Element 2 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded storm water drainage facilities or expansion of facilities, causing significant environmental effects. The proposed program includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table III.E-2). These measures would be required where the proposed program implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, vehicle-related uses. New sensitive uses would have to meet the requirements of the discretionary or ministerial permit that was issued for the use. As a result, any potential impacts to stormwater runoff would have been addressed through the permitting process. The proposed program would not result in the expansion of areas for designated for industrial uses as identified in the County General Plan, including growth projections within the planning period. The areas that would be subject to the requirements of Element 2 would not expand development outside of those areas already designated for industrial development. Therefore, Element 2 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded storm water drainage facilities or expansion of facilities, causing significant environmental effects.

Electric Power Facilities

Construction

Element 2 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded electric power facilities or expansion of facilities, causing significant environmental effects. Other than installation of the proposed improvements such as lighting, the systems required for the construction of the requirements would require negligible electricity usage for construction and operation, and all new construction would be developed and constructed in compliance with Title 12, Title 22, and Title 31, incorporating CALGreen. The program area is currently served by SCE electric power facilities. The parcels that would be subject to the proposed program would already be connected to electric power facilities to support the new sensitive uses. Construction activities required to implement the proposed program would not be expected to require relocation, expansion, or new electric power facilities as the electric power facilities currently serving the area would be sufficient for the construction of the proposed program. The construction of these measures would not differ substantially from existing conditions, such that they would cause significant impacts to utilities and service systems in relation to the construction of new or expanded electrical transmission and distribution lines. Therefore, Element 2 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded electric power facilities or expansion of facilities, causing significant environmental effects.

Operation

Element 2 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded electric power facilities or expansion of facilities, causing significant environmental effects. The updated standards for new sensitive uses would not differ substantially from existing conditions, such that they would cause significant impacts to utilities and service systems in relation to the construction of new or expanded electrical transmission and distribution lines. Other than installation of the proposed improvements such as lighting, these systems would require negligible electricity usage for construction and operation and all new construction would be developed and constructed in compliance with Title 12, Title 22, and Title 31, incorporating CALGreen. The program area is currently served by SCE electric power facilities. The parcels that would be subject to the proposed program would be connected to electric power facilities to support their new sensitive uses. Operation activities required to implement the proposed program would not be expected to require relocation, expansion, or new electric power facilities as the electric power facilities currently serving the area would be sufficient for the construction of the proposed program. Therefore, Element 2 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded electric power facilities or expansion of facilities, causing significant environmental effects.

Natural Gas Facilities

Element 2 would result in no impacts to utilities and service systems in relation to the construction of new or expanded natural gas facilities or expansion of facilities, causing significant environmental effects. The proposed improvements required in conjunction with the new development standards required by the proposed program would not involve construction or operation requiring the use of natural gas. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, as they would be minor additions to new sensitive land uses. As a result, impacts to utilities and services systems in relation to natural gas serving the proposed program area would not occur. Therefore, Element 2 would result in no impacts to utilities and service systems in relation to the construction of new or expanded natural gas facilities or expansion of facilities, causing significant environmental effects.

Telecommunication Facilities

Element 2 would result in no impacts to utilities and service systems in relation to the construction of new or expanded telecommunications facilities or expansion of facilities, causing significant environmental effects. The proposed improvements required in conjunction with the new development standards required by the proposed program would result in no impacts to utilities and service systems in relation to the construction of new or expanded telecommunications facilities. None of the improvements that would be required as part of Element 2 would require telecommunication technology. As a result, impacts to utilities and services systems in relation to telecommunications would not occur. Therefore, Element 2 would result in no impacts to utilities and service systems in relation to the construction of new or expanded telecommunications facilities or expansion of facilities, causing significant environmental effects.

Element 3 – Recycling and Waste Management Revisions

Element 3, including supermarket accessory recycling collection centers, would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities or expansion of facilities, causing significant environmental effects. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The proposed program would allow for permitting of new types of facilities including organic waste that would aid in the reduction of GHGs and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table III.E-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, combustion and non-combustion biomass conversion facilities would be prohibited in ARAs.~~

Water Facilities

Construction

Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water facilities or expansion of facilities, causing significant environmental effects. The proposed program would not result in the expansion of areas for designated for industrial uses as identified in the County General Plan, including growth projections within the planning period. The County has sufficient water supply and infrastructure to meet anticipated growth over the planning period, and there is sufficient water supply to support the anticipated incremental increase for construction of walls and operation and maintenance of irrigated landscaping such that no expansion of water facilities would be required (Table IV.I-1). Additionally, the requirement of the proposed program for all parcels to meet the requirements of the LID Ordinance would result in a net benefit to water supply. Therefore, Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water facilities or expansion of facilities, causing significant environmental effects.

Operation

Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water facilities or expansion of facilities, causing significant environmental effects. The proposed program would not result in the expansion of areas for designated for industrial uses as identified in the County General Plan, including growth projections within the planning period. The County has sufficient water supply and infrastructure to meet anticipated growth over the planning period, and there is sufficient water supply to support the anticipated incremental increase for construction of walls and operation and maintenance of irrigated landscaping such that no expansion of water facilities would be required (Table IV.I-1). Additionally, the requirement of the proposed program for all parcels to meet the requirements of the LID Ordinance would result in a net benefit to water supply during operation as a result of the water saving requirements. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. Automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited from HMAs, SEAs, and VHFHSZs. Additionally, combustion and non-combustion biomass conversion organic waste facilities are prohibited in ARAs. This Prohibiting facilities from these areas would result in a substantial reduction in where these facilities could be sited. Therefore, Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water facilities or expansion of facilities, causing significant environmental effects.

Wastewater Treatment Facilities

Construction

Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded wastewater treatment facilities or expansion of facilities, causing significant environmental effects. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, or an SPR. The majority of the uses in Element 3 would be subject to current development standards would require a discretionary CUP (Table III.E-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. Element 3 would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, combustion and non-combustion biomass conversion organic waste facilities are prohibited in ARAs. This Prohibiting facilities from these areas would result in a substantial reduction in the areas where these uses could be permitted. Construction and operation of Element 3 is not anticipated to generate wastewater flows that would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the County General Plan or other wastewater facilities planning documents. As discussed in Section IV.I.2.b above, the County has adequate wastewater treatment capacity to accommodate growth within the 21-year planning period. Therefore, Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded wastewater treatment facilities or expansion of facilities, causing significant environmental effects, and no mitigation is required.

Operation

Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded wastewater treatment facilities or expansion of facilities, causing significant environmental effects. The proposed program would not result in the expansion of areas for designated for industrial uses as identified in the County General Plan, including growth projections within the planning period. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, or an SPR. The majority of the uses in Element 3 would be subject to current development standards would require a discretionary CUP (Table III.E-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in

HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. Element 3 would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, combustion and non-combustion biomass conversion organic waste facilities are prohibited in ARAs. This Prohibiting facilities from these areas would result in a substantial reduction in the areas where these uses could be permitted. Operation of Element 3 is not anticipated to generate wastewater flows that would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the County's General Plan or other wastewater facilities planning documents. As discussed in Section IV.I.2.b above, the County has adequate wastewater treatment capacity to accommodate growth within the 21-year planning period. Operation of the facilities permitted under Element 3 would not be expected to result in substantially or incrementally exceeding the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the County General Plan or other wastewater facilities planning documents. Therefore, Element 3, Recycling and Waste Management Revisions would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded wastewater treatment facilities or expansion of facilities, causing significant environmental effects.

Stormwater Drainage Facilities

Construction

Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded storm water drainage facilities or expansion of facilities, causing significant environmental effects. The proposed program would not result in the expansion of areas for designated for industrial uses as identified in the County General Plan, including growth projections within the planning period. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, or an SPR. The majority of the uses in Element 3 would be subject to current development standards would require a discretionary CUP (Table III.E-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. Element 3 would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, combustion and non-combustion biomass conversion organic waste facilities are prohibited in ARAs. This Prohibiting facilities from these areas would result in a substantial reduction in the areas where these uses could be permitted. Part of the discretionary CUP would require conformance with the LID Ordinance, which contains BMPs for the treatment of stormwater runoff during construction and operations. Therefore, Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded storm water drainage facilities or expansion of facilities, causing significant environmental effects.

Operation

Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded storm water drainage facilities or expansion of facilities, causing significant environmental effects. The proposed program would not result in the expansion of areas for designated for industrial uses as identified in the County General Plan, including growth projections within the planning period. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, or an SPR. The majority of the uses in Element 3 would be subject to current development standards would require a discretionary CUP (Table III.E-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. Element 3 would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, combustion and non-combustion biomass conversion organic waste facilities are prohibited in ARAs. This Prohibiting facilities from these areas would result in a substantial reduction in the areas where these uses could be permitted. Part of the discretionary CUP would require conformance

with the LID Ordinance, which contains BMPs for the treatment of stormwater runoff during construction and operations. Therefore, Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded storm water drainage facilities or expansion of facilities, causing significant environmental effects.

Electric Power Facilities

Construction

Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded electric power facilities or expansion of facilities, causing significant environmental effects. The construction activities resulting from compliance with development standards required for Element 3 would be minimal and would not substantially alter the existing conditions for existing industrial uses such that electric power transmission serving the program area would be impacted. The proposed program would not result in the expansion of areas for designated for industrial uses as identified in the County General Plan, including growth projections within the planning period. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, or an SPR. The majority of the uses in Element 3 would be subject to current development standards would require a discretionary CUP (Table III.E-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. Element 3 would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, combustion and non-combustion biomass conversion organic waste facilities are prohibited in ARAs. This Prohibiting facilities from these areas would result in a substantial reduction in the areas where these uses could be permitted. Therefore, Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded electric power facilities or expansion of facilities, causing significant environmental effects.

Operation

Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded electric power facilities or expansion of facilities, causing significant environmental effects. Operation activities are not be expected to require relocation, expansion, or new electric power facilities as the electric power facilities currently serving the area would be sufficient for the construction of the requirements of Element 3 of proposed program. SCE provides electricity to the proposed program area. Total electricity demands in SCE's service area were 82,069 gigawatt-hours (GWH)⁹¹ per year in 2012. Per the County General Plan, the total projected electricity demand is 96,516 GWH in 2024. Projected development within the County is subject to Title 24, Part 6 of the California Administrative code, the Energy Efficiency Standards for Residential and Nonresidential Buildings, which requires local jurisdiction to use energy efficient appliances, weatherization techniques and efficient cooling and heating systems to reduce energy demand stemming from new development. The proposed program would not result in the expansion of areas for designated for industrial uses as identified in the County General Plan, including growth projections within the planning period. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, or an SPR. The majority of the uses in Element 3 would be subject to current development standards would require a discretionary CUP (Table III.E-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. Element 3 would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, combustion and non-combustion biomass conversion organic waste facilities are prohibited in ARAs. This Prohibiting facilities from these areas would result in a substantial reduction in the areas where these uses could be permitted. Therefore, Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded electric power facilities or expansion of facilities, causing significant environmental effects.

⁹¹ One GWH is equivalent to one million kilowatt-hours.

Natural Gas Facilities

Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded natural gas facilities or expansion of facilities, causing significant environmental effects. The proposed program would not result in the expansion of areas for designated for industrial uses as identified in the County General Plan, including growth projections within the planning period. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, or an SPR. The majority of the uses in Element 3 would be subject to current development standards would require a discretionary CUP (Table III.E-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~Element 3 would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, combustion and non-combustion biomass conversion organic waste facilities are prohibited in ARAs. This~~ Prohibiting facilities from these areas would result in a substantial reduction in the areas where these uses could be permitted. Implementation of the proposed program would not involve uses that require natural gas. The Southern California Gas Company (SoCalGas) supplies natural gas to most of the proposed program area. For the County, the estimated net increase in natural gas demand is about 192 million therms per year, or 51 million cubic feet of natural gas per day. Forecasted natural gas demands are within SoCalGas' estimated supplies for the County's 2035 buildout. Operations may require natural gas for certain uses. However, the natural gas requirements would not be expected to exceed those projected and planned for in the County General Plan. Therefore, Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded natural gas facilities or expansion of facilities, causing significant environmental effects.

Telecommunication Facilities

Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded telecommunications facilities or expansion of facilities, causing significant environmental effects. The proposed program would not result in the expansion of areas for designated for industrial uses as identified in the County General Plan, including growth projections within the planning period. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, or an SPR. The majority of the uses in Element 3 would be subject to current development standards would require a discretionary CUP (Table III.E-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~Element 3 would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, combustion and non-combustion biomass conversion organic waste facilities are prohibited in ARAs. This~~ Prohibiting facilities from these areas would result in a substantial reduction in the areas where these uses could be permitted. Construction of Element 3 would not involve uses that required new or expanded telecommunications facilities. Similarly, operations would not require telecommunications facilities greater than those that would ordinarily be anticipated. Therefore, Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded telecommunications facilities or expansion of facilities, causing significant environmental effects.

The Supermarket Accessory Recycling Center component of Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities or expansion of facilities, causing significant environmental effects. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted. The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. The Storage Enclosures for Recycling and Solid Waste Revisions is a requirement to build better enclosures for trash receptacles and would not change the total number of parcels that are authorized for development of most land uses in the unincorporated territory of the County. The revisions specify enhancements to existing development standards that are to be applied for storage enclosures for recycling and solid waste storage. The revisions would add additional requirements to

current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the proposed program would only apply to new development and expansion of existing development, excluding residential uses with fewer than four units.

Water Facilities

The Supermarket Accessory Recycling Center component of Element 3 would result in less than significant impacts in relation to the construction of new or expanded water facilities or expansion of facilities, causing significant environmental effects. The proposed program would not result in the expansion of areas for designated for industrial uses as identified in the County General Plan, including growth projections within the planning period. The County has sufficient water supply and infrastructure to meet anticipated growth over the planning period, and there is sufficient water supply to support the anticipated incremental increase for construction of walls and operation and maintenance of irrigated landscaping such that no expansion of water facilities would be required (Table IV.I-1). Additionally, the requirement of the proposed program for all parcels to meet the requirements of the LID Ordinance would result in a net benefit to water supply. Therefore, the Supermarket Accessory Recycling Center component of Element 3 would result in less than significant impacts in relation to the construction of new or expanded water facilities or expansion of facilities, causing significant environmental effects.

Wastewater Treatment Facilities

The Supermarket Accessory Recycling Center component of Element 3 would result in less than significant impacts in relation to the construction of new or expanded water treatment facilities or expansion of facilities, causing significant environmental effects. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers would be constructed on existing parking lots, and no new structures would be built. Construction and operation are not anticipated to generate wastewater flows that would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the County's General Plan or other wastewater facilities planning documents. The ~~construction~~ establishment of a recycling collection center or compliance with development standards would not substantially alter the existing conditions, such that the current wastewater treatment facilities or capacity would be changed and require the construction of new or expanded facilities. Therefore, the Supermarket Accessory Recycling Center component of Element 3 would result in less than significant impacts in relation to the construction of new or expanded water treatment facilities or expansion of facilities, causing significant environmental effects, and no mitigation is required.

Stormwater Drainage Facilities

The Supermarket Accessory Recycling Center component of Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or stormwater facilities or expansion of facilities, causing significant environmental effects. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed program would allow Supermarket Accessory Recycling Collection Centers as an accessory use in the C-1, C-2, C-2, C-3, C-M, C-MJ, C-R, C-RU, MXD, MXD-RU, M-1, M-1.5, M-2, and M-2.5 designated zones. These uses would be located on existing parking lots, and no new structures would be built. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Supermarket Accessory Recycling Centers would be ~~constructed~~ established on existing parking lots, and no new structures would be built, and would be subject to site plan review. Therefore, the Supermarket Accessory Recycling Center component of Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or stormwater facilities or expansion of facilities, causing significant environmental effects.

Electric Power Facilities

The Supermarket Accessory Recycling Center component of Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded electric power facilities. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed supermarket locations in urbanized locations in the County. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed program would allow Supermarket Accessory Recycling Collection Centers as an accessory use in the C-1, C-2, C-2, C-3, C-M, C-MJ, C-R, C-RU,

MXD, MXD-RU, M-1, M-1.5, M-2, and M-2.5 designated zones. These uses would be located on existing parking lots, and no new structures would be built. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Supermarket Accessory Recycling Centers would be ~~constructed~~ established on existing parking lots, and no new structures would be built, and would be subject to site plan review. Therefore, the Supermarket Accessory Recycling Center component of Element 3 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded electric power facilities.

Natural Gas Facilities

The Supermarket Accessory Recycling Center component of Element 3 would result in no impacts to utilities and service systems in relation to the construction of new or expanded natural gas facilities. The permitting of Supermarket Accessory Recycling Centers in existing parking lots would not require the use of natural gas for construction or operations. Therefore, the Supermarket Accessory Recycling Center component of Element 3 would result in no impacts to utilities and service systems in relation to the construction of new or expanded natural gas facilities.

Telecommunication Facilities

The Supermarket Accessory Recycling Center component of Element 3 would result in no impacts to utilities and service systems in relation to the construction of new or expanded telecommunications facilities. The permitting of Supermarket Accessory Recycling Centers in existing parking lots would not require the use or construction of telecommunications facilities for construction or operations. Therefore, the Supermarket Accessory Recycling Center component of Element 3 would result in no impacts to utilities and service systems in relation to the construction of new or expanded telecommunications facilities.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

Element 4 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities or expansion of facilities, causing significant environmental effects.

Water Facilities

Element 4 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water facilities or expansion of facilities, causing significant environmental effects. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted. The Storage Enclosures for Recycling and Solid Waste Revisions is a requirement to build better enclosures for trash receptacles and would not change the total number of parcels that are authorized for development of most land uses in the unincorporated territory of the County. The revisions specify enhancements to existing development standards that are to be applied for storage enclosures for recycling and solid waste storage. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the proposed program would only apply to new development and expansion of existing development, excluding residential uses with fewer than four units. There would be no nexus for increasing current water facilities or capacity through construction or operations that would require the construction of new or expanded facilities as a result of building and maintaining such enclosures. Therefore, Element 4 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water facilities or expansion of facilities, causing significant environmental effects.

Wastewater Treatment Facilities

Element 4 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded wastewater treatment facilities or expansion of facilities, causing significant environmental effects. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted. The Storage Enclosures for Recycling and Solid Waste Revisions is a requirement to build better enclosures for trash receptacles and would not change the total number of parcels that are authorized for development of most land uses in the unincorporated territory of the County. The revisions specify enhancements to existing development standards that are

to be applied for storage enclosures for recycling and solid waste storage. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the proposed program would only apply to new development and expansion of existing development, excluding residential uses with fewer than four units. There would be no nexus for increasing the need new or expanded wastewater treatment facilities or expansion of facilities through construction or operations that would require the construction of new or expanded facilities as a result of building and maintaining such enclosures. Therefore, Element 4 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded wastewater treatment facilities or expansion of facilities, causing significant environmental effects.

Stormwater Drainage Facilities

Element 4 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded storm water drainage facilities or expansion of facilities, causing significant environmental effects. The Storage Enclosures for Recycling and Solid Waste Revisions is a requirement to build better enclosures for trash receptacles and does not change the total number of parcels that are authorized for development of most land uses in the unincorporated territory of the County. The revisions specify enhancements to existing development standards that are to be applied for storage enclosures for recycling and solid waste storage. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the proposed program would only apply to new development and expansion of existing development excluding residential uses with fewer than four units. Construction activities during implementation of the development standards required by the proposed program would be subject to the County LID Ordinance involving measures to reduce stormwater runoff. Compliance with the provisions of the LID Ordinance includes BMPs that would reduce potential effects on the facilities from construction activities required for compliance with the proposed program. Therefore, Element 4 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded storm water drainage facilities or expansion of facilities, causing significant environmental effects.

Electric Power Facilities

Element 4 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded electric power facilities. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the proposed program would only apply to new development and expansion of existing development, excluding residential uses with fewer than four units. These revisions would not affect electric power transmission facilities, given that they do not require electricity for construction or operations other than minimal lighting. Therefore, Element 4 would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded electric power facilities.

Natural Gas Facilities

Element 4 would result in no impacts to utilities and service systems in relation to the construction of new or expanded natural gas facilities. The permitting of Storage Enclosures for Recycling and Solid Waste would not require the use of natural gas for construction or operations. As a result, impacts to utilities and services systems in relation to natural gas serving the program area would not occur. Therefore, Element 4 would result in no impacts to utilities and service systems in relation to the construction of new or expanded natural gas transmission and distribution pipelines.

Telecommunication Facilities

Element 4 would result in no impacts to utilities and service systems in relation to the construction of new or expanded telecommunications facilities. The permitting of Storage Enclosures for Recycling and Solid Waste would not require the use or construction of telecommunications facilities for construction or operations. As a result, impacts to utilities and services systems in relation to telecommunications would not occur. Therefore, Element 4 would result in no impacts to utilities and service systems in relation to the construction of new or expanded telecommunications facilities.

Threshold I-2**Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?**

The proposed program would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years. The potential for impacts has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the County General Plan land use designations for select parcels located within the Green Zone Districts. The qualitative and geospatial analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices (pertaining to New Sensitive Uses and the Recycling and Waste Management Revisions), building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties.

County Water Supplies, Projected Demand, and Purveyor Service Areas

As stated in the Public Services and Facilities Element of the County General Plan, approximately 33 percent of the County's water supply comes from local sources, and approximately 77 percent is imported from the Colorado River, Sacramento Bay Delta, and the Owens Valley.⁹² The Southern California region faces a challenge satisfying its water requirements and securing firm water supplies as continued population growth and economic growth increase water demands in the region and competition for water from outside the region reduces supplies of imported water (see Table IV.I-1). Major sources of uncertainty regarding the County's imported and local water supply include Sacramento Delta pumping restrictions, climate change and sea level rise, and levee and pipeline vulnerability to floods and earthquakes. To reduce the County's dependence on imported water and increase the water supply, County agencies are establishing water conservation programs such as water reclamation projects and groundwater recharge facilities. Several water agencies in Southern California are producing and distributing recycled water, gray water, and most recently desalinated ocean water. Clear visions and strategies for the sustainable management of water resources within a specific region are being delineated by one or more watersheds in the Antelope Valley Region IRWM, the Upper Santa Clara River Region IRWM, and the Greater Los Angeles County (GLAC) Region IRWM (see Table IV.I-2). Based on the three IRWMs and water supply and demand projections provided by each water purveyor, each of the three IRWMs has adequate capacity to provide water for unincorporated areas of the County through a combination of local and imported water that is delivered through a system of aqueducts, reservoirs, and groundwater basins, with a residual water supply of 335,843 acre-feet per year in 2015 and an anticipated projected residual supply of 281,875 acre-feet per year in 2035, based on an anticipated 11 percent increase in demand from 2015 to 2035. From 2020 to 2035, based on the policies and programs disclosed in the County General Plan and projections made in the General Plan Update EIR, the County's water supply sources are anticipated to increase by 4 percent. Water supplies from 2020 to 2035 are anticipated to increase for groundwater (by 2 percent), recycled water (by 22 percent), conservation (by 64 percent), stormwater capture and direct use (by over 300 percent), and desalination (by 48 percent; see Table IV.I-1). Water supplies from 2020 to 2035 are anticipated to decrease for imported water (by 2 percent) and water banking (by 13 percent). Water supplies are anticipated to remain at the same quantity for surface water and water transfers from 2020 to 2035.

Within 9 of the 11 County Planning Areas, the County land use zoning designations that would be subject to the proposed program are located in areas fully served by water purveyor agencies; there is adequate forecasted residual water supply at buildout to serve the proposed program. Each of the water purveyors provides projections for water supply and demand through 2035 that includes imported water and recycled water sources, and shows that with anticipated growth per SCAG projections, each water purveyor would have a water surplus. As there are areas not served by designated private or municipal water purveyors within the Santa Clarita Valley Planning Area and the Antelope Valley Planning Area, additional details are provided below.

The primary sources of water in the Santa Clarita Valley Planning Area are pumped groundwater and imported water from the SWP. Within the Santa Clarita Valley Planning Area, there are areas to the west and south of Castaic Lake, southwest of the City of Santa Clarita, and east of the City of Santa Clarita, including the unincorporated community of Agua Dulce, that are outside the 195-square-mile service area of the Castaic Lake Water Agency and do not receive the agency's 95,200 acre-feet per year of

⁹² The Los Angeles Aqueduct, which imports water from the Owens Valley, primarily serves residents and businesses of the incorporated City of Los Angeles.

purchased SWP water, 11,000 acre-feet per year from high-flow Kern River water, and 115,000 acre-feet of groundwater banks in neighboring Kern County to offset shortages during future dry years.⁹³ Water supply outside this service area is limited to pumped groundwater from the Santa Clara River Valley Groundwater Basin (Santa Clara River Valley East Subbasin [Basin No. 4-4-07]). The 2005 UWMP for the Santa Clarita Valley projects annual increases in water usage of about 2.2 percent through 2030 without conservation measures in place, and 1.3 percent annual water usage increases with conservation measures. Projected 2030 demand is estimated at 138,300 acre-feet.

In the Antelope Valley Planning Area, the three primary sources of water are the SWP (up to 165,000 acre-feet per year, from two SWP contractors), surface water stored in the Littlerock Reservoir (3,325 acre-feet per year), and the Antelope Valley Groundwater Basin and Acton Valley Basin.⁹⁴ In dry years, SWP contractors' allocation percentages decrease. Stormwater and recycled water from LACSD water reclamation plants are secondary sources of water supply in this planning area. There are multiple small water purveyors that provide services primarily in the central and northeastern portions of the planning area; there are several areas outside the service area of a water purveyor in the northern, eastern, southern, and western portions of the Valley Planning Area, as well as the area northeast of Palmdale. Water supply is limited in the Antelope Valley Planning Area. The 2019 Antelope Valley IRWM forecasts that total water demand will exceed the supply by 77,200 acre-feet per year in future single-dry years and 198,800 acre-feet over four years in future multi-dry year periods.⁹⁵ The Antelope Valley Groundwater Basin was adjudicated in 2015, which quantified a safe groundwater pumping yield and established production rights to stabilize groundwater levels. Groundwater rights are adjudicated in the Basin, which has regulated groundwater supplies. The Watermaster management of the adjudicated basin and the prescriptive allowable pumping rights for each agency that accesses the groundwater basin reduces the potential of incremental increases to groundwater pumping that could result from implementation of the proposed program.

Anticipated Water Demand for Proposed Program

The proposed program would only require a small use of water for the purpose of landscaping. The improvements required pursuant to the Green Zones Program would either be ancillary to existing uses (Element 1 only) or estimated as part of future proposed land uses, thus using existing or proposed water pipe improvements and connections to adequately connect to the existing and planned infrastructure. Zone changes with implementation of the proposed program would be limited to decreased intensity of industrial uses, which would not be expected to require additional water. A majority of the improvements would not require the use of water during the construction or operational phases of the improvements. Water required for landscaping irrigation would be ancillary to the land use, and all necessary improvements would be verified through the permit approval process of obtaining required connection permit for the applicable water purveyor within the designated areas. Furthermore, recycled water and stormwater capture are potential water supplies for irrigation of the landscape buffer areas, instead of potable water. All landscaping additions would be developed in compliance with CALGreen nonresidential mandatory measures and County Green Building Program (Drought-Tolerant Landscaping Ordinance, Green Building Ordinance, and LID Ordinance) in order to implement water efficiency and water conservation measures for both indoor and outdoor water use.⁹⁶ In particular, compliance with the MWELo encourages the use of more efficient irrigation systems, graywater usage, and onsite storm water capture for new and retrofitted landscapes, and limits the portion of landscapes that can be covered in turf. The landscaping and landscape barriers would be also be installed consistent with the County's LID Manual, with the required use of LID BMPs to treat and infiltrate stormwater in support of the replenishment of groundwater supplies in Los Angeles County.

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening

⁹⁶ State of California. August 2019. Chapter 5 Nonresidential Mandatory Measures, Division 5.3 Water Efficiency and Conservation. In the 2019 California Green Building Standards Code, California Code of Regulations, Title 24, Part 11. Available at: https://codes.iccsafe.org/content/CGBC2019P2/chapter-5-nonresidential-mandatorymeasures#CGBC2019P2_Ch05_SubCh5.3

where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties. The Green Zone Districts would all be located in the Los Angeles Basin, within the County Planning Areas that are fully served by water purveyor agencies with adequate forecasted residual water supply at buildout to serve the proposed program.

Construction

Construction activities required to implement the new development standards and/or more stringent entitlement process for Element 1 would be completed in all 11 districts within a 3- to 7-year period for existing industrial, recycling, or vehicle-related uses (per the retroactive conformance requirement), and to future entitlements subject to ~~an SPR Ministerial Site Plan Review~~ or a CUP on a project-by-project basis after the individual future projects have received a discretionary approval (which requires environmental review under CEQA). The parcels located within Element 1 are located in areas of intense urban development and currently served by water facilities. Water required for landscaping would be ancillary to the land use, and all necessary improvements would be verified through the permit approval process of obtaining required connection permit for the applicable water purveyor within the designated areas. However, permits would only be needed for a small percentage of development. Construction of the requirements for Element 1 would include installation of walls, fencing, setbacks, and landscaping for which demonstration of compliance with existing development standards is required during plan check, including the installation of landscaping with plants from the Los Angeles County Waterworks District's drought tolerant plant list.⁹⁷ All landscaping additions would be developed in compliance with CALGreen nonresidential mandatory measures in order to implement water efficiency and water conservation measures.⁹⁸ These measures regulate both indoor and outdoor water use and include development in conformance with the MWELo to increase water efficiency standards encouraging the use of more efficient irrigation systems, graywater usage, and onsite storm water capture, and by limiting the portion of landscapes that can be covered in turf. Based on a review of available water supply for parcels with County land use zoning designations that would be subject to the Green Zone Districts, there are sufficient water supplies to support the anticipated incremental increase for during construction of the improvements that would be required.

Statewide per capita water consumption for manufacturing ranges from 341 to 3,911 gallons per day.⁹⁹ Within one of the densest areas for manufacturing, the County is below average for Statewide use of water per manufacturing employee, ranging from 594 to 921 gallons per employee per day. The proposed program would not result in the expansion of areas for designated for industrial uses as identified in the County General Plan, including growth projections within the planning period. The areas that would be subject to the requirements of Element 1 would not expand development outside of those areas already designated for industrial development. The County has sufficient water supply and infrastructure to meet anticipated growth over the planning period which includes projected growth (see Table IV.I-1). Additionally, the requirement of the proposed program for all parcels to meet the requirements of the LID Ordinance including parcels less than 1 acre in size would result in a net benefit to water supply in Element 1 as a result of the water saving requirements of the LID Ordinance. Construction activities would be required to comply with the County LID Ordinance pertaining to recycled water, and the proposed development of the landscaping and landscape barriers would be installed consistent with the County's LID Standards Manual. The currently adopted LID Ordinance exempts parcels that are less than 1 acre in size, which would include approximately 79 percent of the parcels that would be subject to Element 1. As stated in Section III, *Project Description*, under the proposed program, parcels under 1 acre within the Green Zone Districts subject to the Green Zones Program would not be exempt from the provisions of the County LID Ordinance. The additional program parcels of less than 1 acre would reduce impervious surfaces as a requirement of the County LID Ordinance. Therefore, the Green Zone Districts would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.

Operation

Based on a review of available water supply for parcels with County land use zoning designations that would be subject to the Green Zone Districts, there are sufficient water supplies to support the anticipated incremental increase for operation and maintenance of irrigated landscaped buffers (see Table IV.I-1). The majority of the new development standards would not require the use of water during the operational phases of the improvements. Element 1 would only require a small use of water for the purpose of irrigation of landscaping. However, these areas would be required to meet the standards of the LID Ordinance for the use of drought tolerant landscaping. The proposed new development standards would not require additional restrooms, sinks, and other uses that require access to potable water. Furthermore, recycled water and stormwater capture are potential water supplies for irrigation of the landscape buffer areas, instead of potable water, if needed. The proposed new development standards include elements that would require increased water usage through planting landscape barriers. All landscaping additions would be developed in compliance with CALGreen nonresidential mandatory measures in order to implement water efficiency and water conservation measures.¹⁰⁰ These measures regulate both indoor and outdoor water use and include development in conformance with the MWELo to increase water efficiency standards encouraging the use of more efficient irrigation systems, graywater usage, and onsite storm water capture, and by limiting the portion of landscapes that can be covered in turf. Water required for landscape irrigation would be ancillary to the land use and all necessary improvements would be verified through the permit approval process of obtaining required connection permit for the applicable water purveyor within the designated areas. However, permits would only be needed for a small percentage of development. The proposed program would be required to comply with the County LID ordinance pertaining to recycled water. In addition, the proposed program would revise the County's current LID Ordinance's exemption of structures of less than 1 acre, by requiring program parcels of less than 1 acre to be subject to the ordinance. The additional program parcels of less than 1 acre would reduce impervious surfaces as a requirement of the County LID Ordinance. Based on a review of available water supply for parcels with County land use zoning designations that would be subject to the Green Zone Districts, there are sufficient water supplies to support the anticipated incremental increase for during operation and maintenance of the proposed program. The proposed program would comply with existing UWMP to maintain sustainable water resources. Therefore, the Green Zone Districts would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.

Element 2 – New Sensitive Uses

The development standards for the New Sensitive Uses adjoining or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years. The new development standards would apply to parcels that are located in all 11 County Planning Areas. The areas that would be subject to the requirements of Element 2 would not expand development outside of those areas already designated for development in the County General Plan. The County has sufficient water supply and infrastructure to meet anticipated growth over the planning period (see Table IV.I-1). ~~As discussed in Section III, construction activities for the proposed program would include solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the proposed program would implement new development standards for New Sensitive Uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses.

Construction

The majority of construction activities that would be required to implement the new development standards would not require the use of water facilities during the construction phase of the improvements. Construction of the proposed new development standards would either be ancillary to an existing use or part of future proposed land use, using existing or proposed water pipe improvements and connections to adequately connect to the existing and planned infrastructure. Rezoning of uses would not occur with implementation of the development standards. Water required for landscaping would be ancillary to the land use, and all necessary improvements would be verified through the permit approval process of obtaining required connection permit

¹⁰⁰ State of California. August 2019. Chapter 5 Nonresidential Mandatory Measures, Division 5.3 Water Efficiency and Conservation. In the 2019 California Green Building Standards Code, California Code of Regulations, Title 24, Part 11. https://codes.iccsafe.org/content/CGBC2019P2/chapter-5-nonresidential-mandatory-measures#CGBC2019P2_Ch05_SubCh5.3

for the applicable water purveyor within the designated areas. Based on a review of available water supply for parcels with County land use zoning designations that would be subject to the New Sensitive Uses, there is sufficient water supply to support the anticipated incremental increase for construction of walls and operation and maintenance of irrigated landscaped (see IV.I-1).

The proposed program includes elements that would require increased water usage through planting landscape barriers. All landscaping additions would be developed in compliance with CALGreen nonresidential mandatory measures in order to implement water efficiency and water conservation measures.¹⁰¹ These measures regulate both indoor and outdoor water use and include the use of the MWELo to increase water efficiency standards for new and retrofitted landscapes through encouraging the use of more efficient irrigation systems, graywater usage, and onsite storm water capture, and by limiting the portion of landscapes that can be covered in turf. Construction activities would be required to comply with the County LID Ordinance pertaining to recycled water. In addition, the proposed program would revise the County's current LID Ordinance's exemption of structures less than 1 acre, by requiring program parcels of less than 1 acre to be subject to the Ordinance. The additional program parcels of less than 1 acre would be subject to the proposed program. The implementation of these measures would reduce impervious surfaces as a requirement of the County LID Ordinance. Based on a review of available water supply for parcels with County land use zoning designations that would be subject to the New Sensitive Uses, there is sufficient water supply to support the anticipated incremental increase for during construction, operation, and maintenance of the proposed program. The proposed program would comply with existing UWMPs to maintain sustainable water resources. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.

Operation

The majority of the new development standards would not require the use of water during the operational phases of the improvements. The proposed program includes standards for requiring the use of solid wall screening, expanded landscaping buffers between incompatible uses, standards for windows, placement of balconies, and air filtration devices (see Table III.E-2). These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space would not require a large amount of potable water. The proposed new development standards would not require additional restrooms, sinks, and other uses that require access to potable water. Furthermore, recycled water and stormwater capture are potential water supplies for irrigation of the landscape buffer areas, instead of potable water, if needed. The proposed new development standards include elements that would require increased water usage through planting landscape barriers. All landscaping additions would be developed in compliance with CALGreen nonresidential mandatory measures in order to implement water efficiency and water conservation measures.¹⁰² These measures regulate both indoor and outdoor water use and include development in conformance with the MWELo to increase water efficiency standards encouraging the use of more efficient irrigation systems, graywater usage, and onsite storm water capture, and by limiting the portion of landscapes that can be covered in turf. Based on a review of available water supply for parcels with County land use zoning designations that would be subject to the New Sensitive Uses, there are sufficient water supplies to support the anticipated incremental increase for during operation and maintenance of the proposed program. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years. The revisions would apply to parcels that are located in all 11 County Planning Areas. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving,

¹⁰¹ State of California. August 2019. Chapter 5 Nonresidential Mandatory Measures, Division 5.3 Water Efficiency and Conservation. In the 2019 California Green Building Standards Code, California Code of Regulations, Title 24, Part 11. https://codes.iccsafe.org/content/CGBC2019P2/chapter-5-nonresidential-mandatorymeasures#CGBC2019P2_Ch05_SubCh5.3

¹⁰² State of California. August 2019. Chapter 5 Nonresidential Mandatory Measures, Division 5.3 Water Efficiency and Conservation. In the 2019 California Green Building Standards Code, California Code of Regulations, Title 24, Part 11. https://codes.iccsafe.org/content/CGBC2019P2/chapter-5-nonresidential-mandatorymeasures#CGBC2019P2_Ch05_SubCh5.3

signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (see Table III.E-2). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs.~~

Supermarket Accessory Recycling Collection Centers would be permitted in currently developed supermarket locations in urbanized locations in the County. The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed program would allow Supermarket Accessory Recycling Collection Centers as an accessory use in the C-1, C-2, C-2, C-3, C-M, C-MJ, C-R, C-RU, MXD, MXD-RU, M-1, M-1.5, M-2, and M-2.5 designated zones. These uses would be located on existing parking lots, and no new structures would be built. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible.

Construction

The parcels that would be subject to the revisions in Element 3 are located in both areas of intense urban development currently served by water facilities and rural areas in the Santa Clarita Valley Planning Area and Antelope Valley Planning Area, some of which are outside the service area of a water purveyor. Water required for landscaping would be ancillary to the land use, and all necessary improvements would be verified through the permit approval process of obtaining required connection permit for the applicable water purveyor within the designated areas. Construction of the requirements for Element 3 would include installation of walls, fencing, enclosures, and landscaping for which demonstration of compliance with existing development standards is required during plan check, including the installation of landscaping with plants from the Los Angeles County Waterworks District's drought tolerant plant list.¹⁰³ All landscaping additions would be developed in compliance with CALGreen nonresidential mandatory measures in order to implement water efficiency and water conservation measures.¹⁰⁴ These measures regulate both indoor and outdoor water use and include development in conformance with the MWELO to increase water efficiency standards encouraging the use of more efficient irrigation systems, graywater usage, and onsite storm water capture, and by limiting the portion of landscapes that can be covered in turf. Construction activities would be required to comply with the County LID Ordinance pertaining to recycled water, and the proposed development of the landscaping and landscape barriers would be installed consistent with the County's LID Standards Manual.

Statewide per capita water consumption for manufacturing ranges from 341 to 3,911 gallons per day.¹⁰⁵ Within one of the densest areas for manufacturing, the County is below average for Statewide use of water per manufacturing employee, ranging from 594 to 921 gallons per employee per day. The proposed program would not result in the expansion of areas for designated for industrial uses as identified in the County General Plan, including growth projections within the planning period. The areas that would be subject to the requirements of Element 3 would not expand development outside of those areas already designated for industrial development. The County has sufficient water supply and infrastructure to meet anticipated growth over the planning period which includes projected growth (see Table IV.I-1). Any construction would be required to comply with existing development standards and would not substantially alter the existing conditions for existing industrial uses in relation to water

¹⁰⁵ Christina-Smith, J., Heberger, M., Allen, L. August 2012. Urban Water Demand in California to 2100: Incorporating Climate Change. <https://pacinst.org/wp-content/uploads/2014/04/2100-urban-water-efficiency.pdf>

supply within the program area. The Supermarket Accessory Recycling Collection revisions would not require additional areas for landscaping barrier or elements increasing water usage; thus, no additional consumptive use of water beyond that described for the Recycling and Waste Management Revisions would occur. Therefore, the Supermarket Accessory Recycling Collection Centers would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.

Operation

Based on a review of available water supply for parcels with County land use zoning designations that would be subject to the Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, there are sufficient water supplies to support the anticipated incremental increase for operation and maintenance of irrigated landscaped buffers (see Table IV.I-1). The majority of the new development standards would not require the use of water during the operational phases of the improvements. Element 3 would only require a small use of water for the purpose of irrigation of landscaping. However, these areas would be required to meet the standards of the LID Ordinance for the use of drought tolerant landscaping. The proposed revisions would not require additional restrooms, sinks, and other uses that require access to potable water. Furthermore, recycled water and stormwater capture are potential water supplies for irrigation of the landscape buffer areas, instead of potable water, if needed. The proposed new development standards include elements that would require increased water usage through planting landscape barriers. All landscaping additions would be developed in compliance with CALGreen nonresidential mandatory measures in order to implement water efficiency and water conservation measures.¹⁰⁶ These measures regulate both indoor and outdoor water use and include development in conformance with the MWELO to increase water efficiency standards encouraging the use of more efficient irrigation systems, graywater usage, and onsite storm water capture, and by limiting the portion of landscapes that can be covered in turf. Water required for landscape irrigation would be ancillary to the land use and all necessary improvements would be verified through the permit approval process of obtaining required connection permit for the applicable water purveyor within the designated areas. Increased water supply needed for recycling and solid waste facilities would be required to comply with County development standards. Therefore, Recycling and Waste Management Revisions would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years. The Supermarket Accessory Recycling Collection revisions would not require additional areas for landscaping barrier or elements increasing water usage; thus, no additional consumptive use of water beyond that described for ~~Green Zone District Recycling and Waste Management Revisions~~ would occur. Therefore, ~~Element 3 the Supermarket Accessory Recycling Collection Centers~~ would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years. The revisions would apply to parcels that are located in all 11 County Planning Areas. These revisions would require waste, compost, and recyclable materials to be stored in receptacles, which would be located in the same enclosure.

Construction

Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would expand upon current development requirements, including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. A negligible amount of water would be brought to the site when portable toilets would be provided by the construction contractor(s) and the waste disposed of off-site, as required under 8 CCR Section 1526.¹⁰⁷ The proposed revisions would not require additional restrooms, sinks, and other uses that require access to potable water beyond temporary portable toilets. The Storage Enclosures for Recycling and Solid Waste Revisions would not require construction of additional areas for

¹⁰⁶ State of California. August 2019. Chapter 5 Nonresidential Mandatory Measures, Division 5.3 Water Efficiency and Conservation. In the 2019 California Green Building Standards Code, California Code of Regulations, Title 24, Part 11. https://codes.iccsafe.org/content/CGBC2019P2/chapter-5-nonresidential-mandatory-measures#CGBC2019P2_Ch05_SubCh5.3

¹⁰⁷ Department of Industrial Relations. 2020. California Code of Regulations, Title 8, §1526. Toilets at Construction Jobsites. Available at: <https://www.dir.ca.gov/title8/1526.html>

landscaping barriers or elements increasing water usage; thus, no consumptive use of water would occur. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.

Operation

Based on a review of available water supply for parcels with County land use zoning designations that would be subject to Element 4, there are sufficient water supplies to support the anticipated incremental increase for operation and maintenance of Storage Enclosures for Recycling and Solid Waste Revisions (see Table IV.I-1). The proposed program would only apply to new development and expansion of existing development, excluding residential uses with fewer than four units. The proposed revisions would not require additional restrooms, sinks, and other uses that require access to potable water. The Storage Enclosures for Recycling and Solid Waste Revisions would not require additional areas for landscaping barrier or elements increasing water usage; thus, no additional consumptive use of water would occur. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.

Threshold I-3 Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

The proposed program would result in less than significant impacts to utilities and service systems in relation to resulting in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments. The proposed program includes modifications to existing industrial uses, greater stringency in development standards for new sensitive uses near industrial facilities, revisions to industrial facility developments standards in areas zoned for industrial uses within the proposed program area, and for the purpose of minimizing impacts related to industrial uses on nearby sensitive uses. The proposed program is not expected to discharge wastewater that contains harmful levels of toxins beyond the regulations as provided by applicable RWQCB and would comply with the wastewater treatment standards of the RWQCB. The proposed program would not generate wastewater that could combine with wastewater from related projects to result in an exceedance of the RWQCB regulations. Development of industrial facilities that have the potential to discharge hazardous wastewater would be required to comply with existing specification related to permitting by the RWQCB prior to connecting to the sewer system, which would ensure that flows are within the regulations provided under the RWQCB.

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts to utilities and service systems in relation to resulting in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

Construction

Construction activities required to implement the new development standards and/or more stringent entitlement process for Element 1 would be completed in all 11 districts within a 3- to 7-year period for existing industrial, recycling, or vehicle-related uses (per the retroactive conformance requirement), and to future entitlements subject to an MPR ~~Ministerial Site Plan Review~~ or a CUP on a project-by-project basis after the individual future projects have received a discretionary approval (which requires environmental review under CEQA).

As previously discussed, the County land use zoning designations that would be subject to the Green Zone Districts standards are located in areas currently served by wastewater treatment facilities. Construction activities would either be ancillary to an existing use or estimates as part of future proposed land use, thus using existing or proposed on- and off-site sewer pipe improvements and connections to adequately connect to the LACSD's sewer system. Construction activities associated with installation of the required improvements such as the construction of walls, landscaping, paving, and landscaping would require low quantities of additional water that would need to be treated at wastewater treatment facilities. All required improvements would be verified through the permit approval process of obtaining a sewer capacity and connection permit from the LACSD. Construction of the proposed improvements would involve minor alterations and modifications to existing industrial uses,

and/or require more stringent standards of development for new sensitive uses proposed in vicinity of industrial, recycling and solid waste, or vehicle-related uses within areas of the unincorporated areas of the County or adjacent incorporated areas including sensitive uses. As discussed in Section IV.I.2.b, the County has adequate wastewater treatment infrastructure to meet anticipated growth over the planning period which includes projected growth (see Figure IV.I-1). Additionally, the requirement of the proposed program for all parcels to meet the requirements of the LID Ordinance including parcels less than 1 acre in size would result in a net benefit to wastewater treatment facilities for Element 1 as a result of the water saving requirements and stormwater runoff requirements of the LID Ordinance. A negligible amount of wastewater would be generated by construction workers because portable toilets would be provided by the construction contractor(s) and the waste disposed of off-site, as required under 8 CCR Section 1526.¹⁰⁸ Wastewater generation from construction activities is not anticipated to generate wastewater flows that would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the County General Plan or other wastewater facilities planning documents. Construction would include installation of walls, fencing, setback, and landscaping, for which demonstration of compliance with development standards is required during plan check, including landscaping installation of plants from the County's drought tolerant plant list. Wastewater generation from construction activities is not anticipated to cause a measurable increase in wastewater flows at a point where, and at a time when, a sewer's capacity is already constrained or that would cause a sewer's capacity to become constrained. As a result of the requirement of the proposed program that all parcels within Element 1 be subject to the requirements of the LID Ordinance, improvements as a result of the proposed program would not generate wastewater for offsite discharge during construction. Therefore, the Green Zone Districts would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water treatment facilities or expansion of facilities, causing significant environmental effects.

Operation

Operation of the proposed new development standards for the Green Zone Districts is not anticipated to generate wastewater flows that would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the County's General Plan or other wastewater facilities planning documents. The proposed new development standards would not require additional restrooms, sinks, and other uses that generate wastewater. As stated above for Water Facilities, additional water use during operations as a result of the proposed program would be limited to irrigation of new landscaping within buffers that would be required to comply with the County LID Ordinance, which requires drought tolerant landscaping. Water required for landscaping would be ancillary to the land use, and all necessary improvements would be verified through the permit approval process of obtaining a sewer capacity and connection permit from the LACSD. The improvements would not generate wastewater for offsite discharge and would not result in the need for expansion or construction of wastewater treatment facilities. Therefore, the Green Zone Districts would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water treatment facilities or expansion of facilities, causing significant environmental effects.

Element 2 – New Sensitive Uses

The new development standards for the New Sensitive Uses adjoining or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to utilities and service systems in relation to resulting in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

Construction

The County land use zoning designations that would be subject to this element are located in areas currently served by wastewater treatment facilities. Construction of the proposed improvements would either be ancillary to an existing use or estimates as part of future proposed land use, thus using existing or proposed on- and off-site sewer pipe improvements and connections to adequately connect to the LACSDs' sewer system. The proposed program would not generate wastewater for offsite discharge. Construction of the proposed improvements would involve more ~~stringent~~ additional standards of development for new sensitive uses proposed ~~in vicinity of adjacent to or adjoining legally-established, existing industrial, recycling and solid waste, or vehicle-related uses within areas of the unincorporated areas of the County or adjacent incorporated areas including sensitive uses.~~ Construction would include installation of walls, ~~fencing,~~ setback, and landscaping for which compliance with development standards must be demonstrated during plan check, including landscaping installation of plants from the County drought tolerant

¹⁰⁸ Department of Industrial Relations.2020. California Code of Regulations, Title 8, §1526. Toilets at Construction Jobsites. Available at: <https://www.dir.ca.gov/title8/1526.html>

plant list. All required improvements would be verified through the permit approval process of obtaining a sewer capacity and connection permit from the LACSD.

A negligible amount of wastewater would be generated by construction workers. It is anticipated that portable toilets would be provided by the construction contractor(s) and the waste disposed of off-site, as required under 8 CCR Section 1526.¹⁰⁹ Wastewater generation from construction activities is not anticipated to cause a measurable increase in wastewater flows at a point where, and at a time when, a sewer's capacity is already constrained or that would cause a sewer's capacity to become constrained. In addition, construction is not anticipated to generate wastewater flows that would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the County General Plan or other wastewater facilities planning documents. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water treatment facilities or expansion of facilities, causing significant environmental effects.

Operation

As previously discussed, the County land use zoning designations that would be subject to Element 2 are located in areas currently served by wastewater treatment facilities. The proposed program would not generate wastewater for offsite discharge. Operation of the proposed program is not anticipated to generate wastewater flows that would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the County's General Plan or other wastewater facilities planning documents. The proposed new development standards would not require additional restrooms, sinks, and other uses that generate wastewater. As stated above for Water Facilities, additional water use during operations as a result of the proposed program would be limited to irrigating new landscaping buffers that would be required to comply with the County's Drought-Tolerant Landscaping Ordinance. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water treatment facilities or expansion of facilities, causing significant environmental effects.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to utilities and service systems in relation to resulting in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

Construction

Construction activities required for compliance with the proposed development standards would be minimal and would not substantially alter the existing conditions for existing recycling and waste management uses such that wastewater treatment facilities and capacity would be impacted. Construction of the proposed improvements would involve minor alterations and modifications to existing uses, and/or require more stringent standards of development for new uses proposed within these areas zoned for recycling and waste management of the unincorporated areas of the County. Construction would include installation of walls, barriers, and landscaping for which demonstration of compliance with development standards is required during plan check, including landscaping installation of plants from the County's drought tolerant plant list. The proposed requirements are designed to create barriers between industrial, recycling, solid waste, and vehicle-related uses and surrounding areas to sensitive uses. Construction is not anticipated to generate wastewater flows that would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the County General Plan or other wastewater facilities planning documents. Therefore, impacts to Recycling and Waste Management Revisions would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water treatment facilities or expansion of facilities, causing significant environmental effects.

Operation

Operation of the proposed revisions is not anticipated to generate wastewater flows that would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the County General Plan or other wastewater facilities planning documents. The proposed revisions would not require additional restrooms,

¹⁰⁹ Department of Industrial Relations.2020. California Code of Regulations, Title 8, §1526. Toilets at Construction Jobsites. Available at: <https://www.dir.ca.gov/title8/1526.html>

sinks, and other uses that generate wastewater. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, combustion and non-combustion biomass conversion organic waste facilities are prohibited in ARAs.~~ Therefore, the Supermarket Accessory Recycling Collection Centers would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water treatment facilities or expansion of facilities, causing significant environmental effects.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to utilities and service systems in relation to resulting in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

Construction

Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the proposed program would only apply to new development and expansion of existing development, excluding residential uses with fewer than four units. Construction is not anticipated to generate wastewater flows that would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the County General Plan or other wastewater facilities planning documents. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water treatment facilities or expansion of facilities, causing significant environmental effects.

Operation

Operation of the proposed revisions is not anticipated to generate wastewater flows that would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the County's General Plan or other wastewater facilities planning documents. The proposed revisions would not require additional restrooms, sinks, and other uses that generate wastewater. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the proposed program would only apply to new development and expansion of existing development, excluding residential uses with fewer than four units. The proposed requirements are designed to create barriers between industrial, recycling and solid waste, or vehicle-related uses and surrounding areas to sensitive uses. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to utilities and service systems in relation to the construction of new or expanded water treatment facilities or expansion of facilities, causing significant environmental effects.

Threshold I-4 **Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?**

The proposed program would result in less than significant impacts to utilities and service systems in relation to generating solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impairing the attainment of solid waste reduction goals. The proposed program area is currently served by 50 solid waste diversion programs serving unincorporated areas, including composting, material, recovery facilities, household hazardous-waste collection, public education, recycling, source reduction, special-waste materials, and waste-to-energy programs and nine landfills serving the

unincorporated areas. Construction activities would be minimal and would be handled in compliance with all applicable federal, State, and local management and reduction statutes and regulations related to solid waste. Although the proposed program would contribute solid waste to the landfills, during demolition and construction activities creating solid waste per day, the operational solid waste per day would not substantially impact the permitted capacity of the landfills. Further, the purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses by modifying regulatory requirements for specific industrial land uses requiring conformance with greater stringency and new requirements for development. In addition, the proposed program would provide revisions to the ordinance related to implementation of measures for the County to meet required statewide waste reduction targets and legislation impacting solid waste management.¹¹⁰ These measures would be required where the proposed program implements new standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities.

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts to utilities and service systems in relation to a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

Construction

Construction activities required to implement the new development standards and/or more stringent entitlement process for Element 1 would be completed in all 11 districts within a 3- to 7-year period for existing industrial, recycling, or vehicle-related uses (per the retroactive conformance requirement), and to future entitlements subject to an an SPR Ministerial Site Plan Review or a CUP on a project-by-project basis after the individual future projects have received a discretionary approval (which requires environmental review under CEQA). The County land use zoning designations in the 11 districts that would be subject to the Green Zone Districts standards are located in areas currently served by solid waste facilities. Construction of the improvements that would be required pursuant to the proposed program would either be ancillary to an existing use or part of future proposed land use, thus using existing or proposed solid waste facilities serving a given project site. Construction of the proposed improvements would involve minor alterations and modifications to existing industrial uses or require more stringent standards of development for new sensitive uses proposed in vicinity of industrial, recycling and solid waste, or vehicle-related within areas of the unincorporated areas of the County or adjacent incorporated areas including sensitive uses. Construction would include installation of walls, fencing, setback, and landscaping that would be required to demonstrate compliance with development standards during plan check, including landscaping installation of plants from the County's drought tolerant plant list. Compliance with both State and County demolition and construction non-hazardous waste diversion regulations would be required, resulting in the diversion of 50 to 65 percent of waste from individual projects from landfills for recycling or reuse. All solid waste produced as a result of the required improvements would be properly disposed of in accordance with applicable federal, state, and local regulations and requirements pertaining to solid waste disposal. Construction would not substantially or incrementally exceed the future scheduled capacity of any solid waste facilities beyond what is anticipated in the County General Plan or other facilities planning documents. Therefore, the new development standards or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to utilities and service systems in relation to generation of solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

Operation

During the operations phase, the implemented alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties would not be expected to generate large quantities of waste. Green waste from landscaping maintenance would be relatively minimal from each site due to the small size of the landscape buffers and required drought-tolerant plant palette, in accordance with the Drought-Tolerant Landscaping Ordinance. Therefore, the new development standards or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in

¹¹⁰ Los Angeles County Department of Public Works. 2018. Inside Solid Waste. Volume 89. Available at: https://dpw.lacounty.gov/epd/tf/isw/isw_2018_02.pdf

less than significant impacts to utilities and service systems in relation to generation of solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

Element 2 – New Sensitive Uses

The new development standards for the New Sensitive Uses adjoining or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to utilities and service systems in relation to a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

Construction

Construction activities required to implement the new development standards together with the construction of new sensitive uses would be a relatively minimal expansion of the construction efforts and would be handled in compliance with all applicable federal, state, and local management and reduction statutes and regulations related to solid waste. Compliance with both State and County demolition and construction non-hazardous waste diversion regulations would be required, resulting in the diversion of 50 to 65 percent of waste from individual projects from landfills for recycling or reuse. As discussed in Section III, *Project Description*, construction activities for the proposed program would include landscaping barriers, ~~enclosures, fencing, solid walls, signage, lighting solid walls,~~ and air filtration as measures that would decrease impacts to new sensitive uses ~~near or adjacent to or adjoining legally-established,~~ existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).

The County land use zoning designations that would be subject to the development standards for new sensitive uses are located in areas currently served by solid waste facilities. Construction of the proposed improvements would involve minor alterations and modifications to development for new sensitive uses proposed in vicinity of industrial, recycling and solid waste, or vehicle-related within areas of the unincorporated areas of the County. Construction would include installation of walls, ~~fencing,~~ setback, ~~and landscaping, strategic placement of balconies, and air filtration systems~~ that would be required to demonstrate compliance with development standards during plan check, including landscaping installation of plants from the County's drought tolerant plant list. All solid waste produced as a result of the required improvements would be properly disposed of in accordance with applicable federal, state, and local regulations and requirements pertaining to solid waste disposal. Construction waste would not substantially or incrementally exceed the future scheduled capacity of any solid waste facilities beyond what is anticipated in the County General Plan or other facilities planning documents. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to utilities and service systems in relation to generation of solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

Operation

During the operations phase, the implemented standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices would not be expected to generate large quantities of waste. Green waste from landscaping maintenance would be relatively minimal from each site due to the small size of the landscape buffers and required drought-tolerant plant palette, in accordance with the Drought-Tolerant Landscaping Ordinance. The County land use zoning designations for which the proposed program would apply (allowing sensitive uses including dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in the zones where they are located, ~~in close proximity to existing industrial uses are located in areas currently served by solid waste facilities.~~ All solid waste produced as a result of operation of the required improvements would be properly disposed of in accordance with applicable federal, State, and local regulations and requirements pertaining to solid waste disposal. Operation of the improvements would not substantially or incrementally exceed the future scheduled capacity of any solid waste facilities beyond what is anticipated in the County General Plan or other facilities planning documents. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to utilities and service systems in relation to generation of solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to utilities and service systems in relation to a determination by the wastewater treatment provider

which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

Construction

The County land use zoning designations that would be subject to Element 3 are located in areas currently served by solid waste facilities. Construction of the proposed improvements would either be ancillary to an existing use or estimates as part of future proposed land use, thus using existing or proposed solid waste facilities serving a given project site. Construction of the proposed improvements would involve minor alterations and modifications to existing industrial uses and/or require more stringent standards of development for new sensitive uses proposed in vicinity of industrial, recycling and solid waste, or vehicle-related within areas of the unincorporated areas of the County or adjacent incorporated areas including sensitive uses. Construction would include installation of walls, fencing, air filtration, and landscaping in compliance with development standards during plan check including landscaping installation of plants from the County's drought tolerant plant list. All solid waste produced as a result of the required improvements would be properly disposed of in accordance with applicable federal, state, and local regulations and requirements pertaining to solid waste disposal. Compliance with both State and County demolition and construction non-hazardous waste diversion regulations would be required, resulting in the diversion of 50 to 65 percent of waste from individual projects from landfills for recycling or reuse. Construction waste would not substantially or incrementally exceed the future scheduled capacity of any solid waste facilities than those anticipated in the County General Plan or other facilities planning documents. Therefore, impacts to Recycling and Waste Management Revisions would result in less than significant impacts to utilities and service systems in relation to generation of solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

Construction activities required to implement the supermarket accessory recycling collection centers would be minimal and would be handled in compliance with all applicable federal, state, and local management and reduction statutes and regulations related to solid waste. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed program would allow Supermarket Accessory Recycling Collection Centers as an accessory use in the C-1, C-2, C-2, C-3, C-M, C-MJ, C-R, C-RU, MXD, MXD-RU, M-1, M-1.5, M-2, and M-2.5 designated zones. These uses would be located on existing parking lots, and no new structures would be built. Construction of the supermarket accessory recycling collection centers would either be ancillary to an existing use or part of a future proposed land use, thus using existing or proposed solid waste facilities serving the proposed program area. Construction would include installation of walls, fencing, setback, and landscaping in compliance with development standards during plan check including landscaping installation of plants from the County's drought tolerant plant list. All solid waste produced as a result of the required improvements would be properly disposed of in accordance with applicable federal, state, and local regulations and requirements pertaining to solid waste disposal. Construction of the element would not substantially or incrementally exceed the future scheduled capacity of any solid waste facilities beyond what is anticipated in the County General Plan or other facilities planning documents. Therefore, the Supermarket Accessory Recycling Collection Centers would result in less than significant impacts to utilities and service systems in relation to generation of solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

Operation

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The proposed program would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These requirements are already subject to current development standards (Table III.E-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs.~~ Additionally, combustion and non-combustion biomass conversion organic waste facilities are prohibited in ARAs. Therefore, impacts to Recycling and Waste Management Revisions would result in less than significant impacts to utilities and service

systems in relation to generation of solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed program would allow Supermarket Accessory Recycling Collection Centers as an accessory use in the C-1, C-2, C-3, C-M, C-MJ, C-R, C-RU, MXD, MXD-RU, M-1, M-1.5, M-2, and M-2.5 designated zones. These uses would be located on existing parking lots, and no new structures would be built. Therefore, the Supermarket Accessory Recycling Collection Centers would result in less than significant impacts to utilities and service systems in relation to generation of solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to utilities and service systems in relation to a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

Construction

Construction waste associated with storage closures and solid waste revisions would be minimal and would be handled in compliance with all applicable federal, State, and local management and reduction statutes and regulations related to solid waste. Compliance with both State and County demolition and construction non-hazardous waste diversion regulations would be required, resulting in the diversion of 50 to 65 percent of waste from individual projects from landfills for recycling or reuse. The County land use zoning designations that would be subject to this element are located in areas currently served by solid waste facilities. Construction of the required improvements would either be ancillary to an existing use or part of a future proposed land use, thus using existing or proposed solid waste facilities serving a given project site. Construction of the proposed improvements would involve minor alterations and modifications to existing industrial uses, and/or require more stringent standards of development for new sensitive uses proposed in vicinity of industrial, recycling and solid waste, or vehicle-related within areas of the unincorporated areas of the County or adjacent incorporated areas including sensitive uses. Construction would include installation of walls, fencing, setback, and landscaping in compliance with development standards during plan check including landscaping installation of plants from the County's drought tolerant plant list. All solid waste produced as a result of the required improvements would be properly disposed of in accordance with applicable federal, State, and local regulations and requirements pertaining to solid waste disposal. Construction waste would not substantially or incrementally exceed the future scheduled capacity of any solid waste facilities beyond what is anticipated in the County General Plan or other facilities planning documents. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to utilities and service systems in relation to generation of solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

Operation

The operations phase would not substantially or incrementally exceed the future scheduled capacity of any solid waste facilities beyond what is anticipated in the County General Plan or other facilities planning documents. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the proposed program would only apply to new development and expansion of existing development, excluding residential uses with fewer than four

units. All solid waste produced as a result of the required improvements would be properly disposed of in accordance with applicable federal, state, and local regulations and requirements pertaining to solid waste disposal. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to utilities and service systems in relation to generation of solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

Threshold I-5 Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

The proposed program would result in no impacts to utilities and service systems in relation to compliance with federal, State, and local statutes and regulations related to solid waste. The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses by changing regulatory requirements for specific industrial land uses. These measures would be required where the proposed program implements new standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses. The Green Zones Program has been developed in compliance with the County's policies that pertain to solid waste, including maintenance of an efficient, safe, and responsive waste management system that reduces waste while protecting the health and safety of the public; ensuring adequate disposal capacity by providing for environmentally sound and technically feasible development of solid waste management facilities, such as landfills and transfer/processing facilities; and discourage incompatible land uses near or adjacent to solid waste disposal facilities identified in the Countywide IWMP and specifically addressed recycling and waste diversion facilities and requirements within the program area. Therefore, there would be no impacts to utilities and service systems related to compliance with federal, State, and local management and reduction statutes and regulations related to solid waste.

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to utilities and service systems in relation to compliance with federal, State, and local statutes and regulations related to solid waste.

Construction

The purpose of the Green Zone Program is to address incompatible land uses in proximity to sensitive uses by changing regulatory requirements for specific industrial land uses. These measures would be required where the proposed program implements new standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities. In the case of updated standards for existing industrial uses, the implementation of these measures would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses. The Green Zone Districts would be developed in compliance with the County's policies pertaining to solid waste including maintaining an efficient, safe, and responsive waste management system that reduces waste while protecting the health and safety of the public; ensuring adequate disposal capacity by providing for environmentally sound and technically feasible development of solid waste management facilities, such as landfills and transfer/processing facilities; and discouraging incompatible land uses near or adjacent to solid waste disposal facilities identified in the Countywide IWMP. In the case of updated standards for existing industrial uses, the implementation of these measures would not differ substantially from existing conditions, such that they would cause a significant to utilities and service systems in relation to compliance with federal, State, and local statutes and regulations related to solid waste. The Green Zone Districts would be developed in compliance with all federal, State, and local policies pertaining to solid waste. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to utilities and services related to complying with federal, State, and local management and reduction statutes and regulations related to solid waste.

Operation

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to utilities and service systems related to compliance with federal, State, and local management and reduction statutes and regulations related to solid waste. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would

be retroactive to the 11 districts and to future entitlements subject to an ~~SPR Ministerial Site Plan Review~~ or a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table III.E-2). The program requires the nonconforming uses to come into compliance within 3, 5, or 7 years of adoption.

The Green Zone Districts would be developed in compliance with all federal, State, and local policies pertaining to solid waste. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to utilities and service systems related to complying with federal, State, and local management and reduction statutes and regulations related to solid waste.

Element 2 – New Sensitive Uses

The new development standards for the New Sensitive Uses adjoining or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to utilities and service systems in relation to compliance with federal, State, and local statutes and regulations related to solid waste.

Construction

~~As discussed in Section III, Project Description, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130). These measures~~ The new development standards would be required where the proposed program implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses.~~

Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The proposed program establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the proposed program expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The proposed program includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table III.E-2). ~~These measures would be required where the proposed program implements new standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities. In the case of updated standards for existing industrial uses~~ In the case of standards for New Sensitive Uses, the implementation of these measures would not differ substantially from existing conditions, as they would be minor additions to existing ~~industrial land uses development requirements.~~ Therefore, the new development standards for New Sensitive Uses would result in no impacts to utilities and services related to complying with federal, State, and local management and reduction statutes and regulations related to solid waste.

Operation

The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses by changing regulatory requirements for specific industrial land uses and requiring additional development standards for new sensitive uses that locate adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. The Green Zones Program would comply with the County's policies pertain to solid waste, including maintaining an efficient, safe and responsive waste management system that reduces waste while protecting the health and safety of the public; ensuring adequate disposal capacity by providing for environmentally sound and technically feasible development of solid waste management facilities, such as landfills and transfer/processing facilities; and discouraging incompatible land uses near or adjacent to solid waste disposal facilities identified in the Countywide IWMP. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not cause significant impacts to utilities and service systems related to complying with

federal, State, and local management and reduction statutes and regulations related to solid waste. Therefore, the new development standards for New Sensitive Uses would result in no impacts to utilities and services related to complying with federal, State, and local management and reduction statutes and regulations related to solid waste.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts to utilities and service systems in relation to compliance with federal, State, and local statutes and regulations related to solid waste.

Construction

The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (see Table III.E-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, combustion and non-combustion biomass conversion organic waste facilities are prohibited in ARAs.~~ In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses. Therefore, there would be no impacts to Recycling and Waste Management Revisions related to complying with federal, State, and local management and reduction statutes and regulations related to solid waste.

The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses by changing regulatory requirements for specific industrial land uses. These measures would be required where the proposed program implements new standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses. The Green Zones Program would be developed in compliance with the County's policies pertaining to solid waste, including maintaining an efficient, safe and responsive waste management system that reduces waste while protecting the health and safety of the public; ensuring adequate disposal capacity by providing for environmentally sound and technically feasible development of solid waste management facilities, such as landfills and transfer/processing facilities; and discouraging incompatible land uses near or adjacent to solid waste disposal facilities identified in the Countywide IWMP. Therefore, the Supermarket Accessory Recycling Collection Centers would have no impacts to utilities and service systems related to complying with federal, State, and local management and reduction statutes and regulations related to solid waste.

Operation

The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses by changing regulatory requirements for specific industrial land uses. These measures would be required where the proposed program implements new standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities. The Green Zones Program would comply with the County's policies pertain to solid waste, including maintaining an efficient, safe and responsive waste management system that reduces waste while protecting the health and safety of the public; ensuring adequate disposal capacity by providing for environmentally sound and technically feasible development of solid waste management facilities, such as landfills and transfer/processing facilities; and discouraging incompatible land uses near or adjacent to solid waste disposal facilities identified in the Countywide IWMP. Therefore, the Recycling and Waste Management Revisions would result in no impacts to utilities and service systems related to complying with federal, State, and local management and reduction statutes and regulations related to solid waste.

The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do

not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed program would allow Supermarket Accessory Recycling Collection Centers as an accessory use in the C-1, C-2, C-2, C-3, C-M, C-MJ, C-R, C-RU, MXD, MXD-RU, M-1, M-1.5, M-2, and M-2.5 designated zones. These uses would be located on existing parking lots, and no new structures would be built. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. Therefore, the Supermarket Accessory Recycling Collection Centers would have no impacts to utilities and service systems related to complying with federal, State, and local management and reduction statutes and regulations related to solid waste.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to utilities and service systems in relation to compliance with federal, State, and local statutes and regulations related to solid waste.

Construction

Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the proposed program would only apply to new development and expansion of existing development, excluding residential uses with fewer than four units. These measures would be required where the proposed program implements new standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities. In the case of updated standards for existing industrial uses, the implementation of these measures would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to utilities and service systems related to complying with federal, State, and local management and reduction statutes and regulations related to solid waste.

Operation

The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses by changing regulatory requirements for specific industrial land uses. The Green Zones Program would comply with the County's policies pertain to solid waste, including maintaining an efficient, safe and responsive waste management system that reduces waste while protecting the health and safety of the public; ensuring adequate disposal capacity by providing for environmentally sound and technically feasible development of solid waste management facilities, such as landfills and transfer/processing facilities; and discouraging incompatible land uses near or adjacent to solid waste disposal facilities identified in the Countywide IWMP. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to utilities and service systems related to complying with federal, State, and local management and reduction statutes and regulations related to solid waste.

5. CUMULATIVE IMPACTS

Section 15130 of the CEQA Guidelines states that cumulative impacts shall be discussed when the project's incremental effect is considerable. The CEQA Guidelines further state that this discussion of cumulative impacts shall reflect the severity of the impacts and the likelihood of occurrence, but the discussion need not provide as great detail as is provided for the effects attributable to the project alone. The CEQA Guidelines (Section 15130 [b][1]) state that the information utilized in an analysis of cumulative impacts should come from one of two sources:

- 1) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency; or
- 2) A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or areawide conditions contributing to the cumulative impact. Any such planning document shall be referenced and made available to the public at a location specified by the lead agency.

The cumulative impact analysis contained in this PEIR uses method no. 2, as described above. The proposed Green Zones Program consists of amendments to the County General Plan and Title 22 (Planning and Zoning) of the Los Angeles County Code for zoning consistency. Consistent with Section 15130(b)(1)(B) of the CEQA Guidelines, the PEIR analyzes the environmental impacts of development in accordance with the proposed Land Use Policy Map. As a result, the PEIR addresses the cumulative impacts of development within the unincorporated areas and the larger County region surrounding it.

A total of 593,376 building permits were issued in the County of Los Angeles unincorporated areas for the 20-year period of 2000 through 2020. Of these, 305 were building permits issued for industrial uses subject to the Green Zones Program. This equates to 0.05 percent of the total permits filed for the 20-year period. The maximum number of these types of permits that were issued in one year was 43 for the year 2000, while the average over the 20-year period was 16 permits per year. Multiplying the maximum 43 permits per year times the 21-year planning period results in a maximum reasonable estimation of construction and operation scenario of 903 total permits for industrial uses over the 21-year planning period. This estimation includes the potential construction of recycling and waste management uses including automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities.

Assuming the case study project modeled in the HIA (Appendix D to the Draft PEIR) that is 1.39 acres in size (246 feet by 246 feet), using the reasonable estimation of construction and operation scenario of 43 industrial permits issued per year with a 7 percent population growth over 21 years factored in, the potential buildout of industrial projects would be approximately 60 acres per year (43 permits \times 1.39 acres).¹¹¹ This results in a total of 1,260 acres of industrial project buildout over the 21-year General Plan future projection window.

The total number of parcels that would be subject to the Green Zones Program is ~~134,564~~ 134,576. Based on the reasonable estimation of construction and operation scenario discussed above, 903 industrial parcels could be developed over the 21-year planning period. This is approximately 0.7 percent of parcels subject to the Green Zones Program. Similarly, the total acreage of parcels that would be subject to the Green Zones Program is 1,452,569. The total acreage of the 903 industrial projects anticipated to be developed over the 21-year planning period is 1,260. This results in approximately 0.08 percent of all of the total acreage of the parcels subject to the Green Zones Program.

Additionally, very large areas of the Green Zones Program parcels subject to Element 3, Recycling and Waste Management Revisions, would be excluded from potential industrial development due to the prohibition of ~~many various uses~~. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs: including pallet yards; materials recovery facility (MRF) and transfer stations; auto dismantling or scrap metal facilities; C&D or inert debris processing facilities; chipping and grinding or mulching facilities; composting facilities; and combustion and non-combustion biomass conversion organic waste facilities from SEAs, Very High Fire Hazard Severity Zones (VHFHSZs), and

¹¹¹ Los Angeles Almanac. Projected Population by Race & Ethnicity 2020-2060 Los Angeles County. Accessed 10-9-2020. <http://www.laalmanac.com/population/po39.php>

~~areas subject to the Hillside Management Ordinance. Additionally, pallet yards; C&D or inert debris processing facilities; and combustion and non-combustion biomass conversion organic waste facilities would be prohibited from Agricultural Resource Areas (ARAs) (see Section III, *Project Description*, Table III.E-1, *Planning and Permitting Requirements*). Prohibiting these uses from certain sensitive areas of the County would reduce cumulative impacts.~~

Threshold I-1 Require or result in the relocation or construction of new or expanded water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects?

The Green Zones Program would not be expected to contribute incrementally, together with related projects in the County, to cumulative impacts in relation to requiring or resulting in the relocation or construction of new or expanded water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects.

Water Facilities

Cumulative water infrastructure impacts are considered on a system-wide basis and are associated with the capacity of existing and planned water infrastructure. The cumulative system evaluated includes the water infrastructure systems that are serving the proposed program area. Cumulative development within the proposed program area, including the applicable water service areas, would include various types such as residential, commercial, industrial, and infill and redevelopment projects. However, the proposed program includes modifications to existing industrial uses, greater stringency in development standards for new sensitive uses near industrial facilities, revisions to industrial facility developments standards in areas zoned for industrial uses within the proposed program area, and for the purpose of minimizing impacts related to industrial uses on nearby sensitive uses. The proposed program would include measures and more stringent requirements to avoid impacts relates to water facilities and would not require the construction of water new water facilities. Thus, the Green Zones Program would not have a cumulatively considerable contribution to potential significant cumulative impacts associated with water infrastructure.

Wastewater Treatment Facilities

Cumulative water infrastructure impacts are considered on a system-wide basis and are associated with the capacity of existing and planned wastewater infrastructure. The cumulative system evaluated includes the wastewater infrastructure systems that are serving the proposed program area. Implementation of the proposed program elements would not be expected to generate wastewater in excess of effluent standards, as the proposed program includes and would be developed in compliance with the wastewater treatment standards of the applicable RWQCB. However, the proposed program includes modifications to existing industrial uses, greater stringency in development standards for new sensitive uses near industrial facilities, revisions to industrial facility developments standards in areas zoned for industrial uses within the proposed program area, and for the purpose of minimizing impacts related to industrial uses on nearby sensitive uses. The proposed program would include measures and more stringent requirements to avoid impacts relates to water facilities and would not require the construction of new wastewater facilities. Thus, the Green Zones Program would not have a cumulatively considerable contribution to potential significant cumulative impacts associated with water infrastructure.

Stormwater Drainage Facilities

The geographic scope for cumulative impacts related stormwater drainage capacity and polluted runoff includes the drain facilities that are located downstream of sites within the proposed program area. As cumulative development is implemented, compliance with the LID Ordinance requirements for percolation and on-site detention would be required. Compliance with these requirements would reduce the need for downstream drainage facility improvements. In addition, cumulative development would be required to comply with NPDES requirements, County SWPPP Requirements for Construction Activities, and the requirements of the County LID Standards Manual to reduce polluted runoff from cumulative development sites. In accordance with state and regional MS4, LID, and County SUSWMP regulations, development projects are required to maintain pre-project hydrology, such that no net increase of offsite stormwater flows would occur. RWQCB permit conditions require a hydrology study/drainage analysis to demonstrate that all runoff would be appropriately conveyed and not leave the project sites at rates exceeding pre-project conditions, prior to receipt of necessary permits. As a result, increases of runoff from cumulative projects that could cumulatively combine to impact stormwater drainage capacity would be less than cumulatively significant. The proposed Program would not substantially increase the amount of impervious surfaces and runoff, such that existing storm drains would be overwhelmed because all development projects would be required to comply with the same SUSWMP, LID, and RWQCB permit requirements to retain the difference between the volume pre- and post-construction runoff volume. In

addition, implementation of the Proposed Program would result in a net benefit in relation to stormwater drainage with the addition and/or replacement of pervious surfaces and expansion of LID Ordinance requirements to encompass the entirety of the Green Zones Program Area, which would reduce the amount of surface runoff in the storm drain pipelines. Therefore, the Green Zones Program would not have a cumulatively considerable contribution to impacts to stormwater drainage facilities.

Electric Power Facilities

Other than installation of the proposed improvements such as lighting, these systems would require negligible electricity usage for construction and operation, and all new construction would be developed and constructed in compliance with Title 12, Title 22, and Title 31, incorporating the 2019 California Green Building Standards Code with the proposed program area currently served by SCE electric power facilities. Modification, improvements, and facility development under the proposed program would be required to meet Title 24 energy and CALGreen efficiency standards, and under the CEC, these standards are 30 percent better for nonresidential construction.¹¹² Typical CALGreen measures include measures such as insulation, use of energy-efficient HVAC, solar-reflective roofing materials, energy-efficient indoor and outdoor lighting systems; reclamation of heat rejection from refrigeration equipment to generate hot water, and incorporation of skylights. The parcels that would be subject to the proposed program would already be connected to electric power facilities to support the new sensitive uses. Construction activities required to implement the proposed program would not be expected to require relocation, expansion, or new electric power facilities as the electric power facilities currently serving the area would be sufficient for the construction of the proposed program. As a result, cumulative impacts to utilities and services systems in relation to electrical power serving the proposed program area would not occur.

Natural Gas Facilities

The proposed improvements required in conjunction with the new development standards required by the proposed program would not involve construction or operation requiring the use of natural gas. In the case of updated standards for new sensitive uses, the implementation of these measures would not differ substantially from existing conditions, as they would be minor additions to new sensitive land uses. As a result, cumulative impacts to utilities and services systems in relation to natural gas serving the proposed program area would not occur.

Telecommunication Facilities

The proposed improvements required in conjunction with the new development standards required by the proposed program would result in no impacts to utilities and service systems in relation to the construction of new or expanded telecommunications facilities. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, as they would be minor additions to new sensitive land uses. As a result, cumulative impacts to utilities and services systems in relation to telecommunications would not occur.

Therefore, the Green Zones Program would not be expected to contribute incrementally, together with related projects in the County, to cumulative impacts in relation to requiring or resulting in the relocation or construction of new or expanded water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects.

Threshold I-2 Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

The Green Zones Program would not be expected to contribute incrementally, together with related projects in the County, to cumulative impacts in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years. Cumulative water supply impacts are considered on a purveyor service area basis and are associated with the adequacy of the primary sources of water that include groundwater, imported water, and recycled water. Groundwater rights are adjudicated in the Basin, which has regulated groundwater supplies. The Watermaster management of the adjudicated basin and the prescriptive allowable pumping rights for each agency that accesses the groundwater basin reduces the potential of incremental increases to groundwater pumping that could result in a cumulatively considerable impact on the groundwater supplies. Furthermore, each of the water purveyors provides projections for water supply and demand through 2035 that includes imported water and recycled water sources and shows that, with anticipated

¹¹² California Energy Commission (CEC). 2012. Energy Commission Approves More Efficient Buildings for California's Future. Available at: <https://planning.lacity.org/eir/CrossroadsHwd/deir/files/references/C17.pdf>

growth per SCAG projections, each water purveyor would have a water surplus. Furthermore, all development is required to meet water conservation goals including a 20 percent reduction in per capita demand statewide by 2020. The proposed program evaluated infrastructure needs for water supply and has included measures and development requirements to reduce potential impacts related to water supply and infrastructure. Based on a review of available water supply for parcels with County land use zoning designations that would be subject to the Green Zone Districts, there are sufficient water supplies to support the anticipated incremental increase for operation and maintenance of irrigated landscaped. The proposed new development standards include elements that would require increased water usage through planting landscape barriers. All landscaping additions would be developed in compliance with CALGreen nonresidential mandatory measures in order to implement water efficiency and water conservation measures. These measures regulate both indoor and outdoor water use and include development in conformance with the MWELo to increase water efficiency standards encouraging the use of more efficient irrigation systems, graywater usage, and onsite storm water capture, and by limiting the portion of landscapes that can be covered in turf. Increased water supply needed for the most water intensive uses, including recycling and solid waste facilities and landscaping irrigation, would be required to comply with County development standards, and all necessary improvements would be verified through the permit approval process of obtaining required connection permit for the applicable water purveyor within the designated areas. In addition, the proposed program would revise the County's current LID Ordinance's exemption of structures less than 1 acre, by requiring program parcels of less than 1 acre to be subject to the ordinance. The additional program parcels of less than 1 acre would reduce impervious surfaces as a requirement of the County LID ordinance. Based on a review of available water supply for parcels with County land use zoning designations that would be subject to the Green Zone Districts, there are sufficient water supplies to support the anticipated incremental increase for during operation and maintenance of the proposed program. The proposed program would comply with existing UWMP to maintain sustainable water resources. Therefore, the Green Zones Program would not be expected to contribute incrementally, together with related projects in the County, to cumulative impacts in relation to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years.

Threshold I-3 Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

The Green Zones Program would not be expected to contribute incrementally, together with related projects in the County, to cumulative impacts in relation to resulting in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments. Cumulative wastewater treatment requirements impacts are considered on a system wide basis and are associated with the operation of the wastewater disposal within the proposed program area. Cumulative developments within the urban and developed areas that are served by existing wastewater systems within the proposed program area and would include various project types such as residential, commercial, industrial, and infill and redevelopment projects. However, the proposed program includes modifications to existing industrial uses, greater stringency in development standards for new sensitive uses near industrial facilities, revisions to industrial facility developments standards in areas zoned for industrial uses within the proposed program area, and for the purpose of minimizing impacts related to industrial uses on nearby sensitive uses. The proposed program is not expected to discharge wastewater that contains harmful levels of toxins beyond the regulations as provided by applicable RWQCB and would comply with the wastewater treatment standards of the RWQCB. The proposed program would not generate wastewater that could combine with wastewater from related projects to result in an exceedance of the RWQCB regulations. Development or industrial facilities that have the potential to discharge hazardous wastewater would be required to comply with existing specification related to permitting by the RWQCB prior to connecting to the sewer system, which would ensure that flows are within the regulations provided under the RWQCB. Therefore, the Green Zones Program would not be expected to contribute incrementally, together with related projects in the County, to cumulative impacts in relation to resulting in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

Threshold I-4 Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

The Green Zones Program would not be expected to contribute incrementally, together with related projects in the County, to cumulative impacts in relation to generating solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals. The geographic scope of cumulative analysis for landfill capacity in the service area for landfills that serve covering the proposed program area. The projections of future landfill capacities are based on the projected waste stream going to these landfills. The proposed program area is currently served by 50 solid waste diversion programs serving unincorporated areas, including composting, material, recovery facilities, household

hazardous waste collection, public education, recycling, source reduction, special-waste materials and waste-to-energy programs and nine landfills serving the unincorporated areas. Construction under the proposed program would be minimal and would be handled in compliance with all applicable federal, State, and local management and reduction statutes and regulations related to solid waste. Although the proposed program would contribute solid waste to the landfills, during demolition and construction activities creating solid waste per day, the operational solid waste per day would not substantially impact the permitted capacity of the landfills. Further, the purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses by modifying regulatory requirements for specific industrial land uses requiring conformance with greater stringency and new requirements for development. In addition, the proposed program would provide revisions to the ordinance related to implementation of measures for the County to meet required statewide waste reduction targets and legislation impacting solid waste management.¹¹³ These measures would be required where the proposed program implements new standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities. Therefore, the Green Zones Program would not be expected to contribute incrementally, together with related projects in the County, to cumulative impacts in relation to generating solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

Threshold I-5 Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

The Green Zones Program would not be expected to contribute incrementally, together with related projects in the County, to cumulative impacts in relation to compliance with federal, state, and local management and reduction statutes and regulations related to solid waste. Disposal of solid waste generated by cumulative development would be subject to the requirements set forth in AB 939, the policies within the Los Angeles County Integrated Waste Management Plan, the County's Roadmap to a Sustainable Waste Management Future Interdepartmental Sustainable Waste Management Future. The proposed program area is currently served by 50 solid waste diversion programs serving unincorporated areas, including composting, material, recovery facilities, household hazardous-waste collection, public education, recycling, source reduction, special-waste materials and waste-to-energy programs and nine landfills serving the unincorporated areas. Construction under the proposed program would be minimal and would be handled in compliance with all applicable federal, State, and local management and reduction statutes and regulations related to solid waste. Although the proposed program would contribute solid waste to the landfills, during demolition and construction activities creating solid waste per day, the operational solid waste per day would not substantially impact the permitted capacity of the landfills. Further, the purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses by modifying regulatory requirements for specific industrial land uses requiring conformance with greater stringency and new requirements for development. In addition, the proposed program would provide revisions to the ordinance related to implementation of measures for the County to meet required statewide waste reduction targets. These measures would be required where the Ordinance implements new standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities. Therefore, the increase in solid waste from operation of the proposed program in combination with planned growth within the County would not require construction of a new landfill or expansion of the existing landfill to meet capacity needs. As a result, the proposed program's contribution to cumulative impacts on the capacities of the landfill facilities would be less than cumulatively considerable. Therefore, the Green Zones Program would not be expected to contribute incrementally, together with related projects in the County, to cumulative impacts in relation to compliance with federal, state, and local management and reduction statutes and regulations related to solid waste.

6. MITIGATION MEASURES

Implementation of the proposed program would result in less than significant impacts to utilities and service systems. Therefore, no mitigation measures are required.

7. LEVEL OF SIGNIFICANCE AFTER MITIGATION

Impacts to utilities and service systems would be less than significant, and there would be no need for mitigation.

SECTION V

PROJECT ALTERNATIVES

A. INTRODUCTION

This section of the Program Environmental Impact Report (PEIR) describes alternatives to the Green Zones Program (proposed program). Alternatives have been analyzed consistent with the recommendations of Section 15126.6 of the California Environmental Quality Act Guidelines (CEQA Guidelines), which require evaluation of a range of reasonable alternatives to the proposed program, or to the location of the program, that would feasibly attain most of the basic objectives of the program but would avoid or substantially lessen any of the significant effects of the proposed program, and evaluation of the comparative merits of the alternatives. The discussion of alternatives uses the following criteria as an analysis format:

- Alternatives to the proposed program or its location that may be capable of avoiding or substantially reducing any significant effects that the proposed program may have on the environment.
- Alternatives capable of accomplishing most of the basic objectives of the proposed program and potentially avoid or substantially lessen one or more of the significant effects.
- The provision of sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed program.
- The “no project” analysis of what would be reasonably expected to occur in the foreseeable future if the proposed program were not approved.

The range of feasible alternatives is selected and discussed in a manner to foster meaningful public participation and informed decision-making. An EIR need not consider an alternative with effects that cannot be reasonably ascertained, when implementation is remote and speculative, and if its selection would not achieve the basic project objectives. The six objectives of the proposed program are listed in Section III, *Project Description*, of the PEIR.

Three alternatives to the proposed program were considered:

- Alternative 1: No Project/No Build
- Alternative 2: Reduce the Number of Green Zone Districts Communities Included in the Ordinance Revisions
- Alternative 3: Remove the Requirement for Retroactive Compliance of Existing Industrial Uses with the Green Zones Program

Descriptions of the alternatives are provided the following sections, including their potential to result in environmental impacts as compared to the proposed program (Table V.A-1, *Alternatives Impact Comparison*) and their ability to achieve the objectives of the proposed program (Table V.A-2, *Alternative Project Objectives Comparison*).

**TABLE V.A-1
ALTERNATIVES IMPACT COMPARISON**

Environmental Issue Area	Proposed Green Zones Program	Alternative 1: No Project / No Build	Alternative 2: Reduced Number of Green Zone District Communities	Alternative 3: No Retroactive Requirement for Green Zone Districts
Air Quality	Less than significant	Less	Less	Less
Biological Resources	Less than significant	Same	Same	Same
Cultural Resources	Significant and unavoidable	Less	Less	Less
Hazards and Hazardous Materials	Less than significant	Less	Less	Less
Hydrology and Water Quality	Less than significant	Less	Less	Less
Land Use and Planning	Less than significant	Greater	Greater	Greater
Noise	Significant and unavoidable	Less	Less	Less
Tribal Cultural Resources	Significant and unavoidable	Less	Less	Less
Utilities and Service Systems	Less than significant	Less	Less	Less

**TABLE V.A-2
ALTERNATIVE PROJECT OBJECTIVES COMPARISON**

Objective		Proposed Green Zones Program	Alternative 1: No Project / No Build	Alternative 2: Reduced Number of Green Zone Districts Communities	Alternative 3: No Retroactive Requirement for Green Zone Districts
1	Promote environmental justice in the areas where health of residents may be disproportionately affected by surrounding land uses	Consistent	Inconsistent	Partially consistent	Partially consistent
2	Establish Green Zone Districts that address the communities in the unincorporated areas with incompatible land uses to improve the health and quality of life for surrounding residents that have historically borne a disproportionate burden of exposure to pollution.	Consistent	Inconsistent	Partially consistent	Partially consistent
3	Improve the health and quality of life for surrounding residents of incompatible land uses, aligned with the State's environmental justice initiatives such as the Planning for Healthy Communities Act (SB 1000) and California Global Warming Solutions Act of 2006 (AB 32 and SB 535).	Consistent	Inconsistent	Partially consistent	Partially consistent
4	Address incompatible land uses associated with industrial, manufacturing, and commercial land uses, in proximity to sensitive uses	Consistent	Inconsistent	Partially consistent	Partially consistent
5	Include new regulations for recycling and solid waste facilities, to make County regulations consistent with required State Regulations	Consistent	Inconsistent	Partially consistent	Partially consistent
6	Facilitate recycling, recycling collection and processing, and organic waste processing, such as composting and chipping and grinding with zoning requirements.	Consistent	Inconsistent	Partially consistent	Partially consistent

B. ALTERNATIVES CONSIDERED BUT ELIMINATED FROM FURTHER CONSIDERATION

This section provides a discussion of alternatives considered during the development of the PEIR and the reasons why they were not selected for detailed analysis in this PEIR.

During the alternative development phase of preparation of the PEIR, taking into consideration comments that were received by the County during public meetings hosted during the scoping period held on July 13, 2020, and July 22, 2020, an alternative was considered to increase the number of communities for which the Green Zone Districts would apply to include communities located in the Antelope Valley outside of the unincorporated communities of Avocado Heights, East Los Angeles, East Rancho Dominguez, Florence-Firestone, South San Jose Hills, Walnut Park, West Athens-Westmont, West Carson, West Whittier-Los Nietos, West Rancho Dominguez-Victoria, and Willowbrook (see Figure III.E-1, *Planning Areas*, in Section III, *Project Description*). However, after review of the Environmental Justice Screening Method (EJSM) map, it was determined that areas outside of the communities listed above in unincorporated areas did not meet the criteria for consideration of implementation of the Green Zone Districts. Specifically, unincorporated areas containing industrial uses in the Antelope Valley and Santa Clarita area did not meet the criteria as these areas had low or very low EJSM scores outside of the incorporated Cities of Lancaster, Palmdale, and Santa Clarita (Figure III.C-1, *Environmental Justice Screening Method Score*). The 11 communities that would be subject to the provisions of the Green Zone Districts development standards are those areas where sensitive receptors are currently most impacted by adjacent industrial uses. As these additional communities did not meet the EJSM criteria, consideration of this alternative was eliminated.

As the proposed program would apply to the entire unincorporated areas of the County, which covers the entire area that is within the County's jurisdiction, evaluation of an alternative location for the proposed program is not feasible.

C. ALTERNATIVE 1: NO PROJECT/NO BUILD

As required by §15126.6(e) of the State CEQA Guidelines, the No-Project Alternative has been analyzed. The purpose of describing and analyzing a no-project alternative is to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project.

1. Description of the Alternative

The No-Project Alternative describes what would be expected to occur in the absence of the adoption of the proposed program. This alternative assumes that the Existing Title 22 Zoning Code and Los Angeles County General Plan 2035 (County General Plan) would remain unchanged. As a result, no revisions to Title 22 would occur with regard to the following:

- The creation of the Green Zone Districts to minimize potential adverse health and safety impacts to communities that are disproportionately affected by toxic air pollutants such as respirable particulate matter (PM₁₀) and odors generated from various land uses and to promote clean industrial uses.
- The creation of development standards and procedures for existing and new industrial uses located within 500 feet of a sensitive use on an unincorporated parcel in identified Green Zone Districts, or a residential use on an incorporated parcel to minimize adverse effects related to odors, noise, aesthetics, soil contamination, vehicle circulation, and air quality on nearby sensitive uses.
- A schedule of compliance for existing industrial uses/businesses in the Green Zone Districts communities to meet new development standards to reduce impacts from incompatibilities between sensitive receptors and existing industrial uses would not be implemented.
- The creation of regulations and development standards to eliminate impacts and incompatibilities for new sensitive uses proposed adjacent to or adjoining existing, legally established industrial, recycling, or solid waste, or vehicle-related uses would not be implemented.
- The addition of a new Zoning Code section for Recycling and Processing Facilities including standards and regulations for Pallet Yards, Recycling Collection Facilities, Recycling Processing Facilities, Materials Recovery

Facility (MRF) and Transfer Stations, Auto Dismantling or Scrap Metal Facilities, C&D or Inert Debris Processing Facilities, Organic Waste Facilities, Chipping and Grinding or Mulching Facilities, Composting Facilities, In-vessel Facilities, and Solid Waste Facilities would not be implemented.

- The creation of standards for the permitting of Supermarket Accessory Recycling Collection Centers in commercial, industrial, mixed-use, and rural zones through the Zoning Code would not be implemented.
- The creation of enhanced standards to regulate and set development standards for storage enclosure requirements for Recycling and Solid Waste would not be implemented.
- No updates to the Existing General Plan goals and policies would occur towards implementing State EJ initiatives, and the re-zoning of 27 ~~28~~ parcels from Heavy Manufacturing (M-2) to Light Manufacturing (M-1) Zones and change in land use designation of 14 ~~45~~ parcels from the Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation would not occur.

Under the No-Project Alternative, the County would not have developed targeted land-use policies and development standards that can be used to improve the health and quality of life for residents surrounding major sources of pollution, aligned with the State's environmental justice initiatives such as the Planning for Healthy Communities Act (Senate Bill [SB] 1000) and California Global Warming Solutions Act of 2006 (Assembly Bill [AB] 32 and SB 535) as well as waste diversion initiatives aligned with SB 1383, by including appropriate standards in Title 22 and policies in the General Plan.

2. Environmental Impacts

The No-Project Alternative would avoid construction impacts associated with the proposed program (Table V.A-1). There would be no impacts from implementation of the proposed program. However, it would not address existing land use incompatibilities.

Air Quality

Alternative 1, No-Project Alternative, would have lesser impacts than the Green Zones Program. As discussed in Section IV.A, *Air Quality*, implementation of the proposed program is expected to have less than significant impacts. Alternative 1 would result in lesser impacts to air quality than the proposed program because there would be no construction activities required. However, existing land use incompatibilities would remain between industrial and sensitive uses. The No-Project Alternative would not benefit air quality for sensitive uses in the long-term as a result of new development standards and revisions from the Green Zones Program. This alternative would decrease industrial project buildout on 1,260 acres over the 21-year General Plan future projection window. The total number of parcels that would be subject to the Green Zones Program is 134,564 ~~134,576~~. Based on the reasonable estimation of construction and operation scenario of 43 building permits per year, it could be anticipated that a total of 903 industrial parcels would not be developed over the 21-year planning period under this alternative. This is an approximately 0.15 percent reduction in development of parcels that would otherwise be subject to the Green Zones Program. Thus, mobile-source emissions would be slightly less than those associated with buildout of the proposed program. Furthermore, area and energy sources of emissions would also be slightly reduced. Short-term emissions related to project construction activities would be slightly less in this alternative due to the reduced amount of total permitted development. However, this alternative would not substantially reduce significant short- and long-term criteria pollutant contributions of volatile organic compounds (VOC), nitrous oxides (NO_x), carbon monoxide (CO), sulfur dioxide (SO₂), PM₁₀, and fine particulate matter (PM_{2.5}), since mass emissions of criteria pollutants from construction and operation are below applicable Air Quality Management District (AQMD) significance thresholds, and would not be consistent with the adopted Air Quality Management Plans (AQMPs). In addition, under this alternative, no improvements designed to improve air quality for sensitive uses that are located adjacent to industrial land uses would be implemented. Since air quality emissions would not be reduced substantially beyond levels already below localized significance thresholds, this alternative is not considered environmentally superior to the proposed program.

Biological Resources

Alternative 1, No-Project Alternative, would have the same impact as the Green Zones Program. As discussed in Section IV.B, *Biological Resources*, implementation of the proposed program is expected to have less than significant impacts. Alternative 1 would accommodate the same pattern of land use that would result from the proposed program, as the Green Zones Program would

not change the underlying land uses designation or pattern of development, but rather would add development standards to protect sensitive uses located adjacent to industrial uses. The No-Project Alternative continues the land use pattern adopted in the County General Plan. The Los Angeles County General Plan Update EIR (General Plan Update EIR) requires the implementation of mitigation measures to protect listed species; however, it acknowledges that there would be significant and unavoidable impacts related to loss of habitat for special status species in unincorporated areas of the County, as a result of the General Plan Update.¹ As with the proposed program, the County General Plan does not exempt property owners from the “take” provisions of the federal Endangered Species Act, the Magnuson-Stevens Fishery Conservation and Management Act, or the California Endangered Species Act. The ability to obtain an incidental take permit under federal or California regulations requires the applicant to demonstrate that there would be no net adverse effect to ability of the species to survive and recover in the wild.

The land use pattern established in the County General Plan includes policies that emphasize the conservation of Significant Ecological Areas (SEAs) and open space areas. However, the County General Plan does not contain a mechanism for compensation for unavoidable habitat loss or sensitive plant communities. Thus, the County General Plan includes mitigation measures to reduce direct impacts to sensitive habitats. The General Plan Update EIR resulted in a determination of significant and unavoidable impacts to sensitive habitats.

The County General Plan specifically emphasizes the restoration of significant riparian resources and discouragement of development to preserve riparian habitats, including wetlands, in a natural state. Thus, both the proposed program and the County General Plan contain policies that emphasize protection of water sources and watershed to ensure the ecological functions of these systems are maintained. The General Plan Update EIR includes Mitigation Measures BIO-1 and BIO-3 to reduce impacts to wetlands. As with the proposed program, the County General Plan does not exempt property owners from Sections 401 or 404 of the Federal Clean Water Act or Section 1600 of the State Fish and Game Code. The General Plan Update EIR resulted in a determination that it was not feasible to avoid or fully compensate for impacts to regional wildlife linkages. The General Plan Update EIR included a single Mitigation Measure, BIO-1, to provide limited protection measures to avoid or minimize impacts to wildlife corridors and nursery sites, but significant and unavoidable impacts would be expected to occur. The Green Zones Program prohibits some industrial uses in significant ecological areas, and as such may reduce the level of impact to wildlife linkages from that evaluated for the approved County General Plan.

Cultural Resources

Alternative 1, No-Project Alternative, would have lesser impacts than the Green Zones Program. As discussed in Section IV.C, *Cultural Resources*, implementation of the proposed program is expected to have significant and unavoidable impacts. Alternative 1 would result in lesser impacts to cultural resources than the proposed program because there would be no construction activities required. Under this alternative, no unanticipated discovery of a significant cultural resource would occur during excavation in native soils as with implementation of the proposed program. Ground-disturbing activities associated with the buildout of the existing County General Plan would continue independent of a proposed program in order to accommodate new development. Cultural resources are governed on a site-by-site basis, and the probability of uncovering new resources or disturbing known resources would continue to be considered in project-level environmental review for new industrial and other land use projects.

Hazards and Hazardous Materials

Alternative 1, No-Project Alternative, would have lesser impacts than the Green Zones Program. As discussed in Section IV.D, *Hazards and Hazardous Materials*, implementation of the proposed program is expected to have less than significant impacts. Alternative 1 would result in lesser impacts to hazards and hazardous materials than the proposed program because there would be no construction activities required. However, existing land use incompatibilities would remain between industrial and sensitive uses. Impacts related to reasonably foreseeable upset and accident conditions, the emission of hazardous emissions or handling of hazardous material near schools would be less. However, under the proposed program, these impacts are less than significant. Impacts from hazardous sites would be less, as there would be no ground disturbance from program required construction or demolition activities that could expose people to hazardous substances that may be present in soils as a result of past industrial activities. However, any development would be required to meet federal, state, and local regulations and policies regarding hazardous materials and compliance with the provisions of hazardous material policies in the Los Angeles County Code and implementation of the existing regulations related to hazardous materials would reduce this impact to a less than significant level.

¹ County of Los Angeles Department of Regional Planning. 2014. Los Angeles County General Plan Update Environmental Impact Report. State Clearinghouse # 2011081042. Prepared by PlaceWorks.

The No-Project Alternative would not reduce hazards for sensitive uses in the long-term as a result of new development standards and revisions from the Green Zones Program.

Hydrology and Water Quality

Alternative 1, No-Project Alternative, would have lesser impacts than the Green Zones Program. As discussed in Section IV.E, *Hydrology and Water Quality*, implementation of the proposed program is expected to have less than significant impacts. Alternative 1 would result in lesser impacts to hydrology and water quality than the proposed program because there would be no construction activities required. However, existing land use incompatibilities would remain between industrial and sensitive uses. The No-Project Alternative would not benefit water quality near sensitive uses in the long term as a result of new development standards and revisions from the Green Zones Program. Similar to the proposed program, runoff from development during construction and operations phases would be subject to National Pollutant Discharge Elimination System (NPDES) permit standards, Stormwater Pollution Prevention Plan (SWPPP), and applicable Best Management Practices (BMPs) and provisions stipulated in the drainage area management plan, and where required, treatment would be employed to remove excess pollutants from runoff during the construction and operational phase of development. However, operational and maintenance impacts would not result in benefits when compared to the proposed Green Zones Program in terms of water quality, as the No-Project Alternative would not include expansion of Low Impact Development (LID) Ordinance requirements benefitting water quality.

Land Use and Planning

Alternative 1, No-Project Alternative, would have greater impacts than the Green Zones Program. As discussed in Section IV.F, *Land Use and Planning*, implementation of the proposed program is expected to have less than significant impacts. Alternative 1 would result in greater impacts to land use and planning than the proposed program because existing land use incompatibilities would remain between industrial and sensitive uses. The No-Project Alternative would not benefit sensitive uses in the long-term as a result of new development standards and revisions from the Green Zones Program. Given that the goals and policies of the County General Plan, related area plans, and Hillside Management Area (HMA) and SEA programs were strategically developed to guide land use and planning in the County, the proposed program's demonstrated consistency with these plans shows that the full Green Zones Program would improve the land use compatibility in the County. Incompatibility between industrial and sensitive land uses would remain prevalent in communities in the County without the proposed program. The continued development of industrial and other degrading land uses in close proximity to sensitive uses under the No-Project Alternative would result in greater pollution and health risk impacts than if the Green Zones Program were implemented.

Noise

Alternative 1, No-Project Alternative, would have lesser impacts than the Green Zones Program. As discussed in Section IV.G, *Noise*, implementation of the proposed program is expected to have significant and unavoidable impacts. Alternative 1 would result in lesser impacts to noise than the proposed program because there would be no construction activities required that could cause temporary noise impacts near sensitive uses. Alternative 1 would accommodate the same pattern of land use that would result from the proposed program, as the Green Zones Program would not change the underlying land uses designation or pattern of development, but rather would add development standards to protect sensitive uses located adjacent or in close proximity to industrial uses. The No-Project Alternative continues the land use pattern adopted in the County General Plan. The development of new residential, commercial, and industrial uses throughout the County would be in compliance with the development standards included in the County General Plan. The General Plan Update EIR includes Mitigation Measure N-1, N-2, N-3, N-4, and N-5 to reduce impacts to noise and vibration of construction and operational impacts. Under this alternative, construction equipment and groundborne vibration equipment would not be used to implement the improvements of the proposed program. However, existing land use incompatibilities would remain between industrial and sensitive uses. The No-Project Alternative would not benefit noise levels for sensitive uses in the long term as a result of new development standards and revisions from the Green Zones Program.

Tribal Cultural Resources

Alternative 1, No-Project Alternative, would have lesser impacts than the Green Zones Program. As discussed in Section IV.H, *Tribal Cultural Resources*, implementation of the proposed program is expected to have significant and unavoidable impacts. Alternative 1 would result in lesser impacts to tribal cultural resources than the proposed program because there would be no construction activities required that would involve ground disturbance as a result of new development standards and revisions from the Green Zones Program. Under this alternative, there would be no unanticipated discovery of a significant tribal cultural resource during excavation in native soils as with implementation of the proposed program. Ground-disturbing activities

associated with the buildout of the existing County General Plan would continue independent of a proposed program in order to accommodate new development. Tribal cultural resources are governed on a site-by-site basis, and the probability of uncovering new resources or disturbing known resources would continue to be considered in project-level environmental review for new industrial and other land use projects.

Utilities and Service Systems

Alternative 1, No-Project Alternative, would have lesser impacts than the Green Zones Program. As discussed in Section IV.I, *Utilities and Service Systems*, implementation of the proposed program is expected to have less than significant impacts. Alternative 1 would result in lesser impacts to utilities and service systems than the proposed program because there would be no construction activities required. However, existing land use incompatibilities would remain between industrial and sensitive uses. The Green Zones Program would include improvements to reduce waste while protecting the health and safety of the public by ensuring safe and adequate waste disposal and management. The No-Project Alternative would not implement the benefits for the management of utilities and service systems in the long-term as a result of new development standards and revisions from the Green Zones Program. Alternative 1 would not address the utilities and service systems improvements of development standards for recycling and waste diversion facilities. Alternative 1 would allow for certain facilities that are not enclosed, under current maintenance and operational standards, to remain unchanged. Alternative 1 would accommodate the same pattern of land use that would result from the proposed program, as the Green Zones Program would not change the underlying land uses designation or pattern of development, but rather would add development standards to protect sensitive uses located adjacent or in close proximity to industrial uses. Alternative 1 would not result in the increase of population or land use designation densities. As a result, no new or expanded utilities and service systems would be required. The No-Project Alternative would comply with the goals and policies included in the County General Plan. The No-Project Alternative continues the land use pattern adopted in the County General Plan. The General Plan Update EIR includes Mitigation Measures USS-1 through USS-23 to reduce impacts to utilities as a result of construction and operational impacts.

3. Relationship of the Alternative to Project Objectives

Alternative 1 would meet none of the goals and objectives of the proposed program (Table V.A-2). There would not be promotion of environmental justice in the areas where health of residents may be disproportionately affected by surrounding land uses. The Green Zone Districts would not be established to address the communities in the unincorporated areas with incompatible land uses to improve the health and quality of life for surrounding residents that have historically borne a disproportionate burden of exposure to pollution. The health and quality of life for surrounding residents of incompatible land uses would not be improved or aligned with the State's environmental justice initiatives such as the Planning for Healthy Communities Act (SB 1000) and California Global Warming Solutions Act of 2006 (AB 32 and SB 535). Incompatible land uses associated with industrial, manufacturing, and commercial land uses, in proximity to sensitive uses would not be addressed. New regulations for recycling and solid waste facilities to make County regulations consistent with required State regulations would not be included. Facilitation of recycling, recycling collection and processing, and organic waste processing, such as composting and chipping and grinding with zoning requirements would not occur (see Table V.A-1). Therefore, Alternative No. 1 would meet none of the objectives of the proposed program.

D. ALTERNATIVE 2: REDUCE THE NUMBER OF GREEN ZONE DISTRICT COMMUNITIES INCLUDED IN THE ORDINANCE REVISIONS

The proposed program would result in significant and unavoidable impacts to cultural resources and tribal cultural resources as a result of cumulative ground disturbance from potential improvement projects minor enough to be ministerial, such that mitigation would not be feasible. Therefore, an alternative was considered that would reduce the number of parcels subject to the retroactively applicable development standards.

1. Description of the Alternative

Alternative 2 would reduce the scope of Element 1. Elements 2, 3, and 4, as well as the General Plan updates, would remain the same as under the proposed program. This alternative would apply the Green Zone Districts standards to only the five communities with the highest Environmental Justice Screening Method (EJSM) scores (15–20): East Los Angeles, Florence-Firestone, Willowbrook, West Rancho Dominguez-Victoria, and West Whittier-Los Nietos (Figure V.D-1, *Reduced Green Zone Districts Communities Alternative*).

