rural Preservation Strategy, "Smart Growth," "sustainability," and planning documents are ultimately not worth anything to rural communities' citizens who wish to maintain rural community character and lifestyle. F.7-1

The Town and Country outreach efforts and subsequent Antelope Valley Area Plan (AVAP) approved in 2015, has shown great bias and extended exclusive land use and development rights that run counter to Rural Preservation Strategy--in that Economic Opportunty Areas (EOAs) are excluded from Special Hazards Management Areas meant to protect residents, employees, and businesses from risks in building in those areas. Land Use Goals LU-2: "A land use pattern that protects environmental resources" describes this exclusion: F.7-2

> This new model, which directs new investment to areas with existing and/or planned services and facilities and away from areas with natural hazards and environmental resources, will shape land use in the Valley, with policies that emphasize resource

efficiency, economic growth, and the preservation of rural character. Over the next 20 years, this Element will balance growth and economic development, the desires of residents to preserve their rural way of life, and the need for hazard avoidance and mitigation to determine the level of development that these factors can support.

F.7-2 cont.

Additionally, AVAP Land Use Policies detail the Project's special exclusions:

AVAP Policy LU 2.2: Except within economic opportunity areas, limit the amount *of potential* development within Scenic Resource Areas, including water features, significant ridgelines, and Hillside Management Areas, through appropriate land use designations, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

Goal LU 2: A land use pattern that protects environmental resources.

- Policy LU 2.1: Limit the amount of potential development in Significant Ecological Areas, including Joshua Tree Woodlands, wildlife corridors, and other sensitive habitat areas, through appropriate land use designations with very low residential densities, as indicatedin the Land Use Policy Map (Map 2.1) of this Area Plan.
- Policy LU 2.2: Except within economic opportunity areas, limit the amount of potential development within Scenic Resource Areas, including water features, significant ridgelines, and Hillside Management Areas, through appropriate land use designations, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.
- Policy LU 2.3: Except within economic opportunity areas, limit the amount of potential development in Agricultural Resource Areas, including important farmlands designated bythe State of California and historical farmland areas, through appropriate land usedesignations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.
- Policy LU 2.4: Except within economic opportunity areas, limit the amount of potential development in Mineral Resource Areas, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.
- Policy LU 2.5: Except within economic opportunity areas, limit the amount of potential development in riparian areas and groundwater recharge basins, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.
- Policy LU 2.6: Except within economic opportunity areas, limit the amount of potential development near the National Forests and on private lands within the National Forests, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

F.7-3

While the AVAP seeks to limit development in SEAs, Scenic Resource Areas, significant ridgelines, Hillside Management Areas, Agricultural Resource Areas, Mineral Resource Areas, riparian areas, groundwater reharge basins, and private lands within the National Forests, it is considering, with this Specific Plan, to override required "very low densities," that, in all other land use planning areas must

F.7-4

comply with Special Management considerations, ***except EOAs, i.e.*, Centennial Project**. This is *not* rural preservation. Moreover, Goal LU 3: "A land use pattern that minimizes threats from hazards," alternatively allows EOA high density housing and business development along two major fault zones, the San Andreas, and the Garlock faults; allows development in Very High Fire Hazard Severity Zones; development in Flood Zones designated by the Federal Emergency Management Agency; development on steep slopes identified as Hillside Management Areas; development in landslide and liquefaction areas; development in airport influence areas and near military lands (but not airspace?); which otherwise require compliance through "appropriate land use designations with very low residential densities."

F.7-4 cont.

When our town council participated in the Town and Country outreach, we sought a "Rural Preserve" designation, now implemented through "Rural Preservation Strategy" that limits both housing density and commercial development within our council boundaries. We have always understood the trade-off between convenience, infrastructure, and rural living, and always embraced rural living. It is interesting that Regional Planning considers our area "a very remote rural environment," whose residents "should be prepared to forego additional infrastructure in order to live in [that] very remote rural environment, and enjoy the benefits offered by such an environment" (AVAP I-8 June 2015). However, the currently and completely undeveloped land comprising the western EOA—the Project area, immediately adjacent to our rural preserve town council area, is somehow not considered "remote," without expectation of foregoing services and infrastructure, and whose significant environmental resources, and special hazard areas—seismic zones, flood and fire severity zones pose large and specific threat to not only significant environmental resources in the "remote" project area mentioned previously, but to current residents and future residents Regional Planning and this Project might allow. The AVAP, LU-7 June 2015 indicates:

> Rural preserve areas are areas of the unincorporated Antelope Valley outside of Rural Town Center and Town Areas, which are largely undeveloped and generally not served by existing infrastructure and public facilities. Many of these areas contain environmental resources, such as Significant Ecological Areas, Scenic Resource Areas, and Agricultural Resource Areas. In addition, many of these areas contain safety hazards, such as Seismic Zones, Very High Fire Hazard Severity Zones, and Flood Zones. The primary benefit of these areas is that they provide habitat for regionally significant biological species while simultaneously providing scenic values to residents. A secondary benefit of these areas is that they contain natural resources which provide economic opportunities. Development in these areas should be limited to single-family homes at very low densities, light and heavy agricultural uses, including equestrian and animal-keeping uses, and other uses where appropriate.
>
> The lowest land use densities (RL20) of the Area Plan have been used primarily for the Seismic Zones and Significant Ecological Areas, as these are areas where it is critical to limit development to ensure the safety of residents as well as the preservation of important ecological resources in the area. These maximum densities shall apply to all new land divisions. Existing legal lots may be developed with one residential unit each, regardless of lot size, provided that such development meets applicable County Code requirements, and the siting of the structure is supportive of the policies in this Area Plan.

F.7-5

Before the lobbying efforts of the Antelope Valley Blue Ribbon Committee, the Project area was designated very low density rural land, included expanded Significant Ecological Areas, and might have actually satisfied Rural Preservation Strategies of protecting residents from Special Hazards, preserving environmental resources, scenic values, and valuable watershed and riparian areas. Tejon Ranch achieved a land use plan matching their desires for high-density residential development, and expansive industrial development that excised SEA designation from an incredibly high-value, relatively undisturbed natural environment—California Floristic Province—and will expose a projected 50,000 residents and employees of businesses to special hazards via EOAs given *carte blanche* to ignore ordinances with which others must comply. How ironic that the AVAP Introduction states, "This Area Plan covers issues that were important in 1986 and are still important to the communities; for example, managing growth, minimizing disruption of ecological resources, placing development away from natural hazards, and ensuring a variety of housing types and costs" (Antelope Valley Area Plan I-4, I-5). The only possible exception the Project could offer is "ensuring a variety of housing types and costs," albeit in an area of multiple Special Hazards. F.7-6

Concern arises from several statements in the Specific Plan Document. Firstly, the Specific Plan makes claims that it complements the implementation of the AVAP "by capitalizing on the transportation infrastructure investment that state and regional agencies are bringing into the area, *while still achieving the general goal of rural preservation in the Antelope Valley.*" The addition of over 19,000 homes and 10.2 million feet of industrial and commercial space spells 'sprawl,' not rural preservation, and Highway 138 expansion would not be necessary, nor would it occur in the foreseeable future if the Project did not go forward. Not only that, but language in the document asserts its primacy over the General Plan (GP) and the AVAP by stating, "The Specific Plan constitutes the land use regulations (zoning) for the subject properties. Subsequent or concurrent approvals such as parcel maps, tract maps, site plans, and use permits must be consistent with the Specific Plan. Any development agreement for the project must also be consistent with this Specific Plan and the county's general plan. Should there be inconsistency between this Specific Plan and existing County ordinances, the provisions of the Specific Plan shall prevail," while at the same time claiming consistency with planning documents. With reference to rural council areas' Community Standards Districts, their efforts in preserving their communities via CSDs require consistency with planning documents and must allow an override clause for the Director of Regional Planning to approve projects that might be inconsistent with respective CSDs. Does Centennial get a pass, and are inconsistencies in the Specifical Plan, perhaps discovered later, allowed? Goals, policies, and ordinances should be applied equally across the board for all proposed development in Los Angeles County. Finally, the Specific Plan states its application was complete in 2008 and " The General Plan provides that pending projects for which an application has been deemed complete will be evaluated under the General Plan in effect when the application was deemed complete. Additionally, the Board of Supervisors adopted the updated Antelope Valley Area Plan on June 16, 2015. The application of Tejon Ranch, for this Specific Plan was deemed complete by the County as of May 13, 2008, as such this project will be evaluated under the General Plan and Area Plan in effect at the time of adoption of this Specific Plan" (1-11 | DRAFT 5/2017 SP)." How then, can the project use the Land Use Map granting high density housing zoning and Industrial-Commercial zoning that did not exist prior to the AVAP 2015, and skirt Significant Ecological Area Technical Advisory Committee scrutiny and recommendations, and EOA ordinance exclusions from all Special Hazards Management Areas, Hillside Management Areas, Scenic Resource Areas, Seismic Areas, FEMA Floodzones, significant ridgelines, Hillside Management Areas, Agricultural Resource Areas, Mineral Resource Areas, riparian areas, groundwater reharge basins? F.7-7

The Project claims economic benefit to the Antelope Valley through construction jobs, and employment opportunities as Project build-out begins and progresses over a twenty year period. However, we believe it is important to consider *existing* economic values that this project might affect. Two letters were received from branches of military defense, and listed in the NOP comment letters 2004. The Department of the Navy identified two military airspace areas that are directly over the Project, and the United States Marine Corps identified airspace and additional concerns regarding training missions, noise and developments attracting waterfowl. The Navy goes on to say the airspace above the Project is critical to ongoing mission essential training missions readiness requirements to meet national security objectives. Residents will be subject to high-speed low-flying aircraft and associated noise. This brings us to the potential economic impact to the Antelope Valley through Centennial's development and subsequent 'sprawl' in the surrounding area with the possibility of causing interference with flight missions via visibility issues—"dust, steam, or smoke: light emissions, direct (lasers) or indirect (reflective) that might interfere with pilot vision; electromagnetic transmission emissions that might affect aircraft instrumentation or capability; and lastly, the growing of certain types of vegetation or other land uses which would unnecessarily attract birds or waterfowl" (March 21, 2004, Department of the Navy NOP Response Letter, 42-49/444). If these impacts occur throughout the twenty-year projected build-out, how and what mitigation be implemented? If it cannot be adequately mitigated, the 1.6 billion dollar a year Edwards Air Force Base combined economic impact, plus aeronautic and aviation industries *that are already here in the AV and extend regionally,* and employ more than 47 thousand people (GAVEA "Econonomic Roundtable Report 2017," 40), will be negatively affected. Furthermore, the Navy indicates that "induced growth will result in substantive land use conflicts underlying existing major airspace training areas":

F.7-8

> It is likely that the Centennial Project would mark the beginning of the development of the western Antelope Valley. Such induced growth will result in substantive land use conflicts underlying existing major airspace training areas, and would also impact an additional route, Instrument Route 200, located 3 miles to the east of Centennial project. Instrument Route 200 is a major asset to the research, test, development and evaluation of new weapons systems conducted at Naval Base Ventura County and Naval Air Weapons Station China Lake.
>
> Development of the western Antelope Valley would likely subject future residents to noise and safety concerns from low-altitude aircraft and weapons operations on pre-existing military training routes, from the testing activities by the Navy and Air Force, as well as low-altitude aircraft noise and sonic booms from the heavily used R2508 Airspace Complex. The R2508 Airspace Complex is the most significant asset of its kind in the world, and is key to the training and testing conducted for not only the United States, but also our allies around the world. It is located 20 miles to the Northeast of the proposed Centennial development site.

(March 21, 2004. Department of the Navy NOP Response Letter, p.43/444).

Weighing elements of economic harm. and more importantly, elements of injury to military capability for national security reasons must be considered before approval of this Project, and may constitute fine reasons for stopping the Project from going forward. Furthermore. we ask if noticing was extended to NASA Armstrong Flight Research Center, Mojave Air and Space Port, Lockheed Martin. Boeing, Northrup Grumman. or Edwards Air Force Base. F.7-9

The Project site sits along two prominent earthquake faults. the San Andreas and Garlock Faults. While the Alquist-Priolo Zone is adjacent to the Project development boundaries. the DEIR earthquake field investigations identified two previously unidentified active faults. one outside development footprint, and the other crosses westerly through Village 9. Only 50 to 100 foot setbacks are required for buildings in the active fault zone. As unnamed faults. they are not included in the Alquist-Priolo program or otherwisee identified by the State (R:\Projects\PAS\CEN\000306\Draft EIR\5.1 Geo-051117.docx 5.1-10 Centennial Project Draft EIR). It may be useful to remember historically, the area was subject to the 1857 Fort Tejon Earthquake (approx. 7.9 Magnitude). According to the California Institute of Technology Center's Southern California Earthquake Data Index, The earthquake "was one of the greatest earthquakes ever recorded in the U.S., and left and amazing surface rupture scar over 350 kilometers in length along the San Andreas Fault" (http://scedc.caltech.edu/significant/forttejon1857.html). The website goes on to describe the severity of the quake: F.7-10

> The fact that only two lives were lost was primarily due to the the nature of the quake's setting; California in 1857 was ***sparsely populated***, especially in the regions of strongest shaking, and this fact, along with good fortune, kept the loss of life to a minimum. The effects of the quake were quite dramatic, even frightening. ***Were the Fort Tejon shock to happen today, the damage would easily run into billions of dollars, and the loss of life would likely be substantial, as the present day communities of Wrightwood, Palmdale, Frazier Park, and Taft (among others) all lie upon or near the 1857 rupture area.***
>
> As a result of the shaking, the current of the Kern River was turned upstream, and water ran four feet deep over its banks. The waters of Tulare Lake were thrown upon its shores, stranding fish miles from the original lake bed. The waters of the Mokelumne River were thrown upon its banks, reportedly leaving the bed dry in places. The Los Angeles River was reportedly flung out of its bed, too. Cracks appeared in the ground near San Bernadino and in the San Gabriel Valley. Some of the artesian wells in Santa Clara Valley ceased to flow, and others increased in output. New springs were formed near Santa Barbara and San Fernando. Ridges (moletracks) several meters wide and over a meter high were formed in several places. In Ventura, the mission sustained considerable damage, and part of the church tower collapsed. At Fort Tejon, where shaking was greatest, damage was severe. All around southern and central California, the strong shaking caused by the 1857 shock was reported to have lasted for at least one minute, possibly two or three!

"Only two lives were lost" due to sparse population. We must also mention the 1952 Kern County Quake (7.2 Magnitude) which came as a surprise to geolgists and seismologists: F.7-11

> The largest earthquake in southern California since the Fort Tejon earthquake of 1857 and the Owens Valley earthquake of 1872, the Kern County earthquake of 1952 caused immense and widespread damage. The quake occurred on the White Wolf fault, a reverse fault (with some left-lateral component of slip) north of the intersection of the Garlock and San Andreas faults.
>
> The area shaken by this quake was impressively large. It was felt in Reno, Nevada, and required a construction effort in Las Vegas to realign structural steel. In San Francisco, it was felt mainly by people on the upper floors of tall buildings. Power outtages occurred in Los Angeles, along with minor building

> damage. It was felt in San Diego as well, and even damaged one building there! At Owens Lake, about 200 kilometers away, the shaking broke a pipeline and disturbed salt beds, causing damage to a mining operation.
>
> The Kern County earthquake claimed 12 lives, was responsible for at least 18 injuries, and caused at least $50 million in property damage. This quake and its aftershocks (at least 20 were of magnitude 5.0 or greater) were responsible for damaging hundreds of buildings in the Kern County area, at least 100 of which had to be torn down. It devestated a section of the Southern Pacific Railroad line near Bear Mountain. It wreaked havoc on agriculture in the Arvin area, where the land has been reclaimed from the Kern River Delta, creating conditions which amplify the shaking of an earthquake. Slumping and surface rupture caused irrigation breaks and subsurface movement disturbed well output. Major relevelling had to be done in many places.

F.7-11 cont.

How many lives could be lost allowing this kind of high-density development in a Special Hazards Management Area of multiple risks, when the Rural Preservation Strategy Land Use Planning means to prevent loss life and property by encouraging low density rural development in hazard areas?

F.7-12

In addition to earthquake risk, current residents face a decrease in Sheriff's Deparment services through the initial and subsequent phases of development. One thousand homes must be built in order to 'qualify' for a substation. Moreover, the County must fund salaries for additional law enforcement employees, which is the larger real cost. Until homes and businesses are built, response times with currently understaffed Santa Clarita Sheriff's Station run an hour or more. California Highway Patrol wrote in their NOP Letter in 2004, response times would also be an hour or more. Their comments echo our community's worries:

> In reviewing this project, our concern was what effect these projects will have on traffic. The project will increase traffic volume on SR-138 and Interstate 5. The increased traffic will ultimately cause delays in emergency response times. Additionally, we have great concern for the purposed additional roadways which would necessitate additional resources and officers to provide traffic enforcement, emergency incident management, public service, assistance and accident investigation.

(CHP comments NOP Letter, April 6th, 2004).

F.7-13

Furthermore, the DEIR states that "the CHP would have increased responsibilities with the implementation of the Project. The CHP is funded out of revenues from car registration fees. The increase in registrations from development at the site would *partially* offset the impact so that the increased demand for CHP services would not be significant (DEIR 5.16-24). Partial offset of registration fees does not completely reduce impact of increased demand, and the Project needs to consider additional funding to responsibly reduce impacts to inadequately mitgated CHP staffing of administrative and patrol needs.

F.7-14

One might assume the project phases could continue for many years, adding commuter and personal business trips all along that time period without any mitigation to assuage traffic conditions. There is also no guarantee that the projected numbers employed will actually reside in the community, diminishing the idea of 'sustainability' and the premise of 'Smart Growth.' We would like to see studies of actual numbers of commuters and those employed within their communities in areas that have been built under specific plans, as those in the Santa Clarita Valley. Study of commuter numbers should be considered, especially when the Centennial Project is selling the plan to Regional Planning and potential residents and businesses based on the ideas of sustainability and Smart Growth previously mentioned. Subsequent stages of development should require "validation" of claimed internal traffic

F.7-15

useage and projected additional commuters outside the Project, as suggested by Caltrans in their NOP Letter. April 21st, 2004. suggesting entitlements tied to ongoing studies as the development progresses, and they have commented that:

> It is understood the project will be developed in phases over a twenty-year period. Residential will be developed first, followed by commercial, business and employment centers. Initially, a balance between housing and jobs on-site will not exist. Jobs will be off-site many miles from Centennial, thus, establishing commute patterns for early residents that may be difficult to change once jobs are finally introduced on-site. In many areas of the state, the promise of developing jobs for those living within new large develops has not materialized, thus requiring the continuation of long commutes. This possibility must be objectively considered and analyzed for Centennial.
>
> The proposed project includes eight communities, each having a village core including a mixed-use hub of retail/commercial/civic/residential uses. The village core design may enhance the sense of community and "neighborhood" while at the same time reducing the number of trips made on state highway facilities. To the extent that a high number of trips are captured internally, less mitigation to external transportation facilities will be needed. The NOP states that 80 percent of the residents could live within walking distances of the commercial service areas. This assumption must be validated.

(Caltrans NOP Letter. March 26th 2004).

F.7-15 cont.

Traffic increases on Pine Canyon Road from Ridge Route Road, east. to 3 Points Road will have a devastating effect on local residents. This uninproved, lane-and-half unmarked road. lined with ancient oak forest will become a commuter route or alternate route used by Centennial residents to avoid traffic congestion. inclement weather highway closures, and accident closures. This stretch of road borders the High Desert Hunt Club on the north. and the Angeles National Forest (Southern Spotted Owl habitat. and Condor nesting areas) on the south; the area is rich in biological value, has riparian habitats, is entirely in the San Andreas SEA 17. and should be protected from noise. development, construction/commuter traffic. It is used, as well, by road-racing automobile and motorcycle enthusiasts, creating dangerous conditions for residents and for wildlife crossing in the area.

F.7-16

Road access to the general public, including potential Centennial residents. will increase fire risk. Our community has experienced two incidents in the past three years caused by vehicles with hot exhaust parking in, or ending up on dry grass and brush. Our suggestion might be to acquire Pine Canyon Road, maintain it in perpetuity, and make it passable to only residents' vehicles, and then to visitors on foot or on bicycles. much like a bike trail with a walking trail. in order to protect wildlife. our properties, SEAs, and scenic viewshed within the Angeles and Los Padres Forests. More residents and visitors to the area—more fire risk due to recreational use and abuse. potentially causing loss of watershed, and rich biological resources.

F.7-17

The Project identifies increased fire danger as a significant impact. and by building fire stations, and as mitigation "The Project Applicant/Developer would provide funding for the construction of fire protection facilities in accordance with the approved Project, in lieu of paying established

F.7-18

developer fees at the time building permits are issued (MMs 16-1 through 16-3). Implementation of MMs 16-1 through 16-3 would provide for fire station sites and funding for fire protection services to serve the Project. Therefore, impacts on fire services would be reduced to a less than significant level." So, the Project will use developer fees that fund other services for fire stations and fire protection services, with less cost out of their pockets, and at the same time creating increased need for services. It is not detailed what those services are. We recommend services in place as the first phase of development ensues, and that it include a firefighting helicopter to assist fire supression for not only Centennial, but nearby areas like the Angeles and Los Padres National Forests, to be at increased risk as a result of Project-related increases in fire danger. We also recommend funding of increased staffing of US Forest Service and LA County Fire hand crews, and increased USFS firefighting personnel. F.7-18 cont.

Fire is just one of the many potential impacts to sensitive forests, riparian areas, grasslands, including Significant Ecological Areas. Our community is virtually encompassed by SEA designation, identifying the biologically valuable San Andreas SEA 21, and it will face increasing development pressures as a result of this Project; even though we are a Rural Preserve Area, these designations do not preclude development. We are well aware of biological impacts to the Project area, and request the SEA and openspace areas should be mitigated, funded and preserved in perpetuity by a reputable, qualified conservation entity that can provide and operate a Habitat Conservation Area and Plan, and provide ongoing monitoring to ensure the area's importance biological qualities are maintained (not Homeowner Associations) The Project was reviewed by SEATAC before mapping changes and SEA designated areas removed. Board of Supervisors actions removed SEA review requirements from EOAs, but the recommendations made by SEATAC are still valid now: F.7-19

> "To insure preservation of the biological resources of the open space there needs to be a detailed management plan. Although it is typical to have such a plan approved by County without public input after the EIR has been approved, in this case the impact is so substantial that SEATAC thinks the detailed plan should be part of the EIR and subject to SEATAC review as well as to public comment. The permit on the EIR once granted, cannot be revoked, neither legally, nor in the de facto sense" (SEATAC Meeting Minutes, 9/8/2008, 13/47).

We have no mention of final review of the AVAP Land Use Map by SEATAC, even though Community Standards District documents must be reviewed by them if community boundaries fall within SEAs. There was no public discussion of a habitat management plan as was suggested when the Land Use Map was created and went through various iterations. Furthermore, the Project's last visit to SEATAC was September 2008; subsequently, the Centennial Specific Plan land use desires were then inserted into the AVAP Land Use Map and previously detailed goals and policies exclude EOAs from ordinance requirements and SEATAC review. The Plan appears to have skirted continued scrutiny by SEATAC and more stringent environmental review that would have detailed cumulative impacts and sought input from the public. As the Specific Plan stood on the last review, "SEATAC determined that the present design of the Centennial project is **not compatible** with the principles of the Portal Ridge/Liebre Mountain SEA and **not compatible** with the principles of the Tehachapi Foothills SEA." It was requested the project incorporate changes and further recommendations would be forthcoming from SEATAC. F.7-20

The convergence of the San Gabriel, Tehachapi, and Transverse Ranges represents one of the most important wildlife corridors in Southern California. The Mitigation and Monitoring Plan suggests one underpass for movement at the State Route 138 and Cement Plant Road, and a 50 foot buffer zone along the Cement Plant Road. This is shockingly inadequate for wildlife movement along the length of development along SR 138 and 300th St. West. Development within the core areas of Centennial, increasing traffic along the SR 138 will direct wildlife movement to the western and eastern extent of the Project Area. Detailed, substantive surveys of wildlife movement at points along the highway from 300th St. West and Gorman Post Road must be required, and determination of multiple crossing areas to assist movement.

F.7-21

MM 7-14 The designated SR-138 underpass shall be located where the highway crosses the Project's western border near the current intersection with Cement Plant Road. The width of the underpass shall be 100 feet and shall flare out on both sides of the highway to a 150-foot width in the Project open space adjacent to the highway. These specifications areexpected to allow some local wildlife to safely pass between open space areas on opposite sides of the highway. In addition, a 50-foot open space buffer will be incorporated on the eastern and western sides of Cement Plant Road; this buffer shall be from the southern side of the bridge that spans the California Aqueduct to the nearest open space polygon that meets the property edge. The undeveloped 50-foot buffer shall run parallel with the Aqueduct along its southernbank. This buffer may be temporarily disturbed during construction, but shall be retained as greenspace to increase connectivity for local wildlife between open space areas and potential Aqueduct crossing locations.

"This area has enormous biological importance as the only potential montane connection between the 3200km Sierra Nevada-Cascade cordillera and the 1300-km cordillera of the Sierra Madre, Transverse, and peninsular Ranges of southern California. The region's diversity stems from its location the the juncture of four major ecoregions (Sierra Nevada, Sierra Madre. Great Central Valley, [and the] Mojave Desert" (Penrod et al. 2003). Finally, comments from "Conservation Significance of the Tejon Ranch. (2003)" describe the biological significance of the Centennial and greater Tejon Ranch area:

> The Tejon region is an irreplaceable piece of California whose future deserves careful consideration. It lies at the biogeographic crossroads of five geomorphic provinces and four floristic regions, all within the global hotspot recognized by scientists as the California Floristic Province. Within this hotspot, the 270.000-acre Tejon Ranch supports 23 different vegetation communities (60% of the vegetation communities in the region). Critical Habitat for the endangered California condor, and potential habitat for 20 state and federally listed species and 61 other rare and endemic species, all within about 40 miles of the largest population center of California. Tejon Ranch provides a unique opportunity to conserve low-elevation grasslands and oak woodlands that are underprotected in the region.
> Tejon Ranch is a largely roadless, biological core area with high habitat integrity and intact, functioning watersheds. It is one of the California Wilderness Coalition's ten most threatened wild places in California (CWC 2003). Los Angeles County has designated portions of the Ranch as Significant Ecological Areas (SEA) and is considering expanding the area under this designation (PCR Services Corp. 2000). The Ranch meets virtually all of the state Resources Agency priority criteria for conservation (Table 5). Significant conservation on the Ranch is crucial to ensuring that existing conservation investments remain intact and to linking the Sequoia National Forest with the Los Padres National Forest.