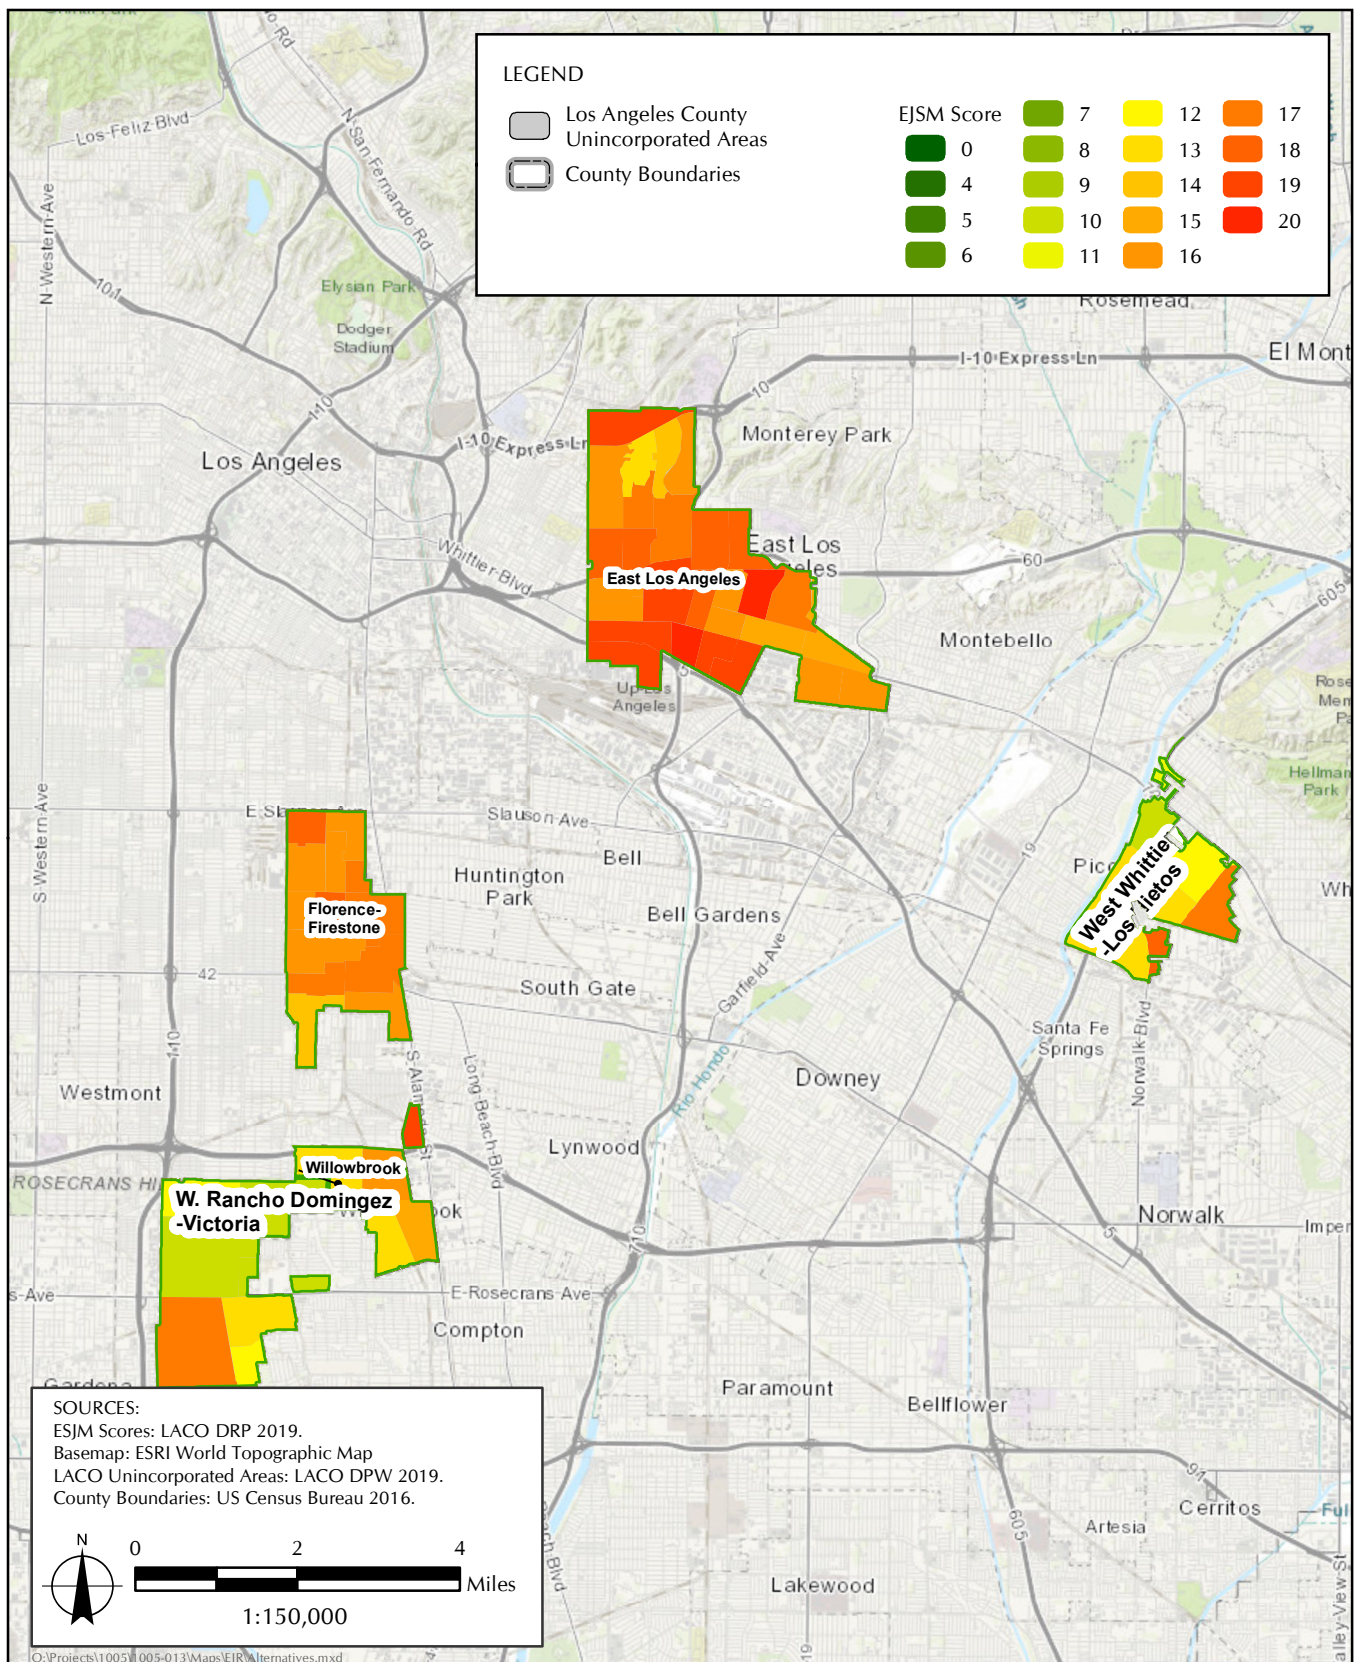

FIGURE V.D-1
 Reduced Green Zone Districts Communities Alternatives

Instead of the Green Zone Districts including the 11 unincorporated communities of Avocado Heights, East Los Angeles, East Rancho Dominguez, Florence-Firestone, South San Jose Hills, Walnut Park, West Athens-Westmont, West Carson, West Whittier-Los Nietos, West Rancho Dominguez-Victoria, and Willowbrook, the new chapter would create development standards and procedures for six fewer communities for existing and new industrial uses located within 500 feet of a sensitive use on an unincorporated parcel, or a residential use on incorporated parcel to minimize adverse effects related to odor, noise, aesthetic, soil contamination, vehicle circulation, and air quality on nearby sensitive uses. Fewer parcels would be required to meet a Schedule for Compliance for existing industrial uses/businesses in the Green Zone District communities. The Schedule for Compliance provides a specific timeline for compliance (3, 5, or 7 years depending on use or proximity) with the new development standards based on the required changes and the type of permitting process.

2. Environmental Impacts

Reducing the number of Green Zone District communities that would be included in the Ordinance revisions would also reduce construction impacts associated with the proposed program (see Table V.A-1).

Air Quality

Alternative 2 would result in lesser impacts to air quality than the proposed program because there would be fewer construction activities required. However, existing land use incompatibilities would remain between industrial and sensitive uses. Alternative 2 would not as effectively benefit air quality for sensitive uses in the long term as a result of new development standards and revisions from the Green Zones Program. This alternative would apply the Green Zone Districts standards to only the five communities with the highest EJSM scores. Assuming the total number of parcels that would be subject to the Green Zones Program is reduced, based on the reasonable estimation of construction and operation scenario of 43 building permits per year, it could be anticipated that a total of 531 industrial parcels would not be developed over the 21-year planning period under this alternative. This is approximately a 42 percent reduction in development of parcels that would otherwise be subject to the Green Zones Program. However, because 90 to 95 percent of the parcels in Element 1 are already developed, reducing the number of Green Zone District communities included in the Ordinance revisions for Element 1 would not substantially reduce significant short- and long-term criteria pollutant contributions of VOC, NO_x, CO, SO₂, PM₁₀, and PM_{2.5} mass emissions of criteria pollutants from construction and operation. Since air quality emissions would only be slightly reduced, in the short-term, this alternative is not considered environmentally superior to the proposed program.

Biological Resources

Alternative 2 would result in the same impacts to biological resources as the Green Zones Program because there would be no change to the underlying land use designation in the County General Plan and the associated pattern of land use development from the approved in the County General Plan. The Green Zones Program would not change the underlying land uses designation or pattern of development, but rather would add development standards to protect sensitive uses located adjacent to industrial uses. By reducing the scope of Element 1 to the five communities with the highest EJSM scores (15–20), Alternative 2 fails to achieve the benefit of avoiding development of solid waste and recycling land uses in significant ecological areas. As with the proposed program, and the County General Plan, Alternative 2 would not exempt property owners from the “take” provisions of the federal Endangered Species Act, the Magnuson-Stevens Fishery Conservation and Management Act, or the California Endangered Species Act. The ability to obtain an incidental take permit under federal or California regulations requires the applicant to demonstrate that there would be no net adverse effect to ability of the species to survive and recover in the wild.

Under Alternative 2, as with the proposed program, the land use pattern established in the General Plan includes policies that emphasize the conservation of SEAs and open space areas. However, the County General Plan does not contain a mechanism for compensation for unavoidable habitat loss or sensitive plant communities. The General Plan Update EIR includes mitigation measures to reduce direct impacts to sensitive habitats. As with the proposed program, Alternative 2 does not increase impacts to habitat or sensitive plant communities beyond that allowed by the County General Plan.

As with the proposed program, Alternative 2 would not change the County General Plan emphasis on the restoration of significant riparian resources and discouragement of development to preserve riparian habitats, including wetlands, in a natural state. The County General Plan contains policies that emphasize protection of water sources and watershed to ensure the ecological functions of these systems are maintained. The County General Plan includes Mitigation Measures BIO-1 and BIO-3 to reduce impacts to wetlands. As with the Green Zones Program, Alternative 2 would not exempt property owners from Sections 401 or 404 of the Federal Clean Water Act or Section 1600 of the State Fish and Game Code. The General Plan Update

EIR resulted in a determination of less than significant impacts. As with the proposed program, construction, operation, and maintenance required pursuant to the development standards in alternative would not increase impacts to riparian and wetland resources afforded protection pursuant to Section 401 and 404 of the Federal Clean Water Act and Section 1600 of the California Fish and Game Code, beyond those evaluated in the County General Plan.

As with the proposed program, Alternative 2 would result in less than significant impacts to wildlife corridors and linkages and connectivity between habitats with upland SEA boundaries. The County General Plan contains policies that emphasize the conservation of SEAs and open space areas, and emphasizes the preservation of wildlife corridors and linkages, and connectivity between habitats with the updated SEA boundaries. The General Plan Update EIR resulted in a determination that it was not feasible to avoid or fully compensate for impacts to regional wildlife linkages is not feasible. The General Plan Update EIR included a single Mitigation Measure, BIO-1, to provide limited protection measures to avoid or minimize impacts to wildlife corridors and nursery sites, but significant and unavoidable impacts would be expected to occur. As with the proposed program, Alternative 2 prohibits some industrial uses in SEAs, although such restrictions are limited to five communities, and as such may reduce the level of impact to wildlife linkages from that evaluated for the approved County General Plan, but to a lesser extent than that contemplated by the proposed program. As with the proposed program, Alternative 2 does not increase impacts to wildlife habitat or linkages, or SEAs beyond that allowed by the County General Plan.

Cultural Resources

Alternative 2 would result in lesser impacts to cultural resources than the proposed program because there would be fewer construction activities required. Under this alternative, the area where unanticipated discovery of a significant cultural resource could occur during excavation in native soils would be slightly reduced. As with the proposed program, this alternative would not impact any historic resources. Ground-disturbing activities associated with the buildout of the improvements required pursuant to the Green Zones program that require excavation in open space areas or excavations greater than 6 feet below the ground surface within existing developed properties, such as the construction of structures, enclosures, and concrete masonry walls would still have the potential to result in the unanticipated discovery of significant archaeological resources, similar to the proposed program. Cultural resources are governed on a site-by-site basis, and the probability of uncovering new resources or disturbing known resources is considered in project-level environmental review for discretionary projects. Implementation of Mitigation Measure CUL-1 would still be required. As the proposed program would be implemented with both discretionary and ministerial projects, similar to the proposed program, impacts to archaeological and paleontological resources would remain significant and unavoidable after mitigation.

Hazards and Hazardous Materials

Alternative 2 would result in lesser impacts to hazards and hazardous materials than the proposed program because there would be fewer construction activities required. However, existing land use incompatibilities would remain between industrial and sensitive uses. Impacts related to reasonably foreseeable upset and accident conditions, the emission of hazardous emissions or handling of hazardous material near schools would be less. However, under the proposed program, these impacts would be less than significant. Impacts from hazardous sites with Alternative 2 would be less as there would be no ground disturbance from program-required construction or demolition activities that could expose people to hazardous substances that may be present in soils as a result of past industrial activities. However, with Alternative 2, any development undertaken in reduced Green Zone Districts would be required to meet federal, state, and local regulations and policies regarding hazardous materials, and compliance with the provisions of hazardous material policies in the Los Angeles County Code. Implementation of the existing regulations related to hazardous materials would reduce this impact to a less-than-significant level. Alternative 2 would still result in the Green Zone Districts revisions to Title 22 being implemented. The Ordinance includes language requiring that property owners required to meet the Green Zone Districts standards would need to provide evidence that the property has received clearance from the appropriate State agency in order to begin construction on the site. Alternative 2 would not reduce hazards for sensitive uses in the long term as a result of new development standards and revisions compared to the Green Zones Program.

Hydrology and Water Quality

Alternative 2 would result in lesser impacts to hydrology and water quality than the proposed program because there would be fewer construction activities required. However, existing land use incompatibilities would remain between industrial and sensitive uses. Alternative 2 would not as effectively benefit water quality near sensitive uses in the long term as a result of new development standards and revisions from the Green Zones Program. Similar to the proposed program, runoff from development during construction and operations within the proposed program area would be subject to NPDES permit

standards, SWPPP, applicable BMPs, and provisions stipulated in the drainage area management plan, and where required, treatment would be employed to remove excess pollutants from runoff during the construction and operational phases of development. However, the operational and maintenance phases of Alternative 2 would not result in the same magnitude of benefits when compared to the proposed Green Zones Program in terms of water quality, as Alternative 2 would decrease the acreage and parcels subject to the expansion of the LID Ordinance requirements benefitting water quality.

Land Use and Planning

Alternative 2 would result in greater impacts to land use and planning than the proposed program because existing land use incompatibilities would remain between industrial and sensitive uses. Alternative 2 would not as effectively benefit sensitive uses in the long term as a result of new development standards and revisions from the Green Zones Program. Given that the goals and policies of the County General Plan, related area plans, and HMA and SEA programs were strategically developed to guide land use and planning in the County, the proposed program's demonstrated consistency with these plans shows that the full Green Zones Program would improve the land use compatibility in the County. Incompatibility between industrial and sensitive land uses would remain prevalent in the communities that would not be considered Green Zone Districts under this alternative. The continued development of industrial and other degrading land uses in the remaining 6 communities would result in greater pollution and health risk impacts than if all 11 Green Zone Districts were implemented.

Noise

Alternative 2 would result in lesser impact to noise and vibration than the Green Zones Program because there would be fewer parcels subject to new development and compliance standards as required with the proposed program. As with the proposed program, there would be no change to the underlying land use designation in the County General Plan and the associated pattern of land use development from the projected growth in the County General Plan. Construction, operation, and maintenance required pursuant to the development standards in Alternative 2 would not increase impacts to noise and vibration. However, the Green Zones Program would add development standards to protect sensitive uses located adjacent to industrial uses. Although, by reducing the scope of Element 1 to the five communities with the highest EJSM scores (10–20) would result in lesser impacts to noise during construction with, Alternative 2 would fail to achieve the benefit of avoiding development of solid waste and recycling land use. As with the proposed program, Alternative 2 would be required to comply with County General Plan goals and policies. The General Plan Update EIR includes Mitigation Measure N-1, N-2, N-3, N-4, and N-5 to reduce impacts to noise and vibration of construction and operational impacts, which would apply for Alternative 2 as well as the proposed program. As with the proposed program, Alternative 2 would result in significant and unavoidable impacts to noise and vibration. However, the potential for impacts would be reduced compared to the proposed program due to the reduced level of construction as a result of there being fewer areas that would be subject to the requirements of the proposed program.

Tribal Cultural Resources

Alternative 2 would result in lesser impacts to tribal cultural resources than the proposed program because there would be fewer construction activities required that would involve ground disturbance as a result of new development standards within the Green Zone Districts. Under this alternative, the area where unanticipated discovery of a significant tribal cultural resource could occur during excavation in native soils would be reduced. Ground-disturbing activities associated with the buildout of the improvements required pursuant to the Green Zones Program that require excavation in open space areas or excavations greater than 6 feet below the ground surface within existing developed properties, such as the construction of structures, enclosures, and concrete masonry walls would still have the potential to result in the unanticipated discovery of significant tribal cultural resources, similar to the proposed program. Tribal cultural resources are governed on a site-by-site basis, and the probability of uncovering new resources or disturbing known resources is considered in project-level environmental review for discretionary projects. Implementation of Mitigation Measure TCR-1 would still be required. As the proposed program would be implemented with both discretionary and ministerial projects, similar to the proposed program, impacts to tribal cultural resources would remain significant and unavoidable after mitigation.

Utilities and Service Systems

Alternative 2 would result in lesser impacts to utilities and services than the proposed program because there would be fewer construction activities required. However, existing land use incompatibilities would remain between industrial and sensitive uses. Alternative 2 would not as effectively benefit existing utilities and service systems near sensitive uses in the long-term as a result of new development standards and revisions from the Green Zones Program. Similar to the proposed program, development during construction and operations within the communities identified in Alternative 2 would be subject to Title 22, applicable

BMPs, and provisions stipulated in the Countywide Integrated Waste Management Plan (IWMP). When required, mitigation measures would be employed to reduce utilities and services impacts during the construction and operational phases of development. However, operational and maintenance phases of the proposed program would not result in the magnitude of benefits when compared to the proposed Green Zones Program, as Alternative 2 would decrease the acreage and parcels subject to the expansion of LID Ordinance requirements that would benefit existing industrial facilities adjacent to sensitive receptors. The General Plan Update EIR includes Mitigation Measures USS-1 through USS-23 to reduce impacts to utilities in result of construction and operational impacts, which would still be required under Alternative 2.

3. Relationship of the Alternative to Project Objectives

Alternative 2 would substantially reduce the effectiveness of the Green Zones Program to address incompatible land uses in proximity to sensitive uses. Alternative 2 would not fully achieve the objectives of the proposed program, especially towards the communities in the unincorporated areas with incompatible land uses, to improve the health and quality of life for surrounding residents that have historically borne a disproportionate burden of exposure to pollution (see Table V.A-2).

E. ALTERNATIVE 3: REMOVE THE REQUIREMENT FOR RETROACTIVE COMPLIANCE OF EXISTING INDUSTRIAL USES WITH THE GREEN ZONES PROGRAM

The proposed program would result in significant and unavoidable impacts to cultural resources and tribal cultural resources as a result of cumulative ground disturbance from potential improvement projects minor enough to be ministerial, such that mitigation would not be feasible. Therefore, an alternative was considered that would remove the proposed retroactively applicable development standards.

1. Description of the Alternative

Alternative 3 would reduce the scope of Element 1. Elements 2, 3, and 4, as well as the General Plan updates, would remain the same as under the proposed program. Instead of the zoning code (Title 22) changes applying to both new industrial uses and existing industrial uses/businesses in the Green Zone Districts communities, only new industrial uses would be subject to the chapter.

Instead of a series of individual construction projects resulting from the ordinance concentrated within a 3 to 7-year time frame, only new uses would be required to incorporate the additional development standards into the entitlement process.

2. Environmental Impacts

Alternative 3 would result in lesser construction impacts associated with small individual construction projects that would be required to implement the retroactive development standards within a 3- to 7-year time frame (see Table V.A-1).

Air Quality

Alternative 3 would result in lesser impacts to air quality than the proposed program because there would be fewer construction activities required. However, existing land use incompatibilities would remain between industrial and sensitive uses. Alternative 3 would not as effectively benefit air quality for sensitive uses in the long term as a result of new development standards and revisions from the Green Zones Program. The reduction of retrofits under this alternative would not substantially reduce significant short- and long-term criteria pollutant contributions of VOCs, NO_x, CO, SO₂, PM₁₀, and PM_{2.5} mass emissions of criteria pollutants from construction and operation. Additionally, this alternative does not take into account potential harms of adjacent land uses, including disproportionate effects on specific populations, or potential health benefits of retrofitting existing structures. Since air quality emissions would only be slightly reduced, in the short-term, and potential health risks posed by existing structures are not fully addressed, this alternative is not considered environmentally superior to the proposed program.

Biological Resources

Alternative 3 would result in the same impacts to biological resources as the Green Zones Program because there would be no change to the underlying land use designation in the County General Plan and the associated pattern of land use development from that approved in the County General Plan. The Green Zones Program would not change the underlying land uses

designation or pattern of development, but rather would add development standards to protect sensitive uses located adjacent to industrial uses. Since the limitations of Alternative 3 apply only to existing parcels designated for industrial land uses, there would be no change in impacts to biological resources as the development standards would apply to the same future land uses, as allowable by the adopted County General Plan. As with the proposed program, and the County General Plan, Alternative 3 would not exempt property owners from the “take” provisions of the federal Endangered Species Act, the Magnuson-Stevens Fishery Conservation and Management Act, or the California Endangered Species Act. The ability to obtain an incidental take permit under federal or California regulations requires the applicant to demonstrate that there would be no net adverse effect to ability of the species to survive and recover in the wild.

Under Alternative 3, as with the proposed program, the land use pattern established in the County General Plan includes policies that emphasize the conservation of SEAs and open space areas. However, the County General Plan does not contain a mechanism for compensation for unavoidable habitat loss or sensitive plant communities. The County General Plan includes mitigation measures to reduce direct impacts to sensitive habitats. As with the proposed program, Alternative 3 would not increase impacts to habitat or sensitive plant communities beyond that allowed by the County General Plan.

As with the proposed program, Alternative 3 would not change the General Plan emphasis on the restoration of significant riparian resources and discouragement of development to preserve riparian habitats, including wetlands, in a natural state. The County General Plan contains policies that emphasize protection of water sources and watershed to ensure the ecological functions of these systems are maintained. The General Plan Update EIR includes Mitigation Measures BIO-1 and BIO-3 to reduce impacts to wetlands. As with the Green Zones Program, Alternative 3 would not exempt property owners from Sections 401 or 404 of the Federal Clean Water Act or Section 1600 of the State Fish and Game Code. The General Plan Update EIR resulted in a determination of less than significant impacts. As with the proposed program, construction, operation, and maintenance required pursuant to the development standards in Alternative 3 would not increase impacts to riparian and wetland resources afforded protection pursuant to Section 401 and 404 of the Federal Clean Water Act and Section 1600 of the California Fish and Game Code, beyond those evaluated in the County General Plan.

As with the proposed program, Alternative 3 would result in less than significant impacts to wildlife corridors and linkages and connectivity between habitats with upland SEA boundaries. The County General Plan contains policies that emphasize the conservation of SEAs and open space areas, and emphasizes the preservation of wildlife corridors and linkages, and connectivity between habitats with the updated SEA boundaries. The General Plan Update EIR resulted in a determination that it was not feasible to avoid or fully compensate for impacts to regional wildlife linkages. The General Plan Update EIR included a single Mitigation Measure, BIO-1, to provide limited protection measures to avoid or minimize impacts to wildlife corridors and nursery sites, but significant and unavoidable impacts would be expected to occur. As with the proposed program, Alternative 3 would prohibit some industrial uses in SEAs. As with the proposed program, Alternative 3 would not increase impacts to wildlife habitat or linkages or SEAs beyond that allowed by the County General Plan.

Cultural Resources

Alternative 3 would result in lesser impacts to cultural resources than the proposed program because there would be fewer construction activities required. Under this alternative, the area where unanticipated discovery of a significant archaeological resource could occur during excavation in native soils would be slightly reduced. As with the proposed program, this alternative would not impact any historic resources. Ground-disturbing activities associated with the buildout of the improvements required pursuant to the Green Zones Program that require excavation in open space areas or excavations greater than 6 feet below the ground surface within existing developed properties, such as the construction of structures, enclosures, and concrete masonry walls, would still have the potential to result in the unanticipated discovery of significant archaeological resources, similar to the proposed program. Cultural resources are governed on a site-by-site basis, and the probability of uncovering new resources or disturbing known resources is considered in project-level environmental review for discretionary projects. Implementation of Mitigation Measure CUL-1 would still be required. As Alternative 3 would be implemented with both discretionary and ministerial projects, similar to the proposed program, impacts to archaeological and paleontological resources would remain significant and unavoidable after mitigation.

Hazards and Hazardous Materials

Alternative 3 would result in lesser impacts to hazards and hazardous materials than the proposed program because there would be fewer construction activities required. However, existing land use incompatibilities would remain between industrial and sensitive uses. Impacts related to reasonably foreseeable upset and accident conditions, the emission of hazardous emissions or handling of hazardous material near schools would be less. However, under the proposed program, these impacts would be less

than significant. Impacts from hazardous sites would be less as there would be no ground disturbance from program-required construction or demolition activities that could expose people to hazardous substances that may be present in soils as a result of past industrial activities. However, impacts to sensitive uses from adjacent industrial uses would remain unchanged. Any development would be required to meet federal, State, and local regulations and policies regarding hazardous materials and compliance with the provisions of hazardous material policies in the Los Angeles County Code. Implementation of the existing regulations related to hazardous materials would reduce this impact to a less than significant level. Alternative 3 would still result in the Green Zone District revisions to Title 22 being implemented. The proposed program includes language requiring that property owners subject to the Green Zone Districts standards would need to provide evidence that the property has received clearance from the appropriate State agency in order to begin construction on the site. Alternative 3 would not reduce hazards for sensitive uses in the long term as a result of new development standards and revisions compared to the Green Zones Program.

Hydrology and Water Quality

Alternative 3 would result in lesser impacts to hydrology and water quality than the proposed program because there would be fewer construction activities required. However, existing land use incompatibilities would remain between industrial and sensitive uses. Alternative 3 would not as effectively benefit water quality near sensitive uses in the long-term as a result of new development standards and revisions from the Green Zones Program. Similar to the proposed program, runoff from development during construction and operations within the proposed program area would be subject to NPDES permit standards, SWPPP, applicable BMPs, and provisions stipulated in the drainage area management plan. Where required, treatment would be employed to remove excess pollutants from runoff during the construction and operational phases of development. However, the operational and maintenance phases of Alternative 3 would not result in the same magnitude of benefits when compared to the proposed Green Zones Program, as Alternative 3 would decrease the acreage and number of parcels with removal of retroactive requirements subject to the expansion of the LID Ordinance requirements benefitting water quality.

Land Use and Planning

Alternative 3 would result in greater impacts to land use and planning than the proposed program because existing land use incompatibilities would remain between industrial and sensitive uses. Alternative 3 would not as effectively benefit sensitive uses in the long term as a result of new development standards, retroactive requirements, and revisions from the Green Zones Program. Given that the goals and policies of the County General Plan, related area plans, and HMA and SEA programs were strategically developed to guide land use and planning in the County, the proposed program's demonstrated consistency with these plans shows that the full Green Zones Program would improve the land use compatibility in the County. Incompatibility between industrial and sensitive land uses would remain prevalent in the areas of the Green Zone Districts that would not be required to retroactively implement the program measures under this alternative. The continued operation of these facilities without development standards mitigating their impacts would result in greater pollution and health risk impacts than if they were required to retroactively comply with the new development standards and revisions. The continued development of industrial and other degrading land uses without retroactively mitigating impacts from existing land uses under Alternative 3 would result in greater pollution and health risk impacts than if the Green Zones Program were implemented and measures were taken to reduce them.

Noise

Alternative 3 would result in lesser impacts to noise than the proposed program because there would be fewer areas where construction activities would be required that would cause temporary noise impacts. However, there would also be fewer areas that receive long-term noise attenuation benefits. The areas that would receive these benefits consist of 2,778 parcels that are subject to the Green Zone Districts. However, the reduction of retrofits in Green Zone Districts under Alternative 3 would not substantially reduce the proposed program's construction and operational impacts of noise and vibration, and impacts would remain significant and unavoidable under Alternative 3. Alternative 3 would include fewer construction activities than the proposed program, but impacts to sensitive receptors from adjacent industrial uses would remain unchanged. As with the proposed program, Alternative 3 would be required to comply with County General Plan goals and policies. The General Plan Update EIR includes Mitigation Measure N-1, N-2, N-3, N-4, and N-5 to reduce impacts to noise and vibration of construction and operational impacts, which would apply for Alternative 3 as well as the proposed program. As with the proposed program, Alternative 3 would result in significant and unavoidable impacts to noise and vibration. However, any potential for impacts would be reduced compared to the proposed program due to the reduced level of construction as a result of there being fewer areas that would be subject to the requirements of the proposed program.

Tribal Cultural Resources

Alternative 3 would result in lesser impacts to tribal cultural resources than the proposed program because there would be fewer construction activities required that would involve ground disturbance as a result of new development standards within the Green Zone Districts. Under this alternative, the areas where unanticipated discovery of a significant tribal cultural resource could occur during excavation in native soils would be reduced. Ground-disturbing activities associated with the buildout of the improvements required for new uses under Alternative 3 pursuant to the Green Zones Program that require excavation in open space areas or excavations greater than 6 feet below the ground surface within existing developed properties, such as the construction of structures, enclosures, and concrete masonry walls, would still have the potential to result in the unanticipated discovery of significant tribal cultural resources, similar to the proposed program. Tribal cultural resources are governed on a site-by-site basis, and the probability of uncovering new resources or disturbing known resources is considered in project-level environmental review for discretionary projects. Implementation of Mitigation Measure TCR-1 would still be required. As Alternative 3 would be implemented with both discretionary and ministerial projects, similar to the proposed program, impacts to tribal cultural resources would remain significant and unavoidable after mitigation.

Utilities and Service Systems

Alternative 3 would result in lesser impacts to utilities and service systems than the proposed program because there would be fewer construction activities required. However, existing land use incompatibilities would remain between industrial and sensitive uses. Alternative 3 would not as effectively benefit existing utility services near sensitive uses in the long-term as a result of new development standards and revisions from the Green Zones Program. Similar to the proposed program, development during construction and operations under Alternative 3 would be subject to Title 22, applicable BMPs, and provisions stipulated in the Countywide IWMP. The elimination of retrofits in Green Zone Districts under Alternative 3 would not substantially reduce the proposed program's construction and operational impacts of utilities and service systems, but impacts would remain less than significant under Alternative 3. Alternative 3 would include fewer construction activities than the proposed program, but impacts to sensitive receptors from adjacent industrial uses would remain unchanged. However, the operational and maintenance phases of the Alternative 3 would not result in the magnitude of benefits when compared to the Green Zones Program, as Alternative 3 would decrease the acreage and parcels subject to the expansion of LID Ordinance requirements benefitting existing industrial facilities adjacent to sensitive receptors. Utilities and service system impacts overall would be less for Alternative 3 when compared to the Green Zones Program, and impacts would remain less than significant. The General Plan Update EIR includes Mitigation Measures USS-1 through USS-23 to reduce impacts to utilities in result of construction and operational impacts, which would still be required under Alternative 3.

3. Relationship of the Alternative to Project Objectives

Alternative 3 would substantially reduce the effectiveness of the Green Zones Program to address incompatible land uses in proximity to sensitive uses. Alternative 3 would not fully achieve the objectives of the proposed program, especially towards the communities in the unincorporated areas with incompatible land uses, to improve the health and quality of life for surrounding residents that have historically borne a disproportionate burden of exposure to pollution (see Table V.A-2).

F. ENVIRONMENTALLY SUPERIOR ALTERNATIVE

Although the No-Project Alternative would not involve construction activities that would be required to implement the new development standards and other revisions, the proposed program would be the environmentally superior alternative as it would result in the most long-term environmental benefits to 2,778 parcels that would not be provided with the No-Project Alternative.

All of the action alternatives have the same impacts as they include the same requirements and regulations. The proposed program includes short-term impacts during the construction of the requirements to protect sensitive uses such as the construction of walls, barriers, landscaping, air filtration, and so forth. However, the proposed program would result in the greatest long-term environmental benefits to 2,778 parcels. These long-term benefits would include addressing the environmental health impacts of incompatible land uses in proximity to sensitive uses and implementing mechanisms to require appropriate mitigation measures within affected communities in the unincorporated County. Specifically, these long-term environmental benefits of the proposed program would include the minimization of potential adverse health and safety impacts to communities that are disproportionately affected by toxic air pollutants and contaminants such as PM₁₀ and odors generated from various industrial land uses, and to promote clean industrial uses. The revisions to the County's zoning code (Title 22) would create development standards and procedures for existing and new industrial uses located within 500 feet of a sensitive use on an unincorporated parcel, or a residential use on incorporated parcel to minimize adverse effects related to odor, noise,

aesthetic, soil contamination, vehicle circulation, and air quality on nearby sensitive uses. The zoning code (Title 22) changes would apply to new industrial uses and also require a Schedule for Compliance for existing industrial uses and businesses in the Green Zone District communities. The Schedule for Compliance provides a specific timeline for compliance (3, 5, or 7 years) with the new development standards based on the required changes and the type of permitting process. The environmental analysis of alternatives above indicates that, through a comparison of potential impacts, the proposed program is the environmentally superior alternative because it would result in the greatest long-term environmental benefits, would achieve all of the environmental benefits of the proposed program, and would meet all of the objectives of the proposed program. The proposed program would fully achieve the objectives of the proposed program, especially towards the communities in the unincorporated areas with incompatible land uses, to improve the health and quality of life for surrounding residents that have historically borne a disproportionate burden of exposure to pollution (see Table V.A-2). The proposed program would address the incompatibilities of the existing land uses with adjacent sensitive receptors and would implement mechanisms to require appropriate mitigation measures within these communities in the unincorporated County. The proposed program would optimize the opportunity to contribute to regional reductions in land use incompatibilities near sensitive uses.

SECTION VI

OTHER ENVIRONMENTAL CONSIDERATIONS

This section of the Program Environmental Impact Report (PEIR) includes an analysis of the potential for the Green Zones Program (proposed program) to result in indirect impacts due to potential growth inducement, significant unavoidable impacts, and significant irreversible environmental changes. The section also includes a discussion as to why the proposed program is being proposed notwithstanding significant unavoidable impacts, as well as a discussion of effects found not to be significant.

A. GROWTH INDUCING IMPACTS

This section of the PEIR analyzes the potential for the proposed program to result in growth-inducing impacts consistent with Section 15126.2(d) of the California Environmental Quality Act (CEQA) Guidelines. Such impacts normally occur when a project results in economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. The types of projects that are normally considered to result in growth-inducing impacts are those that provide infrastructure that would be suitable to support additional growth or remove an existing barrier to growth.

According to the CEQA Guidelines, such projects include those that would remove obstacles to population growth (e.g., a major expansion of a wastewater treatment plant) and projects that encourage and facilitate other activities that are beyond those proposed as part of the project and could affect the environment are growth inducing. In addition, as set forth in the CEQA Guidelines, increases in the population may tax existing community service facilities, requiring construction of new facilities that could cause significant environmental effects. The CEQA Guidelines also state that it must not be assumed that growth in an area is necessarily beneficial, detrimental, or of little significance to the environment. Induced growth is considered a significant impact only if it directly or indirectly affects the ability of agencies to provide needed public services or if it can be demonstrated that the potential growth, in some other way, significantly affects the environment, that is, that it would result in construction that would adversely affect the environment. Factors that would potentially induce population growth include roads, highways, freeways, rail, and other transportation improvements that provide access to previously undeveloped areas. The availability of adequate water supplies, the availability of sewage treatment facilities, the availabilities of developable land, the types and availability of employment opportunities, housing supply and costs, commuting distances, cultural and recreational amenities, climate, and local government growth policies contained in general plans and zoning ordinances would also induce population growth.

The Green Zones Program would not result in significant adverse growth-inducing impacts because it would not change the pattern of parcels allowable for residential use or development, would not include the development of new homes, and would not include the extension of access roads or utilities to new areas that would facilitate development, thereby inducing unplanned population growth, directly or indirectly. The Green Zones Program is not a residential project and would not involve the construction of additional housing. Element 1, Green Zone Districts, implements development standards and/or more stringent entitlement processes for certain industrial, recycling and solid waste, and vehicle-related land uses in close proximity to incompatible sensitive uses. Element 2, New Sensitive Uses, implements development standards for new sensitive land uses, including dwelling units, when located adjacent to or adjoining parcels that contain existing, legally-established industrial, recycling or solid waste, or vehicle-related uses. However, the element itself does not call for the development of new dwelling units. Element 3, Recycling and Waste Management Revisions, implements development standards and/or more stringent entitlement processes for certain recycling and waste-related land uses, including but not limited to recycling collection and processing facilities, organic waste facilities, and supermarket accessory recycling collection centers, but does not encourage development. Element 4, Storage Enclosures for Recycling and Solid Waste Revisions, is a requirement to build better enclosures for trash receptacles related to new development or expansion of certain existing development but would not change the total number of parcels that are authorized for development of most land uses in the unincorporated territory of the County. This element applies to new or expanded commercial and industrial development and residential development with four or more units; however, the element itself does not call for new residential development. Therefore, the Green Zones Program would not result in the construction of new housing.

The proposed program would not induce growth through the provision of additional employment. The Green Zones Program would not involve the construction of buildings that would provide additional employment; nor would it require new or expanded facilities that would increase the need for employees at those facilities. Elements of the proposed program would require implementation of development standards on existing and proposed properties; however, these measures are limited to standards such as alternative fencing materials, solid wall screening or enclosures, landscaping buffers, air filtration, paving,

lighting, signage, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards (see Table III.E-2, *Development Standards*). The implementation of these measures would not increase the need for employees at existing or proposed facilities. Additionally, construction activities for implementation of the proposed program would not require temporary housing due to the urban context and availability of construction workers in the County of Los Angeles (County). Short-term construction employment opportunities would not result in population growth, as they would be expected to be filled by the construction workforce in the County and would not result in in-migration.

The Green Zones Program would not result in significant adverse growth-inducing impacts that would potentially result from the extension of access roads or utilities to new areas that would facilitate development. The proposed program would not require the development of additional utilities infrastructure. The proposed development standards include alternative fencing materials, solid wall screening or enclosures, landscaping buffers, air filtration, paving, lighting, signage, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards (see Table IV.E-2). These development standards do not constitute uses that produce wastewater, such as bathrooms in residential uses; nor would they produce stormwater runoff that would result in the need for new facilities. Additionally, they would not require the construction of new electric, natural gas, or telecommunications facilities, as the only measures which require these utilities, such as lighting, are minor and would be served by the existing utilities infrastructure at the existing facility. The majority of development standards would not require the use of water during the operational phases of improvements, and according to the new development standards would be subject to the County Low-Impact Development (LID) ordinance for water conservation. The Green Zones Program would be served by existing sewer, water, and other utility services that have been established on each parcel that contains existing industrial land uses. Therefore, the proposed program has adequate availability of water supplies, sewage treatment facilities, and other utilities infrastructure such that it would not require construction that would indirectly induce population growth. The elements of the Green Zones Program would include construction of improvements such as solid walls, landscaping, setbacks, and building height requirements that are consistent with the underlying land uses to meet the proposed development standards; however, the development standards are limited to screening and mitigating impacts of industrial land uses from adjacent and nearby sensitive uses based on the land use pattern established in the Los Angeles County General Plan 2035 (County General Plan). The development standards established in the Green Zones Program would not directly or indirectly require construction of new public roads or utilities that would have the potential to induce growth beyond the growth defined in the County General Plan.

Therefore, the Green Zones Program would not result in population growth, direct or indirect increases in development of new dwelling units, or road or utility infrastructure that directly or indirectly induces growth.

B. INDIRECT IMPACTS OF POTENTIAL GROWTH INDUCEMENT

In addition to the impacts caused by direct economic, population, or housing growth, the indirect impacts of the proposed program must be evaluated for their potential to induce growth.

Unplanned and uncontrolled growth may have significant adverse impacts on the environment. The Green Zones Program would not result in significant adverse indirect impacts resulting from potential growth inducement because it would not change the pattern of parcels allowable for development. The County General Plan identifies where development may occur and what additional services would be needed to support the growth of population, jobs, and housing. The County General Plan accommodates future projected growth and development in the unincorporated territory of the County. The Green Zones Program is limited to the application of stricter development standards for the land use designations authorized by the County General Plan, as well as limiting the areas where certain types of solid waste and recycling activities may occur. The Green Zones Program seeks to provide enhanced separation to protect sensitive land uses located adjacent to or in close proximity to industrial land uses from the visual blight, night light, emissions of criteria air pollutants, odor, and noise associated with lawful operation of industrial land uses. Furthermore, the proposed program would not result in indirect growth inducing impacts by changing a zoning or general plan designation. Element 1 proposes a change in the zoning designation for 27 ~~28~~ parcels from Heavy Manufacturing (M-2) to Light Manufacturing (M-1) and General Plan land use designation for 14 ~~45~~ of those parcels from Heavy Industrial (IH) to Light Industrial (IL). However, these zoning and land use designation changes would not result in growth, as they would not change the zoning or general plan designation from nonresidential to residential, allowing for the construction of new housing; nor would they change to a land use that would increase employment, such as heavy commercial land uses. The land uses would remain industrial with a decrease in intensity.

Element 2 of the Green Zone Program requires that new sensitive land uses proposed for development adjacent to industrial land uses incorporate design measures to protect such uses from visual blight, night light, emissions of criteria air pollutants, odor, and noise associated with lawful operation of industrial land uses. Element 3 specifies the locations where solid waste and recycling facilities are allowable uses and establishes entitlement processes and development standards to protect adjacent sensitive uses from visual blight, night light, emissions of criteria air pollutants, odor, and noise associated with lawful operation of such uses. It also provides development standards for protection of workers and patrons from emissions of criteria air pollutants and nuisance odors. Element 4 of the Green Zones Program requires that trash and recycling receptacles be enclosed for residential land uses with four or more dwelling units and for most other commercial and industrial land uses in the unincorporated areas of the County. These elements of the Green Zones Program would not alter the underlying land use pattern and thus would not have the capacity to induce growth beyond that contemplated by the County General Plan.

Therefore, the Green Zones Program would not result in impacts due to indirectly induced growth.

C. SIGNIFICANT UNAVOIDABLE IMPACTS

Consistent with the requirements of Section 15126.2(b) of the CEQA Guidelines, this section of the PEIR summarizes the potential for implementation of the proposed program to result in significant environmental effects that cannot be reduced to below the level of significance. The nine environmental issue areas evaluated in the PEIR are Air Quality, Biological Resources, Cultural Resources, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Noise, Tribal Cultural Resources, and Utilities and Service Systems. The PEIR also evaluates the potential environmental impacts of the No Project alternative and two action alternatives. The potential for the proposed program to result in significant environmental impacts has been analyzed in Sections IV, *Environmental Impact Analysis*, and V, *Alternatives*, of this PEIR.

Table ES-F.1, *Summary of Environmental Consequences*, in the Executive Summary of this PEIR provides a comprehensive identification of the environmental effects of the proposed program, including the level of significance both before and after mitigation. The proposed program would result in significant and unavoidable impacts to Cultural Resources, Noise, and Tribal Cultural Resources.

Many of the parcels with manufacturing and industrial land use designation could be developed pursuant to ministerial processes that would not trigger review subsequent environmental review beyond that completed in the County General Plan EIR. As the projects could proceed pursuant to ministerial approvals such as a building permit or grading permit, there would be no requirement to survey for cultural resources or to conduct Tribal consultation. However, the improvements required pursuant to development standards established in the Green Zones Program would in some instances require excavation and ground disturbance of native soils with potential for unanticipated discovery of significant cultural resources. Therefore, the proposed program would result in significant and unavoidable impacts to Cultural Resources and Tribal Cultural Resources. Many of the impacts that are determined to be significant and unavoidable could be mitigated to less than significant at the project level. However, this PEIR is at the program level, and detailed site plans and project descriptions are not available. Therefore, without the ability to evaluate each project that could occur as a result of the proposed program, these impacts were determined to be significant and unavoidable. Implementation of the proposed program would result in the significant and unavoidable direct, indirect, and cumulative impacts to Cultural Resources and Tribal Cultural Resources.

Cultural Resources: The proposed program would have the potential to result in significant impacts to cultural resources in relation to causing a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5 of the CEQA Guidelines. The improvements that would be required pursuant to the proposed program have the potential to cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5 of the CEQA Guidelines. Ground disturbance is expected to reach depths of approximately 6 feet or greater; for excavation of new footings and so forth that are anticipated for screening or enclosure walls. Due to prior disturbance associated with the construction of existing facilities, native, undisturbed, soils are not anticipated to be encountered until a depth of approximately 3 feet below grade. Therefore, excavation associated with the program developments may reach native undisturbed soils that contain buried archaeological deposits at depths of 3 feet or greater. The proposed revisions to the development standards that have the potential to result in physical changes in the environment in relation to archeological resources include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table III.E-2).

Noise: The proposed program would result in significant and unavoidable impacts to noise in relation to generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the County General Plan or Noise Ordinance (Los Angeles County Code, Title 12, Chapter 12.08), or applicable standards of other agencies. While the program would reduce operational impacts of uses within the program area once constructed (barriers, required setbacks, etc.) and would not induce the development of industrial uses in the program area, the proposed program would require development within the County to be developed in accordance with additional standards in relation to sensitive uses and new industrial uses, thus requiring installation of such structures as cinder block walls, fencing, landscape area, and setback, requiring the use of construction equipment within areas adjacent to sensitive uses. Ministerial projects would be exempt from CUP requirements and, thus, would not require project-level CEQA evaluation prior to plan check and permit approval such that the use of noise reduction and avoidance measures for these types of developments would not be feasible. Therefore, construction would result in temporary but significant and unavoidable impacts to noise. The development of discretionary projects would require project-level evaluation under CEQA prior to plan check and permit approval, and therefore, the use of noise reduction measures, avoidance and minimization measures for these types of developments would be feasible. However, development within 50 feet of a sensitive use would be anticipated to continue to result in noise exceedances at sensitive uses over standards established by the County Noise Ordinance during construction, even with the implementation of project-level noise reduction measures.

The proposed program would result in significant and unavoidable impacts to noise in relation to generation of excessive groundborne vibration or groundborne noise levels. Implementation of the proposed program would reduce operational impacts of uses within the program area and would not induce the development within the program area. However, construction impacts would be significant and unavoidable. The development of ministerial projects would be exempt from CUP requirements and, thus, would not require project-level CEQA evaluation prior to plan check and permit approval, so that the use of noise reduction and avoidance measures for these types of developments would not be feasible. The development of discretionary projects would require project-level evaluation under CEQA prior to plan check and permit approval, and thus, the use of vibratory and groundborne vibration avoidance and minimization measures for these types of developments would be feasible. However, development within 25 feet of a sensitive use would be anticipated to continue to result in generation of excessive groundborne vibration or groundborne noise levels in exceedance of FTA levels for potential impacts during construction, even with the implementation of project-level noise reduction measures.

Tribal Cultural Resources: The proposed program would result in potentially significant impacts to tribal cultural resources in relation to causing a substantial adverse change in the significance of a tribal cultural resource, as defined in Public Resources Code (PRC) Section 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe and that is listed or eligible for listing in the California Register of Historical Resources (CRHR) or in local registers of historical resources as defined in PRC Section 5020.1(k). Ground disturbance is expected to reach depths of approximately 6 feet or greater; for excavation of new footings and so forth anticipated for screening or enclosure walls. Due to prior disturbance associated with the construction of existing facilities, native, undisturbed, soils are not anticipated to be encountered until a depth of approximately 3 feet below grade. Therefore, excavation associated with the program developments may reach native undisturbed soils that contain buried tribal cultural resource deposits at depths of 3 feet or greater. The proposed revisions to the development standards that have the potential to result in physical changes in the environment in relation to causing a substantial adverse change in the significance of a tribal cultural resource, listed or eligible for listing in the CRHR or in a local register as defined in PRC Section 5020.1(k), or determined an eligible resource by the Lead Agency, include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table III.E-2).

D. REASONS WHY THE PROJECT IS BEING PROPOSED, NOTWITHSTANDING SIGNIFICANT UNAVOIDABLE IMPACTS?

In accordance with Section 15093 of the CEQA Guidelines, the County hereby finds that the following economic, legal, social, technological, environmental and other benefits of the proposed program outweigh its unavoidable, adverse environmental impacts discussed in Section IV:

The proposed program would develop targeted land-use policies and development standards that can be used to improve the health and quality of life for residents surrounding major sources of pollution, aligned with the State's environmental justice initiatives such as the Planning for Healthy Communities Act (Senate Bill [SB] 1000) and California Global Warming Solutions Act of 2006 (Assembly Bill [AB] 32 and SB 535) as well as waste diversion initiatives aligned with SB 1383, by including appropriate standards in Title 22 and policies in the General Plan. Toxic pollutants emitted near residential neighborhoods or schools pose serious threats on public health as well as the environment. The Green Zones Program would achieve six objectives:

1. Promote environmental justice in the areas where health of residents may be disproportionately affected by surrounding land uses by providing appropriate zoning requirements for industrial uses, vehicle-related uses, and recycling uses, aligned with the State's environmental justice initiatives such as the Planning for Healthy Communities Act (SB 1000)¹ and California Global Warming Solutions Act of 2006 (AB 32 and SB 535).^{2,3,4}
2. Establish Green Zone Districts that address the communities in the unincorporated areas with incompatible land uses to improve the health and quality of life for surrounding residents that have historically borne a disproportionate burden of exposure to pollution.
3. Improve the health and quality of life for surrounding residents of incompatible land uses, aligned with the State's environmental justice initiatives such as the Planning for Healthy Communities Act (SB 1000) and California Global Warming Solutions Act of 2006 (AB 32 and SB 535).
4. Address incompatible land uses, and address issues such as aesthetics, air pollutants such as respirable particulate matter (PM₁₀) and odors, hazards and hazardous materials, and noise incompatibilities associated with industrial, manufacturing, and commercial land uses, in proximity to sensitive uses and the lack of mechanisms to require appropriate mitigation measures within these communities.
5. Include new regulations for recycling and solid waste facilities, to make County regulations consistent with the California Beverage Container Recycling & Litter Reduction Act (PRC Division 12.1),⁵ Mandatory Commercial Recycling (California Code of Regulations Title 14, Section 18837, Chapter 9.1),⁶ and Short-Lived Climate Pollutants with the intent of reducing pollution associated with waste management, and recycling, including processing of organic waste.
6. Facilitate recycling, recycling collection and processing, and organic waste processing, such as composting and chipping and grinding with zoning requirements.

The Green Zones Program has been developed through a rigorous community engagement process that raises awareness of environmental justice. Ground-truthing activities in the pilot communities, in partnership with community-based organizations and residents, has helped to document environmental hazards block-by-block, and has informed the proposed program's land use policies and identification of Green Zone Districts. The Green Zones Program seeks to develop ways to improve coordination among various regulatory agencies and to support businesses to become better neighbors, helping to mitigate current and prevent future environmental impacts.

The Recycling and Waste Management Revisions would result in a more robust process to permit new types of recycling and waste management facilities using newer technologies in order to meet State requirements, and to further define and provide specific regulations for automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities.

The new policies under the chapters of the County General Plan would include language around promoting environmental justice in areas that bear disproportionate impacts from stationary polluting sources, additional development standards including appropriate technology and building enclosure to address land use incompatibility and encouraging land use patterns that protect the health of sensitive receptors. The edits and additions to policies in these chapters support the incorporation of the Green Zones Program framework into the County General Plan as well as the implementation of the goals of SB 1000 and existing environmental justice language in the County General Plan.

For the abovementioned reasons, the benefits of the proposed program outweigh and override any adverse environmental impacts associated with the program.

E. SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES

Consistent with the requirements of Section 15126.2(c) of the CEQA Guidelines, this section of the PEIR summarizes the potential for implementation of the proposed program to result in significant irreversible environmental changes. Such a change refers to an irretrievable commitment of nonrenewable resources, or other environmental changes that commit future generations to similar uses. In evaluating the potential for irreversible environmental changes, the potential for irreversible environmental changes from potential accidents associated with the proposed program were also considered. The scope of this analysis has been focused on the use of nonrenewable resources to construct improvements required pursuant to the development standards established by the Green Zones Program. The analysis also considers the ongoing commitment of water and energy that would result from operation and maintenance of landscaped setbacks and air filtration systems.

The primary nonrenewable resources that would be affected by implementation of the improvements required pursuant to the development standards established by the Green Zones Program., include fencing, solid wall screening, landscaping buffers, air filtration, paving, lighting, signage, and access and vehicle circulation facilities, would be energy resources. The analysis considers the reasonable estimation of construction and operation scenario evaluated in the PEIR, for anticipated impacts over the 21-year planning horizon. Although not reasonably foreseeable based on current rate of issuance of building permits in the proposed program study area, this section also provides an analysis of the total irreversible environmental change that would result if the proposed development standards were applied to all 134,564 ~~434,567~~ parcels in the proposed program, referred to as the “full build-out” scenario.

The development standards of each element would result in minor additions to existing land uses that would comply with strict building and energy regulations. With regard to energy consumption, the motorized equipment used during construction would comply with California Air Resources Board (CARB) regulations for diesel programs relating to mobile source, stationary engines, and portable equipment. Construction activities required to implement the improvements would be required to comply with energy efficiency standards for design, construction, and operation established by State and County regulations that are among the strictest in the nation, including those specifically required pursuant to the Green Building Operation component of the Energy Expenditure Plan (EEP): Green Building, Low-impact Development, and Drought Tolerant Ordinances, and thus would not constitute an inefficient use of energy. The majority of the proposed improvements would be objects such as walls, fencing, signage, and lighting that would be compliant with Title 31 of the Green Building Codes and would not involve the use of diesel fuels. The South Coast Air Quality Management District (SCAQMD) regulates construction equipment and diesel fuel emissions with the County. Consistent with the objectives of the SCAQMD Commercial Electric Lawn and Garden Program, the County has required the use of electric and manual commercial lawn and garden equipment, including handheld trimmers, chainsaws, pruners, backpack and handheld leaf blowers, and ride-on, stand-on, and walk-behind lawn mowers for landscape areas required in conjunction with the Green Zones Program. The use of electric and manual tools to maintain landscaping optimizes energy efficiency based on Best Available Current Technology. All improvements required to constructed, operated, or maintained would be required to conform to the California Energy Code; therefore, there would be no conflict with the California Code. At the time of this analysis, the County General Plan and Zoning Code do not allow for development of utility-scale renewable energy, and therefore the development standards would have no effect on achieving the Renewable Portfolios Standards (RPS) established by the State. Energy required for construction, operation, and maintenance to implement the proposed improvements such as lighting and signs would be provided by public and investor-owned utilities, such as Southern California Edison, the Metropolitan Water District of Southern California, and other private and municipal power companies

who are required by the State to achieve RPS. Thus, the proposed program would be consistent with State and County goals that encourage reliance on sustainable renewable energy. Therefore, the proposed program would result in less than significant impacts to energy.

F. EFFECTS NOT FOUND TO BE SIGNIFICANT

California Public Resources Code Section 21003 (f) states that “it is the policy of the state that ... [a]ll persons and public agencies involved in the environmental review process be responsible for carrying out the process in the most efficient, expeditious manner in order to conserve the available financial, governmental, physical, and social resources with the objective that those resources may be better applied toward the mitigation of actual significant effects on the environment.” This policy is reflected in CEQA Guidelines Section 15126.2(a), which states that “an EIR shall identify and focus on the significant environmental impacts of the Proposed Project”; and Section 15143, which states that “the EIR shall focus on the significant effects on the environment.” The CEQA Guidelines allow use of an Initial Study to document project effects that are less than significant (Section 15063[a]). CEQA Guidelines Section 15128 requires that an EIR contain a statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant and were therefore not discussed in detail in the Draft EIR.

Such statements are contained in an attached copy of the Initial Study. The Initial Study prepared for the proposed program is provided in Appendix B of this PEIR and satisfies the requirements of CEQA Guidelines Section 15128 for those thresholds not discussed below. Any issues not addressed in this section are addressed in Section IV, *Environmental Impact Analysis*.

In addition to the 6 environmental issue areas evaluated in this PEIR that were determined to have less than significant impacts, 11 additional environmental issue areas were determined to have no impact or less than significant impacts in the Initial Study prepared in support of the Notice of Preparation (NOP):

1. Aesthetics
2. Agriculture and Forestry Resources
3. Energy
4. Geology and Soils
5. Greenhouse Gas Emissions
6. Mineral Resources
7. Population and Housing
8. Public Services
9. Recreation
10. Transportation
11. Wildfire

1. Aesthetics

Consistent with Appendix G of the CEQA Guidelines and the County’s Initial Study Checklist, the analysis concluded that the proposed program would result in a less than significant impact to aesthetics (see Appendix B, *Initial Study*, Section 2.1, *Aesthetics*). The proposed program would not result in significant adverse impacts to aesthetics because the development standards of each element would result in minor additions to existing land uses and would improve the aesthetic qualities of the facilities. With regard to scenic vistas and scenic resources, despite the location of subject parcels in relation to scenic highways, parcels subject to the Green Zones Program would not have a significant adverse impact on scenic vistas nor cause visual blight because the development standards would not block views of resources for which the scenic highways were designated. The proposed program would screen from view incompatible land uses and improve the aesthetic quality of degrading land uses. The development standards and measures of each program element would improve the visual quality of the industrial, commercial, and other facilities along scenic vistas and County-recognized state scenic highway corridors. Additionally, all Hillside Management Area (HMA) parcels of the Green Zones Program would be required to comply with the HMA Ordinance and Hillside Design Guidelines that help preserve and enhance the physical integrity and value of hillsides and associated views. The measures proposed by the proposed program are consistent with the requirements of the five HMA categories: (1) site planning, (2) grading and facilities, (3) road circulation, (4) building design, and (5) landscaping. With regard to trails systems, the elements would not hinder visibility or obstruct views from the Pacific Crest Trail or any of the County’s existing or proposed trails identified in the U.S. Forest Service and the County General Plan trail system or existing regional trails identified on the Trails LA County Website. The proposed development standards have the potential to result in physical changes in the environment that might be visible from and alter the visual character views from the trails include fencing materials; however, these

development standards are consistent with the measures recommended by the County trails manual, including buffers, fencing, walls, open space, and landscaping and planting trees to screen trail view of incompatible adjacent land uses. With regard to visual character, some elements would include requirements such as solid walls, landscaping, setbacks, and building height requirements that are consistent with the underlying land uses; therefore the specified ; development standards would improve the visual quality of the affected by screening industrial land uses from adjacent sensitive uses. With regard to new sources of light, some elements contain provisions for lighting in its development standards while others do not. The use of lighting would not result in light trespass and light pollution, as the County requires that such system be shielded and directed away from sensitive uses and other adjacent properties. Furthermore, should the subject properties fall within an HMA, the revisions would have no adverse impact on light nighttime light trespass, light pollution or daytime light and glare, as they would comply with the HMA Ordinance and Hillside Design Guidelines in providing shielded lighting for nighttime applications and materials with minimal albedo for daytime application along with setbacks and adequate screening. Therefore, the proposed program would result in less than significant impacts to aesthetics.

2. Agriculture and Forestry Resources

Consistent with Appendix G of the CEQA Guidelines and the County's Initial Study Checklist, the analysis concluded that the proposed program would result in no impacts to agriculture and forestry resources (see Appendix B, *Initial Study*, Section 2.2, *Agriculture and Forestry Resources*). The proposed program would not result in significant adverse impacts to agriculture and forestry resources because the development standards of each element would result in minor additions to existing land uses and would not reduce existing agricultural and forestry resources, or lands designated or zoned for such uses. With regard to Farmland, despite some elements' locations within an area which contains Farmland as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program (FMMP), the implementation of the development standards and measures of each element would not differ substantially from existing conditions and would not convert Farmland to non-agricultural uses, or the development standards would be implemented as a part of the use being proposed. With regard to zoning for agriculture and Williamson Act contracts, the County zones some parcels specifically as Agriculture Zones but there are no Williamson Act contracts within the County. For those elements that do apply to Agricultural Zones, there would be no change to underlying Agricultural land use designation or zoning. As defined in Title 22, the purpose of the Agricultural Zones is not solely for agricultural uses, and Zone A-2 allows for many uses beyond agricultural use. Additionally, development standards would not differ substantially from those associated with the existing County General Plan goals and policies for the agricultural land use designations and related Zoning Ordinance. The Green Zone Program does not include provisions that would allow the conversion or rezoning of forest land, timberland, or a Timberland Production Zone. All forests and timber resources located in the Los Angeles County are located within the Angeles National Forest Land, with a small extension into the Los Padres National Forest in the Pyramid Lake Area between Castaic and Gorman. The National Forest are managed by U.S. Forest Service Resource Management Plans and would not be subject to the Green Zones Program. Therefore, there would be no impact on forest or timber reserves. The development articulated in the Green Zones Program would apply to specific existing land uses or would be minimal additions to existing designed agricultural land uses that would not convert agricultural or forest land or resources. Therefore, the proposed program would result in no impacts to agriculture and forestry resources.

3. Energy

Consistent with Appendix G of the CEQA Guidelines and the County's Initial Study Checklist, the analysis concluded that the proposed program would result in a less than significant impact to energy (see Appendix B, *Initial Study*, Section 2.6, *Energy*). The proposed program would not result in significant adverse impacts to energy because the development standards of each element would result in minor additions to existing land uses that would comply with strict building and energy regulations. With regard to energy consumption, the motorized equipment used during construction activities would comply with CARB regulations for diesel programs relating to mobile source, stationary engines, and portable equipment. Construction activities required to implement the improvements would be required to comply with energy efficiency standards for design, construction, operation established by State and County regulations that are among the strictest in the nation, including those specifically required pursuant to the Green Building Operation component of the EEP: Green Building, Low-impact Development, and Drought Tolerant Ordinances, and thus would not constitute an inefficient use of energy. The majority of the proposed improvements are inanimate objects such as walls, fencing, signage, and lighting that would be compliant with Title 31 Green Building Codes and not involve the use of diesel fuels. The SCAQMD regulates construction equipment and diesel fuel emissions with the County. Consistent with the objectives of the SCAQMD Commercial Electric Lawn and Garden Program, the County has required the use of electric and manual commercial lawn and garden equipment, including handheld trimmers, chainsaws, pruners, backpack and handheld leaf blowers, and ride-on, stand-on, and walk-behind lawn mowers for landscape areas required in conjunction with the Green Zones Program. The use of electric and manual tools to maintain landscaping optimizes energy efficiency based on Best Available Current Technology. With regard to energy planning, all improvements required to

constructed, operated, or maintained would be required to conform to the California Energy Code; therefore, there would be no conflict with the California Code. Since, at the time of this analysis, the County General Plan and zoning ordinance do not allow for development of utility scale-renewable energy, the development standards would have no effect on the achieving RPS established by the State. Energy required for construction, operation, and maintenance to implement the proposed improvements such as lighting and signs would be provided by public and investor owned utilities, such as Southern California Edison, and other private and municipal power companies who are required by the State to achieve RPS. Thus, the proposed program would be consistent with State and County goals that encourage reliance on sustainable renewable energy. Therefore, the proposed program would result in less than significant impacts to energy.

4. Geology and Soils

Consistent with Appendix G of the CEQA Guidelines and the County's Initial Study Checklist, the analysis concluded that the proposed program would result in a less than significant impact to geology and soils (see Appendix B, *Initial Study*, Section 2.7, *Geology and Soils*). The proposed program would not result in significant adverse impacts to geology and soils because the development standards of each element would result in minor additions to existing land uses and new development would comply with the regulations in place for the mitigation and avoidance of geologic hazards. With regard to rupture of an Alquist-Priolo mapped fault, the requirements of the Alquist-Priolo Earthquake Fault Zoning Act aim to prevent the construction of residential buildings along traces of active fault. While Alquist-Priolo Earthquake Fault Zones or other active or potentially active faults are located within, near, or projecting toward the proposed program site, the proposed program does not include the development of residential or habitable buildings or structures. Furthermore, through the California Building Code (CBC), building design and construction requirements are implemented to reduce any hazards from earthquakes and safeguard against major structural failures or loss of life caused by earthquakes or seismic related hazards. The improvements constructed and operated as a result of the development standards in the proposed program would be required to adhere to the provisions of the CBC, as required by the County Code during the plan check and development review process, thus reducing potential impacts related to rupture of a known earthquake fault to less than significant levels. Similarly, with regard to seismic ground shaking, the proposed program area contains numerous active earthquake faults, with active or potentially active faults mapped within the proposed program boundaries. However, although strong seismic shaking is a risk throughout Southern California region, the improvements constructed and operated as a result of the development standards in the proposed program site would not exacerbate seismic activity, or the risk of hazards to people or property. Furthermore, the improvements constructed and operated as a result of the development standards in the proposed program would be required to adhere to the provisions of the CBC, as required by the County Code during the plan check and development review process. With regard to seismic-related ground failure (i.e. liquefaction), landslides, and soils, areas of the proposed program site are situated within all of these zones; California Geologic Survey–designated Liquefaction Zones; relatively level ground and steep mountain/canyon slopes that could be potentially susceptible to slope instability; and expansive surficial materials. However, implementation of the improvements constructed and operated as a result of the development standards in the proposed program would not exacerbate underlying geologic, seismic, and soil conditions at the proposed program site resulting in seismic related ground-failure or liquefaction, landslides, or soil hazards. The improvements constructed and operated as a result of the development standards in the proposed program would be required to adhere to existing building and grading codes including adherence to provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to liquefaction, potential seismic-related ground failure, landslides, expansive soils, or potential geologic or soil stability issues. Compliance with existing state and County regulations, as well as the goals and policies included as part of the proposed program, would ensure that the impacts associated with implementation of the proposed program in relation to liquefaction, would be minimized to less than significant levels. The proposed program would be developed in accordance with the CBC, the Safety Element of the County General Plan, and the County's zoning standards and requirements. Furthermore, construction activities on any project sites larger than 1 acre would be subject to National Pollutant Discharge Elimination System (NPDES) requirements, and the preparation and implementation of a Stormwater Pollution Prevention Plan (SWPPP) would be required as well as deployment of approved erosion control best management practices (BMP). With regard to HMAs, all elements of the proposed program would comply with the HMA Ordinance and Hillside Design Guidelines that help preserve and enhance the physical integrity and value of hillsides. Therefore, the proposed program would result in less than significant impacts to geology and soils.

5. Greenhouse Gas Emissions

Consistent with Appendix G of the CEQA Guidelines and the County's Initial Study Checklist, the analysis concluded that the proposed program would result in a less than significant impact to greenhouse gas (GHG) emissions (see Appendix B, *Initial Study*, Section 2.8, *Greenhouse Gas Emissions*). The proposed program would not result in significant adverse impacts to greenhouse gas emissions because the development standards of each element would result in minor additions to existing land uses and would result in a net decrease in GHG emissions. With regard to generation of GHG emissions, the motorized equipment used

during construction would comply with CARB regulations for diesel programs relating to mobile source, stationary engines, and portable equipment. Construction related to implementation of the proposed program's technological updates would be short-term, and GHG emissions impacts would be addressed under federal, State, and County regulations related to GHG emissions reductions, including those specifically required pursuant to the Green Building Operation component of the EEP: Green Building, Low-impact Development, and Drought Tolerant Ordinances. Compliance with the specified Ordinances ensures consistency with the Southern California Association of Governments (SCAG) 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and the County's Community Climate Action Plan (CCAP) regional goals for target reductions in GHGs. Rather than causing direct or indirect impacts to regional GHG emissions, the Green Zones Program implements statewide initiatives to that would have an overall reduction in the direct impact of GHG emissions to surrounding land uses produced by industrial sites. A net reduction of GHG emissions during project operation would reduce construction GHG emissions produced over the course of the phasing of the proposed program. With regard to conflict with any plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases, rather than conflict with any of these plans, the proposed program would be consistent in achieving their goals. The proposed program component would be consistent with the Climate Change Scoping Plan and the 2020-2045 RTP/SCS goals by addressing harmful air pollutants and protect the communities emitted from industrial facilities. Furthermore, the encouragement of the development of organic waste facilities to divert organic waste from landfills and repurposing for repurposing those materials to feed food-insecure people, make carbon sequestering fertilizers and soil amendments, and generate clean, low-carbon renewable energy is consistent with the SCAG RTP/SCS, the CCAP, and Statewide legislations for target reductions in GHGs. The proposed program would also be consistent with the CCAP by focusing on public health and community well-being through the requirement of development standards for industrial facilities. The Green Zones Program is consistent with Statewide Legislation for the reduction of GHG emissions associated through diversion of organic waste from landfills in relation to SB 1383, AB 1826, AB 1594, and AB 341. Therefore, the proposed program would result in less than significant impacts to GHG emissions.

6. Mineral Resources

Consistent with Appendix G of the CEQA Guidelines and the County's Initial Study Checklist, the analysis concluded that the proposed program would result in no impacts to mineral resources (see Appendix B, *Initial Study*, Section 2.12, *Mineral Resources*). The proposed program would not result in significant adverse impacts to mineral resources because the development standards of each element would result in minor additions to existing land uses, including more restrictive allowance in relation to solid waste and recycling facilities. Some elements of the proposed program fall within Mineral Resource Zone-2 (MRZ-2), which contain active mines, and fall within the mineral resource zones designated on the County General Plan. However, in the case of updated standards for existing industrial uses, the implementation of these measures are consistent with the underlying land uses; therefore the specified development standards would not impair the recovery and use of minerals resource, but would be limited to visual screening of industrial land uses from adjacent sensitive uses. The industrial uses would already exist within any MRZ, mine, or County-designated resource, and therefore the proposed program would not result in the loss of availability of a mineral resource as it would not differ substantially from existing conditions. Any construction resulting from compliance with development standards would be minimal and would not substantially alter the existing conditions such that the mineral resources would be lost. New development incorporating the development standards of the proposed program would subject to environmental review under CEQA in relation to mineral resources. Therefore, the proposed program would result in no impacts to mineral resources.

7. Population and Housing

Consistent with Appendix G of the CEQA Guidelines and the County's Initial Study Checklist, the analysis concluded that the proposed program would result in no impacts to population and housing (see Appendix B, *Initial Study*, Section 2.14, *Population and Housing*). The proposed program would not result in significant adverse impacts to population and housing because, with regard to inducing unplanned population growth, directly or indirectly, the proposed program would not change the pattern of parcels allowable for residential use or development. does not include the development of new homes and would not include the extension of access roads or utilities to new areas that would facilitate development. It would not require new or expanded facilities, increasing the need for employees. Additionally, the Green Zones Program would not include or require the extension of infrastructure into areas not currently served by roads and utilities. Construction activities for implementation of the proposed program would not require temporary housing for the manufacturing facility workers due to the urban context. With regard to displacement of people or housing, there is no affordable housing located or planned for the parcels subject to the new development standards for the proposed program. The proposed program would not require vacating existing residences, as no people reside in the applicable zoning areas. Therefore, the proposed program would result in no impacts to population and housing.

8. Public Services

Consistent with Appendix G of the CEQA Guidelines and the County's Initial Study Checklist, the analysis concluded that the proposed program would result in no impacts to public services (see Appendix B, *Initial Study*, Section 2.14, *Public Services*). The proposed program would not result in significant adverse impacts to public services because the proposed program would not include the development of new or physically altered governmental facilities. The development would occur on new or existing industrial, recycling and solid waste, vehicle-related, commercial, or sensitive land uses. While some elements of the proposed program, such as Element 4, Storage Enclosures for Recycling and Solid Waste, would apply to public facilities such as fire stations, sheriff stations, schools, parks, libraries, or other, the development standards and measures would not create capacity or service-level problems nor expand the facilities substantially, given that the development standards of each element would result in minor additions to existing or future public services facilities that would typically involve less than 1 percent of the parcel. The Storage Enclosures for Recycling and Solid Waste Revisions is a requirement to build better enclosures for trash receptacles and would not change the total number of parcels that are authorized for development of most land uses in the unincorporated territory of the County. Additionally, the proposed program would not indirectly increase the demand for these facilities, as the proposed program would not change the underlying land use designation, with the exception of ~~27~~ 28 parcels where the intensity of the allowed industrial land use would be reduced. Rather, Element 4 would require that trash and recycling receptacles at public service facilities be screened from view from adjacent sensitive land uses. Therefore, the proposed program would result in no impacts related to public services.

9. Recreation

Consistent with Appendix G of the CEQA Guidelines and the County's Initial Study Checklist, the analysis concluded that the proposed program would result in no impacts to transportation (see Appendix B, *Initial Study*, Section 2.16, *Recreation*). The proposed program would not result in significant adverse impacts to recreation because none of the elements of the proposed program would include the construction or expansion of parks or recreational facilities. The proposed program would not induce growth or concentration of population. The proposed program would not include the development of new homes, businesses, roads, or utilities and would thereby not induce substantial unplanned population growth, directly or indirectly, in the County. The proposed program would entail improvements that would apply to specific industrial, recycling and solid waste, vehicle-related, commercial, or sensitive land uses and would not be expected to result in a significant increase in the number of people, residents, or visitors to existing park facilities that would increase use of existing neighborhood and regional parks or other recreational facilities such that it would contribute to their physical deterioration. With regard to trail connectivity, the implementation of each element's development standards and measures would not differ substantially from existing conditions, such that they would interfere with regional trail connectivity. These development standards would be minimal additions to existing uses and would be made behind property lines, and therefore would not interfere with existing trails nor regional trail connectivity. Therefore, the proposed program would result in no impacts to recreation.

10. Transportation

Consistent with Appendix G of the CEQA Guidelines and the County's Initial Study Checklist, the analysis concluded that the proposed program would result in less than significant impacts to transportation (see Appendix B, *Initial Study*, Section 2.17, *Transportation*). The proposed program would not result in significant adverse impacts to transportation because the development standards of each element would result in minor additions to existing land uses. With regard to plans, policies, and regulations addressing circulation, the proposed program would retain existing zoning designations for industrial uses and not impede upon State, regional, and County plans to increase multi-modal transportation access. It would comply with the applicable plans for circulation: California Complete Streets Act (AB 1358), 2020-2045 RTP/SCS, County General Plan, and Los Angeles County Congestion Management Plan. The proposed program elements would not generate a substantial increase in traffic because they would not involve the expansion of the facilities or operations; therefore, there would be no impact to sidewalks, bike lanes, roads, or transit stops. Improvements required by these revisions would be interior to the subject property parcels; therefore, there would be no impact to sidewalks, bike lanes, roads, or transit stops. With regard to per capita vehicle miles traveled (VMT), although construction activities for implementation of the required improvements would result in a minor increase in transport of construction equipment and on-road equipment to parcels where improvements would be required to be constructed in conjunction with the proposed development standards, such activities would be expected to apply to approximately 2,700 existing industrial land use parcels a year over a 7-year period of time, and less than 1 percent of all ministerial and discretionary permits in the County between 2021 and 2041. Therefore, the required movement of labor and equipment would be insufficient to result in a discernible increase to per capita VMT in the unincorporated territory of the County. Similarly, implementation of the improvements required to be operated and maintained as a result of the development standards in the proposed program largely consist of features such as walls, enclosures, landscaping, and air filtration systems that would be limited to minor routine

maintenance and would not involve an increase in per capita VMT. Landscaped setbacks could require as much as weekly visits for routine maintenance; however, such improvements would apply to very low percentage of parcels in the unincorporated territory of the County and would be insufficient to result in a discernible increase to per capita VMT. The proposed program would result in no impacts regarding population growth or displacement. The proposed program would require improvements to specified land uses, but would not change the underlying pattern of general plan land use designations or zoning designations; therefore, the Green Zones Program would not introduce or facilitate development beyond that contemplated in the County General Plan, and would not increase per capita VMT. Where a new land use subject to the Green Zones Program is proposed, the new development project would be required to undergo CEQA evaluation of the specific project, including VMT analysis. With regard to road design, the Green Zones Program proposes additional standards that are designed improve circulation safety for vehicles, bicyclists, and pedestrians in the program area, such as on-site vehicle circulation, loading and unloading in rear or side of structures, reduction in potential parking overflow onto public streets, preserving required existing parking spaces and associated maneuvering areas, and maintaining the required line of sight for safe pedestrian and vehicular movement. Improvements required by the Green Zones Program would be interior to the subject property parcels; therefore, there would be no impact to sidewalks, bike lanes, roads, or transit stops. The proposed program would not facilitate or cause changes to the design of existing roads. With regard to emergency access, as the Green Zones Program would not result in changes to any existing roadways, and development standards would be placed behind property lines outside of public rights-of-way, so there would be no effect on emergency access. Additionally, as stated in Section 2.20, *Wildfire*, of the Initial Study, the proposed program would have no impact on existing emergency evacuation plans and roads. Therefore, the proposed program would result in less than significant impacts to transportation.

11. Wildfire

Consistent with Appendix G of the CEQA Guidelines and the County's Initial Study Checklist, the analysis concluded that the proposed program would result in a less than significant impact to wildfire (see Appendix B, *Initial Study*, Section 2.20, *Wildfire*). The proposed program would not result in significant adverse impacts to wildfire because the development standards of each element would result in minor additions to existing land uses. The implementation of these development standards and measures would not differ substantially from existing conditions such that they would result in any impacts by increasing wildfire risk or hindering emergency response because the proposed improvements are not located in or near State Responsibility Areas (SRAs) or classified as Very High Fire Hazard Severity Zones (VHFHSZs) or classified as other levels of Fire Hazard Severity Zones (FHSZs). Improvements would be accomplished within the properties and would not require lane closures or other temporary impairment of emergency response plans or evacuation routes. In addition, the existing development standards for fire and existing building code would apply. Public Works maintains a list of disaster routes in the Los Angeles County Operational Area by city that have been preidentified for use during times of crisis. Emergency response and evacuation routes are already in place throughout the County where current Fire Department services already provide as fire, safety and emergency medical services to all the unincorporated areas. The Operational Area Emergency Response Plan (OAERP) strengthens short and long-term emergency response and recovery capability and identifies emergency procedures and emergency management routes in the County. The OAERP's short and long-term emergency response and recovery capability, emergency procedures, and emergency management routes in the County would facilitate the evacuation process during a wildfire. The measures such as construction of solid walls and planting trees would comply with enclosure standards including site setback, maintenance and operation standards, access and vehicle circulation standards, in addition to County fire and building codes and standards for fire prevention that would avoid rather than expose people to pollutants. The development standards would not exacerbate fire risk. In addition to the County General Plan, fire prevention regulations per the County Fire Department, Public Works, and Building and Safety would also apply, consisting of vegetation management, pre-fire management and planning, fuel modification program, brush clearance inspections, enforcement of fire and building codes per Title 20, 21, 26, and 32 requirements of the fire code for development in FHSZs. Other fire prevention and building regulations under Title 20, 21, and 26 include access and circulation standards, fire access and road clearances, fire flow and fire hydrant standards, brush clearances around structures within hillsides areas considered primary wildland fire risk areas, defensible spaces, utility easement access for fire protection, building standards within Wildland-Urban Interface (WUI), plan review and approval process for land development projects within VHFHSZs, and integrated Vegetation Management Program (VMP). Therefore, the proposed program would result in less than significant impacts to wildfire.

SECTION IX

ACRONYMS, ABBREVIATIONS, AND DEFINITIONS

Acronyms and Abbreviations

μmhos/cm	micromhos per centimeter
1,2,3-TCP	1,2,3-trichloropropane
AB	Assembly Bill
ACHP	Advisory Council on Historic Preservation
afy	acre-foot per year
<u>AHMP</u>	<u>All-Hazard Mitigation Plan</u>
ALUC	Los Angeles County Airport Land Use Commission
ALUCP	Airport Land Use Commission Plan
APCD	Air Pollution Control District
AQMP	Air Quality Management Plan
ARA	Agricultural Resource Area
ASBS	Areas of Special Biological Significance
BAAQMD	Bay Area Air Quality Management District
BACT	best available control technology
BGEPA	Bald and Golden Eagle Protection Act
BMPs	best management practices
Board	County Board of Supervisors
CAA	Clean Air Act
CAAQS	California Ambient Air Quality Standards
Cal ARP	California Accidental Release Prevention Program
Cal OES	California Governor's Office of Emergency Services
CalEEMod	California Emissions Estimator Model
CalEPA	California Environmental Protection Agency
<u>CAL FIRE</u>	<u>California Department of Forestry and Fire Protection</u>
CALGreen	California Green Building Standards Code
CalRecycle	California Department of Resources Recycling and Recovery
CalSites	Site Mitigation and Brownfields Reuse Program Database
CAPCOA	California Air Pollution Control Officers Association
CARB	California Air Resources Board
CBC	California Building Code
CBOs	community-based organizations
CCAP	Community Climate Action Plan
CCR	California Code of Regulations
CDAA	California Disaster Assistance Act

CDFW	California Department of Fish and Wildlife
CDP	Coastal Development Permit
CEQA	California Environmental Quality Act
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act
CFR	Code of Federal Regulations
CGP	Construction General Permit
CGS	California Geological Survey
CH ₄	methane
CHP	California Highway Patrol
CHRIS	California Historical Resource Inventory System
C-MJ	Major Commercial Zone
CNDDDB	California Natural Diversity Database
CNEL	community noise exposure level
CNPS	California Native Plant Society
CO	carbon monoxide
CO ₂	carbon dioxide
County General Plan	Los Angeles County General Plan 2035
County Register	Los Angeles County Register of Landmarks and Historic Districts
County	County of Los Angeles
C-R	Commercial Recreation Zone
CRA	Community Redevelopment Agency
CRHR	California Register of Historical Resources
CRPR	California Rare Plant Ranks
C-RU	Rural Commercial Zone
CSMD	Consolidated Sewer Maintenance District
CUP	conditional use permit
CUPA	Certified Unified Program Agency
CVP	federal Central Valley Project
CWA	Clean Water Act
dB	decibel
dBA	A-weighted decibels
DDW	Division of Drinking Water
DHS	U.S. Department of Homeland Security
DMA	Disaster Mitigation Act
DOT	United States Department of Transportation
DPH	California Department of Public Health
Draft PEIR	Draft Programmatic Environmental Impact Report
DRP	County of Los Angeles Department of Regional Planning

DSOS	California Division of Safety of Dams
DTSC	California Department of Toxic Substances Control
DWR	Department of Water Resources
EEP	Energy Efficiency Plan
EJ	environmental justice
EJSM	Environmental Justice Screening Method
EO	Executive Order
EPA	U.S. Environmental Protection Agency
EPCRA	Emergency Planning and Community Right-to-Know Act
ESA	Endangered Species Act
ESCP	Erosion and Sediment Control Plan
EWMPs	Enhanced Watershed Management Programs
FAA	Federal Aviation Administration
FAR	floor area ratio
FEMA	Federal Emergency Management Agency
FHSZ	Fire Hazard Severity Zone
FHWA	Federal Highway Administration
FIRM	Flood Insurance Rate Map
FMMP	Farmland Mapping and Monitoring Program
FRA	Federal Responsibility Area
ft ²	square feet
FTA	U.S. Department of Transportation Federal Transit Administration
GHG	greenhouse gases
GIS	geographic information system
GLAC	Greater Los Angeles County
GMED	Geotechnical and Materials Engineering Division
gpm	gallons per minute
Green Zones Program	Los Angeles County Green Zones Program
GSA	Groundwater Sustainability Agencies
GSP	Groundwater Sustainability Plan
GWH	gigawatt-hours
H&SC	California Health and Safety Code
H ₂ S	hydrogen sulfide
HAP	hazardous air pollutant
HCP	Habitat Conservation Plan
HEC-6	one dimensional movable boundary open channel flow and sediment
HEC-RAS	Hydrologic Engineering Center River Analysis System
HIA	Health Impact Assessment

HMA	Hillside Management Area
HMTA	Hazardous Materials Transportation Act
HUD	U.S. Department of Housing and Urban Development
HVAC	heating, ventilating, and air-conditioning
IH	Heavy Industrial
IL	Light Industrial
IPaC	Information for Planning and Consultation
IRWM	Integrated Regional Water Management
LACFCD	Los Angeles County Flood Control District
LACFD	Los Angeles County Fire Department
LACSD	Los Angeles County Sanitation Districts
LARWQCB	Los Angeles Regional Water Quality Control Board
LAX	Los Angeles International Airport
LCP	Local Coastal Programs
L_{dn}	day-night average sound level
LEED	Leadership in Energy and Environmental Design
L_{eq}	equivalent sound level
LID	low impact development
L_{max}	maximum sound level
LRA	Local Responsibility Area
LST	localized significance threshold
LTS	less than significant
LU	land use
m^2	square meters
MACT	maximum achievable control technology
MATES	multiple air toxic exposure
MBTA	Migratory Bird Treaty Act
MCL	maximum contaminant level
MCI	maximum contaminant level
MCUP	master conditional use permit
MDAB	Mojave Desert Air Basin
MEP	maximum extent practicable
MFR	Materials Recovery Facility
mg/L	milligrams per liter
mgd	million gallons per day
MICR	maximum individual cancer risk
MRF	materials recovery facility
MRLF	Mesquite Regional Landfill

MRZ	Mineral Resource Zone
MS4	Municipal Separate Storm Sewer System
MT	metric tons
MWD	Metropolitan Water District of Southern California
MWELo	Model Water Efficient Landscape Ordinance
MXD	Mixed-Use Development Zone
MXD-RU	Rural Mixed-Use Development Zone
NAAQS	National Ambient Air Quality Standards
NAGPRA	Native American Graves Protection and Repatriation Act
NAHC	Native American Heritage Commission
NCCP	Natural Community Conservation Plan
NCP	National Contingency Plan
NDMA	N-nitrosodimethylamine
NEPA	National Environmental Policy Act
NESHAPS	National Emission Standards for Hazardous Air Pollutants
NFIP	National Flood Insurance Program
NFRAP	No Further Remedial Action Planned
NHPA	National Historic Preservation Act
NMFS	National Marine Fisheries Service
NO	nitrous oxide
NO ₂	nitrogen dioxide
NOP	Notice of Preparation
NO _x	nitrogen oxides
NPDES	National Pollutant Discharge Elimination System
NPDWRs	National Primary Drinking Water Regulations
NPS	National Park Service
NRF	National Response Framework
NRHP	National Register of Historic Places
NSPS	New Source Performance Standards
OAERP	Operational Area Emergency Response Plan
OHP	California Office of Historic Preservation
ONAC	Office of Noise Abatement and Control
OPR	California Office of Planning and Research
OSHA	Occupational Safety and Health Act
OWTS	Onsite Wastewater Treatment Systems
PACE	Property Assessed Clean Energy
Pb	lead
PCE	perchloroethylene

PEIR	Programmatic Environmental Impact Report
PM ₁₀	Respirable particulate matter
PM _{2.5}	Fine particulate matter
PMF	Probable Maximum Flood
PMP	Probable Maximum Precipitation
ppb	parts per billion
PPD-8	Presidential Policy Directive 8: National Preparedness
PPV	peak particle velocity
PRC	Public Resources Code
PRPs	potentially responsible parties
PTC	Permit to Construct
PTE	potential to emit
PTO	Permit to Operate
Public Works	Los Angeles County Department of Public Works
RCP	reinforced concrete piping
RCRA	Resource Conservation and Recovery Act
RCRIS or RCRAInfo	Resource Conservation and Recovery Act Information System
RMPP	California Risk Management and Prevention Program
ROG	reactive organic gases
RPS	renewable portfolio standard
RTP/SCS	Regional Transportation Plan/Sustainable Communities Strategy
RWQCB	Regional Water Quality Control Board
SAMS	Sediment Assessment and Monitoring Sheet
SARA	Superfund Amendment and Reauthorization
SB	Senate Bill
SBA	U.S. Small Business Administration
SCAB	Southern California Air Basin
SCAG	Southern California Association of Governments
SCAQMD	South Coast Air Quality Management District
SCE	Southern California Edison
SDWA	Safe Drinking Water Act
SEA	Significant Ecological Area
SEATAC	Significant Ecological Areas Technical Advisory Committee
SERAs	Sensitive Environmental Resource Areas
SGMA	California Sustainable Groundwater Management Act
SHL	California Historical Landmarks
SHMP	State Hazard Mitigation Plan
SHPI	California Points of Historical Interest

SHPO	State Historic Preservation Officer
SHRC	State Historical Resources Commission
SIP	state implementation plan
SJVAPCD	San Joaquin Valley Air Pollution Control District
SO ₂	Sulfur Dioxide
SPCC	spill prevention control and countermeasure plan
SPR	site plan review
SRA	State Responsibility Area
SSC	species of special concern
SUSMP	Standard Urban Stormwater Mitigation Plan
SWP	State Water Project
SWPPP	Stormwater Pollution Prevention Plan
SWQDV	Stormwater Quality Design Volume
SWRCB	State Water Resources Control Board
TACs	toxic air contaminants
TCE	trichloroethylene

Definitions

Air Quality

Ozone (O₃): Ozone is a secondary pollutant formed by the chemical reaction of volatile organic compounds and nitrogen oxides (NO_x) under favorable meteorological conditions such as high temperature and stagnation episodes. An elevated level of ozone irritates the lungs and breathing passages, causing coughing and pain in the chest and throat, thereby increasing susceptibility to respiratory infections and reducing the ability to exercise. Effects are more severe in people with asthma and other respiratory ailments. Long-term exposure may lead to scarring of lung tissue and may lower the lung efficiency.

Volatile Organic Compounds (VOCs): These are compounds comprised primarily of atoms of hydrogen and carbon. Internal combustion associated with motor vehicle usage is the major source of hydrocarbons, as are architectural coatings. Emissions of VOCs themselves are not “criteria” pollutants; however, they contribute to formation of O₃ and are regulated as O₃ precursor emissions.

Nitrogen Dioxide (NO₂): Nitrogen dioxide is a reddish-brown, reactive gas that is formed in the ambient air through the oxidation of nitric oxide (NO). The principal form of NO₂ produced by combustion is NO, but NO reacts quickly to form NO₂, creating the mixture of NO and NO₂ referred to as nitrogen oxides (NO_x). Major sources of NO_x include power plants, large industrial facilities, and motor vehicles. Emissions of NO_x can potentially irritate the nose and throat and may increase susceptibility to respiratory infections, especially in people with asthma. According to the California Air Resources Control Board (CARB), NO₂ is an oxidizing gas capable of damaging cells lining the respiratory tract. Exposure to NO₂ along with other traffic-related pollutants, is associated with respiratory symptoms, episodes of respiratory illness and impaired lung functioning. Studies in animals have reported biochemical, structural, and cellular changes in the lung when exposed to NO₂ above the level of the current state air quality standard. Clinical studies of human subjects suggest that NO₂ exposure to levels near the current standard may worsen the effect of allergens in allergic asthmatics, especially in children.

Carbon Monoxide (CO): Carbon monoxide is primarily emitted from combustion processes and motor vehicles due to incomplete combustion of fuel. Elevated concentrations of CO weaken the heart's contractions and lower the amount of oxygen carried by the blood. It is especially dangerous for people with chronic heart disease. Inhalation of CO can cause nausea, dizziness, and headaches at moderate concentrations and can be fatal at high concentrations.

Sulfur Dioxide (SO₂): Major sources of SO₂ include power plants, large industrial facilities, diesel vehicles, and oil-burning residential heaters. Emissions of sulfur dioxide aggravate lung diseases, especially bronchitis. It also constricts the breathing passages, especially in asthmatics and people involved in moderate to heavy exercise. Sulfur dioxide potentially causes wheezing, shortness of breath, and coughing. High levels of particulates appear to worsen the effect of sulfur dioxide, and long-term exposures to both pollutants leads to higher rates of respiratory illness.

Particulate Matter (PM₁₀ and PM_{2.5}): The human body naturally prevents the entry of larger particles into the body. However, small particles including fugitive dust, with an aerodynamic diameter equal to or less than 10 microns (PM₁₀) and even smaller particles with an aerodynamic diameter equal to or less than 2.5 microns (PM_{2.5}), can enter the body and are trapped in the nose, throat, and upper respiratory tract. These small particulates could potentially aggravate existing heart and lung diseases, change the body's defenses against inhaled materials, and damage lung tissue. The elderly, children, and those with chronic lung or heart disease are most sensitive to PM₁₀ and PM_{2.5}. Lung impairment can persist for 2 to 3 weeks after exposure to high levels of particulate matter. Some types of particulates could become toxic after inhalation due to the presence of certain chemicals and their reaction with internal body fluids.

Lead (Pb): Lead is emitted from industrial facilities and from the sanding or removal of old lead-based paint. Smelting or processing the metal is the primary source of lead emissions, which is primarily a regional pollutant. Lead affects the brain and other parts of the body's nervous system. Exposure to lead in very young children impairs the development of the nervous system, kidneys, and blood forming processes in the body.

Biological Resources

Critical Habitat: A designated area defined by the United States Fish and Wildlife Services (USFWS) as being important for the survival of species listed pursuant to the federal ESA. The USFWS evaluates the collection of the environmental conditions

(i.e., plant communities, range, elevation, food source, etc.) essential to the continued conservation and preservation of each species listed as federally threatened and endangered.

Federally Designated Sensitive Species: Species that are not listed by the federal government as endangered, threatened, or candidate species but are categorized by the federal government as a federal species of concern. Federal species of concern is a term-of-art that describes a taxon (organism or group of organisms) whose conservation status may be of concern to the USFWS but does not have official status. In addition, federally designated sensitive species include those that are designated as such by the Bureau of Land Management (BLM) and U.S. Forest Service (USFS) on lands that fall under their jurisdiction.

Federally Listed Species: Species provided with special legal protection under the federal ESA. A federally listed endangered species is a species that is in danger of extinction throughout all or a significant portion of its range. A federally threatened species is one likely to become endangered in the absence of special protection or management efforts provided by the listing. A candidate species is one that is proposed by the federal government for listing as endangered or threatened.

Federal Wetlands: Defined by the U.S. Army Corps of Engineers (USACOE) and the U.S. Environmental Protection Agency (EPA) as: “Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.”¹

Habitat Conservation Plans (HCPs): Required by the USFWS as part of an application for an “incidental take” permit for species listed pursuant to the federal ESA. HCPs describe the anticipated effects of the proposed taking, how the impacts will be minimized and mitigated, and how the HCP is to be funded.

Locally Important Species: Species that are not monitored by the resource agencies, but monitored by private organizations or local municipal governments. For the purposes of this EIR, locally important species include those plant species recognized by the California Native Plant Society (CNPS), a private organization dedicated to the conservation of native plants, as well as those recognized by the Audubon Society.

Natural Community Conservation Plan (NCCP): Defined by CDFW as a plan for the conservation of natural communities that identifies and provides for the regional or areawide protection and perpetuation of plants, animals, and their habitats.

Nursery Site: Considered habitat in which native wildlife may establish nests, maternity roosts, dens, or otherwise engage in breeding and/or the rearing of offspring.

Sensitive Plant Community: A native plant community listed on CDFW Natural Communities List as being rare within California or threatened by human actions.

Special Status Species: Species that have been afforded special recognition by federal, state, and/or local resource agencies or jurisdictions, or recognized resource conservation organizations. Special status wildlife species include those that are federally or state-listed as endangered, threatened, or candidate species pursuant to the federal ESA, the California ESA, or other regulations enforced by a federal or state agency; or those species considered by the scientific community to be rare. For this purposes of this analysis, special status species include listed, sensitive, and locally important species.

Species of Special Concern (SSC): Species, subspecies, or distinct population of an animal (bird, mammal, fish, reptile, and amphibian) native to California that currently satisfies one or more of the following criteria: (a) is extirpated from the state or, in the case of birds, in its primary seasonal or breeding role; (b) is listed as federally-, but not state-, threatened or endangered; (c) meets the state definition of threatened or endangered but has not formally been listed; (d) is experiencing, or formerly experienced, serious (noncyclical) population declines or range retractions (not reversed) that, if continued or resumed, could qualify it for state threatened or endangered status; (e) has naturally small populations exhibiting high susceptibility to risk from any factor(s), that if realized, could lead to declines that would qualify it for state threatened or endangered status.

State-designated Sensitive Species: Species that are not listed by the state government as endangered, threatened, or candidate species but are categorized by the state as a species of special concern or fully protected species. A California species of special concern is defined by the California Department of Fish and Wildlife (CDFW) as being a wildlife species that has declining population levels, a limited range, and/or continuing threats that have made it vulnerable to extinction.

¹ U.S. Army Corps of Engineers. 1987. Corps of Engineers Wetland Delineation Manual. Vicksburg, MS.

State-Listed Species: Species provided special legal protection under the California ESA. A state-listed endangered species is a species that is in danger of extinction throughout all or a significant portion of its range. A state-listed threatened species is one likely to become endangered in the absence of special protection or management efforts provided by the listing. A candidate species is one that is proposed by the federal or state government for listing as endangered or threatened.

State Wetlands/Streams: Defined by the California Fish and Game Code. A *stream* is defined as a body of water that flows at least periodically, or intermittently, through a bed or channel having banks and supporting fish or other aquatic life. *Wetlands* are defined as areas having riparian vegetation, without regard to wetland vegetation, soils, or hydrology.

Waters of the United States: Surface waters such as navigable waters and their tributaries, all interstate waters and their tributaries, natural lakes, all wetlands adjacent to other waters, and all impoundments of these waters. On April 21, 2014, the U.S. EPA proposed to refine the definition of waters of the United States to include all tributaries of traditional navigable waters, interstate waters, territorial seas, and impoundments of such tributaries; wetlands adjacent to the foregoing; and waters other than wetlands that are adjacent to other jurisdictional waters.

Wildlife Movement Corridors: Characterized as areas of habitat that are used by wildlife for the purpose of moving between locations.

Cultural Resources

Archaeological site: Defined by the National Register of Historic Places (NRHP) as the place or places where the remnants of a past culture survive in a physical context that allows for the interpretation of these remains. Archaeological remains usually take the form of artifacts (e.g., fragments of tools, vestiges of utilitarian, or non-utilitarian objects), features (e.g., remnants of walls, cooking hearths, or midden deposits), and ecological evidence (e.g., pollen remaining from plants that were in the area when the activities occurred). The Office of Historic Preservation (OHP) defines an archaeological “site” as consisting of three or more related resources discovered in one locality. In the event of archaeological discovery, the resources are collected, documented, and curated at an educational institution, such as a school or a museum. These can include prehistoric (pre-European contact), historic (post-contact), or combination thereof.

Historical Resource: Defined by CEQA as any object, building, structure, site (including archaeological sites), area, place, record, or manuscript that is listed in, or is eligible for listing in, the California Register of Historical Resources (CRHR); officially designated or recognized as historically significant by a local government pursuant to a local initiative or resolution; or identified as significant in a historic resource survey conducted in accordance with the requirements of the CRHR statute (PRC Section 5024.1(g)). Properties listed in, or determined eligible for listing in, the NRHP are automatically listed in the CRHR and are therefore historical resources under CEQA.

Historic Property: Defined by Section 106 as any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an “Indian” (Native American) tribe or Native Hawaiian organization and that meet the National Register criteria.

Prehistoric Period: The era prior to AD 1769. The later part of the prehistoric period (post–AD 1542) is also characterized as the protohistoric period in some areas, which marks a transitional period during which native populations began to be influenced by European presence resulting in gradual changes to their lifeways.

Secretary of the Interior’ Standards and Guidelines: The **Standards** are a series of concepts about maintaining, repairing, and replacing historic materials, as well as designing new additions or making alterations. The **Guidelines** offer general design and technical recommendations to assist in applying the Standards to a specific property. Together, they provide a framework and guidance for decision-making about work or changes to a historic property. The **Standards** and **Guidelines** can be applied to historic properties of all types, materials, construction, sizes, and use. They include both the exterior and the interior and extend to a property’s landscape features, site, environment, as well as related new construction. Federal agencies use the **Standards** and **Guidelines** in carrying out their historic preservation responsibilities. State and local officials use them in reviewing both Federal and nonfederal rehabilitation proposals. Historic district and planning commissions across the country use the **Standards** and **Guidelines** to guide their design review processes. The **Standards** offer four distinct approaches to the treatment of historic properties—preservation, rehabilitation, restoration, and reconstruction with Guidelines for each. The **Standards for the**

Treatment of Historic Properties are regulatory for all grant-in-aid projects assisted through the national Historic Preservation Fund. The **Standards for Rehabilitation**, codified in 36 CFR 67, are regulatory for the review of rehabilitation work in the Historic Preservation Tax Incentives program. The **Guidelines** are advisory, not regulatory.

Unique Archaeological Resource: Pursuant to Section 21083.2 of the PRC, a unique archaeological resource includes artifacts or sites that meet any one or all of the following criteria:

- It has made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States;
- It is associated with the lives of persons important to California's past;
- It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; and/or
- It has yielded, or may be likely to yield, information important to the prehistory or history of California.

Hazards and Hazardous Materials

Acutely Hazardous: Waste that contains such dangerous chemicals that it could pose a threat to human health and the environment even when properly managed.²

Hazard: An event or physical condition that has the potential to cause fatalities, injuries, property damage, infrastructure damage, agricultural loss, damage to the environment, interruption of business, or other types of harm or loss.³

Hazardous: Capable of posing an unreasonable risk to health, safety, or the environment; capable of causing harm.⁴

Hazardous Waste: Hazardous wastes are by-products of society that can pose a substantial or potential risk or hazard to human health or the environment when improperly managed. Hazardous wastes possess at least one of four characteristics: ignitability, corrosivity, reactivity, or toxicity. In addition, this analysis considers those materials classified as hazardous material on lists maintained by the EPA.⁵

Risk: The estimated impact that a hazard would have on people, services, facilities, and structures in a community; the likelihood of a hazard event resulting in an adverse condition that causes injury or damage.

Hydrology and Water Quality

Best Management Practices (BMPs): A BMP is defined by the Stormwater Quality Task Force as any program, technology, process, siting criteria, operating method, measure, or device that controls, prevents, removes, or reduces storm water pollution. Generally, BMPs focus on water quality problems caused by increased impervious surfaces from land development. BMPs are designed to reduce stormwater volume, peak flows, and/or nonpoint source pollution through evapotranspiration, infiltration, detention, and filtration or biological and chemical actions.

A **County Floodway** is the narrower portion of the County Floodplain where floodwaters during the Capital Flood are deepest and fastest moving and where development is most restricted pursuant to County ordinances. The limits of a County Floodway are determined by calculating the point where the velocity of Capital Flood flows is 10 feet per second or the water surface elevation is 1 foot above the Capital Flood water surface elevation. The first of either criterion reached determines the County Floodway width. Where the flow velocity in the County Floodplain exceeds 10 feet per second for the entire width of the floodplain, the County Floodway boundaries are the same as the County Floodplain boundaries. A County Floodway must remain free of obstruction and construction unless engineering analysis demonstrates that the obstruction/construction will not result in any increase in the Capital Flood water surface elevation and a flow velocity of no greater than 10 feet per second.

⁴ Blanchard, Wayne, Ph.D., CEM. 22 January 2008. Guide to Emergency Management and Related Terms, Definitions, Concepts, Acronyms, Organizations, Programs, Guidance and Legislation: A Tutorial on Emergency Management, Broadly Defined, Past, Present, and Future.

⁵ Title 40, Code of Federal Regulations (CFR), Chapter 1, Part 261.

Development in a County Floodway is generally restricted to uses that do not interrupt or significantly speed the natural flow of the water (tennis courts (within reason), swimming pools, stilts, etc.). County Code Section 11.60.020 identifies Floodways, Water Surface Elevations, and Areas of Special Flood Hazard. County Floodway Map Nos. 43-ML26.1, 43-ML27.1, and 43-ML28 are identified in County Code Section 11.60.020. Additionally, County Floodways are shown in Appendix G of the County's Comprehensive Floodplain Management Plan.

A **County Flood Fringe** is the area outside of the County Floodway but still within the County Floodplain. This area can be completely utilized for construction and/or fill, provided the finished floors of new structures, including their basements, lie above the anticipated Capital Flood water surface level.

Ephemeral Drainages: An ephemeral stream has flowing water only during, and for a short duration after, precipitation events in a typical year. Ephemeral stream beds are located above the water table year-round. Groundwater is not a source of water for the stream. Runoff from rainfall is the primary source of water for stream flow.

FEMA Flood Zone Designations: Flood zones are geographic areas that the FEMA has defined according to varying levels of flood risk. These zones are depicted on a community's Flood Insurance Rate Map (FIRM) or Flood Hazard Boundary Map. Each zone reflects the severity or type of flooding in the area. These zones can be categorized as: Moderate to Low Risk Areas, High Risk Areas, High Risk Coastal Areas, and Undetermined Risk Areas.

Floodplain: The lowlands adjoining natural watercourses which will be inundated during the Capital Flood. The County Floodplain is the area that will be flooded to varying depths in a Capital Flood. Any portion of the floodplain may be subject to damaging flows or water depths. The floodplain is composed of two parts: the floodway and the flood fringe.

Floodplain Hazard: Flood hazard areas identified on the Flood Insurance Rate Map are identified as a Special Flood Hazard Area (SFHA). SFHA are defined as the area that will be inundated by the flood event having a 1-percent chance of being equaled or exceeded in any given year. The 1-percent annual chance flood is also referred to as the base flood or 100-year flood.

Hydrologic Unit Code (HUC): The United States is divided and sub-divided into successively smaller hydrologic units which are classified into four levels: regions, sub-regions, accounting units, and cataloging units. The hydrologic units are arranged or nested within each other, from the largest geographic area (regions) to the smallest geographic area (cataloging units). Each hydrologic unit is identified by a unique hydrologic unit code (HUC) consisting of two to eight digits based on the four levels of classification in the hydrologic unit system.

1. The first level of classification divides the Nation into 21 major geographic areas, or regions. These geographic areas contain either the drainage area of a major river, such as the Missouri region, or the combined drainage areas of a series of rivers, such as the Texas-Gulf region.
2. The second level of classification divides the 21 regions into 221 subregions. A subregion includes the area drained by a river system, a reach of a river and its tributaries in that reach, a closed basin(s), or a group of streams forming a coastal drainage area.
3. The third level of classification subdivides many of the subregions into accounting units. These 378 hydrologic accounting units are nested within, or can be equivalent to the subregions.
4. The fourth level of classification is the cataloging unit, the smallest element in the hierarchy of hydrologic units. A cataloging unit is a geographic area representing part of all of a surface drainage basin, a combination of drainage basins, or a distinct hydrologic feature. There are 2264 Cataloging Units in the Nation.

Impaired Waters: Under section 303(d) of the Clean Water Act, states, territories, and authorized tribes are required to develop lists of impaired waters. These are waters that are too polluted or otherwise degraded to meet the water quality standards set by states, territories, or authorized tribes. The law requires that these jurisdictions establish priority rankings for waters on the lists and develop Total Maximum Daily Loads for these waters.

Los Angeles County Capital Flood (Qcap): is the flooding produced by a 50-year frequency rainfall falling on a saturated watershed under burned watershed conditions, where portions of the watershed are subject to burn. The County's hydrologic method for determining its Capital Flood flow also takes into account possible future land uses consistent with the zoning in and land use designation in the County General Plan.

Low Impact Development (LID): As defined by the U.S. EPA, the term low impact development (LID) refers to systems and practices that use or mimic natural processes that result in the infiltration, evapotranspiration or use of stormwater in order to protect water quality and associated aquatic habitat.⁶ EPA currently uses the term green infrastructure to refer to the management of wet weather flows using these processes, and to refer to the patchwork of natural areas that provide habitat, flood protection, cleaner air and cleaner water. At both the site and regional scale, LID and green infrastructure practices aim to preserve, restore and create green space using soils, vegetation, and rainwater harvest techniques. LID is an approach to land development (or re-development) that works with nature to manage stormwater as close to its source as possible. LID employs principles such as preserving and recreating natural landscape features, minimizing effective imperviousness to create functional and appealing site drainage that treat stormwater as a resource rather than a waste product. There are many practices that have been used to adhere to these principles such as bioretention facilities, rain gardens, vegetated rooftops, rain barrels and permeable pavements. By implementing LID principles and practices, water can be managed in a way that reduces the impact of built areas and promotes the natural movement of water within an ecosystem or watershed. Applied on a broad scale, LID can maintain or restore a watershed's hydrologic and ecological functions.

Mudflow: Mudflows result from the downslope movement of soil and/or rock under the influence of gravity.

Non-Point Source Runoff: Runoff that occurs on surfaces before reaching a channel is also called a nonpoint source. If a nonpoint source contains man-made contaminants, the runoff is called nonpoint source pollution. A land area which produces runoff that drains to a common point is called a drainage basin. When runoff flows along the ground, it can pick up soil contaminants including, but not limited to, petroleum, pesticides, or fertilizers that become discharge or nonpoint source pollution.

Perennial Stream: A perennial stream has flowing water year-round during a typical year. The water table is located above the stream bed for most of the year. Groundwater is the primary source of water for stream flow. Runoff from rainfall is a supplemental source of water for stream flow.

Runoff: Runoff is the water flow that occurs when the soil is infiltrated to full capacity and excess water from rain, meltwater, or other sources flows over the land. This is a major component of the water cycle, and the primary agent in water erosion. In addition to causing water erosion and pollution, surface runoff in urban areas is a primary cause of urban flooding, which can result in property damage, damp and mold in basements, and street flooding.

Regional Water Quality Control Board: As a result of the Porter-Cologne Act, nine RWQCBs were established that exercise rulemaking and regulatory activities by basin. Each RWQCB conducts a broad range of activities to protect ground and surface water resources within their respective jurisdictions.

Region 3—Central Coast RWQCB. The Central Coast RWQCB jurisdiction includes Santa Clara (south of Morgan Hill), San Mateo (southern portion), Santa Cruz, San Benito, Monterey, Kern (small portions), San Luis Obispo, Santa Barbara, Ventura (northern portion) counties.

Region 4—Los Angeles RWQCB. The Los Angeles RWQCB jurisdiction includes the coastal watersheds of Los Angeles and Ventura Counties, along with very small portions of Kern and Santa Barbara Counties.

Region 6—Lahontan RWQCB. The jurisdiction of the Lahontan RWQCB extends from the Oregon border to the northern Mojave Desert and includes all of California east of the Sierra Nevada crest, including San Bernardino County and northeastern Los Angeles County.

Tsunami: A tsunami hazard zone is a place that has risk to be flooded due to a tsunami (which is when you get a series of very large waves that continue to build in height as they travel towards shore that are caused by seismic events in the ocean, like earthquakes or undersea volcanic eruptions).

⁶ United States Environmental Protection Agency. Accessed October 16, 2020. *Urban Runoff: Low Impact Development*. Available at: <https://www.epa.gov/nps/urban-runoff-low-impact-development>

Seiche Zone: A seiche is when an enclosed or partially enclosed body of water like a lake experiences oscillations in the water level and standing waves usually due to changes in atmospheric pressure, wind, or a small earthquake. It is like what happens when you slosh water back and forth in a bathtub but on a much larger scale. Strong winds can push water across a lake, so that the elevation of the water is different at each end of the lake. To try to reach equilibrium again, the lake water sloshes back and forth across the lake, creating large standing waves due to the combination of waves moving in the opposite directions, and flooding at the shores as the water comes in and recedes out. A Seiche Zone therefore is an area that has potential for flooding due to these seiche events. For the baseline data, GIS again is usually contacted as they have access to that location. Depending on where your project is located, some municipalities may also have designated seiche runup zones in their General Plan Safety Element.

Land Use and Planning

Hillside Management Areas (HMAs): Areas with 25 percent or greater natural slopes. The Hillside Design Guidelines are required for development in HMAs, unless exempted under the Ordinance's provisions. In hillside areas with less than 25 percent slope, use of the Guidelines is optional but encouraged.⁷ The Guidelines include specific and measurable design techniques that can be applied to residential, commercial, industrial, and other types of projects. Some design techniques may be more appropriate or feasible than others, depending on the type of project, location, size, complexity, site constraints, and other design techniques incorporated into the project.

Land Use Designation: A land use classification with associated land use or management policies. Land use designations are applied to specific areas through the county land use planning processes and culminate in the adoption of a land use element to the General Plan. Some land use designations have been established through legislation (e.g., National Forest), while other designations such as SEAs have been established through policy or planning processes.

Ordinance: A law set forth by a governmental authority; a municipal regulation.

Significant Ecological Areas (SEAs): Officially designated areas within Los Angeles County with irreplaceable biological resources.⁸ The County's SEA Program objective is to conserve genetic and physical diversity within the County by designating biological resource areas that are capable of sustaining themselves into the future.

Zoning Designation: The regulation of the use of real property by local government, which restricts a particular territory to residential, commercial, industrial, or other uses. The local governing body considers the character of the property as well as its fitness for particular uses. It must enact the regulations in accordance with a well-considered and comprehensive plan intended to avoid arbitrary exercise of government power. A comprehensive plan is a general design to control the use of properties in the entire municipality, or at least in a large portion of it. Individual pieces of property should not be singled out for special treatment. For example, one or two lots may not be placed in a separate zone and subjected to restrictions that do not apply to similar adjoining lands.

Noise

Ambient Noise: The level of the total noise in an area.

CNEL: The Community Noise Equivalent Level (CNEL) is the average sound level over a 24-hour period, with a penalty of 5 decibels (dB) added between the hours of 7:00 p.m. and 10:00 p.m., and a penalty of 10 dB added for the nighttime hours between 10:00 p.m. and 7:00 a.m. These increases account for reduced ambient noise levels during these time periods and increased human sensitivity to noise during the quieter periods of the day.

dBA: A-weighted decibels (dBA) are an expression of the relative loudness of sounds in air as perceived by the human ear. In the A-weighted system, the decibel values of sounds at low frequencies are reduced compared with unweighted decibels, in which no correction is made for audio frequency.

⁷ Los Angeles County Department of Regional Planning. Effective November 5, 2015. Hillside Management Area (HMA) Ordinance. Available at: <http://planning.lacounty.gov/hma>

⁸ Los Angeles County Department of Regional Planning. Update effective January 16, 2020. Significant Ecological Areas Program. Available at: <http://planning.lacounty.gov/site/sea/maps/>

Leq: The equivalent-continuous sound (Leq) is the level of a constant sound, expressed in decibels (dB), which in a given time period ($T = T_2 - T_1$) has the same energy as a time varying sound.

Point Source: A single identifiable, localized source of noise.

Sensitive Receptors: These include, but are not limited to, hospitals, schools, daycare facilities, playgrounds, long-term health care facilities, elderly housing and convalescent facilities. These are areas where the occupants are more susceptible to noise impacts.

Tribal Cultural Resources

Cultural Landscape: The National Park Service defines a cultural landscape as a geographic area, including both cultural and natural resources and the wildlife or domestic animals therein, associated with a historic event, activity, or person, or exhibiting other cultural or aesthetic values. There are four general types of cultural landscapes, not mutually exclusive: historic sites, historic designed landscapes, historic vernacular landscapes, and ethnographic landscapes.⁹

Tribal Cultural Resource: Tribal cultural resources are defined in PRC §21074 as sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either included or determined to be eligible for inclusion in the California Register of Historical Resources (California Register) or included in a local register of historical resources, or a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant. A cultural landscape that meets these criteria is a tribal cultural resource to the extent that the landscape is geographically defined in terms of the size and scope of the landscape. A historical resource described in PRC §21084.1, a unique archaeological resource as defined in subdivision (g) of PRC §21083.2, or a “nonunique archaeological resource” as defined in subdivision (h) of §21083.2 may also be a tribal cultural resource if it conforms with the criteria of subdivision (a).

Utilities and Service Systems

Lahontan Regional Water Quality Control Board: The jurisdiction of the Lahontan Regional Water Quality Control Board (RWQCB) extends from the Oregon border to the northern Mojave Desert and includes all of California east of the Sierra Nevada crest. The name of the Region is derived from prehistoric Lake Lahontan, which once covered much of the State of Nevada. Most of the waters of the North Lahontan Basin drain into closed basins which were previously part of Lake Lahontan. Waters of the South Lahontan Basin also drain into closed basin remnants of prehistoric lakes. The Lahontan RWQCB is responsible for implementing the Water Quality Control Plan for the Lahontan Region.

Los Angeles Regional Water Quality Control Board: The Los Angeles RWQCB is one of nine statewide regional boards. The Los Angeles RWQCB protects ground and surface water quality in the Los Angeles Region, including the coastal watersheds of Los Angeles and Ventura Counties, along with very small portions of Kern and Santa Barbara Counties. The Los Angeles RWQCB is responsible for implementing the Water Quality Control Plan for the Los Angeles Region.

Non-hazardous Municipal Solid Waste: More commonly known as trash or garbage—consists of everyday items that are used and then thrown away, such as product packaging, grass clippings, furniture, clothing, bottles, food scraps, newspapers, appliances, paint, and batteries. This comes from homes, schools, hospitals, and businesses.¹⁰

Septic Tank: An underground vessel for treating wastewater from a single dwelling or building by a combination of settling and anaerobic digestion. Effluent is usually disposed of through a dispersal system which consists of one or a combination of leach fields, seepage pits, and/or subsurface drip dispersal system. Settled solids in septic tank are pumped out periodically and hauled to a treatment facility for disposal.¹¹ A septic system is an onsite (or decentralized) wastewater treatment system.

¹⁰ U.S. Environmental Protection Agency. n.d. Wastes – Non-Hazardous Waste – Municipal Solid Waste. <http://www.epa.gov/waste/nonhaz/municipal/>

¹¹ California Association of Sanitation Agencies. n.d. Definition of Terms – S. <http://www.casaweb.org/definition-of-terms/s>

Storm Water and Stormwater: In layman's terms, stormwater is defined as an abnormal amount of surface water due to a heavy rain or snowstorm. The term *storm water* is used when employed by the cited source of information. In all other instances, *stormwater* is used, consistent with the provision of Appendix G of the CEQA Guidelines and as defined by the EPA. Stormwater runoff is generated when precipitation from rain and snowmelt events flows over land or impervious surfaces and does not percolate into the ground. As the runoff flows over the land or impervious surfaces (paved streets, parking lots, and building rooftops), it accumulates debris, chemicals, sediment, or other pollutants that could adversely affect water quality if the runoff is discharged untreated.

Wastewater: The spent or used water of a community or industry that contains dissolved and suspended matter.¹²

¹² California Association of Sanitation Agencies. n.d. Definition of Terms – S. <http://www.casaweb.org/definition-of-terms/s>

Description of project: See Section 1.0, Project Description.

Surrounding land uses and setting: See Section 1.0, Project Description.

Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code § 21080.3.1? If so, is there a plan for consultation that includes, for example, the determination of significance of impacts to tribal cultural resources, procedures regarding confidentiality, etc.?

Note: Conducting consultation early in the CEQA process allows tribal governments, lead agencies, and project proponents to discuss the level of environmental review, identify and address potential adverse impacts to tribal cultural resources, and reduce the potential for delay and conflict in the environmental review process. (See Public Resources Code section 21080.3.2.) Information may also be available from the California Native American Heritage Commission's Sacred Lands File per Public Resources Code section 5097.96 and the California Historical Resources Information System administered by the California Office

of Historic Preservation. Please also note that Public Resources Code section 21082.3(c) contains provisions specific to confidentiality.

DETERMINATION: (To be completed by the Lead Department.)

On the basis of this initial evaluation:

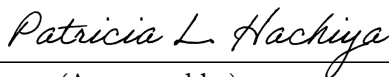

- ☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
- ☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.
- ☒ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.
- ☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
- ☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

EVALUATION OF ENVIRONMENTAL IMPACTS:

- 1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources the Lead Department cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
- 2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
- 3) Once the Lead Department has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.
- 4) "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level. (Mitigation measures from Section XVII, "Earlier Analyses," may be cross-referenced.)
- 5) Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA processes, an effect has been adequately analyzed in an earlier EIR or negative declaration. (State CEQA Guidelines § 15063(c)(3)(D).) In this case, a brief discussion should identify the following:
 - a) Earlier Analysis Used. Identify and state where they are available for review.
 - b) Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of, and adequately analyzed in, an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
 - c) Mitigation Measures. For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.
- 6) Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.
- 7) The explanation of each issue should identify: the significance threshold, if any, used to evaluate each question, and; mitigation measures identified, if any, to reduce the impact to less than significant. Sources of thresholds include the County General Plan, other County planning documents, and County ordinances. Some thresholds are unique to geographical locations.

APPENDICES

A Public Draft Green Zones Program Ordinance

SECTION 1

PROJECT DESCRIPTION

I. INTRODUCTION

This document is an Initial Study to evaluate the potential environmental impacts of the Los Angeles County (County) Green Zones Program (proposed program). The County, administered through the Department of Regional Planning (DRP), has prepared this Initial Study in conformance with the California Environmental Quality Act (CEQA), as established by statute (California Public Resources Code [PRC] Section 21000, et seq.), and the State CEQA Guidelines (Title 14, California Code of Regulations [CCR] Section 15000, et seq.). The County has determined that the proposed program is subject to CEQA, as it requires a discretionary approval by the County. This Initial Study and supporting environmental analysis have been prepared to determine the appropriate level and scope of environmental compliance documentation needed to support the County decision-making process when considering the proposed program for approval.

A detailed description of the proposed program is provided in Section 1.IV.4, *Project Description*, of this document.

II. BACKGROUND

For decades, many communities in the unincorporated areas of Los Angeles County have been disproportionately impacted by pollution from industrial uses, which has impacted air quality, noise, and aesthetics. This pollution has affected the quality of life and health of residents, particularly in communities where zoning and land use patterns resulted in incompatible land uses in close proximity to each other. To address these environmental justice concerns, the County Board of Supervisors (Board), on December 8, 2015, instructed DRP, in coordination with other appropriate departments and stakeholders, to develop targeted land-use policies that can be used to improve the health and quality of life for residents surrounding major sources of pollution, aligned with the State's environmental justice initiatives such as the Planning for Healthy Communities Act (Senate Bill [SB] 1000)¹ and California Global Warming Solutions Act of 2006 (Assembly Bill [AB] 32 and SB 535), by including appropriate policies in the General Plan.^{2,3,4}

DRP established partnerships with community-based organizations (CBOs) in two unincorporated communities that have historically been burdened by pollution impacts. The collaboration enabled DRP to gather firsthand knowledge and experience from community members that would inform policy and land uses changes. Information gathered from various community surveying events coupled with DRP's historical knowledge of polluting sources and community complaints to Zoning Enforcement related to air quality, odor, and noise led to the proposed new regulations of the Green Zones Program.

The Green Zones Program would address incompatible land uses in proximity to sensitive uses and the lack of mechanisms to require appropriate mitigation measures within these communities in the unincorporated County. The County's Zoning Code (Title 22 – Planning and Zoning) currently regulates industrial uses based on the zoning and land use category, without any considerations for proximity to incompatible land uses, such as sensitive uses.⁵

⁴ State of California. Approved by Governor September 30, 2012. Bill Number: SB 535. Available at: http://www.leginfo.ca.gov/pub/11-12/bill/sen/sb_0501-0550/sb_535_bill_20120930_chaptered.html

⁵ County of Los Angeles. Accessed February 26, 2020. Los Angeles County, California – Code of Ordinances. Title 22 – Planning and Zoning. Available at: https://library.municode.com/ca/los_angeles_county/codes/code_of_ordinances?nodeId=TTT22PLZO

In addition, the Green Zones Program would include new regulations for recycling and solid waste facilities in the unincorporated areas of the County, which are sources of pollution. The County's Zoning Code currently regulates recycling facilities and uses in certain zones under a single use category: "junk and salvage." The County's Roadmap to a Sustainable Waste Management Future implements goals and policies designed to meet the State's waste diversion goals as set forth in multiple regulations and legislation including the California Beverage Container Recycling & Litter Reduction Act (PRC Division 12.1)⁶ and Mandatory Commercial Recycling (14 CCR § 18837, Chapter 9.1).⁷ In addition, the County is seeking to reduce emissions consistent with the Short-Lived Climate Pollutants, which is a recent effort under SB 1383 that focuses on waste diversion by promoting organic waste recycling facilities that utilize various up-to-date technologies.⁸ In addition, as part of the Green Zones Program, the County is evaluating the feasibility of a Business Incentive and Support Program. If determined to be feasible, such a program would seek to leverage efforts to help businesses become better neighbors through financial assistance.

The County is proposing the countywide Green Zones Program for the unincorporated areas of the County pursuant to the Los Angeles County General Plan 2035 and Zoning Ordinance to regulate development of industrial uses in proximity to sensitive uses, sensitive uses in proximity to industrial uses, as well as to identify and regulate a set of recycling and solid waste facilities. The proposed ordinance implements relevant goals and policies as set forth below. The County considered four major strategies:

1. Land Use Policy. Environmental Justice issues are inherently related to land use incompatibility and regulations. Toxic pollutants emitted near residential neighborhoods or schools pose serious threats on public health as well as the environment. The Green Zones Program Land Use Policy implementation is proposed to take place through amendments to Divisions 2, 3, 4, 5, 6, and 7 of Title 22. These revisions to Title 22 are the focus of this document (Appendix A, *Public Draft Green Zones Program Ordinance*).

2. Community Engagement. The Green Zones Program has been developed through a rigorous community engagement process that raises awareness of environmental justice. Ground-truthing activities in the pilot communities, in partnership with community-based organizations and residents, has helped to document environmental hazards block-by-block, and has informed the proposed program's land use policies and identified Green Zone District communities.

3. Environmental Justice Screening Method (EJSM). The Green Zones Program's EJSM identifies stationary sources of pollution and analyzes cumulative environmental impacts, based on experts' recommendations and the information gathered from ground-truthing activities. The EJSM was developed for the County by staff at USC PERE / Occidental College, who are experts in the field of Environmental Justice, and who were instrumental in helping develop CalEnviroScreen (an industry-standard Environmental Justice analysis for the State). The EJSM creates a scoring system throughout the County at the census tract level based on hazard proximity to sensitive uses, health risk and exposure, social and health vulnerability, and climate change vulnerability. The overall scores illustrate cumulative pollution impacts that are disproportionately borne by people residing in each census tract. An additional analysis was done by DRP to include "Auto Dismantling / Metal Recycling" facilities in the final scoring (Figure 1.II-1, *Environmental Justice Screening Method Scores*).¹

4. Monitoring and Enforcement. Monitoring and enforcement strategies are important in environmental justice. The Green Zones Program seeks to develop ways to improve coordination among various regulatory agencies and to support businesses to become better neighbors, helping to mitigate current and prevent future environmental impacts.

 Environmental Justice Screening Method Scores

III. PROJECT GOALS AND OBJECTIVES

The following are the goals and objectives of the Green Zones Program:

- Promote environmental justice in the areas where health of residents may be disproportionately affected by surrounding land uses by providing appropriate zoning requirements for industrial uses, vehicle-related uses, and recycling uses, aligned with the State's environmental justice initiatives such as the Planning for Healthy Communities Act (SB 1000)⁹ and California Global Warming Solutions Act of 2006 (AB 32 and SB 535).^{10,11,12}
- Establish Green Zone Districts that address the communities in the unincorporated areas with incompatible land uses to improve the health and quality of life for surrounding residents that have historically borne a disproportionate burden of exposure to pollution.
- Improve the health and quality of life for surrounding residents of incompatible land uses, aligned with the State's environmental justice initiatives such as the Planning for Healthy Communities Act (SB 1000) and California Global Warming Solutions Act of 2006 (AB 32 and SB 535).
- Address incompatible land uses, and address issues such as aesthetics, air pollutants such as PM₁₀ and odors, hazards and hazardous materials, and noise incompatibilities associated with industrial, manufacturing, and commercial land uses, in proximity to sensitive uses and the lack of mechanisms to require appropriate mitigation measures within these communities.
- Include new regulations for recycling and solid waste facilities, to make County regulations consistent with the California Beverage Container Recycling & Litter Reduction Act (PRC Division 12.1),¹³ Mandatory Commercial Recycling (14 CCR § 18837, Chapter 9.1),¹⁴ and Short-Lived Climate Pollutants with the intent of reducing pollution associated with waste management, and recycling, including processing of organic waste.
- Facilitate recycling, recycling collection and processing, and organic waste processing, such as composting and chipping and grinding with zoning requirements.

3. Contact Person and Phone Number:

Tahirah Farris (213.974.6422/6316)
greenzones@planning.lacounty.gov

4. Project Description

The program includes a proposal to adopt the Green Zones Program to promote environmental justice by providing zoning requirements for industrial uses, vehicle-related uses, and recycling and solid waste uses that may disproportionately affect communities surrounding these land uses. The program also defines sensitive uses and requires development standards for new sensitive uses that locate adjacent to or adjoining legally, established industrial, recycling or solid waste, or vehicle-related use. The Green Zones Program would not involve any new construction or physical development and would not result in increased density. The Recycling and Waste Management revisions element of the Green Zones Program would result in providing a more consistent streamlined and simplified process to permit new types of recycling processing facilities using newer technologies in order to meet State requirements, and to further define and provide specific regulations for automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, including auto dismantling yards, scrap metal yards, and junk and salvage yards, organic waste, and solid waste facilities. Additionally, the revisions to Title 22 would result in more restricted locations where certain recycling and waste management facilities could be permitted by prohibiting restricting automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from Hillside Management Areas (HMAs) and Significant Ecological Areas (SEAs). Additionally, pallet yards, chipping and grinding, and mulching facilities would be prohibited in High Fire Hazard Severity Zones (HFHSZs) and Very High Fire Hazard Severity Zones (VHFHSZs); solid waste landfills and inert debris landfills would be prohibited in Federal Emergency Management Agency (FEMA) Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in Agricultural Resource Areas (ARAs), Significant Ecological Areas (SEAs), and Very High Fire Hazard Severity Zones (VHFHSZs). Additionally, combustion and non-combustion biomass conversion organic waste facilities are prohibited in Agricultural Resource Areas (ARAs). The program also includes standards for permitting supermarket accessory recycling collection facilities and new standards for recycling and solid waste enclosures for all non-residential and residential uses with four or more units. The Green Zones Program consists of the following five elements and the associated amendments to the County Zoning Code:

Element 1 – Green Zone Districts

Add Chapter 22.84 to the Zoning Code to establish the Green Zone Districts element of the program to minimize potential adverse health and safety impacts to communities that are disproportionately affected by toxic air pollutants and contaminants such as PM₁₀ and odors generated from various land uses and to promote clean industrial uses (herein referred to as the “Green Zone Districts” element of the program). The Green Zone Districts are identified as the unincorporated communities of Avocado Heights, East Los Angeles, East Rancho Dominguez, Florence-Firestone,

South San Jose Hills, Walnut Park, West Athens-Westmont, West Carson, West Whittier-Los Nietos, West Rancho Dominguez-Victoria, and Willowbrook, (Figure 1.IV-1, *Los Angeles County Planning Areas*). This new chapter creates development standards and procedures for existing and new industrial uses located within 500 feet of a sensitive use on an unincorporated parcel, or a residential use on incorporated parcel to minimize adverse effects related to odor, noise, aesthetic, soil contamination, vehicle circulation, and air quality on nearby sensitive uses. Green Zone Districts are a set of geographic zoning overlays identified based on the high number of stationary sources of pollution near sensitive uses (e.g. residences, schools, and parks) using geographic information system (GIS) data as part of the EJSM. Green Zone Districts would establish new development standards and/or more stringent entitlement processes for specific industrial, recycling and solid waste, or vehicle-related uses if properties are located within a 500-foot radius of a sensitive use of another unincorporated area property or a residential use on a property within incorporated city boundaries (Table 1.IV-1, *Planning and Permitting Requirements*; Table 1.IV-2, *Development Standards*). The zoning code (Title 22) changes would apply to new industrial uses and also require a Schedule for Compliance for existing industrial uses/businesses in the Green Zone District communities. The Schedule for Compliance provides a specific timeline for compliance (3, 5, or 7-10 years) with the new development standards based on the required changes and the type of permitting process. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision allow certain industrial uses in these communities by-right, or through a discretionary review, through the CUP process, and include standards for limited parking, signage, tree planting, and maximum floor area ratio (FAR) requirements. The Green Zones Program would expand discretionary permit requirements for additional land uses and establishes additional standards for fencing materials, solid walls for certain facilities, landscaping buffers and tree planting, paving, signage, lighting, maintenance and operation standards, building height limitations, screening, storage, and vehicle access and on-site circulation.

Due to Board interest in addressing environmental impacts resulting from automobile service (gas) stations and drive-through establishments, and in line with their motion made on June 22, 2021, the Green Zones Program will also require a Conditional Use Permit (CUP) and additional development standards for new automobile service stations and drive-through establishments in Green Zone Districts. Currently, these uses are permitted in commercial zones through a ministerial process. This change would result in the requirement for a discretionary process through a CUP. This change would affect commercial zones in the Green Zone Districts including C-1, C-2, C-3, C-M zones, which comprise approximately 5 percent of the 2,758 parcels in the Green Zone Districts.

Element 2 – New Sensitive Uses

Add Chapter 22.134130 to the Zoning Code to regulate and set development standards for new sensitive uses proposed adjacent to or adjoining an existing, legally established industrial, recycling or solid waste, or vehicle-related uses (herein referred to as “New Sensitive Uses”). Sensitive uses would be defined in Title 22 to include a range of land uses where individuals are most likely to reside or spend time, including dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in the zones where they are located. Sensitive uses shall not include a caretaker residence. New sensitive uses that locate adjacent to or adjoining an existing industrial, recycling or solid waste, or vehicle-related use would be required to comply with development standards including air filtration systems, landscaping landscaped setbacks, solid walls, buffering, and open space. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses.

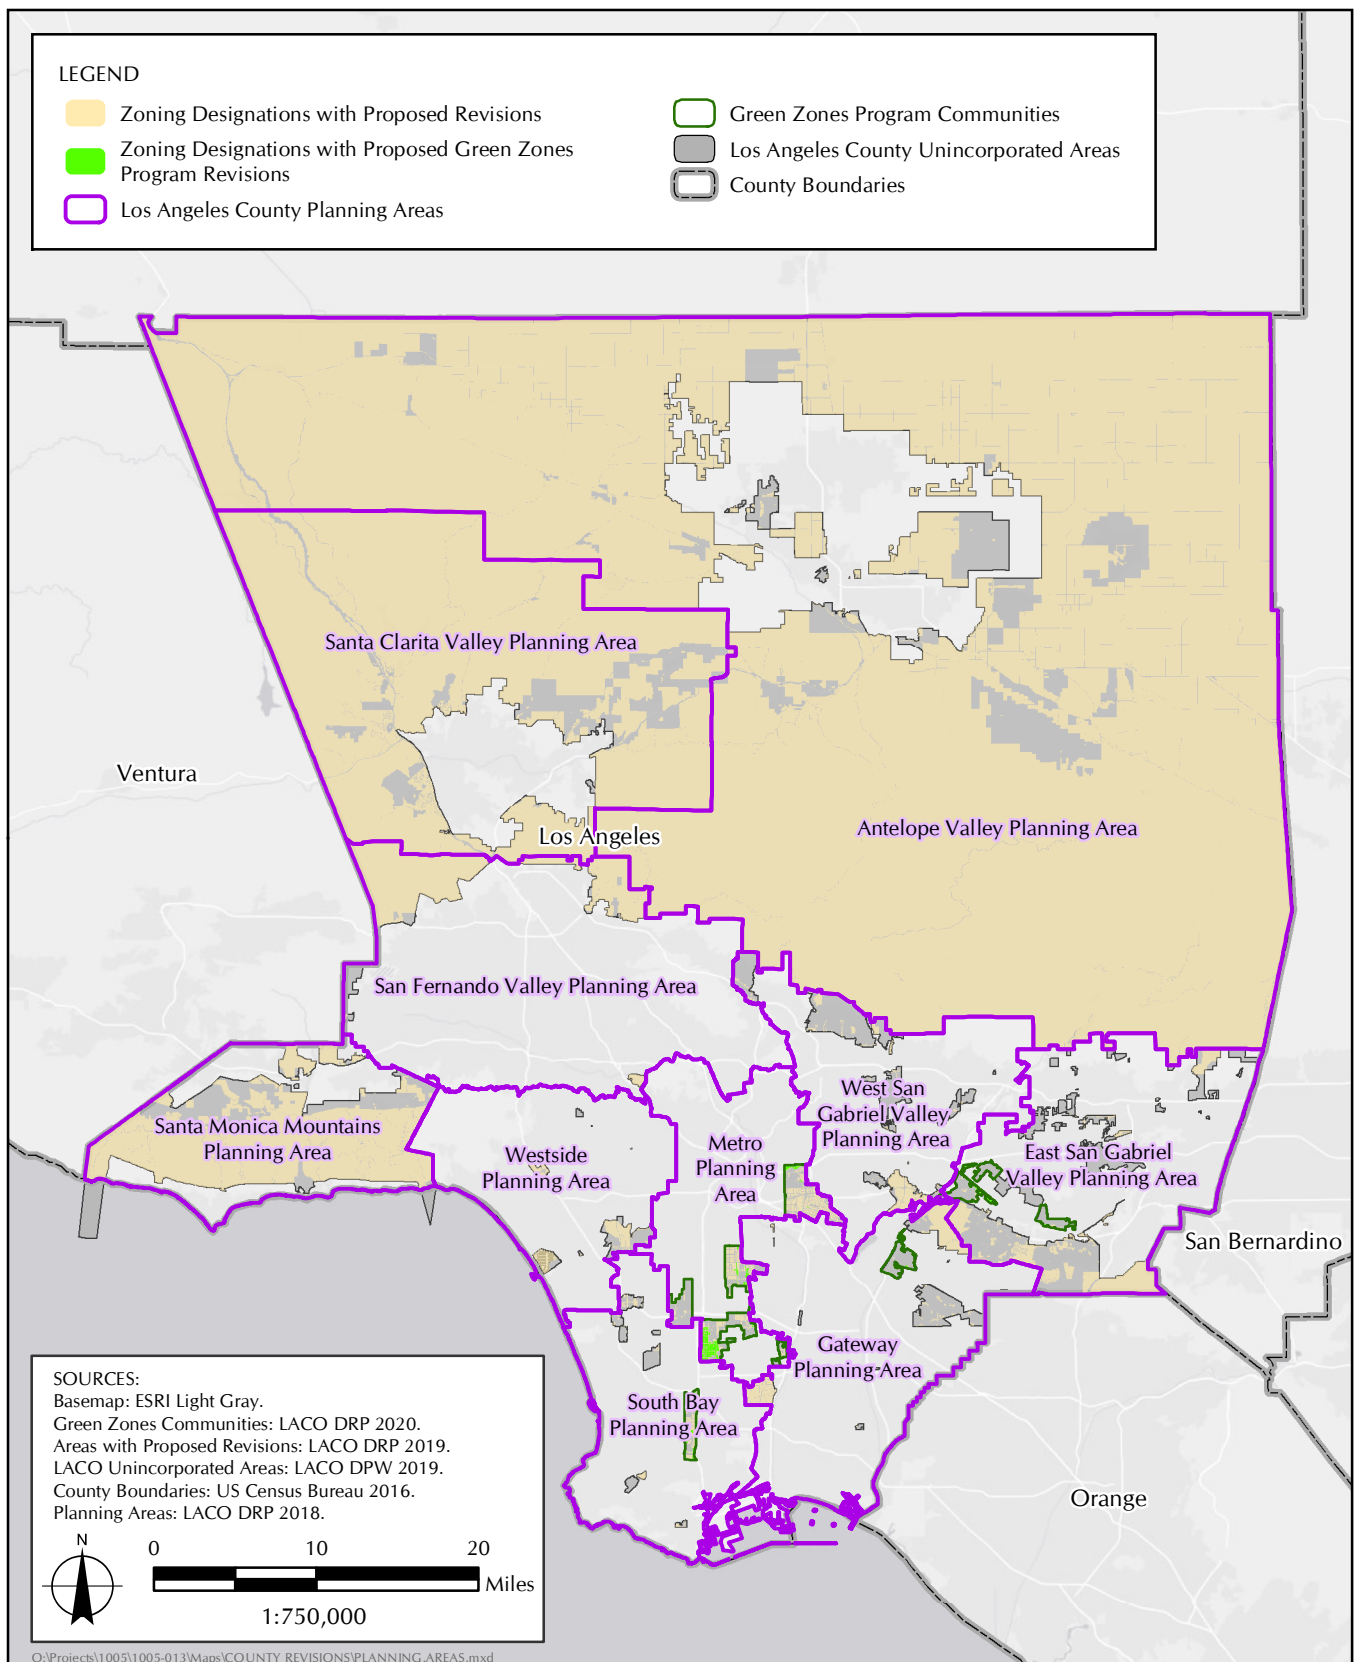

FIGURE 1.IV-1
 Los Angeles County Planning Areas

Element 3 – Recycling and Waste Management Revisions.

Amend Chapter 22.140 of the Zoning Code to revise four, delete one, and add six new sections to the chapter (herein referred to as “Recycling and Waste Management Revisions”). The proposed amendments include the following:

- i) Revise Section 22.140.120 to apply its existing development standards only to Automobile Impound Yards instead of Automobile Dismantling Yards and Junk and Salvage Yards. Removes auto dismantling yards and junk and salvage yards from this section and adds them to a new section for Recycling Processing Facilities (Section 22.140.~~730680~~). See below.
- ii) Revise Section 22.140.350 (Mixed Use Developments in Commercial Zones) to incorporate new standards for Supermarket Accessory Recycling Collection Centers in mixed-use developments in Commercial Zones, prohibiting them within 100 feet of a residence.
- iii) Revise Section 22.140.360 (Mixed Use Developments in MXD-RU) to incorporate new standards for Supermarket Accessory Recycling Collection Centers in mixed-use developments in Mixed Use, Rural Zones, prohibiting them within 100 feet of a residence.
- iv) Revise Section 22.140.430 (Outdoor Storage) to add reference to new Green Zone Districts (Chapter 22.84) in existing Code section for Outdoor Storage development standards to exempt uses subject to Green Zone standards from this section, as they would be regulated by new Green Zone standards. Also adds some clarifying language around types of materials for required fencing and walls. Adds Mixed Use Zones to list of zones where alternative fencing materials may be used if use is not fronting a street or highway.
- v) Delete Section 22.140.530 (Scrap Metal Processing Yards) in its entirety. Removes Scrap Metal Processing Yards as a stand-alone section and incorporates this use under Recycling Processing Facilities (Section 22.140.~~730680~~) to be regulated by new standards proposed. See below.
- vi) Add Section 22.140.~~700650~~ (Pallet Yards) to require a Minor Conditional Use Permit (MCUP) for pallet yards as a primary use in Light Manufacturing and Restricted Heavy Manufacturing Zones (M-1 and M-1.5) and a Site Plan Review in Heavy Manufacturing, Aircraft, and Heavy Industrial (M-2, and M-2.5). ~~In addition, pallet yards would be prohibited in Significant Ecological Areas, High and Very High Fire Hazard Severity Zones, and Agricultural Resource Areas as identified by the County General Plan.~~ Additional development standards include requiring enclosures when adjacent to a sensitive use, solid walls for screening when not enclosed, landscaping buffers, paving, maintenance, lighting, signage, and operation standards.
- vii) Add Section 22.140.~~710660~~ (Supermarket Accessory Recycling Collection Centers) to establish new development standards for recycling beverage containers as an accessory use to a supermarket in all commercial, mixed-use, and industrial zones.
- viii) Add Section 22.140.~~720670~~ (Recycling Collection Facilities) to require a CUP ~~Conditional Use Permit (CUP)~~ for recycling collection facilities and require compliance with standards related to minimum lot area, building height, screening, storage, signage, lighting, and maintenance.
- ix) Add Section 22.140.~~730680~~ (Recycling Processing Facilities) to require a CUP for recycling processing facilities and require compliance with standards for operating recycling processing facilities, including but not limited to auto dismantling yards, scrap metal yards, construction and demolition debris, and inert debris processing facilities. Standards address air filtration, building height, screening, vehicle circulation, storage of materials, signage, paving, access, lighting, and maintenance.
- x) Add Section 22.140.~~740690~~ (Organic Waste Facilities), which will require a CUP for primary uses. Establishes standards for organic waste facilities, including mulching, chipping and grinding, composting, and combustion and non-combustion biomass conversion organic waste conversion.

Standards address air filtration, building height, screening, vehicle circulation, storage of materials, signage, paving, access, lighting, and maintenance. Also establishes requirements and Site Plan Review for small-scale accessory organic waste uses such as composting in Agricultural, Commercial, and Industrial Zones.

- xi) Add Section 22.140.750700 (Solid Waste Facilities), which will require a CUP for solid waste facilities. and establishes standards for solid waste facilities, including solid waste, inert debris landfills, and facilities that convert solid waste to gas or energy. Standards address minimum lot size, air quality, enclosure, screening, vehicle circulation, storage of materials, landscaping, signage, access, and lighting.
- xii) The proposed revisions would prohibit pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs, as identified by the County General Plan.

Currently, a CUP is required for the permitting of a materials recovery facility (MRF), transfer station, land reclamation facility, auto dismantling facility, scrap metal yard, and waste disposal facilities; inert debris landfills, pallet yards, recycling collection facilities, construction and demolition (C&D), inert debris processing facilities, conversion technology (recycling) facilities, chipping and grinding or mulching facilities, composting facilities, including in-vessel composting, anaerobic digestion facilities and combustion and non-combustion biomass conversion organic waste facilities, are not currently defined in the County's Title 22 Ordinance. All of these newly defined use will require a CUP (Table III.E-1). The new development standards and/or more stringent entitlement processes for future entitlements would be subject to a CUP, an MCUP, and/or a Site Plan Review (SPR).

The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collections Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. The discretionary approval is subject to CEQA, and such land use decisions are conditioned on the applicant obtaining all necessary permits through the appropriate agencies.

~~The County currently permits the above uses without a CUP. Additionally, automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities are currently not prohibited in HMAs, SEAs, and VHFHSZs. The proposed Ordinance would prohibit the above uses in these areas and would require a CUP for these uses.~~

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

Add Chapter 22.132428 to the Zoning Code to regulate and set development standards for storage enclosure requirements for Recycling and Solid Waste (herein referred to as “Storage Enclosures for Recycling and Solid Waste Revisions” element of the Program). Any new development or expansion of existing is currently required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation.

Element 5 – Addition of New Uses and Re-Defining/Categorizing Uses in Title 22

Supplemental Revisions to Chapter 22.172; Sections 22.172.050; 22.172.060; Division 10, sections 22.300.020; 22.308; 22.308.040; 22.308.080; 22.308.090; 22.316.040; 22.316.080; 22.324.020; 22.324.040 and chapters 22.14; 22.16; 22.18; 22.20; 22.22; 22.24; 22.26.

Includes the addition of specific recycling and solid waste uses into Title 22 definitions to be regulated countywide. This includes new organic waste facilities such as anaerobic digestion, chipping and grinding, mulching, and composting. This also includes re-categorizing junk and salvage, scrap metal, and auto-dismantling yards under recycling facilities to

allow for improved regulation with new development standards for these types of uses. This also includes changes to various sections of Chapter 22.172 (Nonconforming Uses, Buildings, and Structures) to be consistent with new standards and Schedule for Compliance related to Green Zone Districts (Chapter 22.84). This also makes changes to various sections in Division 10 (Community Standards Districts), including language in Application of Community Standards Districts to Property (22.300.020030) and Community Standards Districts for the following communities: Avocado Heights (22.308), East LA (22.316), and Florence-Firestone (22.324), to be consistent with new development standards in the overlapping Green Zone Districts (Chapter 22.84). Finally, this makes changes to various chapters in Division 3 to update land use regulation summary tables by zones for consistency with new use and development standards in the ordinance.

Green Zones Element 5, *Addition of New Uses and Re-defining/ Categorizing Uses in Title 22*, was determined to not have the potential to result in a direct physical change to the environment. Element 5 consists of new definitions, revisions to land use tables for consistency with the Green Zone Program elements, and revisions that would redefine and recategorize recycling and waste management uses only. No changes to development standards, permitting requirements, or changes to where these uses would be permitted is being proposed in this element of the Ordinance. As a result, this element of the Green Zones Program was not included in the environmental analysis in this document.

General Plan Amendment Revisions

In addition to the revisions to Title 22, the proposed program would also include a General Plan Amendment to ensure consistency with the proposed revisions to Title 22. The proposed program's General Plan Amendment component consists of text changes to policies in Chapter 3 (Guiding Principles), Chapter 6 (Land Use Element), ~~Chapter 13 (Public Services and Facilities Element)~~, Chapter 14 (Economic Development Element), Chapter 16 (General Plan Implementation Programs), and Appendix C (Land Use Element Resources). The edits and additions to policies in these chapters support the incorporation of the Green Zones Program framework into the General Plan as well as the implementation of the goals of SB 1000 and existing environmental justice language in the General Plan.

SB 1000, "The Planning for Healthy Communities Act," requires cities and counties with disadvantaged communities to address certain health considerations within an Environmental Justice element or related goals, policies, and objectives. SB 1000 requires that local jurisdictions include an environmental justice element to their General Plan or related goals, policies, and objectives as they relate to disadvantaged communities in other elements of the General Plan. The Green Zones Program supports the goals of SB 1000 and the implementation of environmental justice throughout the unincorporated areas by identifying communities that disproportionately bear a burden from stationary sources of pollution due to incompatible land uses and better regulating incompatible land uses in close proximity to each other through new Zoning Code definitions, new permitting requirements and development standards.¹⁵

The General Plan currently includes the following environmental justice language:

Environmental justice is the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies.

An environmentally just Los Angeles County is a place where:

- *Environmental risks, hazards, and public service related environmental services, such as trash hauling and landfills, are distributed equitably without discrimination;*
- *Existing and proposed negative environmental impacts are mitigated to the fullest extent to protect the public health, safety, and well-being;*
- *Access to environmental investments, benefits, and natural resources are equally distributed; and*
- *Information, participation in decision-making, and access to justice in environment-related matters are accessible to all.¹⁶*

¹⁵ State of California Department of Justice, Office of the Attorney General. Accessed July 1, 2021 SB 1000 - Environmental Justice in Local Land Use Planning. Accessed July 1, 2021. Available at: <https://oag.ca.gov/environment/sb1000>

¹⁶ Los Angeles County Department of Regional Planning. Final General Plan. October 6, 2015. Available at: https://planning.lacounty.gov/assets/upl/project/gp_final-general-plan.pdf

The new policies under the additional chapters include language around promoting environmental justice in areas that bear disproportionate impacts from stationary polluting sources, additional development standards including appropriate technology and building enclosure to address land use incompatibility, and encouraging land use patterns that protect the health of sensitive receptors.

Additional changes include Zone changes and corresponding changes in the Land Use Designation for a subset of those parcels for consistency and in support of the goals of addressing incompatible land uses.

In order to retain consistency with the General Plan and Title 22 zoning code, 27 ~~28~~ parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 ~~45~~ of the 27 ~~28~~ parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. (Figure 1.IV-2, *Zone Changes and General Plan Amendments*). The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The 14 ~~45~~ parcels included in the general plan amendment and the total 27 ~~28~~ parcels in the zone change are proposed to occur in the same geographic locations as the Green Zone Districts Element (Figure 1.IV-2) and will be evaluated with this element in the analysis.

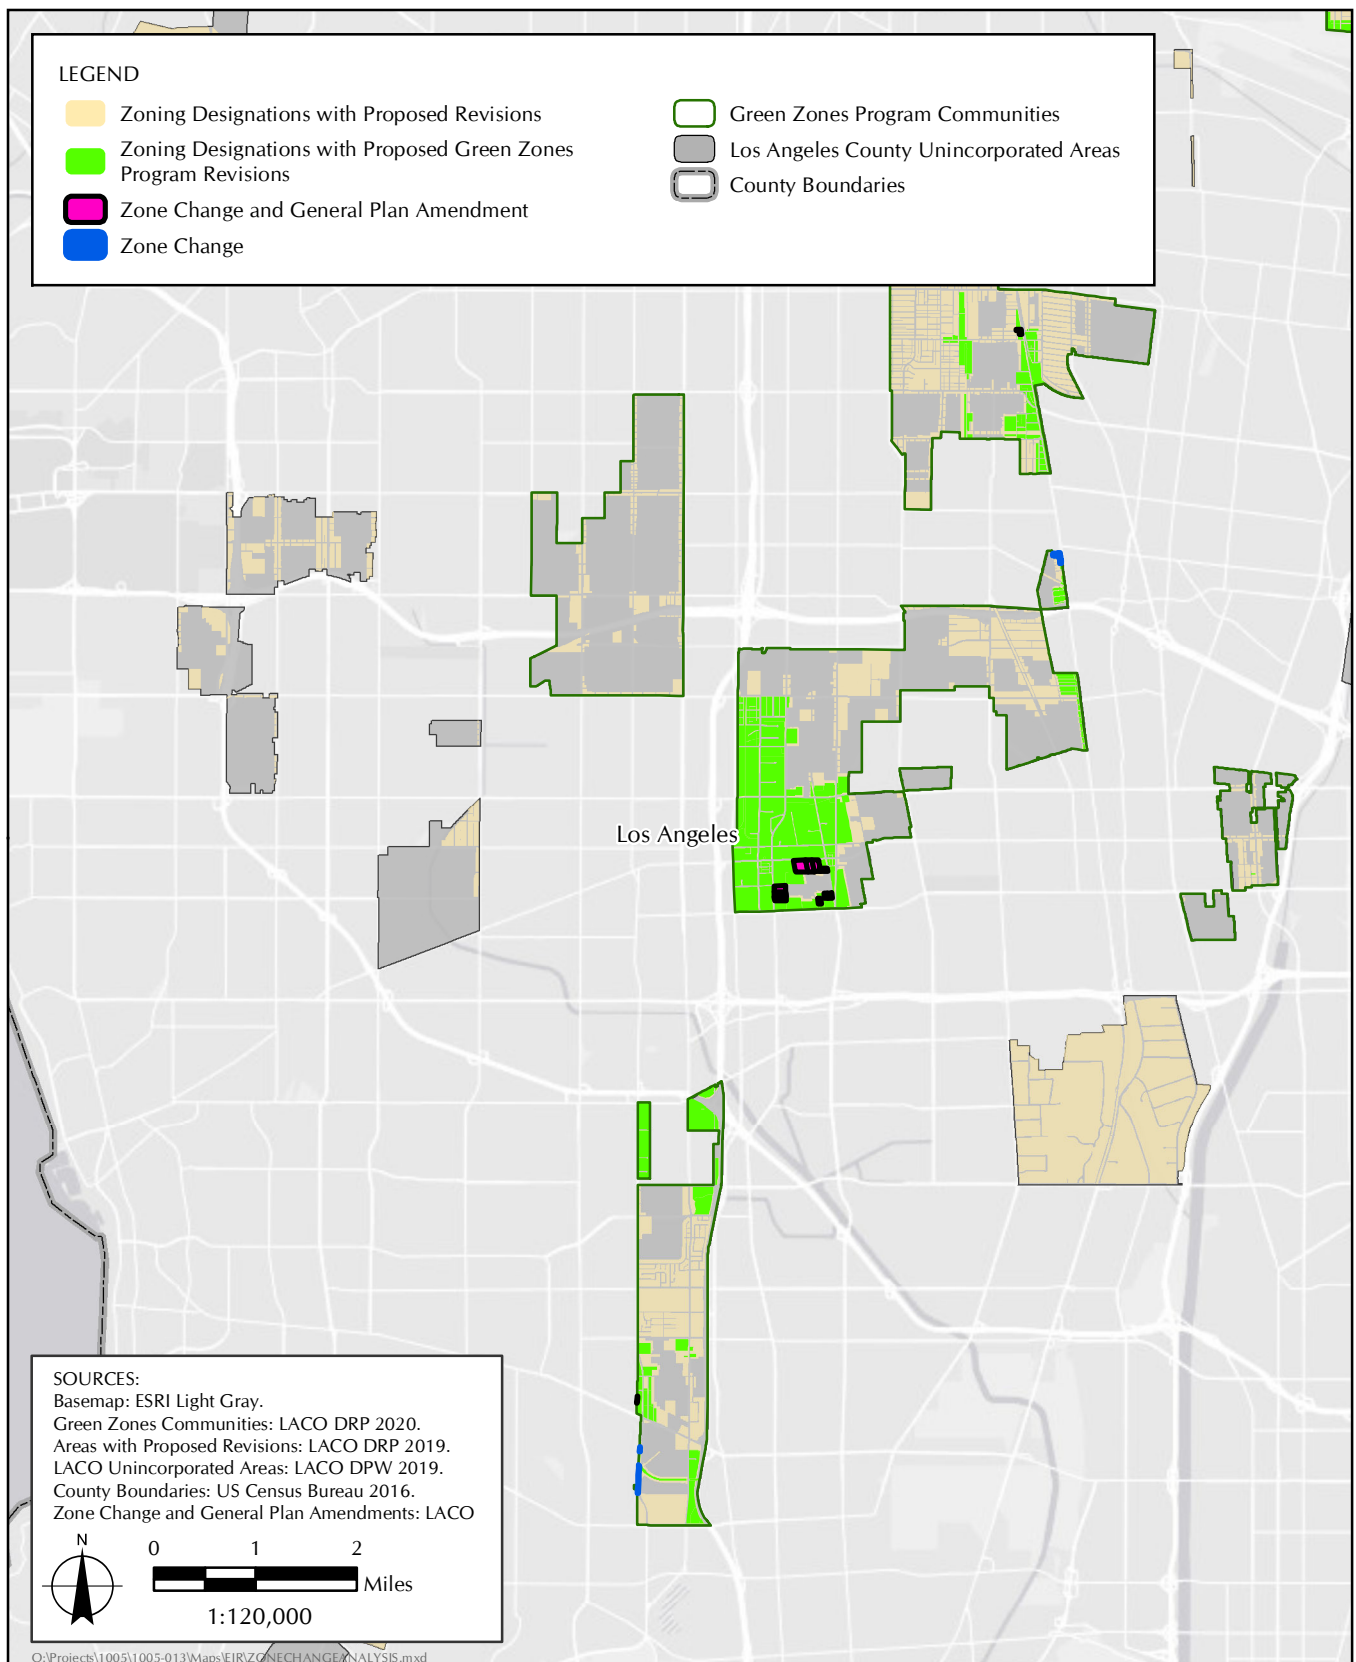

FIGURE 1.IV-2
 Zone Changes and General Plan Amendments

Included in the environmental evaluation undertaken in this EIR are existing General Plan Goals and Policies that the Green Zones Program supports, as well as the new General Plan Goals and Policies, and revisions to existing General Goals and Policies, which are noted in ~~strikethroughs~~, italics, and underlines below:

Chapter 3: Guiding Principles

Environmental Justice (text box)

http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan.pdf

SB 1000 requires that local jurisdictions include an environmental justice element to their General Plan or related goals, policies, and objectives as they relate to disadvantaged communities in other elements of the General Plan. The Green Zones Program supports the goals of SB 1000 and the implementation of environmental justice throughout the unincorporated areas by identifying communities that disproportionately bear a burden from stationary sources of pollution due to incompatible land uses and better regulating incompatible land uses in close proximity to each other through new Zoning Code definitions, new permitting requirements and development standards.

Chapter 6: Land Use Element

II. Background

...

Disadvantaged Unincorporated Legacy Communities (SB 244)

SB 244, which became effective in 2011, requires cities and counties to identify and study the infrastructure needs of disadvantaged unincorporated communities. *These communities were identified and studied only for the infrastructure needs based on the State criteria.* The County used the following criteria to identify “disadvantaged unincorporated legacy communities” as required by state law:

- Parcels are at least 50 years old.
- Parcels are outside of a city’s sphere of influence.
- Parcels are clustered with 10 or more units in close proximity.
- Households earn less than 80% of the state median income.

As shown in Figure 6.4, the majority of parcels identified for SB 244 are concentrated in the eastern portion of the Antelope Valley. The remaining parcels are located in the western portion of the Antelope Valley, Lopez Canyon, Kagel Canyon, Altadena, Hacienda Heights, and Rowland Heights.

Goal LU 7: Compatible land uses that complement neighborhood character and the natural environment. - - Land Use Compatibility

Policy LU 7.1: Reduce and mitigate the impacts of incompatible land uses, where feasible, using buffers, *appropriate technology, building enclosure,* and other design techniques.

Policy LU 7.8: Promote environmental justice in the areas bearing disproportionate impacts from stationary pollution sources.

Goal LU 9: Land use patterns and community infrastructure that promote health and wellness.

Policy LU 9.4: Encourage patterns of development that protect the health of sensitive receptors.

Chapter 14: Economic Development Element

Goal ED 2: Land use practices and regulations that foster economic development and growth.

Policy ED 2.8: Incentivize as much as feasible, environmentally sustainable practices and high standards of development in the communities that bear disproportionate pollution and health impacts.

Policy ED 2.89: Streamline the permit review process and other entitlement processes for businesses and industries.

Policy ED 2.910: Support zoning incentives for the operation of farms in Agricultural Resource Areas (ARAs).

Other Proposed General Plan Revisions

Environmental Justice (text box, page 19, Ch.3 Guiding Principle)

http://planning.lacounty.gov/assets/upl/project/gp_final_general_plan.pdf

SB 1000 requires that local jurisdictions include an environmental justice element to their General Plan or related goals, policies, and objectives as they relate to disadvantaged communities in other elements of the General Plan. The Green Zones Program supports the goals of SB 1000 and the implementation of environmental justice throughout the unincorporated areas by identifying communities that disproportionately bear a burden from stationary sources of pollution due to incompatible land uses and better regulating incompatible land uses in close proximity to each other through new Zoning Code definitions, new permitting requirements and development standards. Related to EJSM

Changes to General Plan LU Element, page 72 (http://planning.lacounty.gov/assets/upl/project/gp_final_general_plan.pdf)

Disadvantaged Unincorporated Legacy Communities (SB 244)

SB 44, which became effective in 2011, requires cities and counties to identify and study the infrastructure needs of disadvantaged unincorporated communities. These communities were identified and studied only for the infrastructure needs based on the State criteria. The County used the following criteria to identify “disadvantaged unincorporated legacy communities” as required by state law:

Chapter 16: General Plan Implementation Programs

Program No.	Program Description	General Plan Goals and Policies	Lead and Partner Agencies	Timeframe
LU 12	<u>Green Zones Program</u> <u>Adopt and implement Green Zones Program to address environmental justice impacts of incompatible land uses in close proximity to each other, promote recycling and waste diversion, and encourage emissions reductions.</u>	<u>Land Use Element:</u> <u>Goals LU 7, LU 9;</u> <u>Policies: 7.1, 7.8, 9.4</u> <u>Goal: ED 2; Policy 2.8</u>	<u>Lead: DRP</u> <u>Partners: DPW,</u> <u>DPH, Fire,</u> <u>LACDA,</u> <u>DCBA</u>	<u>Years 2-6</u>

Changes to GP Appendix C (~~Land Use~~), IV., page 38

http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-appendices.pdf

IV. SB 244 Methodology

As discussed in the Land Use Element, SB244 requires cities and counties to identify and study the infrastructure needs of disadvantaged unincorporated communities. This State bill only focuses on infrastructure needs and does not consider the comprehensive analysis done by the Green Zones Program and EJSM as described below in C.V. In order to meet this state mandate, Los Angeles County utilized GIS to identify sites that match all of the following criteria:

- Parcels are at least 50 years old.
- Parcels are outside of a city's sphere of influence.
- Parcels are clustered with 10 or more units in close proximity.
- Households earn less than 80% of the state median income. (Source 2000 Census, 2010 American Community Survey)

Once sites were identified with GIS, the staff reviewed and refined the list to remove non-qualifying sites.

At end of Appendix C, add:

V. Environmental Justice Screening Method (EJSM)

The EJSM was developed in partnership with USC's Program for Environmental and Regional Equity and Occidental College. The tool is presented using GIS mapping and displays cumulative risks of communities in Los Angeles County that are disproportionately burdened by multiple types of pollution and health risks.

EJSM measures "cumulative impact" by mapping multiple data layers and approximately 40 indicators at the Census Tract level that include sensitive uses, socioeconomic information, and various sources of pollution to come up with a community EJSM score. A complete list of layers can be found here:

http://planning.lacounty.gov/assets/img/gis/agol/Green_Zones_EJSM_Data_Sources.pdf

The categories of cumulative impact include the following:

- Proximity to hazards and sensitive land uses
- Health risk and exposure
- Social and health vulnerability
- Climate change vulnerability

Each category of impact is assigned a score by Census Tract. Then the total cumulative impact scores by Census Tract determine the final EJSM score. EJSM is not a static model but instead is displayed using GIS mapping as it allows for continuous data updates and the overlay of additional data layers as needed. More information is available at:

<http://planning.lacounty.gov/greenzones/ejasm>

The EJSM was one of the key analytic tools used to identify the Green Zone Districts of the County's Green Zones Program. It may be used in the future for other projects consistent with the General Plan.

TABLE 1.IV-1
PLANNING AND PERMITTING REQUIREMENTS

			according to the requirements set forth in Chapter 22.84 (Green Zones District); 8 to 12			Quality Management Districts	approved by the Director		(Directional and/or Informational Signs), and no freestanding signs or portable signs are permitted	contamination, or tracking of dust or mud			
3d	Organic Waste Facilities	Varies from 500 to or 1,500 feet	If an enclosed chipping and grinding or mulching facility site is located within a 500-foot radius from a lot containing a sensitive use, walls and landscaping shall meet the following requirements; 8 to 12	8 to 12 N/A	N/A 4-15-gallon tree for every 50 sq ft of landscaped area. All landscaping shall be drought tolerant	Yes When a building enclosure is provided for facility operation, an appropriate air filtration system shall be required for both indoor and outdoor air quality, as recommended by the Department of Public Health and/or Air Quality Management Districts	Yes On-site vehicular circulation, turnaround, queuing areas, and ingress and egress shall be designated in such a way that they do not impede any other permitted activities and they avoid impacts on the public right-of-way as well as nearby sensitive uses, as approved by the Director and the Department of Public Works.	Yes a. Physical contaminants and refuse removed from feedstock or final products shall be isolated and stored in a solid container and transported to an appropriate off-site waste management facility once per week, or as otherwise approved by the Director. b. All recyclable materials stored on site shall be in designated areas or in receptacles, bins, or pallets in a secured manner, or within an enclosed building.	Yes Each organic waste facility shall provide a perimeter identification sign	Yes All areas designated for operations, storage of materials, and vehicular access shall be maintained and controlled so as to prevent excessive dust generated from operation, offsite water leak or contamination, or tracking of dust or mud, to the satisfaction of the Director and Public Works.	Yes Required for areas designated for vehicle parking, vehicle circulation, or storage of materials or equipment	Yes Facility shall be maintained in a clean, safe and sanitary condition at all times, and maintain a source of running water on site.	Yes No outdoor operation or activities shall be conducted between 9:00 p.m. and 6:00 a.m.; daily
3e	Solid Waste Facilities	N/A 1,500	8 to 12 feet	5-foot minimum	Yes Conversion technology facilities shall provide completely enclosed buildings for all facility operations, including material storage, loading and unloading, and processing of materials.	Yes Conversion technology facilities shall employ an appropriate air filtration system for indoor air quality, in accordance with California 133 Division of Occupational Safety and Health and California Air Resources Board requirements, and for outdoor air quality, in accordance with Air Quality Management Districts.	Yes On-site vehicular circulation, turnaround, queuing areas, and ingress and egress shall be designated in such a way that they do not impede any other permitted activities and they avoid impacts on the public right-of-way as well as nearby sensitive uses, as approved by the Director and the Department of Public Works.	Yes Physical contaminants and refuse removed from feedstock or final products shall be isolated and stored in a solid container and transported to an appropriate off-site waste management facility within seven days.	Yes In addition to the signs permitted by Chapter 22.114 (Signs), and notwithstanding any contrary provisions in Division 10 (Community Standards Districts) in Title 22, each solid waste facility or site shall provide a perimeter identification sign.	N/A	Yes The facility, yard, and equipment shall be equipped with adequate lighting to ensure monitoring and operations. All outdoor lighting shall be directed away from any lots containing residential or agricultural uses.	N/A	N/A

TABLE 1.IV-2
DEVELOPMENT STANDARDS

Sub-Element Number	Green Zones Program Element and Sub-Elements	Sensitive Use Buffer Area of Affect (Feet)	Walls (feet)	Landscaping Setback (feet)	Enclosed Building	Air Filtration	Vehicle Circulation	Storage of Materials	Signage	Surfacing	Lighting	Maintenance	Hours of Operation
3f	Supermarket Accessory Recycling Collection Centers	N/A 100 feet from residential or mixed use development containing residential	N/A	N/A	N/A	N/A	Yes Areas for and access to drop-off and loading shall be clearly designated and shall not impede the on-site traffic circulation.	Yes a. The recyclable materials shall be deposited and stored in containers that have lids and are made of metal. The containers shall be maintained in good condition and appearance with no structural damage, holes or visible rust, and be free of graffiti. b. When the container is placed near a public or private sidewalk, a minimum of five-foot clearance shall be provided between the container and the sidewalk. Vertical stacking of containers or receptacles is prohibited.	Yes One sign with a minimum dimension of two feet in width and two feet in length and maximum dimension of three feet in width and three feet in length shall be permanently fixed on the supermarket accessory recycling collection center in a location visible and with text that is legible to customers and from the front of the nearest street.	Yes d. The containers shall be placed on a paved surface	Yes The supermarket recycling collection center shall be equipped with adequate lighting. All outdoor lighting shall be directed away from any lots containing residential or agricultural uses	Yes The recyclable materials shall be deposited and stored in containers that have lids and are made of metal. The containers shall be maintained in good condition and appearance with no structural damage, holes or visible rust, and be free of graffiti.	Yes Hours of operation are limited to 9:00 am to 6:00 pm, Monday through Saturday, and 12:00 pm to 5:00 pm on Sunday
4	Storage Enclosures for Recycling and Solid Waste	N/A	N/A	N/A	Yes All outdoor recycling and solid waste storage areas are required to have a view-obstructing fence or wall in compliance with Section 22.140.430 (Outdoor Storage).	N/A	Yes Outdoor recycling and solid waste storage areas shall not be located in any required yard, parking space, landscaped areas, or other areas required to remain clear of obstructions to comply with Title 26 (Building Code) and Title 32 (Fire Code) of the County Code, and shall not obstruct vehicular or pedestrian circulation.	Yes All waste, compost, and recyclables shall be stored in closed receptacles at all times.	Yes At least one sign, not to exceed four square feet in area, shall be provided for recycling and waste storage areas.	Yes The ground or floor where the storage area is located shall be paved pursuant to Section 22.112.080.E (Paving). The paving shall extend beyond the walls of the enclosure by at least two feet to the satisfaction of Public Works.	N/A	Yes Recycling and solid waste storage areas shall be maintained in a clean, litter-free condition, in such a way that vermin, rodents, or other pests are prevented from entering the area.	N/A

New Principal Land Use Requirements

The proposed program would require a conditional use permit (CUP) for new organic waste recycling facilities and solid waste facilities as the principal (main/primary) land use on parcels located in the A-2 agricultural zone (Table 1.IV-3, *Existing and Proposed Permit and Review Requirements for Principal Land Uses*). Organic waste recycling facilities and solid waste facilities would not be permitted (allowed) as the principal land use for residential zones, commercial zones, or other agricultural, open space, resort and recreation, and watershed zones (A-1, O-S, R-R, and W).

For industrial zones, the proposed program would require a MCUP for pallet yards as the principal land use for parcels in the M-1 or M-1.5 zone. A ministerial site plan review (SPR) would be required for pallet yards as the principal land use for parcels in the M-2 or M-2.5 zone. A CUP would be required for all permitted (allowed) recycling and solid waste, including new organic waste, ~~except for combustion and non-combustion biomass conversion and anaerobic digestion uses~~ facilities established as primary uses in industrial zones. Recycling processing facilities, combustion and non-combustion biomass conversion organic waste facilities, and solid waste facilities as primary uses would be permitted with a CUP for parcels within the M-2 and M-2.5 zones and not permitted (allowed) within the M-1 or M-1.5 zones.

The proposed program would ~~remove~~ reclassify land reclamation and automobile dismantling yards ~~from allowable principal land uses as they would be reclassified and regulated under~~ as organic waste and recycling processing facilities, respectively.

A CUP or MCUP application would be a discretionary action subject to CEQA. A SPR application would be ministerial and therefore exempt from CEQA.

New Accessory Land Use Requirements

The proposed program would require a ministerial site plan review (SPR) for new organic onsite waste recycling facilities as an accessory land use on parcels located in the A-2 agricultural zone, C-1, C-2, C-3, C-M, C-MJ, C-R, M-1, M-1.5, M-2, and M-2.5 for accessory organic waste composting, including green waste, mixed-food waste, and vermiculture. (Table 1.IV-4, *Existing and Proposed Permit and Review Requirements for Accessory Land Uses*).

Green Zones Program Affected Area

The Green Zones Program would be implemented countywide, throughout all County unincorporated areas that contain applicable zoning designations. Most of these zoning designations include multiple land use designations due to the variety of land ownership and uses in the County. Los Angeles County is divided into 11 different planning areas, including the Antelope Valley, Santa Clarita Valley, San Fernando Valley, Santa Monica Mountains, Coastal Islands, Westside, South Bay, Metro, Gateway, West San Gabriel Valley, and East San Gabriel Valley planning areas (Table 1.IV-5, *Green Zones Program County Planning Areas*) (Figure 1.IV-3, *Project Location Map*, Figure 1.IV-4, *Project Location Map: Green Zone Districts*).

**TABLE 1.IV-5

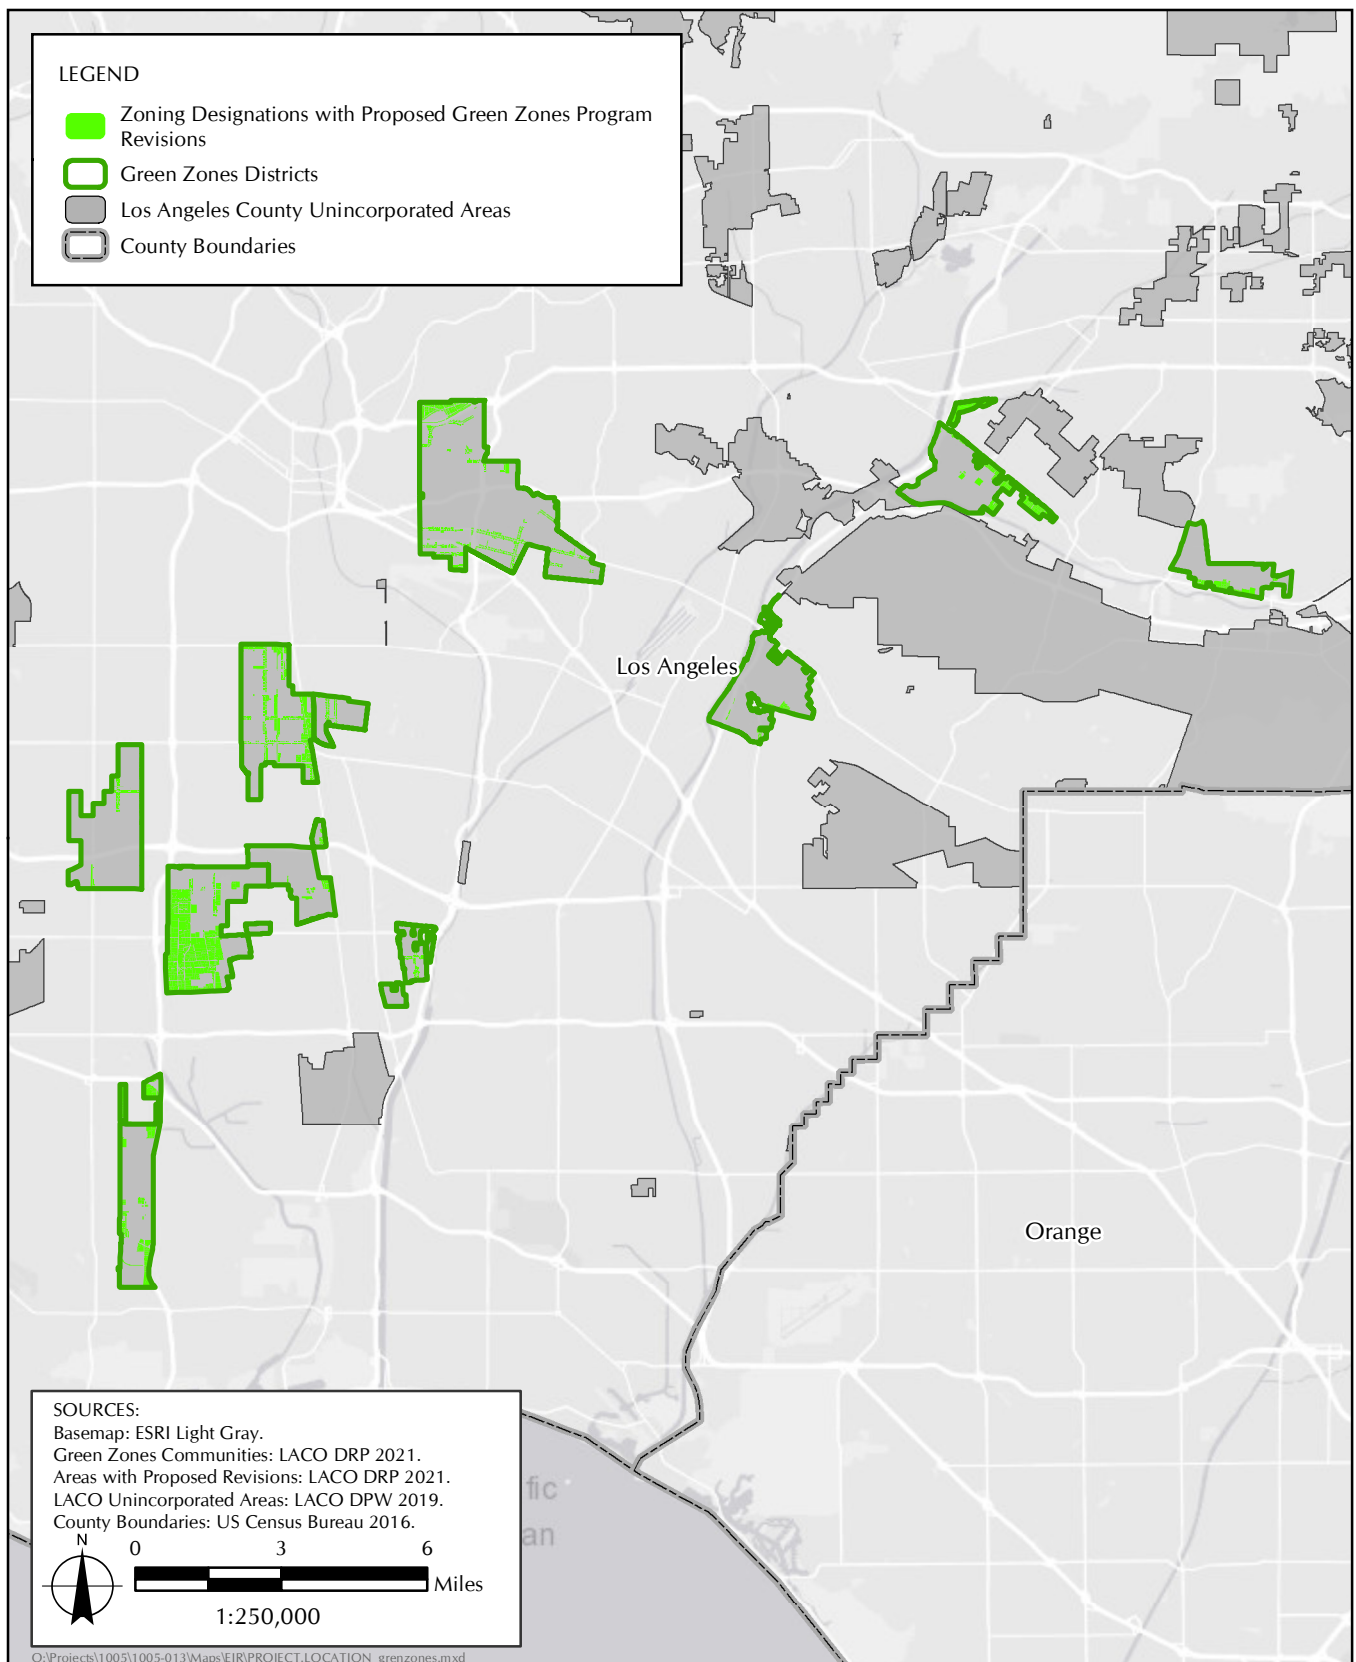

FIGURE 1.IV-4
 Project Location Map: Green Zones Program

5. Compliance Schedule

Unincorporated area communities listed in Chapter 22.84 Green Zones Districts of the Zoning Code would require existing land uses subject to the chapter to be brought into full compliance with all applicable requirements in accordance with the compliance schedule:

- **Within 3 Years of the Effective Date of the Ordinance**
 - Existing uses that are entirely or partially within a 100-foot radius of a lot containing a sensitive use and subject to Site Plan Review pursuant to Chapter 22.84 (Landscaping on Street Frontage and/or Perimeter Identification Signs). The 3-year compliance schedule applies when the existing use is subject to a ministerial site plan.
- **Within 5 Years of the Effective Date of the Ordinance**
 - Existing uses that are entirely or partially within a 100-foot radius of a lot containing a sensitive use and:
 - Subject to Site Plan Review pursuant to Chapter 22.84 (Any combination of the following in addition to Landscaping on Street Frontage and/or Perimeter Identification Signs: Solid Walls; Storage of Materials, Vehicles, or Equipment; Surfacing; Recycling and Solid Waste Storage; Vehicular Access and On-Site Circulation; Accessory Structures and Utilities, unless building enclosure is required; and Perimeter Identification Signs.
 - Subject to a CUP review pursuant to Chapter 22.84 (Any requirements unless building enclosure is required Solid Walls; Landscaping on Street Frontage; and Perimeter Identification Signs.
 - Existing uses that are entirely or partially located between a 100-foot radius and a 500-foot radius of any lot containing a sensitive use and subject to a Site Plan Review pursuant to Chapter 22.84 (Any improvements unless building enclosure is required) (~~Solid Walls; Storage of Materials, Vehicles, or Equipment; Surfacing; Recycling and Solid Waste Storage; Vehicular Access and On-Site Circulation; Accessory Structures and Utilities; and Perimeter Identification Signs~~). The 5-year compliance schedule also applies when the existing use is subject to a CUP and ~~signage is required~~ any improvement requirement applies unless building enclosure is required.
- **Within 7 Years of the Effective Date of the Ordinance**
 - Existing uses that are entirely or partially within a 100-foot radius of a lot containing a sensitive use and:
 - Subject to Site Plan Review, and also requires building enclosure pursuant to Chapter 22.84 (~~Building Enclosure~~).
 - Subject to a CUP review, and also requires building enclosure pursuant to Chapter 22.84.
 - Existing uses that are entirely or partially located between a 100-foot radius and a 500-foot radius of any lot containing a sensitive use and:
 - Subject to a Site Plan Review, and also requires building enclosure pursuant to Chapter 22.85 (~~Building Enclosure~~).
 - Subject to a CUP review and any required improvements pursuant to Chapter 22.84.
- **No Later than January 1, ~~2031~~ 2029**
 - Uses that are subject to a CUP review pursuant to Chapter 22.84 would be required to be brought into full compliance with all applicable requirements no later than January 1, ~~2031~~ 2029, or at the end of the current grant term for existing permits, or cease operation.
- **Upon Discretionary Permit Renewal or Required New Discretionary Permit**
 - All existing uses that have been operating with an approved appropriate discretionary land use permit would be required to be brought into full compliance upon submittal of an application

~~for the renewal of approved~~ the appropriate discretionary land use permits or requirement for a new discretionary permit.

6. Native American Consultation

Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code § 21080.3.1? If so, is there a plan for consultation that includes, for example, the determination of significance of impacts to tribal cultural resources, procedures regarding confidentiality, etc.?

Note: Conducting consultation early in the CEQA process allows tribal governments, lead agencies, and project proponents to discuss the level of environmental review, identify and address potential adverse impacts to tribal cultural resources, and reduce the potential for delay and conflict in the environmental review process. (See Public Resources Code section 21080.3.2.) Information may also be available from the California Native American Heritage Commission's Sacred Lands File per Public Resources Code section 5097.96 and the California Historical Resources Information System administered by the California Office of Historic Preservation. Please also note that Public Resources Code section 21082.3(c) contains provisions specific to confidentiality.

The County has begun the consultation process pursuant to Public Resources Code § 21080.3.1. The County submitted a request to the Native American Heritage Council (NAHC) on May 18, 2020, for a list of tribes pursuant to Senate Bill 18. The list was received on May 28, 2020. Notices will be mailed out on June 11, 2020, for Senate Bill 18 and Assembly Bill 52 consultation.

7. Other Public Agencies Whose Approval Is Required

The County has sole approval authority over the Green Zones Program Project. No approvals are required by other public agencies.

SECTION 2

ENVIRONMENTAL ANALYSIS

2.1. AESTHETICS

This analysis evaluates the proposed project's potential impacts on aesthetics, views, light and glare¹ The analysis covers all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated using information provided in the *Land Use Element, Conservation and Natural Resource* and *Parks and Recreation* Elements of the Los Angeles County General Plan 2035,^{2,3} California Department of Transportation (Caltrans) Scenic Highway System designations,⁴ the Los Angeles County Trails website,⁵ Title 22 Ordinance,⁶ Hillside Management Area Ordinance, Hillside Design Guidelines, and the Rural Outdoor Lighting District Ordinance.

	<i>Potentially Significant Impact</i>	<i>Less than Significant Impact with Mitigation Incorporated</i>	<i>Less than Significant Impact</i>	<i>No Impact</i>
Except as provided in Public Resources Code Section 21099, would the project:				
a) Have a substantial adverse effect on a scenic vista?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Be visible from or obstruct views from a regional riding, hiking, or multi-use trail?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) Substantially degrade the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features and/or conflict with applicable zoning and other regulations governing scenic quality? (Public views are those that are experienced from publicly accessible vantage point)	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

e) Create a new source of substantial shadows, light, or glare which would adversely affect day or nighttime views in the area?

☐☐☒☐

a) Have a substantial adverse effect on a scenic vista?

Existing Conditions

The County has a diverse visual setting that is composed of natural landform features, the built environments, and compositions of the natural and built environments. The built environments within the unincorporated County reflect extensive developments and includes commercial, residential, industrial, office, institutional, and open space and recreation uses. The Natural environments include coastlines, beaches, hillsides/ridgelines, canyons, creeks, foothills, prominent trees, forests, and watershed areas. There are various scenic resources within the unincorporated County, including scenic landform features, historic buildings, riding/hiking trails, and designated State Scenic highways. Four officially designated State Scenic Highways are located within the County, which include portions of the Angeles Crest Highway, Mulholland Highway, Malibu Canyon - Las Virgenes Highway, and Topanga Canyon Boulevard from Postmile 1 to Postmile 3.5 (see Table 2.1-1, *Officially Designated Scenic Highways in Los Angeles County*, and Figure 2.1-1, *Designated and Eligible California Scenic Highways*). In addition, scenic elements are identified in the Santa Monica Mountains Local Coastal Program as “designated areas that contain exceptionally-scenic features unique not only to the Santa Monica Mountains, but to the Los Angeles County region. These areas are characterized by rare or unique geologic formations, such as large rock outcroppings and sheer canyon walls, as well as coastline viewsheds, undisturbed hillsides and/or riparian or woodland habitat with intact locally-indigenous vegetation and plant communities.”

The Conservation and Natural Resources Element of the County General Plan addresses the preservation of valuable designated scenic areas, vistas, and roadways through the County Scenic Highway Plan, which conforms to the State Scenic Highway Program. The County recognizes that the coastline, mountain vistas, and other scenic features of the region are a significant resource. Other scenic resources identified in the County General Plan include scenic viewsheds, hillsides, and ridgelines. A scenic viewshed is defined as a scenic vista from a given location, such as a highway, a park, a hiking trail, river/waterway, or a particular neighborhood. The Conservation and Natural Resources Element of the County General Plan identifies the scenic hillsides that includes the San Gabriel Mountains, Verdugo Hills, Santa Susana Mountains, Simi Hills, Santa Monica Mountains, and Puente Hills as features that physically define the diverse communities in the County unincorporated areas. The County General Plan designates HMAs for natural slope gradients of 25 percent or steeper, with the intent to conserve the natural beauty and public benefit of hillsides, and Significant Ridgelines within Ridgeline Management Areas to be conserved in order to maintain physical scenic integrity and value of hillside viewsheds. Hillsides are protected by the HMA Ordinance, which was adopted as a component of the County General Plan and requires development in HMAs to comply with the Hillside Design Guidelines in a manner that respects the natural topography and biological resources of the area.^{7,8}

Upon review of the County General Plan and the proposed project, the parcels that would be subject to the Green Zone Districts and Storage Enclosures for Recycling and Solid Waste Revisions are located outside the HMA (Figure 2.1-2, *Slope*).⁹ The parcels that would be subject to the Recycling and Waste Management Revisions within the HMAs are located in the Whittier Hills and north of the City of Santa Clarita. Based on the *Hillside Management Areas and Ridgeline Management Map* in the County General Plan, no County designated significant ridgelines are located within the Green Zone Districts, but the Green Zone Districts are within HMAs of both 25–50 percent slope and 50 percent-plus slope (Figure 2.1-2).¹⁰

Threshold of Significance

The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses by changing regulatory requirements for specific industrial land uses. A substantial adverse effect on a scenic vista would normally occur as a result of a physical change in the environment that blocks views or results in visual blight that degrades a scenic vista.

Impact Analysis

The potential for impacts to aesthetics has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, *Project Description*; Table 1.IV-1, *Planning and Permitting Requirements*, and Table 1.IV-2, *Development Standards*). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential to result in a substantial adverse effect on a scenic vista include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

⁹ Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

¹⁰ Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

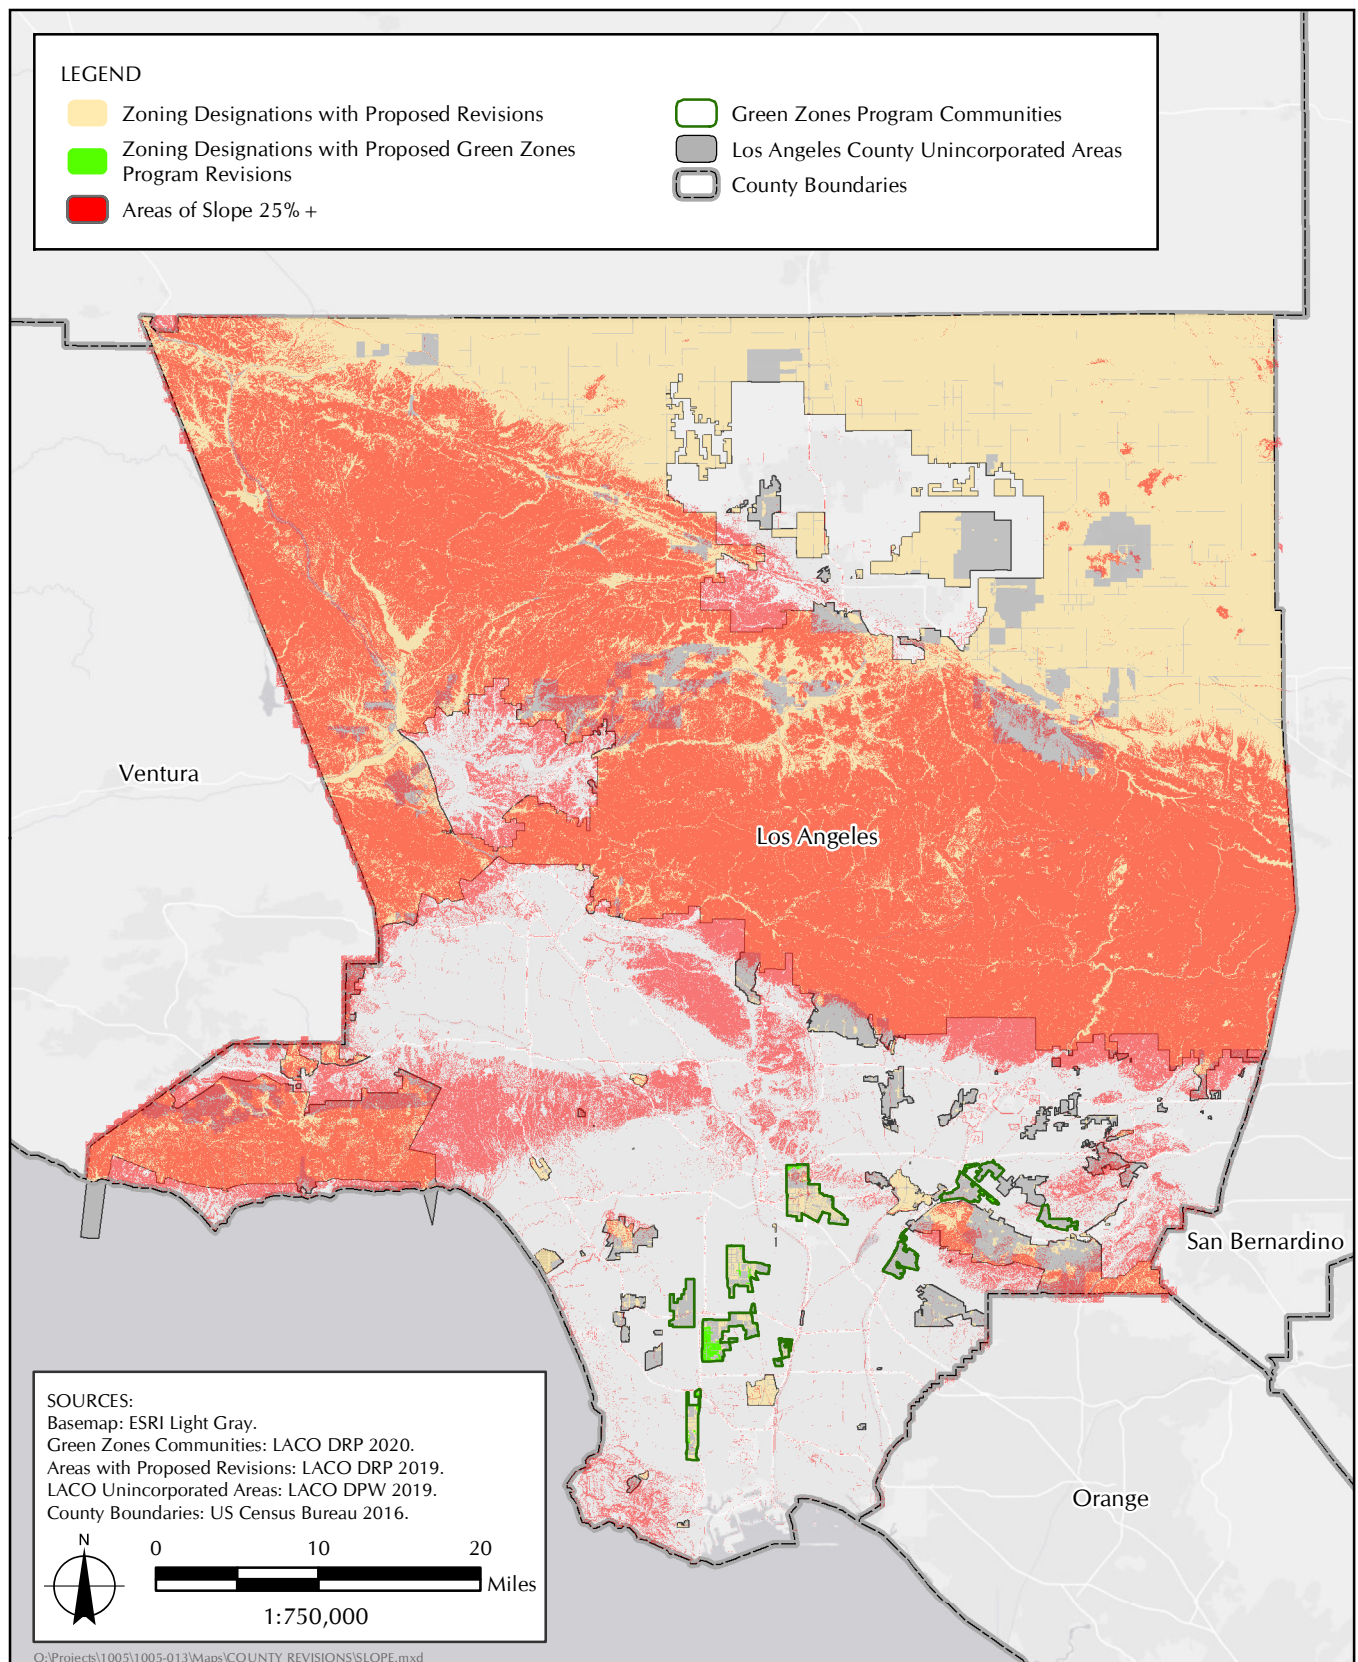

FIGURE 2.1-2
Slope

Element 1 – Green Zone Districts

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to a scenic vista from designated scenic highways because they would neither block the view or create visual blight. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and limited parking, signage, tree planning and maximum floor area ratio (FAR) requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts and to future entitlements subject to a CUP, for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within ~~the~~ 3 to 7 40 years of adoption of the Ordinance. The potential improvements within the Green Zone Districts would not block views from the nearest designated scenic highway due to distance (at least 14 miles away), intervening urban development, and topography. In the case of updated standards proposed for existing industrial uses, the construction of these measures would not differ substantially from existing conditions. Additionally, the new standards such as solid walls and tree plantings would improve the visual quality of the area and avoid rather than create visual blight from any scenic vista point, scenic highways, or historic parkways due.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to a scenic vista within HMAs. None of the Green Zone Districts are located within the areas designated at HMAs within the County General Plan. The proposed project would have no impact on the quality of these hillsides as a scenic resource, as the Green Zones Program would comply with the HMA Ordinance and Hillside Design Guidelines.¹¹ Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to a scenic vista. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to a scenic vista because they would neither block existing views nor create visual blight. Currently the zoning and land use designations defined as sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in close proximity to existing industrial uses the zones where they are located. The existing ~~land use designation have zoning designations include~~ development standards related applicable to the land use designation and zoning; however above listed sensitive uses. However, the Ordinance expands those requirements to include new development where properties are adjacent, or adjoining to industrial, recycling or solid waste, or vehicle-related uses requiring the use of solid wall screening, expanded landscaping buffers between incompatible uses, standards for window, placement of balconies, and air filtration devices, (see Table 1.IV-2). These measures would be required where the Title 22 Ordinance

¹¹ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

implements new development standards for new sensitive uses, such as ~~In the case of updated dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses.~~ In the case of new development standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would be visible from scenic vista points and scenic corridors. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not be a visible difference in the view from any scenic vista point, scenic highways or historic parkways due to distance, intervening urban development, and topography.

The proposed New Sensitive Uses would have no impact on the quality of these hillsides as a scenic resource, as the development standards for New Sensitive Uses within the HMAs would be required to comply with the HMA Ordinance and Hillside Design Guidelines, in particular landscaping barriers, enclosures, fencing, solid walls, signage, and lighting.¹² The use of air filtration systems would not result in visual blight, as the County requires that such system be screened from view from the public right of way and from the ground level of adjacent properties. Per Title 22 Ordinance and in conjunction with Public Works Building and Safety Division and the California Air Resource Board, air filtration systems shall be placed inside a building, residential or other rooms, intended for human occupancy which makes them non-visible from the public right of way. Air filtration systems placed outdoors, require setbacks, screen walls, fencing and/or landscaping that provide screening of the systems from the public right of way.¹³ Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in no impacts to a scenic vista. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impact to a scenic vista. These revisions affect parcels located within HMAs of both 25–50 percent slope and 50 percent-plus slope, as well as key ridgelines in areas such as Puente Hills, Castaic, the Santa Monica Mountains, and the Angeles National Forest.¹⁴ The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The project would allow for new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with state requirements. The new development standards and/or more stringent entitlement processes for future entitlements would be subject to a CUP, an MCUP, and/or an SPR, for the proposed revisions, that include construction improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, lighting, building height restrictions, vehicle circulation, and storage of materials as well as cleaning and maintenance standards. These construction improvement features are already subject to current development standards as identified in the project description (Table 1.IV-1). ~~The proposed revisions would prohibit all these uses from HMAs such as automobile dismantling yards, Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, and mulching facilities would be prohibited in HFHSZs and VHFHSZs. Solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and County Floodways, and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs.~~ Therefore, impacts to Recycling and Waste Management Revisions would be less than significant in relation to scenic vistas.

The proposed Recycling and Waste Management Revisions would screen from view incompatible land uses. The revisions would require waste, compost, and recyclable materials to be stored in receptacles, which would be located in the same enclosure. Storage areas would have a vertical dimension of 8 feet; however, when located outside of a building,

¹² Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

¹³ County of Los Angeles. Title 22 – Planning and Zoning, Division 7 – Standards for Specific Uses, Chapter 22.130.030 – Development Standards for Sensitive Uses. Accessed 31 March 2020.

¹⁴ Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

storage areas would be located in the rear portion of the lot. Additionally, recycling and solid waste storage areas including Supermarket Accessory Recycling Collection Centers would be maintained in a clean, litter-free condition. Waste receptacles and enclosures would improve the waste management of industrial, commercial, and other facilities so that waste is more organized and out of view. The proposed revisions pertain to standards, conditions, and procedures that support and facilitate the development of recycling collection centers as an accessory use to an existing supermarket in a manner that protects public health, safety, and welfare and minimizes significant impacts to the environment (Chapter 22.140.660.710). The revisions apply to Commercial Zones (C-1, C-2, C-3, C-M, C-MJ, C-R, C-RU), Mixed Used Zones (MXD, MXD-RU) and Industrial Zones.

In regard to scenic vistas associated with scenic highway corridors, parcels that are subject to proposed Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, include locations that are directly adjacent to three of the four state scenic highways, designated in the Conservation and Natural Resources of the County of Los Angeles General Plan: Angeles Crest Highway, Mulholland Highway, and Malibu Canyon-Las Virgenes Highway.¹⁵ Despite the location of subject parcels in relation to scenic highways, parcels subject to the Recycling and Waste Management Revisions, would not have a significant adverse impact on scenic vistas because they would not block views of resources for which the scenic highways were designated. Rather than blocking views, the Recycling and Waste Management Revisions would ensure that materials and equipment staged within such centers would be screened from view. The design review process utilized by the County, requires that the developer demonstrate consistency with the integrity of scenic highway corridors, including any new signs, historic building or tree removal, or landscape barriers.

The proposed program would have no adverse effect on the scenic characteristics of the key ridgelines in areas such as Puente Hills, Castaic, the Santa Monica Mountains, and the Angeles National Forest, as the Recycling and Waste Management Revisions would comply with the HMA Ordinance and, Hillside Design Guidelines, the County of Los Angeles All-Hazard Mitigation Plan (AHMP), and fire prevention codes and regulations that help preserve, protect, and enhance the physical integrity and value of hillsides and associated views. The goals of the HMA Ordinance coupled with the Hillside Design Guidelines identify the proposed development location in or near HMAs and use sensitive hillside design techniques for keeping with the preservation and enhancement of physical site integrity and value of hillsides that would apply to all allowable uses governed by the Recycling and Waste Management Revisions. The measures proposed by the project are consistent with the requirements of the five HMA categories: (1) site planning; (2) grading and facilities; (3) road circulation; (4) building design; and (5) landscaping.^{16, 17} Rather than resulting in blight, the Recycling and Waste Management Revisions would ensure that materials and equipment staged within such centers would not be visible from adjacent public rights-of-way, thus protecting scenic vistas within HMAs. In addition, the County's AHMP identify Fire Hazard Areas and aims at protection and risk reduction from natural hazards such as earthquakes, wildfires, floods, and landslides through the use of hazard management goals, guidelines, and requirements.

The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Currently developed Supermarkets in urbanized locations would be permitted in areas of the county where permitting is already required. The County regulates these facilities based on California Department of Resources Recycling and Recovery (CalRecycle) standards.¹⁸ These Supermarket Accessory Recycling Collection Centers within zones C-1, C-2, C-3, C-M as well as all industrial zones must comply with CalRecycle requirements. The County regulates these facilities based on CalRecycle standards.¹⁹ These uses must comply with existing development standards including property line

¹⁵ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

¹⁶ County of Los Angeles Department of Regional Planning. Adopted 6 October 2016 and Accessed 31 March 2020. Title 22 – Planning and Zoning – Hillside Management Areas, Chapter 22.56.217 – Section VI: Sensitive Hillside Design Features. Available at: <http://planning.lacounty.gov/hma>.

¹⁸ County of Los Angeles Department of Regional Planning. November 3, 2008. Memorandum: Subdivision & Zoning Ordinance Standards for Accessory Recycling Collection Centers.

¹⁹ County of Los Angeles Department of Regional Planning. November 3, 2008. Memorandum: Subdivision & Zoning Ordinance Standards for Accessory Recycling Collection Centers.

and residential use setback standards; pedestrian or vehicular access and circulation standards, parking standards, signage standards, maintenance and operations standards, enclosure standards including solid wall screening where certain facilities are not enclosed, and building height and screening standards. The CalRecycle requirements are used to meet the County's waste diversion goals. The proposed revisions would allow these uses in the C-MJ, C-R, C-RU, MXD, and MXD-RU designated zones.

The project already complies with CalRecycle requirement within HMAs such as automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities. In addition, development standards already require that recycling collection centers as an accessory to supermarkets be kept in good condition and would not result in an adverse impact such that the visual quality of a corridor viewshed from an adjacent scenic highway would be impacted. Therefore, the Supermarket Accessory Recycling Collection Centers would have less than significant impacts as it pertains to scenic vistas.

The development standards and measures for the Recycling and Waste Management Revision, including Supermarket accessory recycling collection centers, would improve the visual quality of the industrial, commercial, and other facilities along a County-recognized state scenic highway corridor and would not require the use of landscaping barriers such as trees, fencing, or solid walls for screening purposes. Therefore, the Recycling and Waste Management Revisions, including Supermarket accessory recycling collection centers, would result in less than significant impacts on scenic vistas. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to a scenic vista. These existing uses are subject to the current development standards within of the zones that they reside in. The revisions would add additional requirement such as enclosure wall height with roof, paving, cleaning and maintenance, distance requirements from adjoining doorways or windows, and clearances and circulation standards. The existing uses are subject to the current development standards as required per zone and the new requirements would only apply to new development as well as expansion of existing development in addition to the current standards.

Any new development would be subject to development requirement of HMAs. These revisions contain HMAs of both 25–50 percent slope and 50 percent-plus slope, as well as significant ridgelines in areas such as Castaic.²⁰ However, the proposed program would have no impact on the quality of these hillsides as a scenic resource, as the Green Zones Program would comply with the HMA Ordinance and Hillside Design Guidelines that help preserve and enhance the physical integrity of scenic values. In regard to scenic vistas along scenic highway corridors, the proposed Storage Enclosures for Recycling and Solid Waste Revisions are directly adjacent to two of the four state scenic highway corridors identified in the County General Plan 2035; Angeles Crest Highway and Malibu Canyon-Las Virgenes Highway.²¹

Despite its location next to a County-recognized state scenic highway, these revisions would not have a significant adverse impact on scenic vistas. The Storage Enclosures for Recycling and Solid Waste Revisions pertain to standards, conditions, and procedures that support and facilitate the development and containment of onsite storage as a primary use to an existing collection facility in a manner that protects public health, safety, and welfare and minimizes significant impacts to the environment (Chapter 22.140-660.710). The revisions apply to Commercial Zones (R-3, R-4, RPD, C-1, C-2, C-3, C-M, C-MJ, C-R, C-RU), Mixed Used Zones (MXD, MXD-RU) and Industrial Zones (M-1, M-1.5, M-2, M-2.5). These revisions would require waste, compost, and recyclable materials to be stored in receptacles, which would be located in the same enclosure. Storage areas would have a vertical dimension of 8 feet; however, when located outside of a building, storage areas would be located in the rear portion of the lot. Additionally, recycling and solid waste storage areas would be maintained in a clean, litter-free condition. Waste receptacles and enclosures would improve the waste management of industrial, commercial, and other facilities so that waste is more organized and out of view.

²⁰ Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

²¹ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

The construction of a storage enclosure would not substantially alter the existing conditions such that the viewshed from one of the County-recognized state scenic corridors would be impacted. This Chapter of Title 22 would ensure that enclosed rooms or storage areas are intended to store, collect, and load recyclable and organic waste that is generated by the uses served and that the storage enclosures are safely accessible by building occupants and waste and recycling haulers. In addition, the development standards for a storage enclosure include a maximum total area of 500 square feet and a minimum setback of 10 feet from all property lines, structures, a public right of way, and driveways. The recyclable materials would be deposited and stored in containers that have lids and are made of metal, and the containers would be maintained in good condition with no structural damage, holes, visible rust, or graffiti. Title 22 identifies that existing storage enclosures would be located within a 500-foot radius of a lot containing sensitive uses and are allowed continued operation with a CUP. Therefore, storage enclosures as accessory enclosures would not result in a substantial change, in addition to the development standards which require them to be kept in good condition. As such, the revisions would not result in an adverse impact such that the visual quality of a view from an adjacent County-recognized state scenic vista or corridor would be impacted. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts. No further analysis is warranted.

b) Be visible from or obstruct views from a regional riding, hiking, or multi-use trail?

The proposed program would result in less than significant impacts to aesthetics in relation to being visible from or obstructing views from a regional riding, hiking, or multi-use trail. Although the proposed program would potentially be visible from nearby existing regional trails, it would not obstruct views due to intervening topography, trees, shrubs, and urban development as well as the small scale and height of the proposed facilities that would be visible from a distance.

Existing Conditions

The *Park and Recreation* Element of the County General Plan²² and County trails website were reviewed to identify existing regional trails in the unincorporated areas of Los Angeles County.^{23,24} Due to the adjacency of the unincorporated areas to the national forest, the County trails website was augmented with information from the Angeles National Forest Land Management Plan.²⁵ There are over 2,000 miles of regional trails in Los Angeles County, including a portion of the Pacific Crest National Scenic Trail (PCT) and trails managed by the National Park Service, California State Parks, the Santa Monica Mountains Conservancy, the Mountains Recreation and Conservation Authority, the Mountains Restoration Trust and the Catalina Island Conservancy, and the County of Los Angeles (Figure 2.1-3, *Regional Trails*).²⁶ The PCT, which extends approximately 2,650 miles from the Mexican-California border northward along the mountain ranges of the West Coast states to the Canadian-Washington border, was designated as a national scenic trail with the original establishment of the National Trails System Act and is identified by the United States Department of Agriculture: Forestry Service (USFS). In Los Angeles County, the PCT is located primarily within the Angeles National Forest, generally at a distance from industrial land uses (see Figure 2.1-3).²⁷

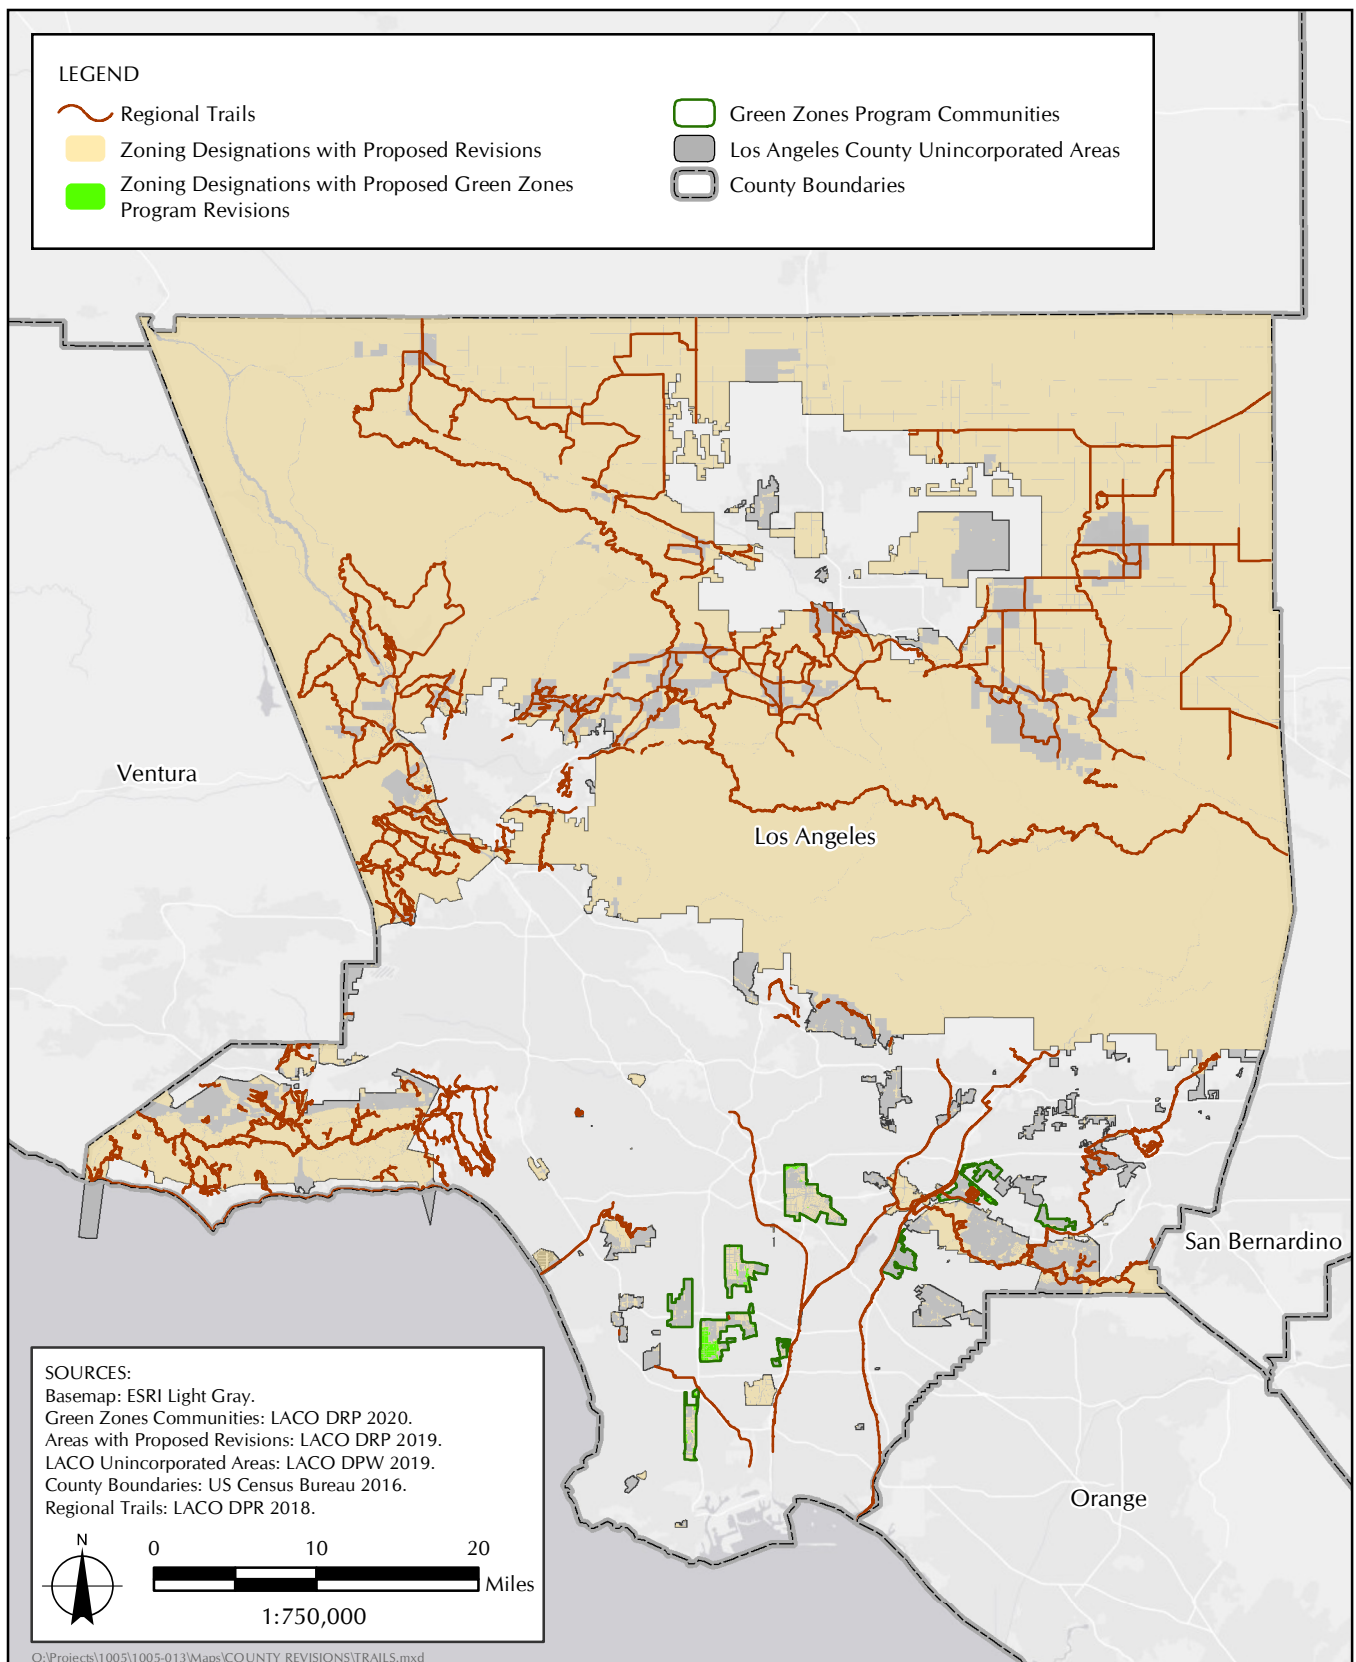

FIGURE 2.1-3
Regional Trails

As identified in the County's Trails Manual, vistas are a visually exciting composition that occurs when a trail sets up an interesting combination of foreground and background views where trails introduce scenic views with a sense of layering and give views a sense of depth.²⁸ Furthermore, in planning, trails are designed to accommodate potential trail users, their needs, and conditions. Where attainable, "trails should be located adjacent to already accessible trailheads and or accessible recreational elements, such as parks. It is also important to locate accessible trails that reach highly used destinations areas as waterfalls, scenic vistas, or other points of interest."²⁹ Consistent with the measures required pursuant to the Green Zones District, the County Trails Manual also recommends that where trails are located adjacent to developed properties the use of fencing, walls, and landscapes materials to screen trail view of incompatible adjacent land uses should be used so as "to create aesthetically pleasing visual barrier to developed land uses not intended to be publicly accessible." Other trail recommended features include lighting, trail barriers, trail gates, kiosks, and other landscaping and revegetation along trails.³⁰

Approximately 15 percent of the 2,000 miles of regional trails in the County are located in areas within urbanized areas of the County that experience nighttime light from street lighting, vehicles on roads, and security lights on structures and buildings. Approximately 85 percent of trails are located in rural areas of the County afforded protection from light pollution pursuant to the County's Rural Outdoor Lighting Districts. County trails are available for use between dusk and dawn, nighttime uses require special use permit authorization from the County Department of Parks and Recreation and are infrequent in nature.

Thresholds of Significance

A substantial adverse effect on a regional riding, hiking, or multi-use trail would normally occur as a result of a physical change in the environment that would obstruct designated views, as defined in the County trails manual.

Impact Analysis

The potential for impacts to aesthetics has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment that might be visible from and alter the visual character views from the trails include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts related to obstructing designated views from a regional riding, hiking, or multi-use trail. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and limited parking, signage, tree planning and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to

²⁸ County of Los Angeles Department of Parks and Recreation. Revised June 2013. County of Los Angeles Trails Manual. Available at: <https://trails.lacounty.gov/Library>

²⁹ County of Los Angeles Department of Parks and Recreation. Revised June 2013. County of Los Angeles Trails Manual. Available at: <https://trails.lacounty.gov/Library>

³⁰ County of Los Angeles Department of Parks and Recreation. Revised June 2013. County of Los Angeles Trails Manual. Available at: <https://trails.lacounty.gov/Library>

M-1. Similarly, as part of the General Plan Amendment Revisions, ~~14~~ 15 of the ~~27~~ 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts and to future entitlements subject to CUP, for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within ~~the 3 to 7~~ 10 years of adoption of the Ordinance. The area affected by the proposed Green Zone Districts does not hinder visibility or obstruct views from the PCT or any of the County's existing or proposed trails identified in the USFS and the County General Plan 2035 trail system or existing regional trails identified on the Trails LA County Website,^{31,32,33} due to distance, intervening topography, and the scale and height of the proposed facilities, the proposed program. Based on the County General Plan 2035, the HMA Ordinance and Hillside Design Guidelines, the improvements required from the Green Zone Districts within the urban fabric would not obstruct designate view from national or regional trails.³⁴ The proposed revisions to the development standards that have the potential result in physical changes in the environment that might be visible from and alter the visual character views from the trails include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). Furthermore, consistent with the measures required pursuant to the Green Zones District, the County trails manual recommends the use of fencing, walls, and landscapes materials to screen trail view of incompatible adjacent land uses. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would be consistent with the County Trails Manual and would result in less than significant impacts to related to obstructing designated views from a regional riding, hiking, or multi-use trail. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts related to obstructing designated views from a regional riding, hiking, or multi-use trail. Currently the zoning and land use designations defined as sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in close proximity to existing industrial uses the zones where they are located. ~~The existing land use designation have zoning designations include development standards related applicable to the land use designation and zoning; however above listed sensitive uses. However,~~ the Ordinance expands those requirements to include new development where properties are adjacent, or adjoining to industrial, recycling or solid waste, or vehicle-related uses requiring the use of solid wall screening expanded landscaping buffers between incompatible uses, standards for window, placement of balconies, and air filtration devices, (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near existing and proposed industrial, recycling and solid~~

³² Los Angeles County Department of Regional Planning. March 2017. Figure 9.7: Scenic Highways. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

³³ County of Los Angeles Department of Parks and Recreation. Accessed May 20, 2020. Trails LA County. <https://trails.lacounty.gov/AboutUs>

³⁴ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

~~waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses.~~ The *Park and Recreation Element* of the County General Plan defines trails as parks.³⁵ In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would hinder visibility or obstruct views from the PCT or any of the County's existing or proposed trails as identified in the USFS, the County General Plan, or the Trails LA County Website.^{36,37,38} The proposed revisions to the development standards with potential to result in physical changes in the environment that might be visible from and alter the visual character views from the trails include fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). Furthermore, consistent with the measures required pursuant to the Green Zones District, the County trails manual recommends the use of fencing, walls, and landscapes materials to screen trail view of incompatible adjacent land uses. These measures to reduce the incompatibility of new sensitive uses, such as trails, with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not be a visible difference from a trail system towards the Sensitive Uses with intervening urban development and topography.

Although some measures required to protect New Sensitive Uses may be visible, the specified measures would result in less than significant impacts related to obstructing designated views from a regional riding, hiking, or multi-use trail as such measures are compatible with the design guidelines articulated in the County Trails Manual. The County Trails Manual specifically recommends the use of landscaping barriers, enclosures, fencing, and solid walls to screen incompatible adjacent land uses.³⁹ The Ordinance regulates signs on public rights-of-way. The use of signs would not obstruct view from designated viewpoints from regional trails which are normally located at or near peaks, or unique biological or cultural resources, rather than at urban land uses such as existing and proposed industrial, recycling and solid waste, or vehicle-related uses. Lighting requirements would not affect regional riding, hiking, or multi-use trail, as such facilities are limited to use between dawn and dusk. Where trails are located in rural districts, the use of lighting in such locations is further regulated by Rural Outdoor Lighting District.⁴⁰ The use of air filtration systems would not result in hindering visibility or obstructing views from a regional trail, as the County requires that such systems be screened from view from the public right of way and from the ground level of adjacent properties. Per Title 22 Ordinance and in conjunction with Public Works Building and Safety Division and the California Air Resource Board, air filtration systems shall be placed inside a building, residential or other rooms, intended for human occupancy which makes them non-visible from the public right of way. Air filtration systems placed outdoors, require setbacks, screen walls, fencing and/or landscaping that provide screening of the systems from the public right of way.⁴¹ Therefore, the new development standards for New Sensitive Uses near industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to visibility from or obstructing views from a regional riding, hiking, or multi-use trail. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to being visible from or obstructing from a regional riding, hiking, or multi-use trail. These revisions affect parcels located within HMAs of both 25–50 percent slope and 50 percent-plus slope, as well as key ridgelines in areas such as Puente Hills, Castaic, the Santa Monica Mountains, and the Angeles National Forest.⁴² The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The project would allow for new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with state requirements. The new development standards and/or more stringent entitlement processes for future entitlements would be subject to a CUP, an MCUP, and/or an SPR, for the proposed revisions, that include construction improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials as well as cleaning and maintenance standards. These construction improvement features are already subject to current development standards as identified in the project description (Table 1.IV-1). ~~The proposed revisions would prohibit all these uses from HMAs such as automobile dismantling yards~~ Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, and mulching facilities would be prohibited in HFHSZs and VHFHSZs. Solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and County Floodways, and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. Therefore, impacts to Recycling and Waste Management Revisions would be less than significant in relation to visibility or obstruction of trails.