F.7-22

Our Council area and adjoining biologically valuable lands will forever be altered by the Project. We request that all possible mitigation efforts include public participation in preservation of environments, scenic qualities, water quality, air quality, and a real livability that makes this area so unique. F.7-23

Responses to Comment Letter F.7
Three Points-Liebre Mountain Town Council
August 16, 2017

Response to Comment F.7-1:

Thank you for your comment and for your participation in this public process. The Commenter's opinion of the Project is noted and will be provided to the Regional Planning Commission and Board of Supervisors for consideration.

The Lead Agency disagrees with this comment's assertion that the Project is inconsistent with the "Rural Preservation Strategy" that is the basis of the Antelope Valley Area Plan (AVAP). The AVAP was adopted by the Board of Supervisors in June 2015 and is a component of the Los Angeles County General Plan 2035 (General Plan).[625] The AVAP serves as the community plan applicable to the unincorporated area of the Antelope Valley, which covers a geographic area of 1,800 square miles, or 44 percent of the total County land area.[626] The AVAP contains regional goals and policies pertaining to land use, housing, community design, circulation, pubic services and facilities, governmental services, environmental resource management, public safety, and energy conservation, among other topics. The AVAP updates and supersedes the 1986 Antelope Valley Areawide General Plan (AVAGP), the previous community plan applicable to the Antelope Valley planning area.[627]

In preparing the AVAP, the County undertook an extensive and inclusive eight-year community participation program that commenced in the fall of 2007 and included a series of 23 community meetings.[628] At these community meetings, area residents and other stakeholders worked with County planners to develop a shared vision for the future that prioritized the participant recommendations and form the foundation of the AVAP.[629] This community vision is embodied in the AVAP's "Rural Preservation Strategy."

As explained in the AVAP's vision statement (Vision), "at the heart of the County's approach to community planning is the idea that the AVAP is an adopted version of the communities' aspirations for the future" which collectively "amount to a community vision, based on shared values and common goals".[630] At its core, the AVAP's Rural Preservation Strategy is intended to ensure that "[t]he growing population's need for additional housing and employment opportunities is balanced against the need to respect historical heritage and preserve the natural environment".[631]

The AVAP's Rural Preservation Strategy is based on four types of environments that serve different purposes but collectively "preserve the rural character of the region, conserve environmental resources, and protect residents from potential hazards while allowing for

625 DRP 2015, p. 1-2.

630 *Ibid.*
631 *Id.,* p. I-6

additional growth and development".[632] These four environments include: Rural Town Centers; Rural Town Areas; Rural Preserve Areas; and Economic Opportunity Areas (EOAs).[633]

Per the AVAP, Rural Town Centers serve as the focal point of low-density communities served by locally-oriented public facilities and new locally-oriented commercial uses.[634] Rural Town Areas serve as transition area between Rural Town Centers and Rural Preserve Areas and are occupied by a mix of low-density residential and light agricultural uses.[635] Rural Preserve Areas are located outside of Rural Town Centers and are largely undeveloped, unserved by existing or planned infrastructure and public facilities, and contain important environmental resources, including Significant Ecological Areas, Scenic Resource Areas, and Agricultural Resource Areas.[636]

The Project site is located entirely within the AVAP's West EOA.[637] Per the Rural Preservation Strategy, EOAs are defined clusters of land located along two new proposed major infrastructure projects in the AVAP planning area – i.e., the High Desert Corridor and the Northwest 138 Corridor Improvement Project.[638] During the AVAP community planning process, EOAs "were identified as having tremendous potential for economic growth" and, per the Rural Preservation Strategy, major development in the AVAP "should be guided to [EOAs] so that the areas around them can be preserved and maintained at low density, or agricultural uses."[639]

Thus, the community vision embodied in the AVAP "necessitates a 'trade-off' between preserving rural character and developing additional infrastructure".[640] As stated by the AVAP's Rural Preservation Strategy, this "trade-off" entails "maximiz[ing]" development in EOAs so as to generate property tax revenues and developer fees needed to help fund new infrastructure and public facilities needed to serve the AVAP planning area without sacrificing the rural character of Rural Town Centers, Rural Town Areas, and Rural Preserve Areas.[641] To ensure that this strategy is implemented, the AVAP specifies that the interpretation of [AVAP] policy should be governed by the AVAP's Rural Preservation Strategy.[642]

The planning policies and environmental benefits of the Rural Preservation Strategy are closely aligned with the regional land use policies described in the 2016-2040 Regional Transportation Plan/Sustainable Communities Plan (2016 RTP/SCS) prepared by the Southern California Association of Governments (SCAG). For example, the AVAP reduces the projected number of new residential housing units in the planning area by 62 percent,

632 DRP 2015, p. I-7; DRP 2014a, p. 7-7
633 *Ibid.*

642 *Ibid.*

locates housing units closer to jobs, and increases the AVAP's jobs/housing ratio from 0.18 to 1.3 at buildout, as compared to the 1986 AVAGP it replaces.[643] As a result, implementation of the AVAP would generate just 17,065,721 vehicle miles traveled (VMT), a 50 percent reduction below the 33,787,619 VMT generated by the 1986 AVAGP.[644] Moreover, implementation of AVAP would convert to urban use only 6,169 acres of undeveloped agricultural land, compared to the 24,433 acres of agricultural land that would be converted under the 1986 AVAGP.[645] Finally, as compared to the 1986 AVAGP, the AVAP greatly expands the boundaries of Significant Ecological Areas within the planning area and specifically provides for greater protection of wildlife movement corridors.[646] Thus, the AVAP substantially limits the potential for "urban sprawl" development patterns in the Antelope Valley by focusing new development into compact and sustainably designed mixed-use EOA communities that place houses in close proximity to jobs and commercial uses while expanding SEA boundaries and preserving wildlife movement corridors and agricultural land.[647]

According to SCAG, "'smart growth' is a term that covers a range of development and conservation strategies that help protect the natural environment and make communities more attractive, economically stronger, and more socially diverse".[648] The Commenter's claim that the Project represents "classic sprawl" because the average trip length for project-generated traffic will be 25.5 miles disregards the fact that the Project is consistent with, and implements, regional and County plans to strategically locate future growth in a manner that both achieves statewide GHG reduction goals and relieves the potential adverse and social effects of focusing too much future growth in both agricultural areas and in infill, transit oriented areas. As discussed below, the Project is specifically designed to protect the natural environment by implementing an attractive and compact development pattern that places homes near jobs and commercial uses, all connected by a multi-modal circulation system that will reduce VMT and, by extension, GHG emissions.

The terms "urban sprawl" and its cousin "leapfrog development" are ambiguous as they are frequently used to describe a variety of conditions, such as a specific type of land use pattern or the aesthetic quality of urban and suburban development forms. However, "Leapfrog development" is often understood to refer to the development of land in a manner requiring the extension of public facilities from their existing terminal point through intervening undeveloped areas where such extension is not provided for in the existing plans of the local governing body.[649] And "sprawl" is typically understood to mean "'uncoordinated growth': the expansion of community without concern for its consequences; in short, unplanned,

649 USLEGAL 2017

incremental urban growth which is often regarded as unstainable".[650] Per these definitions, the Project is neither sprawl nor leapfrog development.

The Project site is situated near the junction of Interstate 5 and the Northwest SR-138 Improvement Project, which links western Los Angeles County the major communities of Palmdale and Lancaster.[651] Thus, the Project site will not require major off-site roadway extensions to provide access to regional freeways. As shown on Draft EIR Exhibit 4-18, there are existing gas, power and telecom transmission facilities to serve the Project located on or immediately adjacent to the Project site. The Project will also construct two on-site wastewater treatment and recycled water distribution facilities to minimize potable water demand to treat Project wastewater and supply recycled water to the Project site.[652] To ensure adequate potable water service, the Applicant/Developer will design, permit, finance, and construct an on-site water treatment plant adjacent to the West Branch of the California Aqueduct, which is located on-site.[653] School, fire, police, emergency medical and library facilities needed to serve the Project will all be constructed on site, and in some cases, will be available to also serve existing Mountain Communities in accordance with existing mutual aid agreements.[654] Finally, none of the Project's backbone infrastructure will be sized to accommodate growth beyond that which is proposed by the Project.[655] Given the its clustered development pattern and self-contained infrastructure improvements, the Project simply does not exhibit the characteristics of leapfrog development.

While there may be some intervening undeveloped land that separates the Project site from other urban areas in the Antelope Valley, the resulting development pattern is anticipated by, and is at the heart of, the AVAP's Rural Preservation Strategy. As explained in the AVAP, the Rural Preservation Strategy "creat[es] a pattern of rural town center areas, rural town areas, rural preserve areas, and economic opportunity areas. Each town in the in the Valley will flow outward from vibrant town centers that offer a range of housing and local-serving activities for day-to-day living. Lower density rural residences will surround these town centers, buffered by large contiguous open spaces that contain habitat areas, recreational spaces, and rural economic activities".[656] This is precisely the "smart growth" clustered and mixed-use development pattern proposed by the Centennial Specific Plan, as demonstrated by its land use plan.[657]

The 2016 RTP/SCS anticipates development of the Project site at densities commensurate with the Centennial Specific Plan.[658] The Specific Plan is also consistent with "complete communities" land use policies described in the 2016 RTP/SCS. As envisioned by SCAG, "complete communities" are compact mixed-use districts that concentrate housing,

658 *Id.,* p. 6-8

employment, and a mix of retail and services located in close proximity to each other.[659] As set forth in the Centennial Specific Plan, the Project includes the development of nine Villages that will each contain a mix of land uses that enable residents to live near schools, shopping, neighborhood businesses and services, civic buildings, medical facilities, and employment centers.[660] The Project includes a mix of housing options within each Village, ranging from apartment homes close to the proposed Town Center to single-family homes in lower-density areas.[661] A full range of light industrial, business, and other commercial uses are planned and will yield a broad range of employment opportunities, from retail services to large corporate employers.[662] The opportunities for employment diversity increase the overall economic sustainability of the Project and the West EOA.

Centennial's unique land use plan is designed to incorporate the main principles of "smart growth" and thus promotes compact, transit-oriented, walkable, bicycle-friendly communities.[663] The Town Center of Centennial is located in Village 3 and is the "downtown" area of the Project. Villages 1, 2, 5, and 7 have a Village Core.[664] Villages 6, 8, and 9 have a Neighborhood Center. As shown in Draft EIR Exhibit 4-3, Centennial Project – Villages and Core Areas, 100 percent of all residential development will be located within ¼ mile walking distance of a park, trailhead, club house or other public amenity; and an 80 percent average, but no less than 50 percent of residential units will be located within ½ mile of a Village Core or the Town Center.[665] Village Cores will have a public gathering space (e.g., square or plaza) of 10,000 square feet or more, with street frontage on at least one side and at least two points of access from a sidewalk, trail, or other pathway.[666] The Town Center will have a public gathering space of 1 acre or more, with street frontage on at least two sides.[667] Additionally, 30 percent of Village 3 residential units will be within the Town Center; and 15 percent of the residential units within Villages 1, 2, 5, and 7 will be within the Village Core.[668] High-density residential uses will be located adjacent to commercial centers and the Specific Plan's Mixed-Use Overlay areas permit residential uses in commercial centers, to further integrate residential and retail uses.[669] The Project also proposes to implement a community intranet system to provide easily accessible information to facilitate telecommuting and non-automotive transit mode use, further reducing demand for SOV travel.[670] All of these design features encourage active transportation modes (e.g., walking and bicycling) and minimize use of single occupancy vehicles (SOV) for trips internal to the Project site.

659 Southern California Association of Governments (SCAG). 2016a (April 7). *The 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy. A Plan for Mobility, Accessibility, Sustainability and a High Quality of Life*. Los Angeles, CA: SCAG. http://scagrtpscs.net/Documents/2016/final/f2016RTPSCS.pdf.

The Project's Mobility Plan proposes a multi-modal transportation system with various components (Roadways, Transit, Bicycle, and Pedestrian) and is designed to provide safe and efficient mobility throughout the community.[671] Centennial will implement a system of complete streets and multi-mode, non-motorized transportation facilities consistent with the California Complete Streets Act of 2008 and in accordance with applicable County policies.[672] The objective of complete street design is to provide safe, efficient and accessible mobility for all motorized and non-motorized users, including motorists, cyclists, pedestrians, and transit riders.[673] Non-motorized transportation planning elements are also integrated into the Centennial Circulation Plan to encourage non-automotive transit modes.[674]

The Project's Mobility Plan further requires the formation and funding of a Transportation Management Agency (TMA) prior to the issuance of the Project's first occupancy permit.[675] The TMA is responsible for monitoring the form of travel, or transit modes, used by the people who live and work in Centennial. Consistent with state and regional transportation, air quality and greenhouse gas planning objectives that focus on reducing SOV trips, Centennial must meet the following mobility performance standards: (1) a minimum of 20 percent of total daily peak morning and afternoon external (e.g., commuting) trips must be completed by using non-SOV transit modes; and (2) a minimum of 30 percent of total daily internal (e.g., local) trips must be completed by using non-SOV transit modes.[676]

Consistent with the AVAP's Rural Preservation Strategy, the Project would ensure the preservation and management of natural resources and open space in and around the Project site. Specifically, no Project development would occur within the 3,866 acres of the San Andreas Significant Ecological Area (SEA 17) located on the Project site, which land would be permanently protected by a conservation easement provided by the Applicant/Developer.[677] Additionally, approximately 39,213 acres of offsite open space and habitat, which includes 8,913 acres of SEA 17 land, would be permanently protected to mitigate the Project's onsite impacts to biological resources.[678]

In addition, the Specific Plan's Green Development Program[679] requires all development within the Specific Plan to incorporate environmentally sustainable development practices to conserve water, energy and natural resources, reduce and divert waste from landfills, and promote a healthier environment.[680] In addition, to decrease the Project's dependence on carbon-based fuel consumption, a minimum of 50 percent of the anticipated electrical energy demand at build out (i.e. household, business, civic/institutional, recreational, and public

671 *Id.,* p. 4-30

facilities) shall be met by onsite renewable energy, and ZEV charging stations will be provided throughout the Project area.[681]

Moreover, all buildings within the Specific Plan will be required to comply with state, regional, and local laws applicable to their design and construction including, without limitation, Pavley Motor Vehicle Standards (AB 1493); Low Carbon Fuel Standard;[682] Title 24 (part 6 [Energy Code] and part 11 [CALGreen Code]) of the California Code of Regulations; Renewable Portfolio Standard (SB X1 2 and SB 350); Natural Gas Cooking Stoves and Fireplaces (SCAQMD Rule 445); Solid Waste Diversion (AB 939, AB 341, AB 1826, SB 1383); statewide reduction in potable urban water usage of 25 percent relative to water use in 2013 (Executive Order B-29-15); Model Water Efficient Landscape Ordinance (MWELO);[683] California Water Code;[684] EPA and NHTSA GHG and CAFE standards for passenger cars, light-duty trucks, and medium-duty passenger vehicles[685] and for medium- and heavy-duty vehicles;[686] Cap-and-Trade Program for Electricity, Stationary Sources, and Fuels;[687] Advanced Clean Cars Program;[688] Under Inflated Vehicle Tires;[689] Heavy-Duty Vehicle Greenhouse Gas Emission Reduction Regulation;[690] Management of High Global Warming Potential Refrigerants for Stationary Sources;[691] Small Containers of Automotive Refrigerant;[692] High-Global Warming Potential Greenhouse Gases in Consumer Products;[693] Los Angeles Tree Planting Ordinance;[694] Los Angeles Green Building Standards Code;[695] and Los Angeles County Community Climate Action Plan.

In addition, the Project would be subject to Title 24 and CALGreen Code energy efficiency standards. However, as discussed in the Specific Plan and Section 5.21, Climate Change, the Project has committed to compliance with CALGreen voluntary measure A4.203.1.2.1 for low-rise residential buildings, resulting in buildings that would exceed 2016 Title 24 requirements by 15 percent (see PDF 11-3 in Section 5.11, Air Resources), and with CALGreen voluntary measure A5.203.1.2.1 for non-residential buildings and residential buildings taller than four stories, resulting in buildings that would exceed 2016 Title 24 requirements by 10 percent (PDF 11 2). Renewable energy produced on the Project site will be primarily rooftop solar, and a minimum of 50 percent of the Project's anticipated electricity demand must be satisfied from on-site renewable energy generation (PDF 21-3). With this approach, development within the Specific Plan will meet and exceed the standards

of 2016 CALGreen Tier 1 as well as the requirements of the County's Green Building Ordinances.

For the reasons discussed above, the Project cannot fairly be described as "leapfrog development" or "sprawl." As clearly demonstrated by the its long planning history at the regional and County level, the Project is anything but "uncoordinated growth" undertaken without regard for its environmental consequences. The Project has been carefully designed to promote regional "smart growth" planning principles established by the 2016 RTP/SCS and the AVAP's Rural Preservation Strategy and will aid the County in its effort to accommodate its fair share of the regional housing need in a manner that reduces reliance on the automobile, reduces per capita GHG emissions, and promotes public health. The Project will also be required to implement an extensive list of Green Development design measures and to comply with and, in some cases exceed, applicable laws mandating efficient building design and construction. Finally, will permanently preserve thousands of acres of sensitive habitat. By any measure, the Project is not "sprawl" or "leapfrog development," particularly when viewed from a regional perspective that includes full consideration of regional planning priorities.

Response to Comment F.7-2:

This comment's opposition to aspects of the AVAP and its Rural Preservation Strategy are noted. The Lead Agency disagrees with this comment's assertion that the AVAP "extend exclusive land and development rights that run counter to [the] Rural Preservation Strategy" and that the AVAP's planning decisions exhibit any kind of bias. As explained in response to Comment F.7-1, the Project is consistent with the AVAP's Rural Preservation Strategy because it would implement the AVAP's land use policies applicable to the West EOA. Moreover, the AVAP does not extend exclusive land use and development rights that are inconsistent with the Rural Preservation Strategy. To the contrary, the AVAP focuses development in EOAs in order to achieve the Rural Preservation Strategy's goals of protecting the rural character of the AVAP planning area located outside of its Economic Opportunity Areas.

The AVAP does not preclude development outside of EOAs. As explained in response to Comment F.7-1, the AVAP authorizes compatible development in both Rural Town Centers and Rural Town Areas, in addition to EOAs.[696] Indeed, the AVAP also permits very low density residential development within Rural Preserve Areas.[697] Moreover, the AVAP establishes a transfer of development rights program intended to fully realize the potential development in the EOAs and encourage the preservation of designated Significant Ecological Areas (SEAs). Under this program, lands designated or identified as SEAs or Seismic Zones or are otherwise located in a Rural Preserve Area, with a land use designation of RL10 or RL20, may transfer their development rights to lands identified as EOAs.[698]

696 DRP 2015, pp. LU-5, LU-6
697 *Id.,* p. LU-7
698 *Id.,* p. IMP-5

This comment's reference to so-called "Special Hazards Management Areas" is unclear as this term is not used in the AVAP or in the Los Angeles County General Plan (General Plan). The General Plan does, however, recognize "Special Management Areas" as a designation applicable to areas that "require additional development regulations to prevent the loss of life and property, and to protect the natural environment and important resources."[699] As depicted on General Plan Figure 6.1, *Special Management Areas Policy Map*, the vast majority of unincorporated Los Angeles County is located in a Special Management Area, including the entire Antelope Valley. Thus, the Project site is not excluded from the General Plan's Special Management Area designation, as inaccurately implied by this comment.

In any case, the AVAP and the Project's proposed Specific Plan are both consistent with the General Plan's Special Management Area designation as both plans establish "additional development regulations to prevent the loss of life and property, and to protect the natural environment and important resources." For example, AVAP Chapter 5, Public Safety, Services and Facilities Element, sets forth goals and policies that ensure public safety, including but not limited to: restricting residential densities in fire hazard areas, flood zones and seismic zones through appropriate land use designations (AVAP Polices PS 1.1; PS 2.1; PS 3.1); requiring new development to provide sufficient evacuation routes and adequate access for fire and emergency services (AVAP Policy PS 1.2); limiting development on steep slopes (AVAP Policy PS 2.2); and strengthening coordination and collaboration between citizens, public agencies, and non-profit group to plan for disaster response (AVAP Policy PS 6). The Project's consistency with all of the goals and policies in AVAP Chapter 5 is demonstrated in Draft EIR Table 5.8-1.

Similarly, Centennial Specific Plan Chapter 2.4, Safety and Ecological Zones, establishes a Floodplain Safety Zone and a Geologic Safety Zone to address specific environmental conditions within the Project site. The Floodplain Safety Zone identifies Project areas with potential for flooding, as mapped by the Federal Emergency Management Agency, and provides regulations for development within areas subject to potential flooding that will protect public safety, promote public health, and minimize economic loss due to flooding. The Geologic Safety Zone establishes development review procedures and setback requirements for Project site areas that are subject to potential surface fault rupture, such as the designated Alquist-Priolo Earthquake Fault Zone. Moreover, Sections 3.10.5 and 3.10.6 of the Specific Plan establish standards for the provision of adequate fire, police and emergency services within the Project area, including a conceptual public services plan that identifies the location of up to four fire stations and a Sheriff's station to serve the public safety needs of Project residents and employees.

Finally, consistent with AVAP Goal LU-2, the Project's proposed Specific Plan provides a land use plan that protects environmental resources by, among other things, designating 3,866 acres of Project site land within Significant Ecological Area No. 17 as conserved open space in order to support plan communities, flora, and fauna representing a transitional area

[699] Los Angeles County Department of Regional Planning (LACDRP). 2015 (October 6, adopted). Los Angeles County General Plan 2035 (p. 67). http://planning.lacounty.gov/generalplan/.

between the Mojave Desert, the Transverse Range, and the Tehachapi Mountains and to provide a wildlife movement linkage between these mountain ranges.

Response to Comment F.7-3:

This comment accurately describes the text of AVAP Goal LU 2 and its implementing policies. The AVAP's designated Economic Opportunity Areas are excluded from application of AVAP Policies LU 2.2 through LU 2.6. This exclusion was adopted by the County in order implement the AVAP's Rural Preservation Strategy, which directs the majority of future Antelope Valley development to designated Economic Opportunity Areas (EOAs) in order to preserve the rural character of the balance of the AVAP planning area. Please see response to Comment F.7-1. However, neither the Project site nor any EOA are excluded from application of AVAP Policy LU 2-1, which limits the amount of potential development within Significant Ecological Areas (SEAs) through appropriate land use designations with very low residential densities. Indeed, the Project goes beyond the requirements of Policy LU 2-1 by prohibiting any ground disturbance or development within designated SEAs on the Project site.[700] One of the Project Objectives is to avoid development within, and that would affect, established SEAs to minimize disturbance of high-value biological resources, including native grasslands, oak savannas, and oak woodlands, and preserve contiguous open space areas in order to keep its viability as wildlife habitat. The San Andreas SEA has been designated as Open Space in the Land Use Map for the Project, where development would not occur. The Project also preserves important regional wildlife corridors and the biological connectivity of regional open space lands, as discussed in Section 5.7, Biological Resources, of the Draft EIR.

Although EOAs, and thus the Project site, are expressly exempt from AVAP Policy LU 2.2, the Project is nevertheless consistent with such policy. The Project site is not located in or near a designated Scenic Resource Area. The majority of the site has slopes less than 25 percent and the areas with the greatest slopes would be preserved as Open Space. Development within the Hillside Management Areas (HMAs) would be required to comply with hillside provisions within the Specific Plan, which have been designed to protect sensitive hillside conditions as discussed further in EIR Section 3.3, Conceptual Grading Plan, and Appendix 1-B, Hillside Design Guidelines, in the Specific Plan.

The Project is also consistent with AVAP Policy LU 2.3. The Project site is located within the West EOA as indicated on the AVAP Land Use Policy Map and thus would accommodate urban development in the Antelope Valley to preserve agricultural areas outside the EOAs. Likewise, the Project is consistent with AVAP Policy LU 2.4 because it is located within the West EOA and outside of any Mineral Resource Areas. The Project is also consistent with AVAP Policy 2.5 because is located within the West EOA and would avoid or minimally impact riparian areas on the site by designating major drainage channels on the site as Open Space, as discussed in greater detail in EIR Section 5.7, Biological Resources. Finally, the Project is consistent with AVAP Policy 2.6 because the Project site is located within the West EOA and outside of all National Forests, including the Angeles National Forest.

700 DRP 2017, p. 6-1

Please also see Section 5.10, Land Use and Planning, of the County's Antelope Valley Plan Environmental Impact Report (SCH # 2014061043) for a discussion of its Rural Preservation Strategy and its associated land use impacts in the Antelope Valley. See also Section 3.11, Land Use, of the Southern California Association of Governments' Environmental Impact Report for the 2016 RTP/SCS (SCH # 2015031035) for a discussion of its preferred regional land use, which assumes the Projects, and its associated land use impacts in the region.

Response to Comment F.7-4:

This comment misstates the regulatory effect of the Project's proposed Specific Plan. Contrary to this comment's claim, the proposed Specific Plan would not "override" any applicable AVAP goal or policy. In fact, the Specific Plan goes beyond the requirements of the AVAP by prohibiting any disturbance or development within designated SEAs, whereas the AVAP allow very low-density development in such SEAs. As the Commenter already points out in Comment F.7-3, it is the AVAP – not the Project's proposed Specific Plan – that excludes Economic Opportunity Areas from many land use restrictions applicable to other AVAP planning areas. In adopting the AVAP, the County determined that such exclusions were appropriate for EOAs because those planning areas are targeted for future development in order to implement the AVAP's Rural Preservation Strategy, as discussed in response to Comment F.7-1. The AVAP is a component of the General Plan.[701] As such, by law, the Centennial Specific Plan must be consistent with, and cannot "override", the goals and policies of the AVAP.[702] Please see Draft EIR Table 5.8-1 for a detailed analysis of the Project's consistency with the AVAP.