The proposed Recycling and Waste Management Revisions would screen from view incompatible land uses. The revisions would require waste, compost, and recyclable materials to be stored in receptacles, which would be located in the same enclosure. Storage areas would have a vertical dimension of 8 feet; however, when located outside of a building, storage areas would be located in the rear portion of the lot. Additionally, recycling and solid waste storage areas including Supermarket Accessory Recycling Collection Centers would be maintained in a clean, litter-free condition. Waste receptacles and enclosures would improve the waste management of industrial, commercial, and other facilities so that waste is more organized and out of view. The proposed revisions pertain to standards, conditions, and procedures that support and facilitate the development of recycling collection centers as an accessory use to an existing supermarket in a manner that protects public health, safety, and welfare and minimizes significant impacts to the environment (Chapter 22.140-660.710). The revisions apply to Commercial Zones (C-1, C-2, C-2, C-3, C-M, C-MJ, C-R, C-RU), Mixed Used Zones (MXD, MXD-RU) and Industrial Zones.

In regards to visibility or obstruction of trails, the parcels that are subject to the proposed Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, are near a national trail (PCT) and existing or proposed county trails as identified in the USFS, the County General Plan 2035, or the Trails LA County Website.^{43,44,45} However, the proposed recycling and waste management revisions would not have a significant adverse impact on the visibility from trails, as it would not be visible despite the location of subject parcels in relation to the trails due to intervening topography, vegetation, urban development, and the scale and height of the proposed facilities from a distance. Rather than obstructing views, the project would ensure that materials and equipment staged within such centers would be screened from view. Therefore, impacts to Recycling and Waste Management Revisions would be less than significant in relation to visibility or obstruction of trails.

⁴² Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

⁴³ United States Department of Agriculture: Forest Service. Accessed May 21, 2020. Pacific Crest Trail. Available at: <https://www.fs.usda.gov/pct/>

⁴⁴ Los Angeles County Department of Regional Planning. March 2017. Figure 9.7: Scenic Highways. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

⁴⁵ County of Los Angeles Department of Parks and Recreation. Accessed May 20, 2020. Trails LA County. <https://trails.lacounty.gov/AboutUs>

The proposed Recycling and Waste Management Revisions would screen from view incompatible land uses. The revisions would require waste, compost, and recyclable materials to be stored in receptacles, which would be located in the same enclosure. Storage areas would have a vertical dimension of 8 feet; however, when located outside of a building, storage areas would be located in the rear portion of the lot. Additionally, recycling and solid waste storage areas including Supermarket Accessory Recycling Collection Centers would be maintained in a clean, litter-free condition. Waste receptacles and enclosures would improve the waste management of industrial, commercial, and other facilities so that waste is more organized and out of view. The proposed revisions pertain to standards, conditions, and procedures that support and facilitate the development of recycling collection centers as an accessory use to an existing supermarket in a manner that protects public health, safety, and welfare and minimizes significant impacts to the environment (Chapter 22.140.660.710). The revisions apply to Commercial Zones (C-1, C-2, C-2, C-3, C-M, C-MJ, C-R, C-RU), Mixed Used Zones (MXD, MXD-RU) and Industrial Zones.

The project within HMAs would comply with the HMA Ordinance and Hillside Design Guidelines, in particular with construction improvement including landscaping barriers, enclosures, fencing, solid walls, paving, signage, lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials as well as cleaning and maintenance standards.⁴⁶ These construction improvement features are already subject to current development standards as identified in the project description (Table 1.IV-1). These revisions would not have a significant adverse impact on the visibility or obstruction of views from the trail. Additionally, should the subject properties fall within an HMA, the revisions would have no impact on the visibility or obstruction of views of the trails, as it would comply with the HMA Ordinance and Hillside Design Guidelines in providing screening from trails.⁴⁷ The subject properties would also comply with the County's AHMP should they fall within an HFHSZ or VHFHSZ and likewise compliance with the FEMA flood zone and the County's floodway regulations and requirements within flood zone areas.

The proposed program would result in the improvement of the views of the trails system, as it would improve the visual quality of existing industrial, commercial, and other land uses. These revisions would require waste, compost, and recyclable materials to be stored in receptacles, which would be located in the one comprehensive enclosure. Storage areas would have a vertical dimension of 8 feet; however, when located outside of a building, storage areas would be located in the rear portion of the lot. Additionally, recycling and solid waste storage areas would be maintained in a clean, litter-free condition. Waste receptacles and enclosures would improve the waste management of industrial, commercial, and other facilities so that waste is more organized and out of view. These development standards and measures would improve the visual quality of the industrial, commercial, and other facilities along any hillside regional trails system. Therefore, the Recycling and Waste Management Revisions would result in less than significant impacts. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to visibility from or obstructing views from a regional riding, hiking, or multi-use trail. These existing uses are subject to the current development standards within of the zones that they reside in. The revisions would add additional requirement such as enclosure wall height with roof, paving, cleaning and maintenance, distance requirements from adjoining doorways or windows, and clearances and circulation standards. The existing uses are subject to the current development standards as required per zone and the new requirements would only apply to new development as well as expansion of existing development in addition to the current standards.

Any new development would be subject to development requirement of HMAs. These revisions contain HMAs of both 25–50 percent slope and 50 percent-plus slope, as well as significant ridgelines in areas such as Castaic.⁴⁸ The proposed program would have no impact on the visibility or obstruction of views from these hillside regional trail systems as it would not be visible due to intervening topography, vegetation, urban development, and the scale and height of the

⁴⁶ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

⁴⁷ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

⁴⁸ Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

proposed facilities from a distance. Furthermore, the Green Zones Program would comply with the HMA Ordinance and Hillside Design Guidelines, in particular with landscaping barriers, enclosures, fencing, solid walls, signage, and lighting to provide further screening of the proposed program.⁴⁹ In regard to national or county-wide trails, subject properties for the proposed Storage Enclosures for Recycling and Solid Waste Revisions including supermarkets are directly adjacent to a national scenic trail (PCT) and existing or proposed county trails as identified in the USFS, the County General Plan 2035, or the Trails LA County Website.^{50,51,52} Despite its location next to national or county trails, these revisions would not have a significant adverse impact to visibility from or obstruction from a trail. The Storage Enclosures for Recycling and Solid Waste Revisions to the Ordinance pertain to standards, conditions, and procedures that support and facilitate the development and containment of onsite storage as a primary use to an existing collection facility in a manner that protects public health, safety, and welfare and minimizes significant impacts to the environment (Chapter 22.140-660.710). The revisions apply to Commercial Zones (C-1, C-2, C-2, C-3, C-M, C-MJ, C-R, C-RU), Mixed Used Zones (MXD, MXD-RU) and Industrial Zones.

The construction of an onsite storage enclosure would not substantially alter the existing conditions such that the view from a national or county trail would be impacted. The storage would be required to have view-obstructing fence or wall enclosures which the height of the stored items could not exceed and thereby would not damage visibility or visual value of a trail system. The development standards for storage enclosures within a recycling and solid waste facility, located outside of a building, shall be at least 8 feet tall and placed in the rear portion of the lot or adjacent to an alley, where applicable. The storage enclosure shall not obstruct or encroach into parking spaces, landscape areas, pedestrian or vehicular circulation, or other areas per County Fire and Building codes and in adherence with the HMA ordinance and Hillside Design Guidelines. Municipal solid waste, recyclables, and compostable material containers would be required to be located in the same enclosure thereby eliminating the need for multiple enclosures, unless allowed per code under extraordinary circumstances. The recyclable materials would be deposited and stored in containers that have lids and are made of metal, and the containers would be maintained in a clean and litter-free condition with no structural damage, holes, visible rust, or graffiti. The storage areas would be required to be accessible to residents, employees, and haulers at all times. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would not result in a substantial change, in addition to the development standards which require them to be kept in good condition and in nonvisible locations. As such, the addition of Storage Enclosures for Recycling and Solid Waste Revisions would not result in an adverse impact such that the visibility or obstruction from an adjacent national or county trail would be impacted. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts. No further analysis is warranted.

c) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Existing Conditions

There are four scenic highways in the County of Los Angeles. The Conservation and Natural Resources Element of the County General Plan 2035, which was adopted in 2015, identifies four state scenic highways (Table 2.1-1).⁵³ However, only two are state designated, and both were designated by Caltrans. The two state scenic highways include the Angeles Crest Highway and the Topanga Canyon Boulevard (see Table 2.1-1).⁵⁴ These scenic highways travel through both

⁴⁹ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

incorporated cities and unincorporated areas of the County, including within the vicinity of areas subject to the Ordinance.

Upon review of the County's General Plan and the proposed program, the parcels that would be subject to the Green Zone Districts and Storage Enclosures for Recycling and Solid Waste Revisions are located outside the HMA (Figure 2.1-2).⁵⁵ The parcels that would be subject to the Recycling and Waste Management Revisions within the HMAs are located in the Whittier Hills and north of the City of Santa Clarita. Based on the *Hillside Management Areas and Ridgeline Management Map* in the County General Plan, no County designated significant ridgelines are located within the Green Zone Districts, but the Green Zone Districts are within HMAs of both 25–50 percent slope and 50 percent-plus slope (Figure 2.1-2).⁵⁶

Threshold of Significance

A substantial adverse effect on scenic resources within a state designated scenic highway would normally occur as a result of removing the resources that define the view from the scenic highway such as trees, rock outcroppings, and historic buildings.

Impact Analysis

The potential for impacts to aesthetics has been evaluated in relation to the five elements of the Green Zones Program and the areas within the unincorporated areas of the County that are subject to revisions in development standards resulting from the proposed program (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the potential for the incremental changes to the physical environment as a result of new and/or revised development standards to result in the removal trees, rocks, or historic buildings that comprise the defining features for which either of two State scenic highways were designated.

Element 1 – Green Zone Districts

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to a scenic resources within designated scenic highways because they would not alter the quality of the existing development standard within a state scenic highway corridor nor would it alter the design review process for consistency with the scenic integrity of development within scenic highway corridors, including any new signs, historic building or tree removal, or landscape barriers. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and limited parking, signage, tree planning and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts and to future entitlements subject to CUP, for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within ~~the 3 to 7~~ 40 years of adoption of the Ordinance. There are no

⁵⁵ Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

⁵⁶ Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

Green Zone Districts within 1 mile of a scenic highway, as there are no eligible or officially designated state scenic highways traversing within or adjacent to the proposed Green Zone Districts. The Green Zone Districts would not alter the visual quality or character or scenic integrity because the proposed improvements are located a distance of at least 14 miles away from the nearest designated scenic highway. As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, and lighting as measures to decrease impacts to surrounding sensitive uses (Chapter 22.84). These measures would be required where the Ordinance implements new development standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities such that they would be visible from a scenic highway corridor. These measures would avoid rather than create visual blight from scenic resources, scenic highways, or historic parkways due to distance, intervening urban development, vegetation, and topography.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to scenic resources within a state scenic highway located within HMAs. None of the Green Zone Districts are located within the areas designated at HMAs within the County General Plan. The proposed program would have no impact on the quality of these hillsides as a scenic resource, as the Green Zones Program would comply with the HMA Ordinance and Hillside Design Guidelines.⁵⁷ Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to a scenic resources. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to aesthetics in relation to substantial damage to scenic resources within a state scenic highway. Currently the zoning and land use designations defined as sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in close proximity to existing industrial uses; the zones where they are located. The existing ~~land use designation have zoning designations include~~ development standards related applicable to the land use designation and zoning; however above listed sensitive uses. However, the Ordinance expands those requirements to include new development where properties are adjacent, or adjoining to industrial, recycling or solid waste, or vehicle-related uses requiring the use of solid wall screening expanded landscaping buffers between incompatible uses, standards for window, placement of balconies, and air filtration devices, (see Table 1.IV-2). There are no areas with the potential for New Sensitive Uses within 0.5 mile of a scenic highway, as there are no eligible or officially designated state scenic highways traversing within or adjacent to the proposed New Sensitive Uses near industrial, recycling and solid waste, or vehicle-related uses.

~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130). These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity adjacent to or adjoining legally-established existing industrial, recycling or solid waste, or vehicle-related uses.~~

The proposed New Sensitive Uses would have no impact on the quality of these hillsides as a scenic resource, as the development standards for New Sensitive Uses within the HMAs would be required to comply with the HMA Ordinance and Hillside Design Guidelines, in particular landscaping barriers, enclosures, fencing, solid walls, signage, and lighting.⁵⁸ The use of air filtration systems would not result in visual blight, as the County requires that such system

⁵⁷ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

⁵⁸ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

be screened from view from the public right of way and from the ground level of adjacent properties. Per Green Zones Ordinance and in conjunction with Public Works Building and Safety Division and the California Air Resource Board, air filtration systems shall be placed inside a building, residential or other rooms, intended for human occupancy which makes them non-visible from the public right of way. Air filtration systems placed outdoors, require setbacks, screen walls, fencing and/or landscaping that provide screening of the systems from the public right of way.⁵⁹

In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would be visible from scenic vista points and scenic corridors. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not be a visible difference in the view from any scenic highways or historic parkways due to distance, intervening urban development, vegetation, and topography. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses near industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to scenic resources. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to aesthetics in relation to substantial damage to scenic resources within a state scenic highway. These revisions affect parcels located within HMAs of both 25–50 percent slope and 50 percent-plus slope, as well as key ridgelines in areas such as Puente Hills, Castaic, the Santa Monica Mountains, and the Angeles National Forest.⁶⁰ The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The project would allow for new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with state requirements. The new development standards and/or more stringent entitlement processes for future entitlements would be subject to CUP, MCUP, and/or SPR, for the proposed revisions, that include construction improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials as well as cleaning and maintenance standards. These construction improvement features are already subject to current development standards as identified in the project description (Table 1.IV-1). ~~The proposed revisions would prohibit all these uses from HMAs such as automobile dismantling yards Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities~~ would be prohibited from HMAs and SEAs. Additionally, pallet yards, chipping and grinding, and mulching facilities would be prohibited in HFHSZs and VHFHSZs, solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways, and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. Therefore, impacts to Recycling and Waste Management Revisions would be less than significant in relation to scenic resources.

The proposed Recycling and Waste Management Revisions would screen from view incompatible land uses. The revisions would require waste, compost, and recyclable materials to be stored in receptacles, which would be located in the same enclosure. Storage areas would have a vertical dimension of 8 feet; however, when located outside of a building, storage areas would be located in the rear portion of the lot. Additionally, recycling and solid waste storage areas including Supermarket Accessory Recycling Collection Centers would be maintained in a clean, litter-free condition. Waste receptacles and enclosures would improve the waste management of industrial, commercial, and other facilities so that waste is more organized and out of view. The proposed revisions pertain to standards, conditions, and procedures that support and facilitate the development of recycling collection centers as an accessory use to an existing supermarket in a manner that protects public health, safety, and welfare and minimizes significant impacts to the environment (Chapter 22.140-660,710). The revisions apply to Commercial Zones (C-1, C-2, C-2, C-3, C-M, C-MJ, C-R, C-RU), Mixed Used Zones (MXD, MXD-RU) and Industrial Zones.

⁵⁹County of Los Angeles. Title 22 – Planning and Zoning, Division 7 – Standards for Specific Uses, Chapter 22.130.030 – Development Standards for Sensitive Uses. Accessed 31 March 2020.

⁶⁰ Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

The revisions would not have a significant adverse impact on the state scenic highway corridor. The Recycling and Waste Management Revisions, including Supermarket Accessory Recycling Collection Centers, per development improvement regulations ensures that enclosed rooms or storage areas are provided to store, collect, and load waste, recyclable materials, and organic materials generated by the uses served and that the area is safely accessible by building occupants and waste and recycling haulers. Any construction resulting from compliance with development standards would be minimal and would not substantially alter the existing conditions for existing industrial, commercial, and other uses such that a view from a state scenic highway would be impacted.

The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Currently developed Supermarkets in urbanized locations would be permitted in areas of the County where permitting is already required. The County regulates these facilities based on CalRecycle standards.⁶¹ These Supermarket Accessory Recycling Collection Centers within zones C-1, C-2, C-3, C-M as well as all industrial zones must comply with CalRecycle requirements. The County regulates these facilities based on CalRecycle standards.⁶² These uses must comply with existing development standards including property line and residential use setback standards; pedestrian or vehicular access and circulation standards, parking standards, signage standards, maintenance and operations standards, enclosure standards including solid wall screening where certain facilities are not enclosed, and building height and screening standards. The CalRecycle requirements are used to meet the County's waste diversion goals. The proposed revisions would allow these uses in the C-MJ, C-R, C-RU, MXD, and MXD-RU designated zones.

The project already complies with CalRecycle requirement within HMAs such as automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities. In addition, development standards already require that recycling collection centers as an accessory to supermarkets be kept in good condition and would not result in an adverse impact such that the visual quality of a corridor viewshed from an adjacent scenic highway would be impacted. Therefore, the Supermarket Accessory Recycling Collection Centers would have less than significant impacts as it pertains to scenic resources.

The proposed revisions would result in the improvement of the views of the scenic resources along a state scenic highway, as it would improve the visual quality of existing industrial, commercial, and other land uses. These revisions would require waste, compost, and recyclable to be stored in receptacles, which would be located in the same enclosure. Storage areas would have a vertical dimension of 8 feet; however, when located outside of a building, storage areas would be located in the rear portion of the lot. Additionally, recycling and solid waste storage areas would be maintained in a clean, leak-proof, litter-free condition. Waste receptacles and enclosures would improve the waste management of industrial, commercial, and other facilities so that waste is more organized and out of view. These development standards and measures would improve the visual quality of the industrial, commercial, and other facilities along a state scenic highway. Therefore, the Recycling and Waste Management Revisions would result in less than significant impacts to scenic resources within a scenic highway corridor. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to aesthetics in relation to substantial damage to scenic resources within a state scenic highway. These existing uses are subject to the current development standards within of the zones that they reside in. The revisions would add additional requirement such as enclosure wall height with roof, paving, cleaning and maintenance, distance requirements from adjoining doorways or windows, and clearances and circulation standards. The existing uses are subject to the current development standards as required per zone and the new requirements would only apply to new development as well as expansion of existing development in addition to the current standards.

The revisions would not have a significant adverse impact to scenic resources within a scenic highway corridor. The revisions pertain to standards, conditions, and procedures that support and facilitate the development and containment

⁶¹ County of Los Angeles Department of Regional Planning. November 3, 2008. Memorandum: Subdivision & Zoning Ordinance Standards for Accessory Recycling Collection Centers.

⁶² County of Los Angeles Department of Regional Planning. November 3, 2008. Memorandum: Subdivision & Zoning Ordinance Standards for Accessory Recycling Collection Centers.

of onsite storage as a primary use to an existing collection facility in a manner that protects public health, safety, and welfare and minimizes significant impacts to the environment (Chapter 22.140.660.710). The revisions apply to Commercial Zones (C-1, C-2, C-3, C-M, C-MJ, C-R, C-RU), Mixed Used Zones (MXD, MXD-RU) and Industrial Zones.

The construction of an onsite storage enclosure would not substantially alter the existing conditions such that scenic resources within a state scenic highway would be impacted. The storage would be required to have view-obstructing fence or wall enclosures which the height of the stored items could not exceed and thereby would not damage scenic resources. The development standards for storage enclosures within a recycling and solid waste facility, located outside of a building, would be required to be at least 8 feet tall and placed in the rear portion of the lot or adjacent to an alley, where applicable, and not obstruct or encroach into parking spaces, landscape areas, pedestrian or vehicular circulation, or other areas per County Fire and Building codes. Municipal solid waste, recyclables, and compostable material containers would be required to be located in the same enclosure thereby eliminating the need for multiple enclosures, unless allowed per code under extraordinary circumstances. The recyclable materials would be deposited and stored in containers that have lids and are made of metal, and the containers would be maintained in good condition with no structural damage, holes, visible rust, or graffiti. The storage areas shall be accessible to residents, employees, and haulers at all times. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would not result in a substantial change, in addition to the development standards which require them to be kept in good condition and in non-visible locations. As such, the addition of Storage Enclosures for Recycling and Solid Waste Revisions would not result in an adverse impact such that visual resources within a state scenic highway corridor would be impacted. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts. No further analysis is warranted.

- d) Substantially degrade the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features and/or conflict with applicable zoning and other regulations governing scenic quality? (Public views are those that are experienced from publicly accessible vantage point)**

Existing Conditions

The proposed program would apply to unincorporated areas of the generally urbanized area of Los Angeles County, including unincorporated communities for which zoning and other regulations governing scenic quality (such as Community Standards Districts) have been established. The proposed program would not conflict with zoning or regulations governing scenic quality. The Conservation and Natural Resources Element of the County General Plan 2035 addresses the preservation of valuable designated scenic areas, vistas, and roadways through the County Scenic Highway Plan, and recognizes that the coastline, mountain vistas, and other scenic features of the region are a significant resource.⁶³ The County has the goal of protecting these visual and scenic resources with ten policies that fall under the goal. The Ordinance would not conflict with any of these policies. The County General Plan 2035 also designates HMAs and Ridgeline Management Areas, and they are protected by the HMA Ordinance, which was adopted as a component of the County General Plan 2035 and requires development in HMAs to comply with Hillside Design Guidelines.⁶⁴

The proposed ordinance applies to urbanized areas within the unincorporated County of Los Angeles. Should the proposed developments occur within an area of scenic quality, the development would be minimal additions to existing industrial, commercial, and other land uses, and would not result in a substantial change. Additionally, should the proposed program fall within an HMA, it would have no impact on the quality of these hillsides as a scenic resource, as it would comply with the HMA Ordinance and Hillside Design Guidelines.⁶⁵ Therefore, the proposed program would result in less than significant impacts to aesthetics in relation to conflict with applicable zoning and other regulations governing scenic quality in an urbanized area.

⁶⁵ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

Thresholds of Significance

A substantial adverse effect on the visual character or quality of public views would normally occur as a result of a physical change in the environment that results in visual blight, as defined in the significance threshold for aesthetics questions A. The potential for impacts to aesthetics has been evaluated in relation to the five elements of the Green Zones Program and the areas within the unincorporated areas that are subject to revisions in development standards resulting from the green zones program (see Section 1, Table 1.IV-1, and Table 1.IV-2). The qualitative and quantitative analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment that might be visible from scenic vista include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Impact Analysis

Element 1 – Green Zone Districts

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to aesthetics in relation to the substantial degradation of the existing visual character or quality of public views of the site and its surroundings. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and limited parking, signage, tree planning and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts and to future entitlements subject to CUP, for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within ~~the 3 to 7~~ 3 to 7 40 years of adoption of the Ordinance. The Green Zone Districts adjacent to industrial, recycling and solid waste, or vehicle-related uses as part of the Ordinance are specifically industrial, recycling, and vehicle-related uses in close proximity to sensitive uses; a range of land uses where individuals most susceptible environmental impacts are most likely to spend time, including dwelling units, schools, parks, nursing homes, and hospitals.

The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses by changing specific regulatory requirements for specific industrial land uses. As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures to decrease impacts to surrounding sensitive uses (Chapter 22.84). These measures would be required where the Ordinance implements new development standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities. The proposed program would change the existing visual character of the site through development standards for industrial uses; however, these changes would improve the quality of public views of the site and its surroundings.

Certain development standards for uses subject to Chapter 22.84 would include construction requirements which would reduce the impacts of the changes to visual character through meeting minimum standards, such as for solid walls and landscaping:

- Solid Walls: Construction requirements for solid walls along the street frontage or any other lot lines adjoining a lot containing sensitive uses would include a uniform height of 8–12 feet, minimum 6-inch thickness, neutral color, workmanlike construction manner, and no fence or wire. Additionally, any materials, vehicles, or equipment that are stored outdoors would not exceed the height of the surrounding wall, and they would be set back at least 10 feet from the wall. Thus, solid walls would be constructed to protect the public view from the sight of industrial uses and would be designed to be uniform and neutral, thereby improving the visual quality of the site.
- Landscaping: Landscaping on street frontage in front of solid walls would include planting one 15-gallon tree for every 50 square feet of landscaped area, planted equally and spaced, with other landscaping in between. Landscaping would be maintained and replaced as necessary and would be planted such that it would not cause root damage to nearby sidewalks and public infrastructure, thereby improving the public views of an industrial site.

Other development standards relevant to aesthetics include the following:

- Full building enclosures would be required for hazardous material facilities, manufacturing or repair facilities, or recycling processing facilities. This would improve the visual quality of site by containing visually degrading industrial uses into a completely enclosed building.
- Trash receptacles and storage areas for waste would meet requirements in Chapter 22.12.128 (please see *Recycling and Waste Management Revisions*).
- Driveway, on-site vehicular circulation, and loading and unloading would be located in the rear or side of structures, or as furthest from the sensitive use as feasible, which would protect public views from constant view of industrial vehicle equipment and loading or unloading.
- Perimeter identification signs would be permanently affixed on a building or wall that is visible from the public right-of-way and for pedestrians. It would be no higher than eight feet from the ground measured vertically from the base of the sign with a minimum sign area of 4 square feet and a maximum of 9 square feet. The purpose of this sign would be to display the business name, hours of operation, telephone number, and emergency contact information related to the operation of the facility, and it would not result in a substantial change in visual character.

Additionally, for new development or proposed additions to existing uses, new building setback and building height requirements would be implemented. These would not result in change to existing industrial uses, and new projects would be required to assess their own impacts to aesthetics in relation to CEQA.

Thus, the new development standards for Green Zone Districts near industrial, recycling and solid waste, or vehicle-related uses would result in changes to visual character and public views of industrial sites; however, these changes would improve the visual quality of the sites through development standards that mitigate impacts of existing visually degrading uses. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to aesthetics in relation to the substantial degradation of the existing visual character or quality of public views of the site and its surroundings.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts to aesthetics in relation to the substantial degradation of the existing visual character or quality of public views of the site and its surroundings. Currently the zoning and land use designations defined as sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or

preschools as accessory to a place of worship ~~permitted in close proximity to existing industrial uses. the zones where they are located.~~ The existing ~~land use designation have zoning designations include~~ development standards ~~related applicable to the land use designation and zoning; however~~ above listed sensitive uses. However, the Ordinance expands those requirements to include new development where properties are adjacent, or adjoining to industrial, recycling or solid waste, or vehicle-related uses requiring the use of solid wall screening expanded landscaping buffers between incompatible uses, standards for window, placement of balconies, and air filtration devices, (see Table 1.IV-2). ~~The New Sensitive Uses near industrial, recycling and solid waste, or vehicle-related uses as part of the Ordinance is specifically industrial, recycling, and vehicle-related uses in close proximity to sensitive uses; a range of land uses where individuals most susceptible environmental impacts are most likely to spend time, including dwelling units, schools, parks, nursing homes, and hospitals.~~

~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures to decrease impacts to surrounding sensitive uses (Chapter 22.130). These measures would be required where the Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity adjacent to or adjoining existing industrial, recycling or solid waste, or vehicle-related uses.~~

Certain development standards for uses subject to Chapter 22.84130 would include construction requirements which would reduce the impacts of the changes to visual character through meeting minimum standards, such as for solid walls and landscaping:

- Setbacks and Landscaping: In addition to Tree Planting Requirements (Chapter 22.126) a landscaped setback of a minimum 15 feet in depth and a minimum 3 feet in height, and shall be provided along the adjoining property lines or street frontage that directly faces any portion of an existing industrial, recycling or solid waste uses, or vehicle-related use; All landscaping shall be drought-tolerant and include a mix of shrubs, turf, trees, or vertical landscaping; The landscaping shall be maintained in a healthy condition, with regular watering, pruning, weeding, fertilizing, litter removal, and replacement of plants when necessary.
- Solid Walls: Solid walls shall be provided along the property lines or along required landscaping adjoining the applicable non-sensitive uses (industrial, recycling or solid waste uses, or vehicle-related uses, except for sales and rental) and shall have a uniform height of at least eight feet.
- Open Space: Any common open space shall be buffered from the adjacent facilities by a building, structure(s), or landscaping of a minimum of three feet in height. The landscaped buffer shall be a minimum of three feet in depth on the premise.

Other development standards relevant to aesthetics include the following:

- All windows in any buildings shall be double-glazed.
- Balconies shall be prohibited on the side of a building that faces an adjoining lot containing an existing industrial uses, recycling or solid waste uses, or vehicle-related uses, except for vehicle sales and rentals.
- Air filtration systems shall be provided in residential units and other rooms that are intended for human occupancy, as by Public Works Building and Safety Division and the California Air Resources Board.

Additionally, for new development or proposed additions to existing uses, new landscape, walls and open space setbacks and height requirements would be implemented. These would not result in change to existing industrial uses, and new projects would be required to assess their own impacts to aesthetics in relation to CEQA.

Thus, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in changes to visual character and public views of industrial sites; however, these changes would improve the visual quality of the sites through development standards that mitigate impacts of existing visually degrading uses. Therefore, the New Sensitive Uses near industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to aesthetics in relation to the substantial degradation of the existing visual character or quality of public views of the site and its surroundings.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to aesthetics in relation to the substantial degradation of the existing visual character or quality of public views of the site and its surroundings. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The project would allow for new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with state requirements. The new development standards and/or more stringent entitlement processes for future entitlements would be subject to a CUP, an MCUP, and/or an SPR, for the proposed revisions, that include construction improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials as well as cleaning and maintenance standards. These construction improvement features are already subject to current development standards as identified in the project description (Table 1.IV-1). ~~The proposed revisions would prohibit all these uses from HMAs such as automobile dismantling yards~~ Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited from HMAs and SEAs. Additionally, pallet yards, chipping and grinding, and mulching facilities would be prohibited in HFHSZs and VHFHSZs, solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways, and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. Therefore, impacts to Recycling and Waste Management Revisions would be less than significant in relation to visual character.

The proposed Recycling and Waste Management Revisions would screen from view incompatible land uses. The revisions would require waste, compost, and recyclable materials to be stored in receptacles, which would be located in the same enclosure. Storage areas would have a vertical dimension of 8 feet; however, when located outside of a building, storage areas would be located in the rear portion of the lot. Additionally, recycling and solid waste storage areas including Supermarket Accessory Recycling Collection Centers would be maintained in a clean, litter-free condition. Waste receptacles and enclosures would improve the waste management of industrial, commercial, and other facilities so that waste is more organized and out of view. The proposed revisions pertain to standards, conditions, and procedures that support and facilitate the development of recycling collection centers as an accessory use to an existing supermarket in a manner that protects public health, safety, and welfare and minimizes significant impacts to the environment (Chapter 22.140-660,710). The revisions apply to Commercial Zones (C-1, C-2, C-2, C-3, C-M, C-MJ, C-R, C-RU), Mixed Used Zones (MXD, MXD-RU) and Industrial Zones. Waste storage areas would not degrade the visual character of the project area, as development improvement requirements would include view-obstructing materials. The proposed program would change the existing visual character of the site through development standards for commercial and industrial uses; however, these changes would improve the quality of public views of the site and its surroundings.

In regard to visual character, parcels that are subject to proposed Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, include locations that are directly adjacent to three of the four state scenic highways, designated in the Conservation and Natural Resources of the County of Los Angeles General Plan: Angeles Crest Highway, Mulholland Highway, and Malibu Canyon-Las Virgenes Highway.⁶⁶ Despite the location of subject parcels in relation to scenic highways, parcels subject to the Recycling and Waste Management Revisions, would not have a significant adverse impact on scenic vistas because they would not block views of resources for which the scenic highways were designated. Rather than blocking views, the Recycling and Waste Management Revisions would ensure that materials and equipment staged within such centers would be screened from view. The design review process utilized by the County, requires that the developer demonstrate consistency with the integrity of scenic highway corridors, including any new signs, historic building or tree removal, or landscape barriers. Furthermore, the Recycling and Waste Management Revisions would comply with the HMA Ordinance, Hillside Design Guidelines, the AHMP, and fire prevention codes and regulations that help preserve, protect, and enhance the physical site integrity and value of hillsides and associated views.

The project may change the public view of the existing uses; however, these waste receptacles and enclosures would

⁶⁶ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

improve the waste management of industrial, commercial, and other facilities so that waste is more organized and out of view. Enclosures would be located in the rear of the lot and designed in a uniform and neutral manner that would not degrade the visual quality. The project already complies with CalRecycle requirement within HMAs such as automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities. In addition, development standards already require that recycling collection centers as an accessory to supermarkets be kept in good condition and would not result in an adverse impact such that the visual quality of a corridor viewshed from an adjacent scenic highway would be impacted. Therefore, the Supermarket Accessory Recycling Collection Centers would have less than significant impacts as it pertains to visual character. Therefore, the Recycling and Waste Management revisions including supermarket accessory recycling collection centers would result in less than significant impacts to aesthetics in relation to the substantial degradation of the existing visual character or quality of public views of the site and its surroundings. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to aesthetics in relation to the substantial degradation of the existing visual character or quality of public views of the site and its surroundings. These existing uses are subject to the current development standards within of the zones that they reside in. The revisions would add additional requirement such as enclosure wall height with roof, paving, cleaning and maintenance, distance requirements from adjoining doorways or windows, and clearances and circulation standards. The existing uses are subject to the current development standards as required per zone and the new requirements would only apply to new development as well as expansion of existing development in addition to the current standards.

The Storage Enclosures for Recycling and Solid Waste Revisions to the Ordinance pertain to standards, conditions, and procedures that support and facilitate the development and containment of onsite storage as a primary use to an existing collection facility in a manner that protects public health, safety, and welfare and minimizes significant impacts to the environment (Chapter 22.140.660, 710). These revisions apply to existing Recycling and Solid Waste Centers in Commercial Zones (C-1, C-2, C-3, C-M, C-MJ, C-R, C-RU), Mixed Use Zones (MXD, MXD-RU) and Industrial Zones.

The construction of an onsite storage enclosures would not substantially alter the existing conditions such that the visual character of the existing site or the surrounding area would be impacted. The storage would be required to have fence or wall enclosures for screening the stored items which the height of the stored items could not exceed and thereby would not damage the visual character or quality of public views of the site and its surroundings. The development standards for storage enclosures within a recycling and solid waste facility, located outside of a building, would be required to be at least 8 feet tall and placed in the rear portion of the lot or adjacent to an alley, where applicable, and not obstruct or encroach into parking spaces, landscape areas, pedestrian or vehicular circulation, or other areas per County Fire and Building codes. Municipal solid waste, recyclables, and compostable material containers would be required to be located in the same enclosure thereby eliminating the need for multiple enclosures, unless allowed per code under extraordinary circumstances. The recyclable materials would be deposited and stored in containers that have lids and are made of metal, and the containers would be maintained in good condition with no structural damage, holes, visible rust, or graffiti. The storage areas shall be accessible to residents, employees, and haulers at all times. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would not result in a substantial change, in addition to the development standards which require them to be kept in good condition and in non-visible locations. As such, the addition of Storage Enclosures for Recycling and Solid Waste Revisions would not result in an adverse impact such that the visual quality, visual character or integrity of the area and its surroundings within the proposed revisions would be impacted. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to aesthetics in relation to the substantial degradation of the existing visual character or quality of public views of the site and its surroundings. No further analysis is warranted.

Therefore, the proposed program would result in less than significant impacts to aesthetics related to the substantial degradation of the existing visual character or quality of public views of the site and its surroundings, or conflict with applicable zoning and other regulations governing scenic quality. No further analysis is warranted.

e) Create a new source of substantial shadows, light, or glare which would adversely affect day or nighttime views in the area?

Existing Conditions

The Ordinance applies to the entire County, and, given its large regional extent, cannot be described by one characterization of nighttime light levels. Urban areas of Los Angeles County can be very high whereas rural areas can be very low, and the unincorporated areas subject to the Ordinance include both (Figure 2.1-4, *Existing Nighttime Light Levels*). The proposed program would be expected to result in impacts if it introduced substantial light or glare to areas with low existing light levels.

The Conservation and Natural Resources Element and the Parks and Recreation Element of the County General Plan 2035 identifies criteria regarding light trespass and light pollution as it pertains to Dark Skies, Policy C/NR 13.3, the Landscape and Lighting Assessment Districts (LLADs), and the Rural Outdoor Lighting Districts Ordinance in relation to safety and security lighting regarding improvements.⁶⁷ The Ordinance would not conflict with any of these policies. The County General Plan 2035 also designates HMAs and Ridgeline Management Areas, and they are protected by the HMA Ordinance, which was adopted as a component of the County General Plan 2035 and requires development in HMAs to comply with Hillside Design Guidelines.⁶⁸

The lighting requirements per HMA Ordinance and Hillside Design Guidelines identifies the use of outdoor lighting to illuminate signage that includes hooded fixtures with a downward projection for minimizing light trespass.^{69, 70} In addition, Title 22 identifies that adequate outdoor lighting should be provided for safety and security, so as to shield the light to be directed inward to the facility, yard and equipment and away from lots with sensitive uses which would not result in substantial light or glare during the daytime.⁷¹ Furthermore, per Title 22, in the case that the facility is located within a Rural Outdoor Lighting District (Chapter 22.80), subsection standards H.4 (Fences, Walls and Landscaping), H.7.b and c (Storage of Collected Materials), and H.13 (Accessory Structures and Utilities) regarding lighting shall apply.⁷² These measures would be required where the Ordinance implements new development standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities.

Thresholds of Significance

A substantial adverse effect that would occur as a result of a physical change in the environment in relation to new sources of shadows, light or glare consists of those that would adversely affect day or nighttime views at the nearest public right of way or adjacent land use. Adverse effects normally occur when new buildings are constructed that cast shadows on adjacent land uses. Adverse effects from light normally occur when security lighting or building lights spills over into adjacent land uses.

⁶⁷ Los Angeles County Department of Regional Planning. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element (Part VII), Scenic Resources, of the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

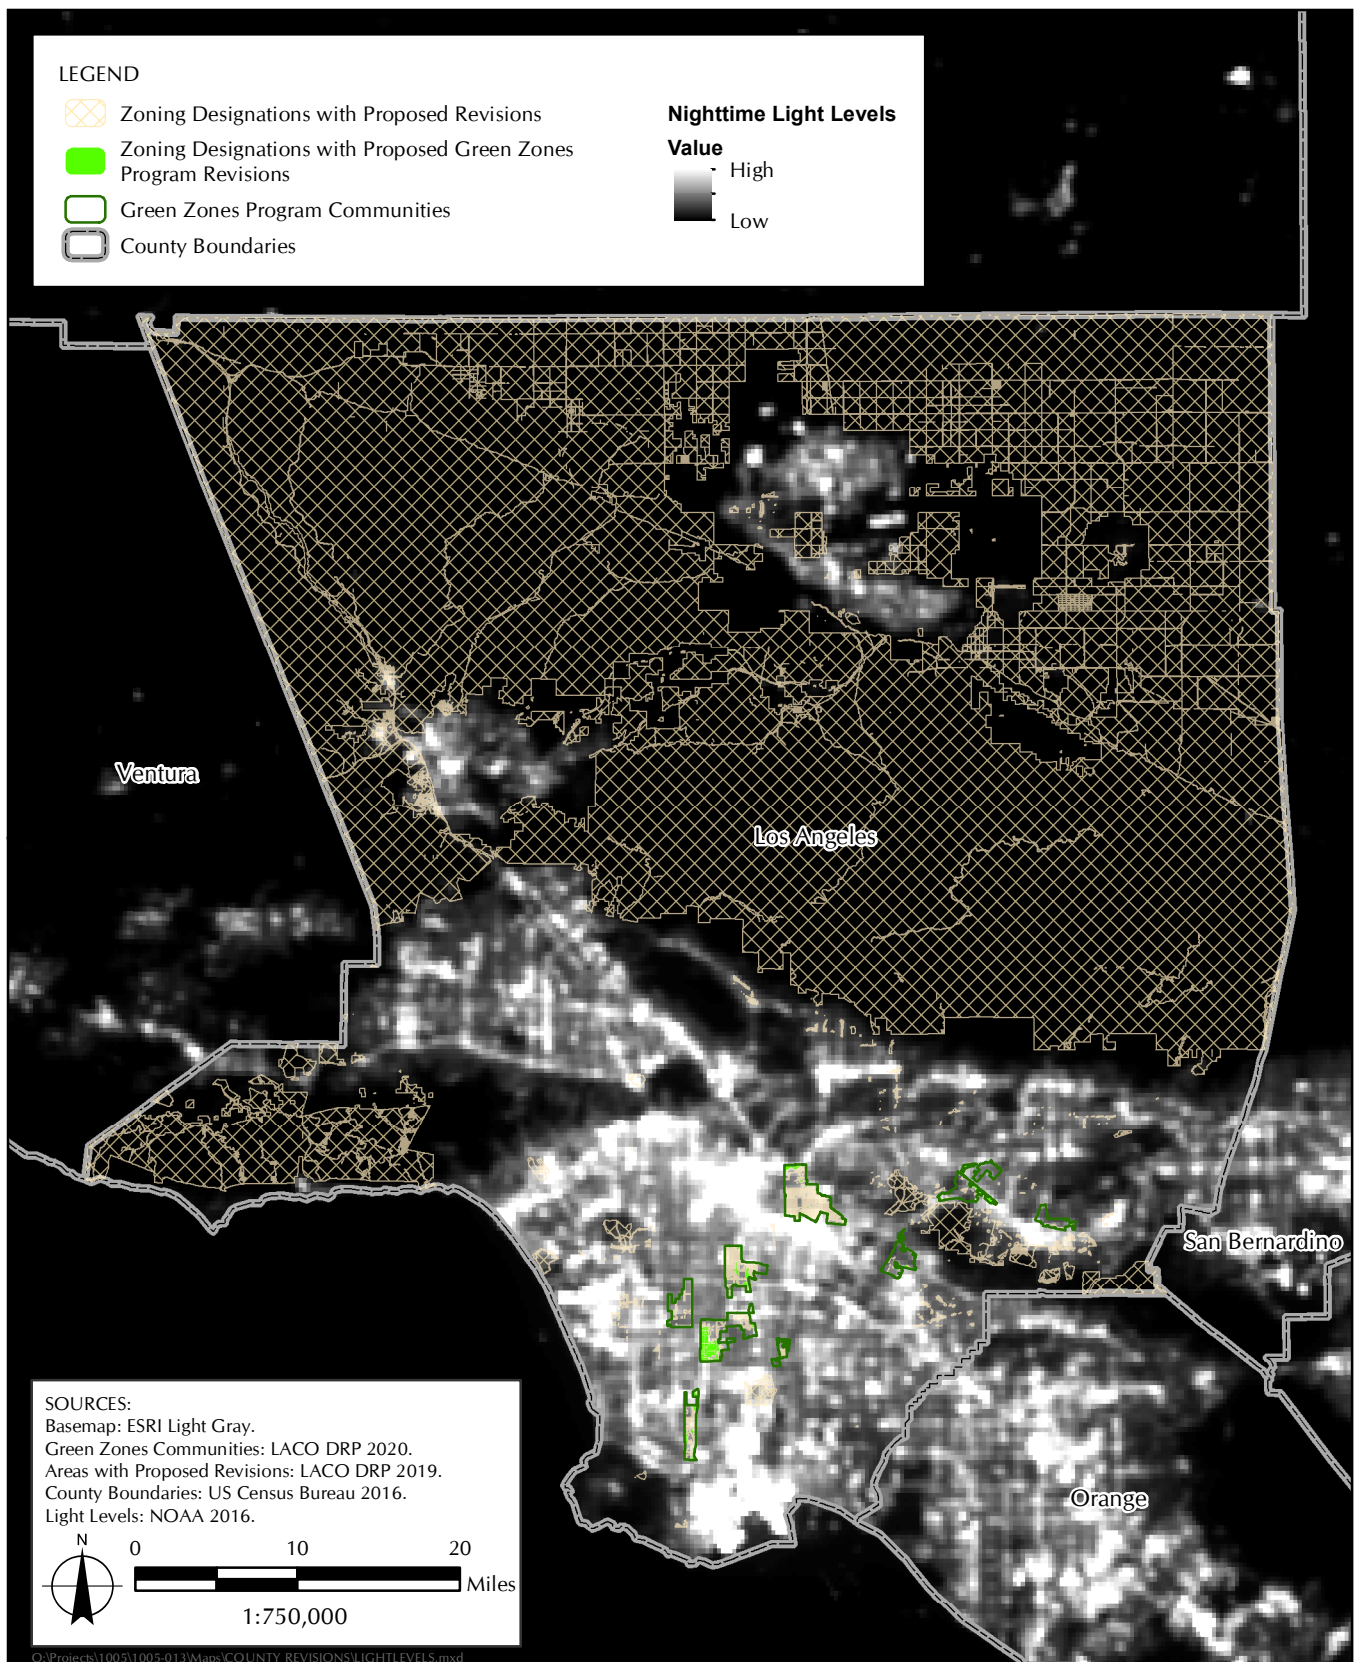

FIGURE 2.1-4
Existing Nighttime Light Levels

Luminance is the only basic lighting parameter that is perceived by the eye. It describes on the one hand a light source's impression of brightness, and on the other, a surface, and therefore depends to a large extent on the degree of reflection (color and surface).⁷³ Albedo is the amount of sunlight (solar radiation) that is reflected by a surface, and is usually expressed as a percentage or a decimal value. The light that hits the surface is either reflected or absorbed.^{74,75} A low albedo means a surface reflects a small amount of the radiation and absorbs the rest, whereas a high albedo means a surface reflects most of the light that hits it. Generally, dark surfaces have a low albedo and light surfaces have a high albedo. For instance, fresh snow reflects up to 95 percent of the incoming radiation resulting in a high albedo surface. By contrast, water reflects about 10 percent of the incoming radiation, resulting in a low albedo of surface. Since 30 percent of the sun's energy is reflected by the entire earth, the earth has an average albedo of 30 percent.^{76,77} Reflective surfaces can also refer to human made structures such as buildings, glass, concrete surfacing or walls, asphalt, wood structures, and vegetation cover, to name a few (Table 2.1-2, *Materials – Light-Reflecting Factors*). Furthermore, albedo is determined by more than just the composition of soil; it is impacted by soil moisture, type of vegetation, and levels of urbanization. Different surfaces on the earth have different albedos, and those albedos vary with time. Changes in albedo occur as the amount of cloud cover changes such as atmospheric composition like optical properties of haze particles that create differences in the albedo of a surface where optimal reflective conditions of sunlight can be under cloud-free conditions.^{78, 79}

Glare: Perceived glare is the unwanted and potentially objectionable sensation as observed by a person looking directly into the light source (e.g., the sun, the sun's reflection, automobile headlights, or other light fixtures). Reflective surfaces on existing buildings, car windshields, etc., can expose people and property to varying levels of glare. Glare may come directly from a light source or be reflected. There are four types of glare: Distracting glare, discomforting glare, disabling glare, and blinding glare. This results in some of the light being reflected off the surface, or internally reflecting within a spectacle lens.

Shadow Sensitive Uses: Shadow sensitive uses are land uses that are considered sensitive to the effects of new light-blocking structures casting shadows because sunlight is important to the function, physical comfort, or commerce of the land use. Facilities and operations that are considered sensitive to the effects of shadows include: routinely useable outdoor spaces associated with residential, recreational, or institutional (e.g., schools, convalescent homes) land uses; commercial uses such as pedestrian-oriented outdoor spaces or restaurants with outdoor eating areas; nurseries; and existing solar collectors.⁸⁰

The potential for impacts to aesthetics has been evaluated in relation to the five elements of the Green Zones Program and the areas within the unincorporated areas that are subject to revisions in development standards resulting from the green zones program (see Section 1, Table 1.IV-1, and Table 1.IV-2). The qualitative and quantitative analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment that might be visible from scenic vista include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (Table 1.IV-2).

SOURCE: The Engineering Toolbox. Accessed on May 24, 2020. Illuminance: Recommended Light Levels. Available at: https://www.engineeringtoolbox.com/light-level-rooms-d_708.html

The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses by changing regulatory requirements for specific industrial land uses. The five elements would result in different levels of incremental changes to the physical environment as a result of new development standards, recycling and solid waste uses, and zoning requirements for industrial uses, vehicle-related uses, and recycling and solid waste uses that may disproportionately affect communities surrounding these land uses. These changes would involve the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). These incremental changes within subject properties would not be substantial enough to create a new source of substantial shadows, light, or glare because they would require minor modifications to existing development standards for specific industrial land uses such as fencing, walls, landscape buffers, paving, lighting and signage, building height and screening, and open space standards. The relative impact levels of each element of the proposed program on new sources of substantial shadows, light, or glare is discussed below.

Element 1 – Green Zone Districts

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to aesthetics in relation to the creation of a new source of substantial light or glare that would adversely affect daytime or nighttime views in the proposed program area. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and limited parking, signage, tree planning and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts and to future entitlements subject to CUP, for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within ~~the 3 to 7-40~~ years of adoption of the Ordinance. The Green Zone Districts would be located in the urbanized Los Angeles area of the County where they experience medium to high nighttime light levels, and Chapter 22.84 (Green Zone Districts) of the Ordinance contains no provisions for lighting in its development standards for industrial uses. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would create no new source of light that would affect daytime or nighttime views, and there would be less than significant impact. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to aesthetics in relation to the creation of a new source of substantial light or glare that would adversely affect daytime or nighttime views in the proposed program area. Currently the zoning and land use designations defined as sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in close proximity to existing industrial uses; the zones where they are located. The existing ~~land use designation have zoning designations include~~ development standards related applicable to the land use designation and zoning; however above listed sensitive uses. However, the Ordinance expands those requirements to include new development where properties are adjacent, or adjoining to industrial, recycling or solid waste, or vehicle-related uses requiring the use of solid wall screening expanded landscaping buffers between incompatible uses, standards for window, placement of balconies, and air filtration devices, (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would experience medium to high nighttime light levels, and Title 22 of the Ordinance indicates that adequate outdoor lighting

should be provided for safety and security but that the light should be shielded to be directed inward to the facility, yard and equipment and away from lots with sensitive uses which would not result in substantial light or glare during the daytime.⁸¹ In addition, vegetation and concrete materials such as walls and surfacing have a low reflectivity factor or albedo of approximately 20–30 percent. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the proposed program area due to existing urban development, topography, vegetation and other existing factors.

The proposed New Sensitive Uses would have no impact on the quality and quantity of these hillsides regarding light trespass and light pollution, as the development standards for New Sensitive Uses within the HMAs would be required to comply with the HMA Ordinance and Hillside Design Guidelines, in particular landscaping barriers, enclosures, fencing, solid walls, signage, and lighting.⁸² The use of lighting would not result in light trespass and light pollution, as the County requires that such system be shielded and directed away from sensitive uses and other adjacent properties. Per Title 22 Ordinance and in conjunction with the Dark Skies, Policy C/NR 13.3, and the Landscape and Lighting Assessment Districts (LLADs), outdoor signage lighting should include hooded fixture with downward projection for minimizing light trespass.^{83,84} In addition, other outdoor lighting should be provided for safety and security, but should shield the light to be directed inward to the facility, yard and equipment and away from lots with sensitive uses with not result in substantial light or glare during the daytime.⁸⁵ In the case that the facility is located within a Rural Outdoor Lighting District (Chapter 22.80), subsection standards H.4 (Fences, Walls and Landscaping), H.7.b and c (Storage of Collected Materials), and H.13 (Accessory Structures and Utilities) regarding lighting shall apply.⁸⁶ These measures would be required where the Ordinance implements new development standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities. Furthermore, require setbacks, screen walls, fencing and/or landscaping that provide screening of the systems will not have light trespass and light pollution during nighttime and shield or reduce light or glare during daytime due to the low reflective or albedo factor of the materials. Therefore, the new development standards for New Sensitive Uses near industrial, recycling and solid waste, or vehicle-related uses would create no new source of light that would affect daytime or nighttime views, and there would be no impact. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impact to aesthetics in relation to the creation of a new source of substantial shadows, light or glare that would adversely affect daytime or nighttime views. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The project would allow for new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with state requirements. The new development standards and/or more stringent entitlement processes for future entitlements would be subject to CUP, MCUP, and/or SPR, for the proposed revisions, that include construction improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials as well as cleaning and maintenance standards. These construction improvement features are already subject to current development standards as identified in the project description (Table 1.IV-1). ~~The proposed revisions will prohibit all these uses from HMAs such as automobile dismantling yards~~ Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste,

⁸¹ County of Los Angeles. Title 22 – Planning and Zoning, Division 7 – Standards for Specific Uses, Chapter 22.140.430 – Outdoor Storage. Accessed 31 March 2020.

⁸² Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

⁸³ County of Los Angeles. Adopted 6 October 2016. Title 22 – Planning and Zoning – Hillside Management Areas, Chapter 22.56.217 – Section VI: Sensitive Hillside Design Features. Accessed 31 March 2020.

⁸⁴ County of Los Angeles. Hillside Design Guidelines. Accessed 31 March 2020.

⁸⁵ County of Los Angeles. Title 22 – Planning and Zoning, Division 7 – Standards for Specific Uses, Chapter 22.140.430 – Outdoor Storage. Accessed 31 March 2020.

⁸⁶ County of Los Angeles. Title 22 – Planning and Zoning, Division 7 – Standards for Specific Uses, Chapter 22.140.430 – Outdoor Storage. Accessed 31 March 2020.

and solid waste facilities would be prohibited from HMAs and SEAs. Additionally, pallet yards, chipping and grinding, and mulching facilities would be prohibited in HFHSZs and VHFHSZs, solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways, and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. Therefore, impacts to Recycling and Waste Management Revisions would be less than significant in relation to a new source of light that would affect daytime or nighttime views.

The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal.^{87,88}

The proposed Recycling and Waste Management Revisions would screen from view incompatible land uses. The revisions would require waste, compost, and recyclable materials to be stored in receptacles, which would be located in the same enclosure. Storage areas would have a vertical dimension of 8 feet; however, when located outside of a building, storage areas would be located in the rear portion of the lot. Additionally, recycling and solid waste storage areas including Supermarket Accessory Recycling Collection Centers would be maintained in a clean, litter-free condition. Waste receptacles and enclosures would improve the waste management of industrial, commercial, and other facilities so that waste is more organized and out of view. The proposed revisions pertain to standards, conditions, and procedures that support and facilitate the development of recycling collection centers as an accessory use to an existing supermarket in a manner that protects public health, safety, and welfare and minimizes significant impacts to the environment (Chapter 22.140-~~660~~,710). The revisions apply to Commercial Zones (C-1, C-2, C-2, C-3, C-M, C-MJ, C-R, C-RU), Mixed Used Zones (MXD, MXD-RU) and Industrial Zones.

The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Currently developed Supermarkets in urbanized locations would be permitted in areas of the County where permitting is already required. The County regulates these facilities based on CalRecycle standards.⁸⁹ These Supermarket Accessory Recycling Collection Centers within zones C-1, C-2, C-3, C-M as well as all industrial zones must comply with CalRecycle requirements. The County regulates these facilities based on CalRecycle standards.⁹⁰ These uses must comply with existing development standards including property line and residential use setback standards; pedestrian or vehicular access and circulation standards, parking standards, signage standards, maintenance and operations standards, enclosure standards including solid wall screening where certain facilities are not enclosed, and building height and screening standards. The CalRecycle requirements are used to meet the County’s waste diversion goals. The proposed revisions would allow these uses in the C-MJ, C-R, C-RU, MXD, and MXD-RU designated zones. These uses will be ~~constructed~~ established on existing parking lots and no structures would be built.

The areas subject to these revisions are located in areas with low to high existing nighttime levels. Chapter 22.128 (Storage Enclosures for Recycling and Solid Waste including Supermarket Accessory Recycling Collection Centers) of the Ordinance contains no provisions for lighting in its development standards for waste storage receptacles and enclosures. However, Chapter 22.140-~~660~~,710 (Supermarket Accessory Recycling Collection Centers) identifies that adequate outdoor lighting provided for Supermarket Recycling Collection Centers shall be directed into the facility and

⁸⁷ County of Los Angeles Department of Regional Planning. November 3, 2008. Memorandum: Subdivision & Zoning Ordinance Standards for Accessory Recycling Collection Centers.

⁸⁸ Public Draft Green Zones Ordinance (Appendix A to the Initial Study) – Section 7. 22.14.180. R.

⁸⁹ County of Los Angeles Department of Regional Planning. November 3, 2008. Memorandum: Subdivision & Zoning Ordinance Standards for Accessory Recycling Collection Centers.

⁹⁰ County of Los Angeles Department of Regional Planning. November 3, 2008. Memorandum: Subdivision & Zoning Ordinance Standards for Accessory Recycling Collection Centers.

away from lots with sensitive uses which would not result in substantial light or glare during the daytime.⁹¹ In addition, the Green Zones Program within HMAs would comply with the HMA Ordinance and Hillside Design Guidelines, in particular with landscaping barriers, enclosures, fencing, solid walls, signage, and lighting to provide further screening of the proposed program.⁹² Furthermore, should the subject properties fall within an HMA, the revisions would have no adverse impact on light nighttime light trespass, light pollution or daytime light and glare, as they would comply with the HMA Ordinance and Hillside Design Guidelines in providing shielded lighting for nighttime applications and materials with minimal albedo for daytime application along with setbacks and adequate screening.⁹³

The proposed revisions will prohibit all these uses from HMAs. In addition, Supermarket Recycling Accessory Collection Centers will be ~~constructed~~ established on existing parking lots and no structures would be built. Therefore, the project would create no new source of light that would affect daytime or nighttime views, and the Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impact. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to aesthetics in relation to the creation of a new source of substantial shadow, light or glare that would adversely affect daytime or nighttime views. These existing uses are subject to the current development standards within of the zones that they reside in. The revisions would add additional requirement such as enclosure wall height with roof, paving, cleaning and maintenance, distance requirements from adjoining doorways or windows, and clearances and circulation standards. The existing uses are subject to the current development standards as required per zone and the new requirements would only apply to new development as well as expansion of existing development in addition to the current standards.

The areas subject to these revisions are located in areas with low to high existing nighttime levels (primarily low levels in rural areas of the County). Chapter 22.128 (Storage Enclosures Requirements for Recycling and Solid Waste) of the Ordinance contains no provisions for lighting in its development standards for waste storage receptacles and enclosures. The Storage Enclosures for Recycling and Solid Waste Revisions per the Ordinance pertain to standards, conditions, and procedures that support and facilitate the development and containment of onsite storage as a primary use to an existing collection facility in a manner that protects public health, safety, and welfare and minimizes significant impacts to the environment (Chapter 22.140.670.720 and 22.140.680.730). These revisions apply to existing Recycling and Solid Waste Centers in Commercial Zones (C-1, C-2, C-3, C-M, C-MJ, C-R, C-RU), Mixed Use Zones (MXD, MXD-RU) and Industrial Zones.

The construction of an onsite storage enclosures would not substantially alter the existing conditions such that views of light or glare of the existing site or the surrounding area would be impacted. The storage would be required to have fence or wall enclosures for screening the stored items and located outside of a building, would be required to be at least 8 feet tall and placed in the rear portion of the lot or adjacent to an alley, where applicable, and not obstruct or encroach into parking spaces, landscape areas, pedestrian or vehicular circulation, or other areas per County Fire and Building codes. Municipal solid waste, recyclables, and compostable material containers would be required to be located in the same enclosure thereby eliminating the need for multiple enclosures, unless allowed per code under extraordinary circumstances. The recyclable materials would be deposited and stored in containers that have lids, and the containers would be maintained in good condition with no structural damage, holes, visible rust, or graffiti. The storage areas shall be accessible to residents, employees, and haulers at all times.

Any new development would be subject to development requirement of HMAs The Green Zones Program within HMAs would comply with the HMA Ordinance and Hillside Design Guidelines, in particular with landscaping barriers,

⁹¹ County of Los Angeles. Title 22 – Planning and Zoning, Division 7 – Standards for Specific Uses, Chapter 22.140.660 – Outdoor Storage. Accessed 31 March 2020.

⁹² Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

⁹³ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

enclosures, fencing, solid walls, signage, and lighting to provide further screening of the proposed program.⁹⁴ Furthermore, should the subject properties fall within an HMA, the revisions would have no adverse impact on light nighttime light trespass, light pollution or daytime light and glare, as they would comply with the HMA Ordinance and Hillside Design Guidelines in providing shielded lighting for nighttime applications and materials with minimal albedo for daytime application along with setbacks and adequate screening.⁹⁵ These measures would be required where the Ordinance implements new development standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities.

The supermarket recycling collection center would be an accessory to existing supermarket which produces light, and it would not result in a substantial change in the existing conditions. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts. No further analysis is warranted.

Therefore, the proposed program would result in less than significant impacts to aesthetics related to the creation of a new source of substantial light or glare that would adversely affect daytime or nighttime views in the proposed program area. No further analysis is warranted.

2.2. AGRICULTURE AND FORESTRY RESOURCES

This analysis is undertaken to determine if the proposed program may have a significant impact to agriculture and forestry resources, thus requiring the consideration of mitigation measures or alternatives in accordance with the State CEQA Guidelines.¹ The analysis covers all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated with regard to the California Department of Conservation (CDC) Farmland Mapping and Monitoring Program (FMMP),² Title 22 of the Los Angeles County Municipal Code,³ the Los Angeles County General Plan 2035,⁴ Public Resource Codes 12220 and 4526,^{5,6} and Government Code 51104.⁷

Definitions

State CEQA Statutes (§21060.1(a), Public Resources Code [PRC] 21000-21177) define agricultural land to mean “prime farmland, farmland of statewide importance, or unique farmland, as defined by the U.S. Department of Agriculture (USDA) land inventory and monitoring criteria, as modified for California,” and is herein collectively referred to as “Farmland.”

“Forest land” is defined in PRC § 12220 (g) as land that can support 10 percent native tree cover of any species including hardwoods, under natural conditions, and that allows for management of one of more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits.⁸

“Timberland” is defined in Public Resources Code § 4526 as land other than land owned by the federal government and land designated by the board as experimental forest land, which is available for, and capable of, growing a crop of trees of a commercial species used to produce lumber and other forest products.⁹

A “Timberland Production Zone” (TPZ) is defined in Government Code § 51104 (g) as an area which has been zoned pursuant to Section 51112 or 51113 and is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses.¹⁰

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Impact Analysis

- a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program (FMMP) of the California Resources Agency, to non-agricultural use?

Existing Conditions

The FMMP allows use of the California Important Farmland Finder, which provides an inventory of agricultural land resources using the most recent maps and data. Based on a comparison of maps prepared by the FMMP and the parcels subject to the Ordinance, the Ordinance would include parcels that have been categorized as Prime Farmland, Unique Farmland, and Farmland of Statewide Importance.¹¹ There are approximately 18,156 acres that are categorized as Farmland according to the FMMP that overlap with the project footprint.

¹¹ California Department of Conservation, Division of Land Resources Protection, Farmland Mapping and Monitoring Program. California Important Farmland Finder. Accessed 10 March 2019. <https://maps.conservation.ca.gov/DLRP/CIFF/>

Threshold of Significance

An impact would occur if construction would be required on lands mapped as Farmland such that the land use would be converted to a non-agricultural use.

Impact Analysis

The proposed program would result in no impacts to agriculture and forestry resources in relation to converting Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) to non-agricultural use. The potential for impacts to agriculture and forestry resources has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts, and the areas within the unincorporated areas of the County that are subject to revisions in development standards resulting from the proposed program (please see Section 1, *Project Description*; Table 1.IV-1, *Planning and Permitting Requirements*, and Table 1.IV-2, *Development Standards*). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment such as Farmland include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to agriculture and forestry resources in relation to converting Farmland to non-agricultural use. There are 0 acres of Farmland in the areas subject to the Green Zone Districts, which are concentrated in the urbanized Los Angeles Basin.

The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently the zoning and land use designations for the 11 districts under consideration for proposed revisions allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum floor area ratio (FAR) requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

An impact would be expected to occur if construction would be required on lands mapped as Farmland. However, in the case of Green Zone Districts, given that there are 0 acres of Farmland in areas subject to the Green Zone Districts, there is no potential for any Farmland to be converted to non-agricultural use as a result of these development standards.

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other

properties would result in no impacts to agriculture in relation to converting Farmland to non-agricultural use. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to agriculture in relation to converting Farmland to non-agricultural use. The New Sensitive Uses apply to new development of sensitive uses in the unincorporated areas of the County.

Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses.~~ permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related, uses.

An impact would be expected to occur if construction would be required on lands mapped as Farmland. However, in the case of updated standards for new sensitive uses, despite its location within an area which contains Farmland, the construction of these measures would not differ substantially from existing conditions, such that they result in an impact to Farmland. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not convert Farmland to non-agricultural uses. If the development standards for New Sensitive Uses were required to be implemented on Farmland, then the development standards would be implemented as a part of the sensitive use being proposed. The development standards would be minimal additions to the design of the proposed new sensitive use, which would be evaluated on an individual project basis under CEQA for impacts to agricultural and forestry resources.

Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in no impacts to agriculture in relation to converting Farmland to non-agricultural use. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts to agriculture in relation to converting Farmland to non-agricultural use. These revisions affect the same four manufacturing land use zoning designations as the Green Zone Districts, along with additional land use zoning designations: Zone A-2 (Heavy Agricultural), and Zone IT (Institutional).

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These

construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities would be prohibited in Agricultural Resource Areas (ARAs).~~

An impact would be expected to occur if construction would be required on lands mapped as Farmland. However, in the case of development standards for these recycling and solid waste uses, despite its location within an area which contains Farmland, the construction of these measures would not differ substantially from existing or proposed conditions, such that they result in an impact to Farmland given that they would not convert Farmland to non-agricultural uses. If the development standards for these facilities were required to be implemented on Farmland, then one of the specified recycling or solid waste uses described in the Ordinance would already exist on the land, or the standards would be included in the design of a proposed use. Furthermore, permitting an organic waste, recycling, and/or solid waste facility as a primary use would remain a discretionary action, and each development would be analyzed for project-level impacts in relation to conversion of Farmland.

Therefore, impacts to Recycling and Waste Management Revisions would result in no impacts to agriculture in relation to converting Farmland to non-agricultural use. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to agriculture in relation to converting Farmland to non-agricultural use. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones.

An impact would be expected to occur if construction would be required on lands mapped as Farmland. However, despite its location within an area which contains Farmland, these uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built. The addition of a recycling collection center as an attachment to an existing supermarket or compliance with development standards would not substantially alter the existing conditions such that the Farmland would be lost. Therefore, the Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to agriculture in relation to converting Farmland to non-agricultural use. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to agriculture in relation to converting Farmland to non-agricultural use. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

An impact would be expected to occur if construction would be required on lands mapped as Farmland. However, despite its location within an area which contains Farmland, the Recycling and Waste Management Revisions would not affect Farmland, given that farms are not recycling or waste facilities. Any construction resulting from compliance with development standards would be minimal and would not substantially alter the existing conditions for existing industrial uses such that the Farmland would be lost, given its location on an existing industrial use. Should the revisions to on-site waste storage standards be relevant to any waste produced by agricultural uses on designated Farmland, the farms would comply, and this would not result in the loss of availability of the Farmland.

Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to agriculture in relation to converting Farmland to non-agricultural use. No further analysis is warranted.

b) Conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract?

Existing Conditions

The County defines all zones in the unincorporated County and their respective land use regulations in Title 22, *Planning and Zoning*, of the County municipal code. Under Title 22, there are two Agricultural Zones designated: Zone A-1 (Light Agricultural) and Zone A-2 (Heavy Agricultural).¹² The purpose of the Agricultural Zones, as defined in Title 22, is “to permit a comprehensive range of agricultural uses in areas particularly suited for agricultural activities.”¹³

ARAs are defined in the County General Plan 2035 as Farmland identified by the California Department of Conservation and lands which have received permits from the Los Angeles County Agricultural Commissioner/Weights and Measures.¹⁴ Williamson Act contracts, or Land Conservation Act contracts, enter local governments and private landowners in a contract to restrict agricultural and open space lands to farming and ranching uses through the California Department of Conservation, Division of Land Resource Protection. However, there are no agricultural or open space lands with Williamson Act contracts in effect in Los Angeles County, as it is a non-participating county. The only exception is Catalina Island where land is eligible for subventions; however, there are no executed Williamson Act contracts reported.¹⁵

¹⁴ Los Angeles County Department of Regional Planning. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. <http://planning.lacounty.gov/generalplan/generalplan>

¹⁵ California Department of Conservation. 2018. The Williamson Act Status Report 2016-17. https://www.conservation.ca.gov/dlrp/wa/Pages/stats_reports.aspx

Threshold of Significance

An impact would occur if construction would be required on lands zoned for agricultural use that have been designated as Agricultural Resource Areas or protected under a Williamson Act contract, such that the land use would be converted to a non-agricultural use.

Impact Analysis

The proposed program would result in no impacts to agriculture and forestry resources in relation to conflicting with existing zoning for agricultural use, or a Williamson Act contract. The potential for impacts to agriculture and forestry resources has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment which may conflict with existing zoning include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to agriculture and forestry resources in relation to conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract.

The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

As described in Section 1, Agricultural Zones would not be affected by the Green Zone Districts. Only Zone M-1, M-1.5, M-2, and M-2.5 would be affected, which are manufacturing and industrial land uses designations. Thus, the Green Zone Districts would result in no conflict with zoning for agricultural use under County Municipal Zoning Code. These revisions would result to no conflict with an ARA or Williamson Act contract, Green Zone Districts are not within any

ARAs¹⁶ and there are no lands in the County, regardless of zoning designations, which hold Williamson Act contracts in effect.¹⁷

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to agriculture in relation to conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to agriculture in relation to conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses.~~ permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 4, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would impact agricultural uses. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not result in a substantial impact to an existing Agricultural Zones, ARA, or Williamson Act contract.

The New Sensitive Uses would apply to all zones in the unincorporated territory of the County; thus, the implementation of development standards for New Sensitive Uses may be within Agricultural Zones under County Municipal Zoning Code or within ARAs identified by the County General Plan 2035. However, these revisions would not conflict with the Agricultural Zones or ARAs, as the development standards would be implemented as a part of the sensitive use being proposed. The proposed new sensitive use including the development standards would be evaluated individually in regard to its location within an Agricultural Zone or ARA. The development standards would be minimal additions to the design of the proposed new sensitive use, which would be evaluated on an individual project basis under CEQA for impacts to agricultural and forestry resources. Additionally, these revisions would result in no conflict with a Williamson Act contract, as there are no lands in the County, regardless of zoning designations, which hold Williamson Act contracts in effect.¹⁸

Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in would result in no impacts to agriculture in relation to conflict with existing zoning

¹⁶ Los Angeles County Department of Regional Planning. May 2014. Figure 9.5: Agricultural Resource Areas Policy Map. In the Los Angeles County General Plan 2035. <http://planning.lacounty.gov/generalplan/figures2015>

¹⁸ California Department of Conservation. 2018. The Williamson Act Status Report 2016-17. https://www.conservation.ca.gov/dlrp/wa/Pages/stats_reports.aspx

for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts to agriculture in relation to conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~

Recycling and Waste Management Revisions affect the same four manufacturing land use zoning designations as the Green Zone Districts, along with additional land use zoning designations: Zone A-2 (Heavy Agricultural), and Zone IT (Institutional). Thus, these revisions overlap with areas in the County that are Zoned A-2 and are located within ARAs.¹⁹

The use regulations for Zones A-1 and A-2 are defined in Tables 22.16.030-B, -C, and -D of Title 22 (Principal, Accessory, and Temporary Uses, respectively). The changes that the Ordinance makes to Zone A-2 apply to Table 22.16.030-B and -C. It removes “Land reclamation” as a Principal Use under the section Agricultural and Resource-Based Uses. It also adds two new Principal Uses under Recycling and Solid Waste Uses: (1) organic waste recycling facilities and (2) solid waste facilities, both with various sub-types of facilities. All new Principal Uses under Recycling and Solid Waste Uses would be permitted in Zone A-2 with a CUP, and they would be commercial-purpose facilities and would not include agricultural uses. Organic waste recycling facilities of various sub-types would also be allowed with a Ministerial Site Plan Review as an accessory use when operated in conjunction with a use permitted in the zone, and they would be commercial-purpose facilities and would not include agricultural uses.²⁰

The new Recycling and Solid Waste Uses would have the potential to be approved on land designated as Zone A-2, and existing agricultural land would be open to more opportunity for non-agricultural use. However, there would no impacts in relation to conflicting with agricultural zoning, as Zone A-2 would still fulfill the purpose of the Agricultural Zones according to the County. The purpose of the Agricultural Zones, as defined in Title 22, is “to permit a comprehensive range of agricultural uses in areas particularly suited for agricultural activities.”²¹ Thus, the purpose of the Agricultural Zones is not solely for agricultural uses, and Zone A-2 already allows for many uses beyond agricultural use, including oil wells, solid fill projects, surface mining, correctional institutions, K-12 and higher education institutions, explosives

¹⁹ Los Angeles County Department of Regional Planning. May 2014. Figure 9.5: Agricultural Resource Areas Policy Map. In the Los Angeles County General Plan 2035. <http://planning.lacounty.gov/generalplan/figures2015>

²⁰ Public Draft Green Zones Ordinance (Appendix A to the Initial Study).

²¹ Los Angeles County. Code of Ordinances, Title 22 – Planning and Zoning, Section 22.16.010 – Purpose. Accessed 10 March 2020. https://library.municode.com/ca/los_angeles_county/codes/code_of_ordinances?nodeId=TTT22PLZO_DIV3ZO_CH22.16AGOPSPRERE_WAZO_22.16.020AGZODE

storage, processing/packing plants, solar energy facilities, hospitals, and airports.²² The purpose of the Agricultural Zones is not to allow agricultural uses alone; therefore, the Recycling and Waste Management Revisions would not impact the zoning for agricultural use by adding a commercial use, as Zone A-2 would still permit agricultural uses.

In addition, the development standards as a result of these Recycling and Waste Management Revisions would not conflict with the Agricultural Zones or ARAs, as these changes would implement development standards on ~~existing~~ recycling or solid waste uses which have been approved within these Agricultural Zones. Additionally, these revisions would result in no conflict with a Williamson Act contract, as there are no lands in the County, regardless of zoning designations, which hold Williamson Act contracts in effect.²³

Therefore, Recycling and Waste Management Revisions would result in no impacts to agriculture in relation to conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to agriculture in relation to conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract.

The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones.

Thus, Agricultural Zones would not be affected by the Supermarket Accessory Recycling Collection Centers, which would therefore result in no conflict with zoning for agricultural use under County Municipal Zoning Code. In addition, these uses would be constructed on existing parking lots, and no new structures would be built, which would not conflict with ARAs, as these changes would not differ from existing conditions. With regard to the Williamson Act, these revisions would result in no conflict with a Williamson Act contract, as there are no lands in the County, regardless of zoning designations, which hold Williamson Act contracts in effect.²⁴

²² Los Angeles County. Code of Ordinances, Title 22 – Planning and Zoning, Section 22.16.030 – Land Use Regulations for Zones A-1, A-2, O-S, R-R, and W. Accessed 10 March 2020.
https://library.municode.com/ca/los_angeles_county/codes/code_of_ordinances?nodeId=TTT22PLZO_DIV3ZO_CH22.16AGOPSPRERE_WAZO_22.16.020AGZODE

²³ California Department of Conservation. 2018. The Williamson Act Status Report 2016-17.
https://www.conservation.ca.gov/dlrp/wa/Pages/stats_reports.aspx

²⁴ California Department of Conservation. 2018. The Williamson Act Status Report 2016-17.
https://www.conservation.ca.gov/dlrp/wa/Pages/stats_reports.aspx

Therefore, the Supermarket Accessory Recycling Collection Centers would result in no impacts to agriculture in relation to conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to agriculture in relation to conflict with existing zoning for agricultural use, with a designated ARA, or with a Williamson Act contract. The purpose of these revisions is to ensure safety and accessibility enclosures and storage areas for waste, recyclable materials, and organic materials generated by recycling and solid waste land uses. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. These revisions do not specify zones under Title 22, and therefore may include Agricultural Zones. However, any construction resulting from compliance with development standards would be minimal and would not substantially alter the existing conditions of the existing land uses. Thus, it would not conflict with Agricultural Zones or ARAs. Should the revisions to on-site waste storage standards be relevant to any waste produced by agricultural uses on designated Farmland, the farms would comply, and this would not result in the loss of availability of the agricultural land. With regard to the Williamson Act, these revisions would result to no conflict with a Williamson Act contract, as there are no lands in the County, regardless of zoning designations, which hold Williamson Act contracts in effect.²⁵

Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to agriculture in relation to conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract. No further analysis is warranted.

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code § 12220 (g)), timberland (as defined in Public Resources Code § 4526), or timberland zoned Timberland Production (as defined in Government Code § 51104(g))?

Existing Conditions

The proposed program area applies to unincorporated areas of the County, which may include land that can be defined as forest land, timberland, or a TPZ under California Public Resources Code and Government Code. Both the Angeles National Forest and the Los Padres National Forest are located within the unincorporated County.²⁶ Although forest resources in the National Forest are managed pursuant to the United States Forest Service (USFS) land management plans and are not subject to the County General Plan 2035, there are approximately 669,220 acres of National Forest land that overlap with the project footprint. Additionally, many zoning designations that are subject to the Green Zones Ordinance permit commercial forestry uses.²⁷

Threshold of Significance

An impact would occur if construction would be required on lands zoned for forest land, timberland, or Timberland Production use, such that the land use would be converted to a non-forestry resource use.

²⁵ California Department of Conservation. 2018. The Williamson Act Status Report 2016-17. https://www.conservation.ca.gov/dlrp/wa/Pages/stats_reports.aspx

²⁶ Los Angeles County Department of Regional Planning. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. <http://planning.lacounty.gov/generalplan/generalplan>

²⁷ Los Angeles County. Code of Ordinances, Title 22 – Planning and Zoning. Accessed 03 March 2020. https://library.municode.com/ca/los_angeles_county/codes/code_of_ordinances?nodeId=TTI22PLZO

Impact Analysis

The proposed program would result in no impacts to agriculture and forestry resources in relation to conflicting with existing zoning for, or cause rezoning of, forest land, timberland, or timberland zoned Timberland Production. The potential for impacts to agriculture and forestry resources has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment such as forestry resources include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to agriculture and forestry resources in relation to conflicting with existing zoning for, or cause rezoning of, forest land, timberland, or a TPZ. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently, the zoning and land use designations for the 11 districts under consideration for proposed revision allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

There are 0 acres of National Forest land in areas subject to the Green Zone Districts. The Green Zone Districts are located in developed urban communities of Los Angeles County, and do not have land which may be defined as forest land, timberland, or a TPZ. The Green Zone Districts do not include provisions which would allow the conversion of forest land, timberland, or a TPZ to other uses beyond those that already exist.

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to agriculture and forestry resources in relation to conflicting with existing zoning for, or cause rezoning of, forest land, timberland, or a TPZ. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to agriculture and forestry resources in relation to conflicting with existing zoning for, or cause rezoning of, forest land, timberland, or a TPZ.

Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses, permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would impact forestry resources. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not impact forestry resource.

These development standards for New Sensitive Uses would be minimal additions to a sensitive use being proposed, which would be evaluated on an individual project basis under CEQA for impacts to forestry resources. The draft Ordinance contains no mention of any zoning, land uses, operations, or standards for forestry resources, commercial forestry, timber, or logging.²⁸ The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses, and forest land is considered neither an incompatible land use nor a sensitive use. The Green Zone Districts do not include provisions which would allow the conversion of forest land, timberland, or a TPZ to other uses beyond those that already exist.

Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in no impacts to agriculture and forestry resources in relation to conflicting with existing zoning for, or cause rezoning of, forest land, timberland, or a TPZ. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts to agriculture and forestry resources in relation to conflicting with existing zoning for, or cause rezoning of, forest land, timberland, or a TPZ.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These

²⁸ Public Draft Green Zones Ordinance (Appendix A to the Initial Study).

construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~

The Recycling and Waste Management Revisions contain National Forest land as well as many zoning designations, such as M-1, M-1.5, M-2, M-2.5, and A-2, which permit commercial forestry uses including tree crops and logging operations.²⁹ Thus, parcels subject to these revisions contain land defined as forest land, timberland, or a TPZ. However, the Ordinance would have no impact on forestry resources, as the Recycling and Waste Management Revisions would not conflict with or re-zone this land. The draft Ordinance contains no mentions of any zoning, land uses, operations, or standards for forest resources, commercial forestry, timber, or logging.³⁰ The development standards for Recycling and Waste Management Revisions would be minimal additions to approved existing or proposed industrial land uses and would not conflict with or rezone any forest land. The Recycling and Waste Management Revisions do not include provisions which would allow the conversion of forest land, timberland, or a TPZ to other uses beyond those that already exist; therefore, there would be no impacts. Permitting an organic waste, recycling, and/or solid waste facility as a primary use would remain a discretionary action, and each development would be analyzed for project-level impacts in relation to conversion of forest land.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to agriculture and forestry resources in relation to conflicting with existing zoning for, or cause rezoning of, forest land, timberland, or a TPZ.

The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones.

²⁹ Los Angeles County. Code of Ordinances, Title 22 – Planning and Zoning. Accessed 03 March 2020.
https://library.municode.com/ca/los_angeles_county/codes/code_of_ordinances?nodeId=TTT22PLZO

³⁰ Public Draft Green Zones Ordinance (Appendix A to the Initial Study).

The Supermarket Accessory Recycling Collection Centers contain National Forest land are many zoning designations, such as M-1, M-1.5, M-2, M-2.5, which permit commercial forestry uses including tree crops and logging operations.³¹ Thus, parcels subject to these revisions contain land defined as forest land, timberland, or a TPZ. However, the Ordinance would have no impact, as the Supermarket Accessory Recycling Collection Centers would not conflict with or rezone this land. The Supermarket Accessory Recycling Collection Centers would be constructed on existing parking lots, and no new structures would be built. The draft Ordinance contains no mentions of any zoning, land uses, operations, or standards for forest resources, commercial forestry, timber, or logging.³² The Supermarket Accessory Recycling Collection Centers do not include provisions which would allow the conversion of forest land, timberland, or a TPZ to other uses beyond those that already exist; therefore, there would be no impacts.

Therefore, the Supermarket Accessory Recycling Collection Centers would result in no impacts to agriculture and forestry resources in relation to conflicting with existing zoning for, or cause rezoning of, forest land, timberland, or a TPZ. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to agriculture and forestry resources in relation to conflicting with existing zoning for, or cause rezoning of, forest land, timberland, or a TPZ. The purpose of these revisions is to ensure safety and accessibility enclosures and storage areas for waste, recyclable materials, and organic materials generated by recycling and solid waste land uses. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

New storage enclosures or compliance with development standards would be minimal additions to existing land uses and would not conflict with or re-zone any forest land. The draft Ordinance contains no mentions of any zoning, land uses, operations, or standards for forest resources, commercial forestry, timber, or logging.³³ The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses, and forest land is considered neither an incompatible land use nor a sensitive use. The Storage Enclosures for Recycling and Solid Waste Revisions do not include provisions which would allow the conversion of forest land, timberland, or a TPZ to other uses beyond those that already exist.

Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to agriculture and forestry resources in relation to conflicting with existing zoning for, or cause rezoning of, forest land, timberland, or a TPZ. No further analysis is warranted.

d) Result in the loss of forest land or conversion of forest land to non-forest use?

Existing Conditions

The proposed program area applies to unincorporated areas of the County, which may include forest land. There are two National Forests located wholly or partially within Los Angeles County; Angeles National Forest and the Los Padres National Forest.³⁴ Although forest resources in the National Forest are managed pursuant to the USFS land management plans and are not subject to the County General Plan 2035, there are approximately 669,220 acres of National Forest land which overlap with the project footprint.

³¹ Los Angeles County. Code of Ordinances, Title 22 – Planning and Zoning. Accessed 03 March 2020. https://library.municode.com/ca/los_angeles_county/codes/code_of_ordinances?nodeId=TTT22PLZO

³² Public Draft Green Zones Ordinance (Appendix A to the Initial Study).

³³ Public Draft Green Zones Ordinance (Appendix A to the Initial Study).

³⁴ Los Angeles County Department of Regional Planning. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. <http://planning.lacounty.gov/generalplan/generalplan>

Threshold of Significance

An impact would occur if construction would be required on forest land uses or forestry resources would otherwise be removed, such that the land use would be converted to a non-forestry resource use.

Impact Analysis

The proposed program would result in no impacts to agriculture and forestry resources regarding loss of forest land or conversion of forest land to non-forest use. The potential for impacts to forestry resources has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment and forestry resources include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to agriculture and forestry resources regarding loss of forest land or conversion of forest land to non-forest use. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

There are 0 acres of National Forest land in areas subject to the Green Zone Districts. The Green Zone Districts are located in developed urban communities of Los Angeles County, and do not have a high likelihood for forest land. Even so, these development standards for Green Zone Districts would be minimal additions to existing industrial, recycling and solid waste, and vehicle-related uses, and would not conflict with or re-zone any forest land. The draft Ordinance contains no mentions of any zoning, land uses, operations, or standards for forest resources, commercial forestry, timber, or logging.³⁵ The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses, and forest land is considered neither an incompatible land use nor a sensitive use. The Green

³⁵ Public Draft Green Zones Ordinance (Appendix A to the Initial Study).

Zone Districts do not include provisions which would allow the conversion of forest land to other uses beyond those that already exist.

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to agriculture and forestry resources regarding loss of forest land or conversion of forest land to non-forest use. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to agriculture and forestry resources regarding loss of forest land or conversion of forest land to non-forest use. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). or solid waste, or vehicle-related uses, in close proximity to existing industrial uses. As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130). These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses.

These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not result in loss of forest land. These development standards for New Sensitive Uses would be minimal additions to a sensitive use being proposed, which would be evaluated on an individual project basis under CEQA for impacts to agricultural and forestry resources. The draft Ordinance contains no mention of any zoning, land uses, operations, or standards for forestry resources, commercial forestry, timber, or logging.³⁶ The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses, and forest land is considered neither an incompatible land use nor a sensitive use. The Ordinance does not include provisions which would allow the conversion of forest land, timberland, or a TPZ to other uses beyond those that already exist.

Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in no impacts to agriculture and forestry resources regarding loss of forest land or conversion of forest land to non-forest use. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts to agriculture and forestry resources regarding loss of forest land or conversion of forest land to non-forest use.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic

³⁶ Public Draft Green Zones Ordinance (Appendix A to the Initial Study).

waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~

The Recycling and Waste Management Revisions contain National Forest land as well as many zoning designations, such as M-1, M-1.5, M-2, M-2.5, and A-2, which permit commercial forestry uses including tree crops and logging operations.³⁷ Thus, parcels subject to these revisions contain forest land. However, the Ordinance would have no impact on forestry resources, as the Recycling and Waste Management Revisions would not conflict with or re-zone this land. The draft Ordinance contains no mentions of any zoning, land uses, operations, or standards for forest resources, commercial forestry, timber, or logging.³⁸ The development standards for Recycling and Waste Management Revisions would be minimal additions to approved existing or proposed industrial land uses and would not conflict with or rezone any forest land. The Recycling and Waste Management Revisions do not include provisions which would allow the conversion of forest land to other uses beyond those that already exist; therefore, there would be no impacts. Permitting an organic waste, recycling, and/or solid waste facility as a primary use would remain a discretionary action, and each development would be analyzed for project-level impacts in relation to conversion of Farmland or forest land.

Therefore, impacts to Recycling and Waste Management Revisions would result in no impacts to agriculture and forestry resources regarding loss of forest land or conversion of forest land to non-forest use. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to agriculture and forestry resources regarding loss of forest land or conversion of forest land to non-forest use.

The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical

³⁷ Los Angeles County. Code of Ordinances, Title 22 – Planning and Zoning. Accessed 03 March 2020.
https://library.municode.com/ca/los_angeles_county/codes/code_of_ordinances?nodeId=TTT22PLZO

³⁸ Public Draft Green Zones Ordinance (Appendix A to the Initial Study).

stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones.

The Supermarket Accessory Recycling Collection Centers contain National Forest land and many zoning designations, such as M-1, M-1.5, M-2, M-2.5, which permit commercial forestry uses including tree crops and logging operations.³⁹ Thus, parcels subject to these revisions contain forest land. However, the Ordinance would have no impact, as the Supermarket Accessory Recycling Collection Centers would not conflict with or re-zone this land. The Supermarket Accessory Recycling Collection Centers would be constructed on existing parking lots, and no new structures would be built. The draft Ordinance contains no mentions of any zoning, land uses, operations, or standards for forest resources, commercial forestry, timber, or logging.⁴⁰ The Supermarket Accessory Recycling Collection Centers do not include provisions which would allow the conversion of forest land to other uses beyond those that already exist; therefore, there would be no impacts. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to agriculture and forestry resources regarding loss of forest land or conversion of forest land to non-forest use. The purpose of these revisions is to ensure safety and accessibility enclosures and storage areas for waste, recyclable materials, and organic materials generated by recycling and solid waste land uses. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

New storage enclosures or compliance with development standards would be minimal additions to existing land uses and would not convert any forest land. The draft Ordinance contains no mentions of any zoning, land uses, operations, or standards for forest resources, commercial forestry, timber, or logging.⁴¹ The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses, and forest land is considered neither an incompatible land use nor a sensitive use. The Storage Enclosures for Recycling and Solid Waste Revisions do not include provisions which would allow the conversion of forest land to other uses beyond those that already exist.

Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to agriculture and forestry resources regarding loss of forest land or conversion of forest land to non-forest use. No further analysis is warranted.

- e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?**

Existing Conditions

There are approximately 18,156 acres that are categorized as Farmland according to the FMMP that overlap with the project footprint. Although forest resources in the National Forest are managed pursuant to the USFS land management plans and are not subject to the County General Plan 2035, there are approximately 669,220 acres of National Forest land which overlap with the project footprint.

³⁹ Los Angeles County. Code of Ordinances, Title 22 – Planning and Zoning. Accessed 03 March 2020. https://library.municode.com/ca/los_angeles_county/codes/code_of_ordinances?nodeId=TTT22PLZO

⁴⁰ Public Draft Green Zones Ordinance (Appendix A to the Initial Study).

⁴¹ Public Draft Green Zones Ordinance (Appendix A to the Initial Study).

Threshold of Significance

An impact would occur if construction would be required on Farmland or forest land uses, or agricultural and forestry resources would otherwise be removed, such that the land use would be converted to a non-agricultural use or non-forestry resource use.

Impact Analysis

The proposed program would result in no impacts to agriculture and forestry resources in relation to involving changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use. The potential for impacts to agriculture and forestry resources has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment to agriculture and forestry resources include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to agriculture and forestry resources in relation to involving changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

As previously discussed, given that there are 0 acres of Farmland, 0 acres of National Forest land, and the Green Zone Districts are located in developed urban communities of the County that do not have a high likelihood for forest land, the Ordinance would have no impact, as the revisions do not include provisions which would result in the loss or conversion of forest land or agricultural land to other uses beyond those that already exist. The development standards would apply to specific existing land uses and would not convert agricultural or forest land.

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to agriculture and forestry resources in relation to involving changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to agriculture and forestry resources in relation to involving changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling, ~~or vehicle-related uses.~~ The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. As previously discussed, these revisions contain Farmland and forest land. However, development standards for New Sensitive Uses would have no impact on agricultural or forest land, as they would be implemented as part of a sensitive use being proposed that would be evaluated on an individual project basis under CEQA for impacts to agricultural and forestry resources. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses no impacts to agriculture and forestry resources in relation to involving changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts to agriculture and forestry resources in relation to involving changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities

would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. As previously discussed, these revisions contain Farmland and forest land. However, development standards for these revisions would have no impact on agricultural or forest land, as they would apply to specific existing land uses and would not convert agricultural or forest land. Furthermore, permitting an organic waste, recycling, and/or solid waste facility as a primary use would remain a discretionary action, and each development would be analyzed for project-level impacts in relation to conversion of Farmland or forest land. Therefore, impacts to Recycling and Waste Management Revisions would result in no impacts to agriculture and forestry resources in relation to involving changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to agriculture and forestry resources in relation to involving changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. As previously discussed, these revisions contain Farmland and forest land. However, these uses would be constructed on existing parking lots, and no new structures would be built. Therefore, the Supermarket Accessory Recycling Collection Centers would have no impacts to agriculture and forestry resources in relation to involving changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to agriculture and forestry resources in relation to involving changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use. No further analysis is warranted. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. As previously discussed, development standards for

these revisions would have no impact on agricultural or forest land, as they would apply to specific existing land uses and would not convert agricultural or forest land. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to agriculture and forestry resources in relation to involving changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use. No further analysis is warranted.

2.3. AIR QUALITY

This analysis is undertaken to determine if the proposed program may have a significant impact to air quality, thus requiring the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State CEQA Guidelines.¹ The analysis covers all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated with regard to the Air Quality Element of the Los Angeles County General Plan 2035,² the South Coast Air Quality Management District (SCAQMD) *CEQA Handbook*,³ the Antelope Valley Air Quality Management District (AVAQMD) *California Environmental Quality Act (CEQA) and Federal Conformity Guidelines*,⁴ and the air quality and environmental justice analyses in the Southern California Association of Governments (SCAG) 2016–2040 Regional Transportation Plan/Sustainable Communities Strategies (RTP/SCS).⁵

The Air Quality Element of the County General Plan characterizes the South Coast Air Basin (SCAB), which includes the majority of Los Angeles County, as having among the worst air quality ratings in the country.

Regional Climate

Southern California Air Basin

The regional climate significantly influences the air quality in the SCAB. Temperature, wind, humidity, precipitation, and the amount of sunshine influence the quality of the air. In addition, the SCAB is frequently subjected to an inversion layer that traps air pollutants. Temperature has an important influence on basin wind flow, pollutant dispersion, vertical mixing, and photochemistry.

Annual average temperatures throughout the SCAB vary from the low to middle 60 degrees Fahrenheit (°F). However, due to decreased marine influence, the eastern portion of the SCAB shows greater variability in average annual minimum and maximum temperatures. January is the coldest month throughout the SCAB, with average minimum temperatures of 47°F in downtown Los Angeles and 36°F in San Bernardino. All portions of the SCAB have recorded maximum temperatures above 100°F.

Although the climate of the SCAB can be characterized as semiarid, the air near the land surface is quite moist on most days because of the presence of a marine layer. This shallow layer of sea air is an important modifier of SCAB climate. Humidity restricts visibility in the SCAB, and the conversion of sulfur dioxide to sulfate (SO₂ to SO₄) is heightened in air with high relative humidity. The marine layer is an excellent environment for that conversion process, especially during the spring and summer months. The annual average relative humidity is 71 percent along the coast and 59 percent inland. Because the ocean effect is dominant, periods of heavy early morning fog are frequent, and low stratus clouds are a characteristic feature. These effects decrease with distance from the coast.

More than 90 percent of the SCAB's rainfall occurs from November through April. Annual average rainfall varies from approximately 9 inches in Riverside to 14 inches in downtown Los Angeles. Monthly and yearly rainfall totals are extremely variable. Summer rainfall usually consists of widely scattered thundershowers near the coast and slightly heavier shower activity in the eastern portion of the region and near the mountains. Rainy days comprise 5 to 10 percent of all days in the SCAB, with the frequency being higher near the coast. The influence of rainfall on the contaminant levels in the SCAB is minimal. Although some washout of pollution would be expected with winter rains, air masses

⁴ Antelope Valley Air Quality Management District. California Environmental Quality Act (CEQA) And Federal Conformity Guidelines. August 2016. <https://avaqmd.ca.gov/files/e5b34d385/AV%20CEQA%20Guides%202016.pdf>

⁵ Southern California Association of Governments, 2016 RTP/SCS. <http://scagrtpscs.net/Pages/default.aspx>

that bring precipitation of consequence are very unstable and provide excellent dispersion that masks wash-out effects. Summer thunderstorm activity affects pollution only to a limited degree. If the inversion is not broken by a major weather system, then high contaminant levels can still persist even in areas of light showers.

Mojave Desert Air Basin

The Mojave Desert Air Basin (MDAB) is an assemblage of mountain ranges interspersed with long broad valleys that often contain dry lakes. Many of the lower mountains that dot the vast terrain rise from 1,000 to 4,000 feet above the valley floor. Prevailing winds in the MDAB are out of the west and southwest. These prevailing winds are due to the proximity of the MDAB to coastal and central regions and the blocking nature of the Sierra Nevada Mountains to the north; air masses pushed onshore in Southern California by differential heating are channeled through the MDAB. The MDAB is separated from the Southern California coastal and central California valley regions by mountains (highest elevation approximately 10,000 feet), whose passes form the main channels for these air masses. The Antelope Valley is bordered in the northwest by the Tehachapi Mountains, separated from the Sierra Nevadas in the north by the Tehachapi Pass (3,800 feet). The Antelope Valley is bordered in the south by the San Gabriel Mountains, bisected by Soledad Canyon (3,300 feet).

During the summer, the MDAB is generally influenced by a Pacific Subtropical High cell that sits off the coast, inhibiting cloud formation and encouraging daytime solar heating. The MDAB is rarely influenced by cold air masses moving south from Canada and Alaska, as these frontal systems are weak and diffuse by the time they reach the desert. Most desert moisture arrives from infrequent warm, moist, and unstable air masses from the south. The MDAB averages between three and seven inches of precipitation per year (from 16 to 30 days with at least 0.01 inch of precipitation). The MDAB is classified as a dry-hot desert climate (BWh), with portions classified as dry-very hot desert (BWh) to indicate at least 3 months have maximum average temperatures over 100.4° F.

Temperature Inversion

The vertical dispersion of air pollutants in the SCAB and MDAB is frequently restricted by the presence of a persistent temperature inversion in the atmospheric layers near the earth's surface. Normally, the temperature of the atmosphere decreases with altitude. However, when the temperature of the atmosphere increases with altitude, the phenomenon is termed an inversion. An inversion condition can exist at the surface or at any height above the ground. The bottom of the inversion, known as the mixing height, is the height of the base of the inversion.

In general, inversions in the SCAB and MDAB are lower before sunrise than during the daylight hours. As the day progresses, the mixing height normally increases as the warming of the ground heats the surface air layer. As this heating continues, the temperature of the surface layer approaches the temperature of the base of the inversion layer. When these temperatures become equal, the inversion layer's lower edge begins to erode, and if enough warming occurs, the layer breaks up. The surface layers are gradually mixed upward, diluting the previously trapped pollutants. The breakup of inversion layers frequently occurs during mid to late afternoon on hot summer days. Winter inversions usually break up by midmorning.

Air Pollutants

Certain air pollutants have been recognized to cause notable health problems and consequential damage to the environment either directly or in reaction with other pollutants, due to their presence in elevated concentrations in the atmosphere. Such pollutants have been identified as criteria air pollutants and regulated as part of the overall endeavor to prevent further deterioration and facilitate improvement in air quality. Criteria pollutants are regulated by the U.S. Environmental Protection Agency (EPA) and are subject to emissions control requirements adopted by federal, state and local regulatory agencies.

Ozone (O₃): Ozone is a secondary pollutant formed by the chemical reaction of volatile organic compounds and nitrogen oxides (NO_x) under favorable meteorological conditions such as high temperature and stagnation episodes. An elevated level of ozone irritates the lungs and breathing passages, causing coughing and pain in the chest and throat, thereby increasing susceptibility to respiratory infections and reducing the ability to exercise. Effects are more severe in

people with asthma and other respiratory ailments. Long-term exposure may lead to scarring of lung tissue and may lower the lung efficiency.

Volatile Organic Compounds (VOCs): These are compounds comprised primarily of atoms of hydrogen and carbon. Internal combustion associated with motor vehicle usage is the major source of hydrocarbons, as are architectural coatings. Emissions of VOCs themselves are not “criteria” pollutants; however, they contribute to formation of O₃ and are regulated as O₃ precursor emissions.

Nitrogen Dioxide (NO₂): Nitrogen dioxide is a reddish-brown, reactive gas that is formed in the ambient air through the oxidation of nitric oxide (NO). The principal form of NO₂ produced by combustion is NO, but NO reacts quickly to form NO₂, creating the mixture of NO and NO₂ referred to as nitrogen oxides (NO_x). Major sources of NO_x include power plants, large industrial facilities, and motor vehicles. Emissions of NO_x can potentially irritate the nose and throat and may increase susceptibility to respiratory infections, especially in people with asthma. According to the California Air Resources Control Board (CARB), NO₂ is an oxidizing gas capable of damaging cells lining the respiratory tract. Exposure to NO₂ along with other traffic-related pollutants, is associated with respiratory symptoms, episodes of respiratory illness and impaired lung functioning. Studies in animals have reported biochemical, structural, and cellular changes in the lung when exposed to NO₂ above the level of the current state air quality standard. Clinical studies of human subjects suggest that NO₂ exposure to levels near the current standard may worsen the effect of allergens in allergic asthmatics, especially in children.⁶

Carbon Monoxide (CO): Carbon monoxide is primarily emitted from combustion processes and motor vehicles due to incomplete combustion of fuel. Elevated concentrations of CO weaken the heart's contractions and lower the amount of oxygen carried by the blood. It is especially dangerous for people with chronic heart disease. Inhalation of CO can cause nausea, dizziness, and headaches at moderate concentrations and can be fatal at high concentrations.

Sulfur Dioxide (SO₂): Major sources of SO₂ include power plants, large industrial facilities, diesel vehicles, and oil-burning residential heaters. Emissions of sulfur dioxide aggravate lung diseases, especially bronchitis. It also constricts the breathing passages, especially in asthmatics and people involved in moderate to heavy exercise. Sulfur dioxide potentially causes wheezing, shortness of breath, and coughing. High levels of particulates appear to worsen the effect of sulfur dioxide, and long-term exposures to both pollutants leads to higher rates of respiratory illness.

Particulate Matter (PM₁₀ and PM_{2.5}): The human body naturally prevents the entry of larger particles into the body. However, small particles including fugitive dust, with an aerodynamic diameter equal to or less than 10 microns (PM₁₀) and even smaller particles with an aerodynamic diameter equal to or less than 2.5 microns (PM_{2.5}), can enter the body and are trapped in the nose, throat, and upper respiratory tract. These small particulates could potentially aggravate existing heart and lung diseases, change the body's defenses against inhaled materials, and damage lung tissue. The elderly, children, and those with chronic lung or heart disease are most sensitive to PM₁₀ and PM_{2.5}. Lung impairment can persist for 2 to 3 weeks after exposure to high levels of particulate matter. Some types of particulates could become toxic after inhalation due to the presence of certain chemicals and their reaction with internal body fluids.

Lead (Pb): Lead is emitted from industrial facilities and from the sanding or removal of old lead-based paint. Smelting or processing the metal is the primary source of lead emissions, which is primarily a regional pollutant. Lead affects the brain and other parts of the body's nervous system. Exposure to lead in very young children impairs the development of the nervous system, kidneys, and blood forming processes in the body.

⁶ California Air Resources Board, “Nitrogen Dioxide – Overview,” July 21, 2011, <http://www.arb.ca.gov/research/aaqs/caaqs/no2-1/no2-1.htm>. Accessed March 2015.

Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations.

	<i>Potentially Significant Impact</i>	<i>Less than Significant Impact with Mitigation Incorporated</i>	<i>Less than Significant Impact</i>	<i>No Impact</i>
Would the project:				
a) Conflict with or obstruct implementation of applicable air quality plans of either the South Coast AQMD (SCAQMD) or the Antelope Valley AQMD (AVAQMD)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Expose sensitive receptors to substantial pollutant concentrations?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
a) Conflict with or obstruct implementation of applicable air quality plans of either the South Coast AQMD (SCAQMD) or the Antelope Valley AQMD (AVAQMD)?				

Existing Conditions

There are three primary air quality plans that seek to improve air quality in the unincorporated areas of the County: (1) the portion of the unincorporated area of the County in the SCAB is regulated by the SCAQMD pursuant to the SCAQMD Air Quality Management Plan (AQMP);⁷ (2) the northernmost portion of the unincorporated area of the County in the Antelope Valley by AVAQMD pursuant to the AVAQMD State Implementation Plan;⁸ and (3) the Air Quality Element of the County General Plan 2035 establishes goals and policies for the County.

SCAQMD Air Quality Management Plan. Air quality compliance with the National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS) is overseen by the SCAQMD pursuant to the AQMP.⁹ There are four primary components of the Air Toxic Control strategy in the SCAQMD AQMP:

⁷ South Coast AQMD. Final 2016 AQMP-CARB/EPA/SIP Submittal. <https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp>

⁸ Antelope Valley Air Quality Management District. Los Angeles County within the Mojave Desert Air Basin. <https://avaqmd.ca.gov/files/620c3957c/AV+Full+SIP+Table+2020+16+Jan.pdf>

⁹ South Coast Air Quality Management District. March 2017. Final 2016 Air Quality Management Plan. <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf?sfvrsn=15>

- Continue efforts to reduce diesel particulate matter.
- Control volatile organic compound (VOC) emissions that are most reactive in ozone and/or fine particulate matter (PM_{2.5}) formation.
- Mobile source control strategies that are designed to reduce nitrogen oxide (NO_x), reactive organic gases (ROG), and PM emissions in order to meet the State Implementation Plan (SIP) commitments in the 2016 AQMP, while also producing co-benefits for a variety of toxic air contaminants (TACs).
- Stationary source control strategies that are implemented by the SCAQMD in order to primarily reduce TACs that can create localized impacts to nearby communities.¹⁰

In addition to criteria pollutants, the SCAQMD periodically assesses levels of TACs in the Air Basin. A TAC is defined by California Health and Safety Code Section 39655:

“Toxic air contaminant” means an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health. A substance that is listed as a hazardous air pollutant pursuant to subsection (b) of Section 112 of the federal act (42 U.S.C. Sec. 7412(b)) is a toxic air contaminant.

The SCAQMD completed the Multiple Air Toxic Exposure (MATES)-IV Study which includes an emissions inventory of TACs in the South Coast Air Basin, and makes several characterizations that are relevant to the consideration of plan conformity:

- During the study period, the average Basin cancer risk from air toxics based on the annual average levels calculated from the 10 monitoring sites data was approximately 418 per million. This is about 65% lower than the estimated risk from the 2004-2006 time period.
- Regional modeling analysis shows the highest risks from air toxics surrounding the port areas, with the highest grid cell risk about 1,000 per million, followed by Central Los Angeles, where there is a major transportation corridor, with grid cell modeled risks MATES IV Final Report 6-2 ranging from about 700 to 750 per million.
- The spatial distribution of diesel PM_{2.5} emission in MATES IV is similar to the diesel PM emission pattern derived in CalEnviroScreen 2.0, both showing the highest diesel PM emission in Central Los Angeles and area around the Ports.¹¹

Antelope Valley State Implementation Plan. The AVAQMD has jurisdiction over the northern, desert portion of Los Angeles. The AVAQMD AQMP Applicable State Implementation Plan (SIP) was designed to provide information on rules contained in the Applicable SIP for various areas within the AVAQMD.¹² The SIP table provides notes about each regulation listed in the AVAQMD Rule Book. The EPA-approved AVAQMD portion of the California SIP includes rules and regulations that require an implementation schedule and measures to reduce air pollution and mobile emissions. The proposed program would not conflict with the AVAQMD SIP regulations. The EPA and CARB have designated portions of the AVAQMD as non-attainment for a variety of pollutants. The AVAQMD has adopted a single attainment plan for ozone (Table 2.3-1).

**TABLE 2.3-1
AVAQMD ATTAINMENT PLANS**

Name of Plan	Date of Adoption	Standard(s) Targeted	Applicable Area	Pollutant(s) Targeted	Attainment Date*
AVAQMD 2004 Ozone Attainment Plan (State and Federal)	4/2004	Federal one hour ozone	Entire District	NOx and VOC	2007
AVAQMD Federal 8-Hour Ozone Attainment Plan	5/20/2008	Federal eight-hour ozone (84 ppb)	Entire District	NOx and VOC	2019 (revised from 2021)

* A historical attainment date given in an attainment plan does not necessarily mean that the affected area has been redesignated to attainment.

Air Quality Element of County of Los Angeles General Plan. The Air Quality Element of the County General Plan contains two goals and three policies that are relevant to the evaluation of the Green Zones Program:

Goal AQ 1: Protection from exposure to harmful air pollutants.

Policy AQ 1.1: Minimize health risks to people from industrial toxic or hazardous air pollutant emissions, with an emphasis on local hot spots, such as existing point sources affecting immediate sensitive receptors.

Goal AQ 2: The reduction of air pollution and mobile source emissions through coordinated land use, transportation and air quality planning.

Policy AQ 2.1: Encourage the application of design and other appropriate measures when siting sensitive uses, such as residences, schools, senior centers, daycare centers, medical facilities, or parks with active recreational facilities within proximity to major sources of air pollution, such as freeways.

Policy AQ 2.3: Support the conservation of natural resources and vegetation to reduce and mitigate air pollution impacts.

Thresholds of Significance

A significant impact in relation to applicable air quality plans of either the SCAQMD or the AVAQMD was considered in relation to the potential conflict with or obstruct implementation of specified air pollution control strategies. The AVAQMD defines this more specifically as conformity as being demonstrated by consistency with growth forecasts and established land use patterns.

Impact Analysis

The proposed program would result in less than significant impacts to air quality in relation to conflicting with or obstruction of implementation of the applicable air quality plan. The potential for impacts to applicable air quality plans has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, *Project Description*, Table 1.IV-1, *Planning and Permitting Requirements*, and Table 1.IV-2, *Development Standards*). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses in relation to the potential change growth forecast of land use patterns.

Element 1 – Green Zone Districts

The designation of Green Zone Districts within the County's Zoning Code, Title 22, would result in less than significant impacts in relation to conflicts with or obstruction of implementation of the SCAQMD AQMP or the AVAQMD AQMP. Rather than changing the land use pattern, the Green Zone Districts (see Figure 1.IV-1, *Los Angeles County Planning Areas*) creates development standards and procedures for existing M-1, M-1.5, M-2, and M-2.5 and industrial

uses within the located within communities of Avocado Heights, East Los Angeles, East Rancho Dominguez, Florence-Firestone, South San Jose Hills, Walnut Park, West Athens-Westmont, West Carson, West Rancho Dominguez-Victoria, West Whittier-Los Nietos, and Willowbrook. The development standards apply where existing and zoned M-1, M-1.5, M-2, and M-2.5 industrial uses are located within 500 feet of a sensitive use on an unincorporated parcel, or a residential use on incorporated parcel. This development standards and procedures would be required to minimize adverse effects related to air quality (and other environmental factors) on nearby sensitive uses. As of June 2020, the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum floor area ratio (FAR) requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to properties within the 11 districts, and to future entitlements subject to a CUP, an MCUP, and/or an SPR. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

SCAQMD AQMP. Green Zone Districts would result in less than significant impacts in relation to conflicts with or obstruction of implementation of the SCAQMD AQMP. The project would not conflict with or prevent the implementation of the four primary components of the Air Toxic Control strategy in the SCAQMD AQMP:

- **Continue efforts to reduce diesel particulate matter.**

The majority of the proposed improvements are inanimate objects such as walls, fencing, signage, and lighting that would be compliant with County Title 22, Zoning Code, and Title 31, Building Codes and not involve the use of diesel fuels.

- **Control volatile organic compound (VOC) emissions that are most reactive in ozone and/or fine particulate matter (PM_{2.5}) formation.**
- **Mobile source control strategies that are designed to reduce nitrogen oxide (NO_x), reactive organic gases (ROG), and PM emissions in order to meet the State Implementation Plan (SIP) commitments in the 2016 AQMP, while also producing co-benefits for a variety of toxic air contaminants (TACs).**

The project regulates existing and allowable land uses that are located in proximity to sensitive uses; therefore, it would not contribute to increased per capita vehicle miles traveled (VMT), which is the primary source of VOCs, NO_x, ROG, and PM.

- **Stationary source control strategies that are implemented by the SCAQMD in order to primarily reduce TACs that can create localized impacts to nearby communities.¹³**

The project measures are consistent with the SCAQMD strategy to reduce localized impacts to sensitive uses within the County and immediately adjacent parcels in incorporated Cities to exposure to TACs, through development standards and the use of air filtration systems.

¹³ South Coast Air Quality Management District. March 2017. Final 2016 Air Quality Management Plan. <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf?sfvrsn=15>

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to the AQMP. No further analysis is warranted.

AVAQMD AQMP. The proposed program would not conflict with the AVAQMD AQMP Applicable SIP since the project would neither exacerbate population growth nor change land use patterns. The effect of the project is limited to updated zoning standards for existing industrial uses. Air filtration would be implemented to reduce pollution and air quality impacts to adjacent sensitive receptors. by minimizing and avoiding exposure, to emissions from pallet yards, and recycling processing, organic waste, and solid waste facilities to filter out the contaminants, in a manner that is consistent with AVAQMD's mission of being protective of public health. Since the protective measures, specified pursuant to the project would not generate VOCs, which are the precursor to O₃, there would be no effect on AVAQMD SIP. The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to the AVAQMD AQMP. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to the AVAQMD AQMP. No further analysis is warranted.

Air Quality Element of the County of Los Angeles General Plan. The goals of the County General Plan 2035 Air Quality Element include the protection of County residents from exposure to harmful criteria air pollutants; the reduction of air pollution and mobile source emissions through coordinated land use, transportation and air quality planning; and implementation of plans and programs to address the impacts of climate change. The Green Zone District element does not conflict with or impede the implementation of the two applicable goals, and three related policies of the Air Quality Element of the County General Plan:

Goal AQ 1: Protection from exposure to harmful air pollutants.

Policy AQ 1.1: Minimize health risks to people from industrial toxic or hazardous air pollutant emissions, with an emphasis on local hot spots, such as existing point sources affecting immediate sensitive receptors. Waste management and recycling involve the use of heavy equipment and on-road vehicles that uses diesel fuels.

The Green Zone District requirements includes the use of air filtration systems for sensitive uses within 500 feet of pallet yards, solid waste management, and recycling facilities. Installation of air filtration systems would be required within building enclosures at pallet yards and recycling processing, organic waste, and solid waste facilities to draw in the dust and particulate matter generated from indoor and outdoor operational activities in order to protect employees and visitors. The types of air filtrations utilized would be “best available control technology” as defined by AQMD Guidelines.

Goal AQ 2: The reduction of air pollution and mobile source emissions through coordinated land use, transportation and air quality planning.

Policy AQ 2.1: Encourage the application of design and other appropriate measures when siting sensitive uses, such as residences, schools, senior centers, daycare centers, medical facilities, or parks with active recreational facilities within proximity to major sources of air pollution, such as freeways.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses implements Policy AQ 2.1 and works towards Goal AQ2.

Policy AQ 2.3: Support the conservation of natural resources and vegetation to reduce and mitigate air pollution impacts.

The Green Zone Districts applies to existing M-1, M-1.5, M-2, and M-2.5, and Industrial Uses within the Green Zone District Boundary (see Table 1.IV-1); therefore, there would be no conflict with the conservation of natural resources and vegetation.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to applicable air quality plans.

Element 2 – New Sensitive Uses

The proposed development standards for new sensitive uses adjoining or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts in relation to conflicts with or obstruction of implementation of the SCAQMD AQMP. New sensitive uses that are constructed adjacent to industrial, recycling, solid waste, or vehicle-related uses would be required to implement development standards similar to those required for existing industrial uses, to protect these new sensitive uses from impacts from existing industrial uses (Chapter 22.84, and Chapter 22.130).

SCAQMD AQMP. The New Sensitive Uses element of the Green Zones Program would result in less than significant impacts in relation to conflicts with or obstruction of implementation of the SCAQMD AQMP. The project would not conflict with or prevent the implementation of the four primary components of the Air Toxic Control strategy in the SCAQMD AQMP:

- **Continue efforts to reduce diesel particulate matter.**

The majority of the proposed improvements are inanimate objects such as walls, ~~fencing, signage balconies, and lighting~~ that air filtration systems would be compliant with County Title 22, Zoning Code, and Title 31, Building Codes and not involve the use of diesel fuels. The SCAQMD regulates construction equipment and diesel fuel emissions with the SCAQMD. Consistent with the objectives of the SCAQMD Commercial Electric Lawn and Garden Program, the County has required the use of electric and manual commercial lawn and garden equipment, including handheld trimmers, chainsaws, pruners, backpack and handheld leaf blowers, and ride-on, stand-on, and walk-behind lawn mowers for landscape areas required in conjunction with the New Sensitive Uses.

- **Control volatile organic compound (VOC) emissions that are most reactive in ozone and/or fine particulate matter (PM_{2.5}) formation.**
- **Mobile source control strategies that are designed to reduce nitrogen oxide (NO_x), reactive organic gases (ROG), and PM emissions in order to meet the State Implementation Plan (SIP) commitments in the 2016 AQMP, while also producing co-benefits for a variety of toxic air contaminants (TACs).**

The project regulates existing and allowable land uses that are located in proximity to sensitive uses; therefore, it would not contribute to increased per capita VMT which is the primary source of VOCs, NO_x, ROG, and PM. Identification of organic waste recycling as an allowable use would not change the generation of such waste, but rather allow them to be diverted from landfills to organic waste recycling and composting centers within the unincorporated areas of the County; therefore, there would be no increase in VOCs, NO_x, ROG, or PM as a result of the allowable use.

- **Stationary source control strategies that are implemented by the SCAQMD in order to primarily reduce TACs that can create localized impacts to nearby communities.¹⁴**

The project measures are consistent with the SCAQMD strategy to reduce localized impacts to sensitive uses within the County and immediately adjacent parcels in incorporated Cities to exposure to TACs, through development standards and the use of air filtration systems. The air filtration systems would be installed, along with recycling processing, organic waste, and solid waste facilities, to protect inhabitants at the location of sensitive receptors including in residential units and other rooms intended for human occupancy, as recommended by Department of Public Health to filter out contaminants such as PM_{2.5} and PM₁₀ from adjacent industrial sites. The proposed program would include construction of fencing and solid walls, temporary truck trips during construction that would not differ substantially from existing

¹⁴ South Coast Air Quality Management District. March 2017. Final 2016 Air Quality Management Plan. <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf?sfvrsn=15>

conditions, and maintenance to existing facilities. The construction would be minimal and short-term. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to the SCAQMD AQMP.

AVAQMD SIP. The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to the AVAQMD AQMP. The proposed program component would address incompatible land uses by changing regulatory requirements for specific industrial land uses in proximity to sensitive uses and require development standards for new sensitive uses in proximity to existing industrial, recycling and solid waste, or vehicle-related uses. The proposed program would not conflict with the AVAQMD AQMP Applicable SIP since the project would neither exacerbate population growth nor change land use patterns. The effect of the project Element 2 is limited to updated standards for ~~existing industrial~~ new sensitive uses. Air filtrations would be implemented to reduce pollution and air quality impacts ~~to from~~ adjacent sensitive receptors ~~industrial uses~~ by minimizing and avoiding exposure, ~~to emissions from pallet yards~~ exposure to air pollution, and ~~recycling processing, organic waste, and solid waste facilities~~ to filter out the contaminants in a manner that is consistent with AVAQMD's mission of being protective of public health. Since the protective measures, specified pursuant to the project would not generate VOCs, which are the precursor to O₃, there would be no effect on AVAQMD SIP. The new development standards ~~and/or more stringent entitlement processes~~ for New Sensitive Uses adjacent to or adjoining existing ~~sensitive uses on other properties~~ industrial, recycling or solid waste, or vehicle-related uses would result in less than significant impacts to the AVAQMD AQMP. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts to the AVAQMD AQMP.

Air Quality Element of County General Plan. The goals of the County General Plan 2035 Air Quality Element include the protection of County residents from exposure to harmful criteria air pollutants; the reduction of air pollution and mobile source emissions through coordinated land use, transportation and air quality planning; and implementation of plans and programs to address the impacts of climate change. The New Sensitive Uses Element does not conflict with impede the implementation of the two applicable goals, and three related policies of the Air Quality Element of the County General Plan:

Goal AQ 1: Protection from exposure to harmful air pollutants.

Policy AQ 1.1: Minimize health risks to people from industrial toxic or hazardous air pollutant emissions, with an emphasis on local hot spots, such as existing point sources affecting immediate sensitive receptors. Waste management and recycling involve the use of heavy equipment and on-road vehicles that uses diesel fuels.

The New Sensitive Uses requirement includes the use of air filtration systems for sensitive uses ~~adjacent to pallet yards, solid waste management, and recycling facilities. In addition, installation of air filtration systems would be required, within building enclosures at pallet yards; and recycling processing, organic waste, and solid waste facilities to draw in the dust and particulate matter generated from indoor and outdoor operational activities in order to protect employees and visitors.~~ adjacent to industrial, recycling or solid waste, or vehicle-related uses. The types of air filtrations utilized would be "best available control technology" as defined by AQMD Guidelines.

Goal AQ 2: The reduction of air pollution and mobile source emissions through coordinated land use, transportation and air quality planning.

Policy AQ 2.1: Encourage the application of design and other appropriate measures when siting sensitive uses, such as residences, schools, senior centers, daycare centers, medical facilities, or parks with active recreational facilities within proximity to major sources of air pollution, such as freeways.

The new development standards ~~and/or more stringent entitlement processes~~ for New Sensitive Uses would protect the adjacent sensitive uses from industrial emissions.

Policy AQ 2.3: Support the conservation of natural resources and vegetation to reduce and mitigate air pollution impacts.

~~The Green Zones Districts New Sensitive Uses applies to all zones where the new sensitive use is within adjacent to or adjoining an existing M-1, M-1.5, M-2, and M-2.5, and Industrial Uses within the Green Zones District Boundary legally-established industrial, recycling or solid waste, or vehicle-related use (see Table 1.IV-1); therefore, there would be no conflict with the conservation of natural resources and vegetation.~~

The proposed program would not conflict with the County General Plan 2035 Air Quality Element since the proposed program would include construction of ~~fencing and solid walls and maintenance to existing facilities~~ landscaping. The construction would be minimal and short-term. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not result in substantial changes to the existing conditions. Air filtration and other updated technologies would be implemented to reduce pollution and air quality impacts to adjacent sensitive receptors. The proposed program would be compliant with County General Plan 2035 Air Quality Element goals to implement programs that address the impacts of climate change. The proposed program's goal is to address air pollution impacts to sensitive receptors. The new development standards ~~and/or more stringent entitlement processes~~ for the New Sensitive Uses would result in less than significant impacts to applicable air quality plans.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts in relation to conflicts with or obstruction of implementation of the SCAQMD AQMP. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, ~~an MCUP, and/or an SPR~~ and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). ~~Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~

SCAQMD AQMP. Recycling and Waste Management Revisions would result in less than significant impacts in relation to conflicts with or obstruction of implementation of the SCAQMD AQMP. The project would not conflict with or prevent the implementation of the four primary components of the Air Toxic Control strategy in the SCAQMD AQMP:

- **Continue efforts to reduce diesel particulate matter.**

The majority of the proposed improvements are inanimate objects such as walls, fencing, signage, and lighting that would be compliant with Title 22 Building Codes and not involve the use of diesel fuels. The SCAQMD regulates construction equipment and diesel fuel emissions with the SCAQMD. Consistent with the objectives of the SCAQMD Commercial Electric Lawn and Garden Program, the County has required the use of electric and manual commercial lawn and garden equipment, including handheld trimmers, chainsaws, pruners, backpack and handheld leaf blowers, and ride-on, stand-on, and walk-behind lawn mowers for landscape areas required in conjunction with the Recycling and Waste Management Revisions.

- **Control volatile organic compound (VOC) emissions that are most reactive in ozone and/or fine particulate matter (PM_{2.5}) formation.**
- **Mobile source control strategies that are designed to reduce nitrogen oxide (NO_x), reactive organic gases (ROG), and PM emissions in order to meet the State Implementation Plan (SIP) commitments in the 2016 AQMP, while also producing co-benefits for a variety of toxic air contaminants (TACs).**

The project regulates existing and allowable land uses that are located in proximity to sensitive uses; therefore, it would not contribute to increased per capita VMT, which is the primary source of VOCs, NOX, ROG, and PM. Identification of organic waste recycling as an allowable use would not change the generation of such waste, but rather allow them to be diverted from landfills to organic waste recycling and composting centers within the unincorporated areas of the County; therefore, there would be no increase in VOCs, NOX, ROG, or PM as a result of the allowable use.

- **Stationary source control strategies that are implemented by the SCAQMD in order to primarily reduce TACs that can create localized impacts to nearby communities.**¹⁵

The project measures are consistent with the SCAQMD strategy to reduce localized impacts to sensitive uses within the County and immediately adjacent parcels in incorporated Cities to exposure to TACs, through development standards and the use of air filtration systems. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to the AQMP.

AVAQMD SIP. The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to the AVAQMD AQMP. The proposed program would not conflict with the AVAQMD AQMP Applicable SIP since the project would neither exacerbate population growth nor change land use patterns. The effect of the project is limited to updated standards for existing industrial uses. Air filtrations would be implemented to reduce pollution and air quality impacts to adjacent sensitive receptors, by minimizing and avoiding exposure, to emissions from pallet yards, and recycling processing, organic waste, and solid waste facilities to filter out the contaminants, in a manner that is consistent with AVAQMD's mission of being protective of public health. Since the protective measures, specified pursuant to the project would not generate VOCs, which are the precursor to O₃, there would be no effect on AVAQMD SIP. The new development standards and/or more stringent entitlement processes for Recycling and Waste Management Revisions would result in less than significant impacts to the AVAQMD AQMP.

Air Quality Element of County General Plan. The goals of the County General Plan 2035 Air Quality Element include the protection of County residents from exposure to harmful criteria air pollutants; the reduction of air pollution and mobile source emissions through coordinated land use, transportation and air quality planning; and implementation of plans and programs to address the impacts of climate change. The Green Zone Districts would not conflict with impede the implementation of the two applicable goals, and three related policies of the Air Quality Element of the County General Plan:

Goal AQ 1: Protection from exposure to harmful air pollutants.

Policy AQ 1.1: Minimize health risks to people from industrial toxic or hazardous air pollutant emissions, with an emphasis on local hot spots, such as existing point sources affecting immediate sensitive receptors.

The improvements, consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards would be compliant with the Air Quality Element goals by addressing incompatible land uses and improving existing facilities. Therefore, impacts to Recycling and Waste Management Revisions would be less than significant impacts to the County General Plan Air Quality Element. The types of air filtrations utilized would be "best available control technology" as defined by AQMD Guidelines.

Goal AQ 2: The reduction of air pollution and mobile source emissions through coordinated land use, transportation and air quality planning.

Policy AQ 2.1: Encourage the application of design and other appropriate measures when siting sensitive uses, such as residences, schools, senior centers, daycare centers, medical facilities, or parks with active recreational facilities within proximity to major sources of air pollution, such as freeways.

¹⁵ South Coast Air Quality Management District. March 2017. Final 2016 Air Quality Management Plan. <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf?sfvrsn=15>

The proposed program would not conflict with the County General Plan 2035 Air Quality Element. The program would address climate change impacts and promotes the reduction of air pollution and mobile source emissions through coordinated land uses by addressing the incompatible land uses and protecting sensitive uses. The improvements, consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards would be compliant with the Air Quality Element goals by addressing incompatible land uses and improving existing facilities.

Policy AQ 2.3: Support the conservation of natural resources and vegetation to reduce and mitigate air pollution impacts.

~~The Green Zones Districts~~ Recycling and Waste Management Revisions applies to existing ~~M-1, C-1, C-2, C-3, C-M, C-MJ, C-R, C-RU, MXD, MXD-RU, M-1, M-1.5, M-2, and M-2.5, and Industrial Uses within the Green Zones District Boundary (see Table 1.IV-1); therefore A-2, and IT zones. As a result,~~ there would be no conflict with the conservation of natural resources and vegetation. Therefore, the ~~new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle related uses within Green Zone Districts within a 500 foot radius of existing sensitive uses on other properties~~ Recycling and Waste Management Revisions would result in less than significant impacts to applicable air quality plans.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts in relation to conflicts with or obstruction of implementation of the SCAQMD AQMP. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The Ca Recycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. The new development standards and/or more stringent entitlement processes for Supermarket Accessory and Recycling Collection Centers would result in less than significant impacts to applicable air quality plans.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in relation to conflicts with or obstruction of implementation of the SCAQMD AQMP. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

SCAQMD AQMP. The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in relation to conflicts with or obstruction of implementation of the SCAQMD AQMP. The project would not conflict with or prevent the implementation of the four primary components of the Air Toxic Control strategy in the SCAQMD AQMP:

- **Continue efforts to reduce diesel particulate matter.**

The majority of the proposed improvements are inanimate objects such as walls, fencing, signage, and lighting that would be compliant with Title 22 Building Codes and not involve the use of diesel fuels. The SCAQMD regulates construction equipment and diesel fuel emissions with the SCAQMD. Consistent with the objectives of the SCAQMD Commercial Electric Lawn and Garden Program, the County has required the use of electric and manual commercial lawn and garden equipment, including handheld trimmers, chainsaws, pruners, backpack and handheld leaf blowers, and ride-on, stand-on, and walk-behind lawn mowers for landscape areas required in conjunction with the Green Zones Program.

- **Control volatile organic compound (VOC) emissions that are most reactive in ozone and/or fine particulate matter (PM_{2.5}) formation.**
- **Mobile source control strategies that are designed to reduce nitrogen oxide (NO_x), reactive organic gases (ROG), and PM emissions in order to meet the State Implementation Plan (SIP) commitments in the 2016 AQMP, while also producing co-benefits for a variety of toxic air contaminants (TACs).**

Identification of organic waste recycling as an allowable use would not change the generation of such waste, but rather allow them to be diverted from landfills to organic waste recycling and composting centers within the unincorporated areas of the County; therefore, there would be no increase in VOCs, NOX, ROG, or PM as a result of the allowable use. The project regulates existing and allowable land uses that are located in proximity to sensitive uses; therefore, it would not contribute to increased per capita VMT, which is the primary source of VOCs, NOX, ROG, and PM. Identification of organic waste recycling as an allowable use would not change the generation of such waste, but rather allow them to be diverted from landfills to organic waste recycling and composting centers within the unincorporated areas of the County; therefore, there would be no increase in VOCs, NOX, ROG, or PM as a result of the allowable use.

- **Stationary source control strategies that are implemented by the SCAQMD in order to primarily reduce TACs that can create localized impacts to nearby communities.¹⁶**

Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. The proposed program would not result in a substantial change from existing conditions. The proposed program component would include improvements to existing facilities to meet the requirements of new standards, conditions, and procedures that support and facilitate the development of recycling collection center as an accessory use to an existing supermarket. The proposed program would not conflict with the AQMP.

Therefore, the new development standards and/or more stringent entitlement processes for The Storage Enclosures for Recycling and Solid Waste Revisions ~~within a 500-foot radius of existing sensitive uses on other properties~~ would result in less than significant impacts to the AQMP.

AVAQMD AQMP. The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to the AVAQMD AQMP. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add

¹⁶ South Coast Air Quality Management District. March 2017. Final 2016 Air Quality Management Plan. <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf?sfvrsn=15>

additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. The proposed program would not result in substantial changes from existing conditions. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to the AVAQMD AQMP. The proposed program would not conflict with the AVAQMD AQMP Applicable SIP since the project would neither exacerbate population growth nor change land use patterns. The effect of the project is limited to updated standards for existing industrial uses. Air filtrations would be implemented to reduce pollution and air quality impacts to adjacent sensitive receptors. by minimizing and avoiding exposure, to emissions from pallet yards, and recycling processing, organic waste, and solid waste facilities to filter out the contaminants, in a manner that is consistent with AVAQMD's mission of being protective of public health. Since the protective measures, specified pursuant to the project would not generate VOCs, which are the precursor to O₃, there would be no effect on AVAQMD SIP. The new development standards and/or more stringent entitlement processes for Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to the AVAQMD AQMP. The proposed program would not conflict with the AVAQMD AQMP Applicable SIP since the Program would neither exacerbate population growth nor change land use patterns. The effect of the project is limited to updated standards for existing industrial uses. The new development standards and/or more stringent entitlement processes for Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to the AVAQMD AQMP.

Air Quality Element of County General Plan. The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to the County General Plan Air Quality Element. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. The proposed program would not conflict with the County General Plan Air Quality Element and would not result in substantial changes to the existing conditions. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to the County General Plan Air Quality Element.

The goals of the County General Plan 2035 Air Quality Element include the protection of County residents from exposure to harmful criteria air pollutants; the reduction of air pollution and mobile source emissions through coordinated land use, transportation and air quality planning; and implementation of plans and programs to address the impacts of climate change. The ~~Green Zones Districts~~ Storage Enclosures for Recycling and Solid Waste Revisions element does not conflict with impede the implementation of the two applicable goals, and three related policies of the Air Quality Element of the County General Plan:

Goal AQ 1: Protection from exposure to harmful air pollutants.

Policy AQ 1.1: Minimize health risks to people from industrial toxic or hazardous air pollutant emissions, with an emphasis on local hot spots, such as existing point sources affecting immediate sensitive receptors. Waste management and recycling involve the use of heavy equipment and on-road vehicles that uses diesel fuels.

The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

Goal AQ 2: The reduction of air pollution and mobile source emissions through coordinated land use, transportation and air quality planning.

Policy AQ 2.1: Encourage the application of design and other appropriate measures when siting sensitive uses, such as residences, schools, senior centers, daycare centers, medical facilities, or parks with active recreational facilities within proximity to major sources of air pollution, such as freeways.

The new development standards and/or more stringent entitlement processes for Storage Enclosures for Recycling and Solid Waste Revisions ~~within Green Zone Districts within a 500-foot radius of existing sensitive uses~~, including all uses specified in PolicyAQ2.1.

Policy AQ 2.3: Support the conservation of natural resources and vegetation to reduce and mitigate air pollution impacts.

Storage Enclosures for Recycling and Solid Waste Revisions apply to all zones that meet the following criteria: new nonresidential uses or residential uses with more than 4 units with solid waste/recycling storage onsite. Green Zones Districts apply to existing M-1, M-1.5, M-2, and M-2.5, and Industrial Uses within the Green Zones District Boundary (see Table 1.1V-1); Therefore, there would be no conflict with the conservation of natural resources and vegetation.

The new development standards and/or more stringent entitlement processes for Storage Enclosures for Recycling and Solid Waste Revisions ~~within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties~~ would result in less than significant impacts to applicable air quality plans.

Although the Green Zones Program is not anticipated to result in significant impacts to air quality in relation to conflicts with adopted air quality management plan, and although it is anticipated that the long-term impact of the proposed program would result in an improvement to air quality, this issue area is being carried forward for further analysis to ensure that the findings will be consistent and in alignment with the findings of the Health Impact Assessment.

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Existing Conditions

The existing air quality in Southern California does not currently meet state and federal standards. Data on existing air quality in the SCAB, in which the proposed program area is located, is monitored by a network of air monitoring stations operated by the California Environmental Protection Agency (CalEPA), CARB, SCAQMD, and the AVAQMD. The air quality assessment considers all phases of project planning, construction, and operation. The Green Zones Program affects County land use zoning designations that fall within areas regulated by two air districts: SCAQMD and AVAQMD. These districts are in nonattainment for criteria pollutants (Table 2.3-2, *CAAAQS and NAAQS Attainment Status for Green Zones Program Areas*).

**TABLE 2.3-2
CAAAQS AND NAAQS ATTAINMENT STATUS FOR GREEN ZONES PROGRAM AREA**

Criteria Pollutants	SCAQMD ¹⁷		AVAQMD ¹⁸	
	California	Federal	California	Federal
O ₃	Nonattainment	Nonattainment	Nonattainment	Nonattainment
NO _x	Attainment	Attainment	Attainment	Unclassified/Attainment
VOC	Not Reported	Not Reported	Not Reported	Not Reported
PM ₁₀	Nonattainment	Attainment	Nonattainment	Unclassified/Attainment
PM _{2.5}	Nonattainment	Nonattainment	No State Standard	Unclassified/Attainment
SO ₂	Nonattainment	Attainment	Attainment	Unclassified/Attainment
CO	Attainment	Attainment	Attainment	Unclassified/Attainment
Lead	Not reported	Nonattainment	Attainment	Unclassified/Attainment

National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAAQS) Attainment Status for South Coast Air Basin. Available at: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/naaqs-caaqs-feb2016.pdf?sfvrsn=14>

¹⁸ Antelope Valley AQMD. Downloaded June 4, 2020. 2017 Attainment Status. Available at: <https://avaqmd.ca.gov/files/e0986ab83/AVAQMD+2017+Attainment+Status+Table.pdf>

Thresholds of Significance

A significant impact would occur if the project results in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors).

The potential air quality impacts occurring during the construction and operation of proposed programs complying with the Green Zones Program is evaluated using the CEQA Guidelines and the quantitative thresholds of significance established by the SCAQMD (Table 2.3-3, *SCAQMD Air Quality Significance Thresholds*).

**TABLE 2.3-3
SCAQMD AIR QUALITY SIGNIFICANCE THRESHOLDS**

Mass Daily Thresholds		
Pollutant	Construction	Operation
NO _x	100 lbs/day	55 lbs/day
VOC	75 lbs/day	55 lbs/day
PM ₁₀	150 lbs/day	150 lbs/day
PM _{2.5}	55 lbs/day	55 lbs/day
SO _x	150 lbs/day	150 lbs/day
CO	550 lbs/day	550 lbs/day
Lead	3 lbs/day	3 lbs/day
Toxic Air Contaminants (TACs), Odor, and GHG Thresholds		
TACs (including carcinogens and noncarcinogens)	Maximum Incremental Cancer Risk ≥ 10 in 1 million Cancer Burden > 0.5 excess cancer cases (in areas ≥ 1 in 1 million) Chronic & Acute Hazard Index ≥ 1.0 (project increment)	
Odor	Project creates an odor nuisance pursuant to SCAQMD Rule 402	
GHG	10,000 MT/yr CO ₂ eq for industrial facilities	
Ambient Air Quality Standards for Criteria Pollutants ^a		
NO ₂ 1-hour average Annual arithmetic mean	SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 0.18 ppm (state) 0.03 ppm (state) and 0.0534 ppm (federal)	
PM ₁₀ 24-hour average Annual average	10.4 µg/m ³ (construction) ^b & 2.5 µg/m ³ (operation) 1.0 µg/m ³	
PM _{2.5} 24-hour average	10.4 µg/m ³ (construction) ^b & 2.5 µg/m ³ (operation)	
SO ₂ 1-hour average 24-hour average	0.25 ppm (state) & 0.075 ppm (federal – 99th percentile) 0.04 ppm (state)	
Sulfate 24-hour average	25 µg/m ³ (state)	
CO 1-hour average 8-hour average	SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 20 ppm (state) and 35 ppm (federal) 9.0 ppm (state/federal)	
Lead 30-day average Rolling 3-month average	1.5 µg/m ³ (state) 0.15 µg/m ³ (federal)	

NOTE: lbs/day = pounds per day; ppm = parts per million; µg/m³ = micrograms per cubic meter; MT/year CO₂eq = metric tons per year of CO₂ equivalents; NO_x = nitrogen oxide; VOC = volatile organic compounds; PM₁₀ = particulate matter 10 microns or less in diameter (coarse PM); PM_{2.5} = particulate matter 2.5 microns or less in diameter (fine PM); SO_x = sulfates; CO = carbon monoxide; TACs = toxic air contaminants; GHG = greenhouse gases; NO₂ = nitrogen dioxide; SO₂ = sulfur dioxide.

^a Ambient air quality thresholds for criteria pollutants based on SCAQMD Rule 1303, Table A-2 unless otherwise stated.

^b Ambient air quality threshold based on SCAQMD Rule 403.

SOURCE: South Coast Air Quality Management District. April 1993. CEQA Air Quality Handbook.

The analysis of impacts was based the construction of the physical improvements required pursuant to the development standards (please see Table I.IV-2). With the exception of air filtration devices and landscaping, the improvements are primarily inanimate objects, such as walls, fencing, lighting, and signs, that would not have the capacity to generate emissions; therefore¹⁹, the operation and maintenance of these facilities was not considered in the analysis of impacts. It is further understood that the use of air filtration devices would be limited to mechanical devices that use physical filtration such pleated or HEPA-Style filters, which do not typically generate O₃. The primary source of criteria pollutants related to landscaping would be associated with the use of diesel tools. Consistent with the objectives of the SCAQMD Commercial Electric Lawn and Garden Program, the County has required the use of electric and manual commercial lawn and garden equipment, including handheld trimmers, chainsaws, pruners, backpack and handheld leaf blowers, and ride-on, stand-on, and walk-behind lawn mowers for landscape areas required in conjunction with the Green Zones Program. The established goals of the program are to “improve air quality by exchanging older, polluting gasoline- or diesel-powered commercial lawn and garden equipment for new zero emission, battery electric commercial grade equipment for operation ... Special focus will be given to environmental justice (EJ) or disadvantaged communities.” There is incentive funding for exchange of equipment in the portion of Los Angeles County regulated by the SCAQMD. The AVAQMD does not have a comparable program.

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts to air quality in relation to cumulatively considerable net increases in criteria pollutants for which the region is in nonattainment. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a CUP, MCUP, or SPR. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. The Green Zone Districts element includes the construction of fencing and solid walls around existing and new uses is the M-1, M 1.5, M-2, M-2.5, and industrial areas within the Green Zone Districts boundaries that are directly adjacent to sensitive receptors. Motorized equipment used during construction would comply with CARB regulations for diesel programs relating to mobile source, stationary engines, and portable equipment.

The construction of walls, fencing, signs, lighting, landscaping, and installation of air filtration devices to meet the improved Development Standards for the Green Zone Districts would not generate cumulatively considerable emissions of O₃, PM₁₀, PM_{2.5}, SO₂ or lead, criteria pollutants for which portions of Green Zone Districts are in nonattainment (see Table 2.3-2). The primary source of VOCs is combustion engines from on-road vehicles powered by carbon-based fuels. VOCs are a precursor to O₃. The Green Zone District regulates existing land use pattern and does not exacerbate population growth or change the land use pattern, in a manner that would be expected to substantial

¹⁹ California Air Resources Board. 2020. California Certified Air Cleaning Devices. Available at: <https://ww2.arb.ca.gov/our-work/programs/air-cleaners-ozone-products/california-certified-air-cleaning-devices>

increase per capita VMT. Since the protective measures, specified pursuant to the project would not generate VOCs, which are the precursor to O₃; therefore, the project would not contribute substantially to O₃. Similarly, the identification of organic waste recycling as an allowable use would not change the generation of such waste, but rather allow them to be diverted from landfills to organic waste recycling and composting centers within the unincorporated areas of the County; therefore, there would be no increase in VOCs, O₃, NO_x, PM, or SO₂ as a result of the allowable use. The project regulates existing and allowable land uses that are located in proximity to sensitive uses; therefore, it would not contribute to increased per capita VMT, which is the primary source of VOCs, NO_x, PM, or SO₂. Lead is emitted from industrial facilities and from the sanding or removal of old lead-based paint. Rather than allowing or expanding the industrial uses that have the potential to result in lead emissions, certain industrial uses are restricted within the densely populated unincorporated areas of the County that comprise the Green Zone Districts, including acid manufacture; cement, lime, gypsum, or plaster of paris manufacture; distillation of bones; drop hammers; forging work; explosives; fertilizer manufacture; gas manufacture; glue manufacture; smelting of tin, copper, zinc or iron ores; tannery or the curing or storage of raw hides; metal plating; and polymer plastics and foam manufacture. Therefore, lead emission would be expected to decrease over the 3- to 10-year implementation period. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to air quality in relation to cumulatively considerable net increases in criteria pollutants for which the region is in nonattainment.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to air quality in relation to cumulatively considerable net increases in criteria pollutants due to construction. The construction of walls, ~~fencing, signs, lighting,~~ landscaping, and installation of air filtration devices to meet the improved development standards for the ~~Green Zones Districts~~ New Sensitive Uses would not generate cumulatively considerable emissions of O₃, PM₁₀, PM_{2.5}, SO₂, or lead, criteria pollutants, ~~for which portions of Green Zones Districts are in nonattainment (see Table 2.3-2).~~ The primary source of VOCs is combustion engines from on-road vehicles powered by carbon-based fuels. VOCs are a precursor to O₃. The ~~Green Zones District~~ New Sensitive Uses regulates existing zoning and land use pattern designations and does not exacerbate population growth or change the land use pattern in a manner that would be expected to substantially increase per capita VMT. Since the protective measures, specified pursuant to the project would not generate VOCs, which are the precursor to O₃, therefore, the project would not contribute substantially to O₃. Similarly, the identification of organic waste recycling as an allowable use would not change the generation of such waste, but rather allow them to be diverted from landfills to organic waste recycling and composting centers within the unincorporated areas of the County; therefore, there would be no increase in VOCs, O₃, NO_x, PM, or SO₂ as a result of the allowable use. The project regulates ~~existing and allowable land~~ sensitive uses that are located in proximity located adjacent to sensitive or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses; therefore, it would not contribute to increased per capita VMT, which is the primary source of VOCs, NO_x, PM, or SO₂. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses.~~ permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions. The

proposed program would require the facilities to comply with new development standards aimed to reduce air quality impacts ~~from nearby industrial uses~~ through creation of landscaped buffers, ~~requiring certain activities to be enclosed when in proximity to sensitive uses~~ and installation of air filters. Construction related to the proposed program's technological updates would be short-term and air pollutant emissions impacts would be addressed under federal, State, and County regulations. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space would not result in a substantial change to existing conditions. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to air quality in relation to cumulatively considerable net increases in criteria pollutants due to construction.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to air quality in relation to cumulatively considerable net increases in criteria pollutants due to construction. The proposed program would include the construction of walls, enclosures and buffers which would have less than significant impacts on air quality. The waste will be properly contained as per development standards. The proposed component includes the construction of updated technologies for the organic waste and solid waste facilities. The construction of walls, fencing, signs, lighting, and landscaping, to meet the improved Development Standards for the ~~Green Zones District~~ Recycling and Waste Management Revisions would not generate cumulatively considerable emissions of O₃, PM₁₀, PM_{2.5}, SO₂, or lead, criteria pollutants ~~for which portions of Green Zones Districts are in nonattainment (see Table 2.3-2).~~ The primary source of VOCs is combustion engines from on-road vehicles powered by carbon-based fuels. VOCs are a precursor to O₃. ~~The Green Zones District regulates existing land use pattern and does not exacerbate population growth or change the land use pattern, in a manner that would be expected to substantial increase per capita VMT.~~ The protective measures specified pursuant to the project would not generate VOCs, which are the precursor to O₃; therefore, the project would not contribute substantially to O₃. Similarly, the identification of organic waste recycling as an allowable use would not change the generation of such waste, but rather allow them to be diverted from landfills to organic waste recycling and composting centers within the unincorporated areas of the County; therefore, there would be no increase in VOCs, O₃, NO_x, PM, or SO₂ as a result of the allowable use. The project regulates existing and allowable land uses that are located in proximity to sensitive uses; therefore, it would not contribute to increased per capita VMT, which is the primary source of VOCs, NO_x, PM, or SO₂. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. The maintenance of the existing facilities would not include and building construction or demolition of existing facilities. Construction would be short-term and would not include the construction of buildings. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. The proposed program would ensure that the facilities are not located in high risk areas. The construction of the improvements would be minimal, and the scope of work is not extensive. Construction would be short-term and would not result in an increase of criteria pollutants. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ Therefore, impacts to Recycling and Waste Management Revisions would result in less than significant impacts to air quality in relation to cumulatively considerable net increases in criteria pollutants due to construction.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts to air quality in relation to cumulatively considerable net increases in criteria pollutants due to construction. The proposed

Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be constructed on existing parking lots, and no new structures will be built. The construction of walls, fencing, signs, lighting, landscaping, and installation of air filtration devices to meet the improved Development Standards for the Supermarket Accessory Recycling Collection Centers would not generate cumulatively considerable emissions of O₃, PM₁₀, PM_{2.5}, SO₂ or lead, criteria pollutants for which portions of Green Zone Districts are in nonattainment (see Table 2.3-2). The primary source of VOCs is combustion engines from on-road vehicles powered by carbon-based fuels. VOCs are a precursor to O₃. The Supermarket Accessory Recycling Collection Centers regulates existing recycling collection facilities. The protective measures specified pursuant to the project would not generate VOCs, which are the precursor to O₃; therefore, the project would not contribute substantially to O₃. Similarly, the identification of organic waste recycling as an allowable use would not change the generation of such waste, but rather allow them to be diverted from landfills to organic waste recycling and composting centers within the unincorporated areas of the County; therefore, there would be no increase in VOCs, O₃, NO_x, PM, or SO₂ as a result of the allowable use. The project regulates existing and allowable land uses that are located in proximity to sensitive uses; therefore, it would not contribute to increased per capita VMT, which is the primary source of VOCs, NO_x, PM, or SO₂. The proposed program is expected to result in a cumulatively considerable net decrease of any criteria pollutant. The air filtration devices would be required as part of any new sensitive uses being developed and the pallet yards which would protect both inhabitants and workers from toxic emissions. The air filtration devices would also filter particulate matter to protect the health of inhabitants and workers surrounding the uses, and at the industrial sites. The proposed program’s air filtrations would be compliant with the County Building Code air filtration grade, which is updated every 2 to 3 years. Additionally, best available control technologies will be implemented based on the AQMD requirements.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to air quality in relation to cumulatively considerable net increases in criteria pollutants due to construction. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The construction of walls, fencing, signs, lighting, landscaping, and installation of air filtration devices to meet the improved Development Standards for the Storage Enclosures for Recycling and Solid Waste Revisions would not generate cumulatively considerable emissions of O₃, PM₁₀, PM_{2.5}, SO₂ or lead, criteria pollutants ~~for which portions of Green Zones Districts are in nonattainment (see Table 2.3-2).~~ The primary source of VOCs is combustion engines from on-road vehicles powered by carbon-based fuels. VOCs are a precursor to O₃. The Storage Enclosures for Recycling and Solid Revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. The protective measures specified pursuant to the project would not generate VOCs, which are the precursor to O₃, therefore, the project would not contribute substantially to

O₃. Similarly, the identification of organic waste recycling as an allowable use would not change the generation of such waste, but rather allow them to be diverted from landfills to organic waste recycling and composting centers within the unincorporated areas of the County; therefore, there would be no increase in VOCs, O₃, NO_x, PM, or SO₂ as a result of the allowable use. The project regulates existing and allowable land uses that are located in proximity to sensitive uses; therefore, it would not contribute to increased per capita VMT, which is the primary source of VOCs, NO_x, PM, or SO₂. The construction of the proposed program would include the implementation of physical barriers between the recycling and solid waste facilities to contain the material in storage. Construction would be short-term and would not result in any new buildings. The construction would not result in substantial changes to existing conditions. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to air quality in relation to cumulatively considerable net increases in criteria pollutants due to construction.

Although the Green Zones Program is not anticipated to result in significant impacts to air quality in relation to a cumulatively considerable net increase in the emission of criteria air pollutants, and although it is anticipated that the long-term impact of the proposed program would result in an improvement to air quality, this issue area is being carried forward for further analysis to ensure that the findings will be consistent and in alignment with the findings of the Health Impact Assessment.

c) Expose sensitive receptors to substantial pollutant concentrations?

Existing Conditions

Land uses identified as sensitive receptors by SCAQMD in CARB's Air Quality Handbook include residences, schools, playgrounds, child care centers, athletic facilities, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes (Table 2.3-4, *Sensitive Receptors in Areas Subject to the Green Zones Program*).²⁰

**TABLE 2.3-4
SENSITIVE RECEPTORS IN AREAS SUBJECT TO THE GREEN ZONES PROGRAM**

Sensitive Use	Number within 500 Feet of Green Zones Program	Number within 500 Feet of Green Zone Districts
Residential parcels	206,208	9,910
Parks	420	15
Libraries	28	0
Senior Living Homes	2	0
Hospitals	11	1
Public Elementary School	87	6
Public Middle School	25	1
Public High School	44	5
Early Childhood Centers	68	8
Private and Charter Schools	113	7
Colleges and Universities	14	0

Significance Threshold

A significant impact on sensitive receptors would occur if the project resulted in increasing the number of sensitive receptors exposed to substantial air pollutant concentrations or increasing the level of air pollutant concentrations.

²⁰ California Air Resources Board. April 2005. Air Quality and Land Use Handbook: A Community Health Perspective. <http://www.arb.ca.gov/ch/handbook.pdf>

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts to air quality in relation to exposure of sensitive receptors to substantial pollutant concentrations. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. New sensitive uses that are constructed adjacent to industrial, recycling and solid waste, or vehicle-related uses would be required to implement development standards similar to those required for existing industrial uses, to protect these new sensitive uses from impacts from existing industrial uses (Chapter 22.84, and Chapter 22.130).

Development standards for the Green Zone Districts would include landscaping barriers, enclosed buildings, fencing, solid walls, signage, paving of permeable areas, and lighting as measures to decrease impacts to surrounding sensitive uses. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions. The proposed program includes more stringent development standards for the facilities in these districts. This component would result in an overall reduction of the concentration of air pollution experienced by sensitive receptors adjacent to the industrial facilities. The net reduction would result from two aspects of the Green Zone Districts: (1) physical separation through buffers; (2) physical separation of sensitive receptors from M-1, M-1.5, M-2, M-2.5, and other industrial uses through barriers including walls, and landscaping. The proposed program would reduce emissions and require compliance with new and existing standards. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to air quality in relation to exposure of sensitive receptors to substantial pollutant concentrations.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to air quality in relation to exposure of sensitive receptors to substantial pollutant concentrations. New sensitive uses that are constructed adjacent to industrial, recycling and solid waste, or vehicle-related uses would be required to implement development standards similar to those required for existing industrial uses, to protect these new sensitive uses from impacts from existing industrial uses (~~Chapter 22.84, and Chapter 22.130~~). Development standards for the New Sensitive Uses would include landscaping barriers, ~~enclosed buildings, fencing, and~~ solid walls, signage, paving of permeable areas, and lighting as measures to decrease impacts to surrounding sensitive uses. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools,

nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses, permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions. ~~The proposed program includes more stringent development standards for the facilities in these districts.~~ This component would result in an overall reduction of direct impacts of air pollution on sensitive receptors adjacent to the industrial facilities. ~~The proposed program would reduce emissions and require compliance with new and existing standards.~~ These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not result in substantial changes to existing conditions. This component would result in an overall reduction of the concentration of air pollution experienced by sensitive receptors adjacent to the industrial facilities. The net reduction would result from two aspects of the New Sensitive Uses component: (1) physical separation through buffers; (2) physical separation of sensitive receptors from M-1, M-1.5, M-2, M-2.5, and other industrial uses through barriers including walls, and landscaping. The proposed program would reduce emissions and require compliance with new and existing standards. The proposed program's improvements include physical barriers and air filtrations which would result in reduce exposure of sensitive receptors to air pollutants. Air filtration and up-to-date technologies would be implemented to reduce pollution and air quality impacts to adjacent sensitive receptors. These air filtration systems would be installed, along with recycling processing, organic waste, and solid waste facilities, to protect inhabitants at the location of sensitive receptors including in residential units and other rooms intended for human occupancy, as recommended by Department of Public Health to filter out contaminants such as PM_{2.5} and PM₁₀ from adjacent industrial sites. The proposed program would include the construction of enclosures, fencing and walls which would provide physical barriers to protect sensitive receptors from industrial emissions. The installation of both air filtrations and walls/fencing would result in reduced impacts of air pollutants to adjacent sensitive uses. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to air quality in relation to exposure of sensitive receptors to substantial pollutant concentrations.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to air quality in relation to exposure of sensitive receptors to substantial pollutant concentrations. the Recycling and Waste Management Revisions element of the Green Zones Program consists of the inclusion of permitting requirements and development standards for Specific Uses including pallet yards, recycling collection facilities, recycling processing facilities, organic waste facilities, and solid waste facilities. A CUP would be required for all of the above uses (Chapter 22.140). Development standards for Recycling and Waste Management Revisions include requirements for landscaping buffers, walls, enclosed buildings, surfacing of storage areas, air filtration, signage, and lighting. ~~Additionally, the Recycling and Waste Management Revisions prohibits specific uses in certain areas identified in the General Plan, including SEAs, LA County Floodways, FEMA Flood Zones, High and Very High Fire Hazard Severity Zones, HMAs, and in some cases ARAs.~~ Operation of the facilities in compliance with the proposed program element would be improved from existing conditions and would result of a net reduction of air quality impacts in the long term. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. This component would result in an overall reduction of the concentration of air pollution experienced by sensitive receptors adjacent to the industrial facilities. The net reduction would result from two aspects of the Recycling and Waste Management Revisions: (1) physical separation through buffers; (2) physical separation of sensitive receptors,

and other industrial uses through barriers including walls, and landscaping. The proposed program would reduce emissions and require compliance with new and existing standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ The facilities would not be located in high-risk areas and would include the maintenance of existing facilities. The improvements would reduce direct exposure to sensitive uses adjacent to the placement of the recycling facilities and would not result in an increased impact of pollutants to sensitive receptors. The proper storage of materials and maintenance of facilities would ensure compliance with CALGreen building standards and would ensure the containment of stored materials at the existing facilities. Therefore, impacts to Recycling and Waste Management Revisions would result in less than significant impacts to air quality in relation to exposure of sensitive receptors to substantial pollutant concentrations.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts to air quality in relation to exposure of sensitive receptors to substantial pollutant concentrations. The purpose of the Supermarket Accessory Recycling Collection Centers is to establish standards, conditions, and procedures that support and facilitate the development of recycling collection center as an accessory use to an existing supermarket (Chapter 22.140-~~660~~, 710), and to establish standards for enclosed rooms or storage areas for storing, collecting, and loading waste, recyclable materials, and organic materials. The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. This component would result in an overall reduction of the concentration of air pollution experienced by sensitive receptors adjacent to the industrial facilities. The net reduction would result from two aspects of the Recycling and Waste Management Revisions: (1) physical separation through buffers; (2) physical separation of sensitive receptors, and other industrial uses through barriers including walls, and landscaping. The proposed program would reduce emissions and require compliance with new and existing standards. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be constructed on existing parking lots, and no new structures will be built. The maintenance of materials for storage and the recycling facilities would reduce direct impacts to adjacent sensitive uses. Operation of the supermarket recycling center revisions would reduce waste at supermarket recycling centers by implementing on-site collection of recyclable materials. The collection center requirements would not result in increased exposure of air pollutants since the improvements would not include substantial changes to existing conditions or the construction of any new buildings. Therefore, the Supermarket Accessory Recycling Collection Centers would have less than significant impacts to air quality in relation to exposure of sensitive receptors to substantial pollutant concentrations.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to air quality in relation to exposure of sensitive receptors to substantial pollutant concentrations. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased

enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. These Revisions would also require that these collection and storage areas be safely accessible by building occupants and waste and recycling haulers in compliance with Title 14, Division 7 (Natural Resources) of the California Code of Regulations (Chapter 22.128). This component would result in an overall reduction of the concentration of air pollution experienced by sensitive receptors adjacent to the industrial facilities. The net reduction would result from two aspects of the Recycling and Waste Management Revisions: (1) physical separation through buffers; (2) physical separation of sensitive receptors, and other industrial uses through barriers including walls, and landscaping. The proposed program would reduce emissions and require compliance with new and existing standards. The improvements would reduce exposure of the facilities to adjacent sensitive uses. The proposed program would implement more energy efficient technologies for the organic and solid waste facilities during operation. The energy efficient technologies would be in compliance with existing regulations and would reduce air pollutant impacts from existing organic and solid waste stored at facilities. The enclosures and maintenance of existing facilities would not result in an increase of air pollutants to adjacent sensitive receptors. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to air quality in relation to exposure of sensitive receptors to substantial pollutant concentrations.

Although the Green Zones Program is not anticipated to result in significant impacts to air quality in relation to exposing sensitive receptors substantial pollution concentrations, and although it is anticipated that the long-term impact of the proposed program would result in an improvement to air quality, this issue area is being carried forward for further analysis to ensure that the findings will be consistent and in alignment with the findings of the Health Impact Assessment.

d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Existing Conditions

According to the CARB's Air Quality Handbook, land uses and industrial operations associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. Similarly, CARB's Air Quality Handbook identifies 17 land uses typically associated with nuisance dust complaints: agriculture; asphalt and cement plants, auto body facilities; construction activities; diesel engines; composting operations, fertilizer operations; fiberglass molding; furniture manufacturing; landfills and transfer stations; refineries; roofing operations; rubber manufacturing; sand and gravel operations; sandblasting; silk screening; and wood dust. A number of the typical sources of nuisance dust and odor complaints are allowable uses within the area subject to the project.

Threshold of Significance

A significant impact would occur if the project would result in emission of dust or odor that would adversely affect a substantial number of people.

Impact Analysis

The proposed program involves implementation of development standards to reduce exposure of residents to emissions from industrial facilities that are typically associated with nuisance dust and odor. The proposed program would address existing dust and odor emissions from recycling and solid waste facilities by requiring property owners or operators to install air filters, maintenance of existing facilities including the construction of buffers, enclosures, and walls to reduce odors impacts to surrounding sensitive uses.

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts to air quality in relation to resulting in emissions of dust or odors with the potential to adversely affect a substantial number of people. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within

Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, ~~27 28~~ parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, ~~14 45~~ of the ~~27 28~~ parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to ~~7 40~~ years of adoption of the Ordinance. Development standards for the Green Zone Districts would include landscaping barriers, enclosed buildings, fencing, solid walls, signage, paving of permeable areas, and lighting as measures to decrease impacts to surrounding sensitive uses. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to air quality in relation nuisance dust and odor emissions.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to air quality in relation to resulting in other emissions (such as those leading to odors adversely affecting a substantial number of people). Development standards for the New Sensitive Uses would include landscaping barriers, ~~enclosed buildings, fencing and~~ solid walls, ~~signage, paving of permeable areas, and lighting~~ as measures to decrease impacts to surrounding sensitive uses. The implementation of development standards associated with the program would not create odors to sensitive uses. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses.~~ permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions. The implementation of development standards associated with the program would not create odors to sensitive uses. ~~In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions.~~ The implementation of development standards result in create dust and odors during the construction of the proposed physical improvements, including walls and landscaping. The net reduction would result from two aspects of the New Sensitive Uses: (1) physical separation through buffers; (2) physical separation of sensitive uses from industrial uses through barriers including walls, and landscaping. Although there would be the potential to

generate dust and odors from ground-disturbing activities and the use of heavy equipment using diesel fuel, the impact would be less than significant due to the limited area and duration required for the construction of such improvements. In the case of updated standards for ~~existing industrial uses~~ New Sensitive Uses, the construction of these measures would not differ substantially from existing conditions. ~~Composting operations would be an allowable use.~~ Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to air quality in relation to resulting in other emissions (such as those leading to odors adversely affecting a substantial number of people).

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to air quality in relation to resulting in other emissions (such as those leading to odors adversely affecting a substantial number of people). Development standards for Recycling and Waste Management Revisions include requirements for landscaping buffers, walls, enclosed buildings, surfacing of storage areas, air filtration, signage, and lighting. ~~Additionally, the Recycling and Waste Management Revisions prohibits specific uses in areas identified in the General Plan, including HMAs, SEAs, VHFHSZs, and in some cases ARAs.~~ The implementation of development standards associated with the program would not increase odors to sensitive uses. The implementation of enclosures, air filtration, and buffers would reduce the odors emitted by the facilities. The solid walls and enclosures would result in the reduction of odors from the collection facilities. The requirements for the storage of materials, cleaning, and maintenance would reduce odors. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. The implementation of development standards associated with the program would result would create dust and odors during the construction of the proposed physical improvements, including walls and landscaping. The net reduction would result from two aspects of the Recycling and Waste Management Revisions: (1) physical separation through buffers; (2) physical separation of sensitive uses from industrial uses through barriers including walls, and landscaping. Although there would be the potential to generate dust and odors from ground-disturbing activities and the use of heavy equipment using diesel fuel, the impact would be less than significant due to the limited area and duration required for the construction of such improvements. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions. Composting operations would be an allowable use. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ Therefore, impacts to Recycling and Waste Management Revisions would be less than significant impacts to air quality in relation to resulting in other emissions (such as those leading to odors adversely affecting a substantial number of people).

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to air quality in relation to resulting in other emissions (such as those leading to odors adversely affecting a substantial number of people). The Revisions also require that the area be safely accessible by building occupants and waste and recycling haulers in compliance with Title 14, Division 7 (Natural Resources) of the California Code of Regulations (Chapter 22.128). The implementation of development standards associated with the program would result would create dust and odors during the construction of the proposed physical improvements, including walls and landscaping. The net reduction would result from two aspects of the Storage Enclosures for Recycling and Solid Waste Revisions: (1) physical

separation through buffers; (2) physical separation of sensitive uses from industrial uses through barriers including walls, and landscaping. Although there would be the potential to generate dust and odors from ground-disturbing activities and the use of heavy equipment using diesel fuel, the impact would be less than significant due to the limited area and duration required for the construction of such improvements. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions. Composting operations would be an allowable use. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. The implementation of enclosures and maintenance of the existing collection facilities would not result in an increase in odors. The construction of solid walls and enclosures would not result in an increase of odors from the collection facilities. The requirements for the storage of materials, cleaning, and maintenance would result in reduced odors. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to air quality in relation to resulting in other emissions (such as those leading to odors adversely affecting a substantial number of people).

Although the Green Zones Program is not anticipated to result in significant impacts to air quality in relation to exposing people to other emissions, such as odors, and although it is anticipated that the long-term impact of the proposed program would result in an improvement to air quality, this issue area is being carried forward for further analysis to ensure that the findings will be consistent and in alignment with the findings of the Health Impact Assessment.

2.4. BIOLOGICAL RESOURCES

This analysis is undertaken to determine if the proposed program may have a significant impact on biological resources, thus requiring the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State CEQA Guidelines.¹ The analysis covers all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated through a query of the U.S. Fish and Wildlife Service (USFWS) Information for Planning and Consultation (IPaC) database,² the California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDB),³ the California Native Plant Society (CNPS) Electronic Inventory,⁴ and a review of published and unpublished literature germane to biological resources potentially affected by the proposed program. The potential for impacts to biological resources has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, *Project Description*, Table 1.IV-1, *Planning and Permitting Requirements*, and Table 1.IV-2, *Development Standards*). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment, including the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). In this analysis, the project footprint of the Green Zones program is hereafter referred as “Zoning Designation with Revision Area.” Although the tables and figures show the footprint of the Zoning Designation with Revision Area, each element was analyzed individually to determine its potential for significant impacts to biological resources.

	<i>Potentially Significant Impact</i>	<i>Less than Significant Impact with Mitigation Incorporated</i>	<i>Less than Significant Impact</i>	<i>No Impact</i>
Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife (CDFW) or U.S. Fish and Wildlife Service (USFWS)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

- a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife (CDFW) or U.S. Fish and Wildlife Service (USFWS)?

Existing Conditions

A query of the CNDDDB resulted in 32 federally-listed threatened or endangered and 10 State-listed rare, threatened, or endangered species whose historic range includes the areas associated with the County land use zoning designation revisions (Table 2.4-1, *Listed Species Whose Range Includes the Zoning Designation with Revision Area*). Of the 32 federally listed species, designated or proposed critical habitat for 13 species overlaps with the Zoning Designation with Revision Area (Table 2.4-2, *Acres of Critical Habitat inside Zoning Designation with Revisions Area*; Figure 2.4.1, *Critical Habitat*). A further 138 sensitive species recognized by the USFWS as species of concern, by the CDFW as California species of special concern, by the Bureau of Land Management, by the United States Forest Service, or by the Western Bat Working Group also are known to previously occur within the boundaries of the proposed program (Table 2.4-3, *Sensitive Species Whose Range Includes the Zoning Designation with Revision Area*).

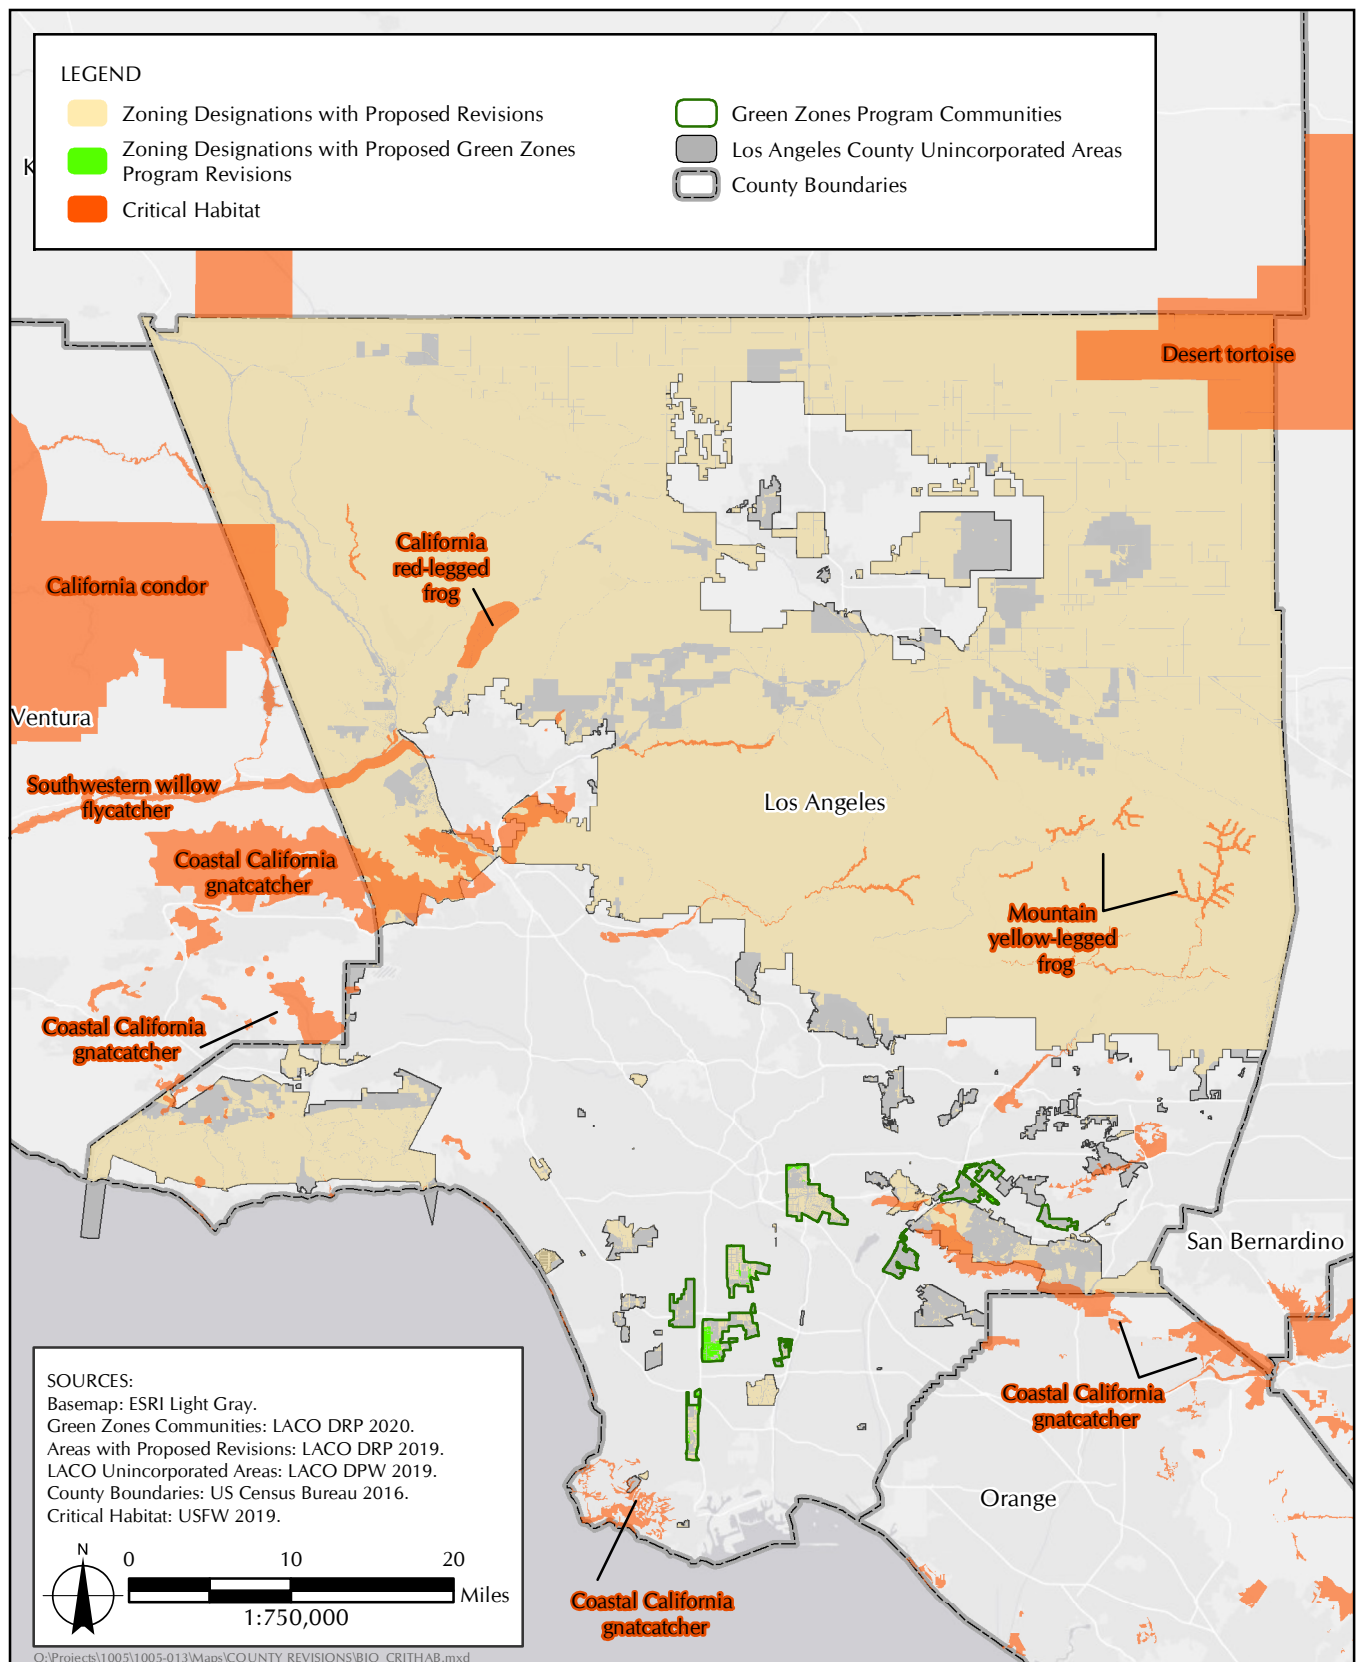

FIGURE 2.4-1
Critical Habitat

Implementation of the proposed program would not affect the CEQA process and would instead impose stricter regulations to certain land use areas. Although industrial use areas are typically situated in highly urbanized areas where disturbance and human activity generally preclude suitable habitat for listed or sensitive species, there is the unlikely possibility that a listed species could reside within the boundaries of the proposed program and be impacted by the work activities. In the unlikely event that a federally or state listed species is found to be present at any of the facilities to which the Zoning Designation Revisions apply, the revisions would neither allow nor facilitate the take of any listed species.

Number of State and Federal Sensitive Species	68	5	9	19	26	2	9

Threshold of Significance

A significant impact would occur if the proposed program caused the take of a state or federally listed or sensitive species, or altered the physical landscape, either directly or indirectly, in such a way that the habitats of any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS were altered in a way that would affect the species ability to survive and reproduce in these environments.

The proposed program would result in potentially significant impacts to biological resources in relation to having a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or the USFWS.

Element 1 – Green Zone Districts

Green Zone Districts would result in potentially significant impacts, either directly or through habitat modifications, to species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the USFWS or CDFW. Nine species are known to historically occur within the boundaries of the Green Zone Districts (one amphibian, four plants, two mammals, two reptiles). The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in potentially significant impacts. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum floor area ratio (FAR) requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, ~~27~~ 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, ~~14~~ 45 of the ~~27~~ 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to ~~7~~ 10 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the implementation of these measures would differ from existing conditions, as there would be modifications and alterations to existing industrial land uses. As a result, there is the potential for significant impacts, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or the U.S. Fish and Wildlife Service, requiring the consideration of mitigation measures and alternatives.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in potentially significant impacts, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in close proximity to existing industrial uses the zones where they are located. The existing zoning designations include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new

development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space. In the case of updated standards for new sensitive uses, the construction of these measures would differ substantially from existing conditions, such that they would potentially results in significant impacts. However unlikely, species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS could be impacted. As a result, there is the potential for significant impacts, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS, requiring the consideration of mitigation measures and alternatives.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in potentially significant impacts to species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls for screening when not enclosed, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning, and maintenance, and operation standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. There is no conversion of proposed or designated critical habitat that would occur as a result of the Recycling and Waste Management Revisions. Although unlikely, species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS could be significantly impacted by the construction of fencing, solid walls, paving, and landscaping barriers, thus requiring the consideration of mitigation measures and alternatives.

The Supermarket Accessory Recycling Collection Centers revisions would result in potentially significant impacts to species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or the USFWS. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire

lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. However unlikely, species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or the USFWS could live in or near these areas and could be impacted by the inclusion of landscape areas and fencing or screening walls, requiring the consideration of mitigation measures and alternatives.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in potentially significant impacts to species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or the USFWS. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. Although unlikely, species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or the USFWS could reside in these areas and be impacted, requiring the consideration of mitigation measures and alternatives.

- b) Have a substantial adverse effect on any sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS?**

Existing Conditions

The boundaries of the proposed program overlap with roughly 62,000 acres of state or federally designated natural communities, such as a Mojave riparian forest and California walnut woodlands (Table 2.4-4, *Acres of State-Designated Sensitive Habitats in the Zoning Designation with Revision Area Threshold of Significance*). Due to the high levels of disturbance and human activity, it is unlikely that any of these sensitive communities will be directly present at the facilities that the proposed program pertains to. However, these communities do have the potential to be located nearby and could be either indirectly or directly affected by the alterations to the landscape. If riparian or sensitive natural communities are found to be present at these facilities, the revisions would neither allow or facilitate the conversion of riparian habitat or any other sensitive natural communities and which would impact their continued existence. The inclusion of the landscaping barriers, enclosures, and paving has the potential to alter the current existing conditions by changing both the amount and availability of water, or other resources needed for the communities to survive. Ultimately, this could result in significant impacts to biological resources regarding riparian habitat or any other sensitive natural community provided protection under federal, state, and local laws, regulations, policies or plans, requiring the consideration of mitigation measures and alternatives.

**TABLE 2.4-4
ACRES OF STATE-DESIGNATED SENSITIVE HABITATS IN
THE ZONING DESIGNATION WITH REVISION AREA**

Habitat Type	Zoning Designation with Revision Area (acres)
California walnut woodland	2,234.89
Canyon live oak ravine forest	4,776.24
Mainland cherry forest	72.98
Mojave riparian forest	947.62
Riversidian alluvial fan sage scrub	564.65
Southern coast live oak riparian forest	5,259.65
Southern cottonwood willow riparian forest	6,283.14
Southern mixed riparian forest	1,725.01
Southern riparian forest	98.46
Southern riparian scrub	2,640.78
Southern sycamore alder riparian woodland	29,882.26
Southern willow scrub	1,370.36
Valley oak woodland	6,580.99
Total	62,437.04

Threshold of Significance

A significant impact would occur if the proposed program altered the physical landscape, either directly or indirectly, in such a way that the sensitive natural communities were irreparably damaged, and that their continued existence was threatened.

Impact Analysis

The proposed program would potentially result in significant impacts to biological resources regarding riparian habitat or any other sensitive natural community provided protection under federal, state, and local laws, regulations, policies or plans.

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS). The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 ~~28~~ parcels are proposed for a zone change from M-2 to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 ~~45~~ of the 27 ~~28~~ parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 ~~40~~ years of adoption of the Ordinance.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in impact to sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS). The Green Zone Districts do not overlap with any areas of riparian or state sensitive natural communities and there is no conversion of aquatic or riparian habitat that would occur as a result of the Green Zone Districts (Table 2.4-4). Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impact. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in a potentially significant impact to sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS). Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in close proximity to existing industrial uses the zones where they are located. The existing zoning designations include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would differ substantially from existing conditions, such that they would cause an impact to sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS). The inclusion of additional landscaping and fencing could result in a modified environment and could lead to impacts to sensitive natural communities that overlap with the boundaries of the zone revisions (Table 2.4-4). Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would potentially result in significant impacts to biological resources regarding sensitive natural communities, requiring the consideration of mitigation measures and alternatives.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in potentially significant impacts to sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS). The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls for screening when not enclosed, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping

and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. Riparian habitats and other sensitive habitats are unlikely to occur in these heavily disturbed and modified areas. If riparian or sensitive habitat is found to be present at these facilities, the revisions would neither allow or facilitate the conversion of riparian habitat or any other sensitive natural communities and which would impact their continued existence. The inclusion of the landscaping barriers, enclosures, and paving has the potential to alter water flow and availability, resulting in significant impacts to biological resources regarding riparian habitat or any other sensitive natural community provided protection under federal, state, and local laws, regulations, policies or plans, requiring the consideration of mitigation measures and alternatives.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to biological resources regarding riparian habitat or any other sensitive natural community provided protection under federal, state, and local laws, regulations, policies or plans. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be constructed established on existing parking lots, and no new structures will be built. Riparian habitats are unlikely to occur in these heavily disturbed and modified areas. If riparian or sensitive habitat is found to be present at these facilities, the revisions would neither allow or facilitate the conversion of riparian habitat or any other sensitive natural communities and which would impact their continued existence. There would be no impacts to biological resources regarding riparian habitat or any other sensitive natural community provided protection under federal, state, and local laws, regulations, policies or plans. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in potentially significant impacts to biological resources regarding riparian habitat or any other sensitive natural community provided protection under federal, state, and local laws, regulations, policies, or plans. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. Riparian habitats are unlikely to occur in these heavily disturbed and modified areas. If riparian or sensitive habitat is found to be present at these facilities, the revisions would neither allow or facilitate the conversion of riparian habitat or any other

sensitive natural communities and which would impact their continued existence. There is the potential to result in significant impacts to biological resources regarding riparian habitat or any other sensitive natural community provided protection under federal, state, and local laws, regulations, policies or plans, requiring the consideration of mitigation measures and alternatives.

- c) **Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.) through direct removal, filling, hydrological interruption, or other means?**

Existing Conditions

The boundaries of the proposed program overlap with nearly 50,000 acres of either state or federally protected wetlands (Table 2.4-5, *Wetland Habitats in the Zoning Designation with Revision Area*). Given that the proposed program generally pertains to facilities in areas that are already highly urbanized and disturbed it is unlikely that any federally protected wetland will be directly affected. However, these wetland habitats do have the potential to be located nearby and could be either indirectly or directly affected by the alterations to the landscape. If wetland habitats are found to be present at these facilities, the revisions would neither allow or facilitate their conversion and which would impact their continued existence. The inclusion of the landscaping barriers, enclosures, and paving has the potential to alter the current existing conditions by changing both the amount and availability of water needed for the wetland habitats to persist. Ultimately, this could result in significant impacts to biological resources regarding state or federally protected wetlands.

**TABLE 2.4-5
WETLAND HABITATS IN THE ZONING DESIGNATION WITHIN REVISION AREAS**

Habitat Type	Zoning Designation with Revision Area (acres)
Estuarine and marine deepwater	371.44
Estuarine and marine wetland	32.99
Freshwater emergent wetland	1,378.59
Freshwater forested/shrub wetland	7,877.48
Freshwater pond	4,697.59
Lake	17,848.53
Riverine	18,033.74
Total	50,240.37

Threshold of Significance

A significant impact would occur if proposed program altered the physical landscape, either directly or indirectly, in such a way that the sensitive natural communities were irreparably damaged or altered and impact their continued existence.

Impact Analysis

The proposed program would result in potentially significant impacts to biological resources regarding federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. The National Wetlands Inventory (NWI) was reviewed and there are state or federally protected wetlands likely to be impacted by the proposed program (Table 2.4-5). The revisions to the zoning caused by the proposed program would be solely limited to previously developed areas used for industrial purposes, and recycling facilities and would not impact any state or federally protected wetlands or any other waters of the United States. The proposed program would generally apply to County industrial and commercial zones. Although “natural” waterways are not typically found in these highly modified areas, water is conveyed through these areas through a variety of means such as through channels, ditches, or storm drains. Often these are subject to the jurisdiction of permitting agencies such as CDFW and the Regional Water Quality Control Board (RWQCB). All construction related activities would center around previously developed facilities and would neither develop nor promote the development of these waterways. However, as shown in Table 2.4-5, several wetland habitat types exist in areas subject to the Zoning Designation with Revision Area, including Estuarine and Marine

Deepwater, Freshwater Emergent Wetland, Freshwater Forested/Shrub Wetland, Freshwater Pond, Lake, and Riverine. Therefore, the Zoning Designation with Revision Area may result in significant impacts to biological resources regarding federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means, requiring the consideration of mitigation measures and alternatives.

Element 1 – Green Zone Districts

Green Zone Districts would result in potentially significant impacts to state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.). The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in potentially significant impacts. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. In total 26.7 acres of wetland habitat overlap into the boundaries of the Green Zone District. It is unlikely that state or federally protected wetlands that are within of the boundaries of the Green Zone Districts would be impacted by the zone revisions. If wetland habitats were found at or near the facilities the zoning ordinance would not facilitate impacts to any protected wetlands. Although unlikely, the proposed program may result in significant impacts to biological resources regarding federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means, requiring the consideration of mitigation measures and alternatives.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in potentially significant impacts to state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.). Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in close proximity to existing industrial uses the zones where they are located. The existing zoning designations include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school

yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity adjacent to or adjoining~~ existing industrial, recycling or solid waste, or vehicle-related uses. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would potentially impact wetland habitats. As shown in Table 2.4-5, several wetland habitat types exist in areas subject to the proposed program including Estuarine and Marine Deepwater, Freshwater Emergent Wetland, Freshwater Forested/Shrub Wetland, Freshwater Pond, Lake, and Riverine. Therefore, the proposed program may result in significant impacts to biological resources regarding federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means, requiring the consideration of mitigation measures and alternatives.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in potentially significant impacts to state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.). The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls for screening when not enclosed, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ Although wetlands habitats overlap with the recycling and waste management revisions, the zoning designation applies only to previously existing facilities and is unlikely to impact any state or federally protected wetlands. However, as shown in Table 2.4-5, several wetland habitat types exist in areas subject to the proposed program including Estuarine and Marine Deepwater, Freshwater Emergent Wetland, Freshwater Forested/Shrub Wetland, Freshwater Pond, Lake, and Riverine. Therefore, the proposed program may result in significant impacts to biological resources regarding federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means, requiring the consideration of mitigation measures and alternatives.

The Supermarket Accessory Recycling Collection Centers revisions would result in potentially significant impacts to state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.). The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property

lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. The revisions would concentrate on supermarket recycling centers would neither promote or allow for the development of any state or federally protected wetlands and would not impact these resources. However, as shown in Table 2.4-5, several wetland habitat types exist in areas subject to the proposed program including Estuarine and Marine Deepwater, Freshwater Emergent Wetland, Freshwater Forested/Shrub Wetland, Freshwater Pond, Lake, and Riverine. Therefore, the proposed program may result in significant impacts to biological resources regarding federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means, requiring the consideration of mitigation measures and alternatives.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in potentially significant impacts to state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.). Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. The revisions would concentrate on storage enclosures and would neither promote or allow for the development of any state or federally protected wetlands and would not impact these resources. However, as shown in Table 2.4-5, several wetland habitat types exist in areas subject to the Storage Enclosures for Recycling and Solid Waste Revisions including estuarine and marine deepwater, freshwater emergent wetland, freshwater forested/shrub wetland, freshwater pond, lake, and riverine. Therefore, the proposed program may result in significant impacts to biological resources regarding federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means, requiring the consideration of mitigation measures and alternatives.

- d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?**

Existing Conditions

Multiple SEAs overlap the boundaries of the Zoning Designation with Revision Area (Figure 2.4-2, *Significant Ecological Areas within the Proposed Program Area*; Table 2.4-6, *Acres of SEA inside Zoning Designation with Revision Area*). However, within these SEAs, the proposed program is generally limited to only highly modified areas throughout the unincorporated areas of the County. None of these areas would be expected to funnel wildlife through the area; nor is there any contiguous natural habitat through which wildlife would be expected to move.

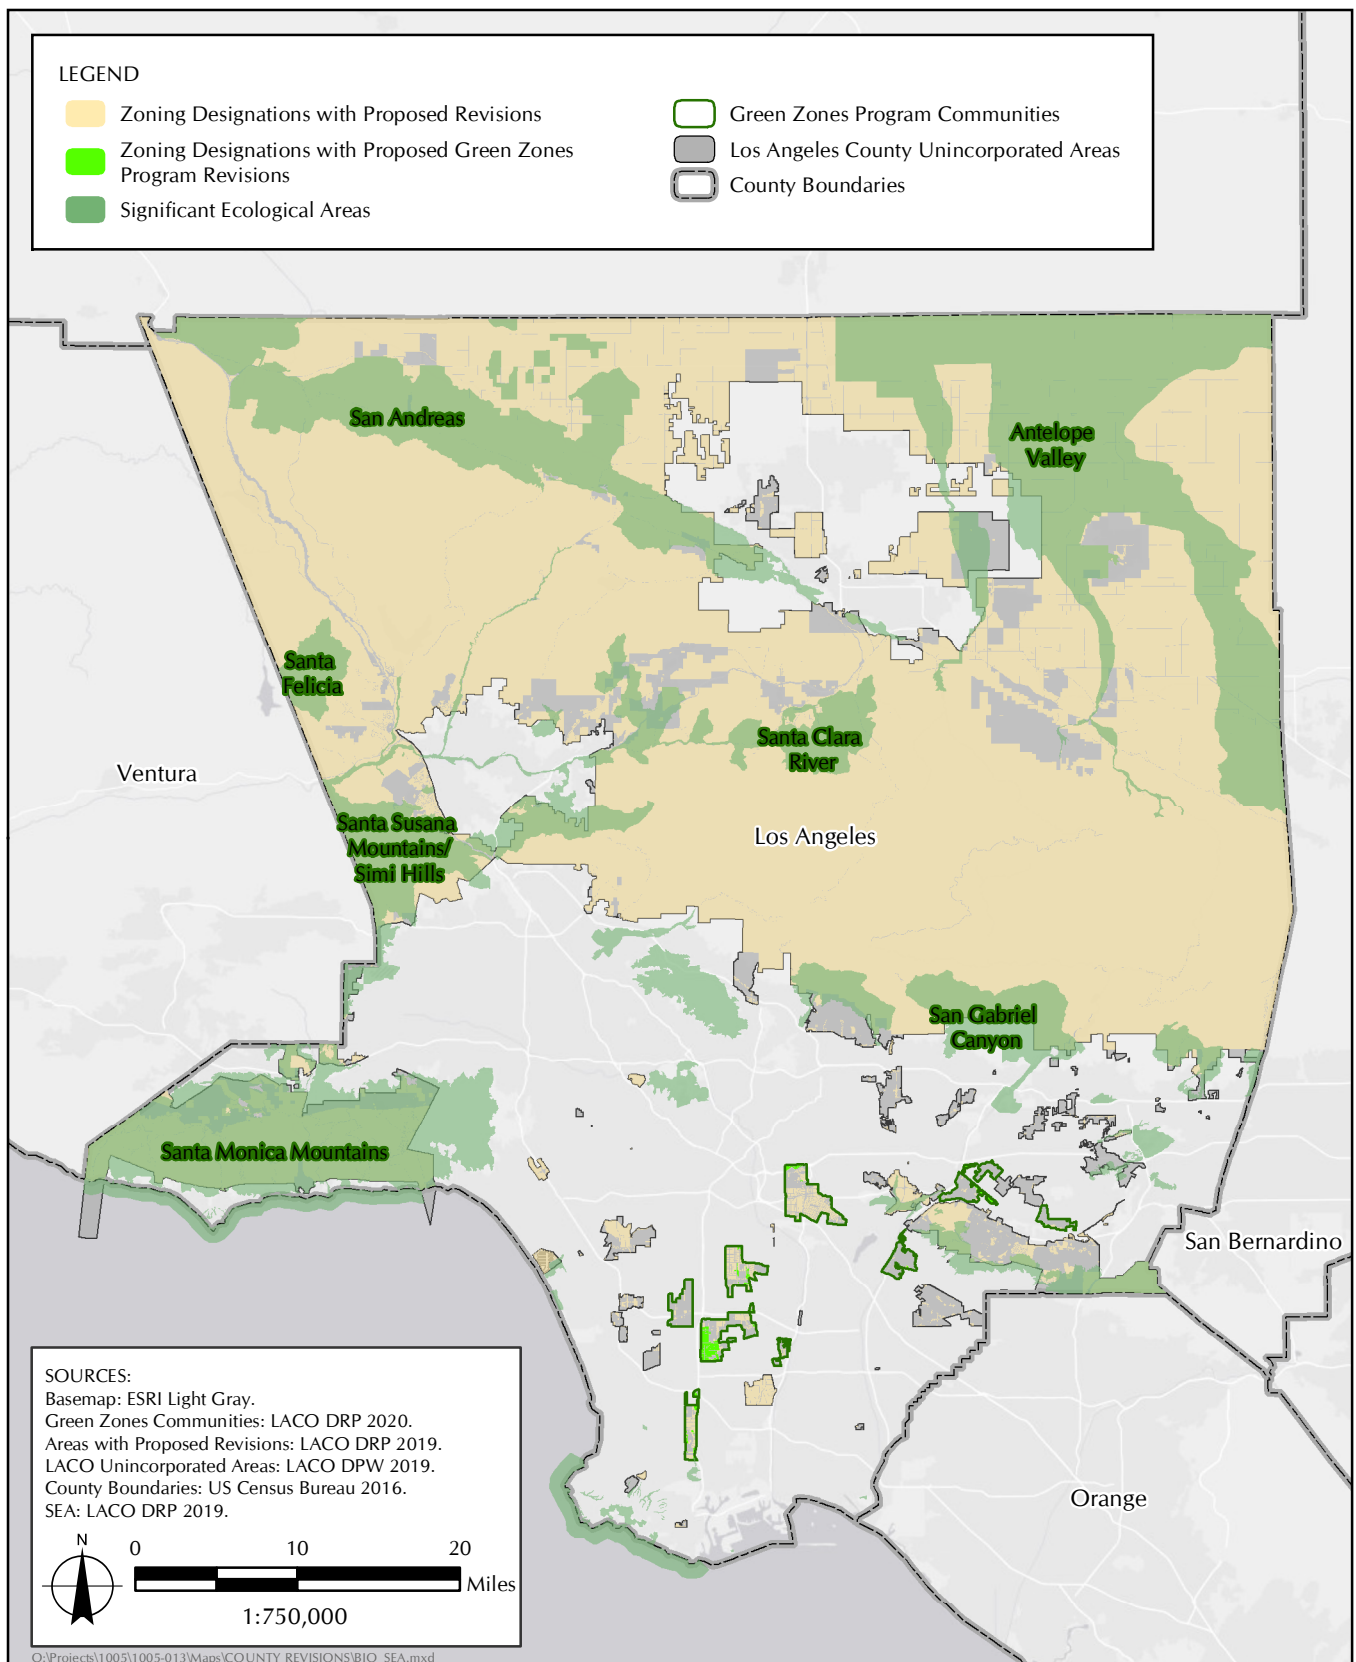

FIGURE 2.4-2
Significant Ecological Areas

**TABLE 2.4-6
ACRES OF SEA INSIDE ZONING DESIGNATION WITH REVISION AREA**

SEA	Zoning Designation with Revision Area (number of parcels)
Altadena Foothills and Arroyos	6,429.26
Antelope Valley	175,377.66
Ballona Wetlands	0.01
Cruzan Mesa Vernal Pools	238.32
East San Gabriel Valley	82.13
Harbor Lake Regional Park	7.15
Joshua Tree Woodlands	5,306.57
Malibu Coastline	4.61
Puente Hills	7,594.26
Rio Hondo College Wildlife Sanctuary	81.41
San Andreas	90,088.24
San Dimas Canyon/San Antonio Wash	3,602.81
San Gabriel Canyon	14,767.09
Santa Clara River	36,538.15
Santa Felicia	9,652.22
Santa Monica Mountains	57,210.97
Santa Susana Mountains/Simi Hills	24,518.53
Valley Oaks Savannah	157.15
Total	431,656.53

Threshold of Significance

An impact would occur if proposed program altered the physical landscape of wildlife corridors and native nurseries, either directly or indirectly, in such a way that the native and migratory wildlife species could no longer utilize these areas for their continued survival.

Impact Analysis

The proposed program would result in less than significant impacts to biological resources regarding the movement of any native resident or migratory fish and/or wildlife species or established native resident or migratory wildlife corridors, or native wildlife nursery sites. Therefore, impacts would be less than significant, and no mitigation or further analysis is warranted.

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts to biological resources regarding the movement of any native resident or migratory fish and/or wildlife species or established native resident or migratory wildlife corridors, or native wildlife nursery sites. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall

screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to biological resources regarding the movement of any native resident or migratory fish and/or wildlife species or established native resident or migratory wildlife corridors, or native wildlife nursery sites). Although 7.15 acres of SEA overlap into the Green Zone Districts, these areas are highly anthropogenically modified and would likely not be conducive for wildlife corridor movement or native nursery sites. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to biological resources regarding the movement of any native resident or migratory fish and/or wildlife species or established native resident or migratory wildlife corridors, or native wildlife nursery sites. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to biological resources regarding the movement of any native resident or migratory fish and/or wildlife species or established native resident or migratory wildlife corridors, or native wildlife nursery sites. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in close proximity to existing industrial uses the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would impact biological resources regarding the movement of any native resident or migratory fish and/or wildlife species or established native resident or migratory wildlife corridors, or native wildlife nursery sites. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not allow nor promote development in these wildlife corridors, SEAs, or native nursery sites. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to biological resources regarding the movement of any native resident or migratory fish and/or wildlife species or established native resident or migratory wildlife corridors, or native wildlife nursery sites. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to

a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls for screen when not enclosed, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. The revisions to recycling and waste management centers pertain solely to storage enclosures used for recycling and solid waste and would not affect any of the SEAs that overlap within the zone's revision. The revisions do not allow nor promote development in these wildlife corridors, SEAs, or native nursery sites. The Recycling and Waste Management Revisions would ultimately reduce the amount of development allowed with SEAs. Therefore, there would be less than significant impacts, and no mitigation or further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts to biological resources regarding the movement of any native resident or migratory fish and/or wildlife species or established native resident or migratory wildlife corridors, or native wildlife nursery sites. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. These areas are highly anthropogenically modified and would likely not be conducive for wildlife corridor movement or native nursery sites. Therefore, there would be less than significant impacts to biological resources regarding the movement of any native resident or migratory fish and/or wildlife species or established native resident or migratory wildlife corridors, or native wildlife nursery sites, and no mitigation or further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to biological resources regarding the movement of any native resident or migratory fish and/or wildlife species or established native resident or migratory wildlife corridors, or native wildlife nursery sites. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall

height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development and would not substantially alter the existing conditions. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to biological resources regarding the movement of any native resident or migratory fish and/or wildlife species or established native resident or migratory wildlife corridors, or native wildlife nursery sites. No further analysis is warranted.

- e) **Convert oak woodlands (as defined by the state, oak woodlands are oak stands with greater than 10% canopy cover with oaks at least 5 inch in diameter measured at 4.5 feet above mean natural grade) or other unique native woodlands (juniper, Joshua, southern California black walnut, etc.)?**

Existing Conditions

The boundaries of the proposed program overlap with roughly 62,000 acres of state or federally designated natural communities, which includes unique native woodlands (Table 2.4-4). Due to the high levels of disturbance and human activity, it is unlikely that any of these woodlands will be directly present at the facilities that the proposed program pertains to. However, these woodlands do have the potential to be located nearby and could be either indirectly or directly affected by the alterations to the landscape caused by the proposed program. If oak or native woodlands are found to be present at these facilities, the revisions would neither allow or facilitate the conversion of any woodland habitat and which would impact their continued existence. The inclusion of the landscaping barriers, enclosures, and paving has the potential to alter the current existing conditions by changing both the amount and availability of water and other resources needed for the woodlands to survive. Ultimately, this would result in significant impacts to biological resources oak woodlands and other unique native woodlands.

Threshold of Significance

An impact would occur if the proposed program altered the physical landscape, either directly or indirectly, in such a way that the sensitive natural communities were irreparably damaged, and that their continued existence was threatened.

Impact Analysis

The proposed program would potentially result in significant impacts to biological resources regarding oak woodlands or other unique native woodlands provided protection under federal, state, and local laws, regulations, policies or plans.

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to oak woodlands (as defined by the state, oak woodlands are oak stands with greater than 10 percent canopy cover with oaks at least 5 inch in diameter measured at 4.5 feet above mean natural grade) or other unique native woodlands (juniper, Joshua, southern California black walnut, etc.). The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to oak woodlands. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage

standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 years of adoption of the Ordinance. The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result into oak woodlands or other unique native woodlands. While other elements of the Zoning Designation with Revision Area overlap into sensitive habitats, the Green Zone District Area does not overlap with any areas of oak woodland or unique native woodlands (Table 2.4-4). Therefore, there would be no impact. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in potentially significant impacts to woodlands (as defined by the state, oak woodlands are oak stands with greater than 10 percent canopy cover with oaks at least 5 inch in diameter measured at 4.5 feet above mean natural grade) or other unique native woodlands (juniper, Joshua, southern California black walnut, etc.). Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in close proximity to existing industrial uses the zones where they are located. The existing zoning designations include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures could alter the existing conditions in such a way that they would cause an impact to oak woodlands or other unique native woodlands. Although the zoning ordinance would overlap with areas of oak woodland or unique native woodlands, it would neither facilitate nor promote their development in such a way that would impact their permanent existence. (Table 2.4-4). Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would potentially result in significant impacts to biological resources regarding oak woodlands and other unique native woodlands, requiring the consideration of mitigation measures and alternatives.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in potentially significant impacts to oak woodlands (as defined by the state, oak woodlands are oak stands with greater than 10 percent canopy cover with oaks at least 5 inch in diameter measured at 4.5 feet above mean natural grade) or other unique native woodlands (juniper, Joshua, southern California black walnut, etc.). The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs

and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. Riparian habitats are unlikely to occur in these heavily disturbed and modified areas. If oak woodlands or other unique native woodlands are found to be present at these facilities, the revisions would neither allow or facilitate the conversion of riparian habitat or any other sensitive natural communities and which would impact their continued existence. However, there is the potential for significant impacts to biological resources regarding oak woodlands and other unique native woodlands, requiring the consideration of mitigation measures and alternatives.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to biological resources regarding oak woodlands (as defined by the state, oak woodlands are oak stands with greater than 10 percent canopy cover with oaks at least 5 inch in diameter measured at 4.5 feet above mean natural grade) or other unique native woodlands (juniper, Joshua, southern California black walnut, etc.). The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be constructed established on existing parking lots, and no new structures will be built, and would not significantly alter the existing conditions. Oak and other unique native woodlands are unlikely to occur in these heavily disturbed and modified areas. If a woodland is found to be present at these facilities, the revisions would neither allow or facilitate the conversion of oak woodland habitat or any other unique native woodlands, which would impact their continued existence. As such, there would be no impact. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to biological resources regarding oak woodlands (as defined by the state, oak woodlands are oak stands with greater than 10 percent canopy cover with oaks at least 5 inch in diameter measured at 4.5 feet above mean natural grade) or other unique native woodlands (juniper, Joshua, southern California black walnut, etc.). Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. Native woodlands are unlikely to occur in these heavily disturbed and modified areas. If oak woodlands or native woodlands are found to be present at these facilities, the revisions would neither allow nor facilitate the conversion of

the woodland habitat which would impact their continued existence. Therefore, there would be no impact. No further analysis is warranted.

- f) **Conflict with any local policies or ordinances protecting biological resources, including Wildflower Reserve Areas (L.A. County Code, Title 12, Ch. 12.36), the Los Angeles County Oak Tree Ordinance (L.A. County Code, Title 22, Ch. 22.174), the Significant Ecological Areas (SEAs) (L.A. County Code, Title 22, Ch. 102), Specific Plans (L.A. County Code, Title 22, Ch. 22.46), Community Standards Districts (L.A. County Code, Title 22, Ch. 22.300 et seq.), and/or Coastal Resource Areas (L.A. County General Plan, Figure 9.3)?**

Existing Conditions

Oak trees and countless wildflower species are endemic and integrals part of the LA County vegetation community and can be found throughout the county. As the urban sprawl reached the outer limits of LA County, local policies and ordinances such as the Los Angeles County Oak Tree Ordinance, were put into affect to preserve the remaining biological resources. As such any construction that happens as a result of the proposed program would be required to abide by the rules, regulations, and mitigations set forth by any local policies or ordinance designed to protect biological resources.

Threshold of Significance

An impact would occur if the proposed program facilitated any construction that conflicted with local policies or ordinances protecting biological resources, and ultimately resulted in the loss of protected species or degradation of habitat for protected oak trees, wildflowers, or other biological resources.

Impact Analysis

The proposed program would result in no impacts to biological resources protected under local policies or ordinances such as the LA County Oak Tree Ordinance or conflict with SEA's.

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to biological resources with regard to conflicts with policies or ordinances protecting biological resources. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Any oak trees or protected trees that are anticipated to be removed or damaged would have to comply with policies or ordinances such as the Los Angeles County Oak Tree Ordinance, and as such would result in no impact with regards to conflicts with policies or ordinances protecting biological resources. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

Under Los Angeles County Code 22.176.030 a person shall not cut, destroy, remove, relocate, inflict damage, or encroach into a protected zone of any tree of the oak genus which is

- (a) 25 inches or more in circumference (eight inches in diameter) as measured 4.5 feet above mean natural grade; in the case of an oak with more than one trunk, whose combined circumference of any two trunks is at least 38 inches (12 inches in diameter) as measured four and one half feet above mean natural grade, on any lot or parcel of land within the unincorporated area of Los Angeles County.
- (b) any tree that has been provided as a replacement tree, pursuant to Section 22.56.2180, on any lot or parcel of land within the unincorporated area of Los Angeles County, unless an oak tree permit is first obtained.

Under the appropriate permit, oak trees may be relocated or removed so long as the applicant agrees to a minimum of 2:1 replacement ratio.⁵

Oak trees, and other trees, provide nesting habitats for native birds, and any removal has the potential to disrupt avian species' ability to reproduce. The Migratory Bird Treaty Act (MBTA) and Sections 3503, 3503.5, and 3513 of the California Fish and Game Code prohibit the take of all birds and their active nests including raptors and other migratory nongame birds.^{6,7} In the event that trees are removed, including oak trees, the proposed program would have to abide by the rules, regulations, and mitigations set forth by the MBTA and California Fish and Game Code. Therefore, the proposed program would have no impacts to tree preservation policies. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to local policies or ordinances protecting biological resources. Any oak trees or protected trees that are anticipated to be removed or damaged would have to comply with policies or ordinances such as the Los Angeles County Oak Tree Ordinance, and as such would result in no impact. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in close proximity to existing industrial uses the zones where they are located. The existing zoning designations include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would differ substantially from existing conditions, such that they would have potentially significant impacts to local policies or ordinances protecting biological resources, particularly the Los Angeles County Oak Tree Ordinance. All removed or relocated oak trees that fall under the requirements of Los Angeles County Code 22.176.030, would be subject to a minimum of 2:1 replacement ratio and appropriate permitting. Oak trees, and other trees provide essential nesting habitat for nesting birds, and any removal has the potential to disrupt avian species' ability to reproduce. The MBTA and Sections 3503, 3503.5, and 3513 of the California Fish and Game

⁵ L.A.C.C. § 22.176.070.6a.

⁶ Migratory Bird Treaty Act, 50 § § FR 13710 (Apr. 5, 1985).

⁷ California Fish and Game Code §§ 3503 & 3513 (2019).

Code prohibit the take of all birds and their active nests including raptors and other migratory nongame birds. In the event that trees are removed, including oak trees, the proposed Recycling and Waste Management Revisions would have to abide by the rules, regulations, and mitigations set forth by the MBTA and California Fish and Game Code. Therefore, the proposed program would have no impacts to tree preservation policies. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts to local policies or ordinances protecting biological resources. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls for screen when not enclosed, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs.~~ The construction of improvements such as landscaping barriers, paving and fencing would have potentially significant impacts to local policies or ordinances protecting biological resources, particularly the Los Angeles County Oak Tree Ordinance. All removed or relocated oak trees that fall under the requirements of Los Angeles County Code 22.176.030, would be subject to a minimum of 2:1 replacement ratio and appropriate permitting. Oak trees, and other trees provide essential nesting habitat for nesting birds, and any removal has the potential to disrupt avian species' ability to reproduce. The MBTA and Sections 3503, 3503.5, and 3513 of the California Fish and Game Code prohibit the take of all birds and their active nests including raptors and other migratory nongame birds. In the event that trees are removed, including oak trees, the proposed Recycling and Waste Management Revisions would have to abide by the rules, regulations, and mitigations set forth by the MBTA and California Fish and Game Code. Therefore, the proposed program would have no impacts to tree preservation policies. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in no significant impacts to local policies or ordinances protecting biological resources. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The

CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. As these revisions pertain solely to recycling collection centers used for recycling and solid waste, there would be no impact to any local policies or ordinances protecting biological resources. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to local policies or ordinances protecting biological resources. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. As these revisions pertain solely to storage enclosures used for recycling and solid waste, there would be no impact to any local policies or ordinances protecting biological resources. No further analysis is warranted.

g) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved state, regional, or local habitat conservation plan?

Existing Conditions

HCP's and NCCP's are protected areas that are designed to protect biodiversity and connect large blocks of federal and other publicly owned land to ensure species are able to utilize the most expansive range of habitats available.⁸ Within the boundaries of the proposed program, there are no HCPs or NCCPs with boundaries that intersect with any of the elements within the proposed program site (Figure 2.4.3, *HCP and NCCP within Proposed Program Area*).

Threshold of Significance

An impact would occur if the proposed program facilitated any construction that would threaten the continued existence, or overall ecological health of any adopted HCP's or NCCP's, or other approved state, regional, and local habitat conservation plans.

Impact Analysis

The proposed program would result in no impacts to any adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved state, regional, or local habitat conservation plan.

Element 1 – Green Zone Districts

Green Zone Districts would result in no impact to the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved state, regional, or local habitat conservation plan. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impact. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 ~~28~~ parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 ~~45~~ of the 27 ~~28~~ parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of

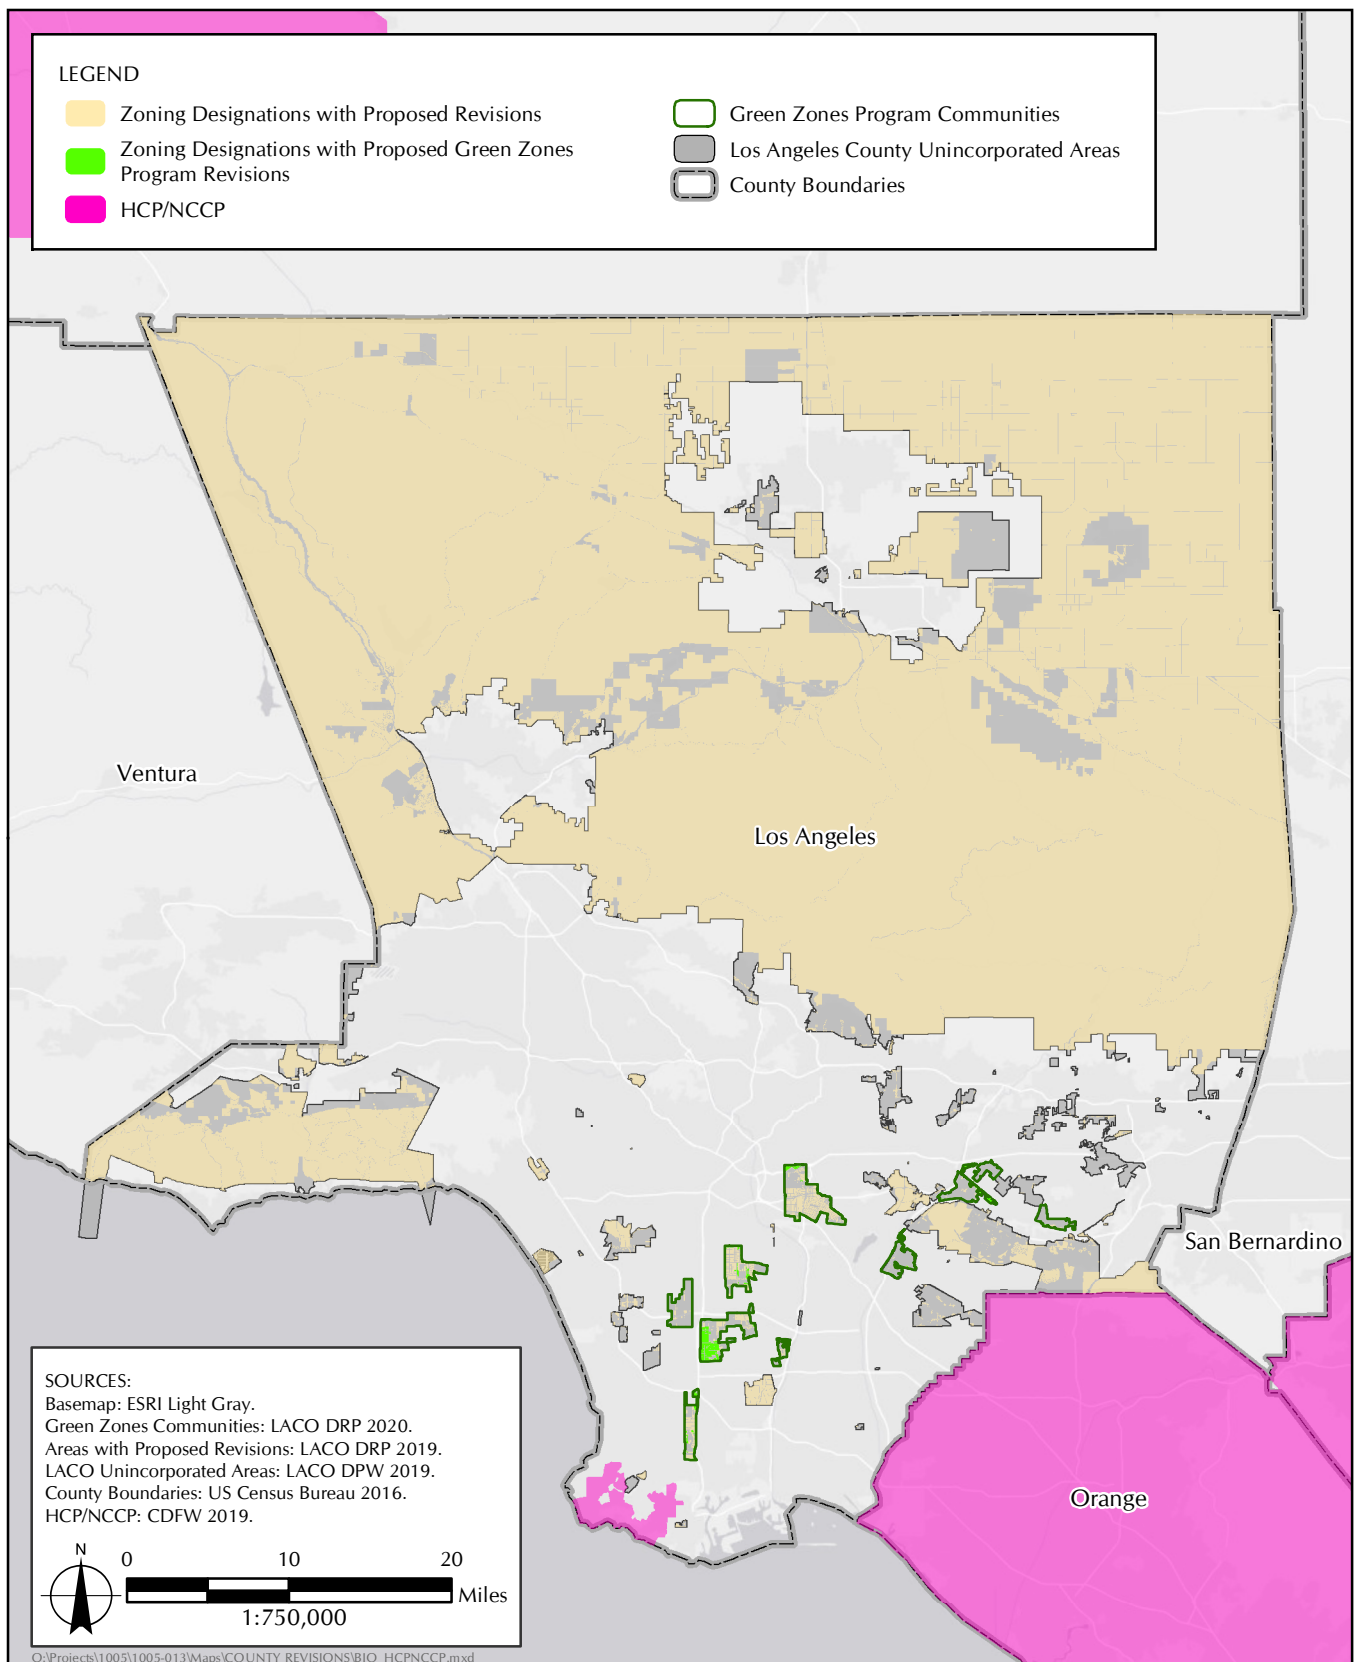

FIGURE 2.4-3
HCPs and NCCPs

the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would impact any HCP or NCCPs. There are no HCPs or NCCPs with boundaries that intersect with any of the elements within the proposed program site (Figure 2.4.3). The proposed program would result in no impact to biological resources regarding conflicts with the provisions of an adopted HCP, NCCP,⁹ or other approved local, regional, or state habitat conservation plan. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to the provisions of an adopted HCP, NCCP, or other approved state, regional, or local habitat conservation plan. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in close proximity to existing industrial uses the zones where they are located. The existing zoning designations include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would cause any impacts to existing or proposed HCPs or NCCPs. There are no HCPs or NCCPs with boundaries that intersect with any of the elements (Figure 2.4.3). Therefore, there would be no impact. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in would result in no impacts to the provisions of an adopted HCP, NCCP, or other approved state, regional, or local habitat conservation plan. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls for screening when not enclosed, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to

⁹ California Regional Conservation Plans, October 2017 <https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=68626&inline>.

current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ There are no HCPs or NCCPs with boundaries that intersect with any of the elements within the proposed program site (Figure 2.4.3). Therefore, there would be no impact. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to the provisions of an adopted HCP, NCCP, or other approved state, regional, or local habitat conservation plan. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. There are no HCPs or NCCPs with boundaries that intersect with any of the elements within the proposed program site (Figure 2.4.3). Therefore, there would be no impact. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in would result in no impact to the provisions of an adopted HCP, NCCP, or other approved state, regional, or local habitat conservation plan. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. There are no HCPs or NCCPs with boundaries that intersect with any of the elements within the proposed program site (Figure 2.4.3). Therefore, there would be no impact. No further analysis is warranted.

2.5. CULTURAL RESOURCES

This analysis is undertaken to determine if the proposed program may have a significant impact to cultural resources, thus requiring the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State CEQA Guidelines. The analysis covers all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated with regard to the *Conservation and Natural Resource Element (Part III)* of the Los Angeles County General Plan 2035;¹ the Los Angeles County *Historic Preservation Program*;² previously published information regarding known cultural resources located within the program area, including publicly disclosed historic properties of significance listed on the National Register of Historic Places (NRHP), National Historic Landmarks database, and the California Register of Historical Resources (CRHR); and a review of the Green Zones Program.³

Eligibility for Historical and Archeological Resources to be Listed in the National Register of Historic Places

Working with State Historic Preservation Offices, Tribal Historic Preservation Offices, and Federal Preservation Offices, the National Park Service (NPS) maintains the NRHP, searchable in the National Historic Landmarks database (currently under reconstruction). This is the official list of properties that are deemed worthy of preservation. Properties listed in the NRHP tell stories that are important to a local community, the citizens of a specific state, or all Americans. Properties listed in the NRHP may be owned by private individuals, universities, nonprofits, governments, and/or corporations. To be eligible for listing in the NRHP, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Districts, sites, buildings, structures, and objects of potential significance must also possess integrity of location, design, setting, materials, workmanship, feeling, and association. A property is eligible for the NRHP if it is significant under one or more of the following criteria:

- Criterion A: Associated with events that have made a significant contribution to the broad patterns of our history; or
- Criterion B: Associated with the lives of persons significant in our past; or
- Criterion C: Embodies the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or represent a significant and distinguishable entity whose components lack individual distinction; or
- Criterion D: That have yielded, or may be likely to yield, information important in history or prehistory.

Cemeteries, birthplaces, or graves of historic figures; properties owned by religious institutions or used for religious purposes; structures that have been moved from their original locations; reconstructed historic buildings; and properties that are primarily commemorative in nature are not considered eligible for the NRHP unless they satisfy certain conditions. In general, a resource must be at least 50 years of age to be considered for listing in the NRHP, unless it satisfies a standard of exceptional importance.

Eligibility for Historical and Archeological Resources to be Listed in California Register of Historical Resources

The CRHR is an authoritative listing and guide to be used by state and local agencies, private groups, and citizens in identifying the existing historical resources of the State and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change. The criteria for eligibility for the CRHR are based upon NRHP criteria. These criteria are as follows:

¹ Conservation and Natural Resource Element (Part III), Chapter 9 - Open Space Resources, of the County of Los Angeles General plan 2035. http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

² Title 22 (Vol. I) Zoning Code Ordinance, Part 22.0124 Historic Preservation of the Los Angeles County Code.

³ Green Zones Program of Los Angeles County. Board of Supervisors, 2015. Available for download at: <http://planning.lacounty.gov/greenzones>

- Criterion 1: Associated with events that have made a significant contribution to the broad pattern of California's history and cultural heritage;
- Criterion 2: Associated with the lives of persons important in our past;
- Criterion 3: Embodies the distinctive characteristics of a type, period, region, or method construction, or represents the work of an important creative individual, or possesses high artistic value; or
- Criterion 4: Has yielded, or may be likely to yield, information important in prehistory or history.

Additionally, a historic resource eligible for listing in the CRHR must meet one or more of the criteria of significance described above and retain enough of its historic character or appearance to be recognizable as a historical resource and to convey the reasons for its significance. Historical resources that have been rehabilitated or restored may be evaluated for listing.

The CRHR consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The CRHR automatically includes the following:

- California properties listed in the NRHP (Category 1 in the State Inventory of Historical Resources) and those formally determined eligible for listing in the NRHP (Category 2 in the California Historical Resource Inventory System [CHRIS])
- California Registered Historical Landmarks from No. 077 and up
- Those California Points of Historical Interest that have been evaluated by the California Office of Historic Preservation (OHP) and have been recommended to the State Historical Resources Commission for inclusion in the CRHR

Other resources that may be nominated for listing in the CRHR include:

- Historical resources with a significance rating of Categories 3 through 5 in CHRIS (Categories 3 and 4 refer to potential eligibility for the NRHP, while Category 5 indicates a property with local significance);
- Individual historical resources;
- Historical resources contributing to historic districts; and
- Historical resources designated or listed as a local landmark.