As explained in Draft EIR Section 5.8, Land Use, Entitlements and Planning, the Project is consistent with the goals and policies of the AVAP, including its land use designations. The Land Use Policy map in the AVAP shows the land use designations for the Project site, which would regulate permitted land uses and development densities/intensities. The Land Use Plan in the *Centennial Specific Plan* includes the same land uses as the designations for the site, with the boundaries of the different land uses generally aligning with the land use designations in the AVAP. No change in land use designation, additional growth, or reduction in the amount of open space is proposed by the Project.[703] Contrary to this comment, the Centennial Specific Plan does not propose to override any "very low" density land use designation established by the AVAP.

The Conservation and Open Space Element identifies the site to have Class 1 and Class 2 constraints. Similarly, as discussed in response to Comment F.7-3, the Project site is located within a designated Scenic Resource Area, Mineral Resource Area or National Forest. Moreover, the majority of the Project site has slopes less than 25 percent and the areas with the greatest slopes would be preserved as Open Space. Project development within the Hillside Management Areas (HMAs) would be required to comply with hillside provisions within the Specific Plan, which have been designed to protect sensitive hillside conditions as

701 DRP 2015, p. 1-2

702 Government Code § 65454 ("No specific plan may be adopted or amended unless the proposed plan is consistent with the general plan.")

703 DRP 2017, p. 5.8-22

discussed further in Draft EIR Section 3.3, Conceptual Grading Plan, and Appendix 1-B, Hillside Design Guidelines, in the Specific Plan.[704]

As discussed in response to Comment F.7-1, since the Project is located within a designated EOA, it would promote, and is consistent with, the AVAP's Rural Preservation Strategy's goals of protecting the rural character of the AVAP planning area located outside of EOAs. Project protection from seismic and geologic hazards is addressed in Draft EIR Section 5.1, Geotechnical, while protection from flood hazards is addressed in Section 5.2, Hydrology and Flood. Project impacts related to fire hazards are addressed in Draft EIR Sections 5.3, Hazards and Fire Safety, and 5.16, Fire and Law Enforcement. Finally, as explained in Draft EIR Section 5.8, the Project site is not located within a designated airport influence area and is not near military lands. Moreover, Draft EIR Section 5.12 explains that the principal military authority has reviewed the Project development footprint and "has not identified any threshold issues that would render [Project] development plans incompatible with [Department of Defense] operations along [Military Training Routes] in the vicinity."[705]

In addition, the environmental impacts associated with developing the AVAP's designated EOAs consistent with the AVAP's land use policy map were examined in detail in the Antelope Valley Plan Environmental Impact Report (SCH # 2014061043) (AVAP EIR). Please see AVAP EIR Sections 5.1 (Aesthetics), 5.2 (Agricultural and Forestry Resources), 5.4 (Biological Resources, including riparian habitat), 5.6 (Geology and Soil), 5.8 (Hazards and Hazardous Materials), 5.9 (Hydrology and Water Quality), 5.10 (Land Use and Planning), 5.11 (Mineral Resources), 5.14 (Public Services), and 5.17 (Utilities and Service Systems).

Response to Comment F.7-5:

The Commenter's stated preference for rural living is noted and will be provided to the Regional Planning Commission and Board of Supervisors for consideration. This comment questions propriety of the AVAP's designation of EOAs with present environmental conditions that purportedly share certain characteristics with designated Rural Preserve Areas. As an initial matter, it should be noted the Project is not "completely undeveloped," as this comment inaccurately claims. As explained in the Draft EIR, State Route (SR) 138 traverses through the Project site, as does a segment of the California Aqueduct.[706] The Oso Pumping Plant, which is part of the aqueduct system, is located in the north-central portion of the Project site.[707] In addition, Cement Plant Road is a paved roadway that runs north from SR-138 through the Project site to the National Cement Plant located northwest of the Project site in Kern County.[708] There are also several paved access roads present on the Project site in the vicinity of the aqueduct facilities.[709] Existing utilities on the Project site include overhead and underground utility lines owned by Southern California Edison, Southern California Gas Company and AT&T.[710] There is an aboveground water storage tank in the

704 Final EIR Appendix 4.0.Rev
705 DRP 2017, p. 5.12-30
706 *Id.,* pp. 5.8-14, -15
707 *Ibid.*
708 *Ibid.*
709 *Ibid.*
710 *Ibid.*

southwestern portion of the Project site, and water well in the central portion of the Project site that was formerly used as a homestead.[711] The High Desert Hunt Club is private hunt club totaling 7,530 acres, of which 1,147 acres are located at the southern end of the Project site.[712] Finally, a residential dwelling is located near the center of the northern property line and a significant portion of the Project site is currently used for livestock grazing and agricultural uses.[713]

As explained in the AVAP, designated Economic Opportunity Areas (EOAs) include areas identified as existing Rural Town Centers, or Rural Town Areas, but also have land use designations that permit a mix of residential, commercial and light industrial land uses to accommodate projected growth in a manner that preserves the rural character of surrounding areas.[714] Thus, the AVAP entails a "trade off" that targets certain open space areas for future development in order to protect other open space and rural areas in unincorporated Antelope Valley, as further discussed in response of Comment F.7-1.

The AVAP explains that the EOA locations were chosen on the basis of their adjacency to major transportation infrastructure projects planned by third-party agencies (e.g., the Northwest 138 Corridor Improvement Project) which would significantly impact the land use pattern in the unincorporated Antelope Valley by supporting commercial and industrial development, providing local employment opportunities, and reducing the need for long-distance commuting.[715] The AVAP's Conservation and Open Space Element also explains that the AVAP directs development to EOAs in order to protect significant natural areas of unincorporated Antelope Valley and their rural character.[716] Thus, although the Project site may currently exhibit some "remote" rural characteristics similar to areas of the AVAP designated as Rural Preserve Areas, the AVAP does not expect such conditions to be maintained. To the contrary, the stated purpose of the AVAP's Rural Preservation Strategy is to direct the majority of future Antelope Valley growth into EOAs so as to protect the "remote" rural character of Rural Preserve Areas from development pressures on a long-term basis.[717]

With respect to the Project site's purported fire hazards, Phase I Environmental Site Assessments were prepared for the Project site to investigate potentially hazardous current and historic land uses that could adversely affect Project site development.[718] Based on these reports, there are no adjacent land uses that represent fire hazards.[719] However, as disclosed in the EIR, portions of the Project site are designated by the California Department of Forestry and Fire Protection (CAL FIRE) as a Very High Fire Hazard Security Zone (VHFHSZ) and as a High Fire Hazard Security Zone (HFHSZ), and the potential for wildland fire hazards would exist at the wildland/urban interface due to (a) the presence of brush; (b) increased

711 *Ibid.*
712 *Ibid.*

714 DRP 2015, p. LU-8
715 *Id.,* p. LU-13.
716 *Id.,* p. COS-2
717 *Id.,* p. I-8
718 DRP 2017, p. 5.3-38
719 *Ibid.*

human activity; and (c) the increased potential for fires due to accidental and arson-related causes.[720]

CAL FIRE classifies a zone as having a moderate, high, or very high fire hazard based on a combination of how a fire will behave and the probability of flames and embers threatening buildings. As explained in the EIR, current characteristics of the Project site that contribute to its hazard designation include (1) limited access, (2) lack of existing adequate fire flows, (3) topography, and (4) types of vegetative cover. These characteristics would be addressed as the Project site is developed, as discussed below.[721]

The EIR explains that Project site's limited access will be significantly improved under Project conditions. The Project would construct an extensive backbone vehicular circulation system that would provide five points of access to the site via SR-138. The design of the Project's internal circulation system would implement the County's Fire Code standards, as applicable, regarding access (e.g., roadway widths, fire hydrant placement, length of single access streets, cul-de-sac dimensions, turning radius, street parking restrictions) (see Section 5.10, Traffic, Access and Circulation, for additional discussion of roadway design; see also the Mobility Plan described in Section 3.2 of the proposed Specific Plan[722]).

Additionally, as required by MMs 16-1 through 16-3, the Project will provide within the Project site up to four new fire stations staffed by a minimum four-person engine company. In Village 1, one fire station is proposed east of the National Cement Plant Road. The second fire station is proposed in Village 4, and the third fire station is proposed in Village 7, with the location of a potential fourth station to be determined. These new fire stations are projected to provide an average five-minute response time for the first arriving unit for fire and eight minutes for the advanced life support (paramedic) unit on the site at Project buildout. This is consistent with the County of Los Angeles Fire Department's (LACFD's) goals for response times in urban areas. Ultimately, the LACFD would approve the final station site locations, and the Applicant would construct and equip the fire stations (MM 16-3). The LACFD has indicated that the proposed fire stations on the site would provide adequate fire service to the Project. Moreover, per MM 3-7, the Project must prepare an Emergency Response Plan for LACFD approval and, per MM 3-8, the Project must prepare a Traffic Control Plan in accordance with the California Manual on Uniform Traffic Control Devices for Caltrans approval. Consequently, access to, from, and in the vicinity of the Project site will be substantially improved from the existing condition.

With respect to fire flows, the EIR explains that the Project would construct a Fire Code compliant water system to support proposed land uses and provide adequate fire flows and pressure to support any fire-suppression activity in the event of wildland or structural fires (refer to Section 5.18, Water Resources, for further discussion of the water system; see also the Water Service Plan described in Section 3.5 of the proposed Specific Plan[723]). The proposed water system includes water mains, water tanks, pump stations (where

720 *Id.,* pp. 5.2-35. -36
721 *Id.,* p. 5.2-35
722 Final EIR Appendix 4.0-A.Rev
723 *Ibid.*

necessary), and fire hydrants to ensure sufficient fire flows and water pressure to meet County of Los Angeles Department of Public Works' and LACFD's fire-suppression standards for improved property and development. These standard requirements must be met prior to the approval of building permits; therefore, the Project would implement a water system that would meet all County requirements in support of fire-suppression activities so that less than significant water-related fire hazards would occur. Under Project conditions, fire flows at the Project site will be substantially improved as compared to existing conditions.

With regards to vegetative cover and topography, the majority of residential development is proposed for the flatter portions of the Project site. Some residential development, however, is proposed in areas that would be adjacent to large open space areas with moderate vegetative cover. Under existing conditions, the plant communities that make up this cover are highly combustible and would therefore present a high fire hazard and pose a potentially significant impact to development in these areas. As development of the Project site proceeds, however, fire hazards associated with the natural vegetative cover would be eliminated through its replacement with urban landscape vegetation, which is irrigated and less combustible than the existing vegetation.[724] Indeed, the Project's proposed Specific Plan includes a landscaping plant palette comprised of many plant species specifically selected for their fire resistance and requires that the Project's final plant palette be approved by the LACFD.[725]

As explained in the Draft EIR, topography is connected to wildland fire hazards because steep slopes are not only inaccessible to fire fighting vehicles, but steep canyons can create updraft conditions (much like a chimney) and a fire in a steep canyon can spread rapidly into adjacent areas.[726] Steep canyons that are densely covered with combustible vegetation are especially hazardous. Thus, the Draft EIR explains that the potential for wildland fire hazards would still exist at the wildland/urban interface due to (a) the presence of brush; (b) increased human activity; and (c) the increased potential for fires due to accidental and arson-related causes.[727] Generally, fire-prevention tactics for urban development in wildland fire hazard areas focus on (1) restricting the types of building materials used; (2) appropriate building design; and (3) incorporating setbacks, including fuel-modification zones.[728] All developments within a VHFHSZ and HFHSV are required to meet the building construction requirements specified in Chapter 7A of the County Building Code (Title 26) and in the Fire Code (Title 32).

The Project's proposed Specific Plan further ensures appropriate building placement and design by requiring LACFD review of all Project tentative tract maps and amendments.[729] Moreover, to further protect against fire, the Specific Plan's General Development expressly prohibits the use of wood-burning fireplaces on the Project site.[730] Finally, public access would be restricted in areas of the Project site that are undeveloped and contain steep slopes

724 DRP 2017, p. 5.3-36
725 *Id.,* Appendix 4.0-A, p. 3-42; Table 3-8
726 *Id.,* p. 5.3-35
727 *Id.,* p. 5.3-36
728 *Id.,* p. 5.3-34
729 *Id.,* Appendix 4.0-A, pp. 4-12, -14
730 *Id.,* Appendix 4.0-A, p. 2-70

in accordance with the Specific Plan's Trail Plan and Open Space Management Plan.[731] Despite limited access to the general population, those areas of the site with the greatest topographic relief would be accessible to fire-fighting equipment via helicopter, other air transport access, and existing unpaved fire roads. As required by the LACFD, upon their Project-level review (e.g., tract map review), clearance for fire access roads and gates would be incorporated into developed areas. Finally, Project implementation of the Fuel Modification Plan required by MM 3-9 would further reduce fire hazards at the wildland/urban interface. With adherence to the required and best-accepted practices for fuel-modification zone management, emergency access, building materials and methods, as well as the changes in land use, and existing mutual aid agreements, the Project's potential to constitute a potentially dangerous fire hazard, or to expose people or structures to a significant risk of loss, injury or death involving fires, would be reduced to a less than significant level.

With respect to purported flood risks, the proposed Project has been designed to meet or exceed County MS4 Permit, LID Standards Manual and LID requirements hydromodification and hydrology (flood control) requirements for new development. The Project incorporates MMs 2-1 and 2-2 that require Project compliance with hydromodification and flood-control performance standards be confirmed in a Drainage System Engineering and Planning Report submitted to the County during the review and approval of each Project tract map. Project runoff will not exceed the planned storm drain capacity and will not require construction of additional drainage facilities not considered in this EIR and that could have significant environmental effects, as discussed in Section 5.2, Hydrology and Flood.

As required by MM 2-3, portions of the Project site along the northern and eastern site boundaries located within a 100-year floodplain will be subject to a Specific Plan Floodplain Safety Overlay that precludes habitable residential, commercial, school and institutional structures in the floodplain. All applications for Project tract maps that would locate any structures not precluded by the Floodplain Safety Overlay in the floodplain must include a Drainage System Engineering and Planning Report that provides a detailed description of the floodplain boundaries and a description of applicable flood protection measures. This report must demonstrate that, after construction, structure designs and floodplain flows will comply with all applicable FEMA and County of Los Angeles floodplain flood flow and development standards. If required, a conditional letter of map revision (CLOMR) from FEMA will be obtained prior to any construction within a mapped 100-year floodplain. There will be no housing development in on-site floodplains, and no significant impacts will occur from placing structures within a floodplain.

Regarding purported seismic risks, with implementation of Project Design Feature (PDF) 1-1, the Project would not expose people or structures to potential substantial adverse effects (including the risk of injury or death) involving strong seismic ground shaking, seismic-related ground failure (e.g., liquefaction, settlement, lateral spreading), or location on an unstable geologic unit (e.g., collapse, expansive soils). As discussed in Section 5.1, Geotechnical, the Project has been designed with a Geologic Safety Zone so that areas with

[731] *Id.,* Appendix 4.0-A, pp. 3-88, -94

potential geologic and seismic constraints are not developed with habitable structures and are planned so that buildings near faults have a minimum 100-foot setback in either direction from the fault line (PDF 1-1). Therefore, the Project would not expose people or structures to potential adverse effects (including the risk of injury or death) from surface rupture of a known earthquake fault with implementation of PDF 1-1. Additionally, in accordance with California Department of Education's Title 5 and current building codes, no sensitive uses (i.e., schools, hospitals, or public assembly sites) would be located on sites presenting a significant geotechnical hazard, as determined by the site-specific geological and soils engineering study. Therefore, there would be less than significant impacts related to fault rupture, seismic ground shaking, and ground failure with implementation of PDF 1-1.

Please also see AVAP EIR Sections 5.6 (Geology and Soil), 5.8 (Hazards and Hazardous Materials), and 5.9 (Hydrology and Water Quality), as well as Sections 3.7 (Geology and Soils), 3.9 (Hazards and Hazardous Materials), and 3.10 (Hydrology and Water Quality) of the RTP/SCS EIR.

Response to Comment F.7-6:

This comment misconstrues the land use regulatory scheme established by the AVAP. Contrary to this comment's claim, the AVAP did not reduce the size of SEAs in the AVAP planning area. Rather, the AVAP expanded the total acreage of SEAs within the AVAP.[732] Indeed, some of the SEA boundary that overlaps portions of the Project site did not exist prior to adoption of the AVAP.[733] In fact, the AVAP substantially reduced the development intensity within SEA's by converting most of the SEA areas designated for residential development from N1- Non-Urban 1 (0.5 dwelling units/acre) and N2- Non Urban 2 (1 dwelling unit/acre) to RL20 – Rural Land 20 (1 dwelling unit/20 acres). The use of RL 20 designation for the SEAs was a compromise reached with the Blue Ribbon Committee, an is an integral part of the balanced Rural Preservation Strategy that the AVAP achieves.[734]

This comment also incorrectly states that the Project's land use plan is designed to achieve the Project Applicant's purported desire for "high density residential housing." In fact, the vast majority of the land within the Project's development footprint is designated for very low, or low-density housing.[735] Moreover, the Specific Plan prohibits all development within SEA land on the Project site, whereas the AVAP would allow some very low density residential uses in such areas.[736] Thus, the Specific Plan is even more protective of on-site SEAs than is the AVAP.

This comment's claim that EOAs are "given *carte blanche* to ignore ordinances with which others must comply" is not accurate. Per the AVAP, development within the Project area must proceed in accordance with a specific plan to ensure development occurs in an orderly and sustainable manner, and to ensure that the required infrastructure and public utilities

732 DRP 2014a, p. 5.4-59
733 *Id.,* Figure 5.4-4
734 *Id.*, p. 2-47
735 DRP 2017, Appendix 4.0-A, Figure 2-3
736 *Id.,* p. 1-6

are in place at a master planned level before new development proceeds.[737] As such, the Project will be required to adhere to the development standards and requirements of the Project's proposed Specific Plan, which itself must comply with the requirements of Government Code Section 65451(a), which provides that all specific plans must include text and a diagram which specifies all of the following:

1. The distribution, location, and extent of the uses of land, including open space, within the area covered by the plan;
2. The proposed distribution, location, and extent and intensity of major components of public and private transportation, sewage, water, drainage, solid waste disposal, energy, and other essential facilities proposed to be located within the area covered by the plan and needed to support the land uses described in the plan;
3. Standards and criteria by which development will proceed, and standards for the conservation, development, and utilization of natural resources, where applicable, and;
4. A program of implementation measures including regulations, programs, public works projects, and financing measures necessary to carry out [the plan].

In addition, per Government Code Section 65454, the Specific Plan may not be adopted unless it is consistent with the terms and provisions of the AVAP and, per Government Code 65455, no public works project, no tentative map, and no zoning ordinance may be adopted within the Specific Plan area unless such action is itself consistent with the Specific Plan. Finally, as a condition of Project approval, the Project must comply with all applicable federal, state and local laws.

With regard to this comment's general references to unspecified "Special Hazards," environmental resources, scenic values, and wetland and riparian resources, please see responses to Comments F.7-4 and F.7-5. Please also see AVAP EIR Sections 5.1 (Aesthetics), 5.2 (Agricultural and Forestry Resources), 5.4 (Biological Resources, including riparian habitat), 5.6 (Geology and Soil), 5.8 (Hazards and Hazardous Materials), 5.9 (Hydrology and Water Quality), 5.10 (Land Use and Planning), 5.11 (Mineral Resources), 5.14 (Public Services), and 5.17 (Utilities and Service Systems).

Response to Comment F.7-7:

As this comment correctly notes, the Project's proposed Specific Plan accurately explains that it would complement the goals and policies of the AVAP by capitalizing on the transportation infrastructure investment that state and regional agencies are bringing into the area, while still achieving the general goal of rural preservation in the Antelope Valley.

The AVAP was adopted by the Board of Supervisors in June 2015 and is a component of the Los Angeles County General Plan 2035 (General Plan).[738] As explained in the AVAP's vision

[737] DRP 2015, p. IMP-4
[738] *Id.,* p. 1-2

statement (Vision), "at the heart of the County's approach to community planning is the idea that the AVAP is an adopted version of the communities' aspirations for the future" which collectively "amount to a community vision, based on shared values and common goals."[739] At its core, the Vision is intended to ensure that "[t]he growing population's need for additional housing and employment opportunities is balanced against the need to respect historical heritage and preserve the natural environment."[740]

In preparing the AVAP, the County undertook an extensive and inclusive eight-year community participation program that commenced in the fall of 2007 and included a series of 23 community meetings.[741] At these community meetings, area residents and other stakeholders worked with County planners to develop a shared vision for the future that prioritized the participant recommendations and form the foundation of the AVAP.[742] This community vision is embodied in the AVAP's "Rural Preservation Strategy."

"The AVAP's Rural Preservation Strategy addresses issues of Valleywide significance in a manner that builds upon the communities' vision statement."[743] The Rural Preservation Strategy is based on four types of environments that serve different purposes but collectively "preserve the rural character of the region, conserve environmental resources, and protect residents from potential hazards while allowing for additional growth and development."[744] These four environments include: Rural Town Centers; Rural Town Areas; Rural Preserve Areas; and Economic Opportunity Areas.[745]

Pursuant to the Rural Preservation Strategy, Rural Town Centers serve as the focal point of low-density communities served by locally-oriented public facilities and new locally-oriented commercial uses.[746] Rural Town Areas serve as transition area between Rural Town Centers and Rural Preserve Areas and are occupied by a mix of low-density residential and light agricultural uses.[747] Rural Preserve Areas are located outside of Rural Town Centers and area largely undeveloped, are generally unserved by existing or planned infrastructure and public facilities, and contain environmental resources, including Significant Ecological Areas, Scenic Resource Areas, and Agricultural Resource Areas.[748]

The Project site is located entirely within the AVAP's West Economic Opportunity Area.[749] Per the Rural Preservation Strategy, Economic Opportunity Areas are defined clusters of land located along two new proposed major infrastructure projects in the AVAP planning area – i.e., the High Desert Corridor and the Northwest 138 Corridor Improvement Project.[750] During the AVAP community planning process, Economic Opportunity Areas "were

739 *Id.,* p. I-5
740 *Id.,* p. I-6
741 *Id.,* p. I-5
742 *Ibid.*
743 *Id.,* p. I-6
744 *Id.,* p. I-7
745 *Ibid.*
746 *Ibid.*
747 *Ibid.*
748 *Ibid.*
749 DRP 2017, p. 4-4
750 *Id.,* p. I-8

identified as having tremendous potential for economic growth" and, per the Rural Preservation Strategy, major development in the AVAP "should be guided to these areas so that the areas around them can be preserved and maintained at low density, or agricultural uses."[751]

Thus, the community vision embodied in the AVAP "necessitates a 'trade-off' between preserving rural character and developing additional infrastructure."[752] As stated by the AVAP's Rural Preservation Strategy, this "trade-off" entails "maximiz[ing]" development in Economic Opportunity Areas so as to generate property tax revenues and developer fees needed to help fund new infrastructure and public facilities needed to serve the AVAP planning area without sacrificing the rural character of Rural Town Centers, Rural Town Areas, and Rural Preserve Areas.[753] To ensure that this strategy is implemented, the AVAP specifies that "[t]he interpretation of [AVAP] policy should be governed by the Vision and Rural Preservation Strategy of the Antelope Valley Area Plan."

To promote implementation of the AVAP's Rural Preservation Strategy, the AVAP's Land Use Goals and Policies direct the majority of the Antelope Valley's projected growth to Economic Opportunity Areas. (See AVAP Policies LU 1-1, 4-1.) Indeed, while it is a goal of the AVAP to ensure a land use pattern that protects environmental resources (see AVAP Goal LU 2), the AVAP policies adopted to implement such goal expressly exclude Economic Opportunity Areas, as do all other AVAP land use policies that affirmatively limit or otherwise restrict the amount of potential development within the AVAP. (See AVAP Policies LU 2.2 through LU 2.2, and LU 3.1 through 3.7.) All of these AVAP policies thus promote the Rural Preservation Strategy's expressly stated "trade-off" that requires "maximiz[ing]" opportunities for development within Economic Opportunity Areas so as to preserve the rural character of Antelope Valley outside of the Economic Opportunity Areas.

The AVAP calls for the development of a specific plan to ensure orderly and sustainable development and the provision of necessary infrastructure and public utilities on the Project site and the West EOA. The Project's proposed Specific Plan implements the AVAP's Rural Preservation Strategy by establishing a Land Use Plan consistent with the AVAP's land use designations for the Project site.[754] No change in land use designation, additional growth, or reduction in the amount of open space is proposed by the Project.[755] Moreover, the Specific Plan implements the AVAP's Rural Preservation Strategy and capitalizes on regional infrastructure investments by proposing an on-site circulation system that would accommodate future widening and realignment of the SR-138, a Caltrans project commonly known as the Northwest 138 Corridor Improvement Project.[756]

This comment's assertion that the Northwest 138 Corridor Improvement Project would not be necessary, nor would it occur in the foreseeable future, if the Project did not go forward is incorrect. As explained in the *Northwest State Route 138 Corridor Improvement Project*

751 *Ibid.*
752 DRP 2015, p. I-8
753 *Ibid.*
754 DRP 2017, p. 5.8-22
755 *Ibid.*
756 *Id.,* p. 5.8-23

Final Environmental Impact Report/Environmental Impact Statement (SR-138 EIR/EIS) approved by Caltrans and the Federal Highway Administration in August 2017, planning for the Northwest 138 Corridor Improvement Project significantly predates the Project and AVAP. The North County Combined Highway Corridors Study (NCCHCS), completed in 2004, identified SR-138 as a bypass corridor and recommend its expansion to a 6-lane freeway between Interstate 5 and State Route 14 to accommodate traffic demand that the NCCHS projected would double by 2025.[757] Four years later, in 2008, the voters approved Measure R, the Los Angeles County half-cent sales tax transportation funding initiative.[758] Measure R allocated $25 million for approval and environmental documentation of the Northwest 138 Corridor Improvement Project to be used between 2012 and 2018.[759] As this comment correctly notes, the Project's application was not deemed complete by the County until 2008 and the AVAP was not adopted until 2015, well after preparation of the NCCHCS and the Measure R campaign. The Northwest 138 Corridor Improvement Project is a long planned public works project needed to accommodate regional growth projections for areas well beyond the Project site, and its planning history demonstrates the error of this comment's inaccurate claim that SR-138 expansion would never occur but for the Project.

This comment's assertion the Specific Plan "asserts its primacy over the General Plan and AVAP" are incorrect. The AVAP is a component of the General Plan and expressly requires preparation and adoption of a specific plan for the Project site before any development of five or more residential units may occur.[760] Moreover, the AVAP expressly allows any specific plan adopted for the Project site to deviate from certain of the AVAP land use designations and other land use controls applicable to the Project site "[i]n order to allow for more flexibility in the future detailed site design of specific neighborhoods in this area."[761] However, consistent with the requirements of California Government Code Section 65454, the AVAP also expressly provides that any specific plan adopted for the Project must be consistent with the General Plan, which includes the AVAP. Indeed, this comment quotes the AVAP requirement that "[a]ny development agreement for the Project must be consistent with the county's general plan." As demonstrated by Draft EIR Table 5.8-1, the Project is consistent with the AVAP.

This comment correctly points out that the Project's proposed Specific Plan states that, "[s]hould there be any inconsistency between this Specific Plan and existing County ordinances, the provisions of the Specific Plan shall control." This regulatory hierarchy is expressly provided for by Los Angeles County Code, Title 22, Part 15, *SP Specific Plan Zone*, which sets forth the County's zoning regulations applicable to the "SP Specific Plan" zoning designation. As explained in the EIR, the Project would require rezoning to the SP zoning designation, consistent with the General Plan and AVAP.[762]

The SP zoning designation was established by the County to provide a zone for property which is subject to an adopted specific plan. As explained in County Code § 22.40.720, the SP

757 Caltrans 2017b, p. 8
758 *Id.,* p 1
759 *Ibid.*
760 DRP 2015, p. IMP-4
761 *Ibid.*
762 DRP 2017, p. 5.8-71

zoning designation "recognizes the detailed and unique nature of specific plans and the need to ensure that development conforms to the uses, development standards and procedures contained in specific plans." Accordingly, County Code § 22.40.730 provides that land located within the SP zone "may be used for any main use permitted by the specific plan *subject to all of the limitations and conditions of the specific plan*" (emphasis added). Moreover, County Code § 22.40.770 provides that land located within the SP zone "shall be *subject to … [a]ny development standards contained in the specific plan*" and "[a]ny development standards contained in [County Code] Title 22 *which are referred to in the specific plan*" (emphasis added). Accordingly, per the County Code, each specific plan adopted in the County establishes the zoning and development standards that are applicable within that specific plan's planning area, which standards *always* control in the event of a conflict with other provisions of the County Code. This regulatory hierarchy is not unique to the *Centennial Specific Plan*.

The lead agency agrees that County goals, policies and ordinances should be applied equally throughout the County, as applicable. Accordingly, the Project will not "get a pass" for any violation of County ordinances or regulations applicable to the Project site. As required by California Government Code § 65455, no public works project, subdivision map, or zoning ordinance may be approved for the Project unless such approval is consistent with the proposed Specific Plan. Moreover, as explained in Section 4.3 of the Specific Plan, the goals, the development standards applicable to the Project site will be adopted by ordinance and will be subject to the penalty provisions and citation procedures of the County Code.

The Department of Regional Planning is responsible for the overall administration and enforcement of the provisions of the Specific Plan, including: administering the application process, interpreting provisions of the Specific Plan. Specifically, the Director of the Department of Regional Planning (Director), the Regional Planning Commission, or in certain cases, a Hearing Officer, are responsible for approving Tentative Maps, Conditional Use Permits (CUPs), variances, and other use permits, in accordance with the Titles 21 (zoning) and 22 (subdivisions) of the County Code. The Regional Planning Commission, a Hearing Officer, or the Director may certify California Environmental Quality Act (CEQA) documentation, as appropriate, for permits or other approvals for which they have discretionary decision-making authority pursuant to state law, this Specific Plan, the Subdivision Ordinance, or the Zoning Ordinance. The Regional Planning Commission acts on appeals from decisions of the Director or the Hearing Officer. The Regional Planning Commission also makes recommendations to the Board of Supervisors regarding matters such as Specific Plan amendments or other legislative actions and any associated CEQA documentation. With respect to Specific Plan amendments, other legislative actions, or actions on final subdivision maps, the Board of Supervisors is responsible for making such determinations, acting on appeals of Regional Planning Commission decisions, and adopting and certifying associated CEQA documentation.

This comment correctly states that the Project application was deemed complete by the County in May 2008, prior to the October 2015 of the current County General Plan and the June 2015 of the AVAP. The Specific Plan quote regarding the County evaluation of complete applications that this comment accurately quotes is incomplete. As this comment notes,

page 1-11 of the Specific Plan states that "[t]he General Plan provides that pending projects for which an application has been deemed complete will be evaluated under the General Plan in effect when the application was deemed complete." In fact, Chapter 2, page 16, of the Los Angeles County General Plan 2035 states, for complete applications filed prior to the effective date of the current General Plan, "[t]he applicant may choose whether the application will be reviewed for consistency with the previously adopted General Plan or with this General Plan." The General Plan also provides that, if the applicant choses to have the application be reviewed for consistency with the previously adopted General Plan, the application may be modified prior to consideration by County decision makers.[763]

At present, the Project Developer/Applicant desires to have the Project application evaluated under the current General Plan and the AVAP. However, as explained on page 1-15 of the Draft EIR, the AVAP has been challenged in court, but no injunction against implementation of the plan has been sought or granted. The County's current General Plan was not challenged and is in effect. Consistent with land use law and CEQA requirements, these land use plans are being implemented and the EIRs prepared for each plan have been considered as part of the Project EIR and each is incorporated by reference. Should the approval and adoption of the AVAP or its accompanying EIR be invalidated pending further environmental and policy review, a possible judicial remedy could effectively revive the now-superseded former *Antelope Valley Areawide General Plan* (AVAGP), the earlier Area Plan for this area of Los Angeles County. In that case, the Project would be evaluated under the AVAGP, and would require an AVAGP amendment in addition to a zone change to Specific Plan and other entitlements, including a Conditional Use Permit for development within a SEA subject to review by the Significant Ecological Area Technical Advisory Committee. In the event the AVAP is invalidated, its various exclusions for economic opportunity areas related to Scenic Resource Areas, Agricultural Resource Areas, Mineral Resource Areas, riparian areas, and groundwater recharge basins (as described in AVAP Policies LU 2.2 through LU2.6) would not apply to the Project.

In response to this comment, the last two full paragraphs on page 1-11 of Draft EIR Appendix 4.0-A, Centennial Specific Plan, are hereby deleted in their entirety, as follows:

> ~~Prior to the date of adoption of this Specific Plan, the Board of Supervisors approved the update to the County's General Plan on March 24, 2015. The General Plan came back for final findings and was adopted on October 6, 2015. The General Plan provides that pending projects for which an application has been deemed complete will be evaluated under the General Plan in effect when the application was deemed complete.~~
>
> ~~Additionally, the Board of Supervisors adopted the updated Antelope Valley Area Plan on June 16, 2015. The application of Tejon Ranch, for this Specific Plan was deemed complete by the County as of May 13, 2008, as such this project will be evaluated under the General Plan and Area Plan in effect at the time of adoption of this Specific Plan.~~

[763] LACDRP 2015, p. 16

Response to Comment F.7-8:

The Applicant is aware that the United States Air Force, the U.S. Marine Corps, and the U.S. Department of the Navy control and use airspace over and near the area as Military Training Routes (MTRs). Military overflights and testing activities, and associated noise including the potential for sonic booms, are part of existing conditions in the Project area. The location of the MTRs and/or frequency of these operations would not change directly as a result of the proposed Project. Noise associated with military overflights is addressed in Section 5.12, Noise, of the Draft EIR.

As discussed in Section 5.12, "The MTR program is a joint venture by the Federal Aviation Administration (FAA) and the U.S. Department of Defense (DoD). The FAA has specific requirements regarding the altitude of MTR flights. Existing regulations prohibit military aircraft from flying lower than 500 feet above ground level (AGL) over sparsely populated areas and lower than 1,000 feet AGL over inhabited areas or lower than 1,000 feet over the tallest obstacle over any congested area of a city, town, or settlement (Federal Aviation Regulations [FAR], Section 91.119)".[764]

The Project Applicant has had discussions with military representatives concerning military flight routes in the vicinity of the Project site. Once development of the Project has progressed to the point where at least a portion of the site is considered to be inhabited, FAR Section 91.119 would prohibit aircraft flying at altitudes lower than 1,000 feet AGL. The principal military authority (Rear Admiral J.L. Betancourt, U.S. Navy), after examining the Project plans, concluded that "we have come to a mutual understanding that the existence of DOD (Department of Defense) Military Training Rates [sic] (MTRs) over Tejon Ranch Company (TRC) development footprints for Centennial . . . should not preclude your planning efforts with regard to [this] area. The military services' analysis of the information you have provided has not identified any threshold issues that would render Tejon Ranch's development plans incompatible with DOD operations along MTRs in the vicinity" (Betancourt 2004). The military has indicated they would cooperate to minimize impacts to the Centennial site, though no formal agreement has been implemented to date. Therefore, while it is acknowledged that the Project site would be subject to periodic and brief single noise event levels (SELs), estimated to range between 53.0 and 108.8 A-weighted decibels (dBA), due to military overflights that may be considered a nuisance, for the reasons described above, it would be considered a less than significant impact on the Project site.[765]

In summary, the DOD determined that the Project, as proposed in 2004, would not result in adverse effects associated with the MTRs in the Project area. The Centennial Project, as currently proposed, includes a similar range of land uses, densities, and associated infrastructure, on a smaller scale. As such, there is no significant impact related to hazards from military flight activity and no mitigation is required. Each development project in the path of any MTRs or other military flight areas would require coordination with the appropriate military representatives and application of FAA regulations, where applicable.

764 DRP 2017, p. 5.12-30
765 *Id.,* p. 5.12-30

As discussed on Draft EIR page 5.9-29, the Project is anticipated to create approximately 23,675 jobs at the on-site commercial uses, business parks, commercial recreation uses, and public facilities. These non-residential uses would not compete with jobs at the US Department of the Navy and US Marine Corps installations located several miles east and northeast of the site. Thus, no loss of jobs at the Edwards Air Force Base, Naval Base Ventura County and the Naval Air Weapons Station China Lake are expected due to the implementation of the Project. Rather, it is more likely that the Project would provide housing for employees at these facilities.

The potential of the Project to induce substantial growth is discussed on Draft EIR pages 5.9-23 through 5.9-32, which state that substantial increases in population, housing and employment would occur with the Project and this growth would be considered significant and unavoidable. Section 6.0, Growth Inducing Impacts, of the Draft EIR also discusses growth inducement potential and the growth inducing impacts of the Project. Again, the Project is expected to result in a significant adverse indirect growth-inducing impact. However, the Project is consistent with approved growth plans in the region, including the growth projections in the 2016 RTP/SCS and the AVAP.

With respect to this comment's concerns regarding the impact on Project residents caused by noise and related effects generated by existing military training operations, such impacts are not required to be analyzed in the EIR. As held by the California Supreme Court in *California Building Industry Association v. Bay Area Air Quality Management District*, "CEQA generally does not require an analysis of how existing environmental conditions will impact a project's future users or residents".[766] With respect to this comment's concern regarding the Project's purported adverse economic effects on regional military installations, CEQA only requires that the EIR evaluate the environmental impacts of the Project; the Project's purported economic and social effects are not treated as effects on the environment pursuant to CEQA Guidelines § 15131(a).

With respect to this comment's claim that the Project will result in "sprawl," please refer to response to Comment F.7-1.

Response to Comment F.7-9:

Please refer to response to Comment F.7-8. The principal military authority (Rear Admiral J.L. Betancourt, U.S. Navy), after examining the Project plans, concluded that the Project, as proposed in 2004, would not result in adverse effects associated with the MTRs in the Project area. The Project, as currently proposed, has a similar range of land uses, densities, and intensities, on a smaller scale. Accordingly, the Project would not result in adverse effects to military capability. As addressed in response to Comment F.7-8, the proposed Project would not result in adverse effects on the local economy as it relates to the military facilities and activities in the Antelope Valley, and such purported impacts need not be evaluated in the EIR per CEQA Guidelines § 15131(a).

[766] *CBIA* v. *BAAQMD* (2015) 62 Cal.4th 369, 386

The Notice of Availability (NOA) for the Draft EIR was mailed overnight to Marvin Sanders and Major General David A. Harris at the Edwards Air Force Base; however, the NOA was not provided to the NASA Armstrong Flight Research Center, the Mojave Air and Space Port, Lockheed Martin, Boeing, or Northrup Grumman, but such notice is not required by CEQA. The NOA was circulated consistent with the requirements of CEQA Guidelines § 15087, and was thus provided to (i) the State Clearinghouse, (ii) organizations and individuals who have previously requested notice, (iii) public libraries serving the area involved, (iv) owners and occupants of the property contiguous to the parcels that comprise the Project site, (v) public agencies with jurisdiction by law and/or special expertise with respect to the Project and Project location, and (vi) the US Department of Defense or any branch of the US Armed Forces that has given the Lead Agency written notice of the specific boundaries of a low-level flight path, military impact zone, or special use airspace and provided the Lead Agency with written notification of the contact office and address for the military service pursuant to CEQA Guideline §15190.5(b). Per CEQA Guidelines § 15087, the NOA was also posted on and in the vicinity of the Project site and in the office of the County Clerk, and was published in a least one newspaper of general circulation in the area affected by the proposed Project.

Response to Comment F.7-10:

The Geologic Safety Zone setback required for the two unnamed faults within the Project site is 100 feet, potentially reduced to 50 feet, to be consistent with the requirements of the Alquist-Priolo Earthquake Fault Zoning Act (AP Act). As discussed on Draft EIR page 5.1-3, "City and County jurisdictions must require a geologic investigation to demonstrate that a proposed development project, which includes structures for human occupancy, is adequately set back (usually at least 50 feet) from an active fault prior to permitting." Additionally, the "purpose of the AP Act is to reduce the threat to life and property, specifically from surface fault rupture, by preventing the construction of building used for human occupancy of the surface trace of active faults".[767] Therefore, the setbacks of "only 50 to 100" feet are appropriate for purposes of avoiding impacts associated with surface rupture of an active fault. However, the risks from surface rupture of a fault are a different issue than the risks from strong seismic ground shaking during an earthquake.

The potential for the San Andreas Fault and other active faults in the region to generate moderate to severe ground shaking is fully disclosed and addressed in the Draft EIR.[768] A probabilistic seismic hazard analysis was prepared for the Project consistent with State and County building code requirements, and is summarized on Draft EIR pages 5.1-11 and 5.1-12. As shown, the Project site has seismic hazard parameters resulting in peak ground accelerations of 72 to 118 percent the force of gravity, depending on the statistical likelihood (i.e., probability) of occurrence. When considering the seismic hazard analysis as well as soil conditions on the site and planned structures, the geotechnical engineer for the Project concluded that there are no soil or geologic (which includes seismic) conditions that would preclude development of the proposed Project, provided that additional site-specific geotechnical studies are performed during later phases of Project implementation, such as

767 DRP 2017, p. 5.1-3
768 *Id.,* p. 5.1-17

tract maps.[769] Requirements for site-specific geotechnical analyses as part of tract map processing are part of the County Building Code. Although it may seem as though the Project area may experience heightened seismic activity due to proximity to the San Andreas Fault or past fault activity, in reality "…the overall seismic risk at the Project site is the same as Southern California in its entirety".[770] In other words, because of the extremely high seismicity throughout Southern California, the nearness of one or more active faults does not have a direct correlation to risk of a seismic event and the magnitude of the event in a certain area.

Response to Comment F.7-11:

Refer to response to Comment F.7-10. As noted, the potential for the San Andreas Fault and other active faults in the region to generate moderate to severe ground shaking is fully disclosed and addressed in the Draft EIR.[771] Although it may seem as though the Project area may experience heightened seismic activity due to proximity to the San Andreas Fault or past fault activity, in reality "…the overall seismic risk at the Project site is the same as Southern California in its entirety".[772] In other words, because of the extremely high seismicity throughout Southern California, the nearness of one or more active faults does not have a direct correlation to risk of a seismic event and the magnitude of the event in a certain area.

Response to Comment F.7-12:

Please refer to responses to Comments F.7-10 and F.7-11. The reference to "Special Hazards Management Area" is assumed to refer to Figure 6.1, Special Management Areas Policy Map, in the *Los Angeles County General Plan* (General Plan). [773] As shown, almost the entirety of the County is encompassed in the Special Management Areas designation. As discussed in the Land Use Element of the General Plan, there are several types of Special Management Areas, including those that represent hazards and those that represent natural resources. The earthquake-related hazards associated with the Project site are clearly acknowledged in the Draft EIR, including on Exhibit 3-4, Local Area Constraints, in Section 3.0, Environmental Setting; and Exhibit 5.1-1, Regional Faults, and Exhibit 5.1-2, Geologic Hazards, in Section 5.1, Geotechnical; and on pages 5.1-9 through 5.1-13 and pages 5.1-16 through 5.1-19 in Section 5.1.

Regarding the intent of the Antelope Valley Area Plan's (AVAP) Rural Preservation Strategy, there is not a connection between the location of low-density land use designations and "hazard areas". The Rural Preservation Strategy is based on four types of environments that serve different purposes but collectively "preserve the rural character of the region, conserve environmental resources, and protect residents from potential hazards while allowing for additional growth and development."[774] These four environments include: Rural Town Centers; Rural Town Areas; Rural Preserve Areas; and Economic Opportunity Areas

769 *Id.,* Appendix 5.1-A, p. 13
770 *Id.,* p. 5.1-15
771 *Id.,* p. 5.1-17
772 *Id.,* p. 5.1-15
773 Available here: http://planning.lacounty.gov/assets/upl/project/gp_2035_2014-FIG_6-1_special_mgt_overlay.pdf.
774 DRP 2015, p. I-7

(EOAs).[775] The Project site is located entirely within the AVAP's West EOA.[776] Per the Rural Preservation Strategy, EOAs are defined clusters of land located along two new proposed major infrastructure projects in the AVAP planning area – i.e., the High Desert Corridor and the Northwest 138 Corridor Improvement Project.[777] During the AVAP community planning process, Economic Opportunity Areas "were identified as having tremendous potential for economic growth" and, per the Rural Preservation Strategy, major development in the AVAP "should be guided to these areas so that the areas around them can be preserved and maintained at low density, or agricultural uses."[778]

Thus, the community vision embodied in the AVAP "necessitates a 'trade-off' between preserving rural character and developing additional infrastructure."[779] As stated by the AVAP's Rural Preservation Strategy, this "trade-off" entails "maximiz[ing]" development in EOAs so as to generate property tax revenues and developer fees needed to help fund new infrastructure and public facilities needed to serve the AVAP planning area without sacrificing the rural character of Rural Town Centers, Rural Town Areas, and Rural Preserve Areas.[780] To ensure that this strategy is implemented, the AVAP specifies that "[t]he interpretation of [AVAP] policy should be governed by the Vision and Rural Preservation Strategy of the Antelope Valley Area Plan."

To promote implementation of the AVAP's Rural Preservation Strategy, the AVAP's Land Use Goals and Policies direct the majority of the Antelope Valley's projected growth to EOAs. (See AVAP Policies LU 1-1, 4-1.) Indeed, while it is a goal of the AVAP to ensure a land use pattern that protects environmental resources (see AVAP Goal LU 2), the AVAP policies adopted to implement such goal expressly exclude EOAs, as do all other AVAP land use policies that affirmatively limit or otherwise restrict the amount of potential development within the AVAP. (See AVAP Policies LU 2.2 through LU 2.2, and LU 3.1 through 3.7.) All of these AVAP policies thus promote the Rural Preservation Strategy's expressly stated "trade-off" that requires "maximiz[ing]" opportunities for development within Economic Opportunity Areas so as to preserve the rural character of Antelope Valley outside of the EOAs.

Response to Comment F.7-13:

As stated on Draft EIR page 5.16-21, prior to the development of the permanent Los Angeles Sheriff's Department (LASD) substation, the LASD could operate out of "store front" substation at the first development area – Village 1 (MM 16-4). This substation would become operational before the first certificate of occupancy for the Project is issued. The costs associated with the construction of the temporary substation would be paid by the Applicant and credited toward the Law Enforcement Facilities Mitigation Fee (LEFMF) that must be paid by new residential, commercial, office, and industrial development in the unincorporated Santa Clarita, Newhall, and Gorman areas.

775 *Ibid*.
776 DRP 2017, p. 4-4
777 DRP 2015, p. I-8
778 *Ibid*.
779 *Id.,* p. I-8
780 *Ibid*.

By the time the 1,000th dwelling unit is built on the site, an on-site fire station would be operational, as required by MM 16-3.[781] However, the permanent LASD substation would be built based on the service demand from the Project as determined by the LASD, with the Applicant and the LASD coordinating to finalize plans for the permanent LASD station upon approval of the applicable future tract map for the substation site.[782]

As stated on Draft EIR page 5.16-17, the LEFMF was established specifically to finance land acquisition, engineering, construction, installation, purchasing, and other direct costs related to capital law enforcement facilities and equipment, as required to serve new development in unincorporated areas of North Los Angeles County. The Applicant will pay the required LEFMF (MM 16-4) that would be used for the development of both the on-site temporary store front substation and the permanent LASD substation.

The operation of the temporary and permanent substations at the Project site would not result in response times from the LASD of an hour or more to the Project. Operation of the store front substation, as well as future operation of the permanent LASD substation, would also have beneficial impacts on response times to existing developments near the site due to proximity of the substation.

Section 5.10, Traffic, Access and Circulation, of the Draft EIR discusses increases in traffic volumes on SR-138 and I-5. The discussion under Threshold 10-5 addresses emergency access[783] and concludes that impacts to emergency access would be less than significant with implementation of the proposed roadway improvements at intersections with SR-138 and compliance with existing regulations and implementation of mitigation measures. In Draft EIR Section 5.3, Hazards and Fire Safety, the discussion under Threshold 3-7 addresses emergency response and evacuation[784] and states that traffic generation by the Project would not adversely affect emergency access or evacuation routes, with the Project Applicant/Developer continually updating the Emergency Response Plan prepared for the Project (MM 3-7) and the Project Applicant/Developer preparing a California MUTCD-compliant Traffic Control Plan for County and Caltrans approval for impacts to emergency access and circulation during activities in the roadway (MM 3-8). Draft EIR page 5.3-25 states that impacts on emergency response or evacuation activities would be less than significant after mitigation.

Response to Comment F.7-14:

The California Highway Patrol (CHP) is funded by the State Highway Account and Motor Vehicle Account of the State Transportation Fund, the Motor Carriers Safety Improvement Fund, the California Motorcyclists Safety Fund, the Federal Trust Fund, the Special Deposit Fund, the California Peace Officer Memorial Foundation Fund, and reimbursements. Over 95 percent of the CHP expenditures are supported by the Motor Vehicle Account that consists primarily of revenues from vehicle registration and driver license fees. Thus, the

781 *Id.,* p. 5.16-16
782 *Id.,* p. 5.16-22
783 *Id.,* pp. 5.10-140 and -141
784 *Id.,* pp. 5.3-23 to -25

vehicle registration and driver license fees paid by residents of the Project, as well as vehicle registration and driver license fees paid throughout the State, would fund the majority of the CHP services that include enforcement of traffic laws on County and State highways; assistance in emergencies exceeding local capabilities; provision of disaster and life-saving assistance; completion of truck and bus inspections; performance of air operations and vehicle theft investigations and prevention measures; protection of State property and employees; and completion of public education on driver safety.[785]

As stated on Draft EIR page 5.16-20, there are no long-range planning documents or uniform staffing requirements used by the CHP to project future needs in each service area. The CHP does not receive or base its deployment on the revenues that may be generated within its service area. Allocation of these fees to each service area is determined by CHP Headquarters in Sacramento. Therefore, no direct correlation between vehicle registration and driver license fees paid by residents of the Project and the cost of CHP services to the Project can be made and the vehicle registration and driver license fees would only partially offset Project impacts. However, the CHP has indicated that implementation of the Project would not require new or physically altered CHP facilities to maintain acceptable service ratios, response times, or other performance objectives.[786] Thus, impacts on CHP services would be less than significant and no additional funding is necessary.

Response to Comment F.7-15:

It is understood that a person's place of residence and employment are personal choices, but providing opportunities to work and shop near residences allows people to reduce vehicle use and by reducing travel times and encouraging walking and biking to work and shopping areas; which, in turn are the main goals of Smart Growth and Sustainability. The US Environmental Protection Agency (USEPA) has a Smart Growth webpage that provides links to examples of smart growth projects.[787]

Development of the Project can be expected to extend over a 20-year time frame; thus, vehicle use and commute patterns will also change over time. Section 4.6 of the Draft EIR discusses the phasing and implementation of the Project and acknowledges that the actual timing of development would be based on the state of the economy, market demand for on-site uses, and timing of regional and off-site infrastructure conditions and needs. As stated on page 4-92, the first phase of development will include services and infrastructure to serve early residents (e.g., schools, roadways, parks, and utilities).

Even if on-site jobs are not all filled by Project residents, there will still be a potential for residents to shop nearby and for on-site employees to look for residences in the Project. The Centennial Specific Plan includes a Design Metric that address village walksheds, density, and centers. One Metric is to "Design with the goal of achieving an 80% average, but no less than 50%, of all project dwelling units to be located within a ½ mile walking distance of a

785 *Id.,* p. 5.16-19
786 *Id.,* p. 5.16-23
787 Available at: https://www.epa.gov/smartgrowth/smart-growth-illustrated.

Village Core or the Town Center".[788] The Design Metrics would locate commercial areas, schools, parks, public service facilities, business parks, and other non-residential development within the Project site in accordance with Smart Growth principles. These Metrics have been incorporated into the Land Use Plan and Development Standards and other programs in the Specific Plan and approval of future developments and tentative tracts on the site would include reviews for compliance with the Specific Plan as part of the permitting process.