Eligibility for County of Los Angeles Historical Landmark Designation

County of Los Angeles Historic Preservation Ordinance (*Title 22 – Planning and Zoning of the Los Angeles County Code, Part 29 of Chapter 22.52*)

22.52.3010 Purpose

The County of Los Angeles Historic Preservation Ordinance has seven established basic purposes:

- A. Enhance and preserve the distinctive historic, architectural, and landscape characteristics which represent the County's cultural, social, economic, political, and architectural history.
- B. Foster community pride in the beauty and noble accomplishments of the past as represented by the County's historic resources.
- C. Stabilize and improve property values and enhance the aesthetic and visual character and environmental amenities of the County's historic resources.
- D. Recognize the County's historic resources as economic assets.
- E. Encourage and promote the adaptive reuse of the County's historic resources.
- F. Promote the County as a destination for tourists and as a desirable location for businesses.
- G. Specify significance criteria and procedures for the designation of landmarks and Historic Districts and provide for the ongoing preservation and maintenance of landmarks and Historic Districts.

- A. Property which is more than 50 years of age may be designated as a landmark if it satisfies one or more of the following criteria:
 - 1. It is associated with events that have made a significant contribution to the broad patterns of the history of the nation, State, County, or community.
 - 2. It is associated with the lives of persons who are significant in the history of the nation, State, County, or community.
 - 3. It embodies the distinctive characteristics of a type, architectural style, period, or method of construction; or represents the work of an architect, designer, engineer, or builder whose work is of significance to the nation, State, County, or community; or possesses artistic values of significance to the nation, State, County, or community.
 - 4. It has yielded, or may be likely to yield, information important locally in prehistory or history.
 - 5. It is listed or has been formally determined eligible by the National Park Service for listing on the National Register of Historic Places, or is listed or has been determined eligible by the State Historical Resources Commission for listing on the California Register of Historical Resources.
 - 6. It is one of the largest or oldest trees of the species located in the County.
 - 7. It is a tree, plant, landscape, or other natural land feature having historical significance due to an association with a historic event, person, site, street, or structure, or because it is a defining or significant outstanding feature of a neighborhood.
- B. Property less than 50 years of age may be designated as a landmark if it meets one or more of the criteria set forth in Section 22.52.3060.A, above, and exhibits exceptional importance.
- C. The interior space of a property, or other space held open to the general public, including but not limited to a lobby, may itself be designated as a landmark or included in the landmark designation of a property if the space is more than 50 years of age and satisfies one or more of the criteria set forth in Subsection A, above, or if the space is less than 50 years of age and satisfies the requirements of Section 22.52.3060.B, above.

Related CEQA Guidance

Pursuant to CEQA, a *historical resource* is a resource listed in, or eligible for listing in, the CRHR. In addition, resources included in a local register of historic resources or identified as significant in a local survey conducted in accordance with state guidelines are also considered historical resources under CEQA, unless a preponderance of the facts demonstrates otherwise. According to CEQA, the fact that a resource is not listed in or determined eligible for listing in the CRHR, or is not included in a local register or survey, shall not preclude a Lead Agency from determining that the resource may be a historical resource as defined in PRC Section 5024.1.⁴

CEQA applies to archaeological resources when (1) the archaeological resource satisfies the definition of a historical resource or (2) the archaeological resource satisfies the definition of a “unique archaeological resource.” A unique archaeological resource is an archaeological artifact, object, or site that has a high probability of meeting any of the following criteria:⁵

- (1) The archaeological resource contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information.
- (2) The archaeological resource has a special and particular quality such as being the oldest of its type or the best available example of its type.
- (3) The archaeological resource is directly associated with a scientifically recognized important prehistoric or historic event or person

c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Disturb any human remains, including those interred outside of dedicated cemeteries?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Existing Conditions

*Historic Context.*⁶ The area making up present-day Los Angeles County was originally settled by differing groups of Native Americans for centuries before the first European contact was made in 1769. California was ruled by Spain until 1822, when Mexico assumed jurisdiction. Mexican and American hostilities over the land came to an end with the Treaty of Cahuenga in 1847 and the Treaty of Guadalupe Hidalgo in 1848, which incorporated Los Angeles and the rest of California as an American territory.

In 1850, Los Angeles County was established as one of the 27 original counties, and the City of Los Angeles, incorporated later that year as the County's first city, was declared to be the county seat.

In the late 19th century, Southern California citrus farming was born, and the Southern Pacific Railroad and Santa Fe Railway completed routes into Los Angeles County. By 1890, the population of Los Angeles County had reached 60,000 residents. The population continued to grow in the late 19th century. During the early 20th century, the San Pedro harbor became operational, including the founding of salable petroleum, and the population continued to grow with the establishment of the motion picture, television, and the defense industries.

Historical Resources. The NRHP, CRHR, California Points of Historical Interest (SPHI), and California Historical Landmarks (SHL) in the CHRIS, and County of Los Angeles Register of Landmarks and Historic Districts (Landmarks), were searched to determine whether known historical resources are located within the area of the proposed program. The literature search was abbreviated due to the large size of the proposed program area. The information reviewed includes sufficient data necessary to determine the level of cultural sensitivity for the project area.

An abundant amount of historical resources was identified in the NRHP, CRHR, SPHI, SHL, and Landmarks and are spread out throughout all of Los Angeles County. According to the Los Angeles County General Plan 2035, the CHRH lists over 500 historical resources throughout Los Angeles County, with zero of those resources located in areas of the unincorporated territory of Los Angeles County affected by the Ordinance.⁷ There are 31 known historical resources within the unincorporated areas of Los Angeles County and none of those resources are known to be located in areas of the unincorporated territory of Los Angeles County affected by the Ordinance.

⁶ County of Los Angeles. "History," accessed March 2020, <https://lacounty.gov/government/about-la-county/history/>.

⁷ Los Angeles County General Plan 2035, Chapter 9.

Threshold of Significance

A significant impact would occur if incompatible land uses or development adversely affected historical resources by degrading the historic nature of the building, structure, object, site, or cultural landscape through incompatible and inappropriate design features by allowing development that blocks views or hinders the public's enjoyment of a particular cultural resource, or development that removes or demolishes significant historical features on existing buildings, structures, objects, sites, or cultural landscapes.

Impact Analysis

The proposed program would result in ~~no~~ potentially significant impacts to historical resources in relation to causing a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines § 15064.5. There are 31 known historical resources within the unincorporated areas of Los Angeles County and none of those resources are known to be located in areas of the unincorporated territory of Los Angeles County affected by the Ordinance. ~~Thus, initiatives within the proposed program area would not impact historical resources.~~ However, there is the potential to encounter unknown resources, and reasonably foreseeable projects could result in impacts to cultural resources in relation to causing a substantial adverse change in the significance of a historical resource pursuant to § 15064.5 of the CEQA Guidelines. Incompatible land uses and development can adversely affect resources by degrading the historic nature of the building, structure, object, site, or cultural landscape through incompatible and inappropriate design features, by allowing development that blocks views or hinders the public's enjoyment of a particular cultural resource, or development that removes or demolishes significant historical features on existing buildings, structures, objects, sites, or cultural landscapes.

The potential for impacts to historical resources has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, *Project Description*; Table 1.IV-1, *Planning and Permitting Requirements*, and Table 1.IV-2, *Development Standards*). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential to result in physical changes in the environment resources in relation to causing a substantial adverse change in the significance of a historical resource include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in ~~no~~ potentially significant impacts to cultural resources in relation to causing a substantial adverse change in the significance of a historical resource as defined in the CEQA Guidelines § 15064.5. There are no known historical resources located in land use zoning designations that are affected by the Green Zone Districts. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties ~~and would result in no.~~ However, there is the potential to encounter unknown resources, and reasonably foreseeable projects could result in impacts to cultural resources in relation to causing a substantial adverse change in the significance of a historical resource pursuant to § 15064.5 of the CEQA Guidelines. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum floor area ratio (FAR) requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, ~~27 28~~ parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, ~~14 45~~ of the ~~27 28~~ parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and

zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling and solid waste, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the non-conforming uses to come into compliance within 3 to 7 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would ~~not~~ differ substantially from existing conditions, ~~such that they would be minor additions to existing industrial land uses.~~

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling and solid waste, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in ~~no~~ potential impacts to cultural resources in relation to causing a substantial adverse change in the significance of a historical resource pursuant to § 15064.5 of the CEQA Guidelines, requiring the consideration of mitigation measures and alternatives in an EIR. ~~No further analysis is warranted.~~

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in ~~no~~ potentially significant impacts to cultural resources in relation to causing a substantial adverse change in the significance of a historical resource as defined in the CEQA Guidelines § 15064.5. Currently the zoning and land use designations that permit sensitive uses do not have requirements for mediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity adjacent to or adjoining legally-established,~~ existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would ~~not~~ differ substantially from existing conditions, such that they would result in potential ~~no~~ impacts to cultural resources in relation to causing a substantial adverse change in the significance of a historical resource as defined in the CEQA Guidelines § 15064.5. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would ~~not~~ impact historical resources, ~~as none~~ No known resources are present within the land designation for these standards. However, future foreseeable projects have the potential to significantly impact unknown historical resources. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in ~~no~~ potentially significant impacts to cultural resources in relation to causing a substantial adverse change in the significance of a historical resource as defined in the CEQA Guidelines § 15064.5, requiring the consideration of mitigation measures and alternatives in an EIR. ~~No further analysis is warranted.~~

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in ~~no potentially significant~~ impacts to cultural resources in relation to causing a substantial adverse change in the significance of a historical resource as defined in the CEQA Guidelines § 15064.5. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. No known resources are present within the land designation for these standards. However, future foreseeable projects have the potential to significantly impact unknown historical resources.~~ Therefore, impacts to Recycling and Waste Management Revisions would result in ~~no potentially significant~~ impacts to cultural resources as it relates to the significance of historical resources, requiring the consideration of mitigation measures and alternatives in an EIR. ~~No further analysis is warranted.~~

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to cultural resources in relation to causing a substantial adverse change in the significance of a historical resource as defined in the CEQA Guidelines § 15064.5. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. ~~The construction establishment~~ of a supermarket accessory recycling collection center or compliance with development standards would not substantially alter the existing conditions such that historical resources would be impacted. These revisions would not affect historical resources given that they are generally not recycling or supermarket facilities. Compliance with the development standards would result in no impacts to cultural resources and thus no mitigation is required. Therefore, the Supermarket Accessory Recycling Collection Centers would result in no impacts to cultural resources as it relates to the significance of historical resources. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in ~~result in no potentially significant~~ impacts to cultural resources in relation to causing a substantial adverse change in the significance of a historical resource as defined in the CEQA Guidelines § 15064.5. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. No known resources are present within the land designation for these standards. However, future foreseeable projects have the potential to significantly impact unknown historical resources. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in ~~no potentially significant~~ impacts to cultural resources as it relates to the significance of historical resources, requiring the consideration of mitigation measures and alternatives in an EIR. ~~No further analysis is warranted.~~

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines § 15064.5?

Existing Conditions

Archaeological Resources. The resources described in Section 9 of the Conservation and Natural Resources Element of the Los Angeles County General Plan⁸ include significant archaeological resources located within the unincorporated territory of Los Angeles County. Archaeological resources are nonrenewable and irreplaceable, and as such, it is the policy of the County to strive for the promotion of public awareness of the value of these resources, and public enjoyment should be fostered whenever possible. The County promotes cooperative efforts between public and private organizations to identify, restore, and conserve these resources.

Archival research and review of published literature considered a general overview of the existing conditions and potentially known archaeological sites or resources that could be impacted. The Native American Heritage Commission (NAHC) was contacted on March 13, 2020, to request a Sacred Lands File search and the current Native American contact list for the proposed program site in order to initiate consultation with interested tribes in accordance with CEQA and Assembly Bill (AB) 52 and Senate Bill (SB) 18. Of the 89 topographic quadrangle maps that document the County, 78 intersect with the Green Zones Program (Figure 2.5-1, *USGS 7.5-Minute Quadrangle Index Map*). Section 9 of the Conservation and Natural Resources Element of the County of Los Angeles General Plan acknowledges the history of occupation by indigenous people of lands that now comprise the unincorporated territory of the County:

The indigenous Chumash and Gabrieliño/Tongva peoples, two of the most populous and sophisticated native cultures, have occupied land within Los Angeles County since prehistoric times. Unfortunately, many of the known archaeological, paleontological, and historic cultural sites in the region have been disturbed to some extent by both human activity, such as development, occupation, and use, and natural occurrences, such as erosion that results from earthquakes, fire, and flood. In some instances, historic and prehistoric artifacts such as stone tools, antique nails, and equipment parts have been picked up or even destroyed by visitors or residents.⁹

Threshold of Significance

A significant impact would occur if incompatible land uses or development adversely affected archaeological resources by excavating native undisturbed soils thereby hindering the archeological resources ability to yield important information regarding prehistory and history.

⁸ Los Angeles County General Plan 2035, Chapter 9.

⁹ Los Angeles County General Plan 2035, Chapter 9.

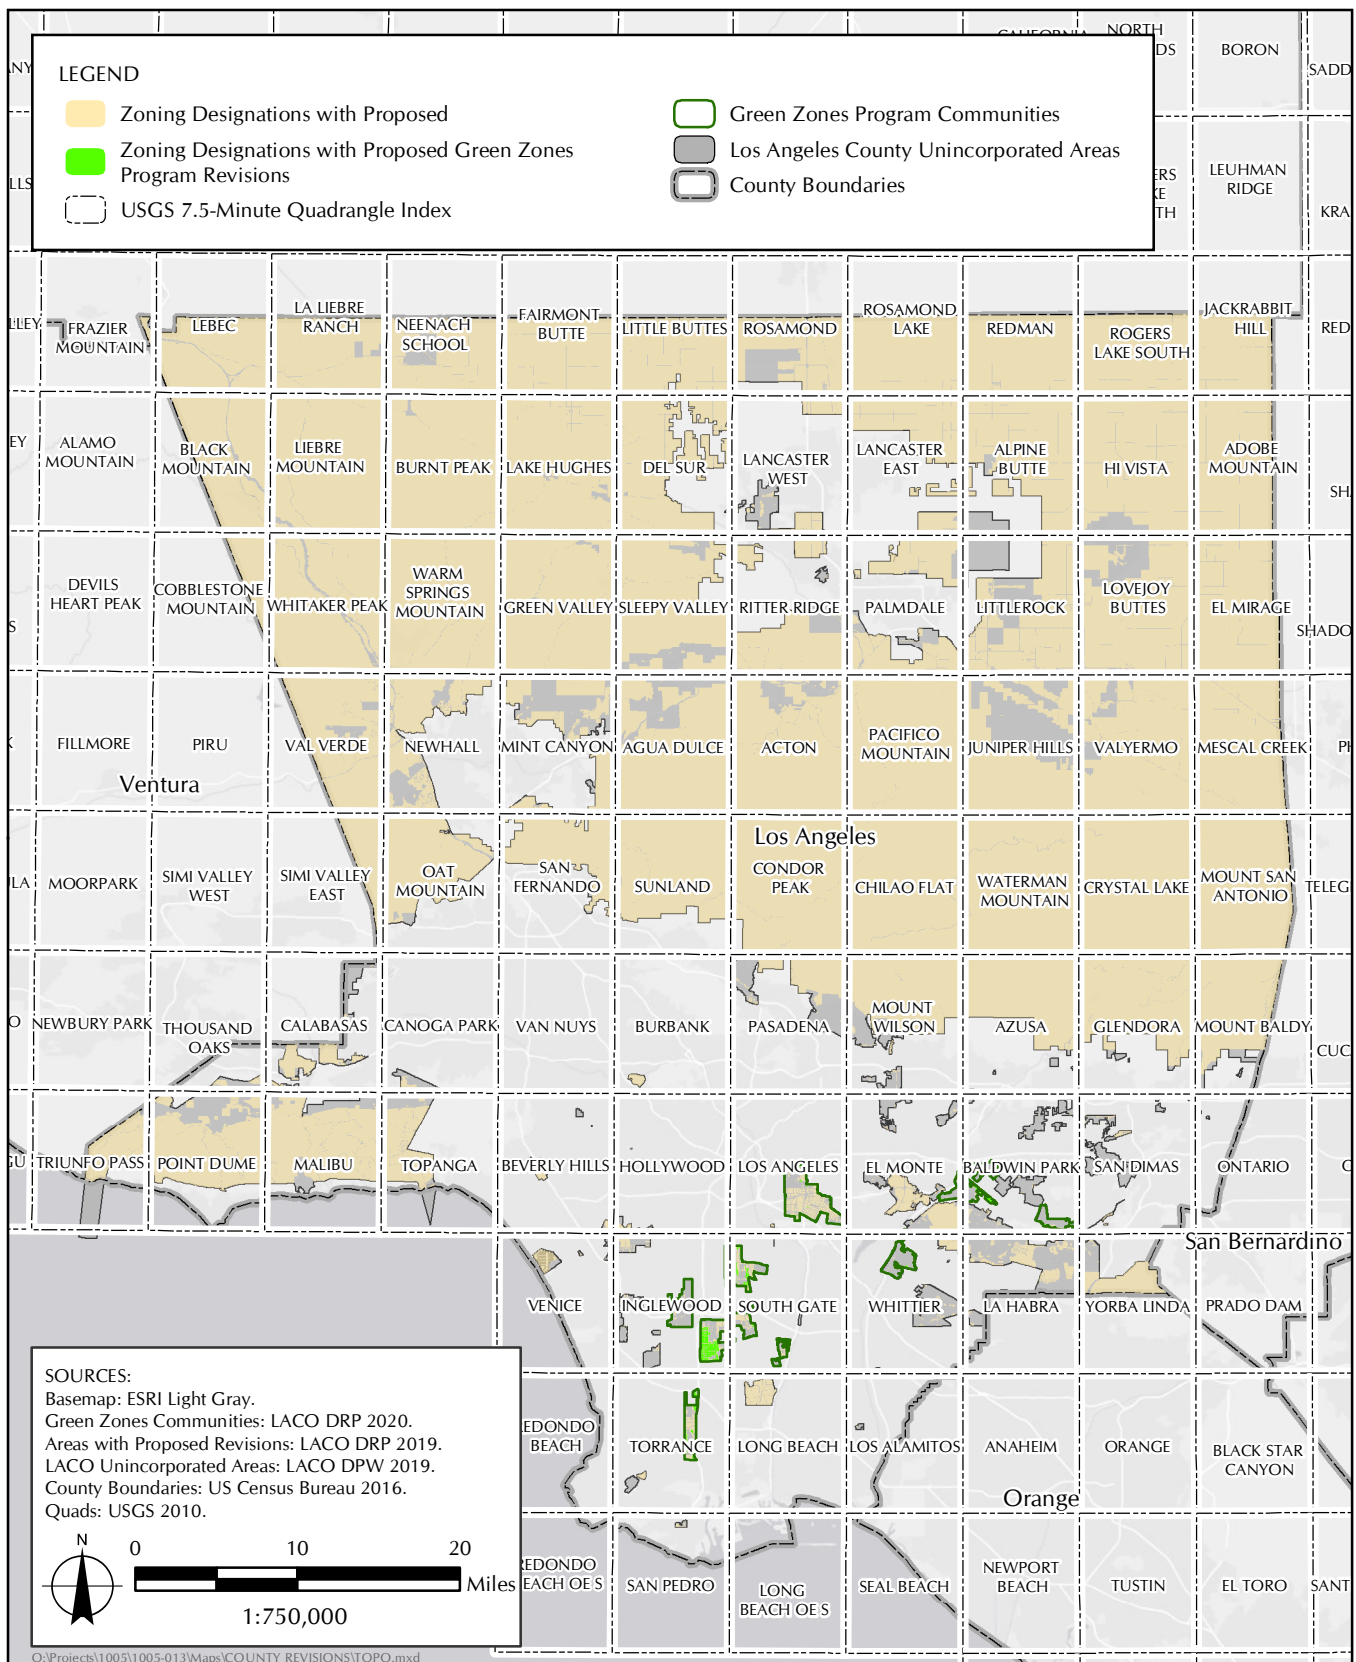

FIGURE 2.5-1
 USGS 7.5-Minute Quadrangle Index Map

Impact Analysis

The proposed program would have the potential to result in significant impacts to cultural resources in relation to causing a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5 of the CEQA Guidelines, requiring the consideration of mitigation measures and alternatives in an EIR. The improvements that would be required pursuant to the Ordinance have the potential to cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5 of the CEQA Guidelines. Ground disturbance is expected to reach depths of approximately 3 feet or greater; therefore, excavation associated with the program developments may reach native undisturbed soils that contain buried archaeological deposits.

The potential for impacts to archaeological resources has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment to archeological resources include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in potentially significant impacts to archaeological resources in relation to causing a substantial adverse change in the significance of an archaeological resource as defined in the CEQA Guidelines § 15064.5. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in potentially significant impacts to archaeological resources in relation to causing a substantial adverse change in the significance of an archaeological resource as defined in the CEQA Guidelines § 15064.5. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, ~~27 28~~ parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, ~~14 45~~ of the ~~27 28~~ parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to ~~7 40~~ years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would be minor additions to existing industrial land uses. Surficial resources are not likely to be encountered; however, there is a potential to encounter intact buried archaeological deposits interred at shallow depths at project locations where ground disturbance is expected to occur.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in potentially significant impacts to archaeological resources in relation to causing a substantial adverse

change in the significance of an archaeological resource as defined in the CEQA Guidelines § 15064.5. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would have the potential to result in significant impacts to historical resources in relation to causing a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5 of the CEQA Guidelines, requiring the consideration of mitigation measures and alternatives in an EIR.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in potentially significant impacts to archaeological resources in relation to causing a substantial adverse change in the significance of an archaeological resource as defined in the CEQA Guidelines § 15064.5. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity adjacent to~~ or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would be minor additions to existing industrial land uses. Surficial resources are not likely to be encountered; however, there is a potential to encounter intact buried archaeological deposits interred at shallow depths at project locations where ground disturbance is expected to occur. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not result in impacts to historical resources in relation to causing a substantial adverse change in the significance of an archaeological resource. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in potentially significant impacts to historical resources in relation to causing a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5 of the CEQA Guidelines, requiring the consideration of mitigation measures and alternatives in an EIR.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in ~~no~~ potentially significant impacts to cultural resources as it relates to causing a substantial adverse change in the significance of an archaeological resource as defined in the CEQA Guidelines § 15064.5. Any construction resulting from compliance with development standards would be minimal and would not substantially alter the existing conditions for existing industrial uses. ~~These revisions would not be expected to affect archaeological resources as development standards would be less restrictive than previously imposed, as they are not recycling or supermarket facilities.~~ The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance

standards. These construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ Therefore, impacts to Recycling and Waste Management Revisions would ~~not~~ result in potentially significant impacts to historical resources as it relates to causing a substantial adverse change to the significance of an archaeological resource. ~~No further~~ Further analysis is warranted, requiring the consideration of mitigation measures and alternatives in an EIR.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to cultural resources as it relates to causing a substantial adverse change in the significance of an archaeological resource as defined in the CEQA Guidelines § 15064.5. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. The ~~construction~~ establishment of a recycling collection center or compliance with development standards would not substantially alter the existing conditions such that they would have the potential to impact historical resources as it relates to causing a substantial adverse change to the significance of an archaeological resource pursuant to CEQA § 15064.5 of the CEQA Guidelines. Therefore, the Supermarket Accessory Recycling Collection Centers would have result in no impacts to cultural resources as it relates to causing a substantial adverse change in the significance of an archaeological resource. No further analysis is warranted.

Element 4 - Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in ~~no~~ potentially significant impacts to cultural resources as it relates to causing a substantial adverse change in the significance of an archaeological resource as defined in the CEQA Guidelines § 15064.5. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. The storage enclosures or compliance with development standards would ~~not~~ substantially alter the existing conditions, such that they would have the potential to impact cultural resources as it relates to causing a substantial adverse change to the significance of an archaeological resource pursuant to CEQA § 15064.5 of the CEQA Guidelines. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in ~~no~~ potentially significant impacts to cultural resources as it

relates to causing a substantial adverse change in the significance of an archaeological resource, requiring the consideration of mitigation measures and alternatives in an EIR. ~~No further analysis is warranted.~~

The improvements that would be required pursuant to the Ordinance have the potential to cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5 of the CEQA Guidelines. Implementation of the improvements required pursuant to the development standards for the Green Zones Program, Recycling and Waste Management Revisions, and Supermarket Recycling Center Revisions would require ground disturbance particularly with regard to the construction of barrier walls, the construction of enclosure buildings, and the planting of landscaping. Ground disturbance is expected to reach depths of approximately 3 feet or greater; therefore, excavation associated with the program developments may reach native undisturbed soils that contain buried archaeological deposits.

Therefore, the proposed program would have the potential to result in significant impacts to archaeological resources in relation to causing a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5 of the CEQA Guidelines, requiring the consideration of mitigation measures and alternatives in an EIR.

c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Existing Conditions

California Public Resource Code 21083.2. PRC 21083.2, defines a *unique geologic feature* as an important and irreplaceable geological formation, and these features may be considered to have scientific and/or cultural value.

- a. *A unique paleontological resource* is defined as a fossil that meets one or more of the following criteria:
- b. It provides information on the evolutionary relationships and developmental trends among organisms, living or extinct.
- c. It provides data useful in determining the age(s) of the rock unit or sedimentary stratum, including data important in determining the depositional history of the region and the timing of geologic events therein.
- d. It provides data regarding the development of biological communities or interaction between plant and animal communities.
- e. It demonstrates unusual or spectacular circumstances in the history of life.
- f. The fossils are in short supply and/or in danger of being depleted or destroyed by the elements, vandalism, or commercial exploitation, and are not found in other geographic locations.

Surficial Geologic Units. Surficial geological units within the proposed program area vary greatly due to the immense geographical area represented and the complex geology found along tectonic plate boundaries like Southern California and are described below in relation to three program ordinance revisions that encompassed in the Green Zones Program. The surficial geology has been discussed within the context of these areas.

The Conservation and Open Space Element of the Los Angeles County General Plan 2035, provides a summary of the significant general fossil locations in the County:¹⁰

“Paleontological resources, or fossils, are the remains of ancient animals and plants, as well as trace fossils such as burrows, which can provide scientifically-significant information on the history of life on Earth.

Over 1,000 fossil localities have been recorded and in excess of a million specimens have been collected in Los Angeles County. Numerous places countywide have yielded fossils, especially in the Santa Monica Mountains and in the vicinity of Rancho La Brea.”

The area subject to the proposed program consists of stationary sources of pollution near sensitive uses in the Los Angeles Basin. These communities are located within highly urbanized areas of Los Angeles County, and have undergone significant development

¹⁰ Sharp, Robert P. 1993. *Geology Underfoot in Southern California*. Missoula, MT: Mountain Press.

Threshold of Significance

A significant impact would occur if incompatible land uses or development adversely affected paleontological resources by excavating native undisturbed soils thereby hindering the paleontological resources ability to yield information on the evolutionary relationships and developmental trends among organisms, living or extinct.

Impact Analysis

The proposed program would result in ~~no~~ potentially significant impacts to paleontological resources in regard to directly or indirectly destroying a unique paleontological resource or site or unique geologic figure. The potential for impacts to paleontological resources has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment to paleontological resources include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in ~~would not~~ potentially significantly impact paleontological resource as related to destroying a unique paleontological resource, site, or unique geologic feature directly or indirectly. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would ~~not~~ potentially impact paleontological resource as related to directly or indirectly destroying a unique paleontological resource, site, or unique geologic feature. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, ~~27~~ 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, ~~14~~ 45 of the ~~27~~ 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to ~~7~~ 40 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses.

As stated in the Conservation and Open Space Element of the County General Plan, the area subject to the proposed program consists of stationary sources of pollution near sensitive uses in the Los Angeles Basin.¹¹ These communities are located within highly urbanized areas of Los Angeles County, and have undergone significant development, resulting

¹¹ Sharp, Robert P. 1993. *Geology Underfoot in Southern California*. Missoula, MT: Mountain Press.

in significant ground disturbance throughout the Green Zone Districts area. Implementation of development standards for the Green Zones Program will likely result in ground disturbance particularly with regards to the construction of barrier walls, the construction of enclosure buildings, and the planting of landscaping. These modifications are expected to result in a maximum depth of approximately 3 feet of ground disturbance.

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties ~~are not expected to~~ would result in potential impacts to paleontological resources related to directly or indirectly destroying a unique paleontological resource, site, or unique geologic feature, requiring the consideration of mitigation measures and alternatives in an EIR. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would ~~not potentially significantly~~ impact paleontological resource as related to destroying a unique paleontological resource, site, or unique geologic feature directly or indirectly. The new development standards would result in ~~a more stringent entitlement processes for specific new sensitive uses implementing landscaped buffers, air filtration systems, and open space when developed adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties~~ and would not potentially significantly impact paleontological resource as related to directly or indirectly destroy a unique paleontological resource, site, or unique geologic feature. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 4, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would ~~not~~ differ substantially from existing conditions, as they would be minor additions to existing industrial land uses.

As stated in the Conservation and Open Space Element of the County General Plan, the proposed program site consists of stationary sources of pollution near sensitive uses in the Los Angeles Basin.¹² These communities are located within highly urbanized areas of Los Angeles County, and have undergone significant development, resulting in significant ground disturbance throughout the New Sensitive Uses Adjacent to Industrial, Recycling and Solid Waste, or Vehicle-Related Uses area. Implementation of development standards for the Green Zones Program will likely result in ground disturbance particularly with regards to the construction of barrier walls, ~~the construction of enclosure buildings,~~ and the planting of landscaping. These modifications are expected to result in a maximum depth of approximately 3 feet of ground disturbance. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space are ~~not~~ expected to result in potential impacts to paleontological resources related to directly or indirectly destroying a unique paleontological resource, site, or unique geologic feature.

Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or

¹² Sharp, Robert P. 1993. *Geology Underfoot in Southern California*. Missoula, MT: Mountain Press.

Vehicle-Related Uses ~~are not expected to~~ would result in potential impacts to paleontological resources related to directly or indirectly destroying a unique paleontological resource, site, or unique geologic feature, requiring the consideration of mitigation measures and alternatives in an EIR. ~~No further analysis is warranted.~~

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions would ~~not be expected~~ have the potential to destroy a unique paleontological resource, site, or unique geologic features directly or indirectly. As discussed in Section 1, the Recycling and Waste Management Revisions element of the Green Zones Program consists of the inclusion of permitting requirements and development standards for Specific Uses including pallet yards, recycling collection facilities, recycling processing facilities, organic waste facilities, and solid waste facilities. A CUP would be required for all of the above uses (Chapter 22.140). Development standards for Recycling and Waste Management Revisions include requirements for landscaping buffers, walls, enclosed buildings, surfacing of storage areas, air filtration, signage, and lighting. Additionally, the Recycling and Waste Management Revisions include prohibitions on areas where certain specific uses would be prohibited including HMAs, SEAs, VHFHSZs, and in some cases ARAs. Any construction resulting from compliance with development standards would be minimal and would not substantially alter the existing conditions for existing industrial uses such that unique paleontological resources, sites, or unique geologic features would be impacted. These revisions would not affect newly discovered paleontological resources at the shallow depth anticipated to be reached. Implementation of development standards for the Recycling and Waste Management Revisions will likely result in ground disturbance particularly with regard to the construction of barrier walls, the construction of enclosure buildings, and the planting of landscaping and result in a maximum extent of approximately 3 feet of ground disturbance. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMA, SEA, and VHFHSZ. Additionally, in-vessel organic waste facilities are prohibited in ARA.~~ Therefore, impacts to Recycling and Waste Management Revisions would ~~not be expected~~ have the potential to destroy a unique paleontological resource, site, or unique geologic features directly or indirectly, requiring the consideration of mitigation measures and alternatives in an EIR. ~~No further analysis is warranted.~~

The Supermarket Accessory Recycling Collection Centers revisions would not be expected to destroy a unique paleontological resource, site, or unique geologic features directly or indirectly. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of

pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. Therefore, the Supermarket Accessory Recycling Collection Centers would not be expected to destroy a unique paleontological resource, site, or unique geologic features directly or indirectly. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would ~~not be expected~~ have the potential to destroy a unique paleontological resource or unique geologic feature. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. Any construction resulting from compliance with development standards would be minimal and would not substantially alter the existing conditions for existing industrial uses ~~such that~~ and impacts to unique paleontological resources or unique geologic features would occur. The construction of these measures would ~~not~~ differ substantially from existing conditions, as they would be minor additions to existing land uses. Therefore, ~~no~~ direct or indirect impact to a unique paleontological resources or unique geologic features could occur ~~is expected~~ in relation to a substantial adverse change in the significance of a unique paleontological resource, site, or unique geologic feature.

Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions ~~are not expected~~ would have the potential to impact paleontological resources in relation to direct or indirect destruction of a unique paleontological resource, site, or unique geologic feature, requiring the consideration of mitigation measures and alternatives in an EIR. ~~No further analysis is warranted.~~

d) Disturb any human remains, including those interred outside of dedicated cemeteries?

Existing Conditions

There are 12 known cemeteries within the proposed program area. The number of informal cemeteries is unknown. Burial features can range in complexity from a modest and isolated internment or a final site for cremated remains to complex elaborate burial sites with multiple individuals interred. Informal burials can often exist as shallow gravesites of no more than a few feet below the surface.

Threshold of Significance

A significant impact would occur if incompatible land uses or development adversely affected human remains by excavating native undisturbed soils.

Impact Analysis

The proposed program would result in less than significant impacts in relation to disturbing human remains, including those interred outside of dedicated cemeteries. The potential for impacts to cultural resources with respect to the disturbance of human remains, including those interred outside of dedicated cemeteries, has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The

proposed revisions to the development standards that have the potential to result in physical changes in the environment to cultural resources with respect to the disturbance of human remains, including those interred outside of dedicated cemeteries, include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 - Green Zone Districts

Green Zone Districts would result in less than significant impacts to cultural resources with respect to the disturbance of human remains, including those interred outside of dedicated cemeteries, through compliance with existing federal, State, and local statutes and regulations. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to cultural resources with respect to the disturbance of human remains, including those interred outside of dedicated cemeteries, through compliance with existing federal, State, and local statutes and regulations. The land use zoning designation affected by the Green Zone Districts does not contain any formal cemeteries and a review of historic topographic maps and state registries does not indicate a presence of informal interment sites. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties. The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would as be minor additions to existing industrial land uses. As a result, ground disturbance, although minimal excavation may reach depths of as much as 3 feet or potentially more in which internments at shallow depths could be encountered, may result in the inadvertent find of human remains in an informal cemetery.

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties could potentially impact human remains as it relates to the disturbance of any human remains, including those interred outside of dedicated cemeteries. In the event of the unanticipated discovery of human remains during construction, the construction contractor shall be required to notify the County Coroner and provide for the required reinternment or repatriation of the recovered human remains. Compliance with government code would ensure that potential impacts related to the unanticipated discovery of human remains, including those interred outside of dedicated cemeteries, is reduced to below the level of significance.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to cultural resources with respect to the disturbance of human remains, including those interred outside of dedicated cemeteries, through compliance with

existing federal, State, and local statutes and regulations. The land use zoning designation affected by the new sensitive uses standards does not contain any formal cemeteries and a review of historic topographic maps and State registries does not indicate a presence of informal interment sites. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would as be minor additions to existing industrial land uses. As a result, ground disturbance, although minimal excavation may reach depths of as much as 3 feet or potentially more in which internments at shallow depths could be encountered, may result in the inadvertent find of human remains in an informal cemetery. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would result in less than significant impacts to cultural resources with respect to the disturbance of human remains, including those interred outside of dedicated cemeteries, through compliance with existing federal, State, and local statutes and regulations.

Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses could potentially impact human remains as it relates to the disturbance of any human remains, including those interred outside of dedicated cemeteries. In the event of the unanticipated discovery of human remains during construction, the construction contractor shall be required to notify the County Coroner and provide for the required reinternment or repatriation of the recovered human remains. Compliance with government code would ensure that potential impacts related to the unanticipated discovery of human remains, including those interred outside of dedicated cemeteries, is reduced to below the level of significance.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in would result in less than significant impacts to cultural resources with respect to the disturbance of human remains, including those interred outside of dedicated cemeteries, through compliance with existing federal, State, and local statutes and regulations. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet~~

~~yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ Therefore, impacts to Recycling and Waste Management Revisions would be minimal and would not substantially alter the existing conditions for existing industrial uses such that human remains, including those interred outside of dedicated cemeteries, would be impacted. These revisions would not affect the significance of human remains, including those interred outside of dedicated cemeteries. Given that they are not recycling or waste facilities, organic waste processing facilities would not be expected to impact human remains, including those interred outside of dedicated cemeteries.

In the event of the unanticipated discovery of human remains during construction, the construction contractor shall be required to notify the County Coroner and provide for the required reinternment or repatriation of the recovered human remains. Compliance with government code would ensure that potential impacts related to the unanticipated discovery of human remains, including those interred outside of dedicated cemeteries, is reduced to below the level of significance.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts to cultural resources with respect to the disturbance of human remains, including those interred outside of dedicated cemeteries, through compliance with existing federal, State, and local statutes and regulations. The land use zoning designation effected by the Supermarket Accessory Recycling Collection Centers does not contain one formal cemetery and a review of historic topographic maps and State registries do not indicate a presence of informal interment sites. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include one parking stall for every 250 square feet of area; any facility larger than 250 square feet of area shall be required to have fencing or walls for screening purposes, containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. These revisions would not affect the significance of human remains, including those interred outside of dedicated cemeteries. Given that they are not recycling or waste facilities, supermarket recycling facilities would not be expected to impact human remains, including those interred outside of dedicated cemeteries.

In the event of the unanticipated discovery of human remains during construction, the construction contractor shall be required to notify the County Coroner and provide for the required reinternment or repatriation of the recovered human remains. Compliance with government code would ensure that potential impacts related to the unanticipated discovery of human remains, including those interred outside of dedicated cemeteries, is reduced to below the level of significance.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to cultural resources with respect to the disturbance of human remains, including those interred outside of dedicated cemeteries, through compliance with existing federal, State, and local statutes and regulations. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted

in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. Any construction resulting from compliance with development standards would be minimal and would not substantially alter the existing conditions for existing industrial uses such that human remains, including those interred outside of dedicated cemeteries, would be impacted. These revisions would not affect the significance of human remains, including those interred outside of dedicated cemeteries.

In the event of the unanticipated discovery of human remains during construction, the construction contractor shall be required to notify the County Coroner and provide for the required reinternment or repatriation of the recovered human remains. Compliance with government code would ensure that potential impacts related to the unanticipated discovery of human remains, including those interred outside of dedicated cemeteries, is reduced to below the level of significance.

2.6. ENERGY

This analysis is undertaken to determine if the proposed program may have a significant impact to energy, thus requiring the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State CEQA Guidelines. The analysis covers all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated with regard to the 2019 California Green Building Standards Code (CALGreen),¹ the California Energy Commission (CEC) Guidebook for the Renewable Portfolio Standard Eligibility,² the Southern California Association of Governments (SCAG) 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS),³ the Los Angeles County General Plan 2035,⁴ and the Los Angeles County Green Building Standards Code.⁵

	<i>Potentially Significant Impact</i>	<i>Less than Significant Impact with Mitigation Incorporated</i>	<i>Less than Significant Impact</i>	<i>No Impact</i>
Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?				

Existing Conditions

The County has characterized the availability of renewable and nonrenewable energy resources in the Conservation and Natural Resources Element of the County General Plan:

Energy in California is produced from a variety of nonrenewable and renewable natural resources, including oil, natural gas, hydrologic, wind, and solar power.⁶ Although nonrenewable energy resources (oil and natural gas) generate a majority of its energy, California has one of the most diverse portfolios of renewable energy resources in the country. Renewable energy is derived from resources that are regenerative and cannot be depleted, such as wind and solar power. For this reason, renewable energy sources are fundamentally different from fossil fuels, such as coal, oil, and natural gas, which are finite and produce greenhouse gases and other

pollutants. Aside from existing oil and natural gas deposits, California's topography and climate lend themselves to the production of energy from wind, solar, and tidal power.⁷

As characterized in the U.S. Energy Information Administration profile for California, the State is one of the most energy efficient in the Nation:

California is the most populous state in the nation, has the largest economy, and is second only to Texas in total energy consumption. Although California has the world's fifth-largest economy and many energy-intensive industries, the state has one of the lowest per capita energy consumption levels in the United States. California's extensive efforts to increase energy efficiency and implement alternative technologies have slowed growth in energy demand. The state is also rich in energy resources. California leads the nation in nonhydroelectric renewable-sourced electricity generation and is among the top producers of conventional hydroelectric power.⁸ ... Per capita energy use in California's residential sector is lower than that of any other state except Hawaii.

There are numerous building codes and standards that would apply to the construction, operation, and maintenance of improvements required pursuant to 2019 CALGreen, CEC Guidebook, and Los Angeles County Green Building Standards Code. The County Green Building Standards Code (Title 31), as well as Green Building Standards Code (CALGreen Code) of Title 24 of the California Code of Regulations and the State of California Green Code, requires applicable projects to provide energy saving features. The proposed program would also be consistent with Goals and Policies related to energy conservation in Part VI, Mineral and Energy Resources of the Conservation and Natural Resources Element (Chapter 9), of the Los Angeles County General Plan. Implementation of the project would also be consistent with the Los Angeles Energy and Environmental Program (EEP), adopted by the County of Los Angeles Board of Supervisors in 2006. The EEP established target reductions in consumptive use of nonrenewable sources of energy by 20 percent between 2006 and 2015.

Threshold of Significance

Impacts to energy would occur if energy is utilized in a manner that is wasteful, inefficient, or results in unnecessary consumption of nonrenewable energy resources.

Impact Analysis

The potential for impacts to energy has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, *Project Description*, Table 1.IV-1, *Planning and Permitting Requirements*, and Table 1.IV-2, *Development Standards*). Wasteful use of energy is defined as expending or consuming energy, thoughtlessly or carelessly, in a manner that results in no benefit or compensatory outcome. Inefficient use of energy results from using a greater amount of energy than required to products and services.

Element 1 – Green Zone Districts

The Green Zone Districts element would result in less than significant impacts to energy in relation to wasteful, inefficient, or unnecessary consumption of energy resources, during construction, operation, or maintenance of improvements required pursuant to the project. The new development standards (see Table 1.IV-2) would result in a more stringent entitlement processes for M-1, M-1.5, M-2, M-2.5 and other industrial uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum floor area ratio (FAR) requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the

⁷ County of Los Angeles. [insert GP date]. Chapter 9, Conservation and Natural Resources Element of the County of Los Angeles General Plan 2035. Available at: http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf, Page 154.

⁸ U.S. Energy Information Administration. January 16, 2020. California State Profile and Energy Estimates. Available at: <https://www.eia.gov/state/analysis.php?sid=CA>

General Plan Amendment Revisions, ~~27~~ ²⁸ parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, ~~14~~ ⁴⁵ of the ~~27~~ ²⁸ parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The program requires the nonconforming uses to come into compliance within 3 to ~~7~~ ⁴⁰ years of adoption of the Ordinance. Development standards for the Green Zone Districts would include landscaping barriers, enclosed buildings, fencing, solid walls, signage, paving of permeable areas, and lighting as measures to decrease impacts to surrounding sensitive uses. The motorized equipment used during construction would comply with California Air Resources Board (CARB) regulations for diesel programs relating to mobile source, stationary engines, and portable equipment. Construction related to the energy required to construct the improvements required pursuant to the project would be required to comply with energy efficiency standards for design, construction, operation established by State and County regulations which are among the strictest in the Nation, including those specifically required pursuant to the Green Building Operation component of the EEP: Green Building, Low-impact Development, and Drought Tolerant Ordinances and thus do not constitute an inefficient use of energy. The majority of the proposed improvements are inanimate objects such as walls, fencing, signage, and lighting that would be compliant with Title 31 Green Building Codes and not involve the use of diesel fuels. The SCAQMD regulates construction equipment and diesel fuel emissions with the SCAQMD. Consistent with the objectives of the South Coast Air Quality Management District Commercial Electric Lawn and Garden Program, the County has required the use of electric and manual commercial lawn and garden equipment, including handheld trimmers, chainsaws, pruners, backpack and handheld leaf blowers, and ride-on, stand-on, and walk-behind lawn mowers for landscape areas required in conjunction with the Green Zones Program. The use of electric and manual tools to maintain landscaping optimizes energy efficiency based on Best Available Current Technology.

Once completed, the development improvements would provide long-term environmental benefits for sensitive receptors adjacent to industrial sites, and thus do not constitute a wasteful use of energy. The construction would include improvements to existing industrial sites. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions. Therefore, the Green Zone Districts would result in less than significant impacts to energy in relation to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation. No further analysis is warranted.

Element 2 – New Sensitive Uses

The New Sensitive Uses element would result in less than significant impacts to energy in relation to wasteful, inefficient, or unnecessary consumption of energy resources, during construction, operation, or maintenance of improvements required pursuant to the project. ~~The implementation of development standards for existing industrial use facilities would reduce wasteful, inefficient, or unnecessary consumption of energy resources during operation by improving the existing facilities.~~ Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses.

The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; and placement of balconies (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, and lighting as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new

development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related~~ uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions.

The measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not result in substantial changes to existing conditions in relation to consumptive use of energy resources. The motorized equipment used during construction would comply with CARB regulations for diesel programs relating to mobile source, stationary engines, and portable equipment. Construction would not be extensive and would be minimal for individual properties. Construction related to the energy required to construct the improvements required pursuant to the project would be required to comply with energy efficiency standards for design, construction, operation established by State and County regulations which are among the strictest in the nation, including those specifically required pursuant to the Green Building Operation component of the EEP: Green Building, Low-Impact Development, and Drought Tolerant Ordinances and thus do not constitute an inefficient use of energy. The majority of the proposed improvements are inanimate objects such as walls, ~~fencing, signage~~ placement of balconies, and lighting air filtration systems that would be compliant with Title 22 Building Codes and not involve the use of diesel fuels. The SCAQMD regulates construction equipment and diesel fuel emissions with the SCAQMD. Consistent with the objectives of the SCAQMD Commercial Electric Lawn and Garden Program, the County has required the use of electric and manual commercial lawn and garden equipment, including handheld trimmers, chainsaws, pruners, backpack and handheld leaf blowers, and ride-on, stand-on, and walk-behind lawn mowers for landscape areas required in conjunction with the Green Zones Program. The use of electric and manual tools to maintain landscaping optimizes energy efficiency based on Best Available Current Technology.

Once completed, construction, the development improvements would provide long-term environmental benefits for sensitive receptors adjacent to industrial sites, and thus do not constitute a wasteful use of energy. ~~The construction would include improvements to existing industrial sites, and would not result in wasteful, inefficient, or unnecessary consumption of energy resources.~~ Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts to energy in relation to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revision, including Supermarket Accessory Recycling Collection Centers, element would result in less than significant impacts to energy in relation to wasteful, inefficient, or unnecessary consumption of energy resources, during construction, operation, or maintenance of improvements required pursuant to the project. The Recycling and Waste Management Revisions include prohibitions on areas where certain specific uses would be prohibited (Table 2.6-1, *Applicable Zones and Prohibited Uses*). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs.

**TABLE 2.6-1
APPLICABLE ZONES AND PROHIBITED USES**

Recycling and Waste Management Revisions					
	Applicable Zones	Prohibited Areas			
		SEA	VHFHSZ	Agricultural	HMA
Pallet Yards	M-1, M-1.5, M-2, and M-2.5	X	X	X	
Recycling Collection Facilities	M-1, M-1.5, M-2, and M-2.5				
Recycling Processing Facilities	M-2, M-2.5	X	X		X
—MRF, XFER Stat, Auto —C&D or Inert Debris	M-1, M-1.5, M-2, M-2.5, and A-2 (Except C&D prohibited in A-2)	X	X	X	X
Organic Waste Facilities	M-1, M-1.5, M-2, and M-2.5				
—Consistency w/SWMP	M-1, M-1.5, M-2, M-2.5, and A-2	X	X		
—Chip/Grind/Mulch	M-1.5, M-2, M-2.5, and A-2	X	X		
—Compost —Mulch In-vessel	M-2, M-2.5, and A-2	X	X	X	
Solid Waste Facilities	M-2, and M-2.5				
Supermarket Accessory Recycling Collection Center Zones	All zones except R-1, R-2, R-A, A-1				

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards (Table 1.IV-2) and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities in selected land use management areas (Table 1.IV-1 and Table 2.6-1). Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~

Improvement required pursuant to the project would be required to achieve the CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built.

Construction equipment used during the construction of development standards would be required to comply with CARB regulations to use energy efficient equipment and construction impacts would be short-term and would not be extensive. Construction related to the energy required to construct the improvements required pursuant to the project would be required to comply with energy efficiency standards for design, construction, operation established by State and County regulations which are among the strictest in the Nation, including those specifically required pursuant to the Green Building Operation component of the EEP: Green Building, Low-Impact Development, and Drought Tolerant Ordinances and thus do not constitute an inefficient use of energy. The majority of the proposed improvements are inanimate objects such as walls, fencing, signage, and lighting that would be compliant with Title 22 Building Codes and not involve the use of diesel fuels. The SCAQMD regulates construction equipment and diesel fuel emissions with the SCAQMD. Consistent with the objectives of the SCAQMD Commercial Electric Lawn and Garden Program, the County has required the use of electric and manual commercial lawn and garden equipment, including handheld trimmers, chainsaws, pruners, backpack and handheld leaf blowers, and ride-on, stand-on, and walk-behind lawn mowers for landscape areas required in conjunction with the Green Zones Program. The use of electric and manual tools to maintain landscaping optimizes energy efficiency based on Best Available Current Technology.

Once completed, the development improvements would provide long-term environmental benefits for sensitive receptors adjacent to industrial sites, and thus do not constitute a wasteful use of energy. The construction would include improvements to existing industrial sites, and would not result in wasteful, inefficient, or unnecessary consumption of energy resources. Operational uses of Supermarket Accessory Recycling Collection Centers would not differ substantially from existing conditions, in relation to consumptive use of energy resources. The purpose of CALGreen is to improve public health, safety, and general welfare by enhancing the design and construction of buildings using concepts which reduce negative impacts and promote principles that have a positive environmental impact and encourage sustainable construction practices. The organic waste facilities and recycling facilities are not currently in compliance with these standards. The proposed program would implement more efficient technologies for the organic and solid waste facilities during operation. Therefore, the Supermarket Accessory Recycling Collection Centers would have less than significant impacts to energy in relation to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Management Revisions element would result in less than significant impacts to energy in relation to wasteful, inefficient, or unnecessary consumption of energy resources, during construction, operation, or maintenance of improvements required pursuant to the project. Any new development or expansion of existing development would be required to meet the current development standards (see Table 1.IV-2) of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. Construction equipment used during the construction of development standards would be required to comply with CARB regulations to use energy efficient equipment and construction impacts would be short-term for individual improvements. The construction of increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation would not be extensive and would result in minor changes to operations. The construction and operation would not result in substantial changes to existing conditions, in relation to consumptive use of energy resources.

The requirements and compliance with standards would maintain and increase the efficiency of existing facilities by enhancing the maintenance of the stored materials. In the case of updated standards for Storage Enclosures for Recycling and Solid Waste Revisions, the construction of these measures would not differ substantially from existing conditions, as they would be minor additions to existing residential, commercial, and industrial land uses. Operational uses of Storage Enclosures for Recycling and Solid Waste Revisions would not differ substantially from existing conditions. Construction related to the energy required to construct the improvements required pursuant to the project would be required to comply with energy efficiency standards for design, construction, operation established by State and County regulations which are among the strictest in the nation, including those specifically required pursuant to the Green Building Operation component of the EEP: Green Building, Low-Impact Development, and Drought Tolerant Ordinances and thus do not constitute an inefficient use of energy. The majority of the proposed improvements are inanimate objects such as walls, fencing, signage, and lighting that would be compliant with Title 22 Building Codes and not involve the use of diesel fuels. The SCAQMD regulates construction equipment and diesel fuel emissions with the SCAQMD. Consistent with the objectives of the SCAQMD Commercial Electric Lawn and Garden Program, the County has required the use of electric and manual commercial lawn and garden equipment, including handheld trimmers, chainsaws, pruners, backpack and handheld leaf blowers, and ride-on, stand-on, and walk-behind lawn mowers for landscape areas required in conjunction with the Green Zones Program. The use of electric and manual tools to maintain landscaping optimizes energy efficiency based on Best Available Current Technology.

The purpose of CALGreen is to improve public health, safety, and general welfare by enhancing the design and construction of buildings using concepts which reduce negative impacts and promote principles that have a positive environmental impact and encourage sustainable construction practices. The organic waste facilities and recycling facilities are not currently in compliance with these standards. The proposed program would implement more efficient technologies for the organic and solid waste facilities during operation.

Once completed, construction, the development improvements would provide long-term environmental benefits for sensitive receptors adjacent to industrial sites, and thus do not constitute a wasteful use of energy. The construction

would include improvements to existing industrial sites, and would not result in wasteful, inefficient, or unnecessary consumption of energy resources. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts to energy in relation to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation. No further analysis is warranted.

b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

The proposed program would result in ~~no less than significant~~ impacts to energy in relation to conflicting with or obstructing a state or local plan for renewable energy or energy efficiency. The CEC adopts energy efficiency standards for appliances and buildings, which reduces air pollution and saves consumers money. The energy-efficient provisions include the California Building Standards Code (24 CCR), Title 31 Green Building Standards Code, and applicable CALGreen mandatory measures.⁹

Existing Conditions

There are existing state and County plans related to renewable energy and energy efficiency.

California Energy Code. The California Energy Code goals include planning, design and development methods that include environmentally responsible site selection, building design, building siting and development to protect, restore and enhance the environmental quality of the site and respect the integrity of adjacent properties. Additionally, with the adoption of Senate Bill 2, the Renewables Portfolio Standard (RPS) mandates that 33 percent of electricity delivered in California be generated by renewable sources such as solar, wind, and geothermal by 2020.

Los Angeles County General Plan 2035. The County of Los Angeles has defined one goal, and related policy that are relevant to consideration of conflicts with local plans for renewable energy or energy:

- Goal CNR 12: Sustainable management of renewable and non-renewable energy resources
 - Policy C/NR 12.1: Encourage the production and use of renewable energy resources

In the most recent energy briefing for the County of Los Angeles, the progress towards increasing reliance on renewable sources of energy was described

Energy generation is distributed throughout Los Angeles County, with concentrations in Long Beach and Lancaster. The County is a leader in solar generation, producing and using more renewable energy than ever before. While, as of 2018, utility-scale wind facilities are currently prohibited in all unincorporated areas within the county, utility-scale solar generation increased by over one million Megawatt Hours (MWh) between 2012 and 2015 and reached over 575 MW of capacity in 2015. A total of 475 MW of rooftop solar was installed in the County as of 2015, mainly in Southern California Edison (SCE) territory. Overall, approximately 14% of the County's electricity generation came from renewable energy sources in 2015. While this represents an increase from years prior, it is equivalent to less than 5% of the County's electricity consumption. Utilities serving L.A. County show a gravitation towards renewable energy purchases with some cities representing nearly 35% of energy consumption with renewable energy purchasing.

Threshold of Significance

A significant impact to a state or local plan for renewable energy or energy efficiency would occur if the Green Zones Program conflicted or obstructed the implementation of strategies established in adopted State or local plans.

⁹ California Building Standards Commission. Effective January 1, 2017. 2016 California Green Building Standards Code. CALGreen (Part 11 of Title 24). <http://www.bsc.ca.gov/Home/CALGreen.aspx>

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to energy in relation to conflicting with or obstructing a state or local plan for renewable energy or energy efficiency. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. Development standards for the Green Zone Districts and New Sensitive Uses Adjacent to Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would include landscaping barriers, enclosed buildings, fencing, solid walls, signage, paving of permeable areas, and lighting as measures to decrease impacts to surrounding sensitive uses. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions. All improvements required to constructed, operated, or maintained would be required to conform to the California Energy Code; therefore, there would be on conflict with the California Code. Since, at the time of this analysis, the County General Plan and zoning ordinance do not allow for development of utility scale renewable energy, the development standards would have no effect on the achieving RPS established by the State. Similarly, energy required for construction, operation, and maintenance of the proposed improvements such as lighting and signs would be provided by public and investor owned utilities, such as Southern California Edison, Los Angeles Department of Water and Power, and other private and municipal power companies who are required by the State to achieve Renewable Portfolio Standard. Thus, the project would be consistent with State and County goals that encourage reliance on sustainable renewable energy. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to energy in relation to conflicting with or obstructing a state or local plan for renewable energy or energy efficiency. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to energy in relation to conflicting with or obstructing a state or local plan for renewable energy or energy efficiency. ~~The new development standards would implement energy-efficient provisions through the use of improved recycling facilities and practices and enforcing proper maintenance of the facilities to reduce emissions and impacts to sensitive receptors. Development Standards include prohibitions on areas where certain specific uses would be prohibited (Table 2.6-1).~~ The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded

landscaping buffers between incompatible uses; standards for windows; and placement of balconies devices (see Table 1.IV-2). In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions. All improvements required to constructed, operated, or maintained would be required to conform to the California Energy Code; therefore, there would be no conflict with the California Code. Since, at the time of this analysis, the County General Plan and zoning ordinance do not allow for development of utility scale renewable energy, the development standards would have no effect on the achieving RPS established by the State. Similarly, energy required for construction, operation, and maintenance of the proposed improvements such as lighting and signs would be provided by public and investor owned utilities, such as Southern California Edison, Los Angeles Department of Water and Power, and other private and municipal power companies who are required by the State to achieve RPS. Thus, the project would be consistent with State and County goals that encourage reliance on sustainable renewable energy. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to energy in relation to conflicting with or obstructing a state or local plan for renewable energy or energy efficiency. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts to energy in relation to conflicting with or obstructing a state or local plan for renewable energy or energy efficiency. The proposed program would be in compliance with CALGreen and the RPS. The RPS aims to reduce emissions and requires private and public utilities to generate 50 percent of their power from renewable sources by 2030. The proposed program would support this RPS goals by implementing updated technologies and enforcing maintenance to comply with development standards to increase energy efficiency and use more recycled material and renewable energy within the facilities. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1), including prohibitions on areas where certain specific uses would be prohibited (~~Table 2.6-1~~). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs.

The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. The construction of a recycling collection center or compliance with development standards would not substantially alter the existing conditions.

All improvements would be required to conform to the California Energy Code; therefore, there would be on conflict with the California Code. Since, at the time of this analysis, the County General Plan and zoning ordinance do not allow

for development of utility scale renewable energy, the development standards would have no effect on achieving RPS established by the State. Similarly, energy required for construction, operation, and maintenance of the proposed improvements such as lighting and signs would be provided by public and investor owned utilities, such as Southern California Edison, Los Angeles Department of Water and Power, and other private and municipal power companies who are required by the State to achieve RPS. Thus, the project would be consistent with State and County goals that encourage reliance on sustainable renewable energy. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to energy in relation to conflicting with or obstructing a state or local plan for renewable energy or energy efficiency. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. The components of the program establish conditions and development standards for recycling processing facilities, recycling as an accessory use to a supermarket in all commercial, mixed use, and industrial zones, organic waste facilities, recycling collection and processing facilities, solid waste facilities, and pallet yards. The solid waste and organic waste facilities development standards would establish conditions including composting and in-vessel organic waste conversion and converting solid waste to gas or energy. The clean energy technologies implemented through the program would be in compliance with renewable energy regulations and goals.

Any projects developed under the proposed program's more stringent development standards would be required to comply with the more energy-efficient provisions of the County's Green Building Standards code, the current California Building Standards Code (24 CCR) and applicable CALGreen mandatory measures.¹⁰ All improvements required to constructed, operated, or maintained would conform to the California Energy Code; therefore, there would be no conflict with the California Code. Similarly, energy required for construction, operation, and maintenance of the proposed improvements such as lighting and signs would be provided by the County's Clean Power Alliance, which provide 100% renewable energy to all unincorporated area communities. Thus, the project would be consistent with State and County goals that encourage reliance on sustainable renewable energy. No further analysis is warranted.

¹⁰ California Building Standards Commission. Effective January 1, 2017. 2016 California Green Building Standards Code. CALGreen (Part 11 of Title 24). <http://www.bsc.ca.gov/Home/CALGreen.aspx>

2.7. GEOLOGY AND SOILS

This analysis is undertaken to determine if the proposed program may have a significant impact to geology and soils, thus requiring the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State CEQA Guidelines.¹ The analysis covers all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated with regard to Safety Element of the Los Angeles County General Plan 2035,² and Conservation and Natural Resources Element of the Los Angeles County General Plan 2035;³ and the Los Angeles County Code of Ordinances – Title 22 Planning and Zoning, California Division of Mines and Geology (CDMG), California Department of Conservation, California Geological Survey (CGS), Regulatory Maps.⁴

Definitions

Alluvium: An unconsolidated accumulation of stream deposited sediments, including sands, silts, clays, or gravels.

Extrusive Igneous Rocks: Rocks that crystallize from molten magma on earth's surface.

Fault: A fracture or fracture zone in rock along which movement has occurred.

Formation: A laterally continuous rock unit with a distinctive set of characteristics that make it possible to recognize and map from one outcrop or well to another. The basic rock unit of stratigraphy.

Holocene: An interval of time relating to, or denoting the present epoch, which is the second epoch in the Quaternary period, from approximately 11,000 years ago to the present time.

Miocene: An interval of time relating to, or denoting the fourth epoch of the Tertiary period, between the Oligocene and Pliocene epochs, from approximately 23 to 5.5 million years ago.

Oligocene: An interval of time relating to, or denoting the third epoch of the Tertiary period, between the Eocene and Miocene epochs, from approximately 34 to 23 million years ago.

Outcrop: A rock formation that is visible on earth's surface.

Paleocene: An interval of time, relating to, or denoting the earliest epoch of the Tertiary period, between the Cretaceous period and the Eocene epoch.

Paleozoic: An interval of time relating to or denoting the era between the Precambrian eon and the Mesozoic era.

Pleistocene: An interval of time relating to, or denoting the first epoch of the Quaternary period, between the Pliocene and Holocene epochs, from approximately 2.6 million years ago to 11,000 years ago.

Pliocene: An interval of time relating to, or denoting the last epoch of the Tertiary period, between the Miocene and Pleistocene epochs, from approximately 5.5 to 2.6 million years ago.

Plutonic Igneous Rocks: Igneous rocks that have crystallized beneath the earth's surface.

Quaternary: The most recent period in geological time; includes the Pleistocene and Holocene Epochs.

- a) **Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:**
- i) **Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known active fault trace? Refer to Division of Mines and Geology Special Publication 42.**

Existing Conditions

Under the Alquist-Priolo Earthquake Fault Zoning Act, the State Geologist is required to delineate “earthquake zones” (formerly called “special studies” zones) along known active faults. An active fault is one that has demonstrated offset of Holocene materials (less than 11,000 years ago) or significant seismic activity. Potentially active faults have demonstrated movement within Pleistocene time (approximately 1.6 million years ago). According to the CDMG, active and potentially active faults must be considered as potential sources of fault rupture. Cities or counties affected by the zones must regulate development within the designated zones. Approval of building permits for sites within State-designated zones must be withheld until geologic investigation demonstrates that a proposed development is not threatened by surface displacement from future seismic activity. Active or potentially active faults are mapped within the proposed program boundaries (Table 2.7-1, *Active and Potentially Active Faults within 2 Miles of the Proposed Ordinance*).

**TABLE 2.7-1
ACTIVE AND POTENTIALLY ACTIVE FAULTS WITHIN
2 MILES OF THE PROPOSED GREEN ZONES PROGRAM**

Fault	Predominant Style of Faulting	Site-to-Source Approximate Distance to Proposed Green Zones Program¹
Anacapa-Dume	Strike-Slip and Reverse	Approximately 2 miles west
Hollywood	Left-Reverse	Approximately 2 miles west
Malibu Coast Fault	Reverse	Approximately 0.5 mile west
Newport-Inglewood	Right-Lateral Strike-Slip	Intersects
Oak Ridge (Onshore)	Reverse	Approximately 2 miles to the west
San Andreas	Right Lateral Strike-Slip	Intersects
San Fernando-Sierra Madre-Cucamonga	Reverse (Thrust)	Intersects
San Gabriel	Primarily Right Lateral Strike Slip	Intersects
Santa Monica Fault	Left-Reverse	Intersects
Santa Susana	Reverse (Thrust)	Intersects
Simi-Santa Rosa- Northridge	Reverse	Intersects
Whittier-Elsinore	Lateral Strike Slip	Intersects

KEY: ¹ Shortest (map) distance from the nearest ordinance location to the inferred fault plane.

The Transverse Ranges (represented by the San Gabriel Mountains in Angeles National Forest, the Santa Susana Mountains, and mountains of the southern Los Padres National Forests in the proposed program area) are an anomalous west-trending geological province of deformation associated with relative movement of the North American and Pacific Tectonic Plates. The majority of the Los Angeles Basin (south of the mountains) lies within the northwest-trending Peninsular Ranges Geomorphic Province, which represents the prevailing structural orientation of California. Associated northwest-trending surface faults are the San Andreas, San Jacinto, Whittier-Elsinore, Palos Verdes, and Newport-Inglewood faults (Figure 2.7-1, *Alquist-Priolo Fault Lines*). Major surface faults and fault zones associated with the Transverse Ranges generally parallel the Province and include: the Malibu Coast, Anacapa-Dume, Oak Ridge, Santa Monica, Hollywood, Santa Susana, Simi-Santa Rosa-Northridge, San Fernando-Sierra Madre-Cucamonga, and San Gabriel faults (Figure 2.7-1).

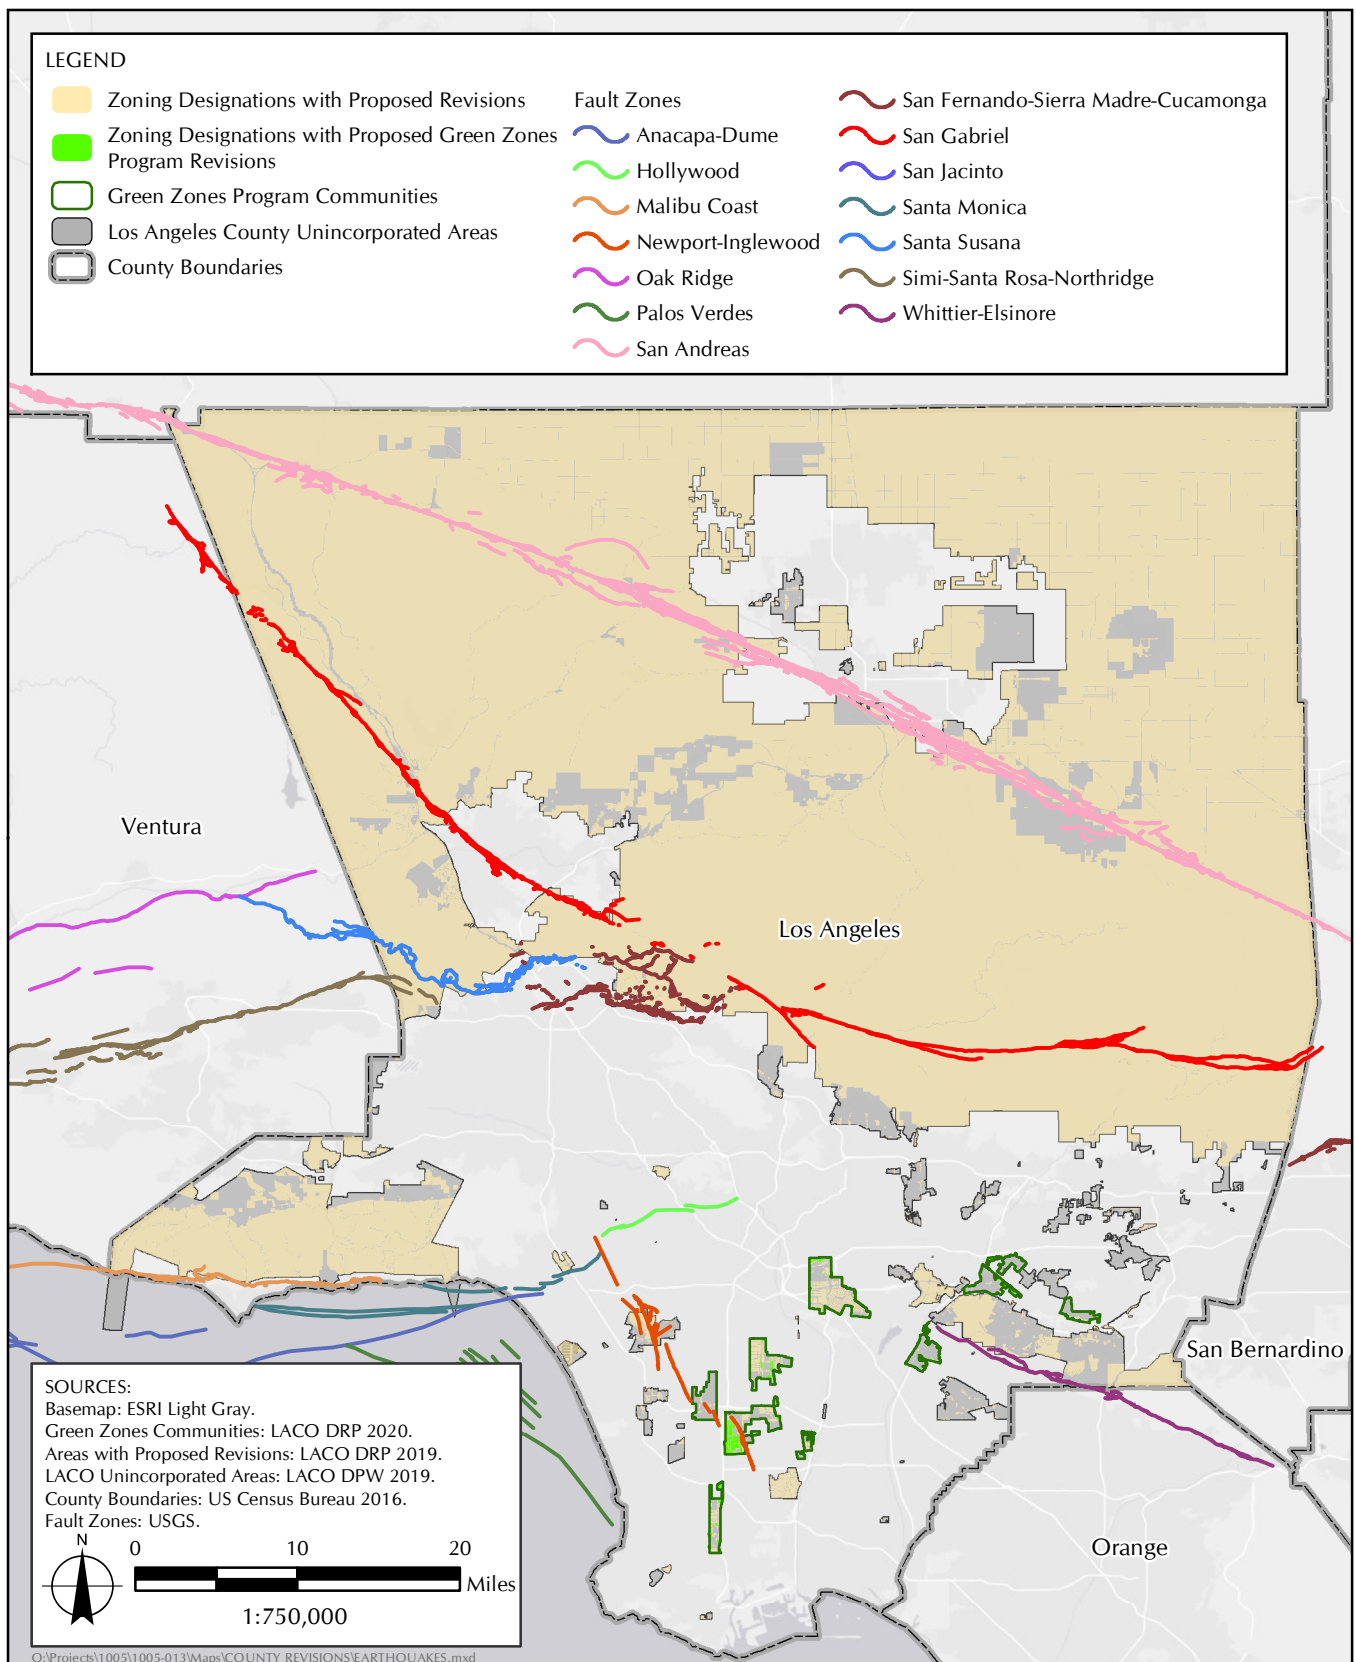

FIGURE 2.7-1
 Alquist-Priolo Earthquake Fault Lines

Thresholds of Significance

The proposed program would result in significant impacts in relation to geology and soils if it results in a direct or indirect substantial adverse effect, including the risk of loss, injury, or death involving rupture of a known earthquake fault.

Impact Analysis

Element 1 – Green Zone Districts

The Green Zone Districts element of the proposed program would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts related to the exposure of people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum floor area ratio (FAR) requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault.

The requirements of the Alquist-Priolo Earthquake Fault Zoning Act aim to prevent the construction of residential buildings along traces of active fault. While Alquist-Priolo Earthquake Fault Zones or other active or potentially active faults are located within, near or projecting toward the proposed program site, the Green Zone Districts element does not include the development of residential or habitable buildings or structures, but rather includes new development standards and/or more stringent entitlement process for development. Further, through the California Building Code (CBC), building design and construction requirements are implemented to reduce any hazards from earthquakes and safeguard against major structural failures or loss of life caused by earthquakes or seismic related hazards. The proposed program would be required to adhere to the provisions of the CBC, as required by the County Code during the plan check and development review process, thus, reducing potential impacts related to rupture of a known earthquake fault to less than significant levels. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts related to the exposure of people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; and placement of balconies; and air filtration devices (see Table 1.IV-1). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, and lighting, as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in impacts to geology and soils in relation to directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault.

Implementation of the New Sensitive Uses Element of the proposed program would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. Implementation of the New Sensitive Uses Element would be developed in accordance with the California Building Code and the Safety Element of the Los Angeles County General Plan and be consistent with the County's zoning standards and requirements. As discussed the New Sensitive Uses Element would require measures where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity adjacent to or adjoining legally-established,~~ existing industrial uses. The requirements of the Alquist-Priolo Earthquake Fault Zoning Act aim to prevent the construction of residential buildings along traces of active fault. While Alquist-Priolo Earthquake Fault Zones or other active or potentially active faults are located within, near or projecting toward the proposed program site. The New Sensitive Uses element would include measures for development would not exacerbate existing geologic conditions. Thus, impacts related to impacts to geology and soils in relation directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault would be less than significant. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions.

As discussed previously, implementation of the proposed program would adhere to provisions of the CBC, as required by the County Code during the plan check and development review process, thus, reducing potential impacts related to rupture of a known earthquake fault to less than significant levels. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from Hillside Management Areas (HMA), Significant Ecological Areas (SEA), and Very High Fire Hazard Severity Zones (VHFHSZ). Additionally, in-vessel organic waste facilities are prohibited in Agricultural Resource Areas (ARA).~~ Therefore, impacts to Recycling and Waste Management Revisions would be less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. No further analysis is warranted.

Implementation of the Recycling and Waste Management Revisions element of the proposed program would not be expected to result in impacts to geology and soils related to directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. The requirements of the Alquist-Priolo Earthquake Fault Zoning Act aim to prevent the construction of residential buildings along traces of active fault. While Alquist-Priolo Earthquake Fault Zones or other active or potentially active faults are located within, near or projecting toward the proposed program site, the element does not include the development of residential or habitable buildings or structures, but rather includes new development standards and/or more stringent entitlement process for development. Further, through the California Building Code, building design and construction requirements are implemented to reduce any hazards from earthquakes and safeguard against major structural failures or loss of life caused by earthquakes or seismic related hazards. As discussed previously, implementation of the proposed program would adhere to provisions of the CBC, as required by the County Code during the plan check and development review process, thus, reducing potential impacts related to rupture of a known earthquake fault to less than significant levels.

Therefore, impacts to geology and soils related to directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault would be less than significant. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket

Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built.

The requirements of the Alquist-Priolo Earthquake Fault Zoning Act aim to prevent the construction of residential buildings along traces of active fault. While Alquist-Priolo Earthquake Fault Zones or other active or potentially active faults are located within, near or projecting toward the proposed program site, this element does not include the development of residential or habitable buildings or structures, but rather includes new development standards and/or more stringent entitlement process for development. Further, through the California Building Code, building design and construction requirements are implemented to reduce any hazards from earthquakes and safeguard against major structural failures or loss of life caused by earthquakes or seismic related hazards. As discussed previously, implementation of the proposed program would adhere to provisions of the CBC, as required by the County Code during the plan check and development review process, thus, reducing potential impacts related to rupture of a known earthquake fault to less than significant levels. Therefore, the Supermarket Accessory Recycling Collection Centers would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

The requirements of the Alquist-Priolo Earthquake Fault Zoning Act aim to prevent the construction of residential buildings along traces of active fault. While Alquist-Priolo Earthquake Fault Zones or other active or potentially active faults are located within, near or projecting toward the proposed program site, this element does not include the development of residential or habitable buildings or structures, but rather includes new development standards and/or more stringent entitlement process for development. Further, through the California Building Code, building design and construction requirements are implemented to reduce any hazards from earthquakes and safeguard against major structural failures or loss of life caused by earthquakes or seismic related hazards, thus, reducing potential impacts related to rupture of a known earthquake fault to less than significant levels. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. No further analysis is warranted.

ii) Strong seismic ground shaking?

Existing Conditions

The primary effects of an earthquake are fault rupture and ground shaking. Earthquake shaking can generate secondary effects as these ground motions permanently deform and dislocate some near-surface earth materials. Ground failure

can include affects ranging from simple ground cracking to complex lateral spreading landslides. Failures may be associated with saturated deposits (liquefaction) or unsaturated deposits (densification).

The proposed program area, and Los Angeles County in general, contains numerous active earthquake faults, with active or potentially active faults mapped within the proposed program boundaries listed in Table 2.7-1, and shown in Figure 2.7-1. Of the faults listed, the southern section of the San Andreas Fault is estimated to be capable of generating the largest earthquake, potentially in excess of Mw 7.1.⁵

Thresholds of Significance

The proposed program would result in significant impacts in relation to geology and soils if it results in a direct or indirect substantial adverse effect, including the risk of loss, injury, or death involving strong seismic ground shaking.

Impact Analysis

Element 1 – Green Zone Districts

The Green Zone Districts element would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking.

As discussed, the proposed program area, and Los Angeles County in general, contains numerous active earthquake faults, with active or potentially active faults mapped within the proposed program boundaries listed in Table 2.7-1 and shown in Figure 2.7-1. Of the faults listed, the southern section of the San Andreas Fault is estimated to be capable of generating the largest earthquake, potentially in excess of Mw 7.1. However, implementation of the Green Zone Districts element of the proposed program would not result in impacts over those currently existing within the proposed program area. Although strong seismic shaking is a risk throughout Southern California region, the proposed program site does not contain any greater risk of seismic activity or impacts when compared with other areas within Southern California. Further, through the California Building Code, building design and construction requirements are

⁵ County of Los Angeles. June 2014. Los Angeles County General Plan Update Draft EIR. http://planning.lacounty.gov/assets/upl/project/gp_2035_deir.pdf

implemented to reduce hazards from earthquakes and safeguard against major structural failures or loss of life caused by earthquakes or other geologic hazards. The County has adopted the most recent version of the CBC by reference and are included in the County Code, Title 26, Chapters 2 through 35. The Green Zone Districts element of the proposed program would be required to adhere to the provisions of the CBC, as required by the County Code during the plan check and development review process.

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts in relation to the exposure of people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. No further analysis is warranted.

Element 2 - New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; and placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, and lighting, as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions.

Although strong seismic shaking is a risk throughout Southern California region, the proposed program site does not contain any greater risk of seismic activity or impacts when compared with other areas within Southern California. Further, through the California Building Code, building design and construction requirements are implemented to reduce hazards from earthquakes and safeguard against major structural failures or loss of life caused by earthquakes or other geologic hazards. The County has adopted the most recent version of the CBC by reference and are included in the County Code, Title 26, Chapters 2 through 35. The New Sensitive Uses element of the proposed program would be required to adhere to the provisions of the CBC, as required by the County Code during the plan check and development review process, thus, reducing potential impacts related to strong seismic ground shaking to less than significant levels.

These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~

Although strong seismic shaking is a risk throughout Southern California region, the proposed program site does not contain any greater risk of seismic activity or impacts when compared with other areas within Southern California. Further, through the California Building Code, building design and construction requirements are implemented to reduce hazards from earthquakes and safeguard against major structural failures or loss of life caused by earthquakes or other geologic hazards. The County has adopted the most recent version of the CBC by reference and are included in the County Code, Title 26, Chapters 2 through 35. The Recycling and Waste Management Revisions element of the proposed program would be required to adhere to the provisions of the CBC, as required by the County Code during the plan check and development review process, thus, reducing potential impacts related to strong seismic ground shaking to less than significant levels. Therefore, impacts to Recycling and Waste Management Revisions would be less than significant in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket

Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built.

Although strong seismic shaking is a risk throughout Southern California region, the proposed program site does not contain any greater risk of seismic activity or impacts when compared with other areas within Southern California. Further, through the California Building Code, building design and construction requirements are implemented to reduce hazards from earthquakes and safeguard against major structural failures or loss of life caused by earthquakes or other geologic hazards. The County has adopted the most recent version of the CBC by reference and are included in the County Code, Title 26, Chapters 2 through 35. The Supermarket Accessory Recycling Collection Centers element of the proposed program would be required to adhere to the provisions of the CBC, as required by the County Code during the plan check and development review process, thus, reducing potential impacts related to strong seismic ground shaking to less than significant levels. Therefore, the Supermarket Accessory Recycling Collection Centers element would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

Although strong seismic shaking is a risk throughout Southern California region, the proposed program site does not contain any greater risk of seismic activity or impacts when compared with other areas within Southern California. Further, through the California Building Code, building design and construction requirements are implemented to reduce hazards from earthquakes and safeguard against major structural failures or loss of life caused by earthquakes or other geologic hazards. The County has adopted the most recent version of the CBC by reference and are included in the County Code, Title 26, Chapters 2 through 35. The Storage Enclosures for Recycling and Solid Waste Revisions element of the proposed program would be required to adhere to the provisions of the CBC, as required by the County Code during the plan check and development review process, thus, reducing potential impacts related to strong seismic ground shaking to less than significant levels. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions element would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. No further analysis is warranted.

iii) Seismic-related ground failure, including liquefaction and lateral spreading?

Existing Conditions

The three key factors that indicate whether an area is potentially susceptible to liquefaction are severe ground shaking, shallow groundwater, and cohesionless sands. In addition to having ground-shaking parameters, quantitative estimates of liquefaction potential require specific data from geotechnical borings and groundwater level information. Although there is some potential for deep liquefaction deeper than approximately 50 feet below ground surface (bgs), liquefaction potential is substantially higher where water has historically been found less than 30 to 50 feet bgs. There is a potential for liquefaction to occur in the various areas within the proposed program area as presented in Figure 2.7-2, *Landslide and Liquefaction Zones*, based on the CGS Seismic Hazard Maps.

FIGURE 2.7-2
 Landslide and Liquefaction Zones

Thresholds of Significance

The proposed program would result in significant impacts in relation to geology and soils if it results in a direct or indirect substantial adverse effect, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction.

Impact Analysis

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2. The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions. While areas of the proposed program site are situated within CGS-designated Liquefaction Zones, implementation of the proposed program would not exacerbate underlying geologic and seismic conditions at the proposed program site resulting in seismic related ground-failure or liquefaction. The proposed program would be required to adhere to existing building and grading codes including adherence to provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to liquefaction or potential seismic-related ground failure. Compliance with existing state and county regulations, as well as the goals and policies included as part of the proposed program, would ensure that the impacts associated with implementation of the proposed program in relation to liquefaction, would be minimized to less than significant levels.

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. Currently the zoning and land use designations that permit sensitive uses do not have

requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; and placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions.

While areas of the proposed program site are situated within CGS-designated Liquefaction Zones, implementation of the proposed program would not exacerbate underlying geologic and seismic conditions at the proposed program site resulting in seismic related ground-failure or liquefaction. The proposed program would be required to adhere to existing building and grading codes including adherence to provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to liquefaction or potential seismic-related ground failure. Compliance with existing state and county regulations, as well as the goals and policies included as part of the proposed program, would ensure that the impacts associated with implementation of the proposed program in relation to liquefaction, would be minimized to less than significant levels. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would result in impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction.

While areas of the proposed program site are situated within CGS-designated Liquefaction Zones, implementation of the proposed program would not exacerbate underlying geologic and seismic conditions at the proposed program site resulting in seismic related ground-failure or liquefaction. The proposed program would be required to adhere to existing building and grading codes including adherence to provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to liquefaction or potential seismic-related ground failure. Compliance with existing state and county regulations, as well as the goals and policies included as part of the proposed program, would ensure that the impacts associated with implementation of the proposed program in relation to liquefaction, would be minimized to less than significant levels.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height

restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ Therefore, impacts to Recycling and Waste Management Revisions would be less than significant in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built.

While areas of the proposed program site are situated within CGS-designated Liquefaction Zones, implementation of the proposed program would not exacerbate underlying geologic and seismic conditions at the proposed program site resulting in seismic related ground-failure or liquefaction. The proposed program would be required to adhere to existing building and grading codes including adherence to provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to liquefaction or potential seismic-related ground failure. Compliance with existing state and county regulations, as well as the goals and policies included as part of the proposed program, would ensure that the impacts associated with implementation of the proposed program in relation to liquefaction, would be minimized to less than significant levels. Therefore, the Supermarket Accessory Recycling Collection Centers would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. Any new development or expansion of existing development

would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. While areas of the proposed program site are situated within CGS-designated Liquefaction Zones, implementation of the proposed program would not exacerbate underlying geologic and seismic conditions at the proposed program site resulting in seismic related ground-failure or liquefaction. The proposed program would be required to adhere to existing building and grading codes including adherence to provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to liquefaction or potential seismic-related ground failure. Compliance with existing state and county regulations, as well as the goals and policies included as part of the proposed program, would ensure that the impacts associated with implementation of the proposed program in relation to liquefaction, would be minimized to less than significant levels. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. No further analysis is warranted.

iv) Landslides?

Existing Conditions

The County's Hillside Management Area Ordinance and the Hillside Design Guidelines regulates, through the permitting process, development on hillsides that have natural slope gradients of 25 percent or steeper with potential hazards.

The topography of the proposed program ranges from flat slightly dissected desert plains to rolling hills to rugged mountains and canyons. The topography is defined by two geomorphic provinces: the Transverse Ranges and the Mojave Desert. The Transverse Ranges are an anomalous east-west-trending group of mountain ranges (most California mountain ranges trend approximately northwest to southeast) that divide the Los Angeles Basin from the Mojave Desert. The anomalous east-west orientation of the Transverse Ranges is due to rotation along the San Andreas Fault System during the Miocene.⁶ The Mojave Desert Geomorphic Province is located north of the Transverse Ranges Geomorphic Province and is bounded on the east by the Colorado River and Nevada-California border, on the north by the Garlock Fault, and the Los Angeles Basin on the south.

In the case of slope instability, static slope instability can arise for many reasons (e.g., adverse geologic bedding, overly steep slopes, saturation of weak materials) in hillside areas. Earthquake shaking can destabilize earth materials, which under static conditions may be stable or marginally stable. The CDMG maps such areas for planning purposes, primarily considering slope angle, seismic intensity, and material type. The landslide areas that traverse the proposed program site are presented in Figure 2.7-2.

Thresholds of Significance

The proposed program would result in significant impacts in relation to geology and soils if it results in a direct or indirect substantial adverse effect, including the risk of loss, injury, or death involving landslides.

Impact Analysis

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the

⁶ Harden, Deborah R. 2004. California Geology. 2nd Edition. New Jersey: Pearson Education, Inc.

risk of loss, injury, or death involving landslides. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions.

While areas of the Green Zone Districts element are situated on a variety of ground surfaces including relatively level ground and steep mountain/canyon slopes that could be potentially susceptible to slope instability. According to the CDMG, areas within the proposed program are situated within a Seismic Hazard Zone. However, while these areas of the are situated within CGS-designated Landslide Zones, implementation of the proposed program would not exacerbate underlying geologic and seismic conditions at the proposed program site. The proposed program would be required to adhere to existing building and grading codes including adherence to provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to landslides or potential geologic or soil stability issues. Compliance with existing state and County regulations, as well as the goals and policies included as part of the proposed program, would ensure that the impacts associated with implementation the Green Zone Districts element of the proposed program in relation to landslides, would be minimized to less than significant levels. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. While areas of the New Sensitive Uses element are situated on a variety of ground surfaces including relatively level ground and steep mountain/canyon slopes that could be potentially susceptible to slope instability. According to the CDMG, areas within the proposed program are situated within a Seismic Hazard Zone. However, while these areas of the are situated within CGS-designated Landslide Zones, implementation of the proposed program would not exacerbate underlying geologic and seismic conditions at the proposed program site. The proposed program would be required to adhere to existing building and grading codes including adherence to provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to landslides or potential geologic or soil stability issues. Compliance with existing state and County regulations, as well as the goals and policies included as part of the proposed program, would ensure that the impacts associated with implementation the New Sensitive Uses element of the proposed program in relation to landslides, would be minimized to less than significant levels.

Currently, the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the

zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity adjacent to or adjoining~~ existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving landslides.

These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would result in impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving landslides.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. While areas of the Recycling and Waste Management Revisions element are situated on a variety of ground surfaces including relatively level ground and steep mountain/canyon slopes that could be potentially susceptible to slope instability. According to the CDMG, areas within the proposed program are situated within a Seismic Hazard Zone. However, while these areas of the are situated within CGS-designated Landslide Zones, implementation of the proposed program would not exacerbate underlying geologic and seismic conditions at the proposed program site. The proposed program would be required to adhere to existing building and grading codes including adherence to provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to landslides or potential geologic or soil stability issues.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ Therefore, impacts to Recycling and Waste Management Revisions would be less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built.

While areas of the Supermarket Accessory Recycling Collection Centers element are situated on a variety of ground surfaces including relatively level ground and steep mountain/canyon slopes that could be potentially susceptible to slope instability. According to the CDMG, areas within the proposed program are situated within a Seismic Hazard Zone. However, while these areas of the are situated within CGS-designated Landslide Zones, implementation of the proposed program would not exacerbate underlying geologic and seismic conditions at the proposed program site. The proposed program would be required to adhere to existing building and grading codes including adherence to provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to landslides or potential geologic or soil stability issues. Therefore, the Supermarket Accessory Recycling Collection Centers element would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. No further analysis is warranted. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

While areas of the Storage Enclosures for Recycling and Solid Waste Revisions element are situated on a variety of ground surfaces including relatively level ground and steep mountain/canyon slopes that could be potentially susceptible to slope instability. According to the CDMG, areas within the proposed program are situated within a Seismic Hazard Zone. However, while these areas of the are situated within CGS-designated Landslide Zones, implementation of the proposed program would not exacerbate underlying geologic and seismic conditions at the proposed program site. The proposed program would be required to adhere to existing building and grading codes including adherence to provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to landslides or potential geologic or soil stability issues. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in relation to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. No further analysis is warranted.

b) Result in substantial soil erosion or the loss of topsoil?

Existing Conditions

Erosion of earth materials is the process of wearing away and transport due to concentrated water, wind, or gravitational forces. Harder, denser, and more cemented bedrock formations (usually older) will erode much less than softer, uncemented alluvium under the same forces. Erosion by water and gravity is usually more severe on steep terrain/slopes than on relatively flat ground, and in seismically active (uplifting) areas. The shale, siltstone, and claystone bedrock formations will generally have low erosion potential due to their higher density and some cementation. Sandstones and conglomerates with a sandy matrix will generally have low to moderate erosion potential due to the presence of some cementation. Holocene alluvium and colluvium/soil are softer and less dense than the other deposits and, therefore, will have a moderate to high erosion potential where exposed. New cut slopes or newly graded fill slopes will have relatively high to low erosion potential for Holocene alluvium, artificial fill, and bedrock, respectively.

Thresholds of Significance

The proposed program would result in significant impacts in relation to geology and soils if it results in substantial soil erosion or loss of topsoil

Impact Analysis

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions.

The proposed program is not expected to result in impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. As discussed, erosion of earth materials is the process of wearing away and transport due to concentrated water, wind, or gravitational forces. Harder, denser, and more cemented bedrock formations (usually older) will erode much less than softer, uncemented alluvium under the same forces. Erosion by water and gravity is usually more severe on steep terrain/slopes than on relatively flat ground, and in seismically active (uplifting) areas. The shale, siltstone, and claystone bedrock formations will generally have low erosion potential due to their higher density and some cementation. Sandstones and conglomerates with a sandy matrix will generally have low to moderate erosion

potential due to the presence of some cementation. Holocene alluvium and colluvium/soil are softer and less dense than the other deposits and, therefore, will have a moderate to high erosion potential where exposed. New cut slopes or newly graded fill slopes will have relatively high to low erosion potential for Holocene alluvium, artificial fill, and bedrock, respectively. Implementation of the Green Zone Districts element would be developed in accordance with the California Building Code and the Safety Element of the Los Angeles County General Plan and consistent with the County's zoning standards and requirements. Furthermore, construction activities on any project sites larger than 1 acre would be subject to National Pollutant Discharge Elimination System (NPDES) requirements and the preparation and implementation of a Stormwater Pollution Prevention Plan (SWPPP) would be required as well as deployment of approved erosion control best management practices (BMP).

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. Implementation of the New Sensitive Uses element would be developed in accordance with the California Building Code and the Safety Element of the Los Angeles County General Plan and consistent with the County's zoning standards and requirements. Furthermore, construction activities on any project sites larger than 1 acre would be subject to NPDES requirements and the preparation and implementation of a SWPPP would be required as well as deployment of approved erosion control BMPs. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not result in impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. Implementation of the Recycling and Waste Management Revisions element would be developed in accordance with the California Building Code and the Safety Element of the Los Angeles County General Plan and consistent with the County's zoning standards and requirements. Furthermore, construction activities on any project sites larger than 1 acre

would be subject to NPDES requirements and the preparation and implementation of a SWPPP would be required as well as deployment of approved erosion control BMPs. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ Therefore, impacts to Recycling and Waste Management Revisions would be less than significant impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. Implementation of the Supermarket Accessory Recycling Collection Centers would be developed in accordance with the California Building Code and the Safety Element of the Los Angeles County General Plan and consistent with the County’s zoning standards and requirements. Furthermore, construction activities on any project sites larger than 1 acre would be subject to NPDES requirements and the preparation and implementation of a SWPPP would be required as well as deployment of approved erosion control BMPs. Therefore, the Supermarket Accessory Recycling Collection Centers would have less than significant impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. Any new development or expansion of existing

development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. Implementation of the Storage Enclosures for Recycling and Solid Waste Revisions element would be developed in accordance with the California Building Code and the Safety Element of the Los Angeles County General Plan and consistent with the County's zoning standards and requirements. Furthermore, construction activities on any project sites larger than 1 acre would be subject to NPDES requirements and the preparation and implementation of a SWPPP would be required as well as deployment of approved erosion control BMPs. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to geology and soils in relation to substantial soil erosion and loss of topsoil. No further analysis is warranted.

- c) **Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?**

Existing Conditions

Dry to partially saturated sediments that may not be susceptible to liquefaction may be susceptible to dynamic consolidation and local ground subsidence during strong earthquake shaking. This consolidation or densification occurs in loose, cohesionless sediments as the void spaces are diminished due to grain-to-grain compaction from the intense seismic shaking. Bedrock has a low potential for dynamic consolidation, engineered artificial fill has a moderate potential, and the younger alluvium has the highest potential. Variations in vertical subsidence may occur within a small area, such as an individual lot or beneath an individual structure. Settlements of 5 to 30 centimeters (2 to 12 inches) can occur during strong earthquake shaking, as was the case during in the 1994 Northridge event. The amount of dynamic consolidation and subsidence would not be consistent from location to location throughout the proposed program area.

Thresholds of Significance

The proposed program would result in significant impacts in relation to geology and soils if located on a geologic unit or soil that is unstable, or that would become unstable as a result of the proposed program, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.

Impact Analysis

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts to geology and soils in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result less than significant impacts to geology and soils in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific

industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to ~~7~~ 10 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in impacts in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. Implementation of the proposed program recycling and waste management revisions would not be expected to result in impacts to geology and soils in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.

Implementation of the Green Zone Districts element would be developed in accordance with the California Building Code and the Safety Element of the Los Angeles County General Plan and consistent with the County's zoning standards and requirements. As discussed previously, adherence to existing building and grading codes including provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to liquefaction, subsidence, and other potential geologic or soil stability issues would ensure that the impacts associated with implementation of the proposed program, atop unstable geologic units and soil, would be minimized to less than significant levels. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to geology and soils in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to geology and soils in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions.

Implementation of the New Sensitive Uses element would be developed in accordance with the California Building Code and the Safety Element of the Los Angeles County General Plan and consistent with the County's zoning standards and requirements. As discussed previously, adherence to existing building and grading codes including provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to liquefaction, subsidence, and other potential geologic or soil stability issues would ensure that the impacts associated with

implementation of the proposed program, atop unstable geologic units and soil, would be minimized to less than significant levels.

These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not result in impacts to geology and soils in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts to geology and soils in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to geology and soils in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. Implementation of the Recycling and Waste Management Revisions element would be developed in accordance with the California Building Code and the Safety Element of the Los Angeles County General Plan and consistent with the County's zoning standards and requirements. As discussed previously, adherence to existing building and grading codes including provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to liquefaction, subsidence, and other potential geologic or soil stability issues would ensure that the impacts associated with implementation of the proposed program, atop unstable geologic units and soil, would be minimized to less than significant levels. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ Therefore, impacts to Recycling and Waste Management Revisions would be less than significant in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts to geology and soils in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that "contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code" (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently

developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. Implementation of the Supermarket Accessory Recycling Collection Centers be developed in accordance with the California Building Code and the Safety Element of the Los Angeles County General Plan and consistent with the County's zoning standards and requirements. As discussed previously, adherence to existing building and grading codes including provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to liquefaction, subsidence, and other potential geologic or soil stability issues would ensure that the impacts associated with implementation of the proposed program, atop unstable geologic units and soil, would be minimized to less than significant levels. Therefore, the Supermarket Accessory Recycling Collection Centers would have less than significant impacts to geology and soils in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to geology and soils in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. Implementation of the Storage Enclosures for Recycling and Solid Waste Revisions element would be developed in accordance with the California Building Code and the Safety Element of the Los Angeles County General Plan and consistent with the County's zoning standards and requirements. As discussed previously, adherence to existing building and grading codes including provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards related to liquefaction, subsidence, and other potential geologic or soil stability issues would ensure that the impacts associated with implementation of the proposed program, atop unstable geologic units and soil, would be minimized to less than significant levels. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to geology and soils in relation to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. No further analysis is warranted.

- d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?**

Existing Conditions

Expansive surficial materials are found within various parts of the proposed program area. The siltstone, claystone, shale, sandstone, and conglomerate units of the surficial sediments and formations have expansion potential that is variable. These units are generally moderately to highly expansive for shale, siltstone, and claystone beds and are non-expansive to slightly expansive for sandstone and conglomerate beds. Surficial deposits of young and older alluvium, playa clays, and colluvium/soil can be fine-grained due to the nature of the surrounding bedrock formations, and are therefore generally moderately to highly expansive, depending on the clay content. In areas where the surficial young

and older alluvial deposits have higher gravel content and less clay, they are more often than not non-expansive to slightly expansive.

Thresholds of Significance

The project would result in significant impacts in relation to geology and soils if the project is located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property.

Impact Analysis

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts to geology and soils in relation to being located on expansive soil creating substantial risks to life or property. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to geology and soils in relation to being located on expansive soil creating substantial risks to life or property. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions.

Implementation of the Green Zone Districts element would not involve development of inhabitable or residential buildings or structures. As a result, the proposed elements would not be expected to result in impacts to geology and soils in relation to being located on expansive soil creating substantial risks to life or property. While expansive surficial materials are found within the project area, development of the Green Zone Districts element would be in accordance with the County's Code and developed in accordance with the California Building Code adhering to existing building and grading codes containing provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards from unstable and expansive soils; and the Safety Element of the Los Angeles County General Plan and consistent with the County's zoning standards and requirements. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to geology and soils in relation to being located on expansive soil creating substantial risks to life or property. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to geology and soils in relation to being located on expansive soil creating substantial risks to life or property. Currently the zoning and land use designations that permit

sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling, ~~in close proximity to existing industrial uses~~ or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions.

Implementation of the New Sensitive Uses element would not involve development of inhabitable or residential buildings or structures. As a result, the proposed elements would not be expected to result in impacts to geology and soils in relation to being located on expansive soil creating substantial risks to life or property. While expansive surficial materials are found within the project area, development of the New Sensitive Uses element would be in accordance with the County's Code and developed in accordance with the California Building Code adhering to existing building and grading codes containing provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards from unstable and expansive soils; and the Safety Element of the Los Angeles County General Plan and consistent with the County's zoning standards and requirements.

These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not result in impacts in relation to being located on expansive soil creating substantial risks to life or property. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts to geology and soils in relation to being located on expansive soil creating substantial risks to life or property. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to geology and soils in relation to being located on expansive soil creating substantial risks to life or property. Implementation of the Recycling and Waste Management Revisions element would not involve development of inhabitable or residential buildings or structures. As a result, the proposed elements would not be expected to result in impacts to geology and soils in relation to being located on expansive soil creating substantial risks to life or property. While expansive surficial materials are found within the project area, development of the Recycling and Waste Management Revisions element would be in accordance with the County's Code and developed in accordance with the California Building Code adhering to existing building and grading codes containing provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards from unstable and expansive soils; and the Safety Element of the Los Angeles County General Plan and consistent with the County's zoning standards and requirements. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid

waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in vessel organic waste facilities are prohibited in ARAs. Therefore, impacts to Recycling and Waste Management Revisions would be less than significant in relation to being located on expansive soil creating substantial risks to life or property. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts to geology and soils in relation to being located on expansive soil creating substantial risks to life or property. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. Implementation of the Supermarket Accessory Recycling Collection Centers would not involve development of inhabitable or residential buildings or structures. As a result, the proposed elements would not be expected to result in impacts to geology and soils in relation to being located on expansive soil creating substantial risks to life or property. While expansive surficial materials are found within the project area, development of the elements Supermarket Accessory Recycling Collection Centers would be in accordance with the County’s Code and developed in accordance with the California Building Code adhering to existing building and grading codes containing provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards from unstable and expansive soils; and the Safety Element of the Los Angeles County General Plan and consistent with the County’s zoning standards and requirements. Therefore, the Supermarket Accessory Recycling Collection Centers would have less than significant in relation to being located on expansive soil creating substantial risks to life or property. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in relation to being located on expansive soil creating substantial risks to life or property. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. Implementation of Storage Enclosures for Recycling and Solid Waste Revisions element would not involve development of inhabitable or residential buildings or structures. As a result, the proposed elements would not be expected to result in impacts to geology and soils in relation to being located on expansive soil creating substantial risks to life or property. While expansive surficial materials are found within the project area, development of the Storage

Enclosures for Recycling and Solid Waste Revisions element would be in accordance with the County's Code and developed in accordance with the California Building Code adhering to existing building and grading codes containing provisions for grading, soil compaction, and soil preparation/conditioning to minimize hazards from unstable and expansive soils; and the Safety Element of the Los Angeles County General Plan and consistent with the County's zoning standards and requirements. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in relation to being located on expansive soil creating substantial risks to life or property. No further analysis is warranted.

e) Have soils incapable of adequately supporting the use of onsite wastewater treatment systems where sewers are not available for the disposal of wastewater?

Existing Conditions

The existing surficial conditions in portions of the proposed program area are those of cohesionless alluvial sands and gravels; however, the proposed program would not involve the construction or installation of septic tanks or alternative wastewater disposal systems.

Thresholds of Significance

The project would result in significant impacts in relation to geology and soils if the project proposes onsite wastewater treatment systems and is located on an area having soils incapable of adequately supporting the use of onsite wastewater treatment systems where sewers are not available for the disposal of wastewater.

Impact Analysis

Element 1 – Green Zone Districts

Green Zone Districts would not result in impacts to geology and soils in relation to location having soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would not result in impacts to geology and soils in relation to location having soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewer are not available for the disposal of waste water. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that geology and soils in relation to septic tanks or alternative waste systems would be impacted. As a result, the proposed program would not be expected to result in impacts to geology and soils in relation to having soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water. While the existing surficial conditions in parts

of the proposed program area are those of cohesionless alluvial sands and gravels; the proposed program would not involve the construction or installation of septic tanks or alternative wastewater disposal systems.

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would not result in impacts to geology and soils in relation being located in an area having soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewer are not available for the disposal of waste water. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would not result in impacts to geology and soils in relation to location having soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewer are not available for the disposal of waste water. the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses.~~ The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that geology and soils in relation to septic tanks or alternative waste systems would be impacted. As a result, the proposed program would not be expected to result in impacts to geology and soils in relation to having soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water. While the existing surficial conditions in parts of the proposed program area are those of cohesionless alluvial sands and gravels; the proposed program would not involve the construction or installation of septic tanks or alternative wastewater disposal systems. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not result in impacts to geology and soils in relation to location having soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewer are not available for the disposal of waste water. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would not result in impacts to geology and soils in relation to being located in ana area having soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewer are not available for the disposal of waste water. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would not result in impacts to geology and soils in relation to location having soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewer are not available for the disposal of waste water. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which it is permitted, and each development would be analyzed for project-level impacts in relation to on-site wastewater disposal systems. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for

permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. Therefore, no impacts would result from the implementation of the Recycling and Waste Management Revisions element in relation to being located in an area having soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewer are not available for the disposal of waste water. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers would not result in impacts to geology and soils in relation to location having soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. While the existing surficial conditions in parts of the proposed program area are those of cohesionless alluvial sands and gravels; the proposed program would not involve the construction or installation of septic tanks or alternative wastewater disposal systems. Therefore, no impacts would result from the implementation of the Supermarket Accessory Recycling Collection Centers in relation to being located in an area having soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewer are not available for the disposal of waste water. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would not result in impacts to geology and soils in relation to location having soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewer are not available for the disposal of waste water. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are

permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. While the existing surficial conditions in parts of the proposed program area are those of cohesionless alluvial sands and gravels; the proposed program would not involve the construction or installation of septic tanks or alternative wastewater disposal systems. Therefore, no impacts would result from the implementation of the Storage Enclosures for Recycling and Solid Waste Revisions element in relation to being located in an area having soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewer are not available for the disposal of waste water. No further analysis is warranted.

f) Conflict with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104)?

Existing Conditions

Upon review of the County General Plan and the proposed program, the parcels that would be subject to the Green Zone Districts and Storage Enclosures for Recycling and Solid Waste Revisions are located outside the HMA (Figure 2.1-2, *Slope*).⁷ The parcels that would be subject to the Recycling and Waste Management Revisions within the HMAs are located in the Whittier Hills and north of the City of Santa Clarita. Based on the *Hillside Management Areas and Ridgeline Management Map* in the County General Plan, no County designated significant ridgelines are located within the Green Zone Districts, but the Green Zone Districts are within HMAs of both 25–50 percent slope and 50 percent-plus slope (Figure 2.1-2).⁸ However, the proposed Green Zones District element of the proposed program would not result in impacts in relation to the quality of these hillsides, as the development standards for Green Zone Districts element within the HMAs would be required to comply with the HMA Ordinance and Hillside Design Guidelines, in particular landscaping barriers, enclosures, fencing, solid walls, signage, and lighting.

Thresholds of Significance

The project would result in significant impacts in relation to geology and soils if the project would conflict with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104).

Impact Analysis

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts in relation to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104). The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts in relation to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104). Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses

⁷ Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

⁸ Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to ~~7~~ 40 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in impacts related to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104).

As discussed, the parcels that would be subject to the Green Zone Districts and Storage Enclosures for Recycling and Solid Waste Revisions are located outside the HMA (Figure 2.1-2).⁹ The parcels that would be subject to the Recycling and Waste Management Revisions within the HMAs are located in the Whittier Hills and north of the City of Santa Clarita. Based on the *Hillside Management Areas and Ridgeline Management Map* in the County General Plan, no County designated significant ridgelines are located within the Green Zone Districts, but the Green Zone Districts are within HMAs of both 25–50 percent slope and 50 percent-plus slope (Figure 2.1-2).¹⁰ However, the proposed Green Zones District element of the proposed program would not result in impacts in relation to the quality of these hillsides, as the development standards for Green Zone Districts element within the HMAs would be required to comply with the HMA Ordinance and Hillside Design Guidelines, in particular landscaping barriers, enclosures, fencing, solid walls, signage, and lighting. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts in relation to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104). No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts in relation to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104). The proposed New Sensitive Uses would have no impact on the quality of these hillsides, as the development standards for New Sensitive Uses within the HMAs would be required to comply with the HMA Ordinance and Hillside Design Guidelines, in particular landscaping barriers, enclosures, fencing, solid walls, signage, and lighting.¹¹ Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction

⁹ Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

¹⁰ Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

¹¹ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

of these measures would not differ substantially from existing conditions, such that they would result in impacts in relation to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104).

These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not result in impacts in relation to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104). Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts in relation to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104). No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts in relation to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104). The proposed program would have no adverse effect on the scenic characteristics of the key ridgelines in areas such as Puente Hills, Castaic, the Santa Monica Mountains, and the Angeles National Forest, as the Recycling and Waste Management Revisions would comply with the HMA Ordinance and Hillside Design Guidelines that help preserve and enhance the physical integrity and value of hillsides and associated views. The goals of the HMA Ordinance coupled with the Hillside Design Guidelines identify the proposed development location in or near HMAs and use sensitive hillside design techniques for keeping with the preservation and enhancement of physical site integrity and value of hillsides that would apply to all allowable uses governed by the Recycling and Waste Management Revisions. The measures proposed by the Project are consistent with the requirements of the five HMA categories: (1) site planning; (2) grading and facilities; (3) road circulation; (4) building design; and (5) landscaping.^{12, 13} Rather than resulting in blight, the Recycling and Waste Management Revisions would ensure that materials and equipment staged within such centers would not be visible from adjacent public rights-of-way, thus protecting scenic vistas within HMAs.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in vessel organic waste facilities are prohibited in ARAs.~~ Therefore, impacts to Recycling and Waste Management Revisions would be less than significant impacts in relation to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104). No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts in relation to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104). The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line,

¹² County of Los Angeles Department of Regional Planning. Adopted 6 October 2016 and Accessed 31 March 2020. Title 22 – Planning and Zoning – Hillside Management Areas, Chapter 22.56.217 – Section VI: Sensitive Hillside Design Features. Available at: <http://planning.lacounty.gov/hma>.

¹³ County of Los Angeles Department of Regional Planning. Accessed 31 March 2020. Hillside Design Guidelines. Available at: <http://planning.lacounty.gov/hma>

self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be constructed on existing parking lots, and no new structures will be built.