The Mobility Plan requires the formation and funding of a Transportation Management Agency (TMA) prior to the issuance of the first occupancy permit. The TMA is responsible for monitoring the form of travel, or transit modes, used by the people who live and work in Centennial. Pages 4-30 through 4-31 of the Draft EIR discuss the TMA and the Mobility Performance Standards of the Project and pages 4-36 through 4-39 discuss the Transportation Demand Management (TDM) measures to be implemented by the Project. As stated on page 4-36 of the Draft EIR and page 3-25 of the Centennial Specific Plan, the TMA would manage compliance with the internal and external mobility performance standards of the Specific Plan by conducting transit mode surveys and other appropriate monitoring activities to verify the effectiveness of TDM measures. The monitoring and adaptive management process will be a continuing obligation of the TMA.

As discussed on pages 5.10-49 to 5.10-51 of the Draft EIR, the Project analysis includes a discussion of internal and external "tripends" and "trips." A "tripend" refers to a trip start or destination point. An internal tripend is a trip that starts or begins in the Project site, such as from a residence. A "trip" includes a starting tripend and ending tripend. An internal trip is a trip that both starts and ends within the Project site. An external trip is a trip with either a starting or ending point outside of the Project site.

As discussed on Draft EIR pages 5.10-2 to 5.10-5, the Draft EIR uses the most recent version of the North County Sub-Area Model to evaluate traffic conditions in north Los Angeles County, including the Project site. This version of the model was updated by Los Angeles County to reflect the Antelope Valley Area Plan (AVAP) approved by the County in June 2015. The updated North County Sub-Area Model provides the estimates of Project internal trips and tripends utilized in the Draft EIR. As shown in Table 5.10-19 of the Draft EIR, the model projects that about 48 percent of the Project's total average daily trips (ADT) at buildout will be internal, and 52 percent will be external to the Project site. The model also projects that about 65 percent of the Project's full buildout total average daily tripends (the start or ending of a trip) will be internal to the site, and 35 percent will be external to the site.

The proportion of trips and tripends that are projected to be internal and external to the Project site by the North County Sub-Area Model updated by the County are based on model parameters such as population, employment and the relative distances between areas for which Project trips will be made. As discussed on Draft EIR page 5.10-50, the Project includes schools, parks, and retail shopping areas within the Project site located and sized to meet the Project's residential and workforce needs. The Project site is relatively isolated and most of the trips generated by travel to and from these locations will be internal to the Project area.

[788] DRP 2017, Appendix 4.0-A, Table MV-1

In addition, at buildout, the Project will include approximately 10.1 million square feet (sf) of commercial office, shopping/retail, and industrial land uses that will provide approximately 23,675 jobs, many of which would be filled by future Centennial residents. In comparison, applicable traffic models for the Lancaster/Palmdale area, which is larger than the Project but also relatively isolated, project that 70 percent of all tripends are internal to the region.[789] Similarly, traffic models indicate that 74 percent of the total tripends in the Santa Clarita Valley will be internal when the region is built out.[790]

The North County Sub-Area Model estimates of the Project's average daily internal and external trips and tripends at buildout is consistent with available census bureau data of the percentage of residents who work within or outside of their places of residence for communities with similar locational characteristics as the Project. The table below summarizes the 2011-2015 American Community Survey (ACS) 5-Year Estimates of the percentage of all workers aged 16 or older working in their own community, or internal to 11 communities that are relatively isolated from other locations and that have approximately the same average total workforce as the Project at full buildout.

	Total Workforce Over 16 Years of Age	**Percent Working in Own Community**
Santa Maria California	43,861	60%
El Centro California	15,368	57%
Tehachapi California	3,343	54%
Porterville California	18,810	53%
Barstow California	7,927	51%
Paso Robles California	14,771	48%
Madera California	18,525	46%
Lancaster California	53,503	46%
Watsonville California	22,271	45%
Santa Clarita California	84,987	37%
Palmdale California	55,867	32%
AVERAGE	**30,839**	**48%**
Source: U.S. Census Bureau, 2011-2015 American Community Survey 5-Year Estimates, Table S0810		

The ACS data indicates that the percentage of workers that are employed within their own community ranges from 60 percent in Santa Maria, California to 46 percent in Lancaster, California and 32 percent in Palmdale, California. The average percentage of residents who work within their communities is 48 percent. As discussed on Draft EIR page 5.10-50, most of the Project trips will be generated by residential land uses, and an average single-family residential unit generates approximately nine home-based trips per day. About two of these nine trips are home-based work trips related to travel directly to and from work. The remaining trips are related to travel between residential units for a non-work activity such as school, shopping, or recreation, which may be trips that are entirely local or may represent

789 Enhanced Antelope Valley Transportation Analysis Model Version 2.0, City of Palmdale

790 Santa Clarita Valley Consolidated Traffic Model Version 4.1, City of Santa Clarita and the County of Los Angeles

one leg of a journey between home and the workplace. The percentage of internal trips and tripends for non-work activity in locations such as the Project which provide schools, recreational facilities and shopping opportunities that are relatively far from other options is generally higher than for work-related trips. Residents in relatively isolated locations are more willing to utilize local school, shopping, and recreational facilities than to modify or change employment even if the desired work requires a significant daily commute. The internal trip rate for the Project that results from the North County Sub-Area Model is approximately the same as the average internal trip rate for work commutes in similarly isolated communities in California (48 percent). Since more daily trips in a community are related to non-work purposes, and the percentage of non-work internal trips is typically higher than for employment purposes, these data indicate that the North County Sub-Area Model internal and external trip estimates for the Project are reasonable. The Lead Agency is entitled to rely on expert traffic model estimates as substantial evidence of a project's likely traffic impacts, including the air emissions associated with such traffic trips.[791] This comment does not question the accuracy of the North County Sub-Area Traffic Model, or provide evidence that the model is unreliable.

The Draft EIR discusses the Northwest State Route 138 Corridor Improvement Project ("NW SR-138 project"), including State Route (SR) 138 improvement alternatives, design, purpose and how the alternatives related to the Project's proposed circulation system in Section 4.0, Project Description, pages 4-39 to 4-41, Section 5.10, Traffic, Access, and Circulation, pages 5.10-34 to 5.10-36, and Section 7.0, Cumulative Impacts, pages 7-8 to 7-9. This information was based on the Draft EIR/EIS for the NW SR-138 project which was circulated for public review and comment in July 2016. A Notice of Completion and Availability for the Project Draft EIR was filed by the County on May 15, 2017 and the 60-day comment period began on May 17, 2017.

As noted on Draft EIR page 4-41, the NW SR-138 project Draft EIR/EIS, Transportation Analysis Report (TAR) and Intersection Control Evaluation report (ICE Report) deferred the selection of a preferred SR-138 improvement alternative until the NW SR-138 project Final EIR/EIS ("NW SR-138 FEIR") was published. In June 2017, during the comment period for the Draft EIR, Caltrans issued the NW SR-138 FEIR and identified Alternative 2 (Expressway/Highway) ("Alt 2") as the preferred alternative for the SR-138 improvements.

In July 2017 Caltrans submitted a comment letter requesting that the Project traffic analysis discuss and incorporate the Alt 2 facilities to be consistent with the NW SR-138 FEIR. In response, a Supplemental Traffic Study (STS) was prepared to incorporate Alt 2 with the Project traffic analysis. The STS is attached as Appendix 5.10-C of the Final EIR. As in the Draft EIR, the STS considers potential Project impacts under existing and future (cumulative) traffic conditions. Potential impacts are evaluated using the Highway Capacity Manual (HCM) methodology utilized in the NW SR-138 FEIR. As discussed on Draft EIR pages 5.10-2 to 5.10-5, both the Draft EIR and the NW SR-138 FEIR use the North County Sub-Area Model to evaluate traffic conditions in north Los Angeles County. The Draft EIR utilizes a more recent version of the model that was updated by Los Angeles County to reflect the Antelope Valley

[791] *Laurel Heights Improvement Ass'n v. Regents of Univ. of Cal* (1988) 47 Cal.3d 376, 410; *National Parks & Conserv. Ass'n v. County of Riverside* (1999) 71 Cal.App.4th 1341, 1362

Area Plan (AVAP) approved by the County in June 2015. The STS also uses the traffic forecasts from the updated North County Sub-Area Model provided by the County to analyze potential Project and cumulative impacts to reflect the most current information available regarding traffic conditions in the North County region.

The Draft EIR considered potential Project impacts with improvements required to accommodate the full buildout of the Project under existing traffic plus Project buildout conditions, and cumulative traffic plus Project buildout conditions. The Draft EIR identified MMs that would maintain acceptable level of service (LOS) standards at all applicable highway segments, intersections, and ramps. To incorporate Alt 2 into the Draft EIR analysis, the STS considers potential Project impacts: (a) utilizing the current SR-138 facilities; (b) utilizing the Alt 2 facilities described in the NW SR-138 FEIR; and (c) utilizing the Alt 2 facilities and additional improvements to SR-138 that may be required under cumulative conditions with full Project buildout. The STS identifies certain mitigation measure clarifications required to address the design details of Alt 2 and to connect the Project internal circulation system with the Alt 2 facilities. The STS determined that the implementation of Alt 2, and additional improvements to SR-138 that may be required under cumulative conditions with full Project buildout, will not result in any new or more severe significant physical construction and operational impacts than considered in the NW SR-138 FEIR and the Draft EIR.[792] The STS also demonstrates that, using the HCM methodology, the Project will not result in any new or more severe significant impacts to applicable highway segments, intersections and ramps than considered in the Draft EIR.

The STS findings include the following:

- Under interim cumulative traffic conditions, the current SR-138 facilities would accommodate approximately 10 percent of the Project's full buildout traffic without adversely affecting applicable LOS standards.[793]
- Under existing traffic plus Project conditions, the implementation of Alt 2 would accommodate the full buildout of the Project without adversely affecting applicable LOS standards.[794]
- Under interim cumulative traffic plus Project conditions, the implementation of Alt 2 would accommodate approximately 75 percent of the Project's full buildout traffic without adversely affecting applicable LOS standards.[795]
- Under long-range cumulative traffic plus Project conditions, the implementation of Alt 2 and additional SR-138 improvements would accommodate the full buildout of the Project without adversely affecting applicable LOS standards.[796]

The STS compares the Project's potential impacts identified in the Draft EIR for Interstate-5 (I-5), SR-14 and SR-99 facilities using the volume to capacity methodology specified by the

792 Final EIR, Appendix 5.10-C, Sections 2.5 and 3
793 *Id.,* Appendix 5.10-C, Tables 3-3 and 3-4
794 *Id.,* Appendix 5.10-C, Tables 3-1, 3-2 and 3-9
795 *Id.,* Appendix 5.10-C, Tables 3-5 and 3-6
796 *Id.,* Appendix 5.10-C, Table 3-7, Tables 3-8 and 3-9

Congestion Management Plan for Los Angeles County and the Project's potential impacts using the Caltrans' recommended HCM methodology. HCM calculations were prepared for 62 locations within the Draft EIR study area consisting of freeway segments in advance of and after major system interchanges as well as representative locations between major system interchanges. The analyzed locations provide a comprehensive coverage of the Draft EIR study area because they include the freeway facilities with the greatest potential to be affected by congestion. Under existing plus Project conditions, the Draft EIR and the STS show that all applicable highway segments, intersections and ramps would operate at acceptable LOS levels.[797] Under cumulative plus Project conditions with mitigation, the Draft EIR and the STS show that almost all applicable highway segments, intersections and ramps would operate at acceptable LOS levels.[798] The STS indicates that certain study locations, such as the Grapevine grade segment of I-5, would not meet HCM-based LOS standards because topographic conditions, lane and speed controls, and other localized conditions would result in higher traffic densities. As shown in STS Table A-5, however, LOS conditions would be worse under cumulative without Project conditions, and LOS conditions improve under cumulative with Project conditions with the implementation of the Project MMs.[799] Consequently, the Project does not result in a significant impact at any location that does not meet HCM-based LOS standards under cumulative with Project conditions with mitigation.

As discussed above, the Draft EIR considered improvements to SR-138 that would be required to accommodate the full buildout of the Project under cumulative traffic conditions. The implementation of Alt 2 would accommodate approximately 75 percent of the Project's full buildout traffic under interim cumulative conditions, and additional improvements consistent with the SR-138 facilities considered in the Draft EIR would be required to accommodate all of the Project's full buildout traffic under long-range cumulative conditions. The NW SR-138 FEIR also clarified certain aspects of the SR-138 design details that would be implemented with Alt 2, including the number and locations of intersections along SR-138 from I-5 to SR-14. The NW SR-138 FEIR addressed several types of intersection configurations for each location, but defers selection of the final configurations to the SR-138 design phase. Subject to minor adjustments for consistency with these Alt 2 design details, the SR-138 facilities that would result from the additional improvements to Alt 2 required for full Project buildout under long-range cumulative conditions as described in the STS are substantially similar to the full buildout SR-138 facilities discussed in the Draft EIR. The STS provides a summary of SR-138 improvements in the context of the implementation of Alt 2, including the following:

- To connect the Project circulation system to the Alt 2 facilities, an additional intersection and certain intersection upgrades, such as additional lanes, will be constructed at locations where SR-138 borders the Specific Plan boundary.[800]
- The implementation of Alt 2, including minor modifications in certain intersection locations within the Specific Plan area to accommodate the Alt 2 design details, that

797 *Id.,* Appendix 5.10-C, Table 4-1
798 *Id.,* Appendix 5.10-C, Table 4-2
799 *Id.,* Appendix 5.10-C, Section 5
800 *Id.,* Appendix 5.10-C, Sections 2.2 and 2.3

accommodate approximately 75 percent of the Project's full buildout traffic under interim cumulative traffic conditions.[801]

- SR-138 improvements in addition to Alt 2 that would be required to accommodate all of the Project's buildout traffic under the long-range cumulative traffic conditions projected in the Draft EIR and STS.[802]

As discussed in the STS,[803] and as shown below, the Project's mitigation measures have been clarified to reflect the implementation of these improvements with Alt 2. As required by MMs 10-3 and 10-4, the Project will contribute fair share funding or provide funding for SR-138 improvements in accordance with a mitigation agreement with Caltrans for the implementation of Alt 2, improvements required to connect the Project circulation system with the Alt 2 facilities, and, if confirmed in traffic studies submitted in conjunction with the review and approval process for future Project tract maps, additional SR-138 improvements that may be required to accommodate full Project buildout under cumulative traffic conditions.

As discussed in Draft EIR Section 5.10, Traffic, Access, and Circulation, the Project Applicant intends to implement and fund State transportation facility mitigation measures through a proposed Traffic Mitigation Agreement with Caltrans which would provide funding contributions, phasing, guarantees of payments, and collection of third- party contributions for required SR-138 mitigation. Alternatively, the Project will pay a fair share contribution towards the construction of transportation facilities that will mitigate for potential Project impacts. More specifically, as discussed on Draft EIR page 5.10-91, and in the Supplemental Traffic Study (STS) prepared to incorporate the identification of preferred Alternative 2 in the Northwest State Route 138 Corridor Improvement project Final EIR/EIS with the Project traffic analysis, MMs 10-3 and 10-4 require the Project Applicant to seek to enter into a Traffic Mitigation Agreement and transportation mitigation fee program that would fully mitigate for all impacts to SR-138 highway segments under cumulative plus Project conditions or to contribute fair share funding for the required improvements. The timing and need for these improvements will be evaluated in the traffic studies required for each Project tract map application in accordance with the MMRP for the Project.[804]

Consequently, the North County Traffic Model estimates of the amount of the Project's total daily trips and tripends that will be internal to the site is consistent with the results of model projections and available census data for other similarly situated locations. The Project analysis identifies and requires mitigation that will meet each phase of development incorporating the preferred SR-138 improvements identified by Caltrans in the NW SR-138 FEIR. The Project is required to contribute fair share funding for all required improvements to SR-138 and in other locations, and the timing and need for these improvements will be evaluated and implemented in conjunction with the tract map approval process as required by the MMRP.

Response to Comment F.7-16:

This comment addresses the potential use of Pine Canyon Road, which extends along the southern Antelope Valley foothills from about Sandberg to the south of the Project site to Lake Hughes. As noted in the comment, the segment of Pine Canyon Road between Ridge Route Road and Three Points Road is narrow in width and has a winding alignment. Significant use of Pine Canyon Road by Project residents or non-residents seeking alternative routes to State Route (SR) 138, which extend east and west to the north of Pine Ridge Road is not likely to occur for several reasons. First the use of Pine Ridge Road to traverse east and west along the Antelope Valley would require substantially longer travel times than travel on SR-138 even under relatively congested conditions. Travel from the Project site or from SR-138 to Three Points Road via Pine Canyon Road would take significantly longer than using SR-138. In addition, under current conditions, the use of Pine Canyon Road to bypass SR-138 would increase travel time by approximately 300 percent as compared to using SR-138 (26 minutes versus 8 minutes).

Finally, as discussed in the Draft EIR, Caltrans is planning to improve SR-138 by implementing the Northwest State Route 138 Corridor Improvement Project ("NW SR-138 project").[805] As noted on Draft EIR page 4-41, the NW SR-138 project Draft EIR/EIS, Transportation Analysis Report (TAR) and Intersection Control Evaluation report (ICE Report) deferred the selection of a preferred SR-138 improvement alternative until the NW SR-138 project Final EIR/EIS ("NW SR-138 FEIR") was published. In June 2017, during the comment period for the Draft EIR, Caltrans issued the NW SR-138 FEIR and identified Alternative 2 (Expressway/Highway) ("Alt 2") as the preferred alternative for the SR-138 improvements. In July 2017 Caltrans submitted a comment letter requesting that the Project traffic analysis discuss and incorporate the Alt 2 facilities to be consistent with the NW SR-138 FEIR. In response, a Supplemental Traffic Study (STS) was prepared to incorporate Alt 2 with the Project traffic analysis. The STS is attached as Appendix 5.10-C of the Final EIR. The implementation of the preferred Alternative 2 improvements identified in the NW SR-138 FEIR will further reduce travel times on SR-138 by reconstructing the roadway as a six-lane expressway between Gorman Post Road and 300th Street West. These improvements will increase the reliability of SR-138, minimize closures for inclement weather and accidents, and further reduce potential incentives to use Pine Ridge Road as a bypass option.

As a result, Pine Ridge Road is not now and will not become under future conditions a reasonable alternative route for travel that currently uses SR-138. The Project will not result in significant impacts to Pine Ridge Road or to any resources located along the roadway.

Response to Comment F.7-17:

The increased potential for wildfires due to increased human presence is acknowledged on page Draft EIR page 5.3-36, as follows "As development of the Project site proceeds, fire hazards associated with the natural vegetative cover would be eliminated through its replacement with urban landscape vegetation, which is irrigated and less combustible than the existing vegetation. However, the potential for wildland fire hazards would still exist at

[805] DRP 2017, pp. 4-39 to -41; 5.10-34 to -36; 7-8 and -9

the wildland/urban interface due to (a) the presence of brush; (b) increased human activity; and (c) the increased potential for fires due to accidental and arson-related causes." Fire due to the operation and storage of vehicles near dry vegetation falls into the category of accidental causes. As indicated, arson-related causes are also disclosed as a potential wildfire source. The risk of both wildfire and structural fires, and response to those events, with implementation of the proposed Project has been thoroughly assessed by the Los Angeles County Fire Department (LACFD). The LACFD worked closely with the Project Applicant regarding site design, fuel modification planning, and fire infrastructure planning. With implementation of the Project, the Project vicinity would experience increased fire protection resources. This would include emergency fire response to brushfires or other fires caused by human activity on area roadways, such as Pine Canyon Road. However, requiring the Applicant to acquire and maintain the road, and manage the road for limited access is not feasible or warranted. This roadway, and all public roadways, would remain public roadways with proposed Project implementation. The LACFD has thoroughly reviewed the Project plans and provided the Applicant with all measures considered appropriate to minimize the risk of wildfires and ensure capable fire and medical emergency response with Project implementation.

Response to Comment F.7-18:

As stated on Draft EIR page 5.16-5, the County's Developer Fee Program was adopted specifically to fund the purchase of fire station sites; the construction of new stations and facility improvements; and the purchase of equipment. Thus, use of the developer fees paid by the Project would be in accordance with the County's intent for the Developer Fee Program. Separate fees are required for police protection services (Law Enforcement Facilities Mitigation Fee), school services (SB 50 school impact fees or agreements), and library services (Library Facilities Mitigation Fee).

MM 16-2 on Draft EIR page 5.16-16 allows the Applicant to enter into a program where the Applicant provides the land and constructs and equips the fire stations in exchange for credit towards the fee payments. MM 16-3 states that the Applicant will provide the land and construct and equip up to four new fire stations to serve the Project. These stations would meet the demand for fire protection services from the Project within the County's response time standards, as outlined in MM 16-1.

The construction of an on-site fire station prior to the start of the construction of the first phase of development is not considered necessary since fire services and emergency response during initial construction would be provided by the Los Angeles County Fire Department (LACFD) Fire Station 77.[806] Based on coordination with the LACFD, prior to the construction of the first fire station, the Project would pay developer fees, which may be used for the construction of facility improvements and the purchase of equipment at Fire Station 77.

The need for a helicopter would be dependent on the needs identified by the LACFD and would be funded by the developer fees from the Project and other developments in the area.

806 *Id.,* p. 5.16-12

However, the Project itself is not required to fund services for other areas, such as the Angeles and Los Padres National Forests, which are under the jurisdiction of the US Forest Service (USFS). Also, the Project site does not share a common boundary with these national forests and compliance with pertinent fire regulations and required setbacks, as well as implementation of a Fuel Modification Plan (MM 3-9 on page 5.3-39) in Section 5.3, Hazards and Fire Safety, of the Draft EIR, would reduce fire incidents at the site. Since no direct impact related to fires at the Angeles and Los Padres National Forests would occur with the Project, mitigation to fund increased staffing of the USFS hand crews and increased USFS firefighting personnel cannot be required of the Project. However, as discussed in Draft EIR Section 5.16.2, Fire Services, LACFD fire stations, facility improvements, and equipment would be funded by developer fees paid by the Project and/or a program between the LACFD and the Applicant and the on-site fire station operating and staffing costs would be funded by property tax revenues from the Project. Impacts on fire protection services would be less than significant after mitigation.

Response to Comment F.7-19:

The comment correctly states that the Project, in its previous design prior to 2008, was subject to Significant Ecological Areas Technical Advisory Committee (SEATAC) review. Prior to 2008, the Project was designed to overlap SEA 17 (previously SEAs 58 and 59), which would have resulted in impacts to the SEA. The prior design is described in the 2004 Notice of Preparation, included in Draft EIR Appendix 2.0-B. However, the Project design was subsequently changed and considerably reduced in size, and is currently designed to avoid all direct impacts on SEA 17. As a result, SEATAC no longer has jurisdiction to comment on the Project. In addition, implementation of Draft EIR PDF 7-1, dedication of a Mitigation Preserve, sets aside thousands of acres within SEA 17 and as such these areas shall be preserved and managed in perpetuity.[807] Further information on the SEA program in relation to the Project is included in response to Comment B.4-48.

Response to Comment F.7-20:

As stated in response to Comment F.7-19, the Project boundaries avoid direct impacts to SEA 17 completely. The comment correctly states that SEATAC determined the previous design of the Project was not compatible with the principles of the SEA. Since that time however, the Project was redesigned and a large portion of the Project located west of the California Aqueduct was removed and direct impacts to the SEA have been avoided completely. Since the Project no longer overlaps the SEA, no further SEATAC review is required.

Response to Comment F.7-21:

The comment correctly states that the convergence of the San Gabriel, Tehachapi, and Transverse Ranges (The Tehachapi Linkage) represent one of the most important wildlife corridors in Southern California. The main function of SEA 17 is to preserve and protect this important linkage area and the associated habitats.[808] Multiple studies have been conducted

807 *Id.,* pp. 5.7-135 to -137, revised Exhibit 5.7-10
808 *Id.,* p. 5.7-8

on regional wildlife movement in the Project area (see Table 5.7-2 in Section 5.7-3, Environmental Setting, of the Draft EIR). The general conclusion of these studies has been that the habitat types that occur within the Project area that border SR-138 are not ideal for facilitating movement from one preferred habitat type to another. Although some limited crossing may occur here, an overall lack of cover, food, and water make this particular area less attractive to wildlife wishing to cross from SEA 17 in the north to SEA 17 in the south.

Response to Comment F.7-22:

The comments about the biological importance of the Tejon Ranch (Ranch) property and surrounding region are recognized and reflected in the Tejon Ranch Conservation and Land Use Agreement (Ranch-Wide Agreement or TRCRWA), as discussed in the Draft EIR at page 5.7-18, which explains that in recognition of the biological importance of Tejon Ranch, the project Applicant voluntarily agreed to permanently preserve 90 percent of the Ranch determined to be the most ecologically important, and limit Ranch development to the less than 10 percent of the Ranch determined to be developable without compromising the biological integrity and biological values. The proposed project is located in a development area, has relatively limited impact on oak woodland and riparian habitat, and fully mitigates its impacts to grasslands (please refer to Section 5.7.6, Environmental Impacts, and Section 5.7.7, Mitigation Measures).

Furthermore, as summarized in the Mitigation Preserve Review in Appendix 5.7-C of the Draft EIR, an evaluation of potential mitigation lands generally considers lands within closer proximity to the impacted lands as highest potential value. This generality stems from that fact that conditions are generally more similar in close proximity than further apart. Conditions include weather, geographic position, soil type, slope, and many others. The mitigation lands selected utilize this approach and include lands on site and immediately adjacent and then with the most similar conditions when moving further away from the Project site to capture additional acreage.

All of the lands selected for the Mitigation Preserve in Los Angeles County fall within the County's Significant Ecological Area designation. Although the designation does not preclude development, it is an indication of high biological value in the County. With inclusion in the Centennial Mitigation Preserve, these County SEA lands will now be preserved in perpetuity allowing the maximum protection of the biological values that the SEA designation was intended to protect, such as unique assemblages of oak tree species, wildflower fields, and regional wildlife movement corridors. Furthermore, the lack of future development or other landscape disturbances to these lands will also influence adjacent undeveloped SEA lands by reducing the potential for the spread of non-native plants and wildlife.

The majority of the acreage in the Mitigation Preserve was selected for its grassland resources. Extensive research was conducted in the grasslands on the Project site to understand and document composition of these distinctive communities of herbaceous plants and wildflowers. Grassland communities in the Mitigation Preserve were subsequently reviewed to support a reasonable expectation that their composition is similar and the quality is the same or better than grassland areas directly impacted by the Project.

Studies included native bunchgrass modeling, model testing/truthing, indices of nativeness, indices of similarity, plot sampling, and many other methods. In addition, through and a subsequent series of field visits, many populations of special status plant species—including California androsace, round leaved filaree, adobe yampah, Mojave spineflower, and Sylvan scorzonella—have been identified in the Mitigation Preserve and on many additional acres of potentially suitable habitat for these and other species. These findings support the effectiveness of the Mitigation Preserve to off-set the impacts to grasslands as well as the associated rare plant species impacted by the Project.

Another important element considered in the selection of mitigation lands was the potential to support existing populations/and or potentially suitable habitat for wildlife species impacted by the Project. In finding areas with similar vegetation types and in close proximity to the Project site, the Mitigation Preserve captures habitat that is very similar to the site, which would be expected to be occupied by a very similar suite of wildlife species. In addition, field visits in the Mitigation Preserve have identified several unique wetland habitat areas with potential to support tricolored blackbird breeding and hundreds of acres of potential foraging land. Some of these areas are, in fact, occupied by breeding colonies of tricolored blackbirds, which have been recorded foraging throughout the areas. Occupied burrowing owl habitat and hundreds of acres of potentially suitable habitat for this species has also been recently detected from within the Mitigation Preserve. These results are not unexpected given the process used in selecting these lands. Furthermore, regional wildlife movement corridors identified in the higher elevations of the surrounding landscape will benefit from the preservation of the selected lands due to the effect of buffering from undeveloped lands. The evidence gathered supports the determination that lands in the Mitigation Preserve are appropriate and well suited to meet the applicable mitigation requirement and adequately off-set Project impacts.

For greater details of the Mitigation Preserve lands, please see Appendix 5.7-C of the Draft EIR.

Regional montane connection specifically was considered in detail.[809] The assessment, which used various scientific studies, including site-specific studies listed in Table 5.7-2,[810] concluded that maintaining baseline connectivity between the two regions is essential, and although development of the Project would not significantly impact movement between these regions,[811] MMs 7-13 through 7-19 are proposed, which incorporate planning and construction methods to reduce potential indirect impacts to wildlife movement.[812]

A discussion of Regional Wildlife Movement, beginning on page 5.7-6, is provided in the Draft EIR. The section acknowledges the importance of movement in the region where several major biological regions come together stating that various recent reports that discuss the biotic resources in the vicinity of the Tehachapi Mountains (including the Project region) describe the importance of these mountains as a landscape linkage between the Sierra

809 DRP 2017, pp. 5.7-50 to -64, -164 to -170
810 *Id.,* p. 5.7-23
811 *Id.,* pp. 5.7-164 and -165
812 *Id.,* pp. 5.7-190 to -194

Nevada and the Coast Ranges (see Exhibit 5.7-6, Regional Wildlife Movement). Typically, landscape linkages facilitate wildlife movement between large areas of similar terrain, vegetation types, or habitats. Because of the unique adaptations required of wildlife species that inhabit the low elevations of the San Joaquin Valley to the north of the Tehachapi Mountains and the Antelope Valley and adjacent Mojave Desert to the south of the mountain range, most species that occupy these geographically separate and distinct ecosystems do not venture south or north, into or over, the Tehachapi Mountains.[813] As noted above, wildlife species within the mountains surrounding the Project site are expected to move freely within the mountains to satisfy their life history requirements. Accordingly, most wildlife movement in the mountains probably occurs within large landscape areas in upland portions of the Tehachapi range, and to the south of the Centennial property within the western extent of the San Gabriel Mountains much more than between these areas. The same can be expected of movement on the valley floor and surrounding low foothills, where the proposed Project is located.[814]

The Draft EIR goes on to discuss the long-term sustainability of regional linkages beginning on page 5.7-62. The section describes how two regional conservation plans, the TRCRWA and the Tehachapi Upland Multiple Species Habitat Conservation Plan (TUMSHCP), will assist in sustaining the functionality of the regional landscape linkage for future wildlife populations. These plans offer elements for long-term sustainability and management of a Tehachapi Mountains landscape linkage.

Under the TRCRWA, the Tejon Ranch Conservancy will adopt, update, monitor, and enforce implementation of the Ranch-wide Management Plan (RWMP) on dedicated conservation areas and option areas subject to conservation, preservation, mitigation, and enhancement measures, as required under applicable law or imposed by federal, State or local agencies as part of any permit or approval for the Ranch or projects within the Ranch. Maintenance of the open space or conserved lands will be the responsibility of the Conservancy, funded in large part by a fee based on a portion of the purchase price for each residential parcel on Tejon Ranch. Since Centennial constitutes over 75 percent of the currently planned residential units on the Ranch, it will bear the substantial costs of funding the Conservancy and maintaining wildlife movement corridor areas through the Ranch.[815] The Mitigation Preserve is available for mitigation under the TRCRWA, and development of the project will fund its ongoing management.[816]

In addition, the TUMSHCP ensures the persistence of covered species, including sustaining viable populations of those species, providing for (within property dispersal) and protecting current opportunities for wildlife movement beyond the Ranch by preserving existing landscape linkages. Lands to be conserved as part of the TUMSHCP are adjacent to other lands within Tejon Ranch ownership and are also slated to be protected as part of the TRCRWA. The sum of these interconnected open space commitments, development restrictions, and mitigation measures is a conservation commitment that is, by design,

813 *Id.,* p. 5.7-56
814 *Id.,* p. 5.7-57
815 *Id.,* pp. 5.7-62 and -63
816 *Id.,* p. 5.7-16

consistent with conservation biology principles calling for large, interconnected blocks of habitat that support the life history requirements of Covered Species and other resident wildlife. The TUMSHCP, if fully implemented, will sustain crucial landscape linkages across cismontane Southern California.[817]

With respect to condor, in approving the TUMSHCP, the U.S. Fish and Wildlife Service considered development within the region, specifically inclusive of several major projects including Centennial, Newhall, Tejon Mountain Village, and Grapevine, and concluded that the TUMSHCP includes measures to minimize and mitigate remaining impacts on condor, such that even with cumulative projects, the Ranch would contribute to conservation and recovery of the species.[818] Project impacts are carefully assessed and mitigated for in the Project Draft EIR. The Project area avoids SEA 17 completely and also avoids condor Critical Habitat. Lastly, the Project design is consistent with the Antelope Valley Area Plan (AVAP), inclusive of open space designations, SEA protection, and preservation of habitat linkages.[819] The AVAP is a community-based plan that is a subset of the County of Los Angeles General Plan, which includes the Project area. The AVAP EIR provides an analysis of all potential, reasonably foreseeable environmental impacts related to the implementation of the AVAP "to indicate possible ways to reduce or avoid environmental damage and to identify alternatives" to the AVAP.[820] Additionally, the AVAP EIR discloses "significant environmental impacts that cannot be avoided; growth inducing impacts; effects not found to be significant; and significant cumulative impacts of all past, present and reasonably foreseeable future projects".[821]

Response to Comment F.7-23:

Please refer to response to Comments F.7-1 through F.7-23, which address all issues raised in this letter, including comments regarding land use and, secondarily, biological resources, scenic quality, water quality, and air quality as they affect the living environment for existing residents. The Project is consistent with the intent of the AVAP, being located in the West EOA, which allows for urban development in selected areas while maintaining the rural nature of the majority of the Antelope Valley. It is unclear what is intended in the request for public participation to be part of "all possible mitigation efforts". Public participation in implementation of mitigation measures is not practical or in alignment with County policies on the implementation of the Mitigation Monitoring and Reporting Program (MMRP). The responsible parties for implementation and monitoring of all MMs would be clearly defined in the MMRP that was attached in the Final EIR in Appendix 2.0-C.Rev, for consideration by the Los Angeles County Regional Planning Commission and Board of Supervisors. The County of Los Angeles, as Lead Agency, has conducted all appropriate public and agency outreach, including a scoping meeting as well as an extended public review period. All comments on the Draft EIR, including any comments on mitigation measures, will be considered by the Regional Planning Commission and Board of Supervisors.

jsackett@planning.lacounty.gov

Re: Centennial Project Draft Environmental Impact Report

Dear Mr. Sackett:

These comments are submitted on behalf of the Center for Biological Diversity ("Center"), the Center for Food Safety and the California Native Plant Society regarding the Draft Environmental Impact Report ("DEIR") for the proposed Centennial Project ("Project"). The California Environmental Quality Act ("CEQA") mandated environmental review for the Project is inadequate and fails to comply with the requirements of the statute. The DEIR fails to adequately analyze a range of environmental impacts, mitigation measures, and alternatives. For the reasons detailed below, we urge that the Project be denied, or at a minimum, the DEIR must be revised and recirculated to remedy these deficiencies. F.8-1

The Center is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has over one million members and online activists throughout California and the United Sates. The Center has worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in Los Angeles County. F.8-2

The Center for Food Safety ("CFS") is a nonprofit, public interest advocacy organization dedicated to protecting human health and the environment by curbing the proliferation of harmful food production technologies and promoting sustainable agriculture, including impacts to water resources. In furtherance of this mission, CFS uses legal actions, groundbreaking scientific and policy reports, books and other educational materials, and grassroots campaigns on behalf of its 850,000 farmers and consumer members across the country. F.8-3

The California Native Plant Society ("CNPS") is a non-profit environmental organization with 10,000 members in 35 Chapters across California and Baja California, Mexico. CNPS' F.8-4

mission is to protect California's native plant heritage and preserve it for future generations through application of science, research, education, and conservation. CNPS works closely with decision-makers, scientists, and local planners to advocate for well-informed policies, regulations, and land management practices.

F.8-4 cont.

I. The Current Project Description Does Not Represent The True Scope of the Project and is Misleading.

Under CEQA, a "project" is defined as "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment . . . ." (*Tuolumne County Citizens for Responsible Growth, Inc. v. City of Sonora* (2007) 155 Cal.App.4th 1214, 1222 (citing CEQA Guidelines § 15378, subd. (a).) An "accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR." (*Cnty. of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 193; (*San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 655 (project description held unstable and misleading) [hereinafter "*San Joaquin Raptor*"].) "However, a curtailed, enigmatic or unstable project description draws a red herring across the path of public input." (*San Joaquin Raptor*, 149 Cal.App.4th, at 655.).

F.8-5

An inaccurate or truncated project description is prejudicial error because it fails to "adequately apprise all interested parties of the true scope of the project." (*See City of Santee v. Cnty. of San Diego* (1989) 214 Cal.App.3d 1438, 1454-55 [hereinafter "*City of Santee*"].) "Only through an accurate view of the project may the public and interested parties and public agencies balance the proposed project's benefits against its environmental cost, consider appropriate mitigation measures, assess the advantages of terminating the proposal and properly weigh other alternatives." (*San Joaquin Raptor*, 149 Cal.App.4th, at 655.)

F.8-6

The DEIR contains a number of misleading statements regarding the project description. For instance, the DEIR states "the Project anticipates and would complement the planned SR-138 improvements, as intended by the West EOA." (DEIR at 4-9.) The DEIR does not cite any portion of the West EOA that evidences an "intent" for the development of Centennial. Instead, the Antelope Valley Area Plan ("AVAP") merely defines the West EOA as specific lands including "large contiguous landholdings that have been proposed for master-planned developments . . ."[1] (AVAP at IMP-4.) The AVAP cautions that "any master-planned community within the West EOA will require further planning activities in addition to this Area Plan." (*Ibid.*) The AVAP further states that it requires the preparation of a specific plan even for extremely small developments of only five residential dwelling units. (*Ibid.*) Nowhere does the AVAP state that it expects or "intends" the development of a city of nearly 60,000 people in this remote area.

F.8-7

The DEIR's Project Description also misleadingly claims that "No new environmental impacts occur" as a result of permitting assessor dwelling units ("ADUs") on the project due to "variations in household occupancy." (DEIR at 4-18-19.) Obviously, a household that contains an ADU will on average have a significantly higher occupancy than a household that does not

F.8-8

[1] Los Angeles County Department of Regional Planning, Antelope Valley Area Plan (June 2015), available at http://planning.lacounty.gov/assets/upl/project/tnc_draft-20150601.pdf.

F.8-7A

contain an ADU. And with a higher occupancy comes greater environmental impacts – e.g., air pollution and GHG emissions arising from the additional occupants commuting to jobs. F.8-8 cont.

The DEIR needs to clarify whether the additional persons living in ADUs were calculated in assessing the Project's impacts. While it is unclear, it appears that the DEIR excluded persons living in ADUs from its analysis by claiming that "[t]here is also no basis for estimating whether or when an ADU would be built by any given homeowner, and CEQA does not require speculation." (DEIR at 4-19.) This claim is inconsistent with the rest of the DEIR – the DEIR includes estimates regarding the number of residents who would work onsite even though predicting such fact and location-specific phenomena is uncertain. Yet, at the same time, the DEIR avoids "speculation" regarding how many people or developers would build ADUs, even though the DEIR could easily determine ADU rates in neighboring communities. F.8-9

The Project Description does not adequately disclose whether grazing will be allowed on areas designated as "open space." The DEIR states that there will be "continued grazing in some areas." (DEIR at 4-24.) However, the actual Natural Resource/Open Space Management Plan ("OSMP") appears to permit grazing throughout the open space designation. (Appx. 4.0-A at 3-97.) The DEIR should be clear that the OSMP allows grazing throughout areas designated as "open space" if that is what the DEIR permits. The DEIR also vaguely states that grazing might be allowed "in perpetuity if determined necessary to maintain grassland values based Grassland Mitigation Plan." (DEIR at 4-44.) The DEIR needs to be clear who determines whether grazing is "necessary." F.8-10

The DEIR does not contain a firm timeframe as to when construction on the various phases will take place. Instead, the DEIR states that the various project phases would be timed depending upon (1) the state of the economy; (2) market demand for uses on the site; and (3) the timing of regional and off-site infrastructure conditions and needs. (DEIR at 4-91.) This indicates that the developer(s) and/or builders will be able to pick and choose which portions of the development are most profitable at any given time, and only develop those portions. For instance, if only residential – and not commercial development – is profitable, then the developer(s) and/or builders could avoid such commercial development. F.8-11

This lack of clarity renders the Project description unstable, such that the FEIR fails to inform decision-makers and the public of the true scope of the Project from which all interested parties could assess the direct and indirect environmental effects of the Project. (*City of Santee*, 214 Cal.App.3d, at 1454-55; *San Joaquin Raptor*, 149 Cal.App.4th, at 655; *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 83-86.) F.8-12

More importantly, the lack of any firm phasing plan for the Project renders the Project's various calculations and commitments regarding traffic, air pollution, and GHGs unreliable. Even if the DEIR's extremely optimistic internal trip capture rates are correct, they will not be met if the developer(s) build the residential project pieces first and then either abandon or only later build the commercial portions. And even if the commercial portions were eventually built, the Project would still result in a "carbon debt" for the years in which the commercial portions were not built. F.8-13

The DEIR contains a similarly unstable description for school sites. In particular, the DEIR states that "any rejected school site shall revert to residential land use at the density of the F.8-14

surrounding residential designation; however, the maximum number of units allowed by the *Centennial Specific Plan* would not be exceeded." (DEIR at 4-26.) Neither the DEIR's Project Description (nor the text of the Specific Plan) explain the process for "rejecting" a school site. The developer may have an incentive to have school sites "rejected" so it can build more homes. Again, this means that the air quality, traffic, and quality of life benefits of having schools close to residences will not necessarily be realized. Instead, the Project could result in more traffic, air pollution, and GHGs as residents are forced to drive many miles to send their children to schools in other areas. Additionally, the public and local government would need to add expense limited resources in adding schools for residents of the Project.

F.8-14 cont.

The Project Description also provides that the Project "must" meet certain mobility performance standards, including minimum percentages of different types of non-single occupancy vehicle ("SOV") trips. (DEIR at 4-29 – 4-31.) The Project Description fails to describe how such minimum standards will be met. On a practical level, it is unclear what types of mechanisms the project proponent could use to mandate this minimum percentage. Will the project proponent or HOA require residents to report how often they take SOV trips and prohibit them from taking more than a certain amount? Such a system would be unprecedented and likely unworkable. In short, the Project Description should not include promises regarding the attributes of the Project or behavior of the residents that are not enforceable or feasible.

F.8-15

The Project Description further states that the Project will include a "transmit management authority" or "TMA." While the DEIR's Project Description does specify *when* the TMA will be formed, it does not specify how much funding it will receive or identify its funding source. (*See* DEIR at 4-36.) The DEIR also does not specify which entity will fund the "transit centers" near the "village cores." (DEIR at 4-37.) These omissions are especially problematic because the Project Description elsewhere states that "funding for the local transit system would come from a combination of Proposition A and property taxes." (DEIR at 4-37.) The Project Description needs to be clearer whether it will contain a self-funded public transportation system or whether the broader region will bear the cost of this system.

F.8-16

The DEIR states that Caltrans has not yet identified a "preferred alternative" for the Northwest State Route 138 Improvement Project (the "138 Improvement Project"). However, the 138 Improvement Project EIR has since been certified.[2] As such, the DEIR should be updated to reflect this.

F.8-17

The DEIR also is unclear as to whether areas designated as "open space" will remain undeveloped. Notably, while 5,624 acres are designated as "open space," only 3,681 acres are designated as "SEA 17 to be preserved in perpetuity within the Project site boundaries." (DEIR at 4-44.) This suggests that the remaining 1,943 acres will ***not*** be preserved in perpetuity. The DEIR is unclear as to whether the project proponent and/or County can revert any of the "open space" to developable space. Elsewhere in the DEIR, the DEIR states that the Project would "permanently preserve 5,624 acres of on-site open space…" (DEIR at 5.8-59.) If this statement regarding permanent preservation is accurate, the DEIR should include conditions of approval requiring conservation easements for all 5,624 acres.

F.8-18

[2] Northwest State Route 138 Corridor Improvement Project Final Environmental Impact Report/Environmental Impact Statement and Section 4(f) Evaluation (June 2017), available at http://www.dot.ca.gov/d7/env-docs/docs/NW_138-FED-06_28_17.pdf.

F.8-17A

II. The DEIR Fails to Adequately Assess the Project's Traffic Impacts.

The DEIR fails to adequately assess or mitigate the Project's traffic impacts. The report from Griffin Cove Transportation Consulting, PLLC attached as Exhibit A outlines many of deficiencies in the traffic analysis (the "Griffin Letter"). We request that the Final EIR provide specific responses to all of the comments raised in the Griffin Letter. F.8-19

A. Centennial is undisputedly a sprawl project.

One point that needs emphasis is that Centennial is a classic "sprawl" project and contains all of the worst elements of sprawl. As the Girffin Letter explains:

> Stantec Table 3-5 (p. 3.9) shows that the overall average trip length for project-generated traffic will be 25.5 miles, with "external" trips (i.e., those that have an origin or a destination outside the project) having an average trip length of 45.9 miles. Although trip lengths have no effect on the level of service at any of the intersections and roads within the study area, ***these extraordinary values demonstrate clearly that the project exemplifies the worst elements of "sprawl," with its related issues of fuel consumption and pollutant emissions***.

F.8-20

The County should not approve this 20th century sprawl project centered around the automobile. County residents deserve better than to have their air further impaired with disease-causing pollutants and their streets further clogged with cars. And by locking in significant greenhouse gas emissions for the next century, approval of the Project would be a huge step backward in the County and state's efforts to combat the climate crisis.

B. The DEIR does not accurately describe the baseline conditions.

The DEIR misstates the traffic baseline by including other Tejon projects such as Tejon Mountain Village and Grapevine Specific Plan. (*See* DEIR at 5.10-34.) The DEIR improperly suggests these are "approved" projects. While both projects do have certified EIRs, Grapevine is currently subject to litigation brought by CBD and CFS. And both projects have numerous other discretionary agency approvals that they must undergo before breaking ground; for example, both projects will likely require consultation and with U.S. Fish and Wildlife Service for impacts to endangered species and "take" permits. The DEIR's misinformation regarding the traffic baseline undermines its analysis. F.8-21

The DEIR also uses the outdated 2012 SCAG RTP/SCS in its analysis of growth projections. The DEIR should instead reference the 2016-2040 RTP/SCS, which was adopted on April 7, 2016. F.8-22

C. The DEIR understates the traffic impacts of the Project.

The DEIR optimistically claims that "Because of the balanced land use plan, all jobs could be filled by workers in the community and all service needs could be met by on-site retail and other service land uses." (DEIR at 5.10-49.) While this sentence identifies a desirable goal, the DEIR does not cite any evidence showing how all jobs would or could actually be filled by onsite residents. At best, this statement constitutes unfounded speculation; at worst, it is a F.8-23

misleading attempt to downplay the enormous traffic impacts of Project, given that DEIR itself estimates average trip lengths of 45.9 miles. F.8-23 cont.

In addition, as explained in the Project Description section of this letter, the DEIR's various traffic analysis are dependent upon buildout of the Project with both the residential and commercial portions. Yet, the DEIR does not require buildout in any particular order, and even allows the project proponent to avoid building entire portions of the Project if the project proponent so desires based upon "market conditions." Accordingly, the purported "23,675 jobs" generated by the Project may never materialize, thereby requiring *all* the residents to still commute many dozens of miles to their jobs. This lack of stability in the Project renders all of the traffic analyses fundamentally unreliable. F.8-24

The DEIR also contains unreasonable and unsubstantiated assumptions regarding the frequency of non-automobile trips by residents. For example, the DEIR assumes that people will make 3 mile bike trips within 15 to 20 minutes. The DEIR does not cite evidence that people will in fact make such trips on a regular basis. Nor does the DEIR appear to account for the fact that the Project is located in an arid and extremely hot area that contains hilly topography, which may make everyday cycling less desirable to the average resident. While CBD fully supports cycling as a form of transportation for commuting, currently only 0.6 percent of commuters in the U.S. bike to work.[3] The DEIR does not explain how the Project will be substantially different in the amount of cycling done by residents. F.8-25

The DEIR contains other unfounded assumptions regarding the traffic impacts of the Project. For example, the DEIR states that the "Existing plus Project analysis" assumes that "***existing background traffic conditions do not change***, other than changes directly due to the Project, over the approximate 20-year time frame required to build the Project." (DEIR at 5.10-53, emphasis added.) The DEIR again repeats this unfounded assumption later, claiming that "the amount of traffic that would be generated under future conditions in developed areas outside the Project site would not change with or without the Project." (DEIR at 5.10-88.) These statements are inconsistent with the Final EIR for the Northwest State Route 138 Improvement Project – this EIR stated that Highway 138 is "anticipated to experience traffic volumes ***in excess of its existing capacity***." (138 Improvement Project EIR at 4, emphasis added.) Indeed, the stated purpose of the 138 Improvement Project is to accommodate "foreseeable increases in travel and goods movement" in the area of the Centennial. (*Ibid.*) The DEIR for the Project later changes course and states that traffic on SR-138 "is forecasted to exceed available capacity in several locations under cumulative conditions with and without the proposed Project." (DEIR at 5.10-88.) In short, the DEIR cannot both maintain that traffic will increase and will stay the same. F.8-26

The DEIR also uses an outdated measure to analyze whether impacts are significant. In particular, the DEIR claims that if the 138 Improvement Project moves forward, then SR-138 "would operate within acceptable performance criteria . . ." (DEIR at 5.10-90.) The DEIR extensively uses "Level of Service" or "LOS" to analyze the Project's impacts. (*See, e.g.,* Table 5.10-25 & Table 5.10-28, Table 5.10-30.) This fixation on LOS is misplaced given that the State of California recently directed agencies to analyze projects using the Vehicle Miles Travelled F.8-27

[3] Alliance for Biking and Walking, "Bicycling and Walking in the United States 2016 Benchmarking Report," available at http://www.bikewalkalliance.org/download-the-2016-benchmarking-report. F.8-25A

("VMT") measure instead of LOS. In the Updated Guidance Document, the OPR stated, "vehicle miles traveled is the most appropriate measure to replace level of service."[4]

F.8-27 cont.

In addition, while the DEIR approvingly notes Caltran's plans to widen SR-138 are based upon the North County Combined Highway Corridors Study (DEIR at 5.10-35), this 2004 study should have no bearing upon whether the County now approves this growth-inducing and traffic-generating sprawl project. Indeed, the 2004 study did not take into account the impacts of further expanding freeways on air pollution and climate change. In fact, these detrimental impacts to expanding freeways are never mentioned in the report.[5]

F.8-28

D. The DEIR's Traffic Mitigation Measures Are Inadequate.

The County is required to adopt all feasible mitigation measures to lessen the traffic impacts of the Project. Nonetheless, the DEIR does not adequately analyze whether certain mitigation measures are feasible and instead short-circuits the process by assuming that certain impacts are "significant and unavoidable." More specifically, the DEIR states: "If improvements at Project access points on SR-138 are not constructed, impacts would be significant and unavoidable." (DEIR at 5.10-130.) The problem with this statement is that the DEIR does not consider whether such access points *can* be constructed, or whether it is feasible to do so. CEQA requires that if such improvements at project access points are "feasible," then the DEIR must include these measures are a condition of project approval. The DEIR cannot assume that impacts are "unavoidable" merely if such improvements are not constructed. The DEIR attempts to substantiate its claims by noting that the County lacks jurisdiction over state highway facilities. (DEIR at 5.10-130.) While this is generally true, the DEIR does not require the project proponent to fund such highway facilities. The County does have the power to require the project proponent to fund them as a condition of the Project. Again, the County is prohibited from approving the Project until it has required the project proponent to comply with all feasible mitigation measures within its power to lessen the Project's environmental impacts.

F.8-29

Other traffic mitigation measures identified in the DEIR are illusory and unenforceable. For instance, MM 10-2 merely requires the project proponent to submit a traffic study to the County. (DEIR at 5.10-145.) This is not a mitigation measure. Similarly, MM 10-6 states that the project proponent shall comply with the terms of the Centennial Transportation Improvement Plan ("CTIP"). (DEIR at 5.10-145.) Yet, as noted above, the DEIR does not require the project proponent to even enter into a CTIP; it only requires the project proponent to ***seek*** to enter into a CTIP. MM 10-3 also just requires the project proponent to "seek" to enter into a CTIP. (*Ibid.*) As such, MM 10-6 is not binding upon the project proponent. Likewise, MM 10-7, 10-8, and 10-9 contain language allowing the project proponent to either comply with the CTIP or contribute its "fair share" towards infrastructure improvements. (DEIR at 5.10-146.) At most, these measures commit the project proponent to paying some unspecified amount of money to alleviate the Project's impacts, with no assurances that such "fair share" payment will adequately mitigate such impacts.