The proposed program would have no adverse effect on the scenic characteristics of the key ridgelines in areas such as Puente Hills, Castaic, the Santa Monica Mountains, and the Angeles National Forest, as the Recycling and Waste Management Revisions would comply with the HMA Ordinance and Hillside Design Guidelines that help preserve and enhance the physical integrity and value of hillsides and associated views. The goals of the HMA Ordinance coupled with the Hillside Design Guidelines identify the proposed development location in or near HMAs and use sensitive hillside design techniques for keeping with the preservation and enhancement of physical site integrity and value of hillsides that would apply to all allowable uses governed by the Recycling and Waste Management Revisions. The measures proposed by the Project are consistent with the requirements of the five HMA categories: (1) site planning; (2) grading and facilities; (3) road circulation; (4) building design; and (5) landscaping.^{14, 15} Rather than resulting in blight, the Recycling and Waste Management Revisions would ensure that materials and equipment staged within such centers would not be visible from adjacent public rights-of-way, thus protecting scenic vistas within HMAs. Therefore, the Supermarket Accessory Recycling Collection Centers would result in less than significant impacts in relation to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104). No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in relation to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104). Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. These existing uses are subject to the current development standards within of the zones that they reside in. The revisions would add additional requirement such as enclosure wall height with roof, paving, cleaning and maintenance, distance requirements from adjoining doorways or windows, and clearances and circulation standards. The existing uses are subject to the current development standards as required per zone and the

¹⁴ County of Los Angeles Department of Regional Planning. Adopted 6 October 2016 and Accessed 31 March 2020. Title 22 – Planning and Zoning – Hillside Management Areas, Chapter 22.56.217 – Section VI: Sensitive Hillside Design Features. Available at: <http://planning.lacounty.gov/hma>.

¹⁵ County of Los Angeles Department of Regional Planning. Accessed 31 March 2020. Hillside Design Guidelines. Available at: <http://planning.lacounty.gov/hma>

new requirements would only apply to new development as well as expansion of existing development in addition to the current standards.

Any new development would be subject to development requirement of HMAs. These revisions contain HMAs of both 25–50 percent slope and 50 percent-plus slope, as well as significant ridgelines in areas such as Castaic.¹⁶ However, the proposed program would have no impact on the quality of these hillsides as a scenic resource, as the Green Zones Program would comply with the HMA Ordinance and Hillside Design Guidelines that help preserve and enhance the physical integrity of scenic values. In regard to scenic vistas along scenic highway corridors, the proposed Storage Enclosures for Recycling and Solid Waste Revisions are directly adjacent to two of the four state scenic highway corridors identified in the County General Plan 2035; Angeles Crest Highway and Malibu Canyon-Las Virgenes Highway.¹⁷ Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in relation to conflicting with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch.22.104). No further analysis is warranted.

¹⁶ Los Angeles County Department of Regional Planning. May 2014. Figure 9.8: Hillside Management Areas and Ridgeline Management Map. In the Los Angeles County General Plan 2035. Available at <http://planning.lacounty.gov/generalplan/figures2015>

¹⁷ Los Angeles County. Adopted 6 October 2015. Chapter 9: Conservation and Natural Resources Element. In the Los Angeles County General Plan 2035. Available at http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

2.8. GREENHOUSE GAS EMISSIONS

This analysis is undertaken to determine if the proposed program may have a significant impact to greenhouse gas (GHG) emissions, thus requiring the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State CEQA Guidelines.¹ The analysis covers all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated with regard to the Air Quality Element of the County General Plan 2035 (including the Community Climate Action Plan),^{2,3} and the SCAG 2016–2040 RTP/SCS.⁴

	<i>Potentially Significant Impact</i>	<i>Less than Significant Impact with Mitigation Incorporated</i>	<i>Less than Significant Impact</i>	<i>No Impact</i>
Would the project:				
a) Generate greenhouse gas (GHGs) emissions, either directly or indirectly, that may have a significant impact on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
a) Generate greenhouse gas (GHGs) emissions, either directly or indirectly, that may have a significant impact on the environment?				

Existing Conditions

GHGs emitted from the combustion of fuels such as natural gas consists of carbon dioxide (CO₂), methane (CH₄), and nitrous oxide (N₂O), collectively reported as carbon dioxide equivalent (CO₂e). GHGs are also emitted from mobile sources such as on-road vehicles and construction equipment burning fuels such as gasoline, diesel, biodiesel, propane, or natural gas. Indirect GHG emissions result from electric power generated elsewhere (i.e., power plants) and used to operate process equipment, lighting, and utilities at a facility. The principal anthropogenic GHGs that enter the atmosphere are CO₂, CH₄, N₂O, chlorofluorocarbons (CFCs), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF₆). Among these GHGs, CO₂ emissions are considered to be the most abundant type of GHG emissions contributing to global climate change.

As described in the Final SCAG Regional Greenhouse Gas Emissions Inventory and Reference Case Projections 1990-2035,⁵ SCAG's gross GHG emissions are rising at a slower rate than those of the nation. The growth in emissions from 1990 to 2008 was primarily associated with the transportation sector, the use of ozone-depleting substances substitutes, the fossil fuel industry and electricity generation. Existing sources of GHG emissions in the County of Los Angeles includes building energy, transportation, water conveyance and wastewater generation, waste generation, agricultural

⁵ Final Southern California Association of Governments (SCAG). Regional Greenhouse Gas Emissions Inventory and Reference Case Projections, 1990-2035. May 30, 2012. Accessible at: http://sustain.scag.ca.gov/Sustainability%20Portal%20Document%20Library/05-30-12_SCAG_Revised_IF%20Report_Final.pdf

activities, and stationary sources. Four sectors account for more than 90 percent of GHG emissions in the SCAG Region: Transportation, Electric Power, Commercial-Residential, and Industrial. Building energy is the first largest source of emissions and transportation emissions are the second largest source of emissions, accounting for 42 percent of total emissions in the unincorporated areas. Similar to the building energy sector, transportation is typically a considerable component of a community's total GHG emissions, ranging from 30 percent to 70 percent depending on other sources and local conditions. The third largest source is waste generation, with a contribution of 7 percent of the total 2010 inventory. The remaining sources are water conveyance and wastewater generation (2 percent), agriculture (0.4 percent), and stationary sources (0.02 percent). Key strategies in the AB 32 Scoping Plan⁶ regarding industry includes audits of the largest industrial sources to identify greenhouse gas reduction opportunities and the regulation of fugitive emissions. The proposed program would implement development regulation of industrial uses in proximity to sensitive uses as well as regulate a set of recycling and solid waste facilities to further reduce GHG emissions.

According to the Air Quality Element of the County General Plan, the County “adopted an Energy and Environmental Program (EEP) for the development and enhancement of energy conservation and environmental programs for County departments. These programs contribute to the County's efforts to reduce communitywide GHGs and GHGs from County operations.” The EEP consists of four programs intended to manage GHG emission in the unincorporated areas of the County:

- **Energy and Water Efficiency** which establishes a target reduction in energy through water and energy conservation practices, particularly the operation and maintenance of County Buildings and programs.
- **Green Building Construction and Operations** utilizes Green Building, Low-impact Development, and Drought Tolerant Ordinances to avoid and minimize direct consumptive uses of energy and indirect uses related to transport and delivery of water.
- **Environmental Stewardship** audits and provides measures to reduce direct and indirect sources of GHG Emissions related to County operations.
- **Public Outreach and Education** utilizes the County's communication tools to share information, particularly as it relates to utility subsidy and assistance programs and encourage energy conservation practices.

According to CalRecycle, as of 2018, the disposal of organic waste in landfills is a substantial contributor to greenhouse gas emissions:

“California disposed approximately 39 million tons of waste in landfills in 2018 (approximately one ton of waste per person⁷), of which approximately one third is compostable organic materials, including 18 percent food, 12 percent lumber, 9 percent landscape waste, and nearly 20 percent paper and cardboard.

Inedible food waste can be composted or used to generate renewable energy; landscape waste is ideal for composting; and lumber can be turned into mulch, used in a biofilter, or burned in a biomass plant for renewable energy. Paper can be composted, but greater climate benefits are achieved when it is recycled, allowing other trees to stay in the ground.

Anaerobic decomposition of organic materials in landfills produces methane (CH₄), a greenhouse gas with global warming potential approximately 85 times higher than carbon dioxide (CO₂) over a 20-year time period. Landfills emit the majority of man-made methane emissions in California, and are one of the top emitters in the United States. Reducing the amount of organic materials sent to landfills and increasing the production of compost and mulch are part of the AB 32 Scoping Plan.”⁸

⁶ California's Climate Plan. California Environmental Protections Agency; Air Resources Board.

⁷ United States Census Bureau (2019) California population = 39.51 million.

Threshold of Significance

Even though the proposed program does not fit the typical “land-use” project, the project would result in regulation of industrial, commercial, and residential land uses; therefore, the use of the “Tier 3” quantitative thresholds for residential and commercial projects has been used as a reasonable metric. The SCAQMD proposes that if a project generates GHG emissions below 3,000 CO₂e annually, it could be concluded that the proposed program’s GHG contribution is not “cumulatively considerable” and is therefore less than significant under CEQA.

Impact Analysis

The proposed program would result in less than significant impacts, directly or indirectly, regarding generating GHG emissions that would have a significant impact on the environment. The potential for impacts to GHG emissions has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, *Project Description*, Table 1.IV-1, *Planning and Permitting Requirements*, and Table 1.IV-2, *Development Standards*). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment which would include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Construction

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum floor area ratio (FAR) requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 15 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a Conditional Use Permit. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 10 years of adoption of the Ordinance. These measures would be required where the Ordinance implements new standards for existing industrial uses, or in the case of new industrial uses, such as new recycling processing facilities and new organic waste facilities. In the case of updated standards for existing industrial uses, the new required measures would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses. The Green Zone Districts component of the proposed program would result in less than significant impacts. The component includes the construction of fencing and solid walls around the industrial sites which are directly adjacent to sensitive

receptors. Motorized equipment used during construction would comply with California Air Resources Board (CARB) regulations for diesel programs relating to mobile source, stationary engines, and portable equipment. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions. The Green Zone Districts component includes the use of updated technologies for the organic waste and solid waste facilities. Construction related to the proposed program's technological updates would be short-term and GHG emissions impacts would be addressed under federal, State and County regulations related to GHG emissions reductions, including those specifically required pursuant to the Green Building Operation component of the EEP: Green Building, Low-impact Development, and Drought Tolerant Ordinances. Compliance with the specified Ordinances ensures consistency the SCAG RTP/SCS and the County's Community Climate Action Plan regional goals for target reductions in GHGs.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. The New Sensitive Uses component of the proposed program would result in less than significant impacts. The component includes the construction of fencing and solid walls around the industrial sites which are directly adjacent to sensitive receptors. Motorized equipment used during construction would comply with CARB regulations for diesel programs relating to mobile source, stationary engines, and portable equipment. The New Sensitive Uses component includes the use of updated technologies for the organic waste and solid waste facilities. Construction related to the proposed program's technological updates would be short-term and GHG emissions impacts would be addressed under federal, State and County regulations related to GHG emissions reductions such as those mentioned in the County's Community Climate Action Plan.

Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity adjacent to or adjoining legally-established,~~ existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standard, the measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not result in substantial changes to existing conditions. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. The proposed program's component requires a CUP which establishes conditions and development standards for operating the recycling and waste management facilities. The proposed program would require standards addressing minimum lot area, building height, screening, storage, signage, lighting, air filtration, vehicle circulation, storage of materials, access, paving, and maintenance. These development standards were created to mitigate impacts to the environment. The maintenance of the existing facilities would not include and building construction or demolition of existing facilities.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~

- As part of the Green Zones ~~Districts~~ Program, the County is identifying the development of organic waste facilities and specifying the location where such facilities would be an allowable use. The encouragement of the development of organic waste facilities to divert organic waste from landfills and repurposing for repurposing those materials to feed food-insecure people, make carbon sequestering fertilizers and soil amendments, and generate clean, low-carbon renewable energy is consistent with the SCAG RTP/SCS, the County's Community Climate Action Plan, and Statewide legislations for target reductions in GHGs: SB 1383 (Lara, Chapter 395, Statutes of 2016) targets a 50 percent reduction of statewide organic waste disposal from the 2014 level by 2020, and a 75 percent reduction by 2025. Grants CalRecycle regulatory authority to achieve the organic waste disposal reduction targets and establishes an additional target that not less than 20 percent of currently disposed edible food is recovered for human consumption by 2025. Attaining this goal will require an expansion of California's organics infrastructure, creating infrastructure, jobs, and value-added products along the way.
- AB 1826 (Chesbro, Chapter 727, Statutes of 2014) requires businesses to recycle their organic waste, depending on the amount of waste they generate per week. Cities and counties across the state must implement an organic waste recycling program to divert organic waste generated by businesses, including multifamily residential dwellings that consist of five or more units.
- AB 1594 (Williams, Chapter 719, Statutes of 2014). Green materials are the perfect feedstock for composting but are sometimes used to cover garbage in landfills at the end of the day, a practice known as alternative daily cover (ADC). Green materials used for daily cover break down anaerobically in a landfill, the same as if they were disposed. AB 1595 eliminates incentives to use green materials as ADC by ensuring it counts as disposal.
- AB 341 (Chapter 476, Statutes of 2011) set a goal of a 75 percent reduction in the amount of waste going to landfills by the year 2020, to be achieved through source reduction, recycling, and composting.

Therefore, rather than causing direct or indirect impacts to regional GHG emissions, the Green Zones Program implements statewide initiatives to facilitate infrastructure to divert organic waste from landfills with a corresponding reduction in anaerobic decomposition of organic materials in landfills which produces CH₄, a GHG with global warming potential approximately 85 times higher than CO₂ over a 20-year time period. Therefore, impacts from Recycling and Waste Management Revisions would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These measures would ensure that the collection centers are located in allowable areas and containers are appropriately maintained as per CalRecycle requirements. No new structures will be built, and the proposed program component would not result in substantial changes to existing conditions. The maintenance and placement of the containers would help reduce the exposure of the collection facility to adjacent sensitive receptors. Therefore, the Supermarket Accessory Recycling Collection Centers would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. The Storage Enclosures for Recycling and Solid Waste Revisions component includes the construction of enclosures, buffers, and walls necessary to meet the existing standards. Construction impacts would be short term, and the walls and maintenance of the facilities would not result in an increase of direct GHG emissions impacts to adjacent sensitive receptors. The enclosures would further contain potential emissions and protect sensitive receptors from exposure. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment.

Operation

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. The operation of the Green Zone Districts would have an overall reduction in the direct impact of GHG emissions to surrounding sensitive receptors produced by industrial sites. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions. Significant GHG emission reductions can be achieved through sustainable construction, operation, and renovation of new and existing buildings. California's CALGreen Code includes mandatory measures to support the goals of the State's GHG reduction and building energy efficiency programs. In addition to achieving GHG reductions to meet AB 32 targets, the green building strategy also provides a significant contribution towards meeting the 2050 climate goals. Executive Order S-3-05 calls for reducing greenhouse gas emission reduction for 2020 to 1990 levels; and for 2050, reduce GHG emissions to 80 percent below 1990 levels. The proposed program would contribute to and be in compliance with the building energy efficiency programs by implementing standards which includes buffers, maintenance, and air filtration devices which would not result in an increase of GHG emissions and would further protect sensitive uses from industrial use emissions.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. The operation of the New Sensitive Uses would have an overall reduction in the direct impact of GHG emissions to surrounding sensitive receptors produced by industrial sites due to the implementation of the program. The implementation of use of solid wall screening; expanded landscaping buffers between incompatible uses would reduce exposure to sensitive uses. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible

adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located~~. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions. The construction would be minimal and short-term. The landscaping buffers would reduce exposure of the industrial uses to adjacent sensitive uses. The program would ensure compliance of the industrial facilities to and reduce direct impacts of GHG emissions. As a result of the overall proposed program, a net reduction of GHG emissions, offsetting construction GHG emissions produced over the course of the phasing of the proposed program, would be excepted with the additional waste diversion percentage provided with implementation of the proposed program. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. The Recycling and Waste Management Revisions element of the Green Zones Program consists of the inclusion of standards for Specific Uses (revisions to existing Chapter 22.140) and would modify one section of Chapter 22.140 and introduces six new sections to the chapter, in Division 7 (Standards for Specific Uses) of Title 22 in relation to primary recycling. The operation of the applied development standards would have less than significant impact on greenhouse gas emissions. The updates to the facilities should reduce the GHG emissions by complying with CALGreen building standards and other GHG reduction requirements.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards would include requirements that limit the location of the facilities and regulating the facilities. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards. The improvements would reduce direct exposure to sensitive uses adjacent to the placement of the recycling facilities. The proper storage of materials and maintenance of facilities would ensure compliance with CALGreen building standards which would contribute to GHG reduction requirements. Compliance with building standards and the implementation of maintenance standards, fencing, walls, and air filtration would result impacts of GHG emissions on surrounding sensitive uses. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ As discussed, the State of California disposed of approximately 39 million tons of waste into landfills in 2018 (approximately one ton of waste per person), of which approximately one third is compostable organic materials. Further, as of 2012, disposal per resident has increased from 5.3 to 6 pounds with the recycling rate decreasing from 50 percent to the current 44 percent as of 2016 and far below the State's 2020 goal of 75 percent.

Based on the average per capita rate of waste production for the state (approximately one ton of waste per person disposed of in landfills), Los Angeles County's waste stream would result in approximately 10 million tons of waste disposed of in landfills within the County. As described, this would include approximately one third of compostable organic materials (or 3.33 million tons of organic waste) and resulting in the production of CH₄ during the anaerobic decomposition in landfills. As the Recycling and Waste Management Revisions would involve the implementation of measures requiring new standards new industrial uses, such as new recycling processing facilities and new organic waste facilities. These measures would allow for the development of organic waste facilities allowing for greater availability and access to composting facilities serving the County and facilitating diversion requirements for waste hauler, facilities, residents, and business to meet the State's goal of 75 percent waste diversion. Specifically, the County (including 88 cities and unincorporated communities), recorded an estimated diversion rate of 60 percent (2012) and diverted from landfills and transformation facilities.

In establishing requirements to progress towards meeting the statewide objective of 75 percent waste diversion, the proposed program would include measures facilitating the diversion of organic waste from landfills to organic waste facilities providing for the diversion of the additional 20 to 31 percent needed to meet the statewide goal of 75 percent. Based on the EPA Waste Reduction Model (WARM) Model Version 15, the County's diversion of 500,000 to 1.03 million tons of organic material would result in a reduction of 88,006.1 to 181,824.02 Metric tons of carbon dioxide equivalent (MTCO₂e) when compared to the 271,089.92 to 560,071.78 of MTCO₂e produced resulting in the waste stream to County landfills. As a result, a net reduction of GHG emissions, offsetting construction GHG emissions produced over the course of the phasing of the proposed program, would be excepted with the additional waste diversion percentage provided with implementation of the proposed program. Therefore, impacts to Recycling and Waste Management Revisions would be less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that "contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code" (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. The proposed program component would not result in substantial changes to existing conditions since construction consists of fencing and walls. The maintenance of materials for storage and the recycling facilities would reduce direct impacts to adjacent sensitive uses. Operation of the supermarket recycling center revisions would reduce waste at supermarket recycling centers by implementing on-site collection of recyclable materials. There would be less than significant impact on GHG emissions. As a result of the overall proposed program, a net reduction of GHG emissions, offsetting construction GHG emissions produced over the course of the phasing of the proposed program, would be excepted with the additional waste diversion percentage provided with implementation of the proposed program.

Both construction and operation GHG emissions are well below the suggested GHG reporting thresholds. Therefore, the Supermarket Accessory Recycling Collection Centers would have less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. The implementation of the increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation would have less than significant impact on GHG emissions and would better contain the recycling and solid waste. The improvements and maintenance of existing facilities would reduce exposure of the facilities to adjacent sensitive uses. The proposed program would implement more energy efficient technologies for the organic and solid waste facilities during operation. The energy efficient technologies would be in compliance with existing regulations and would reduce direct GHG impacts from existing organic and solid waste equipment at facilities. As a result of the overall proposed program, a net reduction of GHGs, offsetting construction GHG emissions produced over the course of the phasing of the proposed program, would be excepted with the additional waste diversion percentage provided with implementation of the proposed program. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts regarding generating GHG emissions, either directly or indirectly, that would have a significant impact on the environment. No further analysis is warranted.

b) Conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Existing Conditions

The primary applicable plans are the SCAG 2016 RTP/SCS and the County's Community Climate Action Plan (CCAP) adopted with the General Plan in 2015. CARB has prepared a Climate Change Scoping Plan⁹ that lays out the GHG emission reduction goals for the state. This 2017 plan calls for an ambitious but achievable reduction in California's carbon footprint. Reducing GHGs to 1990 levels means cutting approximately 30 percent from "business-as-usual" emission levels projected for 2020, or about 15 percent from current (2019) levels. The proposed program would help achieve these GHG reduction goals by improving existing facilities with building retrofits and technologies that improve energy efficiency. In addition, the analysis considers the four key pieces of statewide legislation identified by CalRecycle in relation to reducing the net generation of methane from landfills, by diverting organic waste from landfills for repurposing, including organic waste recycling.

The final 2016-2040 RTP/SCS complies with the emission reduction targets established by the California ARB and meets the requirements of SB 375 as codified in Government Code §65080(b) et seq. by achieving per capita GHG emission reductions relative to 2005 of 8 percent by 2020 and 18 percent by 2035.. Being in the SCAG region, the proposed program is required to reduce GHG emissions from automobiles and light trucks to achieve the GHG reduction targets.

The CCAP outlines County actions designed to reduce GHG emissions. The CCAP states that climate change could affect public health and community well-being and lists the potential public health impacts. The CCAP was adopted by the County in 2015 to reduce GHG emissions and contribute to an overall state, national, and global effort to avoid the worst effects of climate change.

⁹ California Air Resources Board. Accessed November 27, 2019. California's 2017 Climate Change Scoping Plan. https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf

Pursuant to the CEQA Guidelines Section 15183.5, projects which are consistent with the General Plan may rely on the General Plan EIR and the CCAP to address project-specific GHG emissions. The CCAP¹⁰ is composed of State and local actions to reduce GHG emissions within the unincorporated areas. The State actions considered in the CCAP include the Renewables Portfolio Standard, Title 24 Standards for Commercial and Residential Buildings (Energy Efficiency and CALGreen), Pavley/Advanced Clean Cars (Vehicle Efficiency), and the Low Carbon Fuel Standard. These State actions generally do not require action from the County but will result in local GHG reductions in the unincorporated areas. The proposed program is consistent with three of five local action strategy areas included in the CCAP: green building and energy, land use and transportation, and waste reduction, reuse, and recycling.

Statewide legislations passed between 2011 and 2016 target reductions in GHGs through diversion of organic waste from landfills and repurposing:

- SB 1383 (Lara, Chapter 395, Statutes of 2016) targets a 50 percent reduction of statewide organic waste disposal from the 2014 level by 2020, and a 75 percent reduction by 2025. Grants CalRecycle regulatory authority to achieve the organic waste disposal reduction targets and establishes an additional target that not less than 20 percent of currently disposed edible food is recovered for human consumption by 2025. Attaining this goal will require an expansion of California's organics infrastructure, creating infrastructure, jobs and value-added products along the way.
- AB 1826 (Chesbro, Chapter 727, Statutes of 2014) requires businesses to recycle their organic waste, depending on the amount of waste they generate per week. Cities and counties across the state must implement an organic waste recycling program to divert organic waste generated by businesses, including multifamily residential dwellings that consist of five or more units.
- AB 1594 (Williams, Chapter 719, Statutes of 2014). Green materials are the perfect feedstock for composting but are sometimes used to cover garbage in landfills at the end of the day, a practice known as alternative daily cover (ADC). Green materials used for daily cover break down anaerobically in a landfill, the same as if they were disposed. AB 1595 eliminates incentives to use green materials as ADC by ensuring it counts as disposal.
- AB 341 (Chapter 476, Statutes of 2011) set a goal of a 75 percent reduction in the amount of waste going to landfills by the year 2020, to be achieved through source reduction, recycling, and composting.

Threshold of Significance

There would be a significant impact in relation to applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs if the project conflicts with the overall strategies for regional reductions in GHG.

Impact Analysis

The proposed program would result in no impacts to GHG emissions and will not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. The potential for impacts to GHG emissions has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, *Project Elements*, Table 1.IV-1, *Planning and Permitting Requirements*, and Table 1.IV-2, *Development Standards*). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment would not result in an increase in greenhouse gas emissions. The proposed revisions include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping

¹⁰ County of Los Angeles Department of Regional Planning. Final Unincorporated Los Angeles County Community Climate Action Plan 2020. August 2015. http://planning.lacounty.gov/assets/upl/project/ccap_final-august2015.pdf

buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to GHG emissions and would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a Conditional Use Permit. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. Air filtrations and other updated technologies would be implemented to reduce pollution and GHG emissions. Air filtrations and landscaping buffers would reduce exposure of adjacent sensitive uses to emissions from industrial facilities. The maintenance to existing facilities and improvements would result in reduced air pollutants. The proposed program component would be consistent with the Climate Change Scoping Plan by addressing harmful air pollutants and protect the communities emitted from industrial facilities. The Climate Change Scoping Plan aims to enhance industrial efficiency and competitiveness by extending successful programs to reduce GHG emissions, increase energy cost savings, offer business flexibility to reduce emissions at low cost and provide clear policy and market direction. The development standards would ensure compliance with the Climate Change Scoping Plan's goals. The proposed program would also be consistent with the CCAP by focusing on public health and community well-being through the requirement of development standards for industrial facilities. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions. The Green Zone Districts is consistent with Statewide Legislation for the reduction of GHG emissions associated through diversion of organic waste from landfills:

- SB 1383: The Green Zone Districts support reduction of statewide organic waste disposal by specifying locations where organic waste recycling facilities are an allowable use.
- AB 1826: The Green Zone Districts are consistent with the requirement for the County to implement waste recycling programs, by facilitating the development of the required infrastructure as an allowable use.
- AB 1594: The Green Zone Districts, through identifying specific organic waste facilities as allowable uses, are consistent with the desired outcome of this legislation to decrease the use of organic waste as cover in landfills.
- AB 341: The Green Zone Districts support the statewide goal of 75 percent reduction in waste going to landfills by identifying organic waste recycling as an allowable use that supports reduction of organic waste in landfills to recycling and composting.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to GHG emissions and will not conflict with any applicable plan, policy, or regulation

adopted for the purpose of reducing the emissions of GHGs. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to GHG emissions in relation to conflicting with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to GHG emissions and will not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. Operation of the proposed program would reduce GHG emissions and the impact of pollution to surrounding sensitive receptors. The proposed program component would be consistent with the Climate Change Scoping Plan by addressing harmful air pollutants and protect the communities emitted from industrial facilities. The Climate Change Scoping Plan aims to enhance industrial efficiency and competitiveness by extending successful programs to reduce GHG emissions, increase energy cost savings, offer business flexibility to reduce emissions at low cost and provide clear policy and market direction. The development standards would ensure compliance with the Climate Change Scoping Plan's goals. The proposed program would also be consistent with the CCAP by focusing on public health and community well-being through the requirement of development standards for industrial facilities. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130). These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would implement landscape barriers, enclosures, lighting, and air filtration. These improvements to the existing facilities would filter and provide physical barriers between industrial uses and adjacent sensitive uses. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not result in substantial changes to existing conditions. The proposed program would not result in the construction of structures or buildings and would not result in increased emissions or long-term construction emissions. The implementation of landscape, hardscape, and mechanical measures to protect sensitive uses would have no impact on Statewide legislation for the reduction of GHG emissions associated through diversion of organic waste from landfills as it would exacerbate or increase the diversion of organic waste to landfills. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in no impacts to GHG emissions and will not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts to GHG emissions and will not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. The proposed program would result in decreased GHG emissions and would be consistent with the SCAG 2016-2040 RTP/SCS and the Climate Change Scoping Plan. The proposed program would be consistent with SCAG 2016-2040 RTP/SCS strategies by requiring compliance of existing

development standards to better the existing safety and health of surrounding communities to the Recycling and Waste Management facilities and would increase effectiveness by improving existing facilities. Implementation of the proposed program would not result in increased GHG emissions and would be consistent with all plans, policies, and regulations. The proposed program component does not include the construction of any facilities or structures and consists of improvements to existing facilities. The improvements include physical barriers, better maintenance of stored materials, height restrictions and standards which would result in contained materials and enclosures. The proposed program is consistent with the Climate Change Scoping Plan and the 2016-2040 RTP/SCS by promoting environmental protection and public health by reducing and containing air pollutants from the facilities.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ The proposed program would help achieve GHG reduction goals by prohibiting facilities in high risk areas and requiring improvements to existing facilities. The proposed program would result in no impacts to GHG emissions in relation to conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. Therefore, impacts of the Recycling and Waste Management Revisions would result in no impacts to GHG emissions and would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to GHG emissions and will not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Recycling collection center locations must be approved by the State of California as a Supermarket Site prior to application submittal. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. The proposed program would result in decreased

GHG emissions and would be consistent with the SCAG 2016-2040 RTP/SCS and the Climate Change Scoping Plan. The proposed program would have no impact to GHG emissions and would include improvements to existing facilities. The proposed program would meet the requirements of AB 32 by improving environmental quality and safety and health to communities adjacent to Supermarket Recycling Centers. The proposed program is consistent with the Climate Change Scoping Plan and the 2016-2040 RTP/SCS by promoting environmental protection and public health. The compliance with requirements would ensure enclosure of materials, location of recycling collection facilities in approved areas, and the requirement of fencing and storage would contribute to the SCAG 2016-2040 RTP/SCS and the Climate Change Scoping Plan by maintaining and improving existing facilities. The implementation of landscape, hardscape, and mechanical measures to protect sensitive uses would have no impact on Statewide legislation with Statewide Legislation for the reduction of GHG emissions associated through diversion of organic waste from landfills as it would exacerbate or increase the diversion of organic waste to landfills. The proposed program component would not result in new structures, construction of the walls and fencing would be short-term, and the proposed program component would not result in any substantial changes to existing conditions.

Therefore, the Supermarket Accessory Recycling Collection Centers would have no impacts to GHG emissions and will not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to GHG emissions and will not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. The requirements would provide requirements for wall height and maintenance to promote efficient storage of materials. The proposed program would be consistent with the Climate Change Scoping Plan and the 2016-2040 RTP/SCS by promoting environmental protection and public health by reducing exposure of the stored materials from adjacent sensitive uses. The receptacles and storage of recycling and solid waste would contribute to and would be in compliance with the Climate Change Scoping Plan and the 2016-2040 RTP/SCS goals. The implementation of landscape, hardscape, and mechanical measures to protect sensitive uses would have no impact on Statewide legislation with Statewide Legislation for the reduction of GHG emissions associated through diversion of organic waste from landfills as it would exacerbate or increase the diversion of organic waste to landfills. The proposed program component would not increase GHG emissions and would improve containment methods of recycling and solid waste material. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to GHG emissions and will not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. No further analysis is warranted.

2.9. HAZARDS AND HAZARDOUS MATERIALS

This analysis is undertaken to determine if the proposed program may have a significant impact to hazards and hazardous materials, thus requiring the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State CEQA Guidelines.¹ The analysis covers all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated in light of the Safety Element of the Los Angeles County (County) General Plan 2035;² and review of available public records, expert opinion, supported facts, literature, and relevant environmental regulatory databases.³

Hazardous wastes are by-products of society that can pose a substantial or potential hazard to human health or the environment when improperly managed. Hazardous wastes possess at least one of four characteristics (ignitability, corrosivity, reactivity, or toxicity), or appears on special U.S. Environmental Protection Agency (EPA) lists.⁴

Definitions

Acutely Hazardous: Waste that contains such dangerous chemicals that it could pose a threat to human health and the environment even when properly managed.⁵

Hazard: An event or physical condition that has the potential to cause fatalities, injuries, property damage, infrastructure damage, agricultural loss, damage to the environment, interruption of business, or other types of harm or loss.⁶

Hazardous: Capable of posing an unreasonable risk to health, safety, or the environment; capable of causing harm.⁷

Hazardous Waste: Hazardous wastes are by-products of society that can pose a substantial or potential risk or hazard to human health or the environment when improperly managed. Hazardous wastes possess at least one of four characteristics: ignitability, corrosivity, reactivity, or toxicity. In addition, this analysis considers those materials classified as hazardous material on lists maintained by the EPA.⁸

Risk: The estimated impact that a hazard would have on people, services, facilities, and structures in a community; the likelihood of a hazard event resulting in an adverse condition that causes injury or damage.

The analysis of impacts related to hazards and hazardous materials was undertaken with the recognition that the construction and operation of improvements required pursuant to the proposed program would be required to comply with applicable federal, State, and local statutes and regulations. Applicable regulations require strict adherence to specific guidelines regarding the use, transportation, and disposal of hazardous materials. Regulations that would be required of those transporting, using or disposing of hazardous materials include Resource Conservation and Recovery Act (RCRA), which provides the ‘cradle to grave’ regulation of hazardous wastes; Comprehensive Environmental Response Compensation and Liability Act (CERCLA), which regulates closed and abandoned hazardous waste sites;

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) For a project located within an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
f) Impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires, because the project is located:				
i) within a high fire hazard area with inadequate access?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
ii) within an area with inadequate water and pressure to meet fire flow standards?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

iii) within proximity to land uses that have the potential for dangerous fire hazard?

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
--------------------------	--------------------------	--------------------------	-------------------------------------

h) Does the proposed use constitute a potentially dangerous fire hazard?

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
--------------------------	--------------------------	--------------------------	-------------------------------------

a) Create a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials?

Existing Conditions

The Green Zones Ordinance would affect supermarket recycling collection facilities, industrial uses, and solid waste facilities, which typically involve the use, storage, disposal, and transportation of hazardous materials, such as fuels, lubricants, solvents and degreasers, and paints. There are 18 existing hazardous waste facilities that service the area subject to the proposed program (Figure 2.9-1, *Los Angeles County Hazardous Waste Facilities*). However, these 18 identified sites are located outside of the unincorporated area of the County and located within the jurisdiction of cities adjacent to the program area. These 18 sites are required to comply with regulatory requirements related to the routine transport, use, or disposal of hazardous materials within their specific jurisdictions and would not be subject to the revision of the Green Zones Ordinance in relation to supermarket recycling collection facilities, and solid waste facilities.

Hazardous materials in various forms can cause death, serious injury, long-lasting health effects, and damage to buildings, homes, and other property. Many products containing hazardous chemicals are also used and stored in homes routinely. Varying quantities of hazardous materials are manufactured, used, or stored at facilities in the project area. Hazardous materials come in the form of explosives, corrosives, flammable and combustible substances, poisons, and radioactive materials (Figure 2.9-2, *Typical Contaminants from Land Use Sources*).

The Los Angeles County Fire Department (LACFD) is the Certified Unified Program Agency (CUPA) for the County and is responsible for enforcing Chapter 6.95 of the California Health and Safety Code. As the CUPA, LACFD is required to regulate hazardous materials business plans and chemical inventory, hazardous waste and tiered permitting, underground storage tanks (UST), and risk-management plans. The Hazardous Materials Business Plan is required to contain basic information on the location, type, quantity, and health risks of hazardous materials stored, used, or disposed of on development sites. The plan also contains an emergency-response plan, which describes the procedures for mitigating a hazardous release, procedures, and equipment for minimizing the potential damage of a hazardous materials release, and provisions for immediate notification of the HMD, the Office of Emergency Services, and other emergency-response personnel, such as the local Fire Agency having jurisdiction. Implementation of the emergency response plan facilitates rapid response in the event of an accidental spill or release, thereby reducing potential adverse impacts. Furthermore, the LAFCD is required to conduct ongoing routine inspections to ensure compliance with existing laws and regulations; to identify safety hazards that could cause or contribute to an accidental spill or release; and to suggest preventative measures to minimize the risk of a spill or release of hazardous substances. The County, in conjunction with its many emergency services partners, has prepared a Local All-Hazards Mitigation Plan that sets strategies for coping with the natural and man-made hazards faced by residents. The plan is a compilation of information from County departments correlated with known and projected hazards that face Southern California. The plan complies with, and has been approved by, FEMA and the Governor's Office of Emergency Services (OES). The plan has been formally adopted by the Los Angeles County Board of Supervisors for use in the development of specific hazard mitigation proposals that have a high cost-benefit ratio.

FIGURE 2.9-1
 Los Angeles County Hazardous Waste Facilities

Typical Contaminants from Land Uses / Sources	
Land Use / Facility / Source	Typical Contaminants ^{1,2,3}
Commercial / Industrial	
Automobile Body shops/repair shops	Waste oils; solvents; acids; paints; automotive wastes; ⁴ miscellaneous cutting oils
Car washes	Soaps; detergents, waxes; miscellaneous chemicals
Gas stations/sumps	Oils; solvents; miscellaneous wastes
Boat Services/repair/refinishing	Diesel fuels; oil; septage from boat waste disposal area; wood preservative and treatment chemicals; paints; waxes; varnishes; automotive wastes ⁴
Cement/concrete plants	Diesel fuels; solvents; oils; miscellaneous wastes
Chemical/petroleum processing/storage	Hazardous chemicals; solvents; hydrocarbons; heavy metals; asphalt
Dry cleaners	Solvents (perchloroethylene, petroleum solvents, Freon); spotting chemicals (trichloroethane, methylchloroform, ammonia, peroxides, hydrochloric acid, rust removers, amyl acetate)
Electrical/electronic manufacturing	Cyanides; metal sludges; caustic (chromic acid); solvents; oils; alkalis; acids; paints and paint sludges; calcium fluoride sludges; methylene chloride; perchloroethylene; trichloroethane; acetone; methanol; toluene; PCBs
Fleet/trucking/bus terminals	Waste oil; solvents; gasoline and diesel fuel from vehicles and storage tanks; fuel oil; other automotive wastes ⁴
Food processing	Nitrates; salts; phosphorus; miscellaneous food wastes; chlorine; ammonia; ethylene glycol
Furniture repair/manufacturing	Paints; solvents; degreasing and solvent recovery sludges; lacquers; sealants
Hardware/lumber/parts stores	Hazardous chemical products in inventories; heating oil and fork lift fuel from storage tanks; wood-staining and treating products such as creosote; paints; thinners; lacquers; varnishes
Home manufacturing	Solvents; paints; glues and other adhesives; waste insulation; lacquers; tars; sealants; epoxy wastes; miscellaneous chemical wastes
Junk/scrap/salvage yards	Automotive wastes ⁴ ; PCB contaminated wastes; any wastes from businesses ⁶ and households ⁷ ; oils; lead
Machine shops	Solvents; metals; miscellaneous organics; sludges; oily metal shavings; lubricant and cutting oils; degreasers (tetrachloroethylene); metal marking fluids; mold-release agents
Medical/vet offices	X-ray developers and fixers ⁸ ; infectious wastes; radiological wastes; biological wastes; disinfectants; asbestos; beryllium; dental acids; miscellaneous chemicals
Metal plating/finishing/ fabricating	Sodium and hydrogen cyanide; metallic salts; hydrochloric acid; sulfuric acid; chromic acid; boric acid; paint wastes; heavy metals; plating wastes; oils; solvents
Mines/gravel pits	Mine spills or tailings that often contain metals; acids; highly corrosive mineralized waters; metal sulfides; metals; acids; minerals sulfides; other hazardous and nonhazardous chemicals ⁹
Office buildings/complexes	Building wastes ⁶ ; lawn and garden maintenance chemicals ⁵ ; gasoline; motor oil
Parking lots/malls	Hydrocarbons; heavy metals; building wastes ⁶
Photo processing/printing	Biosludges; silver sludges; cyanides; miscellaneous sludges; solvents; inks; dyes; oils; photographic chemicals
Plastics/synthetics producers	Solvents; oils; miscellaneous organic and inorganics (phenols, resins); paint wastes; cyanides; acids; alkalis; wastewater treatment sludges; cellulose esters; surfactant; glycols; phenols; formaldehyde; peroxides; etc.
Research laboratories	X-ray developers and fixers ⁸ ; infectious wastes; radiological wastes;

FIGURE 2.9-2
Typical Contaminants from Land Uses / Sources

	biological wastes, disinfectants; asbestos; beryllium; solvents; infectious materials; drugs; disinfectants; (quaternary ammonia, hexachlorophene, peroxides, chlornexade, bleach); miscellaneous chemicals
RV/mini storage	Automobile wastes ⁴ ; gasoline and diesel fuel from vehicles and storage tanks
Wood preserving/treating	Wood preservatives; creosote, pentachlorophenol, arsenic
Wood/pulp/paper processing and mills	Metals; acids; minerals; sulfides; other hazardous and nonhazardous chemicals ⁹ ; organic sludges; sodium hydroxide; chlorine; hypochlorite; chlorine dioxide; hydrogen peroxide; treated wood residue (copper quinolate, mercury, sodium bazide); tanner gas; paint sludges; solvents; creosote; coating and gluing wastes
<u>Agricultural/Forest</u>	
Auction lots	Livestock sewage wastes; nitrates; phosphates; coliform and noncoliform bacteria; giardia, viruses; total dissolved solids
Chicken/turkeys	Nitrates; phosphates; potassium; total dissolved solids; salts
Confined animal feeding operations	Livestock sewage wastes; nitrates; phosphates; chloride; chemical sprays and dips for controlling insect, bacterial, viral and fungal pests on livestock; coliform ¹⁰ and noncoliform bacteria; viruses; giardia; total dissolved solids
Dairies	Nitrates; total dissolved solids; salts; phosphates; potassium
Farm chemical distributor/application service	Pesticides ¹¹ ; fertilizers ¹² ; hydrocarbons from motor vehicles and storage tanks
Farm machinery repair	Automotive wastes ⁴ ; welding wastes
Irrigated crops	Pesticides ¹¹ ; fertilizers ¹² ; nitrates; phosphates; potassium (can be worsened by over-watering)
Lagoons	Nitrates; Livestock sewage wastes; salts; pesticides ¹¹ ; fertilizers ¹⁷ ; bacteria
Managed forest lands	Sediments; pesticides ¹¹ ; fertilizers ¹² ; petroleum (spills)
Nonirrigated crops	Pesticides ¹¹ ; fertilizers ¹² ; nitrates; phosphates; potassium
Pesticide/fertilizer/petroleum storage & transfer areas	Pesticides ¹¹ ; fertilizers ¹² ; petroleum residues
Rural homesteads	<i>Machine shops:</i> Automotive wastes ⁴ ; welding wastes; solvents; metals; lubricants; sludges <i>Septic systems:</i> Septage; coliform ¹⁰ and noncoliform bacteria; viruses; nitrates; heavy metals; synthetic detergents; cooking and motor oils; bleach; pesticides, ^{5,13} paints; paint thinner; photographic chemicals; swimming pool chemicals; ¹⁴ septic tank/cesspool cleaner chemicals; ¹⁵ elevated levels of chloride, sulfate, calcium, magnesium, potassium, and phosphate
Swine	Nitrates; phosphates; potassium
<u>Residential / Municipal</u>	
Airports (maintenance/fueling areas)	Jet fuels; deicers; diesel fuel; chlorinated solvents; automotive wastes; ⁴ heating oil; building wastes ⁶
Apartments and condominiums	Swimming pool maintenance chemicals ¹⁴ ; pesticides for lawn and garden maintenance and cockroach, termite, ant, rodent, and other pest control ^{5,13} , wastes from on-site sewage treatment plants; household hazardous wastes ⁷
Camp grounds/RV parks	Septage; gasoline; diesel fuel from boats; pesticides for controlling mosquitoes, ants, ticks, gypsy moths, and other pests ^{11,13} ; household hazardous wastes from recreational vehicles (RVs) ⁷
Drinking water treatment plants	Treatment chemicals; pesticides ¹¹
Fire stations	General building wastes ⁶ ; hydrocarbons from test burn areas
Golf courses	Fertilizers ¹² ; herbicides ¹¹ ; pesticides for controlling mosquitoes, ticks, ants, gypsy moths, and other pests ⁵

FIGURE 2.9-2
Typical Contaminants from Land Uses / Sources

Housing	<p><i>Household hazardous wastes</i>⁷: Household cleaners; oven cleaners; drain cleaners; toilet cleaners; disinfectants; metal polishes; jewelry cleaners; shoe polishes; synthetic detergents; bleach; laundry soil and stain removers; spot removers and dry cleaning fluid; solvents; lye or caustic soda; household pesticides;¹³ photo chemical; printing ink, paints; varnishes; stains; dyes; wood preservatives (creosote); paint and lacquer thinners; paint and varnish removers and deglossers; paint brush cleaners; floor and furniture strippers</p> <p><i>Mechanical Repair and Other Maintenance Products</i>: Automotive wastes;⁴ waste oils; diesel fuel; kerosene; #2 heating oil; grease; degreasers for driveways and garages; metal degreasers; asphalt and roofing tar; tar removers; lubricants; rustproofers; car wash detergents; car waxes and polishes; rock salt; refrigerants</p> <p><i>Lawn/garden care</i>: Fertilizers;¹¹ herbicides and other pesticides used for lawn and garden maintenance⁵ (can be worsened by over-watering)</p> <p><i>Swimming pools</i>: Swimming pool maintenance chemicals¹⁴</p> <p><i>Urban runoff/stormwater</i>³: Gasoline; oil; other petroleum products; microbiological contaminants</p>
Landfills/dumps	Leachate; organic and inorganic chemical contaminants; waste from households ⁷ and businesses ⁶ ; nitrates; oils; metals; solvents; sludge
Motor pools	Automotive wastes ⁴ ; solvents; waste oils; hydrocarbons from storage tanks
Parks	Fertilizers ¹² ; herbicides ⁵ ; insecticides ^{11,13} ; (can be worsened by over-watering)
Railroad yards/maintenance/fueling areas	Diesel fuel; herbicides for rights-of-way ¹¹ ; creosote for preserving wood ties; solvents; paints; waste oils
Schools	Machinery/vehicle serving wastes; gasoline and heating oil from storage tanks; general building wastes ⁶ ; pesticides ^{11,13}
Septic systems	Nitrates; septage; Cryptosporidium; Giardia; coliform ¹⁰ and noncoliform bacteria; viruses; drain cleaners; solvents; heavy metals; synthetic detergents; cooking and motor oils; bleach; pesticides; ^{5,13} paints; paint thinner; photographic chemicals; swimming pool chemicals; ¹⁴ septic tank/cesspool cleaner chemicals ¹⁵ ; elevated levels of chloride, sulfate, calcium, magnesium, potassium, and phosphate; other household hazardous wastes ⁷
Utility stations/maintenance areas	PCBs from transformers and capacitors; oils; solvents; sludges; acid solution; metal plating solutions (chromium, nickel, cadmium); herbicides from utility rights-of-way
Waste transfer/recycling stations	Residential and commercial solid waste residues
Wastewater	Municipal wastewater; sludge ¹⁶ ; treatment chemicals ¹⁷ ; nitrates; heavy metals; coliform ¹⁰ and noncoliform bacteria; nonhazardous wastes ¹⁶
Miscellaneous	
Above ground storage tanks	Heating oil; diesel fuel; gasoline; other chemicals
Construction/demolition areas (plumbing, heating, and air conditioning, painting, paper hanging, decorating, drywall and plastering, acoustical insulation, carpentry, flooring, roofing, and sheet metal etc.)	Solvents; asbestos; paints; glues and other adhesives; waste insulation; lacquers; tars; sealants; epoxy waste; miscellaneous chemical wastes
Historic gas stations	Diesel fuel; gasoline; kerosene
Historic waste dumps/landfills	Leachate; organic and inorganic chemicals; waste from households ⁷ ; and businesses ⁶ ; nitrates; oils; heavy metals; solvents
Injection wells/drywells/sumps	Stormwater runoff ³ ; spilled liquids; used oils; antifreeze; gasoline; solvents; other petroleum products; pesticides ¹¹ ; and a wide variety

FIGURE 2.9-2

Typical Contaminants from Land Uses / Sources

	of other substances
Military installations	Wide variety of hazardous and nonhazardous wastes depending on the nature of the facility and operation ^{3,9} ; diesel fuels; jet fuels; solvents; paints; waste oils; heavy metals; radioactive wastes
Surface water - stream/lakes/river	(Directly related to surface water quality in the stream, lake, or river which is recharging groundwater)
Transportation corridors	Herbicides in highway right-of-way ^{11,5} ; road salt (sodium and calcium chloride); road salt, anticaking additives (ferric ferrocyanide, sodium ferrocyanide); road salt anticorrosives (phosphate and chromate); automotive wastes ⁴
Underground storage tanks	Diesel fuel; gasoline; heating oil; other chemical and petroleum products
Wells (such as water supply wells, monitoring wells, unsealed or abandoned wells, and test holes)	Storm water runoff ³ ; solvents; nitrates; septic tanks; hydrocarbons; and a wide variety of other substances

SOURCE: Adapted from EPA ; Supplemented with information from Oregon DEQ hazardous waste / water quality databases and Drinking Water Protection citizen's and technical advisory committees

NOTES

¹In general, water contamination stems from the misuse and improper disposal of liquid and solid wastes; the illegal dumping or abandonment of household, commercial, or industrial chemicals; the accidental spilling of chemicals from trucks, railways, aircraft, handling facilities, and storage tanks; or the improper siting, design, construction, operation, or maintenance of agricultural, residential, municipal, commercial, and industrial drinking water wells and liquid and solid waste disposal facilities. Contaminants also can stem from atmospheric pollutants, such as airborne sulfur and nitrogen compounds, which are created by smoke, flue dust, aerosols, and automobile emissions, fall as acid rain, and percolate through the soil. When the contaminants list in this table are used and managed properly, environmental contamination is not likely to occur.

²Contaminants can reach water bodies from activities occurring on the land surface, such as industrial waste storage; from sources below the land surface but above the water table, such as septic systems; from structures beneath the water table, such as wells; or from contaminated recharge water.

³This table lists the most common wastes, but not all potential wastes. For example, it is not possible to list all potential contaminants contained in stormwater runoff or from military installations.

⁴Automobile wastes can include gasoline; antifreeze; automatic transmission fluid; battery acid; engine and radiator flushes; engine and metal degreasers; hydraulic (brake) fluid; and motor oils.

⁵Common pesticides used for lawn and garden maintenance (i.e., weed killers, and mite, grub, and aphid controls) include such chemicals as 2,4-D; chlorpyrifos; diazinon; benomyl; captan; dicofol; and methoxychlor.

⁶Common wastes from public and commercial buildings include automotive wastes; and residues from cleaning products that may contain chemicals such as xlenols, glycol esters, isopropanol, 1,1,1-trichloroethane, sulfonates, chlorinated phenols, and cresols.

⁷Household hazardous wastes are common household products which contain a wide variety of toxic or hazardous components (contact Oregon DEQ Household Waste Program for list).

⁸X-ray developers and fixers may contain reclaimable silver, glutaldehyde, hydroquinone, potassium bromide, sodium sulfite, sodium carbonate, thiosulfates, and potassium alum.

⁹The Resource Conservation and Recovery Act (RCRA) defines a hazardous waste as a solid waste that may cause an increase in mortality or serious illness or pose a substantial threat to human health and the environment when improperly treated, stored, transported, disposed of, or otherwise managed. A waste is hazardous if it exhibits characteristics of ignitability, corrosivity, reactivity, and/or toxicity. Not covered by RCRA regulations are domestic sewage; irrigation waters or industrial discharges allowed by the Clean Water Act; certain nuclear and mining wastes; household wastes; agricultural wastes (excluding some pesticides); and small quantity hazardous wastes (i.e., less than 220 pounds per month) generated by businesses.

¹⁰Coliform bacteria can indicate the presence of pathogenic (disease-causing) microorganisms that may be transmitted in human feces. Diseases such as typhoid fever, hepatitis, diarrhea, and dysentery can result from sewage contamination of drinking water supplies.

¹¹Pesticides include herbicides, insecticides, rodenticides, fungicides and avicides. EPA has registered approximately 50,000 different pesticide products for use in the United States. Many are highly toxic and quite mobile in the subsurface. An EPA survey found that the most common pesticides found in drinking water wells were DCPA (dacthal) and atrazine, which EPA classifies as moderately toxic (class 3) and slightly toxic (class 4) materials, respectively

¹²The EPA National Pesticides Survey found that the use of fertilizers correlates to nitrate contamination of groundwater supplies.

FIGURE 2.9-2
Typical Contaminants from Land Uses / Sources

¹³Common household pesticides for controlling pests such as ants, termites, bees, wasps, flies, cockroaches, silverfish, mites, ticks, fleas, worm, rates, and mice can contain active ingredients include naphthalene, phosphorus, xylene, chloroform, heavy metals, chlorinated hydrocarbons, arsenic, strychnine, kerosene, nitrosamines, and dioxin.

¹⁴Swimming pool chemicals can contain free and combined chlorine; bromine; iodine; mercury-based, copper-based, and quaternary algaecides; cyanuric acid; calcium or sodium hypochlorite; muriatic acid; sodium carbonate.

¹⁵Septic tank/cesspool cleaners include synthetic organic chemicals such as 1,1,1 trichloroethane, tetrachloroethylene, carbon tetrachlorine, and methylene chloride.

¹⁶Municipal wastewater treatment sludge can contain organic matter, nitrates; inorganic salts, heavy metals; coliform and noncoliform bacteria; and viruses.

¹⁷Municipal wastewater treatment chemicals include calcium oxide; alum; activated alum, carbon, and silica; polymers; ion exchange resins; sodium hydroxide; chlorine; ozone; and corrosion inhibitors.

The California OES, Hazardous Materials (HazMat) Section, under the Fire and Rescue Division, coordinates statewide implementation of hazardous materials accident prevention and emergency response programs for all types of hazardous materials incidents and threats. In response to any hazardous materials emergency, the Section staff is called upon to provide state and local emergency managers with emergency coordination and technical assistance.⁹ The California OES immediately takes on the Incident Command responsibility after an emergency incident involving transport on the railways, and has a goal of resolving incidents within 90 minutes. The unincorporated territory of the County is covered by California OES.

The California Highway Patrol (CHP) has the responsibility to minimize exposure of the public to unsafe conditions resulting from emergency incidents on state highways.¹⁰ The CHP immediately takes on the Incident Command responsibility after an emergency incident, and has a goal of resolving incidents within 90 minutes. The unincorporated area of the County is covered by the CHP.

Threshold of Significance

A significant impact in relation to creation of a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials was considered in relation to the potential for new or expanded use or production of hazardous materials that could be released into the environment.

Impact Analysis

The proposed program would result in less than significant impacts to hazards and hazardous materials in relation to creation of a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials. The proposed program would include new regulations for recycling and solid waste facilities but would not result in an increase in locations where such land uses are allowable. The proposed program would include construction of fencing and solid walls, temporary truck trips during construction that would not differ substantially from existing conditions, and maintenance to existing facilities. The construction would be minimal and short-term. While, the proposed program would involve new regulations for recycling and solid waste facilities, including the construction of buffers such as enclosed rooms or storage areas, to provide safely accessible storage and collection of waste, recyclable materials, and organic materials to building occupants and waste and recycling haulers in compliance with Title 14, Division 7 (Natural Resources) of the California Code of Regulations, the proposed program would not regulate the current operations regarding transport, use, and disposal of hazardous material at these facilities or alter the requirements for these activities. All routine transport, use, and disposal of hazardous material at these facilities would be required to comply with all applicable existing local, state, and federal regulations in relation to hazardous waste and transport. Additionally, a CUP would be required for the development of new recycling and solid waste facilities.

Construction and operation of the new requirements under the proposed program must comply with applicable existing federal, state and local regulations related to hazardous materials (RCRA, CERCLA, Title 22 and Section 6.95 of the HSC) as discussed above. Required compliance with these regulations would ensure impacts related to transport, use and disposal of hazardous materials would be less than significant. Therefore, the proposed program would result in less than significant impacts to hazards and hazardous materials in relation to creating a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials.

The potential for impacts in relation to creation of a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts (please see Section 1, *Project Description*, Table 1.IV-1, *Planning and Permitting Requirements*, and Table 1.IV-2, *Development Standards*). The qualitative and geospatial analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the

⁹ State of California. 2011. <http://www.calema.ca.gov/hazardousmaterials/pages/hazardous-materials.aspx>

¹⁰ California Highway Patrol, Enforcement and Planning Division, Special Projects Section. January 2014. California Highway Patrol Strategic Plan 2014-2015.

development standards that have the potential to result in physical changes to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials, include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts in relation to creating a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials. The new development standards would result in more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. The Green Zone Districts would cover approximately 1,950 acres of the unincorporated territory of the County. As discussed in Section 1, the purpose of the Green Zone Districts is to address incompatible land uses in proximity to sensitive uses by changing regulatory requirements for specific industrial land uses. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, ~~27~~ 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, ~~14~~ 45 of the ~~27~~ 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement processes would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The CUP is issued the Los Angeles County Fire Department (LACFD). These new development standards are addressed through hazardous materials business plans and chemical inventory, hazardous waste and tiered permitting, and risk-management plans. LACFD is required to regulate transportation of hazardous materials in a hazardous materials business plan and chemical inventory, hazardous waste and tiered permitting, underground storage tanks (UST), and risk-management plans. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to ~~7~~ 10 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would in a less than significant impact.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts in relation to creating a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to

include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity to~~ adjacent to or adjoining legally-established, existing industrial, ~~uses. Similarly, new sensitive uses that are constructed adjacent to industrial, recycling or solid waste, or vehicle-related uses would be required to implement development standards similar to those required for existing industrial uses,~~ to protect these new sensitive uses from impacts from existing industrial uses (Chapter 22.84, and Chapter 22.130). In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in less than significant impacts to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would result in less than significant impacts to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts related to hazards and hazardous materials in relation to creating a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials. Within the Recycling and Waste Management portion of the Green Zones Program there are seven zoning designations. The five manufacturing zoning designations combined with agricultural and institutional zoning account for approximately 600,000 acres and 37 percent of the unincorporated territory of the County. The Recycling and Waste Management element of the proposed program does not change the underlying allowable uses within these zoning designations, with the exception to the introduction of organic waste recycling facilities. As discussed in Section 1, the Recycling and Waste Management Revisions element of the Green Zones Program includes permitting requirements and development standards for pallet yards, recycling collection facilities, recycling processing facilities, organic waste facilities, and solid waste facilities. A CUP would be required for all of the above uses (Chapter 22.140). Development standards for Recycling and Waste Management Revisions include requirements for landscaping buffers, walls, enclosed buildings, surfacing of storage areas, air filtration, signage, and lighting. ~~Additionally, the Recycling and Waste Management Revisions include prohibitions on areas where certain specific uses would be prohibited including Significant Ecological Areas, High and Very High Fire Hazard Severity Zones, Hillside Management Areas, and in some cases Agricultural Resource Areas.~~

While the proposed program would involve new regulations for recycling and solid waste facilities, including the construction of buffers such as enclosed rooms or storage areas, to provided safely accessible storage and collection of waste, recyclable materials, and organic materials to building occupants and waste and recycling haulers in compliance with Title 14, Division 7 (Natural Resources) of the California Code of Regulations, the proposed program would not regulate the current operations regarding transport, use, and disposal of hazardous material at these facilities or alter the requirements for these activities. All routine transport, use, and disposal of hazardous material at these facilities would be required to comply with all applicable existing local, state, and federal regulations in relation to hazardous waste and transport. Additionally, a CUP would be required for the development of new recycling and solid waste facilities. The CUP is issued by the LACFD and they are required to address standards through hazardous materials business plans

and chemical inventory, hazardous waste and tiered permitting, underground storage tanks (UST), and risk-management plans, if applicable. Thus, no impacts would occur.

Construction of any required improvements would involve the transport and use of hazardous materials such as solvents, dust, and man-made mineral fibers over minimal and short-term construction periods.¹¹ In the case of the construction of new recycling and waste management facilities, the Recycling and Waste Management Revisions element of the proposed program establishes greater stringency in conditions and development standards existing for proposed facilities, and it requires conditions of approval as an additional permitting requirement. Based on the proposed Standards for Specific Uses (Chapter 22.140), new recycling processing and organic waste facilities would be processed on a project by project basis and subject to environmental review under CEQA in relation to hazards and hazardous materials. The operation and maintenance of the proposed improvements would not differ substantially from existing conditions, as they would be minor physical improvements to existing agricultural, commercial, manufacturing, institutional, and mixed-use zoning designations. Operation and maintenance of the facilities would not require the routine use, transport, storage, production use or disposal of hazardous materials beyond that typically associated with the allowable uses for underlying land use zoning designations.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR and would also include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards as identified in the Project Description (Table 1.4.2-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would also prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in vessel organic waste facilities are prohibited in ARAs.~~ Therefore, the Recycling and Waste Management Revisions would result in no impact in relation to creating a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials.

The Supermarket Accessory Recycling Collection Centers Revisions would result in no impacts to hazards and hazardous materials in relation to creating a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials. The manufacturing zoning categories, combined with commercial zoning categories account for 63,419 acres of land, or 4 percent of the unincorporated areas of the County. As discussed in Section 1, the purpose of the Supermarket Accessory Recycling Collection Centers Revisions is to establish standards, conditions, and procedures that support and facilitate the development of recycling collection center as an accessory use to an existing supermarket (Chapter 22.140-~~660.710~~), and to establish standards for enclosed rooms or storage areas that are provided to store, collect, and load waste, recyclable materials, and organic materials generated by the uses served and that the area is safely accessible by building occupants and waste and recycling haulers in compliance with Title 14, Division 7 (Natural Resources) of the California Code of Regulations (Chapter 22.128).¹² Construction of the required improvements would involve the transport and use of hazardous materials such as solvents, dust, and man-made mineral fibers over minimal and short-term construction periods.¹³

¹¹ Craig, Duane. 8 May 2017. Construction's Most Common Hazardous Substances. <https://jobsite.procore.com/hazardous-building-materials-in-construction/>

¹² See Appendix A to the Initial Study.

¹³ Craig, Duane. 8 May 2017. Construction's Most Common Hazardous Substances. <https://jobsite.procore.com/hazardous-building-materials-in-construction/>

The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized areas of the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built.

The operation and maintenance of the proposed improvements would not differ substantially from existing conditions, as they would be minor additions to existing and proposed commercial, industrial, and residential uses over four dwelling units. There would be no hazardous materials or hazardous waste stored on-site at these facilities. As such, operation and maintenance of the facilities would not require the routine use, transport, storage, production use or disposal of hazardous materials beyond that typically associated with the allowable uses for underlying land use zoning designations. The construction and operation the proposed improvements for supermarket recycling collection center would not substantially alter the existing conditions, such that there would be a significant increase of transport, storage, production, use, or disposal of hazardous materials. Therefore, there would be no impact. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no significant impacts with regards to creating a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. Hazardous waste would not be stored in the storage enclosures. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts in relation to creating a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials. No further analysis is warranted.

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment?

Existing Conditions

A review of the CalEPA Envirostor database indicates that there 168 hazardous waste sites within the project footprint, 55 of which are affected by the Green Zone Districts. A review of the California State Water Resources Control Board’s database system, GeoTracker indicates that there are 585 hazardous sites within the project footprint and GeoTracker’s Underground Storage Tank (UST) database identifies a total of 238 hazardous sites within the project footprint (Table 2.9-1, *Known Hazardous Materials Sites within Proposed program Footprint*).

TABLE 2.9-1
KNOWN HAZARDOUS MATERIALS SITES WITHIN PROPOSED PROGRAM FOOTPRINT

	Number of Sites within the Project Footprint	Number of Sites in Project Footprint Affected by the Green Zone Districts
Envirostor	168	55

SOURCE: CalEPA Envirostor Database & California State Water Resources Control Board GeoTracker Database.

Threshold of Significance

A significant impact in relation to creating a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment was considered in relation to the potential excavation and/or transport of hazardous materials during construction or operations activities that could be accidentally released into the environment.

Impact Analysis

The proposed program would result in potentially significant impacts to hazards and hazardous materials in relation to creating a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. The potential for impacts to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The qualitative and geospatial analysis considers the incremental changes to the physical environment, as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in the potential for significant impacts to hazards and hazardous materials in relation to creating a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. The Green Zone Districts cover 11 unincorporated area communities totaling approximately 1,950 acres of the County. The parcels in the Green Zone Districts, with the exception of hazardous materials storage, do not include the recycling of hazardous materials. However, within the Green Zone Districts portion of the project there are a total of 168 hazardous sites located on the CalEPA Department of Toxic Substance Control (DTSC) Envirostor database, 585 listed in GeoTracker, and 238 located on GeoTracker UST (Table 2.9-1). Many of the improvements required pursuant to the Green Zone Districts development standards would require some grading or excavation with the potential to disturb underlying soil, in order to establish landscaping barriers, enclosures, fencing, solid walls, signage, paving of permeable areas, and lighting. These improvements would be required where the Ordinance implements new standards for new and existing industrial uses. Construction of the proposed improvements has the potential to encounter known and unknown hazardous materials sites and result in a release of hazardous materials into the environment, requiring the consideration of mitigation measure and/or alternatives. Once constructed, the operation and maintenance of the improvements required in

association with the Green Zone Districts element of the proposed program would not result in foreseeable risk of upset or release of hazardous materials to the environment.

The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in potentially significant the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in potentially significant impacts to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in potentially significant impacts related to hazards and hazardous materials with respect to creating potentially significant impacts to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment, requiring the consideration of mitigation measures and alternatives in an EIR.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in the potential for significant impacts related to hazards and hazardous materials with respect to creating potentially significant impacts to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The Sensitive Use Areas Adjacent to Industrial, Recycling and Solid Waste, or Vehicle-Related Uses cover 11 unincorporated area communities totaling approximately 1,950 acres of the County. The parcels in the Sensitive Use Areas Adjacent to Industrial, Recycling and Solid Waste, or Vehicle-Related Uses, with the exception of hazardous materials storage, do not include the recycling of hazardous materials. However, within the Sensitive Use Areas and Adjacent to Industrial, Recycling and Solid Waste, or Vehicle-Related Uses portion of the project there are a total of a total of 168 hazardous sites located on the CalEPA DTSC Envirostor database, 585 listed in GeoTracker, and 238 located on GeoTracker UST (Table 2.9-1). Many of the improvements required pursuant to ~~the Green Zone Districts~~ New Sensitive Uses would require some grading or excavation with the potential to disturb underlying soil, in order to establish landscaping barriers, ~~enclosures, fencing, solid walls, signage, paving of permeable areas, and lighting.~~

~~These improvements would be required where the Ordinance implements new standards for new and existing industrial uses, and solid walls.~~ Construction of the proposed improvements has the potential to encounter known and unknown hazardous materials sites and result in a release of hazardous materials into the environment, requiring the consideration of mitigation measure and/or alternatives. Once constructed, the operation and maintenance of the improvements required in association with the New Sensitive Uses element of the proposed program would not result in foreseeable risk of upset or release of hazardous materials to the environment.

The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would differ substantially from existing conditions, such that they would result in potentially significant impacts to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would result in potentially significant impacts to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment. Therefore, the new development standards for New Sensitive Uses would result in potentially significant impacts to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment, requiring the consideration of mitigation measures and alternatives in an EIR.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in the potential for significant impacts related to hazards and hazardous materials with respect to creating a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment, requiring the consideration of mitigation measures and/or alternatives. Recycling of hazardous materials is permitted for recycling processing if permits are obtained from the County Fire Department, and the DTSC. Within properties zoned for uses identified in the Recycling and Waste Management Revisions element there are a total of 112 hazardous sites located on Envirostor Sites, 262 listed in GeoTracker sites, and 64 located on GeoTracker UST (Table 2.9-1). The Green Zones Ordinance would require that recycling processing facilities and pallet yards pave areas designated for operations, vehicle parking, vehicle circulation, or storage of materials or equipment with impervious materials such as an asphalt or an oil and aggregate mixture and maintained to the satisfaction of the Director (Section 22.140.690.740, 22.84.030). Construction of the proposed improvements has the potential to encounter known and unknown hazardous materials sites and result in a release to the environment, requiring the consideration of mitigation measure and/or alternatives. Once constructed, the operation and maintenance of the improvements required in association with the Recycling and Waste Management Revisions element of the proposed program would not result in foreseeable risk of upset or release of hazardous materials to the environment.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to CUP and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and

storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards: Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs, as identified in the project description table 1.4.2-1. The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.

Therefore, the construction of improvements required pursuant to the Recycling and Waste Management Revisions element of the proposed program would result in the potential for significant impacts related to hazards and hazardous materials with respect to creating a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment, requiring the consideration of mitigation measures and alternatives in an EIR.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would have less than significant impacts related to hazards and hazardous materials with respect to creating a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. No further analysis is warranted.

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses?

Existing Conditions

As stated in Section 1, the area that would be subject to the countywide Green Zones Program for the unincorporated areas of the County would regulate development of industrial uses in proximity to sensitive uses, as well as to identify and regulate a set of recycling and solid waste facilities. The proposed program area includes sensitive uses and parcels located within a quarter-mile radius of sensitive uses. As stated in Section 2.3, *Air Quality*, land uses identified as sensitive receptors by SCAQMD in CARB's Air Quality Handbook include residences, schools, playgrounds, child care centers, athletic facilities, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes (see Table 2.3-4, *Sensitive Receptors in Areas Subject to the Green Zones Program*).¹⁴ With the proposed program, sensitive land uses would be defined in Title 22 to include a range of land uses where individuals are most likely to reside or spend time, including dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship.

As stated in Section 2.3, *Air Quality*, there are over 200,000 residential parcels, 420 parks, 2 senior living homes, 11 hospitals, 156 public schools, and 68 early childhood centers within 500 feet of the area subject to the Green Zones Program (see Table 2.3-4, *Sensitive Receptors in Areas Subject to the Green Zones Program*). As stated in Section 2.14, *Population and Housing*, according to SCAG's 2019 Profile of Unincorporated Los Angeles County, as of 2018, the total number of residential homes in the unincorporated areas of Los Angeles County was 293,730.¹⁵ There are 164 public elementary schools, 44 public middle schools, 61 public high schools, 107 early childhood centers, 169 private and charter schools,

Threshold of Significance

A significant impact in relation to hazardous emissions or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses was considered in relation to the potential excavation and/or transport of hazardous materials during construction or operations activities that could be accidentally released into the environment within one-quarter mile of sensitive land uses, such as residences, schools, school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship

Impact Analysis

The proposed program would result in potentially significant impacts to hazards and hazardous materials in relation to emitting hazardous emissions or handling hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses. The uses regulated by the Green Zones Ordinance may create hazardous emissions or handle hazardous or acutely hazardous materials, substances or waste and have impact on existing or proposed schools within one-quarter mile of the facilities' sites. Additionally, construction activities as a result of the ordinance have the potential to encounter known and unknown hazardous materials sites, thereby requiring the consideration of mitigation measures and alternatives.

The potential for impacts to hazards and hazardous materials in relation to emitting hazardous emissions or handling hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The qualitative and geospatial analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

The ordinance would provide environmental benefits after construction and implementation through development standards that mitigate potentially incompatible land uses adjacent to sensitive uses. However, due to the close proximity of hazardous waste sites to sensitive uses within the Green Zones Ordinance project area, there is potentially significant

¹⁶ Los Angeles County Department of Parks and Recreation. 2016. County Parks and Open Space GIS Data. <https://egis3.lacounty.gov/dataportal/2016/10/25/departments-of-parks-and-recreation-county-parks-and-open-space/>

impacts from to hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed sensitive use. Mitigation measures and/or alternatives are required.

Element 1 – Green Zone Districts

Green Zone Districts would result in potentially significant impacts to hazardous materials and hazards with respect to the emission of hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses. As discussed in Section 1, the purpose of the new development standards for Green Zone Districts is to address incompatible land uses in proximity to sensitive uses by changing regulatory requirements for specific industrial land uses. Development standards for the Green Zone Districts would include landscaping barriers, enclosed buildings, fencing, solid walls, signage, paving of permeable areas, and lighting as measures to decrease impacts to surrounding sensitive uses. The construction of these improvements would be minor physical additions to existing industrial facilities.

The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in potentially significant impacts to hazardous materials and hazards with respect to the emission of hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

Once constructed, the operation and maintenance of the improvements required by the proposed ordinance would not result in foreseeable risk of upset or release of hazardous materials to the environment. Therefore, the construction of improvements required pursuant to the Green Zone Districts would result in the potential for significant impacts related to hazards and hazardous materials with respect to creating a potentially significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment, requiring the consideration of mitigation measures and/or alternatives.

Therefore the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in potentially significant impacts to hazards and hazardous materials with respect to the emission of hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school, requiring the consideration of mitigation measures and alternatives.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses would result in potentially significant impacts to hazardous materials and hazards with respect to the emission of hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses. ~~As discussed in Section 1, the~~

~~The purpose of the New Sensitive Uses is to address incompatible incompatibility of land uses in proximity by changing regulatory requirements for specific when sensitive uses locate near industrial land uses. Development standards for the New Sensitive Uses would include landscaping barriers, enclosed buildings, fencing, solid walls, signage, paving of permeable areas, and lighting as measures to decrease impacts to surrounding sensitive uses air filtration systems. The construction of these improvements would be minor physical additions to existing industrial facilities development standards.~~

Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity to adjacent to or adjoining legally-established, existing industrial uses. Similarly, ~~new sensitive uses that are constructed adjacent to industrial, recycling or solid waste, or vehicle-related uses would be required to implement development standards similar to those required for existing industrial uses,~~ to protect these new sensitive uses from impacts from existing industrial uses (Chapter 22.84, and Chapter 22.130). In the case of updated new standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, ~~such that they but~~ would result in potentially significant impacts to hazardous materials and hazards with respect to the emission of hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses.

Therefore, the new development standards for New Sensitive Uses would result in potentially significant impacts to hazardous materials and hazards with respect to the emission of hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses, requiring the consideration of mitigation measures and alternatives.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in the potential for significant impacts related to hazardous materials and hazards with respect to the emission of hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to CUP and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet~~

~~yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~

As discussed in Section 1, the Recycling and Waste Management Revisions consist of the inclusion of permitting requirements and development standards for Specific Uses including pallet yards, recycling collection facilities, recycling processing facilities, organic waste facilities, and solid waste facilities. A CUP would be required for all of the above uses (Chapter 22.140). Development standards for Recycling and Waste Management Revisions would include requirements for landscaping buffers, walls, enclosed buildings, surfacing of storage areas, air filtration, signage, and lighting. ~~Additionally, the Recycling and Waste Management Revisions would include prohibitions of these Specific Uses in Significant Ecological Areas, High and Very High Fire Hazard Severity Zones, Hillside Management Areas, and in some cases Agricultural Resource Areas.~~ The Green Zones Program would establish greater stringency in development standards for proposed facilities and require development standards to be met for approved as an additional permitting requirement. Based on the proposed Standards for Specific Uses (Chapter 22.140), new recycling processing and organic waste facilities would be processed on a project by project basis and subject to environmental review under CEQA in relation to hazards and hazardous materials prior to project approval. Construction of the proposed improvements has the potential to encounter known and unknown hazardous materials sites and result in a release to the environment, requiring the consideration of mitigation measure and/or alternatives. Once constructed, the operation and maintenance of the improvements required in association with the Recycling and Waste Management Revisions element of the proposed program would not result in foreseeable risk of upset or release of hazardous materials to the environment. Therefore, the construction of improvements required pursuant to the Recycling and Waste Management Revisions element of the proposed program would result in the potential for significant impacts related to hazardous materials and hazards with respect to the emission of hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses, requiring the consideration of mitigation measures and alternatives in an EIR.

The Supermarket Accessory Recycling Collection Centers revisions would not result in the potential for significant impacts related to hazards and hazardous materials with respect to the potential to emit hazardous emissions or handling hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed sensitive land use. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. Therefore, there would be no impact. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for

distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions component of the Green Zones ordinance would result in potentially significant impacts to due to these uses potentially locating on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, creating a significant hazard to the public or the environment. Therefore, the construction of improvements would result in the potential for significant impacts related to hazards and hazardous materials with respect to being located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, creating a significant hazard to the public or the environment. Therefore, further analysis is warranted, requiring the consideration of mitigation measures and alternatives.

- d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would it create a significant hazard to the public or the environment?**

Existing Conditions

The review of the CalEPA Envirostor database indicates that there are 129 hazardous waste sites in the unincorporated areas of Los Angeles County. A review of GeoTracker sites indicates that there are 498 hazardous sites within the Green Zones Ordinance project area while Geo Tracker UST indicates that there are 206 hazardous sites within the Green Zones Ordinance project area (Table 2.9-1).

Threshold of Significance

A significant impact in relation to being located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 was considered in relation to the potential release of hazardous materials into the environment as a result of construction or operations activities that could create a significant hazard to the public or the environment.

Impact Analysis

The proposed Green Zones Program would result in potentially significant impacts in relation to being located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5, as many of the industrial facilities regulated under the proposed program may be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, create a significant hazard to the public or the environment. The potential for impacts to hazards and hazardous materials has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The qualitative and geospatial analysis considers the incremental changes to the physical environment, as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment regarding hazards and hazardous materials include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in a potentially significant impact as many of the industrial facilities regulated under the proposed program may be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, create a significant hazard to the public or the environment. As discussed in Section 1, the purpose of the Green Zone Districts is to address incompatible land uses in proximity to sensitive uses by changing regulatory requirements for specific industrial land uses. Development standards for the Green Zone Districts would include landscaping barriers, enclosed buildings, fencing, solid walls, signage, paving of permeable areas,

and lighting as measures to decrease impacts to surrounding sensitive uses. Within the Green Zone Districts, there are 112 hazardous sites listed on Envirostor sites, 585 listed in GeoTracker sites, and 238 listed on GeoTracker UST sites (Table 2.9-1). These hazardous sites have the potential to pose significant impacts to the public or the environment due to the nature of the land use. In addition, construction activities from improvements required pursuant to the new development standards for Green Zone Districts would require grading or excavation with the potential to disturb underlying soil, including landscaping barriers, enclosures, fencing, solid walls, signage, paving of permeable areas, and lighting. These improvements would be required for both new and existing industrial uses. Construction activities have the potential to encounter known and unknown hazardous materials sites and result in a release to the environment, requiring the consideration of mitigation measure and/or alternatives. Once constructed, the operation and maintenance of the improvements required in association with the Green Zone Districts would not result in foreseeable risk of upset or release of hazardous materials to the environment.

The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in creating significant environmental impacts as many of the industrial facilities regulated under the proposed program may be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in creating a significant environmental impacts as many of the industrial facilities regulated under the proposed program may be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, create a significant hazard to the public or the environment, requiring the consideration of mitigation measures and alternatives.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in significant impacts in relation to being located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would create a significant hazard to the public or the environment. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses~~ permitted in the zones where they are located. New sensitive uses that are constructed next to existing industrial uses would be required to implement ~~more stringent~~ additional development standards ~~similar to those required for existing industrial uses, including landscaping buffers, solid walls, open space, and air filtration systems~~ to protect these new sensitive uses from impacts from existing industrial uses. The construction

of these measures would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses or minor additions to new residential or other sensitive use construction. Therefore, the construction of improvements required pursuant to the New Sensitive Uses element of the proposed program would result in potentially significant impacts related to hazards and hazardous materials regarding being located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, creating a significant hazard to the public or the environment, requiring the consideration of mitigation measures and alternatives. ~~Similarly, new sensitive uses that are constructed adjacent to industrial, recycling, or vehicle-related uses would be required to implement development standards similar to those required for existing industrial uses, to protect these new sensitive uses from impacts from existing industrial uses (Chapter 22.84, and Chapter 22.130).~~

The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity adjacent to or adjoining legally-established,~~ existing industrial, recycling or solid waste, or vehicle-related uses.

Therefore, the new development standards for New Sensitive Uses would result in significant impacts in relation to being located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, it would create a significant hazard to the public or the environment, requiring the consideration of mitigation measures and alternatives in an EIR.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in significant impacts in relation to being located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would create a significant hazard to the public or the environment. As discussed in Section 1, the Recycling and Waste Management Revisions would consist of the inclusion of permitting requirements and development standards for Specific Uses including pallet yards, recycling collection facilities, recycling processing facilities, organic waste facilities, and solid waste facilities. A CUP would be required for all of the above uses (Chapter 22.140). Development standards for Recycling and Waste Management Revisions include requirements for landscaping buffers, walls, enclosed buildings, surfacing of storage areas, air filtration, signage, and lighting. ~~Additionally, the Recycling and Waste Management Revisions prohibits specific uses in SEAs, High and Very High Fire Hazard Severity Zones, HMAs, and in some cases ARAs.~~ Therefore, the proposed Recycling and Waste Management Revisions component has the potential to result in potentially significant impacts due to these uses potentially locating on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, creating a significant hazard to the public or the environment, requiring the consideration of mitigation measures and alternatives.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to CUP and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs;

solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHHHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.

Within the Green Zones Program project area where recycling and waste management facilities would be permitted, there are 113 hazardous sites listed on Envirostor Sites, 262 listed on GeoTracker, and 64 listed on GeoTracker UST sites (Table 2.9-1). Hazardous sites have the potential to pose significant impacts to the public and the environment. Construction of the proposed improvements required by the Recycling and Waste Management Revisions would usually require one month. These improvements would require grading or excavation with the potential to disturb underlying soil, including landscaping barriers, enclosures, fencing, solid walls, signage, paving of permeable areas, and lighting. These measures would be required where the Ordinance implements new standards for existing manufacturing uses. Construction activities have the potential to encounter known and unknown hazardous materials sites and result in a release to the environment, requiring the consideration of mitigation measure and/or alternatives. Once constructed, the operation and maintenance of the improvements required in association with the Recycling and Waste Management Revisions portion of the proposed program would not result in foreseeable risk of upset or release of hazardous materials to the environment. Therefore, impacts to Recycling and Waste Management Revisions has the potential to result in significant impacts due to these uses potentially locating on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, creating a significant hazard to the public or the environment, requiring the consideration of mitigation measures and alternatives.

The Supermarket Accessory Recycling Collection Centers revisions would result in significant impacts due to these uses potentially locating on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, creating a significant hazard to the public or the environment. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. Therefore, the Supermarket Accessory Recycling Collection Centers would result in significant impacts due to these uses potentially locating on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, creating a significant hazard to the public or the environment, requiring the consideration of mitigation measures and alternatives.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions component of the Green Zones ordinance would result in potentially significant impacts to due to these uses potentially locating on a site which is included on a list of

hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, creating a significant hazard to the public or the environment. Within the Green Zones Program project area where recycling, solid waste and supermarket recycling collection facilities would be permitted, there are 98 hazardous sites listed on Envirostor Sites, 435 listed in GeoTracker sites, and 195 listed on GeoTracker UST sites (Table 2.9-1). These hazardous sites have the potential to pose significant impacts in regard to creating a significant hazard to the public or the environment. In addition, construction of the proposed improvements has the potential to encounter known and unknown hazardous materials sites and result in a release to the environment, requiring the consideration of mitigation measure and/or alternatives. Once constructed, the operation and maintenance of the improvements would not result in foreseeable risk of upset or release of hazardous materials to the environment. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions component of the Green Zones ordinance would result in potentially significant impacts to due to these uses potentially locating on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, creating a significant hazard to the public or the environment. Therefore, further analysis is warranted, requiring the consideration of mitigation measures and alternatives.

- e) **For a project located within an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?**

Existing Conditions

There are 10 public and private use airports located within 2 miles of the proposed Green Zones Program area: Ague Dulce Airport, Compton/Woodley Airport, General William J. Fox Airfield, Hawthorne Municipal Airport/Jack Northrop Field, Los Angeles International Airport (LAX), Palmdale Regional Airport, San Gabriel Valley Airport, Santa Monica Airport, Torrance Municipal Airport/Zamperini Field, and Whiteman Airport (Figure 2.9-3, *Airports within 2 miles of Project Location*).¹⁷ There are 2,973 parcels subject to the project located within 2 miles of a public or private use airport. The existing land uses subject to the elements of the Green Zones Program include existing industrial, recycling and solid waste, and vehicle-related uses. These industrial uses currently exist within 2 miles of an airport, and the proposed program's minimal development standards would not introduce or propose new development of excessive noise uses.

Threshold of Significance

A significant impact in relation to safety hazards or excessive noise within an airport land use plan or within two miles of a public airport was considered in relation to the potential conflict with an airport land use plan as a result of new residential development or job generating development within an airport land use plan or in close proximity to an airport.

¹⁷ Los Angeles County. Location Management System (LMS) GIS Data. 2018.

FIGURE 2.9-3
 Airports within 2 Miles of Project Location

The proposed program would result in less than significant impacts to hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. The potential for impacts to hazards and hazardous materials has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The qualitative and geospatial analysis considers the incremental changes to the physical environment, as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment to hazards and hazardous materials for a project located within an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

The Green Zones Program proposes the construction of small structures, include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures to decrease impacts as it relates to safety and excessive noise to surrounding sensitive uses, and propose new Special Uses under *Standards for Specific Uses* (Chapter 22.140). The proposed improvements would not include the development of housing. In addition, none of the improvements require an increase in number of people working at locations within 2 miles of airport, as there is no proposed change in the underlying land use.

Element 1 – Green Zone Districts

Green Zone Districts would result in less than significant impacts from hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. As discussed in Section 1, the purpose of the Green Zone Districts is to address incompatible land uses in proximity to sensitive uses by changing specific regulatory requirements for specific industrial land uses. Development standards for the Green Zone Districts would include landscaping barriers, enclosed buildings, fencing, solid walls, signage, paving of permeable areas, and lighting as measures to decrease impacts to surrounding sensitive uses. There are 2,973 parcels subject to project located within 2 miles of a public or private use airport, and, of those, 454 parcels are within 2 miles of the Green Zone Districts element. However, the purpose of the Green Zone Districts is to address incompatible land uses in proximity to sensitive uses by changing specific regulatory requirements for specific industrial land uses. As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, paving of permeable areas, lighting, and air filtration as measures to decrease impacts to surrounding sensitive uses. These measures would be required where the Ordinance implements new standards for existing industrial uses. The construction of these measures would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses or minor additions to new residential or other sensitive use construction. The proposed improvements would not include the development of housing. In addition, none of the improvements would require an increase in number of people working at locations within 2 miles of either a public or public use airport, as there is no change in the underlying land use. Therefore, the proposed Green Zone Districts would result in less than significant impacts from hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area.

The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of

the General Plan Amendment Revisions, ~~27~~ ²⁸ parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, ~~14~~ ¹⁵ of the ~~27~~ ²⁸ parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to ~~7~~ ⁴⁰ years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would have less than significant impact to hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. As stated in Section 2.13, *Noise*, these industrial uses currently exist within the proposed area, and therefore, the proposed program would not introduce or propose new development of excessive noise uses.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impact to hazard and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in would result in less than significant impact to hazard and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts from hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity to~~ adjacent to or adjoining legally-established, existing industrial uses. ~~Similarly, new sensitive uses that are constructed adjacent to industrial, recycling or solid waste, or vehicle-related uses would be required to implement development standards similar to those required for existing industrial uses,~~ to protect these new sensitive uses from impacts from existing industrial uses (Chapter ~~22.84~~, and Chapter 22.130).

In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially

from existing conditions, such that they would result in less than significant impacts from hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not impact hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts from hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. As discussed in Section 1, the Recycling and Waste Management Revisions would consist of the inclusion of permitting requirements and development standards for Specific Uses including pallet yards, recycling collection facilities, recycling processing facilities, organic waste facilities, and solid waste facilities. A CUP would be required for all of the above uses (Chapter 22.140). Development standards for Recycling and Waste Management Revisions include requirements for landscaping buffers, walls, enclosed buildings, surfacing of storage areas, air filtration, signage, and lighting. ~~Additionally, the Recycling and Waste Management Revisions include prohibitions on areas where certain specific uses would be prohibited including Significant Ecological Areas, High and Very High Fire Hazard Severity Zones, Hillside Management Areas, and in some cases Agricultural Resource Areas.~~ In the case of the construction of new recycling and waste management facilities, the Green Zones Program establishes greater stringency in conditions and development standards existing for proposed facilities, and it requires conditions of approval as an additional permitting requirement. Based on the proposed Standards for Specific Uses (Chapter 22.140), new recycling processing and organic waste facilities would be processed on a project by project basis and subject to environmental review under CEQA in relation to hazards and hazardous materials prior to project approval.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to CUP and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~

The proposed improvements would not include the development of housing. In addition, none of the improvements would require an increase in number of people working at locations within 2 miles of either a public or public use airport, as there is no change in the underlying land use. Therefore, the proposed Recycling and Waste Management Districts would result in less than significant impacts from hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area.

The Supermarket Accessory Recycling Collection Centers would result in less than significant impacts from hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items,

and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built.

The construction of a recycling collection center or compliance with development standards would not substantially alter the existing conditions such that there would be a safety hazard or excessive noise. The proposed improvements will not include the development of housing. In addition, none of the improvements would require an increase in number of people working at locations within 2 miles of either a public or public use airport, as there is no change in the underlying land use. Therefore, the proposed Supermarket Accessory Recycling Collection Centers Revisions would result in less than significant impacts from hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in than significant impacts from hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts from hazards and hazardous materials in relation to the proximity of airports and the safety hazard for people residing or working in the proposed program area. No further analysis is warranted.

f) Impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan?

Existing Conditions

The Safety Element of the County General Plan 2035 establishes one goal and six policies for emergency response, including Policy S 4.3: “Coordinate with other County and public agencies, such as transportation agencies, and health care providers on emergency planning and response activities, and evacuation planning.”¹⁸ The County Office of Emergency Management (OEM), which is responsible for organizing and directing the emergency responders preparedness efforts, prepares the Operational Area Emergency Response Plan (OAERP) that identifies emergency

¹⁸ Los Angeles County Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035. Safety Element. http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch12.pdf

response procedures and emergency management routes in Los Angeles County.¹⁹ Los Angeles County Public Works (Public Works) maintains a list of disaster routes for pre-identified for use during times of crisis the entire County.^{20,21} Public Works also maintains a list of disaster routes in the Los Angeles County Operational Area by city that have been preidentified for use during times of crisis.²² An evacuation route is used to move an affected population out of an area in response to a specific condition under which an evacuation would be necessary, such as fires, floods, or earthquakes. The County's fire code (Title 32, *Fire Code*, of the County Municipal Code), which incorporates the 2016 California Fire Code and 2015 International Fire Code by reference, requires developed areas to maintain emergency vehicle access, fire lanes, and existing fire apparatus access roads.²³

Threshold of Significance

An impact would occur if roadways designated as evacuation routes on an adopted emergency response plan or emergency evacuation plan were obstructed. More specifically, a significant impact would occur if development of the project would reduce the width of roadways, block lanes, or obstruct roadways such that vehicular access is blocked in the event of an emergency.

Impact Analysis

The proposed program would result in no impacts from hazards and hazardous materials in relation to impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. As the proposed program would not result in changes to any existing roadways, there would be no effect on emergency access. Although the proposed program would require an increase in minor construction projects in Los Angeles County to meet the requirements, these measures would be too minor to require lane closures or partial lane closures that could obstruct emergency access routes. The proposed program is intended to improve compatibility between land uses by increasing setbacks between industrial uses and sensitive uses; locate storage, enclosure, buffers, signage, and maintenance to be safely accessible by building occupants and waste and recycling haulers; and establish standards for fences and walls, paving, landscaping, and screening.

The potential for impacts to hazards and hazardous materials in relation to impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The qualitative and geospatial analysis considers the incremental changes to the physical environment, as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment from hazards and hazardous materials in relation to impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

²³ County of Los Angeles. March 27, 2020 version. Los Angeles County, California – Code of Ordinances. Title 32 – Fire Code. https://library.municode.com/ca/los_angeles_county/codes/code_of_ordinances?nodeId=TTT32FICO

Pursuant to the Mobility Element of the County of Los Angeles General Plan 2035,²⁴ Los Angeles County will review land development projects to ensure appropriate roadway transitions and multimodal connectivity that would allow the most efficient movement of traffic during an emergency or evacuation. It is not anticipated that the proposed program would result in impacts from hazards and hazardous materials from impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. No further analysis is warranted.

Element 1 – Green Zone Districts

Green zone districts would result in no impacts in relation to hazards and hazardous materials from impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. As discussed in Section 1, the purpose of the Green Zone Districts is to address incompatible land uses in proximity to sensitive uses by changing specific regulatory requirements for specific industrial land uses. Development standards for the Green Zone Districts would include landscaping barriers, enclosed buildings, fencing, solid walls, signage, paving of permeable areas, and lighting as measures to decrease impacts to surrounding sensitive uses. There are no parcels affected by the Green Zone Districts that are located in or near SRAs or classified as VHFHSZs and no parcels classified as other levels of FHSZs, that are located adjacent to emergency response and emergency evacuation plan areas (see Section 3.20, *Wildfire*, Table 2.20-1, *Fire Hazard Areas*). The purpose of the Green Zone Districts is to address incompatible land uses in proximity to sensitive uses by changing specific regulatory requirements for specific industrial land uses. The construction of these measures would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses or minor additions to new residential or other sensitive use construction.

The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts from hazards and hazardous materials from impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in no impacts from hazards and hazardous materials from impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in result in no impacts from hazards and hazardous materials from impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. As the Green Zone Districts would not result in changes to any existing roadways, there would be no effect on emergency access. Additionally, as stated in Section 2.20, *Wildfire*, the proposed program would have no impact on existing emergency evacuation plans and roads. Therefore, the new development standards and/or more stringent entitlement processes

²⁴ Los Angeles County General Plan 2035, Public Review Draft. January 2014. Mobility Element.

for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts from hazards and hazardous materials from impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts from hazards and hazardous materials from impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity to~~ adjacent to or adjoining legally-established, existing industrial uses. ~~Similarly, new sensitive uses that are constructed adjacent to industrial, recycling or solid waste, or vehicle-related uses would be required to implement development standards similar to those required for existing industrial uses, to protect these new sensitive uses from impacts from existing industrial uses (Chapter 22.84, and Chapter 22.130).~~ In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in no impacts from hazards and hazardous materials from impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would result in no impacts from hazards and hazardous materials from impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. As this element would be applied as additional standards for new development projects, the construction of these measures would not differ substantially from construction of the new sensitive uses, ~~subject to discretionary CEQA review (or exempt, depending on the project)~~ whether or not these development standards are required. As a result, these revisions to Title 22 would not affect emergency access. As the Green Zone Districts would not result in changes to any existing roadways, there would be no effect on emergency access. Additionally, as stated in Section 2.20, the proposed program would have no impact on existing emergency evacuation plans and roads. Therefore, the new development standards for New Sensitive Uses would result in no impacts from hazards and hazardous materials from impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts related to hazards and hazardous materials as a result of the impairment of adopted emergency response and emergency evacuation plan. There are 13,459 parcels affected by the Waste Management and Recycling Center Revisions that are located in or near SRAs. There are 2,057 parcels classified as VHFHSZs: 740 parcels in Local Responsibility Areas (LRA), 1,317 parcels in Federal Responsibility Areas (FRA), and 8,331 parcels classified as other levels of FHSZs, that are located adjacent to emergency response and emergency evacuation plan areas (see Table 2.20-1). As discussed in Section 1.0, *Project Description*, the Recycling and Waste Management Revisions would consist of the inclusion of permitting requirements and development standards for Specific Uses including pallet yards, recycling

collection facilities, recycling processing facilities, organic waste facilities, and solid waste facilities. A CUP would be required for all of the above uses (Chapter 22.140).

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ Any construction resulting from compliance with development standards would be minimal and would not substantially alter the existing conditions for existing recycling and solid waste uses such that emergency access would be impacted. These revisions would not affect emergency access and would be placed behind property lines. As the revisions would not result in changes to any existing roadways, there would be no effect on emergency access. Additionally, as stated in Section 2.20, the proposed program would have no impact on existing emergency evacuation plans and roads. Therefore, the proposed Recycling and Waste Management Revisions would result in no impacts from hazards and hazardous materials in relation to impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts from hazards and hazardous materials in relation to impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built. Therefore, the Supermarket Accessory Recycling Collection Centers would have no impacts from hazards and hazardous materials in relation to impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

The proposed Supermarket Accessory Recycling Collection Centers for Recycling and Solid Waste Revisions would result in no impacts from hazards and hazardous materials in relation to impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. There are 969 parcels affected by the Supermarket Accessory Recycling Collection Centers and Storage Enclosures for Recycling and Solid Waste Revisions that are located in or near SRAs, and a combined total of 644 parcels classified as VHFHSZs: 554 parcels in LRAs and 90 parcels in FRAs, and 256 parcels classified as other levels of FHSZs, that are located adjacent to emergency response and emergency evacuation plan areas (see Table 2.20-1). As discussed in Section 1.0, *Project Description*, the purpose of the Supermarket Accessory Recycling Collection Centers is to establish standards, conditions, and procedures that support and facilitate the development of recycling collection center as an accessory use to an existing supermarket (Chapter 22.140-~~660~~710), and to establish standards for enclosed rooms or storage areas that are provided to store, collect, and load waste, recyclable materials, and organic materials generated by the uses served and that the area is safely accessible by building occupants and waste and recycling haulers in compliance with Title 14, Division 7 (Natural Resources) of the California Code of Regulations (Chapter 22.128).²⁵ The construction of a recycling collection center or compliance with development standards would not substantially alter the existing conditions such that there would be an interference with an adopted emergency response plan or emergency evacuation plan. Therefore, the proposed Supermarket Accessory Recycling Collection Centers would result in no impacts from hazards and hazardous materials in relation to impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts from hazards and hazardous materials in relation to impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. The construction of a storage enclosures for recycling and solid waste or compliance with development standards would not substantially alter the existing conditions such that existing roads would be changed. As the revisions would not result in changes to any existing roadways, there would be no effect on emergency access. Additionally, as stated in Section 2.20, the proposed program would have no impact on existing emergency evacuation plans and roads. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts from hazards and hazardous materials in relation to impairing the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. No further analysis is warranted.

- g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires, because the project is located:**
 - i) within a high fire hazard area with inadequate access?**
 - ii) within an area with inadequate water and pressure to meet fire flow standards?**
 - iii) within proximity to land uses that have the potential for dangerous fire hazard?**

Existing Conditions

Approximately 29.1 percent of the total project footprint is located in areas within a moderate, high, or very high FHSZ in an LRA, SRA, or FRA for wildland fire protection and suppression (see Section 2.20, *Wildfire*). Approximately 5,853 parcels are located within a high FHSZ and 31,994 parcels are located within a very high FHSZ. Zero of these parcels are subject to the Green Zone Districts element (Table 2.9-3, *Fire Hazard Severity Zones*; Figure 2.9-4, *Los Angeles County Fire Hazard Severity Zones and Responsibility*).

²⁵ See Appendix A to the Initial Study.

FIGURE 2.9-4
 Los Angeles County Fire Hazard Severity Zones and Responsibility

**TABLE 2.9-3
FIRE HAZARD SEVERITY ZONES**

	Project Footprint Parcels per FHSZs	Project Footprint Percentile per FHSZs	Project Footprint Parcels per FHSZs within Green Zone Districts
SRA Very High	21,310	15.7%	0
SRA High	5,836	4.3%	0
SRA Moderate	1,606	1.2%	0
LRA Very high	8,663	6.4%	0
FRA Very High	2,021	1.5%	0
FRA High	17	0.013%	0
FRA Moderate	4	0.003%	0
Total	39,457	29.1%	0

The Safety Element of the Los Angeles County General Plan 2035 designates at-risk areas as FHSZs per government code sections 51175–51189.²⁶ In the unincorporated areas of the County, SRAs have been classified as Very High, High, and Moderate. However, Local and Federal Responsibility Areas are classified as Very High. The Forestry Division of the Los Angeles County Fire Department (Fire Department) assists, supports, and institutes a variety of regulatory programs and standards. These programs and standards include vegetation management, pre-fire management and planning, fuel modification plan review program, and brush clearance inspections. Section V (Emergency Response) of the Safety Element of the Los Angeles County General Plan states the provision of disaster routes through the OAERP.²⁷ The County Department of Public Works (Public Works) maintains a list of disaster routes in the Los Angeles County Operational Area by city that have been preidentified for use during times of crisis.²⁸ County-wide FHSZ standards and regulations for HMAs are coordinated by the County Fire Department, Public Works, Building and Safety, Flood Control District, Corps of Engineers and FEMA. The standards and regulations pertaining to development in FHSZs include access and circulation standards, as well as road clearance.²⁹ County-wide FHSZs standards and regulations for HMAs are coordinated by the County Fire Department, Public Works, Building and Safety, Flood Control District, Corps of Engineers and FEMA. The standards and regulations pertaining to development in FHSZs include fire flow and fire hydrant standards.³⁰

Threshold of Significance

A substantial adverse effect that would occur as a result of a physical change in the environment would expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving fires. Adverse effects normally occur within a high fire hazard area with inadequate access, such as impaired emergency evacuation routes or public rights of way with the addition of development standards; within areas that have inadequate water and pressure to meet fire flow standards, such as due to decreased water supply to implement the development standards; and within proximity to land uses that have the potential for dangerous fire hazard, such as the uncontrolled spread of a wildfire from open space land uses with high fuel loads.

Impact Analysis

The proposed program would result in no impacts to hazards and hazardous materials in relation to the exposure of people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires. The proposed

²⁶ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

²⁹ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

³⁰ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

Ordinance requires compliance with the County's programs, standards, and regulatory programs for fuel management and fire protection. The improvements required pursuant to the Ordinance would not expose people or structures to fire risk. ~~Therefore, there will be less than significant impacts from hazards and hazardous materials in relation to the exposure of people or structures to a significant risk of loss, injury or death involving fires.~~

The potential for impacts to the exposure of people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The qualitative and geospatial analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment due to hazardous wildfires include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to hazards and hazardous materials from exposure of people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts in relation to exposing people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires due to project location. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

Fire Access

In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in inadequate access in regard to emergency response and evacuation plans. The Green Zone Districts are not located in or near SRAs or classified as VHFHSZs or classified as other levels of FHSZs (see Table 2.9-1; see Figure 2.20-1). When emergency response or evacuation orders are issued, evacuation routes, temporary shelter facilities, public alerts and warnings plus procedures would be provided by County Sheriff and Fire personnel based on the disaster to facilitate the evacuation process.³¹ These measures and development

³¹ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch12.pdf

standards involved in the Green Zone Districts, such as construction of solid walls and planting trees, would comply with enclosure standards including site setback, maintenance and operation standards, and access and vehicle circulation standards, would avoid rather than obstruct or impair emergency response plans or evacuation routes. In addition, improvements would be accomplished within the properties and would not require lane closures or other temporary impairment of emergency response plans or evacuation routes. Emergency response and evacuation routes are already in place throughout the county where current Fire Department services such as fire, safety, and emergency medical services are provided to all the unincorporated areas as well as contracted cities within the County. The OAERP's short and long-term emergency response and recovery capability, emergency procedures, and emergency management routes in Los Angeles County which would facilitate the evacuation process during a fire. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to impairment of emergency response plans or evacuation routes.

Fire Flow Standards

In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in inadequate water and pressure to meet fire flow standards. The Green Zone Districts are not located in or near SRAs or classified as VHFHSZs or classified as other levels of FHSZs (see Table 2.9-1; Figure 2.20-1). Regardless, County-wide FHSZ standards and regulations for HMAs are coordinated by the County Fire Department, Public Works, Building and Safety, Flood Control District, Corps of Engineers and FEMA. The standards and regulations pertaining to development in FHSZs include fire flow and fire hydrant standards.³² As discussed in Section 2.19, *Utilities and Service Systems*, based on a review of water supply for parcels with County land use zoning designations that would be subject to the Green Zone District element of proposed program, there is sufficient water supply to support the anticipated incremental increase for construction of walls and operation and maintenance of irrigated landscaped (Table 2.19-1). Water sources include various sources such as the imported water, groundwater, and recycled wastewater. Water supply in proposed program area is served by the MWD and various member agencies to maintain sufficient water supplies available to serve the project, and they continue to implement water conservation projects and emergency supplies. The Green Zone District development standards would not result in water consumption which would decrease the water and pressure such that they would be inadequate to meet fire flow standards. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to water and pressure to meet fire flow standards. No further analysis is warranted.

Land Use Proximity

In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in a hazard due to proximity to land use that have the potential for dangerous fire hazard. The proposed improvements that are not located in or near SRAs or classified as VHFHSZs or classified as other levels of FHSZs (see Table 2.9-1; see Figure 2.20-1). These measures and development standards involved in the Green Zone Districts, such as construction of solid walls and planting trees, would comply with enclosure standards including site setback, maintenance and operation standards, and access and vehicle circulation standards, plus Fire Codes and standards for fire prevention, would avoid rather than expose people to pollutants from nearby land uses. In addition, the County Fire Department along with Public Works assists, supports, and institutes a variety of regulatory programs and standards that includes vegetation management, pre-fire management and planning, fuel modification plan review program, and brush clearance inspections, enforcement of fire and building codes as well as Title 32 requirements of the fire code related to development in FHSZs.^{33,34} Additionally, the purpose of the Green Zone Districts is to implement development standards on industrial uses where sensitive uses are in close proximity.

³² County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

³³ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

³⁴ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

Sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, are not land uses typically associated with wildfire hazards. The Green Zone Districts are also located within very urban areas in the County which typically do not contain land uses with high fuel loads. These are communities that are located in a highly urbanized area of the Los Angeles Basin and have been in existence for many years with existing urban infrastructure. The improvements to the industrial facilities would be located behind property lines and would not create fuel loads. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no significant impacts from hazards and hazardous materials in relation to the exposure of people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires.

Therefore, the Green Zone Districts would result in no impacts to hazards and hazardous materials from exposure of people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to hazards and hazardous materials from exposure of people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). As discussed in Section 4, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130). These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity to existing industrial uses. New sensitive uses that are constructed next to existing industrial uses would be required to implement more stringent development standards similar to those required for existing industrial uses, to protect these new sensitive uses from impacts from existing industrial uses adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. The construction of these measures would not differ substantially from existing conditions, as they would be minor additions to new residential or other sensitive use construction. No further analysis is warranted.

Fire Access

In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in inadequate access in regard to emergency response and evacuation plans. When emergency response or evacuation orders are issued, evacuation routes, temporary shelter facilities, public alerts and warnings plus procedures would be provided by County Sheriff and Fire personnel based on the disaster to facilitate the evacuation process.³⁵ These measures and development standards for new sensitive uses, such as construction of solid walls and planting trees, would comply with enclosure standards including site setback, maintenance and operation standards, and access and vehicle circulation standards, would avoid rather than obstruct or impair emergency response plans or evacuation routes. In addition, improvements would be accomplished within the

³⁵ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch12.pdf

properties and would not require lane closures or other temporary impairment of emergency response plans or evacuation routes. Emergency response and evacuation routes are already in place throughout the county where current Fire Department services are already being provided such as fire, safety, and emergency medical services to all the unincorporated areas as well as contracted cities within the County. The OAERP's short and long-term emergency response and recovery capability, emergency procedures, and emergency management routes in Los Angeles County which would facilitate the evacuation process during a fire. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in no impacts to impairment of emergency response plans or evacuation routes. No further analysis is warranted.

Fire Flow Standards

In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in inadequate water and pressure to meet fire flow standards. As discussed in Section 2.19, Utilities and Service Systems, based on a review of water supply for parcels with County land use zoning designations that would be subject to the New Sensitive Uses element of proposed program, there are sufficient water supply to support the anticipated incremental increase for construction of walls and operation and maintenance of irrigated landscaped (Table 2.19-1). Water sources include various sources such as the imported water, groundwater, and recycled wastewater. Water supply in proposed program area is served by the MWD and various member agencies to maintain sufficient water supplies available to serve the project, and they continue to implement water conservation projects and emergency supplies. The New Sensitive Use development standards would not result in water consumption which would decrease the water and pressure such that they would be inadequate to meet fire flow standards. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in no impacts to water and pressure to meet fire flow standards. No further analysis is warranted.

Land Use Proximity

In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in a hazard due to proximity to land use that have the potential for dangerous fire hazard. These measures and development standards for new sensitive uses, such as construction of solid walls and planting trees, would comply with enclosure standards including site setback, maintenance and operation standards, and access and vehicle circulation standards, plus Fire Codes and standards for fire prevention, would avoid rather than expose people to pollutants from nearby land uses. In addition, the County Fire Department along with Public Works assists, supports, and institutes a variety of regulatory programs and standards that includes vegetation management, pre-fire management and planning, fuel modification plan review program, and brush clearance inspections, enforcement of fire and building codes as well as Title 32 requirements of the fire code related to development in FHSZs.^{36,37} While the purpose of the New Sensitive Uses element is to implement development standards on new sensitive uses adjacent to industrial land uses, which may contain fire hazards, the development standards would protect new sensitive uses from the existing industrial uses. This element would not be the cause of the new sensitive use being placed nearby an industrial land use, but rather would mitigate the effects that may come from it to avoid exposure to pollutants from nearby land uses. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not cause or exacerbate fire risks. Additionally, the improvements to New Sensitive Uses would be located behind property lines and would not create fuel loads. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in no significant impacts from hazards and hazardous materials in relation to the exposure of people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires. No further analysis is warranted.

³⁶ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

³⁷ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts to hazards and hazardous materials in relation to the exposure of people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to CUP and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to hazards and hazardous materials from exposure of people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built.

Fire Access

The construction of these measures for specific recycling and waste management uses would not differ substantially from existing conditions, such that they would result in inadequate access in regard to emergency fire response and evacuation plans. When emergency response or evacuation orders are issued, evacuation routes, temporary shelter facilities, public alerts and warnings plus procedures would be provided by County Sheriff and Fire personnel based on

the disaster to facilitate the evacuation process.³⁸ These measures and development standards for specific recycling and waste management uses, such as construction of solid walls and planting trees, would comply with enclosure standards including site setback, maintenance and operation standards, and access and vehicle circulation standards, would avoid rather than obstruct or impair emergency response plans or evacuation routes. In addition, improvements would be accomplished within the properties and would not require lane closures or other temporary impairment of emergency response plans or evacuation routes. Emergency response and evacuation routes are already in place throughout the county where current Fire Department services are already being provided such as fire, safety, and emergency medical services to all the unincorporated areas as well as contracted cities within the County. The OAERP's short and long-term emergency response and recovery capability, emergency procedures, and emergency management routes in Los Angeles County which would facilitate the evacuation process during a fire.

The Supermarket Accessory Recycling Collection Centers would result in no impacts within a high fire hazard area with inadequate access. These structures would be minimal additions to existing supermarket facilities. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built. They would be setback a minimum of 10 feet behind property lines, structures, public rights of way, and driveways, and therefore would not obstruct available fire protection access. The construction of Supermarket Accessory Recycling Collection Centers would not differ substantially from existing conditions, such that they would result in inadequate access in regard to emergency response and evacuation plans. Therefore, the new development standards for Recycling and Waste Management Revisions would result in no impacts to impairment of emergency response plans or evacuation routes. Therefore, the new development standards would result in no impacts to impairment of emergency response plans or evacuation routes. No further analysis is warranted.

Fire Flow Standards

The construction of these measures for specific recycling and waste management uses would not differ substantially from existing conditions, such that they would result in inadequate water and pressure to meet fire flow standards. County-wide FHSZs standards and regulations for HMAs are coordinated by the County Fire Department, Public Works, Building and Safety, Flood Control District, Corps of Engineers and FEMA. The standards and regulations pertaining to development in FHSZs include fire flow and fire hydrant standards.³⁹ As discussed in Section 2.19, Utilities and Service Systems, these revisions would result in less than significant impacts to water supply. Water supply in proposed program area is served by the MWD and various member agencies to maintain sufficient water supplies available to serve the project, and they continue to implement water conservation projects and emergency supplies. Any construction would be in compliance with development standards and would not substantially alter the existing conditions for existing industrial uses in relation to water supply within the proposed program area, and increased water supply needed for recycling and solid waste facilities would be in compliance with county development standards. The Recycling and Waste Management development standards would not result in water consumption which would decrease the water and pressure such that they would be inadequate to meet fire flow standards.

The Supermarket Accessory Recycling Collection Centers would result in no impacts to water and pressure to create inadequate fire flow standards. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built. These structures would be minimal additions to existing supermarket facilities and would not require additional water consumption. As discussed in Section 2.19, Utilities and Service System, the Supermarket Accessory Recycling Collection revisions would not require additional areas for landscaping barrier or elements increasing water usage; thus, no additional consumptive use of water would occur such that water and pressure in the area would be reduced. The construction of Supermarket Accessory Recycling Collection Centers would not differ substantially from existing conditions, such that they would create inadequate water and pressure. Therefore, the new development standards for Recycling and Waste Management Revisions would result in no impacts to water and pressure to meet fire flow standards. Therefore, the new development standards would result in no impacts to water and pressure to meet fire flow standards. No further analysis is warranted.