F.8-30

---

[4] https://www.opr.ca.gov/docs/Revised_VMT_CEQA_Guidelines_Proposal_January_20_2016.pdf

[5] North County Combined Highway Corridors Study, SR-14, SR-138, and I-5, Final Report (June 2004), available at http://media.metro.net/board/Items/2004/07_July/NORTH%20%20COUNTY.pdf.

F.8-27A

F.8-28A

The DEIR elsewhere again states that the project proponent would either enter into an agreement with Caltrans to fund transportation facility mitigation measures or it would pay its "fair share" towards MM implementation. (DEIR at 5.10-1.) The DEIR does not explain what constitutes a "fair share" and does not commit the project proponent to paying for the MMs in the event that Caltrans lacks the funds to do so. MM 11-3 merely requires the project proponent to "seek" to enter into an agreement with the County and Caltrans called the CTIP to fund mitigation measures for the project. (DEIR at 5.10-52.) F.8-31

The DEIR therefore impermissibly puts the burden of significant impact reduction on Caltrans and their improvement of State facilities. F.8-32

Moreover, the DEIR does not analyze the environmental impacts of the traffic mitigation measures. The DEIR specifically calls for widening significant portions of SR-138 to a four-lane highway in order to mitigate impacts of the Project. (*See* DEIR at 5.10-84.) Yet, the DEIR does not consider the environmental impacts of these mitigation measures, which undoubtedly will result in habitat destruction, growth-inducing impacts, and impaired wildlife connectivity. F.8-33

III. The DEIR Fails to Adequately Assess the Project's Noise Impacts.

A. The DEIR fails to adequately assess noise impacts from traffic.

Traffic created and facilitated by the Project will cause direct, indirect, and cumulative environmental impacts, including increased traffic-related noise. The DEIR recognizes that Project-related vehicular traffic will cause significant impacts to sensitive receptors. However, the mitigation that the DEIR proposes does not meet CEQA's enforceability standards and must be revised. The mitigation measures regarding roadway noise impacts do not provide decision-makers or the public with any concrete information, as required by CEQA. (Guidelines § 15126.4(a)(2); *Federation of Hillside & Canyon Ass'ns v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1261 (mitigation measures must be "fully enforceable through permit conditions, agreements, or other measures" so "that feasible mitigation measures will actually be implemented as a condition of development").) Mitigation must be binding and enforceable to be valid. (Guidelines § 15126.4, subd. (a)(2)). The project proponent cannot defer formulating enforceable mitigation that would reduce impacts until after project approval. (CEQA Guidelines § 15126.4, subd. (a)(1)(B); *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 234 Cal. App. 4th 214, 240.) "[A]n agency goes too far when it simply requires a project applicant to obtain a [] report and then comply with any recommendations that may be made in the report." (*Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 793.) F.8-34

As mentioned, traffic will be one the main Project-generated noise. Despite this, the DEIR fails to provide a satisfactory description of mitigation measures for reducing traffic created noise to less than significant. The DEIR states that methods for reducing traffic related noise are out of the control of the project proponent and require alterations to private property. (DEIR 5.12-1.) MM 12.1 proposes combatting significant noise impacts from traffic by requiring the project proponent to submit a noise assessment (DEIR 5.12-48), which may or may not be used to formulate mitigation and which may or may not be effective. Furthermore, the DEIR does not provide standards outlining how the decision-maker would be able to determine whether any future mitigation measures would be deemed effective, and any mitigation would be F.8-35

proposed only after project approval. CEQA requires more. The DEIR then suggests the project proponent/other parties may be required implement noise reduction measures but provides no guidelines to show whether any future mitigation would be effective. (DEIR 5.12-1.) The burden of mitigation measures rests on the project proponent, not on private parties to install their own noise cancelling features. Additionally the mitigation measures provided fail to include any tangible actions to be taken outside of conducting an acoustical analysis and including appropriate noise-reduction features. (DEIR 5.12-1.) The mitigation measures provided fail to meet basic CEQA requirements. F.8-35 cont.

The DEIR provides conflicting statements about mobile source noise levels: the DEIR states that project-generated traffic would potentially create noise levels in excess of the State and County Standards but then later states that mobile equipment noise levels would not exceed County standards and would be less than significant. (DEIR 1-20.) This ignores the fact that mobile equipment cannot be distinguished from "traffic" noise as both come from mobile sources. F.8-36

The DEIR also states without support that, although Project-generated traffic noise would be significant, noise increases of 3.3 dBA and 3 dBA are barely perceptible to most people. (DEIR 5.12-1.) This is both unsupported by substantial evidence and discounts the noise perceptibility of wildlife. F.8-37

B. The DEIR fails to adequately assess General Plan consistency and noise.

The DEIR states that maximum noise levels are prescribed by the County Code ("Noise Ordinance"). (DEIR 5.12-1). The DEIR attempts to underscore the noise related impacts of the project by stating that "the land uses proposed as part of the Project are routinely constructed in Southern California and are able to meet the applicable noise standards through use of common, feasible methods and materials[.]" (DEIR 5.12-1.) However, other land uses and their impacts are irrelevant to the current Project. Additionally, the DEIR states that the construction period for the Project is approximately 20 years but goes on to state, without any additional information, that despite this two-decade construction project, noise level due to construction would be relatively short-term and temporary. (DEIR 5.12-2.) F.8-38

MM 12-3 vaguely states that noise generated from stationary construction equipment would be mitigated by requiring stationary equipment to operate at greater than 450 feet (DEIR 5.12-2) but fails to give adequate information as to what this means: 450 feet from other equipment? 450 feet from sensitive receptors? It is unclear. The DEIR also states that equipment staging and maintenance areas should be located 500 feet from sensitive receptors, but only if feasible (DEIR 5.12-49), which creates no binding requirement on the project proponent. MM 12-3 would limit the hourly daytime noise level to 60 dBA or less, which the DEIR states would be less than significant. (DEIR 5.12-2.) However, Table 5.12-2 indicates that the County Code limits noise levels for noise-sensitive areas and residential properties at all times of the day to 50 dBA or less. (DEIR 5.12-6.) It is also unclear how Table 5.12-2 can be reconciled with Table 5.12-3 (DEIR 5.12-8) as deserving separate analyses because many of the construction noises will come from stationary sources. F.8-39

C. The DEIR fails to adequately assess cumulative impacts and noise.

CEQA defines "cumulative impacts" as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." (Guidelines § 15355.) The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project "when added to other closely related past, present, and reasonably foreseeable probable future projects." (CEQA Guidelines § 15355(b).) And while an agency is not expected to foresee the unforeseeable, it is expected to use its "best efforts to find out and disclose all that it reasonably can." (CEQA Guidelines § 15144; see also *City of Richmond*, supra, 184 Cal.App.4th at 96; *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal. 4th 412, 428 [hereinafter *Vineyard*].) F.8-40

The purpose of analyzing cumulative environmental impacts is to assess adverse environmental change "as a whole greater than the sum of its parts." (*Environmental Protection Information Center v. Johnson* (1985) 170 Cal.App.3d 604, 625.) Absent meaningful cumulative analysis there would be no control of development and "piecemeal development would inevitably cause havoc in virtually every aspect of the [] environment." (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 721.) F.8-41

The DEIR impermissibly relies on the aforementioned mitigation measures to conclude that there would be no cumulative noise impacts related to construction, stationary sources, and mobile source noise from traffic. (DEIR at 7-21.) The DEIR states that the potential for overlapping construction activity from this Project and SR-138 activities is low because of "the mobile nature of construction activities (moving from area to area on a site or alignment)." (*Id.*) This statement runs contrary to common sense; construction typically occurs within a confined area for the duration of that particular project. F.8-42

IV. The DEIR Fails to Adequately Disclose, Analyze, or Mitigate the Project's Impacts to Population, Housing, and Employment.

The DEIR states that the Project would provide an estimated jobs/housing ration of 1.22 through development of commercial and business park uses on site. (DEIR at 1-17.) The DEIR also claims that development of job opportunities at the site reduces vehicle trips and their associated emissions. (DEIR at 5.9-23.) However, there is no guarantee that those living in the area will work on site or that those working on site will live in the area. Moreover, there is no guarantee that the jobs being offered will provide adequate income to support the housing that the Project will be building. The DEIR relies on the assumption that local employment opportunities will meet most of Project residents' employment needs. (DEIR at 5.9-3.) However, this conclusion overlooks the current state of Kern County's job market. As the DEIR recognizes, Kern County is experiencing remarkably high rates of unemployment, and there is no evidence that this is a temporary phenomenon. (DEIR 5.9-22.) According to the DEIR, Kern County has an unemployment rate of 9.2 percent as of 2016—almost two times higher than the California average. (*Id.*) Employers in Kern County have been shedding rather than creating jobs, and these unemployed Kern County residents will likely welcome any new jobs the Project creates. It is therefore likely that workers residing offsite will flood the Project's job market. F.8-43

The DEIR states that the Project would substantially increase population and housing relative to the existing Project site conditions, which by the DEIR's own admission, is F.8-44

considered significant. (DEIR at 5.9-31). However, the DEIR attempts to negate this significance by stating that the Project would be growth accommodating and not growth inducing, citing consistency with regional growth plans. (DEIR at 5.9-31.) The DEIR cannot override their own finding of a significant impact by citing consistency with growth plans in the region, a separate and unrelated threshold standard. The increase in population and housing on the Project site is significant and unavoidable (DEIR at 5.9-33) and CEQA requires a discussion of mitigation measures relative to this significant impact.

F.8-44 cont.

There is also a much higher chance than the DEIR suggests that Project residents will work in the higher-paying, larger Los Angeles job market. It is quite possible that the main demographic that could afford Project housing will be current Los Angeles residents looking for housing outside of Los Angeles. The DEIR states that SCAG projects that Los Angeles County will experience substantial growth between 2012 and 2040 (DEIR 5.9-2); SCAG actually indicates that the average annual growth rate of population has been decreasing, and a rate faster than both California and the United States (SCAG Table 2.) "The SCAG region's population is projected to grow slower than that of the previous years." (SCAG at 12.) Moreover, SCAG indicates that the age of residents in regional households are increasing while the working age population of 16-64 years old have shown decline which "may result in a potential shortage of works and slower job growth unless the older population extends their retirement age." (SCAG Table 4, SCAG at 14.) This means few residents are of peak employment age living in the city, meaning the regional ability to fill employment (likely retail) of the Project are limited.

F.8-45

The DEIR fails to address cumulative impacts regarding population, housing, and employment and instead counteracts earlier disclosures regarding significant, stating that the impacts would be less than significant and do not require mitigation because of their relationship to County and regional plans. (DEIR 7-19.) Yet the DEIR then immediately follows this by stating that the existence of the Project creates a significant adverse indirect growth-inducing impact. (*Id.*)

F.8-46

V. The DEIR Fails to Adequately Analyze the Project's Growth-Inducing Impacts.

EIRs are required to provide a detailed discussion regarding the growth-inducing impacts of a project. (Guidelines §§ 21100(b)(5); 21156.) In addition, *Napa Citizens for Honest Government v. Napa County Bd. of Supervisors* (2001) 91 Cal.App.4th 342, 369 sets forth three factors to determine the level of detail required in a growth-inducing impacts analysis: (a) the nature of the project; (b) the directness or indirectness of the contemplated impact; and (c) the ability to forecast the actual effects the project will have on the physical environment. (*Id.*) Applied here, these factors militate in favor of a highly detailed analysis – (a) the Project is extremely large and will result in the installation of a city in a remote and undeveloped area; (b) the Project will result in direct impacts on thousands of acres of undeveloped land as well as indirect impacts such as further infrastructure growth; (c) forecasting the effects on the physical environment is generally feasible.

F.8-47

Despite *Napa Citizens*, the DEIR's growth-inducing impacts section is only nine pages in length, and the "analysis" portion is less than four pages. More importantly, the analysis is riddled with inconsistencies and faulty assumptions, as discussed below:

F.8-48

The DEIR for the current Project references an EIR that was conducted for AVAP in 2015 as though the AVAP EIR is relevant and supersedes an analysis for the current Project. (DEIR at 6-2.) Whatever previous environmental review has occurred is irrelevant for the current Project. Additionally, alleged consistency with planned growth in the region (*Id.*) does not negate a need for consideration of growth-inducing impacts for the Project. Yet, despite these statements indicating consistency with anticipated growth, the DEIR by its own admission states that the Project would substantially increase population and housing relative to existing site conditions and that it is reasonably foreseeable that future *unplanned* development may occur. (*Id.*) F.8-49

The DEIR suggests that the Ranchwide Agreement entered into in 2008 will limit growth. (DEIR at 6-4.) As a preliminary matter, given that the Ranchwide Agreement is extensively referenced in the DEIR, a copy of the Agreement must be included as an exhibit or appendix to the DEIR. The existence of this agreement does not negate a need to consider growth-inducing impacts for the current Project, especially considering at least one the projects covered under the Agreement is currently under litigation. CEQA requires that the DEIR analyze impacts that are indirect and impacts to on adjacent properties – not just the developer's own property. F.8-50

In addition, the Ranchwide Agreement is not a binding and enforceable mitigation measure under CEQA, such that the DEIR cannot rely upon it to mitigate growth-inducing impacts, impacts to biological resources, or any other impacts. Indeed, per section 3.9 of the Ranchwide Agreement, the only party that can enforce the Agreement is the Tejon Ranch Conservancy, which is partially controlled by the project proponent. F.8-51

The DEIR claims that the Project's infrastructure facilities are not sized to accommodate growth beyond that which is proposed for the Centennial Project. (DEIR at 6-7.) This statement oversimplifies growth-inducing impacts; a project would not build more infrastructure than the project requires, but the mere existence of those facilities makes increasing and connecting to those facilities much easier than if they did not exist in the first place. The DEIR does admit that future nearby landowners could propose to connect to or build upon the Project's infrastructure to serve future development in the surrounding area. (DEIR at 5.8-22.) F.8-52

The DEIR contains inconsistencies relating to significant impacts between and among sections of DEIR. Additionally, the DEIR does not adequately analyze impacts and develop mitigation measures for those impacts. For a finding of significant impact, CEQA requires that mitigation measures be identified to reduce the impact to less than significant. (Guidelines Appendix G p.327.) For example, in the Population section, the DEIR states that there will be significant and unavoidable increases in population and housing (DEIR at 5.9-3) but fails to address any mitigation measures. "The project would not result in significant growth-inducing impacts" (DEIR 6-9) immediately followed by "existence of project…could result in a significant impact on the environment…which is considered and an adverse indirect growth-inducing impact." (*Id.*) Not only is this a clear inconsistency, which frustrates CEQA's informational and public-participation goals, but this finding of significance nor mitigation measures are discussed in the Population section to which the DEIR is referring. [*See Laurel Heights Improvement Assn v. Regents of or the University of California* (1988) 47 Cal.3d 376, 390, 392 ("CEQA's fundamental goal that the public be fully informed as to the environmental consequences of action by their public officials.").] The DEIR states that there will be no F.8-53

changes by the Project that would affect population generation or otherwise lead to additional indirect growth (DEIR at 6-1) then later admits that there will be growth inducing impacts to the eastern fringes of project site. (DEIR at 6-2.) DEIR also states that the Project would not lead to substantial growth on the Project site. (DEIR at 5.9-27.)

F.8-53 cont.

Inconsistencies also exist between the growth-inducing impacts and other sections of the DIER. For example, as previously pointed out, the DIER states that there will be significant and unavoidable growth inducing impacts regarding population but none regarding traffic. This is a clear inconsistency and fails to consider that increases in population will necessarily implicate growth-inducing impacts regarding traffic. (DEIR at 9.4.)

F.8-54

The DEIR repeatedly attempts to understate the projects impacts by relying on the non-CEQA term "growth-accommodating." (DEIR at 5.9-33.) CEQA requires an analysis of growth-inducing impacts; the term "growth accommodating" has no basis in CEQA and the assertion that the Project is growth accommodating is not supported by substantial evidence.

F.8-55

The DEIR does not acknowledge its role in causing growth-inducing impacts, particularly regarding the Northwest State Route 138 Improvement Project (the "138 Improvement Project"), for which the final EIR was certified in June 2017.[6] The 138 Improvement Project will turn the existing 2-lane highway into a 6-lane freeway, thereby impairing wildlife connectivity and paving over habitat. The 138 Improvement Project EIR routinely references Centennial as one of the key projects expected to cause growth in the area, thereby necessitating the 138 Improvement Project. (*See* 138 Improvement Project EIR at 31, 47, 83, 336.) The 138 Improvement Project EIR further states that the purpose of the project is to "[a]ccommodate foreseeable increases in travel and goods movement within northern Los Angeles County." (*Id.* at 3.) In short, the specter of Centennial appears to be of the key reasons that the 138 Improvement Project was approved. The DEIR admits as much, stating that "the Project anticipates and would complement the planned SR-138 improvements." (DEIR 4-9.) Accordingly, the DEIR must analyze, disclose, and mitigate growth-inducing impacts arising from the 138 Improvement Project.

F.8-56

VI. The DEIR Fails to Adequately Analyze the Project' Impacts on Visual Resources.

The Aesthetics section of the DEIR contains numerous deficiencies and inaccuracies. The DEIR concludes that there will be a less than significant impact to the Pacific Crest Trail ("PCT") because MM 13-4 will construct a wall that would screen structures and residences (DEIR at 5.13-21.) Basic common sense indicates that it would be almost worse to put up a large wall in a scenic trail – it is difficult to conceive how this measure would mitigate the impact to hikers on the trail when compared the current environmental setting. Furthermore, the DEIR only claims that the U.S. Forest Service, Pacific Crest Trail Association, Tejon Conservancy, and Tejon Ranch Company are in ongoing discussions regarding an alternative realignment for the PCT, without giving any more on whether this is binding or how these discussions contribute to mitigating significant impacts. (DEIR at 5.13-11.)

F.8-57

[6] Northwest State Route 138 Corridor Improvement Project, Final Environmental Impact Report / Environmental Impact Statement and Section 4(f) Evaluation.

F.8-56A

The DEIR provides an unclear analysis regarding scenic highways. The DEIR seem to be indicating that, although many of the roads are considered scenic drives on the AVAP, inclusion of the site in the West EOA counteracts these considerations. (DEIR at 5.13-2.) This is incorrect – the DEIR must analyze all direct and indirect impacts of the Project and cannot generally cite to other plans in justifying the Project. Regardless, the DEIR is wrong in claiming that the Project would not substantially damage scenic resources within a state scenic highway. (DEIR at 5.13-24.) The DEIR States:

> The greatest change in scenic views would occur on SR-138 as development occurs on both sides of this road, as it passes through the site. Existing views of undeveloped land and agricultural land would be replaced with business parks and commercial structures, as well as residential development that would be constructed onsite. While distant views of the mountains will remain, the view of passing motorists will consist of urban structures that would be different than the existing rural environment. (*Id.*)

F.8-58

The DEIR states that there will be significant and unavoidable impacts regarding new sources of light and glare (5.13-2), counteracted by MM 13.6, referred to as a Dark Sky Plan (DEIR at 5.13-2.) The DEIR does not set forth adequate measures to mitigate the substantial light pollution caused by the Project. While the DEIR proposes a number of mitigation measures such as directing light downward and using time control devices (DEIR at 5.13-31), there is no way to mitigation the light impacts of installing thousands of people in an undeveloped wildlife area. The DEIR fails to cite any studies or biological opinions indicating that the mitigation measures proposed are sufficient to mitigate impacts on wildlife.

F.8-59

The DEIR states that construction will last 20 years and result in a significant and unavoidable impact to visual character, yet provides no mitigation measures to combat this. (DEIR at 5.13-14.)

F.8-60

The DEIR also states that converting the site from a rural to an urban condition, which would partially to wholly obstruct existing views, would result in a significant and unavoidable impact to the visual character of the Project site and surrounding area. (DEIR at 5.13-19.) The only mitigation measure discussed, though, are inadequate. MM 7-13 (DEIR at 1-58), discusses a landscaping plan including use of non-invasive species; MM 13-1 (DEIR at 5.13-19) discusses preservation of existing rock outcroppings, but only to the extent feasible,[7] and implementing designs that emulate natural contours of existing topography (although none of the visuals provided, especially Exhibit 5.1-4 with its use of extensive glass windows, seem to emulate this); MM 13-2 (DEIR at 5.13-19) discusses clustering development to minimize impacts to dense stands of oak trees, steep slopes, and existing natural drainages; and MM 13-3 (DEIR at 5.13-9) indicates that off-site electrical lines *may* be placed underground. None of these mitigation measures are sufficient and do not impose real requirements on the Project.

F.8-61

[7] What is "feasible" is not defined, therefore, this mitigation measure is also illusory and lacks enforceable performance standards because the project proponent may decide on its own that compliance is not "feasible."

F.8-61A

VII. The DEIR Fails to Adequately Analyze the Project's Impacts to Fire Services.

The DEIR concludes that MM's 16-1 through 16-3 would reduce the impact to fire services to less than significant. However, these mitigation measures do not take into consideration the environmental analysis or impacts of building new facilities; instead, the DEIR defers analysis stating that actual square footage of each fire station would be determined at the time of Project development. (DEIR 5.16-12.) The DEIR also fails to conduct an analysis of environmental impacts from the construction of water systems/access to existing bodies of water or the construction of internal roadways to accommodate emergency ingress and egress. (DEIR 5.16-13, 5.16-14.) F.8-62

The DEIR states that the Project would introduce urban development into an undeveloped area that is subject to wildfire hazards. (DEIR at 5.16-14.) The DEIR also states that portions of the Project are within a very high fire hazard safety zone but never discloses where this area is in relation to the Project. (*Id.*) This fails to inform the public as to the fire dangers associated with the Project. Additionally, building houses in "high" and "very high" Fire Zones will require compliance a "Fuel Modification Plan." (DEIR at 5.16-14.) Nonetheless, the DEIR does not provide any information regarding the specifics of this fuel modification plan, nor does the DEIR analyze the environmental impacts on biological resources of implementing such a plan. F.8-63

The DEIR should include areas impacted by fuel modification plans as part of the development "footprint" of the Project, and be analyzed as such. Moreover, no fire clearance/thinning activities should occur within the boundaries of any federally designated critical habitat, open-space, natural area or wildlife movement corridor. Finally, fuel modification plans must ensure that no invasive species are planted as part of the plans. F.8-64

VIII. The Alternatives Analysis in the DEIR Is Inadequate and Fails to Comply with CEQA.

CEQA mandates that significant environmental damage be avoided or substantially lessened where feasible. (Pub. Res. Code § 21002; Guidelines §§ 15002(a)(3), 15021(a)(2), 15126(d).) Moreover, although "an EIR need not consider every conceivable alternative to a project . . . it must consider a reasonable range of potentially feasible alternatives that will foster informed decision decision-making and public participation." (Guidelines § 15126.6(a).) Additionally, the "key to the selection of the range of alternatives is to identify alternatives that meet most of the project's objectives but have a reduced level of environmental impacts." (*Watsonville Pilots Assn. v. City of Watsonville* (2010) 183 Cal.App.4th 1059, 1089.) Accordingly, a rigorous analysis of reasonable alternatives to the Project must be provided to comply with this strict mandate. Unfortunately, the DEIR fails to meet this requirement on two levels: the DEIR analysis of the alternatives proposed is inadequate and the DEIR fails to include a reasonable range of alternatives. F.8-65

A. The DEIR does not adequately analyze and compare the proposed alternatives.

The first project objective – which is to "Implement the Antelope Valley Area Plan…" – impermissibly restricts the alternatives analysis because it too narrowly frames the goal of the F.8-66

project as somehow flowing from a need to respond to the existence of this area plan. (DEIR 8-69.)

F.8-66 cont.

In analyzing the No Project Alternative, the DEIR impermissibly rejected this alternative in a conclusory fashion. (*See Concerned Citizens of Costa Mesa, Inc. v. 32nd Dist. Agricultural Assn.* (1986) 42 Cal.3d 929, 935 ("To facilitate CEQA's informational role, the EIR must contain facts and analysis, not just the agency's bare conclusions or opinions."). The DEIR states that this alternative is not consistent with the AVAP without giving any more information. (DEIR at 8-30.) It is likely that the DEIR intends to argue that the existence of the AVAP somehow *mandates* development; yet, this is not correct. Additionally, if the reasons for rejection the No Project Alternative is for feasibility reasons, case law indicates the standard for feasibility is high and the project proponent has not demonstrated lack of feasibility for other locations.

F.8-67

The DEIR provides insufficient and confusing reasons given for eliminating the Public Input Alternative from further consideration. The impetus for this alternative seems to be to design a wildlife reserve and proposes to set aside the majority of the Tejon Ranch property as open space. (DEIR at 8-13.) Yet, the DEIR rejects this alternative, claiming that this alternative does not provide enough acreage to include on-site natural open space areas and leaves a substantial amount land undeveloped. (*Id.*)

F.8-68

In analyzing Alternative B – Previously Proposed Project, The DEIR impermissibly tries to break up the "footprint" by land use type (i.e. residential, commercial, etc.) in order to argue that the proposed project has decreased its footprint/site acreage from the previously proposed project site. Although the proposed Project may have a smaller designation for *commercial* uses, the overall footprint of the project is larger. The DEIR itself admits this when it states that the proposed Project expands site boundary by approximately 647 acres (DEIR at 8-9.) Table 8-1 additionally indicates that the proposed project site will consist of 12,323 acres while the previously proposed project site consisted of 11,676 acres. The current project increases the project site by 647 acres. (DEIR at 8-15.) The DEIR also confusingly states that Alternative B is a larger alternative than the proposed Project (DEIR at 8-16.)

F.8-69

In analyzing Alternative C – Additional Drainage Avoidance, the DEIR fails to explain why this alternative is not considered the preferred alternative given that is has fewer environmental impacts than the proposed Project, meets the project goals, and creates no more significant and unavoidable impacts than the proposed Project. (DEIR at 8-44). And in analyzing Alternative E – Density Clustering/East of Aqueduct, the DEIR similarly fails to explain why this alternative is not considered the preferred alternative given that is has fewer environmental impacts than the proposed Project, meets the project goals, and creates no more significant and unavoidable impacts than the proposed Project. (DEIR at 8-59 – 8-60.) The DEIR lists Alternative E as the environmentally superior option but provides no explanation for why the project proponent chose not to make this their preferred alternative. Under CEQA, "the public agency bears the burden of affirmatively demonstrating that, notwithstanding a project's impact on the environment, the agency's approval of the proposed project followed meaningful consideration of alternatives and mitigation measures." (*Mountain Lion Foundation v. Fish & Game Com.* (1997), 16 Cal.4th 105, 134.)

F.8-70

In analyzing Alternative D – Infrastructure Relocation, it is unclear why Alternative D was even considered or what value it adds at all to the project/public reviewing the DEIR. (DEIR at 8-51.)

F.8-71

B. The DEIR should have considered accommodating development in disturbed areas.

In analyzing all of the alternatives, the DEIR should have discussed the need for the Project and whether the uses that would potentially utilize the Project can be accommodated in existing areas. As CAPCOA states in its white paper, one way local governments can avoid significant increases in GHG emissions and help solve the problem of climate change is to "facilitate more efficient and economic use of the lands" already developed within the community. (CAPCOA 2008.) Reinvesting in existing communities is "appreciably" more efficient than new development and may even result in a net reduction of greenhouse gases. (CAPCOA 2008.) The DEIR should consider an alternative that relies more on higher-density mixed commercial/residential development projects on existing disturbed lands in order to support the reduction of vehicle trips, promote alternatives to individual vehicle travel, and encourage efficient delivery of services and goods. (Office of the California Attorney General 2008.). Here, the objectives do not indicate that this specific site is necessary to accomplish the project goals (other than the first objective, which as previously stated, is impermissibly narrow).

F.8-72

C. The DEIR should have considered a wider range of alternatives, including those with a significantly smaller development footprint.

The DEIR should have analyzed a wider range of alternatives. As courts have made clear, "[a] potential alternative should not be excluded from consideration merely because it would impede to some degree the attainment of the project objectives, or would be more costly." (*Save Round Valley Alliance v. County of Inyo* (2007) 157 Cal. App. 4th 1437, 1456-57 (quotations omitted).) The DEIR should have included a larger range of alternatives from which decision-makers could choose.

F.8-73

The DEIR improperly refused to consider any alternatives for projects with a significantly smaller development footprint. The DEIR states:

> Because the proposed Project was substantially reduced compared to the previously proposed project (Alternative B) in both development footprint and land use intensity to avoid and/or reduce environmental impacts, further consideration of a reduced development scenario (e.g., reduced grading footprint; reduced dwelling units; reduced nonresidential square footage) was not considered reasonable. (DEIR 8-10.)

The implication here is that is if the project footprint is somewhat reduced from an (1) extremely large project to (2) a very large project, then any project smaller than a very large project is "unreasonable," such that the County is excused from considering any smaller project alternatives. Neither the CEQA Guidelines nor case law support this proposition, nor does the EIR cite any authority supporting this striking assertion.

F.8-74

The DEIR again trots out the unfounded claim that the Project is "required" to be very large in order to support "the goals and policies of the AVAP." (DEIR 8-10.) Contrary to the DEIR's misleading assertions, the AVAP does not mandate that a very large version of Centennial go forward; it envisions that some level of development ***may*** occur in the area, provided that such development is approved by applicable authorities and complies with applicable laws, including CEQA and the state and federal Endangered Species Acts. Indeed, the sentences following this claim undermine it – the DEIR states that the Project would require significant amendments to applicable land use plans (e.g., amendment to the AVAP Highway Plan and adoption of a Specific Plan). (*Id.*) If the Project is "required" by the AVAP, then why does the project necessitate amendments to land use plans? F.8-75

The DEIR also claims that "any reduction" in the proposed project size would not be "supportive of the project objectives." (*Id.*) The DEIR does not provide any evidence indicating that a smaller version of the project is not feasible. Such conclusory claims are insufficient under CEQA. (*See Concerned Citizens*, 42 Cal.3d at 935 ("To facilitate CEQA's informational role, the EIR must contain facts and analysis, not just the agency's bare conclusions or opinions."). Such conclusory claims are especially inappropriate here when the County is considering whether to approve the installment of a city in a remote and undeveloped area. F.8-76

By refusing to include any alternatives that provide for a significantly reduced project size, the DEIR sets up a false "all or nothing" decision for the County and prohibits the County from considering or approving a smaller version of the Project that does not have such profound environmental impacts on California's grasslands, air quality, and carbon footprint. The DEIR's failure to include any alternatives with a significantly reduced footprint also violates CEQA's mandate that a reasonable ***range*** of alternatives be considered. F.8-77

The project could be significantly down-sized and still be considered "feasible." Whether a project is economically unfeasible "is not measured by increased cost or lost profit, but upon whether the effect of the proposed mitigation is such that the project is rendered impractical." (*Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 600 (internal citation omitted).) In *Citizens of Goleta Valley v. Board of Supervisors* (1988) 197 Cal.App.3d 1167, 1180, the Court agreed with the trial court that the administrative record did not contain analysis of the project alternatives in terms of comparative costs, comparative profit or losses, or comparative economic benefit to the project proponent or the community at large. F.8-78

IX. The DEIR Fails To Adequately Analyze, Disclose, And Mitigate The Project's Greenhouse Gas Emissions.

Climate change and the finite nature of fossil fuel energy sources require the increased development of renewable sources of energy, such as solar and wind. (Cameron 2012) However, these developments, especially when done on a large scale, can have negative impacts on local species and their habitats. (Subramanian 2012; Lovich 2011) Renewable energy development projects need to ensure that the solution to environmental harm does not become part of the problem. (Cameron 2012; Walston 2016) Distributed solar, as opposed to utility scale, is one way to avoid energy developments that convert prime habitat into unusable areas for species. F.8-79

(McDonald 2009) When solar becomes part of already existing infrastructure and development, its footprint and impact is reduced. (Elkind 2009)

F.8-79 cont.

A. Electricity generation is a key contributor to greenhouse gas pollution.

The generation and consumption of electricity pose many negative impacts to human and environmental health. Therefore, it is necessary to both reduce consumption through conservation and efficiency, and also transition to less damaging forms of generation. Electricity generation accounts for 20% of California's greenhouse gas emissions. Without energy efficiency measures, California's combined electricity demand is projected to grow by 1.41 percent from 2010-2020, while efficiency measures could reduce that to a projected .91 percent. (CEC 2011) Electricity generated from fossil fuels contributed to air pollution from carbon dioxide and fine particulate matter, and water pollution from direct spills or impacts to groundwater through drilling, mining and injection activities. (Heberger 2015) The generation of electricity is highly water intensive, which is problematic in persistent drought conditions. (Larson 2007) In order to reduce the negative impacts to water supplies, water and energy utilities should work together to design more efficient systems for both resources. (Tarroja 2016) Wildlife and their habitats are impacted by electricity generation and transmission. (Cameron 2012) The land-use footprint of energy production is significant and will continue to grow with population unless conservation and distributed generation siting measures are put in place. (Trainor 2016)

F.8-80

The concept of energy efficiency as a resource has the potential to decrease energy production requirements and associated costs and negative impacts. Energy efficiency reduces the need for resource consumption and is thereby in itself a consumable resource with positive impacts rather than negative. (Hopper 2009) Shifting from non-renewable fossil fuels to renewable energy sources will reduce greenhouse gas emissions, air and water pollution and impacts to wildlife and habitat provided these renewable sources are sited appropriately in the vicinity of the demand they serve. (McDonald 2009; Hernandez 2015) As mentioned above, distributed solar, often referred to as rooftop or on-site solar, is a good example of appropriately sited renewable energy that maximizes system and cost efficiency and protects open space, wildlife and habitat. (Elkind 2009; Powers 2009) Legislation that supports the appropriate siting of renewable energy, such as the California Green Building Standards Code, which requires solar-ready roofs and solar-ready pre-wiring, is needed to ensure that renewable energy is able to realize its full potential. (LA Dept. Public Planning 2013) Building codes that support and encourage passive solar design contribute to even greater energy efficiency. (LA DPP 2013) Another building design concept that offers a variety of benefits from greater energy security to cost efficiency and environmental protection is the zero energy building. Such buildings produce enough renewable energy to meet annual needs, and when combined into communities, the zero energy design means that these areas are no longer reliant upon nonrenewable energy grids that harm human and environmental health, contribute to climate change and are vulnerable to outages and natural disasters. (Peterson 2015) The California Public Utilities Commission has committed to the goal of zero net energy for all new residential construction by 2020 and for all new commercial construction by 2030. (CPUC 2008)

F.8-81

B. The DEIR does not adequately disclose or analyze the Project's GHG impacts.

The DEIR's GHG analysis underestimates the amount of GHGs generated by the Project by relying upon the unrealistic assumptions that most residents will find onsite employment. (*See* DEIR at 5-21-64.) The DEIR's GHG emissions analysis also fails to consider the GHG emissions if the Project is not built in the order proposed, which is likely given the flexibility in the DEIR for the developers to modify the Project based upon market conditions and other factors. (*See* DEIR at 4-91.) F.8-82

C. The DEIR should take a more aggressive approach to reducing the Project's energy demands and increasing use of renewable energy onsite.

The DEIR should take a far more aggressive approach to reducing GHGs arising from the Project. Mitigation measures to reduce vehicle miles traveled, energy use, waste, water consumption as well as use of solar power could lower the Project's impact on climate change (as well as air pollution and water use). CAPCOA has identified existing and potential mitigation measures that could be applied to projects during the CEQA process to reduce a project's GHG emissions. (CAPCOA 2008). The California Office of the Attorney General also has developed a list of reduction mechanisms to be incorporated through the CEQA process. (CAPCOA 2008 at Table 16.) These resources provide a rich and varied array of mitigation measures to be incorporated into the Project. F.8-83

In general, the EIR should consider mitigation measures that will ensure the Project will use energy efficiently and conservatively. In doing so, it should analyze incorporating "green building" in the development. Green buildings are those buildings that lower energy consumption, use renewable energy, conserve water, harness natural light and ventilation, use environmentally friendly materials and minimize waste. (Commission for Environmental Cooperation 2008.) F.8-84

Specific mitigation measures for the GHG emissions generated by the Project's energy consumption include, but are not limited to: F.8-85

- Requiring that all developers seek and obtain the U.S. Green Building Council's LEED or comparable standards for energy- and resource efficient building during pre-design, design, construction, operations and management;
- Designing buildings for passive heating and cooling, and natural light, including building orientation, proper orientation and placement of windows, overhangs, skylights, etc.;
- Designing buildings for maximum energy efficiency including the maximum possible insulation, use of compact florescent or other low-energy lighting, use of energy efficient appliances, etc.;
- Reducing the use of pavement and impermeable surfaces;
- Requiring water re-use systems;
- Installing light emitting diodes (LEDs) for traffic, street and other outdoor lighting
- Limiting the hours of operation of outdoor lighting;
- Maximizing water conservation measures in buildings and landscaping, using drought tolerant plants in lieu of turf, planting shade trees;
- Ensure that the Project is fully served by full recycling and composting services;

- Ensure that the Project's wastewater and solid waste will be treated in facilities where GHG emissions are minimized and captured;
- Installing the maximum possible photovoltaic array on the building roofs and/or on the project site to generate all of the electricity required by the Project, and utilizing wind energy to the extent necessary and feasible;
- Installing solar water heating systems to generate all of the Project's hot water requirements;
- Installing solar or wind powered electric vehicle and plug-in hybrid vehicle charging stations to reduce emissions from vehicle trips.

F.8-85 cont.

The Project should further utilize the following mitigation measures related to construction:

- Utilize recycled, low-carbon, and otherwise climate-friendly building materials such as salvaged and recycled-content materials for building, hard surfaces, and non-plant landscaping materials;
- Minimize, reuse, and recycle construction-related waste;
- Minimize grading, earth-moving, and other energy-intensive construction practices;
- Landscape to preserve natural vegetation and maintain watershed integrity;
- Utilize alternative fuels in construction equipment and require construction equipment to utilize the best available technology to reduce emissions.

F.8-86

D. The DEIR should require "zero net energy" as a condition of the Project.

Other projects in the County that have recently been approved include a goal of zero net GHG emissions. Such projects intend to achieve that goal through reducing onsite GHG emissions to the greatest extent practicable, but also by offsetting any other emissions through local emissions reductions projects.[8] Here, the DEIR fails to provide substantial evidence that such additional reductions needed to achieve zero net energy are infeasible – for instance, the DEIR could include more robust EV charging requirements, more onsite renewable energy, and a program to offset the remaining GHG emissions locally.

F.8-87

Any offset program must ensure "Additionality." California law establishes specific standards for greenhouse gas offset credits used in the AB 32 cap-and-trade system. Health and Safety Code section 38562(d) requires, in relevant part, that:

> (1) The greenhouse gas emission reductions achieved are real, permanent, quantifiable, verifiable, and enforceable by the state board.
>
> (2) For regulations pursuant to Part 5 (commencing with Section 38570) [i.e., regulations implementing the market-based cap-and-trade system], the reduction is in addition to any greenhouse gas emission reduction otherwise required by law or regulation, and any other greenhouse gas emission reduction that otherwise would occur.

F.8-88

[8] *See* California Department of Fish and Wildlife, *Newhall Ranch Resource and Development Management and Development Plan, Final Additional Environmental Analysis*, Appendix 2.1, available at http://planning.lacounty.gov/assets/upl/case/tr_53108_appendix-2-0-cdfw-final-aea-excerpts.pdf.

F.8-87A

(3) If applicable, the greenhouse gas emission reduction occurs over the same time period and is equivalent in amount to any direct emission reduction required pursuant to this division.

F.8-88 cont.

In particular, the two-part definition of "additional" under subdivision (d)(2) requires not only that credited reductions are not otherwise legally required, but also that credited reductions would not otherwise occur in the absence of the offset project.

F.8-89

This definition of "additional" also applies in the CEQA context, as the regulatory history of the relevant CEQA Guidelines makes clear. The CEQA Guidelines specify that only GHG reductions that are "not otherwise required" may be used to offset project emissions. (CEQA Guidelines, § 15126.4, subd. (c)(3).) However, as the California Resources Agency's Final Statement of Reasons for adopting this Guideline explains, the "not otherwise required" language was intended to make clear that only "additional" emissions reductions—that is, reductions not otherwise required by law or likely to occur anyway—may be used to generate offsets for CEQA mitigation.[9] The Final Statement of Reasons explicitly interprets CEQA's mitigation requirements, including requirements governing use of offsets, as "consistent with the Legislature's directive in AB32 that reductions relied on as part of a market-based compliance mechanism must be 'in addition to any greenhouse gas emission reduction otherwise required by law or regulation, and any other greenhouse gas emission reduction that otherwise would occur.'" (*Ibid.*)

F.8-90

In short, if the County does decide to approve an iteration of this Project, we urge the County to require that it be zero net energy and include sufficient safeguards to ensure that any offsets are in fact "additional," as defined by California law.

F.8-91

E. The DEIR fails to adopt all feasible mitigation measures to reduce the Project's GHG emissions.

Mitigation of a project's environmental impacts is one of the "most important" functions of CEQA. (*Sierra Club v. Gilroy City Council* (1990) 222 Cal.App.3d 30, 41.) Therefore, it is the "policy of the state that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures which will avoid or substantially lessen the significant environmental effects of such projects." (Pub. Res. Code § 21002.)

F.8-92

In the GHG context, the CEQA Guidelines specifically requires lead agencies to "consider feasible means, supported by substantial evidence and subject to monitoring or reporting…" (14 Cal. Code Regs. § 15126.4(c).) These measures can include (1) Measures in an existing plan or mitigation program for the reduction of emissions that are required as part of the lead agency's decision; (2) Reductions in emissions resulting from a project through implementation of project features, project design, or other measures, such as those described in Appendix F; or (3) Off-site measures, including offsets that are not otherwise required, to mitigate a project's emissions.

F.8-93

[9] California Natural Resources Agency, Final Statement of Reasons for Regulatory Action: Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97 at 48, 87-90 (December 2009).

F.8-90A

As a preliminary matter, many of the proposed mitigation measures are styled as "Project Design Features" or "PDFs." (*See* DEIR at 5.21-41.) Mitigation measures must be binding and enforceable. (Pub. Res. Code § 21081.6(b); Guidelines § 15126.4(a)(2)). In addition, CEQA prohibits an agency from incorporating proposed mitigation measures into the description of the project in order to conclude that the project's impacts will be less than significant. (*See Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56.) The PDFs should be incorporated into the DEIR as mitigation measures so that they are binding, enforceable, and subject to monitoring under CEQA. F.8-94

While we are heartened the Project includes some mitigation measures to reduce the Project's GHG impacts, there are significant areas in which the measures could be much stronger. Below are a few of the instances in which the mitigation measures/PDFs should be strengthened:

- The Project should generate more than the proposed 50 percent of renewable energy onsite. (*See* DEIR at 5.21-88; MM 21-2.) Given the extremely sunny climate of the Project site, this percentage could be higher, especially if the Project is to achieve zero net energy. In addition, the DEIR should specify that most or all of this energy will come from distributed rooftop solar. As currently written, the DEIR does not appear to consider impacts on raptors and wildlife – including the critically endangered California condor – of employing wind energy onsite.

- EV chargers should be more widely available for residents of multifamily units as well as people travelling to the Project area for work, shopping, etc. EV chargers in commercial parking lots should have "Level 3" DC fast charging instead of slower Level 2 charging. As currently written, PDF 21-11 and PDF 21-12 could provide for some technology other than EV-charging for multifamily and business uses. (*See* DEIR at 5.21-43.) Alternatives to EV-charging should be in addition to – and not in lieu of – EV charging stations. In addition, the Project should require more charging stations per 50,000 square feet of commercial area as well as more charging stations for multifamily units. F.8-95

The DEIR does not explain why stronger mitigation measures – including zero net energy standards – are infeasible. Instead, the DEIR generally states that "the Project's climate change impacts would remain significant and unavoidable." (DEIR at 5.21-94.) This is not sufficient under CEQA. The DEIR must provide evidence supporting this claim. (*See Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 600 (whether a project is economically unfeasible "is not measured by increased cost or lost profit, but upon whether the effect of the proposed mitigation is such that the project is rendered impractical.").) F.8-96

F. The DEIR fails to adequately analyze the Energy Conservation Mitigation Measures set forth in Appendix F of the CEQA Guidelines.

The DEIR is required to analyze whether the energy conservation mitigation measures in Appendix F of the CEQA Guidelines could be adopted as part of the Project. (*See California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 209 (an EIR is defective when it fails to include a detailed statement setting forth the mitigation measures proposed to reduce wasteful, inefficient, and unnecessary consumption of energy in accordance F.8-97

with Appendix F of the CEQA Guidelines) [hereinafter "CCEC"].) Nonetheless, the DEIR does not appear to contain any analysis of Appendix F. F.8-97 cont.

X. The DEIR's Water Quality Analysis Is Inadequate.

A. The DEIR's analysis of baseline water quality conditions is inadequate.

The DEIR contains inconsistent information regarding the baseline hydrology conditions for the Project. In the Hydrology section, the DEIR states that 55 percent of the Project site is in the Gorman Drainage Area. (DEIR at 5.2-18.) Yet in the Water Quality section, the DEIR states that only 4 percent of the site drains into Gorman Creek. (DEIR at 5.4-4.) The DEIR needs to explain how these statements are consistent or reassess the Project area hydrology. F.8-98

The Project does not adequately analyze the impacts on water quality and biological resources of residential use of pesticides and chemicals associated with the Project. In particular, the DEIR fails to include an analysis – including appropriate surveys – of the aquatic and riparian wildlife present in Gorman Creek, Oso Creek, and Quail Lake. Moreover, because Gorman Creek is within the Santa Clara River watershed (DEIR at 5.2-15), the DEIR should analyze the baseline and potential impacts to aquatic and riparian wildlife in the Santa Clara River. F.8-99

B. The DEIR does not adequately disclose the water quality impacts of the Project.

The DEIR claims that that it will not have any significant impacts to water quality. This likely inaccurate because the Project will install a city adjacent to a lake and multiple creeks, which are home to special status wildlife. The Project will result in the discharge of metals, nutrients, pesticides, organic compounds, sediments, trash and debris, oxygen demanding substances, and oil and grease. These substances will runoff from the site and drain into the adjacent lake and creeks. F.8-100

The Project similarly fails to analyze the impacts on water quality and biological resources of commercial use of chemicals associated with the Project. The DEIR does not list which chemicals will be permitted for use within the Project area, which suggests that any otherwise legal chemicals – including those used for industrial activities – will be permitted onsite. Many of these chemicals can be extremely harmful to wildlife. The DEIR contains no analysis of using such industrial chemicals in a largely undeveloped area surrounded by creeks and wildlife, including the Angeles National Forest. In general, the DEIR claims that adherence to existing regulations will ensure that impacts are not significant. Yet, this is insufficient under CEQA. (*See Californians for Alternative to Toxics v. Dept. of Food & Agric.* (2005) 136 Cal.App.4th 1, 17.) This lack of detail and appropriate mitigation makes it impossible for the public to ascertain the true environmental impacts of the Project F.8-101

C. The DEIR's water quality mitigation measures are vague and inadequate.

While the DEIR provides a list of Best Management Practices ("BMPs") that may reduce impacts, none of BMPs listed are specified as enforceable mitigation measures, which is required under CEQA. The DEIR does not indicate that these mitigation measures are binding on the project or that the project proponent is required to comply. F.8-102

The DEIR fails to adequately analyze the impacts to water quality and wildlife – including from pesticides – of adding tens of thousands of people to an undeveloped area. F.8-103

Moreover, the DEIR claims that it will implement "integrated pest management" or "IPM" and generally references "guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program. (DEIR at 5.4-30.) The DEIR does not appear to explain or describe those Guidelines, nor does it contain these Guidelines as enforceable mitigation measures or conditions of project approval. F.8-104

Because the project proponent is under no legal duty to adhere to each of the Guidelines, the County cannot and should not rely on this measure to reduce harm to individuals, water quality, or wildlife on or near the Project property. (CEQA Guidelines § 15126.4(a)(2); *Federation of Hillside & Canyon Ass'ns v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1261 (mitigation measures must be "fully enforceable through permit conditions, agreements, or other measures" so "that feasible mitigation measures will actually be implemented as a condition of development").) Additionally, the DEIR does not point to any study or analysis that would suggest IPM is an effective means to mitigate harm to sensitive species, including amphibians such as the California treefrog, California toad, and black-bellied salamander. Thus, the DEIR fails to present IPM for the Project to interested members of the community from becoming fully informed of the benefits and risks of this form of mitigation. (Cal. Pub. Res. Code § 21002, 21003.) F.8-105

The Project will include 28 on-site detention and retention basins. (DEIR at 5.4-45.) While erosion control measures are important, the DEIR analyze whether these basins may attract or harbor invasive bullfrogs, which are known to harm native wildlife populations. F.8-106

XI. The DEIR Fails To Adequately Analyze Or Mitigate The Impacts Of The Project On Biological Resources.

A. Habitat destruction is a leading cause of extinction.

Species diversity is critical for healthy ecosystems, and ensuring habitat integrity if a key component to species survival. (Dobson 1997.) Habitat destruct or alteration can increase incidents of wildfire and flooding as the ecosystem becomes imbalanced, making it more susceptible to these events. (Brooks 2004; Nilsson 2000.) Developments that convert open space into another use, such as housing, industry, energy or agriculture, negatively impact the species that live in these areas, and the ecosystem as a whole. (Walston 2016; Chaplin-Kramer 2015; Minnich 1998.) Many of the species that have potential to occur in the project area are already imperiled or endangered, and further encroachment onto their habitat worsens the threat to their success and survival. F.8-107

While the entire habitat may not be converted or destroyed through development, it may be fragmented such that it becomes useless as a habitat for particular species. Even if the habitat remains intact, light and noise pollution can negatively impact the health and reproductive rates of species that are sensitive to these types of pollution. (Slabbekoorn 2008; Longcore 2004.) Pollution in the form of pesticides and rodenticides are also a threat, in addition to run-off pollution from roads that impacts water quality and aquatic life and the species that depend on it. (Perez 2007; Miller 2006; Relyea 2005.) Roads create habitat fragmentation since they act as dangerous physical barriers that many species won't cross, or are killed or injured if they do. F.8-108

(Poessel 2014; Ware 2015; Brock 2004; Swihart 1984.) Additionally, roads facilitate the spread of non-native and invasive species, particularly plants and their seeds, which threaten the survival of species native to these areas. (Gelbard 2003.) Fences create another type of habitat fragmentation by reducing mobility and prevent species from accessing all areas that they depend on for survival, or worse, they ensnare the animals that do try to cross them, resulting in injury or death. (Baines 2003; Paige 2008.) For many species, climate change will mean the need for adaptation in the form of migration to new habitats that support their needs. Fragmentation or obstruction of this mobility will result in greater mortality. (Scheffers 2016.)

F.8-108 cont.

Urban infill projects reuse land that has already been disturbed and that is located near urban centers, thus removing the need for conversion of open space for housing, businesses, shopping, roads and other infrastructure. (Wheeler 2002.) These projects are also good candidates for citing distributed solar, further reducing impacts to species and habitat. (Powers 2009.) Wildlife corridors, bridges and underpasses can be constructed in places where roads bisect and disconnect habitat and mobility. (Servheen 2007.) Fences should be used with an understanding of the impacts they have on species mobility, and should be constructed in such a way as to specifically exclude the target species, not all species. Consideration should be given to the type of fencing and the ways in which species could become entangles, injured or killed. (Paige 2008.) Connective corridors between fragmented habitats will enable species to utilize the habitat and retain needed mobility for survival. (South Coast Wildlands 2008.) Alternatives to toxic and poisonous pesticides and herbicides should be used whenever possible to reduce harm to species and their habitats. (Litmans 2004.)

F.8-109

B. The Project Site is unsuitable for development and will the Project will cause significant impacts.