³⁸ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch12.pdf

³⁹ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

Land Use Proximity

The construction of these measures for specific recycling and waste management uses would not differ substantially from existing conditions, such that they would result in a hazard due to proximity to land use that have the potential for dangerous fire hazard. These measures and development standards for new sensitive uses, such as construction of solid walls and planting trees, would comply with enclosure standards including site setback, maintenance and operation standards, and access and vehicle circulation standards, plus Fire Codes and standards for fire prevention, would avoid rather than expose people to pollutants from nearby land uses. In addition, the County Fire Department along with Public Works assists, supports, and institutes a variety of regulatory programs and standards that includes vegetation management, pre-fire management and planning, fuel modification plan review program, and brush clearance inspections, enforcement of fire and building codes as well as Title 32 requirements of the fire code related to development in FHSZs.^{40,41} While the purpose of these revisions is to implement development standards on specific recycling and waste management uses, which may contain fire hazards, the development standards would protect adjacent land uses from the existing uses. This element would not be the cause of a land use being placed nearby an industrial land use, but rather would mitigate the effects that may come from it to avoid exposure to pollutants from nearby land uses. These measures to reduce the incompatibility of recycling and solid waste uses with surrounding land uses through development standards would not cause or exacerbate fire risks. New recycling processing and organic waste facilities would be processed on a project by project basis and subject to environmental review under CEQA in relation to hazards and hazardous materials prior to project approval. Additionally, the improvements to recycling and solid waste land uses would be located behind property lines and would not create fuel loads.

The Supermarket Accessory Recycling Collection Centers would result in no impacts within a high fire hazard area with inadequate access. These structures would be minimal additions to existing supermarket facilities, and they would be ~~constructed~~ established on existing parking lots so that no new structures would be built. They would be placed behind property lines and would not result in increased fuel loads given that they would be located on an existing supermarket lot and would be maintained in good condition. There would be no change in land use on the supermarket facility or adjacent to it. The construction of Supermarket Accessory Recycling Collection Centers would not differ substantially from existing conditions, such that they would create land use with potential for a dangerous fire hazard. Therefore, the Supermarket Accessory Recycling Collection Centers would not result in a hazard due to proximity to land use that have the potential for dangerous fire hazard. Therefore, the new development standards would not result in a hazard due to proximity to land use that have the potential for dangerous fire hazard. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to hazards and hazardous materials from exposure of people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

Fire Access

The construction of Storage Enclosures for Recycling and Solid Waste Revisions would not differ substantially from existing conditions, such that they would result in inadequate access in regard to emergency response and evacuation plans. When emergency response or evacuation orders are issued, evacuation routes, temporary shelter facilities, public alerts and warnings plus procedures would be provided by County Sheriff and Fire personnel based on the disaster to

⁴⁰ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

⁴¹ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

facilitate the evacuation process.⁴² These Storage Enclosures for Recycling and Solid Waste Revisions would contain recycling and solid waste in areas that would not obstruct or impair emergency response plans or evacuation routes. In addition, improvements would be accomplished within the properties and would not require lane closures or other temporary impairment of emergency response plans or evacuation routes. Emergency response and evacuation routes are already in place throughout the county where current Fire Department services are already being provided such as fire, safety, and emergency medical services to all the unincorporated areas as well as contracted cities within the County. The OAERP's short and long-term emergency response and recovery capability, emergency procedures, and emergency management routes in Los Angeles County which would facilitate the evacuation process during a wildfire. Therefore, the new development standards for Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to impairment of emergency response plans or evacuation routes. No further analysis is warranted.

Fire Flow Standards

The Storage Enclosures for Recycling and Solid Waste Revisions would not differ substantially from existing conditions, such that they would result in inadequate water and pressure to meet fire flow standards. County-wide FHSZs standards and regulations for HMAs are coordinated by the County Fire Department, Public Works, Building and Safety, Flood Control District, Corps of Engineers and FEMA. The standards and regulations pertaining to development in FHSZs include fire flow and fire hydrant standards.⁴³ As discussed in Section 2.19, Utilities and Service Systems, the Storage Enclosures for Recycling and Solid Waste Revisions would not require additional areas for landscaping barrier or elements increasing water usage; thus, no additional consumptive use of water would occur such that water and pressure in the area would be reduced. Water supply in the proposed program area is served by the MWD and various member agencies to maintain sufficient water supplies available to serve the project, and they continue to implement water conservation projects and emergency supplies. Any construction would be in compliance with development standards and would not substantially alter the existing conditions for existing land uses in relation to water supply within the proposed program area, and increased water supply needed for Storage Enclosures for Recycling and Solid Waste Revisions would be in compliance with county development standards. The Storage Enclosures for Recycling and Solid Waste Revisions development standards would not result in water consumption which would decrease the water and pressure such that they would be inadequate to meet fire flow standards. Therefore, the new development standards for Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to water and pressure to meet fire flow standards. No further analysis is warranted.

Land Use Proximity

The Storage Enclosures for Recycling and Solid Waste Revisions would not differ substantially from existing conditions, such that they would result in a hazard due to proximity to land use that have the potential for dangerous fire hazard. These structures would be minimal additions to existing land uses, and they would be constructed behind property lines and would not result in increased fuel loads given that they would be located on an existing lot and would be maintained in a clean, litter-free condition. There would be no change in land use either of the facility itself or of adjacent land uses. The construction of Storage Enclosures for Recycling and Solid Waste Revisions would not differ substantially from existing conditions, such that they would create land use with potential for a dangerous fire hazard. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would not result in a hazard due to proximity to land use that have the potential for dangerous fire hazard.

Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to hazards and hazardous materials from exposure of people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires. No further analysis is warranted.

⁴² County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch12.pdf

⁴³ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

h) Does the proposed use constitute a potentially dangerous fire hazard?

Existing Conditions

The purpose of the Safety Element of the Los Angeles County General Plan 2035 is to reduce the potential risk of death injury and economic damage resulting from natural and man-made hazards.⁴⁴ In addition, the General Plan Safety Element designates at-risk areas as FHSZs per government code sections 51175–51189. In the unincorporated areas of the Los Angeles County, SRAs have been classified as Very High, High, and Moderate. However, Local and Federal Responsibility Areas are classified as Very High. The Fire Department assists, supports, and institutes a variety of regulatory programs and standards. Among those programs and standards include fire-related land use and building regulations, hillside ordinances, fire standards, vegetation management, pre-fire management and planning, fuel modification plan review program, and brush clearance inspections to name a few. Furthermore, the County's Fire Department is one of six contract counties that maintain a contractual relationship with CAL FIRE who implements the California Fire Plan. The California Fire Plan guides the Los Angeles County Strategic Fire Plan developed by the Fire Department.⁴⁵ The County Fire Department's Strategic Fire Plan also includes a map of existing Fire Department helispot fuel reduction projects, water resources, motorway maintenance maps, and a description of the road and fuel maintenance functions of the Fire Department.⁴⁶ Furthermore, Section 503 of Title 32 provides additional specifications for fire access roads in developed areas, including dimensions and markings.

Section V (Emergency Response) of the Safety Element of the Los Angeles County General Plan states the provision of disaster routes (Figure 2.20-1) through the OAERP.⁴⁷ When emergency response or evacuation orders are issued, evacuation routes, temporary shelter facilities, public alerts and warnings plus procedures would be provided by County Sheriff and Fire personnel based on the disaster to facilitate the evacuation process.⁴⁸ Public Works maintains a list of disaster routes in the Los Angeles County Operational Area by city that have been preidentified for use during times of crisis.⁴⁹

The Fire Department provides fire, safety, and emergency medical services to the unincorporated areas. The Strategic Fire Plan includes the County of Los Angeles Fire Department Operations Bureau Map, which indicates that emergency services are available in all unincorporated areas of the County. Additionally, many cities within Los Angeles County utilize Fire Department services. There are three major geographic regions in the Fire Department service area, which are divided into nine divisions and 22 battalions.⁵⁰ The County of Los Angeles Disaster Routes (Figure 2.20-1).⁵¹ The OAERP strengthens short and long-term emergency response and recovery capability, and identifies emergency procedures and emergency management routes in Los Angeles County.

The County's Fire Department assist and supports the implementation of the CAL FIRE FHSZs model in Los Angeles County. In an effort to reduce the threats to lives and property, the Fire Department has instituted a variety of regulatory programs and standards. These include vegetation management, pre-fire management and planning, fuel modification plan review program, and brush clearance inspection program. In addition to these programs, the Fire Department,

⁴⁴ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

Public Works, and Building and Safety enforce fire and building codes related to development in FHSZs such as Title 20, 21, 26, and 32 (Fire Code). Furthermore, the General Plan Safety Element and the Strategic Fire Plan identifies and prioritizes pre- and post-fire management strategies and tactics to reduce loss of life, property, and natural resources.^{52,53, 54} Fire prevention as it relates to FHSZs, and per the General Plan, the County's fire code and building regulations (Title 20, 21, 26, and 32), includes fire access and clearance road standards for equipment and public evacuation, access and circulation standards, fire flow and fire hydrant standards, brush clearances around structures within hillsides that are fire prone, fuel modification, defensible spaces, utility easement access for fire protection, Building standards within Wildland-Urban Interface (WUI), plan review and approval process for land development projects within VHFHSZs, and integrated Vegetation Management Program (VMP).⁵⁵

Threshold of Significance

The purpose of the Green Zones Program is to address incompatible land uses in proximity to sensitive uses by changing regulatory requirements for specific industrial land uses. A substantial adverse effect on wildfire risk would normally occur as a result of a physical change in the environment that would exacerbate or expose people to significant wildfire risk involving loss, injury or death. The County's General Plan per the government code sections 51175–51189 define at-risk areas as FHSZs and SRAs being classified as Very High, High and Moderate within the County.^{56,57} A substantial adverse effect would occur when the use proposed in the project would constitute a potentially dangerous fire hazard. Uses which constitute a potentially dangerous fire hazard may include open space with high fuel loads, industrial areas, and other land uses in which the operations have the potential to become fire hazards.

Impact Analysis

The proposed program would result in no impacts to hazards and hazardous materials in regard to a proposed use that constitutes a potentially dangerous fire hazard. The potential for impacts to hazards and hazardous materials has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The qualitative and geospatial analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment in regard to a proposed use that constitutes a potentially dangerous fire hazard include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to hazards and hazardous materials in regard to a proposed use that constitutes a potentially dangerous fire hazard. The new development standards would result in a more stringent

⁵² Los Angeles County Fire Department. May 2018. 2017-2021 Strategic Plan: Act. Action. Accomplish. Available at: <https://www.fire.lacounty.gov/wp-content/uploads/2018/10/LACoFD-Strategic-Plan-2017-2021.pdf>

⁵³ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

⁵⁴ Los Angeles County Fire Department. May 2018. 2017-2021 Strategic Plan: Act. Action. Accomplish. Available at: <https://www.fire.lacounty.gov/wp-content/uploads/2018/10/LACoFD-Strategic-Plan-2017-2021.pdf>

⁵⁵ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

⁵⁶ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

⁵⁷ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to exacerbated wildfire risk due to slope, prevailing winds, and other factors and thereby expose Project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire in or near SRAs or lands classified as VHFHSZs. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to ~~40~~ 7 years of adoption of the Ordinance.

In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would constitute a potentially significant fire hazard because the proposed improvements are not located in or near SRAs or classified as VHFHSZs or classified as other levels of FHSZs (see Table 2.9-1; Figure 2.20-1). These measures such as construction of solid walls and planting trees would comply with enclosure standards including site setback, maintenance and operation standards, access and vehicle circulation standards, plus Fire Codes and standards for fire prevention that would avoid rather than expose people to pollutants. In addition, the County Fire Department along with Public Works assists, supports and institutes a variety of regulatory programs and standards that includes vegetation management, pre-fire management and planning, fuel modification plan review program, and brush clearance inspections, enforcement of fire and building codes as well as Title 32 requirements of the fire code related to development in FHSZs.^{58, 59}

The use of the proposed program, development standards for industrial uses, do not constitute a potentially dangerous fire hazard. These development standards would be placed behind property lines and would not result in increased fuel loads, and they do not constitute a potentially hazardous land use.

Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to hazards and hazardous materials in regard to a proposed use that constitutes a potentially dangerous fire hazard. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to hazards and hazardous materials in regard to a proposed use that constitutes a potentially dangerous fire hazard. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close~~

⁵⁸ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

⁵⁹ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

~~proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. In addition, the Fire Department along with Public Works assists, supports and institutes a variety of regulatory programs and standards that includes vegetation management, pre-fire management and planning, fuel modification plan review program, and brush clearance inspections, enforcement of fire and building codes as well as Title 32 requirements of the fire code related to development.^{60,61} The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would obstruct or impair adopted emergency response plans and emergency evacuation routes. Public Works maintains a list of disaster routes in the Los Angeles County Operational Area by city that have been preidentified for use during times of crisis.⁶² Emergency response and evacuation routes are already in place throughout the county where current Fire Department services such as fire, safety and emergency medical services are provided to all the unincorporated areas as well as contracted cities within the County.⁶³ The OAERP strengthens short and long-term emergency response and recovery capability, and identifies emergency procedures and emergency management routes in Los Angeles County. Furthermore, the Ordinance is expanding development standards for requiring screening, buffers, or placement of features between incompatible uses of non-conforming and new construction projects. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not constitute a fire hazard. The use of the proposed program, development standards for new sensitive uses, do not constitute a potentially dangerous fire hazard. These development standards would be placed behind property lines and would not result in increased fuel loads, and they do not constitute a potentially hazardous land use. Therefore, New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to hazards and hazardous materials in regard to a proposed use that constitutes a potentially dangerous fire hazard. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts to hazards and hazardous materials in regard to a proposed use that constitutes a potentially dangerous fire hazard. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to CUP, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities

⁶⁰ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

⁶¹ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

⁶² County of Los Angeles Department of Public Works. Accessed November 6, 2019. Disaster Routes by City. <https://dpw.lacounty.gov/dsg/DisasterRoutes/>

⁶³ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch12.pdf

would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ In addition, the Fire Department along with Public Works, assists, supports and institutes a variety of applicable regulatory programs and standards that includes vegetation management, pre-fire management and planning, fuel modification plan review program, brush clearance inspections, enforcement of fire and building codes as they relate to Title 32 requirements of the fire code for development in FHSZs.^{64,65} These measures to reduce the incompatibility of recycling and solid waste uses with surrounding land industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not constitute a fire hazard. The use of the proposed program, development standards for recycling and solid waste uses, do not constitute a potentially dangerous fire hazard. These development standards would be placed behind property lines and would not result in increased fuel loads, and they do not constitute a potentially hazardous land use.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to hazards and hazardous materials in regard to a proposed use that constitutes a potentially dangerous fire hazard. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the C-MJ, C-R, C-RU, MXD, MXD-RU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. Supermarket Accessory Recycling Collection Centers would not constitute a potentially dangerous fire hazard. These structures would be placed behind property lines and would not result in increased fuel loads, and they do not constitute a potentially hazardous land use. Therefore, there would be no impact. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Waste Management Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to hazards and hazardous materials in regard to a proposed use that constitutes a potentially dangerous fire hazard. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining

⁶⁴ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

⁶⁵ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Los Angeles County General Plan 2035: Safety Element. <http://planning.lacounty.gov/generalplan/generalplan>

doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. The construction of an onsite storage enclosure would not substantially alter the existing conditions such that slope stability would be impacted. The storage would be required to have view-obstructing fence or wall enclosures which the height of the stored items could not exceed and thereby would not intrude within circulation patterns and maintain clearances. The development standards for storage enclosures within a recycling and solid waste facility, located outside of a building, would be required to be at least 8 feet tall and placed in the rear portion of the lot or adjacent to an alley, where applicable, and not obstruct or encroach into parking spaces, landscape areas, pedestrian or vehicular circulation, or other areas per County Fire and Building codes. Municipal solid waste, recyclables, and compostable material containers would be required to be located in the same enclosure thereby eliminating the need for multiple enclosures, unless allowed per code under extraordinary circumstances. The recyclable materials would be deposited and stored in containers that have lids and are made of metal, and the containers would be maintained in good condition with no structural damage, holes, visible rust, or graffiti. The storage areas shall be accessible to residents, employees, and haulers at all times. The Storage Enclosures for Recycling and Solid Waste Revisions would not result in a substantial change, as the development standards for storage enclosures require them to be kept in good condition and away from circulation clearances. Construction and maintenance of the improvements can be accomplished within the properties and would not utilize materials that would contribute to fuel load or become a source of pollutants during a wildfire that would expose workers or nearby residents to excessive pollutant concentrations during a wildfire. Regulations and programs such as building codes, vegetation management, and fire inspections would reduce fuel load or source of pollutants during a wildfire. As such, the addition of Storage Enclosures for Recycling and Solid Waste Revisions would not result in an adverse impact such that slope, wind or other factors in relation to exposure to pollutants from wildfires or uncontrolled wildfires would be impacted in or near SRAs or lands classified as VHFHSZs. Storage enclosures would not constitute a potentially dangerous fire hazard. These structures would be placed behind property lines and would not result in increased fuel loads, and they do not constitute a potentially hazardous land use, as they would not store any hazardous materials. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to hazards and hazardous materials in regard to a proposed use that constitutes a potentially dangerous fire hazard. No further analysis is warranted.

2.10. HYDROLOGY AND WATER QUALITY

This analysis is undertaken to determine if the proposed program may have a significant impact to hydrology and water quality, thus requiring the consideration of mitigation measures or alternatives, in accordance with Section 15063 of the State CEQA Guidelines.¹ The analysis covers all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated with regard to the Los Angeles Regional Water Quality Control Board (RWQCB), the Lahontan RWQCB, the Conservation and Natural Resources Element and Public Services and Facilities Element of the Los Angeles County (County) General Plan 2035,² the 2015 Antelope Valley Area Plan – Town & Country,³ and the 2012 Santa Clarita Valley Area Plan – One Valley One Vision,⁴ the State Water Resources Control Board Onsite Wastewater Treatment Systems Policy (OWTS Policy),⁵ National Flood Insurance Program Flood Insurance Rate Maps for Los Angeles and Kern Counties, the 75 U.S. Geological Survey (USGS) 7.5-minute series topographic quadrangles where the proposed program study area is located, and a review of published and unpublished literature.

	<i>Potentially Significant Impact</i>	<i>Less than Significant Impact with Mitigation Incorporated</i>	<i>Less than Significant Impact</i>	<i>No Impact</i>
Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of a Federal 100-year flood hazard area or County Capital Flood floodplain; the alteration of the course of a stream or river; or through the addition of impervious surfaces, in a manner which would:				
(i) Result in substantial erosion or siltation on- or off-site?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
(ii) Substantially increase the rate, amount, or depth of surface runoff in a manner which would result in flooding on- or offsite?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

(iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
(iv) Impede or redirect flood flows which would expose existing housing or other insurable structures in a Federal 100-year flood hazard area or County Capital Flood floodplain to a significant risk of loss or damage involving flooding?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Otherwise place structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
e) Conflict with the Los Angeles County Low Impact Development Ordinance (L.A. County Code, Title 12, Ch. 12.84)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Use onsite wastewater treatment systems in areas with known geological limitations (e.g. high groundwater) or in close proximity to surface water (including, but not limited to, streams, lakes, and drainage course)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?				

Existing Conditions

Water is imported into the County from three sources: the Colorado River, the Bay Delta in Northern California via the State Water Project, and the Owens Valley via the Los Angeles Aqueduct. The Los Angeles RWQCB (Region 4) has prepared a Water Quality Control Plan (Basin Plan) for the Los Angeles Region, which includes the coastal watersheds of Los Angeles and Ventura Counties.⁶ The Lahontan RWQCB (Region 6) has prepared a Basin Plan for the Lahontan Region, which includes the inland watersheds of the Mojave Desert in Los Angeles County east and northeast through San Bernardino, Kern, Inyo, and Mono Counties to the Nevada state border and north to the Oregon state border.⁷ The Basin Plans assign beneficial uses to surface and groundwater such as municipal water supply and water-contact recreation to all waters in the basin. They also set water-quality objectives, subject to approval by the U.S. Environmental Protection Agency (EPA), intended to protect designated beneficial uses. These objectives apply to specific parameters (numeric objectives) and general characteristics of the water body (narrative objectives). An example of a narrative objective is the requirement that all waters must remain free of toxic substances in concentrations producing detrimental effects upon aquatic organisms. Numeric objectives specify concentrations of pollutants that are not to be exceeded in ambient waters of the basin.

⁶ California Water Boards: Los Angeles – R4. Accessed June 9, 2020. *Los Angeles Basin Plan*. Available at: https://www.waterboards.ca.gov/losangeles/water_issues/programs/basin_plan/

⁷ California Water Boards: Lahontan – R6. Accessed June 9, 2020. *Lahontan Basin Plan*. Available at: https://www.waterboards.ca.gov/lahontan/water_issues/programs/basin_plan/

Storm water discharges that are composed entirely of runoff from qualifying construction activities may require regulation under the General Construction Activity Storm Water Permit issued by the SWRCB. Construction activities that qualify include clearing, grading, excavation, reconstruction, and dredge-and-fill activities that result in the disturbance of at least 1 acre and less than 5 acres of total land area.

The Conservation and Natural Resources Element of the County General Plan identifies 21 major groundwater basins, or aquifers, within the nine watersheds in Los Angeles County, six of which are primarily located in Los Angeles County (Figure 2.10-1, *Los Angeles County Groundwater Basins*; Figure 2.10-2, *Los Angeles County Watersheds*).⁸ There are a total of 61,307 parcels subject to the proposed program in the Antelope-Freemont Valleys watershed, 28,822 project parcels in the Los Angeles watershed, 17,637 project parcels in the Santa Clara River watershed, 17,525 project parcels in the San Gabriel watershed, and several other parcels in the remaining five watersheds in the County. The area subject to the proposed program is primarily located within the Antelope-Freemont Valleys watershed (45 percent of project parcels). Appendix E of the County General Plan provides an overview of the six major watersheds.

Threshold of Significance

A substantial adverse effect would occur if surface or ground water quality was degraded due to a violation of water quality standards or waste discharge requirements.

Impact Analysis

The potential for impacts to hydrology and water quality has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts (please see Section 1, *Project Description*, Table 1.IV-1, *Planning and Permitting Requirements*, and Table 1.IV-2, *Development Standards*). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment to hydrology and water quality include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2, *Development Standards*).

Element 1 – Green Zone Districts

The Green Zone Districts element would result in potentially significant impacts to hydrology and water quality in relation to violating water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in potentially significant impacts to hydrology and water quality in relation to violating water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality.

⁸ Los Angeles County Department of Regional Planning. Adopted 6 October 2015. Los Angeles County General Plan 2035. [http://planning.lacounty.gov/generalplan/generalplan Chapter 9](http://planning.lacounty.gov/generalplan/generalplan%20Chapter%209) available at: http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

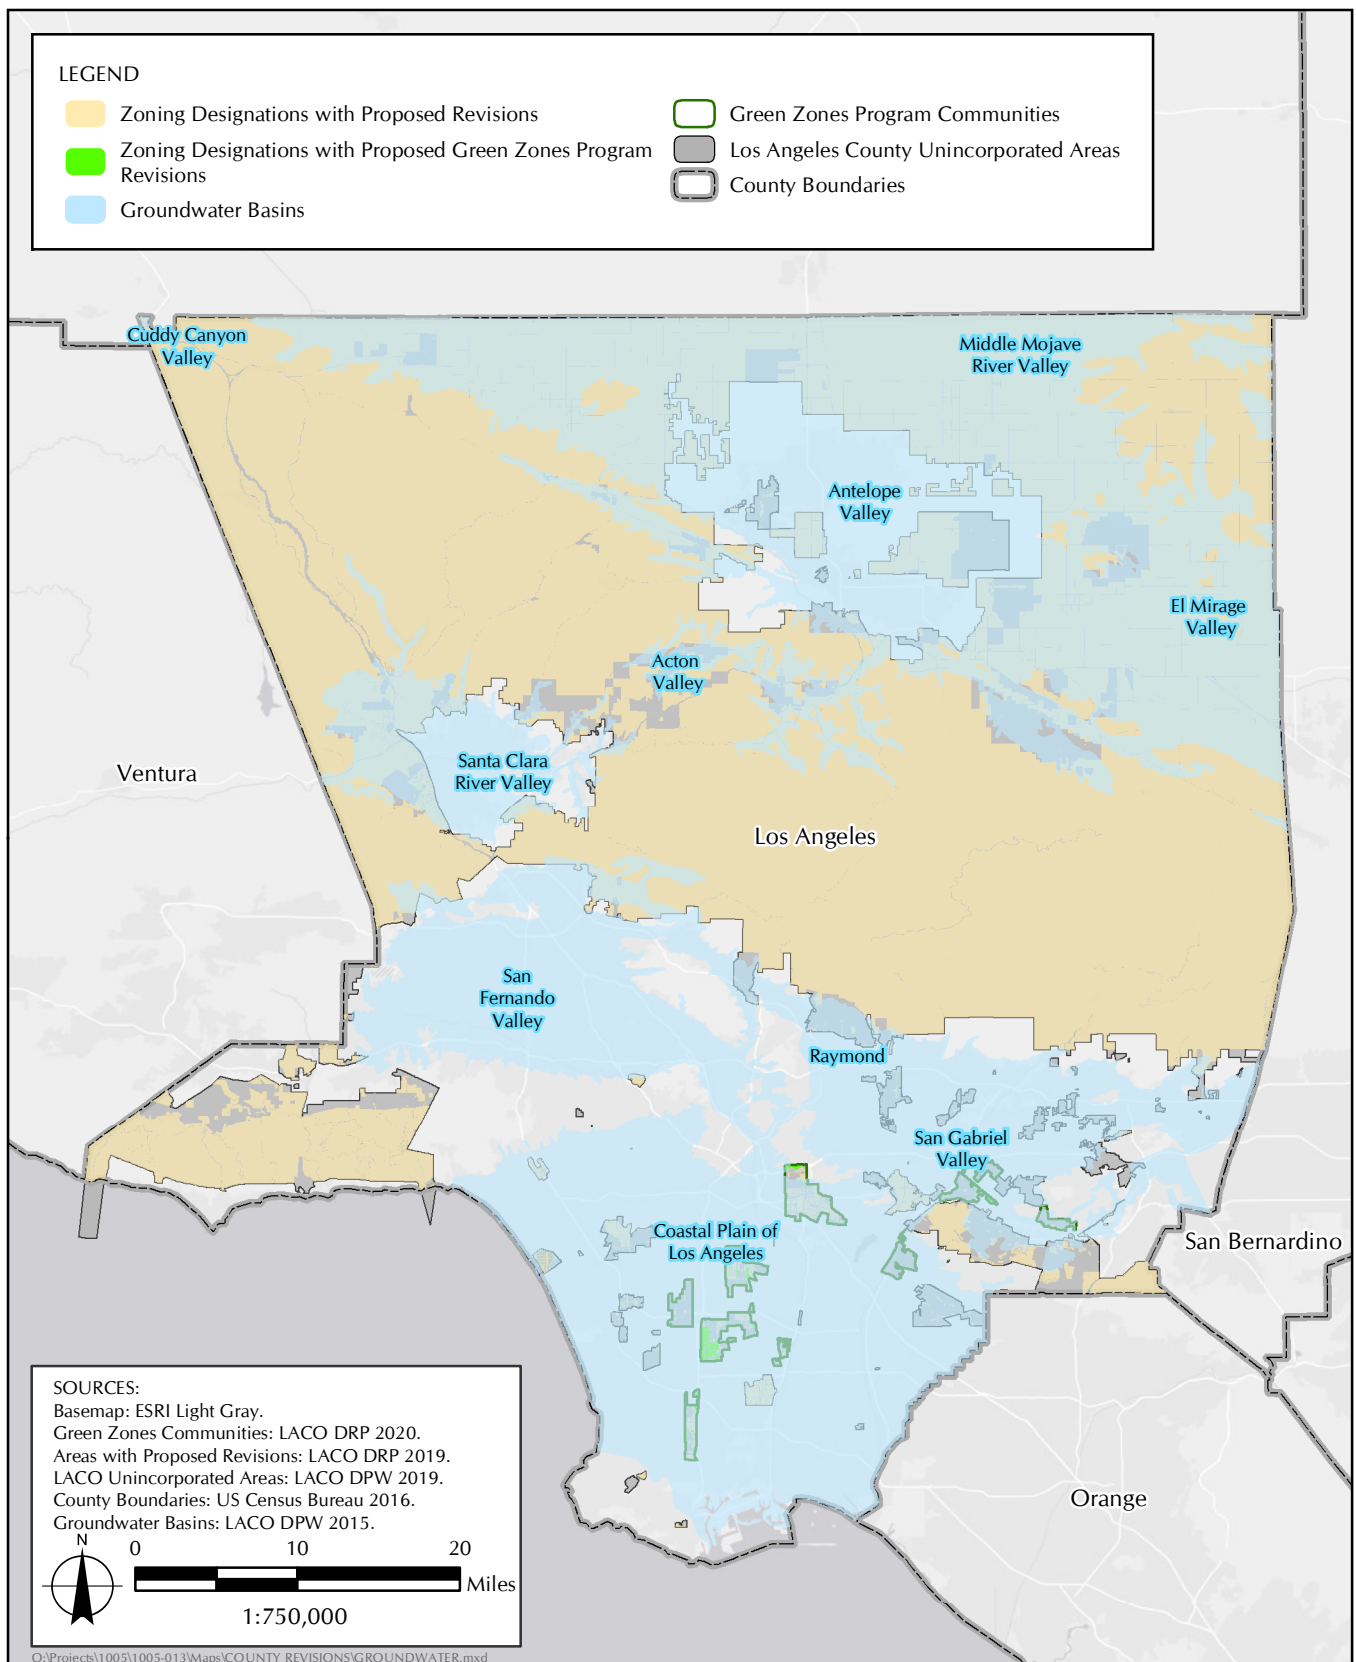

FIGURE 2.10-1
 Los Angeles County Groundwater Basins

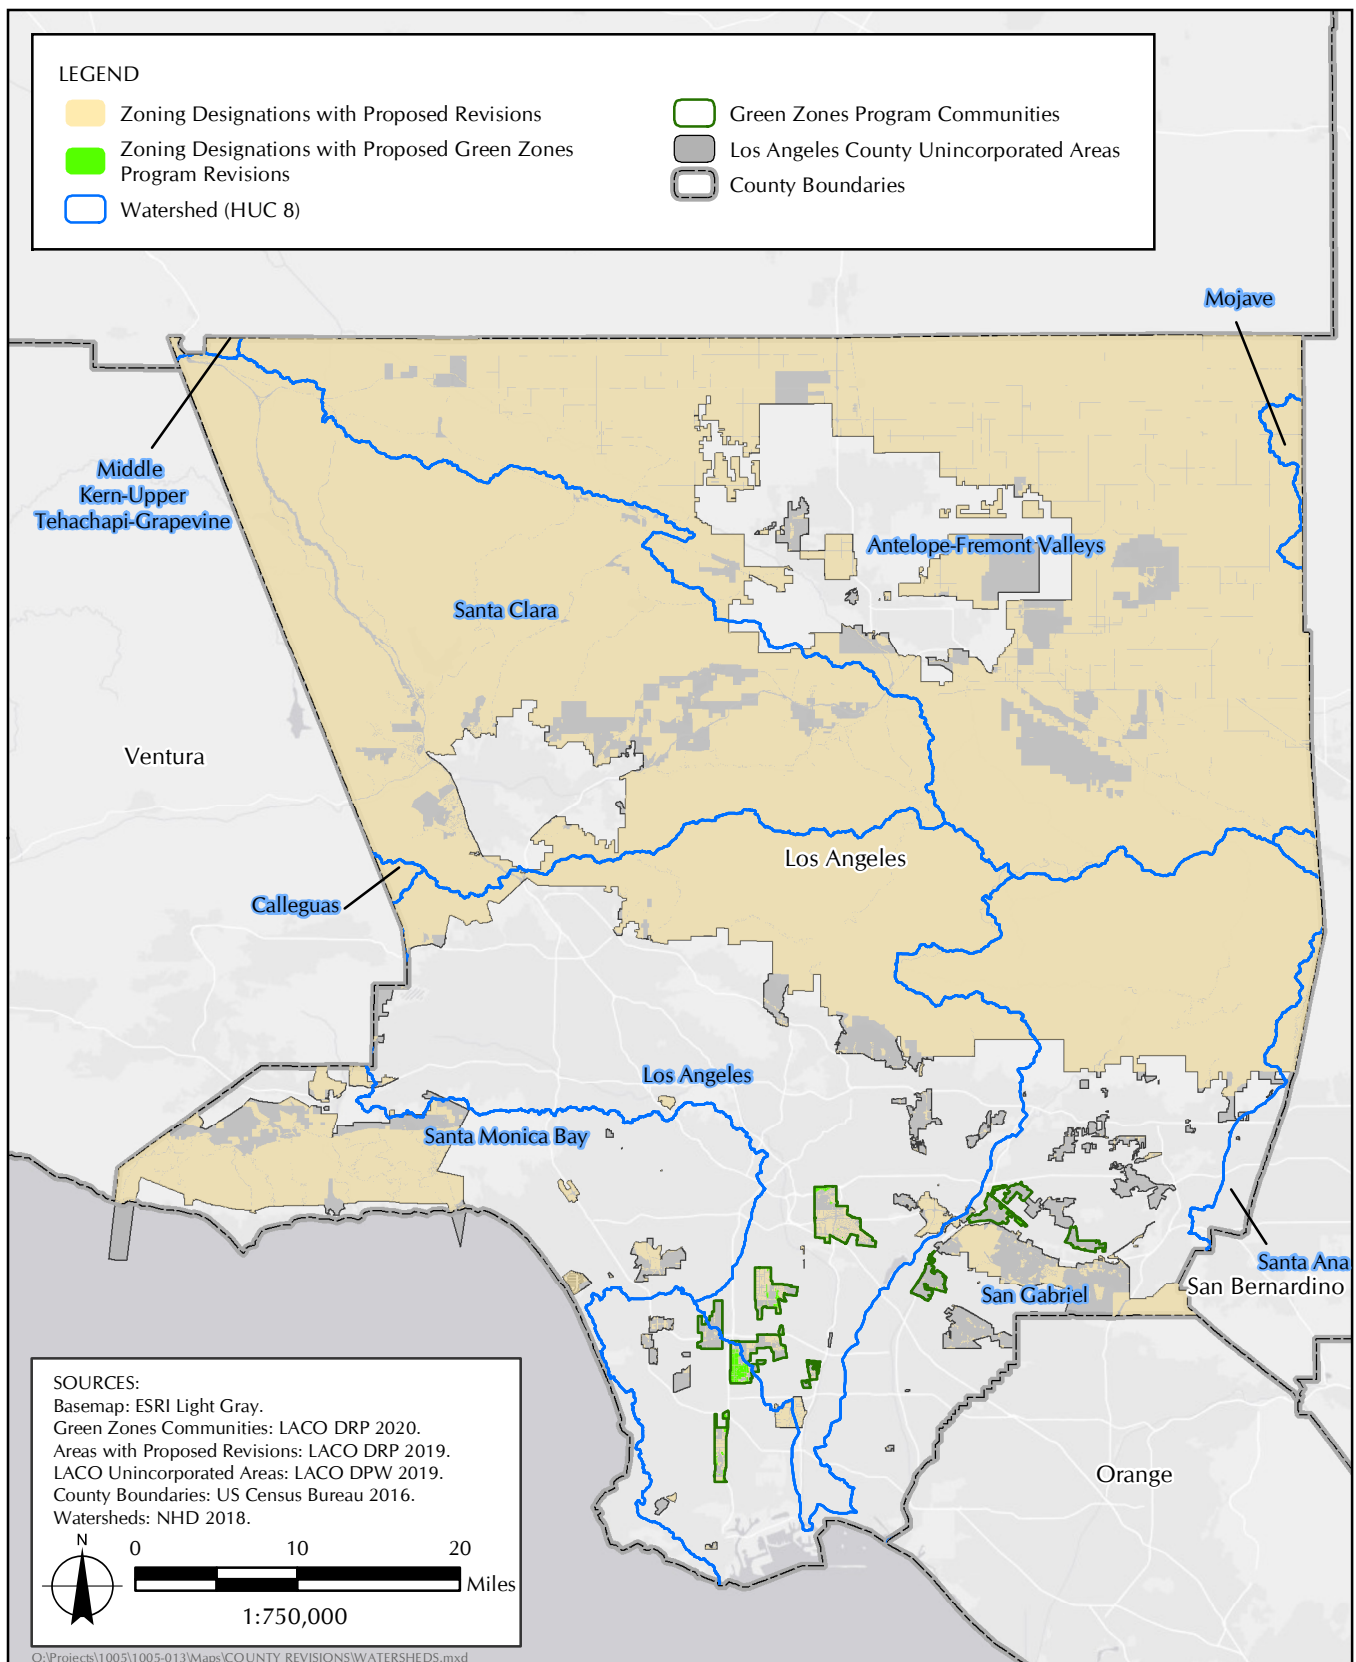

FIGURE 2.10-2
 Los Angeles County Watersheds

Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum floor area ratio (FAR) requirements. In order to retain consistency with the General Plan and Title 22 zoning code, As part of the General Plan Amendment Revisions, 27 ~~28~~ parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 ~~45~~ of the 27 ~~28~~ parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 ~~40~~ years of adoption of the Ordinance. The construction of these measures would not differ substantially from existing conditions on individual properties, as they would be minor additions to existing industrial land uses. The primary development of concern would be the paving of permeable areas, as they would be converted to impervious areas that may increase runoff of typical pollutants generated on industrial land uses which could result in water quality impacts. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles Low-Impact Development (LID) Ordinance to reduce the impacts of the development.⁹ In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions.

However, these new impervious areas may increase surface runoff containing typical pollutants generated on industrial land uses, which could result in water quality impacts to nearby surface water bodies. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would have the potential to result in significant impacts to hydrology and water quality in relation to water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality, requiring the consideration of mitigation measures and alternatives in an EIR.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in potentially significant impacts to hydrology and water quality in relation to violating water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers,

⁹ County of Los Angeles. February 2014. Low Impact Development Standards Manual.
<https://dpw.lacounty.gov/ldd/lib/fp/Hydrology/Low%20Impact%20Development%20Standards%20Manual.pdf>

preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses.~~ In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not violate water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality.

However, these new impervious areas may increase surface runoff containing typical pollutants generated adjacent to industrial land uses which could result in water quality impacts to nearby surface water bodies. Therefore, the new development standards for New Sensitive Uses near industrial, recycling and solid waste, or vehicle-related uses would result in potentially significant impacts to hydrology and water quality in relation to violating water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality, requiring the consideration of mitigation measures and alternatives in an EIR.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would have the potential to result in significant impacts to hydrology and water quality in relation to violating water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality. The Recycling and Waste Management Revisions would require that recycling processing facilities, and pallet yards pave areas designated for operations, vehicle parking, vehicle circulation, or storage of materials or equipment with impervious materials such as an asphalt or an oil and aggregate mixture and maintained to the satisfaction of the Director (Section 22.140.690, ~~740~~, 22.84.030). The purpose of this would be to protect water quality from contaminants associated with industrial uses, as it would prevent offsite water leak or contamination. As a result, implementation of the proposed program would result in the construction of new areas of impervious surfaces. These new impervious areas may increase surface runoff containing typical pollutants generated on industrial land uses, which could result in water quality impacts to nearby surface water bodies. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development.¹⁰ However, the cumulative increase in impervious surfaces may result in significant impacts to water quality, requiring the consideration of mitigation measures and alternatives in an EIR.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~

However, regardless of the LID Ordinance and LID Standards Manual, the cumulative quantity of new impervious surfaces is unknown, given that the implementation of development standards under Green Zone Districts would occur

¹⁰ County of Los Angeles. February 2014. Low Impact Development Standards Manual.
<https://dpw.lacounty.gov/ldd/lib/fp/Hydrology/Low%20Impact%20Development%20Standards%20Manual.pdf>

at various sites across the County. Increased runoff from individual properties combined with typical pollutants generated on industrial land uses could result in water quality impacts because the new impervious areas may increase surface runoff containing typical pollutants generated adjacent to industrial land uses, which could result in water quality impacts to nearby surface water bodies.

The Supermarket Accessory Recycling Collection Centers revisions would have the potential to result in significant impacts to hydrology and water quality in relation to violating water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built.

Per Chapter 22.140.660.710, the supermarket recycling collection containers would be required to be placed on a paved surface. Per Chapter 22.128, the surface where a storage area is located and two feet beyond the walls of the enclosure would be required to be paved pursuant to County Code 22.112.080.E with concrete, asphalt, or another approved material. The compliance with development standards would not substantially alter the existing conditions at an individual parcel such that there would be impedance or redirection of flood flows. However, these new impervious areas may increase surface runoff containing typical pollutants generated on industrial land uses which could result in water quality impacts to nearby surface water bodies. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development.¹¹ However, the cumulative increase in impervious surfaces may result in significant impacts to water quality. Therefore, the proposed program would have the potential to result in significant impacts to hydrology and water quality in relation to violating water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality, requiring the consideration of mitigation measures and alternatives in an EIR.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would have the potential to result in significant impacts to hydrology and water quality in relation to violating water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

¹¹ County of Los Angeles. Low Impact Development Standards Manual. February 2014.
<https://dpw.lacounty.gov/ldd/lib/fp/Hydrology/Low%20Impact%20Development%20Standards%20Manual.pdf>

Per Chapter 22.140-660.710, the supermarket recycling collection containers would be required to be placed on a paved surface. Per Chapter 22.128, the surface where a storage area is located and two feet beyond the walls of the enclosure would be required to be paved pursuant to County Code 22.112.080.E with concrete, asphalt, or another approved material. The compliance with development standards would not substantially alter the existing conditions at an individual parcel such that there would be impedance or redirection of flood flows. However, these new impervious areas may increase surface runoff containing typical pollutants generated on industrial land uses which could result in water quality impacts to nearby surface water bodies. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development.¹² Additionally, the proposed program would require the implementation of the National Pollutant Discharge Elimination System (NPDES) for locations in excess of one acre, LID Ordinance, Hillside Management Ordinance, and MS-4 Permit. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions have the potential to result in significant impacts to hydrology and water quality in relation to violating water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality, requiring the consideration of mitigation measures and alternatives in an EIR.

The proposed Green Zones Program would have the potential to result in less than significant impacts to hydrology and water quality in relation to violating water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality. Further analysis was conducted based on the Green Zones Program Initial Study which reduced impacts to the level of less than significant in relation to violating water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality. New impervious areas may increase surface runoff containing typical pollutants generated on industrial land uses, which could result in water quality impacts to nearby surface water bodies. The new impervious areas as a result of the proposed program may increase surface runoff containing typical pollutants generated on industrial land uses, which could result in water quality impacts to nearby surface water bodies. Therefore, the proposed Green Zones Program would have the potential to result in significant impacts to hydrology and water quality in relation to violating water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality, requiring the consideration of mitigation measures and alternatives in an EIR.

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Existing Conditions

Water is imported into the County from three sources: the Colorado River, the Bay Delta in Northern California via the State Water Project, and the Owens Valley via the Los Angeles Aqueduct. The Los Angeles RWQCB (Region 4) has prepared a Basin Plan for the Los Angeles Region, which includes the coastal watersheds of Los Angeles and Ventura Counties.¹³ The Lahontan RWQCB (Region 6) has prepared a Basin Plan for the Lahontan Region, which includes the inland watersheds of the Mojave Desert in Los Angeles County east and northeast through San Bernardino, Kern, Inyo, and Mono Counties to the Nevada state border and north to the Oregon state border.¹⁴ The Basin Plans assign beneficial uses to surface and groundwater such as municipal water supply and water-contact recreation to all waters in the basin. They also set water-quality objectives, subject to approval by the EPA, intended to protect designated beneficial uses. These objectives apply to specific parameters (numeric objectives) and general characteristics of the water body (narrative objectives). An example of a narrative objective is the requirement that all waters must remain free of toxic substances in concentrations producing detrimental effects upon aquatic organisms. Numeric objectives specify concentrations of pollutants that are not to be exceeded in ambient waters of the basin.

https://www.waterboards.ca.gov/lahontan/water_issues/programs/basin_plan/

The Conservation and Natural Resources Element of the County General Plan identifies 21 major groundwater basins, or aquifers, within the nine watersheds in Los Angeles County, six of which are primarily located in Los Angeles County (see Figure 2.10-1 and Figure 2.10-2).¹⁵ Aquifers can hold millions of acre-feet of water and extend for miles. Except during times of drought, groundwater extraction accounts for nearly one-third of the water usage in the unincorporated areas. There are a total of 61,307 parcels subject to the proposed program in the Antelope-Freemont Valleys watershed, 28,822 project parcels in the Los Angeles watershed, 17,637 project parcels in the Santa Clara River watershed, 17,525 project parcels in the San Gabriel watershed, and several other parcels in the remaining five watersheds in the County. The area subject to the proposed program is primarily located within the Antelope-Freemont Valleys watershed (45 percent of project parcels). Appendix E of the County General Plan provides an overview of the six major watersheds:

1. **Antelope Valley Watershed:** The southern half of the Lahontan hydrologic region is located in the Antelope Valley. Unlike the coastal watersheds in Los Angeles County, it is a closed basin on the edge of the Mojave Desert, having no outlet to the ocean or major river system. Numerous streams drain the north-facing San Gabriel Mountains, carrying rainfall and snow melt from the Angeles National Forest into the Antelope Valley. Significant stream systems in the Antelope Valley are Amaroosa Creek, Big Rock Creek, and Little Rock Creek. During most years, the rainfall in the Antelope Valley is scant, averaging less than eight inches per year. Every few years, major storms cause flooding, sending sheets of water flow across the eastern portion of the Antelope Valley to the dry lakebeds of Rosamond and Rodgers lakes in Kern County. Antelope Valley Watershed has a natural runoff process which is important for benefits the local communities with groundwater recharge and surfaces the dry lake beds.
2. **Los Angeles River:** The Los Angeles River watershed covers approximately 870 square miles, a small part of which extends into Ventura County. It includes the San Fernando Valley and is the largest watershed in the Los Angeles Basin. The river extends 51 stream miles, from the confluence of Bell Creek and Arroyo Calabasas, to the Pacific Ocean. The first 32 miles of the river flow through the cities of Los Angeles, Burbank, and Glendale, and then, subsequently, through Vernon, Commerce, Maywood, Bell, Bell Gardens, Lynwood, Compton, South Gate, Paramount, Cudahy, and Long Beach. Numerous tributaries feed the Los Angeles River, as it flows through the San Fernando Valley and the coastal plain to the Long Beach Harbor. These tributaries include Tujunga Wash, Verdugo Wash, Arroyo Seco, Rio Hondo, and Compton Creek. Several important biotic communities exist in the northern tributaries that feed the river, including freshwater marsh areas in Tujunga Canyon and the Hansen Flood Control Basin. The Los Angeles River's sole purpose for years has been efficient water conveyance—carrying stormwater from the land to the ocean as quickly as possible. Efforts continue under the auspices of the Los Angeles County Flood Control District to capture as much stormwater as possible and redirect it to regional groundwater recharge areas to replenish groundwater basins, saving thousands of acre-feet of water every year.
3. **Los Angeles Harbor:** The major river system within the area that drains to Los Angeles Harbor is the Dominguez Channel. The Dominguez Channel watershed, part of the larger Los Angeles Harbor watershed, is located within the southern portion of Los Angeles County and encompasses approximately 110 square miles of intensely urban area. Approximately 81 percent of the watershed is developed. Residential development covers nearly 40 percent of the watershed, and another 41 percent is made up by industrial, commercial and transportation uses. With a population of nearly 1 million, considerable demands are made on infrastructure and services within the watershed. Local water supply is limited and the majority of water use is provided by imported sources. Parkland and open space are in short supply and generally are deficient. Another significant stream system within the Los Angeles Harbor watershed is the Wilmington Drain.
4. **San Gabriel River:** The San Gabriel River watershed encompasses part of the Angeles National Forest, the San Gabriel Valley, and large urban areas in southeast portion of Los Angeles County. It is bounded by the Los Angeles River on much of its western flank, and extends to San Bernardino and Orange counties. Totaling more than 640 square miles, the watershed has extensive areas of un-channeled tributaries, which support riparian and woodland habitats. The San Gabriel River extends 59 stream miles from the Angeles National

¹⁵ Los Angeles County Department of Regional Planning. Adopted 6 October 2015. Los Angeles County General Plan 2035. [http://planning.lacounty.gov/generalplan/generalplan Chapter 9](http://planning.lacounty.gov/generalplan/generalplan%20Chapter%209) available at: http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

Forest to the Pacific Ocean, draining 350 square miles of land. It also recharges groundwater tables in several basins. The major tributaries that feed the San Gabriel River include Coyote Creek, Walnut Creek, Puente Creek and San Jose Creek.

5. **Santa Clara River:** The Santa Clara River watershed is an extensive hydrologic system that encompasses the western portion of the Angeles National Forest in Los Angeles County and the eastern portion of Los Padres National Forest in Ventura County. The river is an essential component of this watershed. It recharges local groundwater, provides riparian habitat and supplies water to downstream agricultural lands in Ventura County. It is the largest relatively unaltered river system in Southern California, and the single most important natural wildlife corridor in Los Angeles County. The Santa Clara River and its tributaries provide drainage for approximately 654 square miles of the upper watershed within Los Angeles County.
6. **Santa Monica Bay Coastal Watersheds:** The County, other agencies, cities, and stakeholders coordinate the management of the coastal watersheds of Santa Monica Bay as two distinct management areas, due to the vast differences in land use and population density: North Santa Monica Bay watersheds (North Bay) and the South Santa Monica Bay watersheds (South Bay). The North Bay consists of the Malibu Creek and Topanga Creek watersheds as well as sixteen other rural coastal watersheds. North Bay watersheds are primarily natural open space with low-density residential developments. The South Bay includes Ballona Creek watershed, Marina del Rey, and 10 urban coastal sub-watersheds. The coastal watersheds of the Santa Monica Bay extend from the Ventura County-Los Angeles County line to outer Cabrillo Beach in San Pedro. This length includes 44 beaches along 55 miles of coastline.

Threshold of Significance

A substantial adverse impact would occur if sustainable ground water management of a basin were impeded by a decrease in ground water supplies or the interference of groundwater recharge.

Impact Analysis

The proposed program has the potential to result in significant impacts to hydrology and water quality in relation to a decrease in groundwater supplies or interfering substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin. Implementation of proposed program would result in the construction of new areas of impervious surfaces that may inhibit groundwater recharge.

The potential for impacts to hydrology and water quality has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

The Green Zone Districts element has the potential to result in significant impacts to hydrology and water quality in relation to decrease in groundwater supplies or interfering substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would have the potential to result in significant impacts to hydrology and water quality in relation to decrease in groundwater supplies or interfering substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin. Currently

the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, As part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

The Green Zone District covers approximately 1,950 acres of the County, including the communities of Avocado Heights, East Los Angeles, East Rancho Dominguez, Florence-Firestone, South San Jose Hills, Walnut Park, West Athens-Westmont, West Carson, West Rancho Dominguez-Victoria, West Whittier-Los Nietos, and Willowbrook. These areas are located in the Coastal Plains of Los Angeles and San Gabriel Valley ground water basins (see Figure 2.10-1).

The Green Zone District would not substantially decrease groundwater resources through operation or maintenance of the development standards, as the only measure that may require water is landscaping. However, the introduction of impervious surfaces as a result of the development standards may reduce the amount of precipitation available to seep into the groundwater. Therefore, the Green Zone Districts element has the potential to result in significant impacts to hydrology and water quality in relation to decrease in groundwater supplies or interfering substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin, requiring the consideration of mitigation measures and alternatives in an EIR.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would have the potential to result in significant impacts to hydrology and water quality in relation to decrease in groundwater supplies or interfering substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses.

The updated standards for new sensitive uses would not substantially decrease groundwater resources through operation or maintenance of the development standards, as the only measure that may require water is landscaping. However, the introduction of impervious surfaces as a result of the development standards may reduce the amount of precipitation which is available to seep into the groundwater. Therefore, the new development standards for New Sensitive Uses have the potential to result in significant impacts to hydrology and water quality in relation to a decrease in groundwater supplies or interfering substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin, requiring the consideration of mitigation measures and alternatives in an EIR.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions have the potential to result in significant impacts to hydrology and water quality in relation to decrease in groundwater supplies or interfering substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to CUP, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ The Recycling and Waste Management Revisions cover nearly 600,000 acres of the County and are located in all nine groundwater basins in the County (Figure 2.10-1). The Recycling and Waste Management Revisions would not substantially decrease groundwater resources through operation or maintenance of the development standards, as the only measure that may require water is landscaping. However, the introduction of impervious surfaces as a result of the development standards may reduce the amount of precipitation that is available to seep into the groundwater.

The Supermarket Accessory Recycling Collection Centers have the potential for significant impacts on hydrology and water quality in relation to a decrease in groundwater supplies or interfering substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The

CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built.

These revisions are located in all nine groundwater basins in the County (see Figure 2.10-1). The Supermarket Accessory Recycling Collection Centers and Storage Enclosures for Recycling and Solid Waste Revisions would not substantially decrease groundwater resources through operation or maintenance of the recycling collection facilities or the development standards. However, the introduction of impervious surfaces as a result of the measures may reduce the amount of precipitation that is available to seep into the groundwater. Therefore, the proposed program has the potential to result in significant impacts to hydrology and water quality related to a decrease in groundwater supplies or interference substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin, requiring the consideration of mitigation measures and alternatives in an EIR.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions has the potential to result in significant impacts to hydrology and water quality related to a decrease in groundwater supplies or interference substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin. The new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. These revisions are located in all nine groundwater basins in the County (Figure 2.10-1). The Supermarket Accessory Recycling Collection Centers and Storage Enclosures for Recycling and Solid Waste Revisions would not substantially decrease groundwater resources through operation or maintenance of the recycling collection facilities or the development standards. However, the introduction of impervious surfaces as a result of the measures may reduce the amount of precipitation that is available to seep into the groundwater. Therefore, the proposed program has the potential to result in significant impacts to hydrology and water quality related to a decrease in groundwater supplies or interference substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin, requiring the consideration of mitigation measures and alternatives in an EIR.

- c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of a Federal 100-year flood hazard area or County Capital Flood floodplain; the alteration of the course of a stream or river; or through the addition of impervious surfaces, in a manner which would:**

(i) Result in substantial erosion or siltation on- or off-site?

The potential for impacts to hydrology and water quality has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Existing Conditions

The Green Zones Ordinance would apply to a total of 16,556 parcels which intersect blue-line streams. Impacts to natural water bodies would be required to comply with Section 404 of the Federal Clean Water Act and Section 1600 of the California Fish and Game Code, which require no net loss of habitat functions or values. Implementation of the

development standards required by the proposed program would also be subject to the County of Los Angeles LID Ordinance, which would prevent substantial erosion and siltation.¹⁶

Threshold of Significance

A substantial adverse impact would occur if substantial erosion or siltation on- or off-site were caused by substantial alterations to the existing drainage pattern of the site or area, including through the alteration of a Federal 100-year flood hazard area or County Capital Flood floodplain; the alteration of the course of a stream or river; or through the addition of impervious surfaces.

Impact Analysis

The proposed program would result in potentially significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of a Federal 100-year flood hazard area or County Capital Flood floodplain; the alteration of the course of a stream or river; or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site.

Element 1 – Green Zone Districts

The Green Zone Districts have the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and other with a CUP, and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

Impacts to natural water bodies would be required to comply with Section 404 of the Federal Clean Water Act and Section 1600 of the California Fish and Game Code, which require no net loss of habitat function or values. Implementation of the development standards required by the proposed program would also be subject to the County of Los Angeles LID Ordinance, which would help prevent substantial erosion or siltation. Additionally, the construction of these measures on individual properties would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses. However, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from many individual properties could result in impacts to surface water bodies that may

¹⁶ County of Los Angeles. February 2014. Low Impact Development Standards Manual.
<https://dpw.lacounty.gov/ldd/lib/fp/Hydrology/Low%20Impact%20Development%20Standards%20Manual.pdf>

increase the erosion downstream. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in potentially significant impacts to hydrology and water quality, warranting further investigation of impacts and mitigation measures in an EIR.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in potentially significant impacts to hydrology and water quality in relation to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses.

Impacts to natural water bodies would be required to comply with Section 404 of the Federal Clean Water Act and Section 1600 of the California Fish and Game Code, which require no net loss of habitat function or values. Implementation of the development standards required by the proposed program would also be subject to the County of Los Angeles LID Ordinance, which would help prevent substantial erosion or siltation. Additionally, the construction of these measures on individual properties would not differ substantially from existing conditions. However, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from many individual properties could result in impacts to surface water bodies that may increase the erosion downstream. Therefore, the new development standards for New Sensitive Uses would result in potentially significant impacts to hydrology and water quality, warranting further investigation of impacts and mitigation measures in an EIR.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would have the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities

would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. While Element 3 would allow for development of Recycling and Waste Management facilities, the proposed improvements would require that all future recycling and solid waste facilities be subject to a CUP. In addition, no change in the underlying land use would occur.

Impacts to natural water bodies would be required to comply with Section 404 of the Federal Clean Water Act and Section 1600 of the California Fish and Game Code, which require no net loss of habitat functions or values. Construction of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance, which would help prevent substantial siltation or erosion.¹⁷ Additionally, the construction of these measures on individual properties would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses. However, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from many individual properties could result in impacts to surface water bodies which may increase the erosion downstream. Therefore, the Recycling and Waste Management Revisions have the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, warranting further investigation of impacts and mitigation measures in an EIR.

The Supermarket Accessory Recycling Collection Centers revisions would have the potential to result in significant impacts on hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones, would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built.

Impacts to natural water bodies would be required to comply with Section 404 of the Federal Clean Water Act and Section 1600 of the California Fish and Game Code, which require no net loss of habitat functions or values. Construction of the development standards required by the proposed program would also be subject to the County of Los Angeles LID Ordinance, which would help prevent substantial erosion and siltation.¹⁸ However, the cumulative

¹⁷ County of Los Angeles. February 2014. Low Impact Development Standards Manual.
<https://dpw.lacounty.gov/ldd/lib/fp/Hydrology/Low%20Impact%20Development%20Standards%20Manual.pdf>

¹⁸ County of Los Angeles. February 2014. Low Impact Development Standards Manual.
<https://dpw.lacounty.gov/ldd/lib/fp/Hydrology/Low%20Impact%20Development%20Standards%20Manual.pdf>

quantity of new impervious surfaces is unknown. Increased runoff from many individual properties could result in impacts to surface water bodies which may increase the erosion downstream. Therefore, the Supermarket Accessory Recycling Collection Centers have the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site, thus warranting further investigation of impacts and mitigation measures in an EIR.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would have the potential to result in significant impacts on hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

Impacts to natural water bodies would be required to comply with Section 404 of the Federal Clean Water Act and Section 1600 of the California Fish and Game Code, which require no net loss of habitat functions or values. Construction of the development standards required by the proposed program would also be subject to the County of Los Angeles LID Ordinance, which would help prevent substantial erosion and siltation.¹⁹ However, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from many individual properties could result in impacts to surface water bodies which may increase the erosion downstream. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would have the potential to result in significant impacts on hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site, thus warranting further investigation of impacts and mitigation measures in an EIR.

(ii) Substantially increase the rate, amount, or depth of surface runoff in a manner which would result in flooding on- or offsite?

Existing Conditions

The area subject to the proposed program is primarily located within the Antelope-Freemont Valleys watershed (45 percent of project parcels), with the Los Angeles, San Gabriel, Santa Clara, and Santa Monica Bay watersheds also containing large portions, while the Calleguas, Middle Kern-Upper Tehachapi-Grapevine, Mojave, and Santa Ana watersheds include a much smaller portion (Table 2.10-1, *Project Parcels within Watersheds*).

¹⁹ County of Los Angeles. February 2014. Low Impact Development Standards Manual.
<https://dpw.lacounty.gov/ldd/lib/fp/Hydrology/Low%20Impact%20Development%20Standards%20Manual.pdf>

**TABLE 2.10-1
PROJECT PARCELS WITHIN WATERSHEDS**

Name of Watershed	Number of Project Parcels	Percentage of Project Parcels	Subset of Parcels within the Green Zone Districts Element
Antelope-Fremont Valleys	61,307	45%	0
Calleguas	30	0%	0
Los Angeles	28,822	21%	1,338
Middle Kern-Upper Tehachapi-Grapevine	16	0%	0
Mojave	730	1%	0
San Gabriel	17,525	13%	1440
Santa Ana	184	0%	0
Santa Clara	17,637	13%	0
Santa Monica Bay	9,132	7%	0

Threshold of Significance

A significant and adverse effect to hydrology would occur on-or offsite if there were to be a substantial increase in the rate amount, or depth of surface runoff.

Impact Analysis

The proposed program would result in potentially significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of a Federal 100-year flood hazard area or County Capital Flood floodplain; the alteration of the course of a stream or river; or through the addition of impervious surfaces, in a manner which would substantially increase the rate, amount, or depth of surface runoff in a manner which would result in flooding on- or offsite. Impacts to natural water bodies would be required to comply with Section 404 of the Federal Clean Water Act and Section 1600 of the California Fish and Game Code, which require no net loss of habitat functions or values. Implementation of the development standards required by the proposed program would also be subject to the County of Los Angeles LID Ordinance, which would prevent substantial erosion and siltation.²⁰

Element 1 – Green Zone Districts

The Green Zone Districts element has the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would have the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, As part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts

²⁰ County of Los Angeles. February 2014. Low Impact Development Standards Manual.
<https://dpw.lacounty.gov/ldd/lib/fp/Hydrology/Low%20Impact%20Development%20Standards%20Manual.pdf>

with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 ~~10~~ years of adoption of the Ordinance.

A total of 1,338 Los Angeles River watershed parcels and 1,440 San Gabriel River watershed parcels would be subject to the Green Zone Districts. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance, which would help prevent substantial flooding. Additionally, the construction of these measures on individual properties would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses. However, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from many individual properties could result in impacts to surface water bodies which may increase the flooding off-site and downstream. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would have the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site, warranting further investigation of impacts and mitigation measures in an EIR.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would have the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 4, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses.

Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance, which would help prevent substantial flooding. Additionally, the construction of these measures on individual properties would not differ substantially from existing conditions, as they would be minor additions to existing ~~industrial land uses~~ development standards. However, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from many individual properties could result in impacts to surface water bodies, which may increase the flooding off-site and downstream. Therefore, the New Sensitive Uses Revisions have the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing

drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site, warranting further investigation of impacts and mitigation measures in an EIR.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would have the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site.

Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance, which would help prevent substantial flooding. Additionally, the construction of these measures on individual properties would not differ substantially from existing conditions, as they would be minor additions to existing industrial land uses. However, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from many individual properties could result in impacts to surface water bodies, which may increase the flooding off-site and downstream.

The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to CUP, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ While Element 3 would allow for development of Recycling and Waste Management facilities, the proposed improvements would require that all future recycling and solid waste facilities be subject to a CUP. In addition, no change in the underlying land use would occur. Therefore, Recycling and Waste Management Revisions would have the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site, thus warranting further investigation of impacts and mitigation measures in an EIR.

The Supermarket Accessory Recycling Collection Centers revisions would have the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only

allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built.

Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance, which would help prevent substantial flooding. Additionally, the construction of these measures on individual properties would not differ substantially from existing conditions, as they would be minor additions to existing supermarkets or industrial land uses. However, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from many individual properties could result in impacts to surface water bodies, which may increase the flooding off-site and downstream. Therefore, the Supermarket Accessory Recycling Collection Centers would have the potential to result in significant impacts on hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site, warranting further investigation of impacts and mitigation measures in an EIR.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would have the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance, which would help prevent substantial flooding. Additionally, the construction of these measures on individual properties would not differ substantially from existing conditions, as they would be minor additions to existing supermarkets or industrial land uses. However, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from many individual properties could result in impacts to surface water bodies which may increase the flooding off-site and downstream. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would have the potential to result in significant impacts on hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site, warranting further investigation of impacts and mitigation measures in an EIR.

(iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Existing Conditions

The area subject to the proposed program is primarily located within the Antelope-Freemont Valleys watershed (45 percent of project parcels), with the Los Angeles, San Gabriel, Santa Clara, and Santa Monica Bay watersheds also containing large portions, while the Calleguas, Middle Kern-Upper Tehachapi-Grapevine, Mojave, and Santa Ana watersheds include a much smaller portion (Table 2.10-1). The Clean Water Act prohibits the discharge of pollutants to waters of the United States from stormwater, unless such discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) Permit. Additionally, the County has a Stormwater Ordinance that requires that the discharge, deposit, or disposal of any stormwater and/or runoff to storm drains must be covered by an NPDES Stormwater Permit.²¹ The County Flood Control District maintains the County Storm Drain System, which encompasses 3,300 miles of underground storm drains throughout the County.²²

Threshold of Significance

A significant and adverse effect would occur if the storm water drainage system exceeded capacity or provided substantial additional sources of pollution due to the contribution of runoff water.

Impact Analysis

The proposed program has the potential to result in significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.

Element 1 – Green Zone Districts

The Green Zone Districts element would have the potential to result in significant impacts to hydrology and water quality in relation to creating or contributing runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties have the potential to result in significant impacts to hydrology and water quality in relation to creating or contributing runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping

²¹ County of Los Angeles. County General Plan.

²² Los Angeles County Department of Public Works. Los Angeles Flood Control District. Accessed 14 April 2020. <https://dpw.lacounty.gov/LACFCD/web/>

buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to ~~7~~ 40 years of adoption of the Ordinance.

The construction of these measures would not differ substantially from existing conditions on individual properties, as they would be minor additions to existing industrial land uses. The primary development of concern would be the paving of permeable areas, as they would be converted to impervious areas that may increase runoff of typical pollutants generated on industrial land uses which could result in water quality impacts. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development.²³ However, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from individual properties may exceed existing stormwater drainage infrastructure, and the runoff may contain the typical pollutants generated on industrial land uses which could result in water quality impacts to storm drains. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would have the potential to result in significant impacts to hydrology and water quality in relation to creating or contributing runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff, warranting further investigation of impacts and mitigation measures in an EIR.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would have the potential to result in significant impacts to hydrology and water quality in relation to creating or contributing runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling and solid waste, or vehicle-related uses.

The construction of these measures would not differ substantially from existing conditions on individual properties, as they would be minor additions to existing industrial land uses. The primary development of concern would be the paving of permeable areas, as they would be converted to impervious areas that may increase runoff of typical pollutants generated on industrial land uses which could result in water quality impacts. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development.²⁴ However, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from individual properties may exceed existing stormwater drainage infrastructure, and the runoff may contain

²³ County of Los Angeles. February 2014. Low Impact Development Standards Manual.

the typical pollutants generated on industrial land uses which could result in water quality impacts to storm drains. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would have the potential to result in significant impacts to hydrology and water quality in relation to creating or contributing runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff, warranting further investigation of impacts and mitigation measures in an EIR.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would have the potential to result in significant impacts to hydrology and water quality in relation to creating or contributing runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to CUP, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. While Element 3 would allow for development of Recycling and Waste Management facilities, the proposed improvements would require that all future recycling and solid waste facilities be subject to a CUP. In addition, no change in the underlying land use would occur.

The construction of these measures would not differ substantially from existing conditions on individual properties, as they would be minor additions to existing industrial land uses. The primary development of concern would be the paving of permeable areas, as they would be converted to impervious areas that may increase runoff of typical pollutants generated on industrial land uses which could result in water quality impacts. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development.²⁵ However, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from individual properties may exceed existing stormwater drainage infrastructure, and the runoff may contain the typical pollutants.

The Supermarket Accessory Recycling Collection Centers revisions would have the potential to result in significant impacts to hydrology and water quality in relation to creating or contributing runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently

²⁵ County of Los Angeles. February 2014. Low Impact Development Standards Manual.
<https://dpw.lacounty.gov/ldd/lib/fp/Hydrology/Low%20Impact%20Development%20Standards%20Manual.pdf>

developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built.

The construction of a supermarket recycling collection center or compliance with development standards would not substantially alter the existing conditions, on individual properties, as they would be minor additions to existing supermarkets or industrial land uses. The primary development of concern would be the paving of permeable areas, as they would be converted to impervious areas that may increase runoff of typical pollutants generated on industrial land uses which could result in water quality impacts. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development.²⁶ However, the cumulative quantity of new impervious surfaces is unknown.

Therefore, the proposed program would have the potential to result in significant impacts to impacts to hydrology and water quality in relation to creating or contributing runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff, warranting further investigation of impacts and mitigation measures in an EIR.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would have the potential to result in significant impacts to impacts to hydrology and water quality in relation to creating or contributing runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. The revisions would not substantially alter the existing conditions, on individual properties, as they would be minor additions to existing supermarkets or industrial land uses. The primary development of concern would be the paving of permeable areas, as they would be converted to impervious areas that may increase runoff of typical pollutants generated on industrial land uses which could result in water quality impacts. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development.²⁷ However, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from individual properties may exceed existing stormwater drainage infrastructure, and the runoff may contain the typical pollutants generated on industrial land uses which could result in water quality impacts to storm drains. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions have the potential to result in significant impacts to impacts to hydrology and water quality in relation to creating or contributing runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff, warranting further investigation of impacts and mitigation measures in an EIR.

- (iv) **Impede or redirect flood flows which would expose existing housing or other insurable structures in a Federal 100-year flood hazard area or County Capital Flood floodplain to a significant risk of loss or damage involving flooding?**

Existing Conditions

Approximately 62,565 acres of zoning districts that would be subject to the Ordinance are located within Federal Emergency Management Agency (FEMA)–designated flood zones (Figure 2.10-3, *Los Angeles County Tsunami Inundation Zones and Flood Zones*).

The County General Plan identifies Tsunami Hazard Areas in Los Angeles County, which include Marina del Rey and portions of the Santa Monica Mountains Coastal Zone and flood zones. Flood-prone areas in unincorporated areas of the County are located in the Los Angeles Basin. The main bodies of water and sources of flooding include Ballona Creek, Los Angeles River, Malibu Creek, Pacific Ocean, Rio Hondo River, San Gabriel River and its tributaries (Santa Clara River and Topanga Canyon).²⁸

Threshold of Significance

As substantial and adverse impact to hydrology would occur if the significant loss or damage involving flooding were to result as a cause of impeding or redirecting flood flows thereby exposing existing housing or other insurable structures in a Federal 100-year flood hazard area.

Impact Analysis

The proposed program would result in potentially significant impacts to hydrology and water quality in relation to substantially altering the existing drainage pattern of the site or area, including through the alteration of a Federal 100-year flood hazard area or County Capital Flood floodplain; the alteration of the course of a stream or river; or through the addition of impervious surfaces, in a manner which would Impede or redirect flood flows which would expose existing housing or other insurable structures in a Federal 100-year flood hazard area or County Capital Flood floodplain to a significant risk of loss or damage involving flooding.

Element 1 – Green Zone Districts

Green Zone Districts would have the potential to result in significant impacts to hydrology and water quality in relation to impeding or redirecting flood flows. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would have the potential to result in significant impacts to hydrology and water quality in relation to impeding or redirecting flood flows. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards,

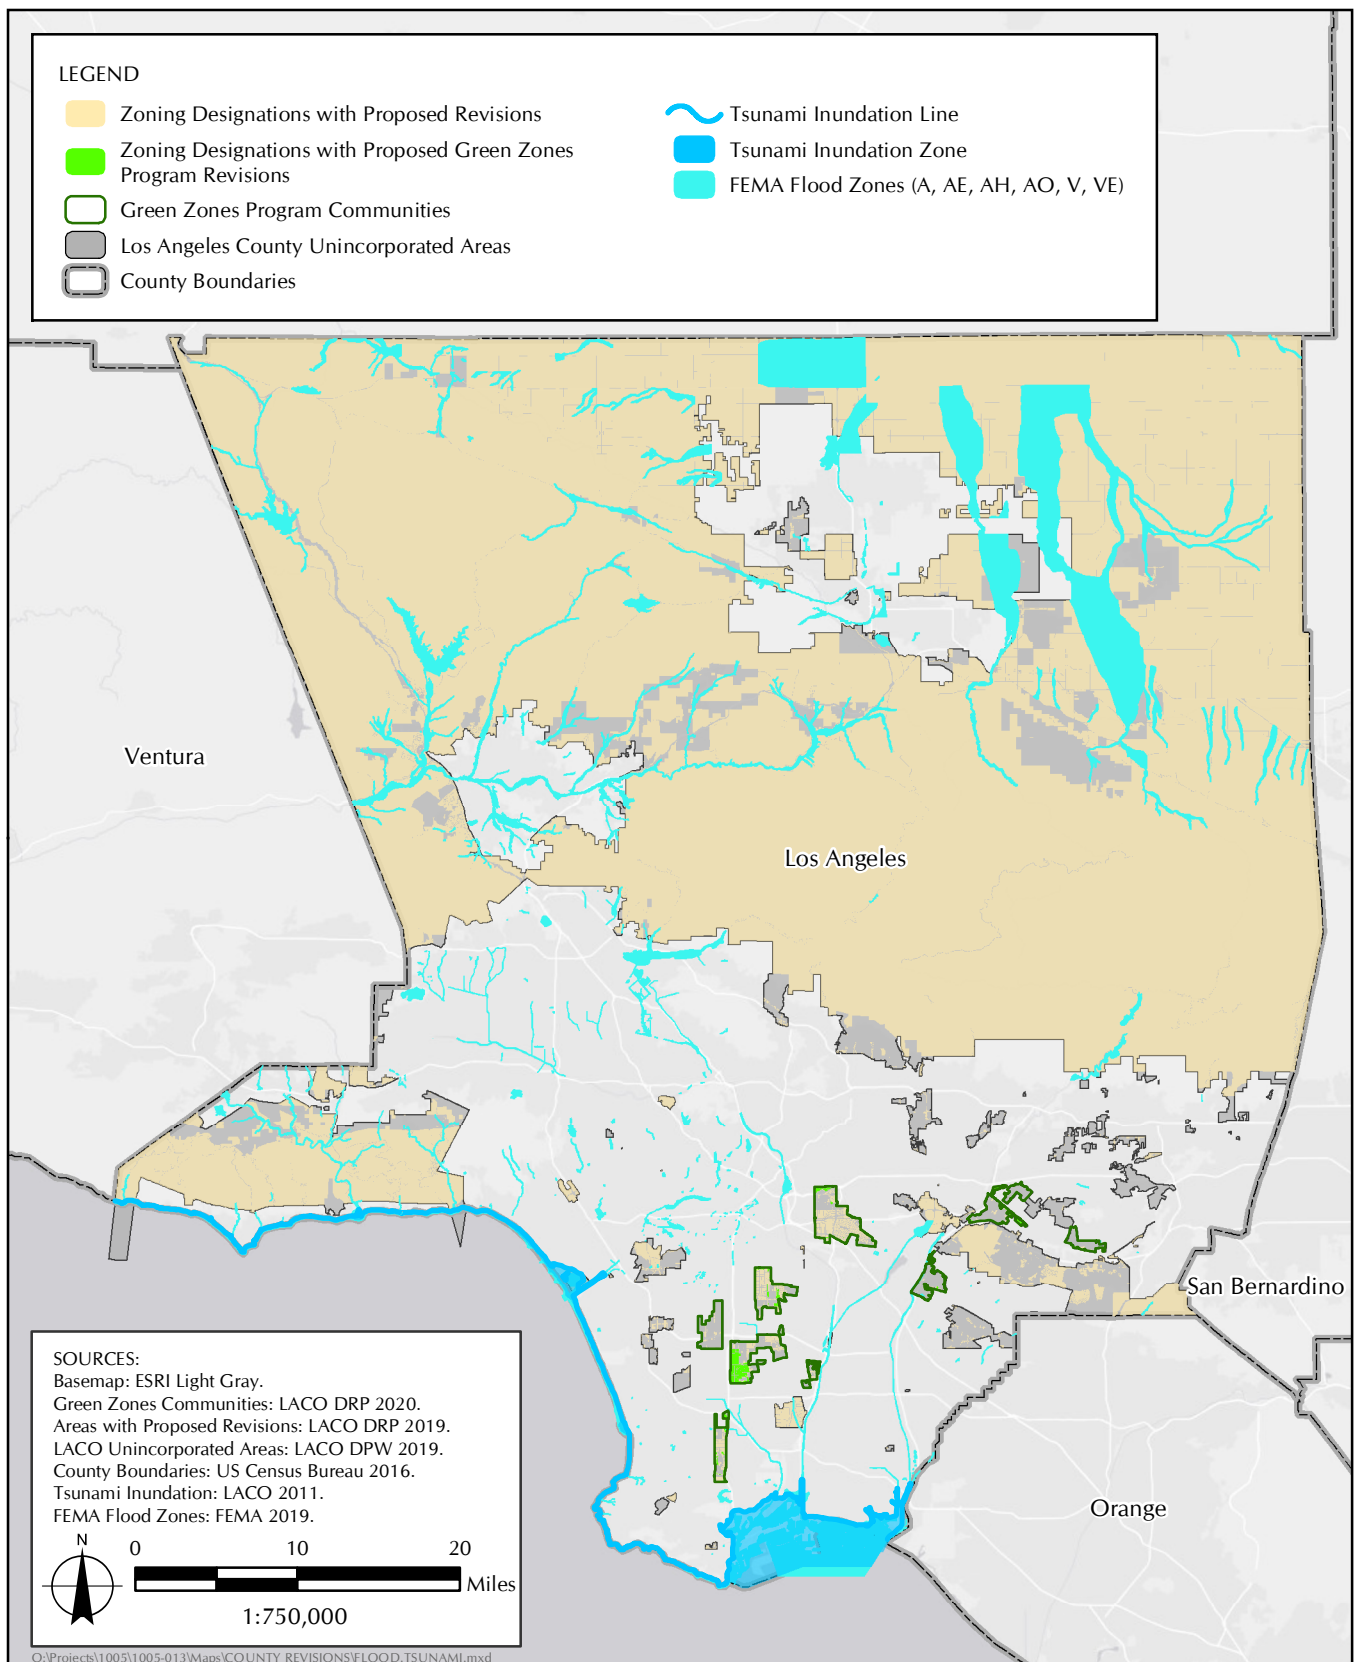

FIGURE 2.10-3
 Los Angeles County Tsunami Inundation Zones and Flood Zones

signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 years of adoption of the Ordinance.

Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development.²⁹ However, regardless of the LID Ordinance and LID Standards Manual, the addition of impervious surfaces, solid walls, buildings, and other barriers on multiple parcels may substantially impede or redirect flows within the approximately 0.6 acre of Green Zone Districts parcels that are located within a designated flood zone (Figure 2.10-3). The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would have the potential to result in significant impacts to hydrology and water quality in relation to impeding or redirecting flood flows. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would have the potential to result in significant impacts to hydrology and water quality in relation to impeding or redirecting flood flows, warranting further investigation of impacts and mitigation measures in an EIR.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would have the potential to result in significant impacts to hydrology and water quality in relation to impeding or redirecting flood flows. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses.

The construction of these measures would not differ substantially from existing conditions on individual properties, as they would be minor additions to existing industrial land uses. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development.³⁰ However, regardless of the LID Ordinance and LID Standards Manual, the addition of impervious surfaces, solid walls, buildings, and other barriers on multiple parcels may substantially impede or redirect flows within the parcels that are located within a designated flood zone (Figure 2.10-3). Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would have the potential to result in significant impacts to hydrology and water quality in relation to impeding or redirecting flood flows, warranting further investigation of impacts and mitigation measures in an EIR.

³⁰ County of Los Angeles. February 2014. Low Impact Development Standards Manual.
<https://dpw.lacounty.gov/ldd/lib/fp/Hydrology/Low%20Impact%20Development%20Standards%20Manual.pdf>

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would have the potential to result in significant impacts to hydrology and water quality in relation to impeding or redirecting flood flows. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to CUP, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. While Element 3 would allow for development of Recycling and Waste Management facilities, the proposed improvements would require that all future recycling and solid waste facilities be subject to a CUP. In addition, no change in the underlying land use would occur.

The construction of these measures would not differ substantially from existing conditions on individual properties, as they would be minor additions to existing industrial land uses. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development.³¹ However, regardless of the LID Ordinance and LID Standards Manual, the addition of impervious surfaces, solid walls, buildings, and other barriers on multiple parcels may substantially impede or redirect flows within the 61,816 acres of Recycling and Waste Management Revisions parcels that are located within a designated flood zone (Figure 2.10-3). Therefore, the Recycling and Waste Management Revisions have the potential to result in significant impacts to hydrology and water quality in relation to impeding or redirecting flood flows, warranting further investigation of impacts and mitigation measures in an EIR.

The Supermarket Accessory Recycling Collection Centers revisions would have the potential to result in significant impact on hydrology and water quality in relation to impeding or redirecting flood flows. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities

³¹ County of Los Angeles. February 2014. Low Impact Development Standards Manual.
<https://dpw.lacounty.gov/ldd/lib/fp/Hydrology/Low%20Impact%20Development%20Standards%20Manual.pdf>

where materials would be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built.

The construction of these recycling collection centers or development measures would not differ substantially from existing conditions on individual properties, as they would be minor additions to existing supermarket or industrial land uses. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development.³² However, regardless of the LID Ordinance and LID Standards Manual, the addition of impervious surfaces, solid walls, enclosures, and other barriers on multiple parcels may substantially impede or redirect flows within the 3,136 acres of Supermarket Accessory Recycling Collection Centers parcels that are located within a designated flood zone (Figure 2.10-3). Therefore, the Supermarket Accessory Recycling Collection Centers have the potential to result in significant impact on hydrology and water quality in relation to impeding or redirecting flood flows, warranting further investigation of impacts and mitigation measures in an EIR.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would have the potential to result in significant impacts on hydrology and water quality in relation to impeding or redirecting flood flows. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. These development measures would not differ substantially from existing conditions on individual properties, as they would be minor additions to existing supermarket or industrial land uses. Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development.³³ However, regardless of the LID Ordinance and LID Standards Manual, the addition of impervious surfaces, solid walls, enclosures, and other barriers on multiple parcels may substantially impede or redirect flows (Figure 2.10-3). Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions have the potential to result in significant impact on hydrology and water quality in relation to impeding or redirecting flood flows, warranting further investigation of impacts and mitigation measures in an EIR.

d) Otherwise place structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements?

Existing Conditions

Approximately 62,565 acres of zoning districts that would be subject to the Ordinance are located within FEMA designated flood zones (see Figure 2.10-3). The County of Los Angeles General Plan identifies Tsunami Hazard Areas located in Los Angeles County, which include Marina del Rey and portions of the Santa Monica Mountains Coastal Zone and flood zones. Flood-prone areas in unincorporated areas of the County are located in the Los Angeles Basin. The main bodies of water and sources of flooding include Ballona Creek, Los Angeles River, Malibu Creek, Pacific Ocean, Rio Hondo River, San Gabriel River and its tributaries (Santa Clara River and Topanga Canyon).³⁴ Los Angeles County Public Works (Public Works) serves as the floodplain administrator for the unincorporated areas of the County. In addition to the floodplain mapping done by FEMA on non-Federal lands throughout the County for the National Flood Insurance Program (NFIP), the County has prepared County Floodway Maps for unincorporated areas containing non-Federal lands that are either inhabited or have the potential to be developed. Public Works prepares

³³ County of Los Angeles. February 2014. Low Impact Development Standards Manual. <https://dpw.lacounty.gov/ldd/lib/fp/Hydrology/Low%20Impact%20Development%20Standards%20Manual.pdf>

³⁴ Los Angeles County Department of Water. September 2016. Comprehensive Flood Plain Management Plan. Retrieved from: <https://dpw.lacounty.gov/wmd/nfip/FMP/documents/Los%20Angeles%20County%20FMP%20Final%20-%20No%20appendices.pdf>

maps (County Floodway Maps) that delineate the Capital Floodplain and County Floodway for numerous watercourses in the County, which are then used to regulate the development in those floodplains and floodways.

A County Floodway must remain free of obstruction and construction unless engineering analysis demonstrates that the obstruction/construction will not result in any increase in the Capital Flood water surface elevation and a flow velocity of no greater than 10 feet per second. Development in a County Floodway is generally restricted to uses that do not interrupt or significantly speed the natural flow of the water (tennis courts (within reason), swimming pools, stilts, etc.). County Code Section 11.60.020 identifies Floodways, Water Surface Elevations, and Areas of Special Flood Hazard. County Floodway Map Nos. 43-ML26.1, 43-ML27.1, and 43-ML28 are identified in County Code Section 11.60.020. Additionally, County Floodways are shown in Appendix G of the County's Comprehensive Floodplain Management Plan.

Threshold of Significance

A significant adverse effect would occur if additional flood proofing and flood insurance would be required due to the placement of structures in a Federal 100-year flood hazard or County Capital Flood floodplain area.

Impact Analysis

The proposed program would result in less than significant impacts to hydrology and water quality in relation to placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements. The potential for impacts to hydrology and water quality has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment to hydrology and water quality include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

The Green Zone Districts element would result in less than significant impacts to hydrology and water quality in relation to placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements. The zoning and land use designations for the 11 districts under consideration for proposed revision allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 ~~28~~ parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 ~~45~~ of the 27 ~~28~~ parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 ~~10~~ years of adoption of the Ordinance.

The proposed program contains parcels that are located within a designated flood zone (Figure 2.10-3). However, the Green Zone Districts standards and development does not include occupied structures that would require the need for additional flood proofing and insurance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would cause significant impacts to hydrology and water quality in relation to placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts in relation to in placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to hydrology and water quality in relation to in placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing recycling or solid waste, or vehicle-related industrial uses.

The proposed program contains parcels that are located within a designated flood zone (Figure 2.10-3). However, the New Sensitive Uses revisions do not include occupied structures which would require the need for additional flood proofing and insurance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would cause significant impacts to hydrology and water quality in relation to placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to hydrology and water quality in relation to in placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to Hydrology and water quality in relation to in placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid

waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. While Element 3 would allow for development of Recycling and Waste Management facilities, the proposed improvements would not involve the construction of housing and would require that all future recycling and solid waste facilities be subject to a CUP. In addition, no change in the underlying land use would occur.

The proposed program contains parcels that are located within a designated flood zone (Figure 2.10-3). However, the Recycling and Waste Management Revisions do not include occupied structures which would require the need for additional flood proofing and insurance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would cause significant impacts to hydrology and water quality in relation to placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts to Hydrology and water quality in relation to in placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built.

The Supermarket Accessory Recycling Collection Centers proposed program contains parcels that are located within a designated flood zone (Figure 2.10-3). However, the Supermarket Accessory Recycling Collection Centers do not include occupied structures which would require the need for additional flood proofing and insurance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would cause significant impacts to hydrology and water quality in relation to placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements.

Therefore, the proposed program would result in less than significant impacts to hydrology and water quality in relation to in placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to Hydrology and water quality in relation to in placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

The Storage Enclosures for Recycling and Solid Waste Revisions element contains parcels that are located within a designated flood zone (Figure 2.10-3). However, the Storage Enclosures for Recycling and Solid Waste Revisions element does not include occupied structures which would require the need for additional flood proofing and insurance. Therefore, the proposed program would result in less than significant impacts to Hydrology and water quality in relation to in placing structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements. No further analysis is warranted.

e) Conflict with the Los Angeles County Low Impact Development Ordinance (L.A. County Code, Title 12, Ch. 12.84)?

Existing Conditions

The County of Los Angeles has adopted the LID Ordinance into the Los Angeles County Code Title 12, Chapter 84 to require the use of LID principles in all development projects except road and flood infrastructure projects.³⁵ The County LID Ordinance requires that projects

- Mimic undeveloped stormwater runoff rates and volumes in any storm event up to and including the “Capital Flood” event, as defined by the County of Los Angeles Department of Public Works (DPW);
- Prevent pollutants of concern from leaving the development site in stormwater as the result of storms, up to and including a Water Quality Design Storm Event; and
- Minimize hydromodification impacts to natural drainage systems.

Hydromodification is the change in runoff and in-stream processes caused by altered land development, which increase impervious surfaces and drainage infrastructure that can negatively affect runoff. Development can increase runoff volumes, frequency of runoff events, flow duration, and peak flows. Requirements for hydromodification management are established by the County LID Manual. Projects required to analyze for hydromodification impacts must conduct hydrology and hydraulic frequency analyses for LID, 2-, 5-, 10-, 25-, and 50-year storm events per the Public Works Hydraulic and Hydrology manuals. The frequency analyses, which analyze changes in flow velocity, flow volume, and depth/width of flow for all natural drainage systems using HEC-RAS, are used to demonstrate compliance with hydromodification requirements and identify drainage impacts on off-site property. A sediment transport analysis is also required for any project tributary to a natural drainage system with a capital flood flow rate greater than 5,000 cubic feet per second. The sediment transport analyses should be conducted using HEC-RAS, SAMS, or HEC-6 to determine long-term impacts of streambed accretion and degradation of these natural drainage systems.

³⁵ County of Los Angeles. February 2014. Low Impact Development Standards Manual.
<https://dpw.lacounty.gov/ldd/lib/fp/Hydrology/Low%20Impact%20Development%20Standards%20Manual.pdf>

Threshold of Significance

A significant and adverse impact would occur if there were conflicts with the Los Angeles County LID Ordinance (L.A. County Code, Title 12, Ch. 12.84) such that hydromodification impacts to natural drainage systems would occur.

Impact Analysis

The proposed program would have the potential to result in significant impacts to hydrology and water quality in relation to conflicting with the Los Angeles County LID Ordinance (L.A. County Code, Title 12, Ch. 12.84). The potential for impacts to hydrology and water quality has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment to hydrology and water quality include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

The Green Zone Districts element would result in potentially significant impacts to hydrology and water quality in relation to conflicting with the Los Angeles County LID Ordinance (L.A. County Code, Title 12, Ch. 12.84). The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to hydrology and water quality in relation to conflicting with the LID Ordinance. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 15 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 10 years of adoption of the Ordinance.

Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development. Procedures from the County's LID Standards Manual would be followed to determine the difference in the proposed program's pre- and post-development runoff volumes and potential pollutant loads. All development would occur in compliance with the County's LID Ordinance. However, regardless of the LID Ordinance and LID Standards Manual, the addition of impervious surfaces, solid walls, enclosures, and other barriers on multiple parcels may substantially impede or redirect flows within the Green Zone Districts. In addition, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from individual properties may exceed existing stormwater drainage infrastructure, and the runoff may contain the typical pollutants generated on industrial land uses which could result in water quality impacts to storm drains. Therefore, the new

development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in potentially significant impacts to hydrology and water quality in relation to conflicting with the Los Angeles County LID Ordinance, warranting further investigation of impacts and mitigation measures in an EIR.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would have the potential to result in significant impacts to hydrology and water quality in relation to conflicting with the Los Angeles County LID Ordinance (L.A. County Code, Title 12, Ch. 12.84). Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling, ~~in close proximity to existing industrial uses~~ or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses.

Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development. Procedures from the County's LID Standards Manual would be followed to determine the difference in the proposed program's pre- and post-development runoff volumes and potential pollutant loads. All development would occur in compliance with the County's LID Ordinance. However, regardless of the LID Ordinance and LID Standards Manual, the addition of impervious surfaces, solid walls, enclosures, and other barriers on multiple parcels may substantially impede or redirect flows within the New Sensitive Uses. In addition, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from individual properties may exceed existing stormwater drainage infrastructure, and the runoff may contain the typical pollutants generated on industrial land uses which could result in water quality impacts to storm drains. Therefore, the new development standards for New Sensitive Uses would have the potential to result in significant impacts to hydrology and water quality in relation to conflicting with the Los Angeles County LID Ordinance, warranting further investigation of impacts and mitigation measures in an EIR.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would have the potential to result in significant impacts to hydrology and water quality in relation to conflicting with the Los Angeles County LID Ordinance (L.A. County Code, Title 12, Ch. 12.84). The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs;

solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. While Element 3 would allow for development of Recycling and Waste Management facilities, the proposed improvements would require that all future recycling and solid waste facilities be subject to a CUP. In addition, no change in the underlying land use would occur.

Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development. Procedures from the County's LID Standards Manual would be followed to determine the difference in the proposed program's pre- and post-development runoff volumes and potential pollutant loads. All development would occur in compliance with the County's LID Ordinance. However, regardless of the LID Ordinance and LID Standards Manual, the addition of impervious surfaces, solid walls, enclosures, and other barriers on multiple parcels may substantially impede or redirect flows. In addition, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from individual properties may exceed existing stormwater drainage infrastructure, and the runoff may contain the typical pollutants generated on industrial land uses which could result in water quality impacts to storm drains.

The Supermarket Accessory Recycling Collection Centers revisions would have the potential to result in significant impacts to hydrology and water quality in relation to conflicting with the Los Angeles County LID Ordinance (L.A. County Code, Title 12, Ch. 12.84). The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that "contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code" (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones, would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built.

Implementation of the development standards required by the proposed program would be subject to the County of Los Angeles LID Ordinance to reduce the impacts of the development. Procedures from the County's LID Standards Manual would be followed to determine the difference in the proposed program's pre- and post-development runoff volumes and potential pollutant loads. All development would occur in compliance with the County's LID Ordinance. However, regardless of the LID Ordinance and LID Standards Manual, the addition of impervious surfaces, solid walls, enclosures, and other barriers on multiple parcels may substantially impede or redirect flows within Supermarket Accessory Recycling Collection Centers. In addition, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from individual properties may exceed existing stormwater drainage infrastructure, and the runoff may contain the typical pollutants generated on industrial land uses which could result in water quality impacts to storm drains.

Therefore, Recycling and Waste Management Revisions would have the potential to result in significant impacts to hydrology and water quality in relation to conflicting with the Los Angeles County LID Ordinance, warranting further investigation of impacts and mitigation measures in an EIR.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would have the potential to result in significant impacts to hydrology and water quality in relation to conflicting with the Los Angeles County LID Ordinance (L.A. County Code, Title 12, Ch. 12.84). Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

The Los Angeles County LID Ordinance has been adopted to reduce the impacts of development. Procedures from the County's LID Standards Manual would be followed to determine the difference in the proposed program's pre- and post-development runoff volumes and potential pollutant loads. All development would occur in compliance with the County's LID Ordinance. However, regardless of the LID Ordinance and LID Standards Manual, the addition of impervious surfaces, solid walls, enclosures, and other barriers on multiple parcels may substantially impede or redirect flows. In addition, the cumulative quantity of new impervious surfaces is unknown. Increased runoff from individual properties may exceed existing stormwater drainage infrastructure, and the runoff may contain the typical pollutants generated on industrial land uses which could result in water quality impacts to storm drains. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would have the potential to result in significant impacts to hydrology and water quality in relation to conflicting with the Los Angeles County LID, warranting further investigation of impacts and mitigation measures in an EIR.

- f) Use onsite wastewater treatment systems in areas with known geological limitations (e.g. high groundwater) or in close proximity to surface water (including, but not limited to, streams, lakes, and drainage course)?**

Existing Conditions

Given that the unincorporated territory of the County includes a diverse range of geological formations, watersheds, and waterbodies, there is potential for the existing parcels subject to the Green Zones Program to be in close proximity to geological limitations and surface water. As stated in Section 2.7, *Geology and Soils*, liquefaction is influenced by shallow groundwater, and there is a potential for liquefaction to occur in the various areas within the proposed program area, indicating the potential for shallow groundwater. Additionally, the Green Zone Districts are in close proximity to surface water. Parcels in nine different watersheds are subject to the proposed program, including a total of approximately 50,240 acres of wetlands and 15,833 acres of riparian area.

The existing sanitary sewers in the County of Los Angeles convey sewage from lavatories and other plumbing fixtures in buildings and factories to a wastewater treatment facility where the effluent is treated before being discharged to the ocean or river. The Los Angeles County Sanitation Districts (LACSD) oversees the construction, operation, and the maintenance of facilities that collect, treat, recycle, and dispose of sewage, and industrial wastes. The LACSD oversees a confederation of 24 independent districts, serve the wastewater and solid waste management needs of approximately 5.5 million people within 73 cities and the unincorporated areas. The LACSD owns, operates, and maintains approximately 1,400 miles of sewers, ranging from 8 to 144 inches in diameter, that convey approximately 500 million gallons per day of wastewater to 11 wastewater treatment plants. This includes a wastewater collection system with 48 active pumping plants located throughout the County.

The County plans for sewer infrastructure needs through long-range capital improvement planning through the ongoing Condition Assessment Program utilizing their Accumulative Capital Outlay Program Funds. The Department of Public Works Environmental Programs Division also permits and inspects industrial waste discharge into local sewers. The County Code requires that every business that disposes industrial wastewater obtain a permit. The Sewer System

Management Plan (SSMP) controls and mitigates sewer sanitary overflows.³⁶ The proposed program contains provisions for updates to existing land uses, which already contain sewer utilities and are served by existing infrastructure. The existing uses would not require the construction of new onsite wastewater treatment systems (OWTS) as a result of the Green Zones Program.

Threshold of Significance

A substantial adverse effect would occur if the project proposed new OWTS in areas with known geological limitations, such as high groundwater, or in close proximity to surface water, such as streams, lakes, and drainage courses.

Impact Analysis

The proposed program would result in no impacts to hydrology and water quality regarding the use of OWTS in areas of known geological limitations or in close proximity to surface water. The potential for impacts to hydrology and water quality has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

The Green Zone Districts element would result in no impacts to hydrology and water quality regarding the use of OWTS in areas of known geological limitations or in close proximity to surface water. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently, the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The Program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

The Green Zone Districts do not contain provisions for implementing new OWTS as a part of the development standards for industrial, recycling, and vehicle-related uses. Additionally, the Green Zone Districts are located in very

³⁶ County of Los Angeles. Department of Public Works. Sewer System Management Plan. Accessible at: <https://dpw.lacounty.gov/smd/smd/ssmp.pdf>

urbanized areas of the County that are served by existing sewage pipelines and other utilities. As stated in Section 2.19, *Utilities*, construction and operation are not anticipated to generate wastewater flows that would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the County's General Plan or other wastewater facilities planning documents. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to hydrology and water quality regarding the use of OWTS in areas of known geological limitations or in close proximity to surface water. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to hydrology and water quality regarding the use of OWTS in areas of known geological limitations or in close proximity to surface water. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located.~~ The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 4, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses.

In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions in relation to OWTS. These measures reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, and they do not contain provisions for implementing new OWTS as a part of the development standards for new sensitive uses. These measures would be minimal additions to the design of proposed new sensitive use construction projects. Should OWTS or sewage utilities be necessary for the construction of an individual new sensitive use, the project's impacts would be evaluated on a project-by-project basis under CEQA and would not be a result of the development standards proposed under the Green Zones Program. Therefore, the new development standards for New Sensitive Uses would result in no impacts to hydrology and water quality regarding the use of OWTS in areas of known geological limitations or in close proximity to surface water. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts to hydrology and water quality regarding the use of OWTS in areas of known geological limitations or in close proximity to surface water. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic

waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. While Element 3 would allow for development of Recycling and Waste Management facilities, the proposed improvements would require that all future recycling and solid waste facilities be subject to a CUP. In addition, no change in the underlying land use would occur.

In the case of updated standards for recycling and solid waste uses, the construction of these measures would not differ substantially from existing conditions in relation to OWTS. These measures reduce the incompatibility of recycling and solid waste uses with surrounding land uses through development standards such as construction of landscaping and planting trees, buffering, and open space, and they do not contain provisions for implementing new OWTS. Should OWTS or sewage utilities be necessary for the construction of an individual new recycling and or solid waste use, the project's impacts would be evaluated on a project-by-project basis under CEQA, and would not be a result of the development standards proposed under the Green Zones Program.

The definitions of biosolids and solid waste in the proposed Ordinance include waste generated during the sewage or wastewater treatment process. As described in Section 22.140.690, 740 (Organic Waste Facilities), which is included in the Recycling and Waste Management Revisions and outlines the land use regulations including permitted zones, types of permits, and development standards for Organic Waste Facilities, biosolids are an accepted material in these facilities. However, although waste generated from wastewater treatment systems would be accepted in facilities subject to the Recycling and Waste Management Revisions, this would not result in new OWTS. The Ordinance does not contain provisions for new OWTS. Should any of the facilities subject to these revisions require the construction of a new OWTS, their impacts would be evaluated on a project-by-project basis under CEQA.

Therefore, Recycling and Waste Management Revisions would result in no impacts to hydrology and water quality regarding the use of OWTS in areas of known geological limitations or in close proximity to surface water. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to hydrology and water quality regarding the use of OWTS in areas of known geological limitations or in close proximity to surface water. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking

lots, and no new structures would be built. These revisions only contain provisions for the implementation of Supermarket Accessory Recycling Collection Centers, and therefore would not include OWTS.

Therefore, the Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to hydrology and water quality regarding the use of OWTS in areas of known geological limitations or in close proximity to surface water. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to hydrology and water quality regarding the use of OWTS in areas of known geological limitations or in close proximity to surface water. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. These revisions only contain provisions for the construction of storage enclosures and storage areas for recycling and solid waste, and therefore would not include OWTS. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to hydrology and water quality regarding the use of OWTS in areas of known geological limitations or in close proximity to surface water. No further analysis is warranted.

g) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

Existing Conditions

Approximately 62,565 acres of zoning districts that would be subject to the Ordinance are located within FEMA designated flood zones (see Figure 2.10-3). The County of Los Angeles General Plan identifies Tsunami Hazard Areas located in Los Angeles County, which include Marina del Rey and portions of the Santa Monica Mountains Coastal Zone and flood zones. Flood-prone areas in unincorporated areas of the County are located in the Los Angeles Basin.

Threshold of Significance

A significant and adverse effect would occur if pollutants were released in flood hazard, tsunami or seiche zones due to project inundation.

Impact Analysis

The proposed program would result in no impacts to hydrology and water quality in relation to risking release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones. The potential for impacts to hydrology and water quality has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

The Green Zone Districts element would result in no impacts to hydrology and water quality in relation to risking release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones. Currently the zoning and land

use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance.

The existing land uses may contain pollutants typical of industrial land uses; however, the Green Zone Districts element consists of minor additions to development standards that do not contain pollutants. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts to hydrology and water quality in relation to risking release of pollutants due to project inundation in flood hazard. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts to hydrology and water quality in relation to risking release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 4, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would cause significant impacts to hydrology and water quality in relation to risking release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones.

The existing land uses may contain pollutants typical of industrial land uses; however, the New Sensitive Uses element consists of minor additions to development standards that do not contain pollutants. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space would result in no impacts to hydrology and water quality

in relation to risking release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts to hydrology and water quality in relation to risking release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to CUP, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs. While Element 3 would allow for development of Recycling and Waste Management facilities, the proposed improvements would require that all future recycling and solid waste facilities be subject to a CUP. In addition, no change in the underlying land use would occur.

The Recycling and Waste Management Revisions would not create a source of pollutants that would be released through inundation. In regard to Chapter 22.128, the existing land uses may contain pollutants typical of industrial or commercial land uses, however, this element of the proposed program refers to the minor additions that would help decrease contamination. These revisions would contain the litter, industrial waste, and other pollutants in storage areas and enclosures that would improve the site's response to inundation. Therefore, there would be no impact. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts to hydrology and water quality in relation to risking release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the

CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built.

The Supermarket Accessory Recycling Collection Centers Revisions would not create a source of pollutants that would be released through inundation. In regard to Chapter 22.128, the existing land uses may contain pollutants typical of industrial or commercial land uses, however, this element of the proposed program refers to the minor additions that would help decrease contamination. These revisions would contain the litter, industrial waste, and other pollutants in storage areas and enclosures that would improve the site's response to inundation. Therefore, there would be no impact. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts to hydrology and water quality in relation to risking release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

The Supermarket Accessory Recycling Collection Centers and Storage Enclosures for Recycling and Solid Waste Revisions would have no impact in relation to releasing pollutants due to a flood, tsunami, or seiche, as the development does not include hazardous pollutants that would be released by inundation. In regard to Chapter 22.140-~~660~~,710, the addition of a recycling collection center to an existing supermarket would not create a source of pollutants that would be released through inundation. In regard to Chapter 22.128, the existing land uses may contain pollutants typical of industrial or commercial land uses, however, this element of the proposed program refers to the minor additions that would help decrease contamination. These revisions would contain the litter, industrial waste, and other pollutants in storage areas and enclosures that would improve the site's response to inundation. Additionally, none of the parcels that would be subject to the Storage Enclosures for Recycling and Solid Waste Revisions fall in a flood hazard, tsunami, or seiche zone. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in in no impacts to hydrology and water quality in relation to risking release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones. No further analysis is warranted.

h) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Existing Conditions

The RWQCB has prepared a Water Quality Control Plan for the Los Angeles Region (Basin Plan), which includes the coastal watersheds of Los Angeles and Ventura Counties. The Basin Plan assigned beneficial uses to surface and groundwater such as municipal water supply and water-contact recreation to all waters in the basin. It also set water-quality objectives, subject to approval by the EPA, intended to protect designated beneficial uses. These objectives apply to specific parameters (numeric objectives) and general characteristics of the water body (narrative objectives). An example of a narrative objective is the requirement that all waters must remain free of toxic substances in concentrations producing detrimental effects upon aquatic organisms. Numeric objectives specify concentrations of pollutants that are not to be exceeded in ambient waters of the basin.

The Conservation and Natural Resources Element of the County General Plan identifies 21 major groundwater basins, or aquifers, within the nine watersheds in Los Angeles County, six of which are primarily located in Los Angeles County (see Figures 2.10-1 Figure 2.10-2).³⁷ Appendix E of the County General Plan provides an overview of the six major watersheds.

³⁷ Los Angeles County Department of Regional Planning. Adopted 6 October 2015. Los Angeles County General Plan 2035. [http://planning.lacounty.gov/generalplan/generalplan Chapter 9](http://planning.lacounty.gov/generalplan/generalplan%20Chapter%209) available at: http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf

Threshold of Significance

A significant adverse impact would occur if a water control plan or sustainable groundwater plan were conflicted or obstructed.

Impact Analysis

The proposed program would result in less than significant impacts to hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. The proposed program would comply with the objectives described in the Basin Plan.³⁸ According to the Basin Plan, the project would stay consistent with the maximum benefit to the people of the state, it must not unreasonably affect present and anticipated beneficial uses of such water, and it must not result in water quality less than that prescribed in water quality plans and policies. The beneficial uses of Los Angeles River Reach 2 include Municipal and Domestic Supply, Industrial Service Supply, Ground Water Recharge, Warm Freshwater Habitat, and Wildlife Habitat. Furthermore, any actions that can adversely affect surface waters are also subject to the federal Antidegradation Policy, developed under the CWA. Furthermore, the project is not anticipated to obstruct the Los Angeles River or Ballona Creek Enhanced Watershed Management Plan/Watershed Management Plan.

The potential for impacts to hydrology and water quality has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment to Hydrology and Water Quality include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

The Green Zone Districts element would result in less than significant impacts to hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping

³⁸ Los Angeles Regional Water Quality Control Board. LARWQCB Basin Plan. Accessed April 15, 2020. https://www.waterboards.ca.gov/losangeles/water_issues/programs/basin_plan/

buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to ~~7~~ 40 years of adoption of the Ordinance.

The Basin Plan requires that the project would stay consistent with the maximum benefit to the people of the state, it must not unreasonably affect present and anticipated beneficial uses of such water, and it must not result in water quality less than that prescribed in water quality plans and policies. The proposed new development standards for Green Zone Districts would comply with the Los Angeles Basin Plan. These revisions would not unreasonably affect present and anticipated beneficial uses of water. The improvements required for the Green Zone would not require beyond that which can be accommodated by existing water allocations. Areas subject to the Green Zone are required to have drought tolerant landscaping and the improvements by the proposed program would not exceed water supply. Operations and maintenance would not require the development/use of groundwater resources beyond their current uses. The Green Zone Districts would not cause a conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would cause a significant impact to hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. The new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in less than significant impacts to hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, in close proximity adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in significant impacts to hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan.

The Basin Plan requires that the project would stay consistent with the maximum benefit to the people of the state, it must not unreasonably affect present and anticipated beneficial uses of such water, and it must not result in water quality less than that prescribed in water quality plans and policies. The proposed new development standards for New Sensitive Uses would not unreasonably affect present and anticipated beneficial uses of water. Areas subject to the New Sensitive Uses are required to have drought tolerant landscaping, and the improvements by the proposed program would not exceed water supply. Operations and maintenance would not require the development or use of groundwater resources beyond their current uses. The measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not cause significant impacts to hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. Therefore, the new development standards for New Sensitive Uses would result in less than significant impacts to hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts to hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards (Table 1.IV-1). Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ While Element 3 would allow for development of Recycling and Waste Management facilities, the proposed improvements would require that all future recycling and solid waste facilities be subject to a CUP. In addition, no change in the underlying land use would occur.

The Basin Plan requires that the project would stay consistent with the maximum benefit to the people of the state, it must not unreasonably affect present and anticipated beneficial uses of such water, and it must not result in water quality less than that prescribed in water quality plans and policies. The proposed Recycling and Waste Management Revisions would comply with the Basin Plan. These revisions would not unreasonably affect present and anticipated beneficial uses of water. The landscaping buffers would be required to have drought tolerant landscaping and the improvements by the proposed program would not exceed water supply. Operations and maintenance would not require the development or use of groundwater resources beyond their current uses. Therefore, the Recycling and Waste Management Revisions would result in less than significant impacts to hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts on hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft

ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials would be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures would be built.

The Basin Plan requires that the project would stay consistent with the maximum benefit to the people of the state, it must not unreasonably affect present and anticipated beneficial uses of such water, and it must not result in water quality less than that prescribed in water quality plans and policies. The Supermarket Accessory Recycling Collection Centers would comply with the Basin Plan. These revisions would not unreasonably affect present and anticipated beneficial uses of water. The landscaping buffers would be required to have drought tolerant landscaping, and the improvements by the proposed program would not exceed water supply. Operations and maintenance would not require the development or use of groundwater resources beyond their current uses. Therefore, the Supermarket Accessory Recycling Collection Centers would result in less than significant impacts on hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. No further analysis is warranted

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts to hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development.

The Basin Plan requires that the project would stay consistent with the maximum benefit to the people of the state, it must not unreasonably affect present and anticipated beneficial uses of such water, and it must not result in water quality less than that prescribed in water quality plans and policies. The Storage Enclosures for Recycling and Solid Waste Revisions would comply with the Basin Plan. These revisions would not unreasonably affect present and anticipated beneficial uses of water. The landscaping buffers would be required to have drought tolerant landscaping, and the improvements by the proposed program would not exceed water supply. Operations and maintenance would not require the development or use of groundwater resources beyond their current uses. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts on hydrology and water quality in relation to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. No further analysis is warranted.

2.11. LAND USE AND PLANNING

This analysis is undertaken to determine if the proposed program may have a significant impact in relation to Land Use and Planning, thus requiring the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State CEQA Guidelines.¹ The analysis covers all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated based on review of the Los Angeles County General Plan 2035 Land Use Element,² the County Zoning Code,³ the 2015 Antelope Valley Area Plan: Town and Country Land Use Element,⁴ and the 2012 Santa Clarita Valley Area Plan: One Valley One Vision Land Use Element.⁵

Definitions

Hillside Management Areas (HMAs): Areas with 25 percent or greater natural slopes. The Hillside Design Guidelines are required for development in HMAs, unless exempted under the Ordinance's provisions. In hillside areas with less than 25 percent slope, use of the Guidelines is optional but encouraged.⁶ The Guidelines include specific and measurable design techniques that can be applied to residential, commercial, industrial, and other types of projects. Some design techniques may be more appropriate or feasible than others, depending on the type of project, location, size, complexity, site constraints, and other design techniques incorporated into the project.

Land Use Designation: A land use classification with associated land use or management policies. Land use designations are applied to specific areas through the county land use planning processes and culminate in the adoption of a land use element to the General Plan. Some land use designations have been established through legislation (e.g., National Forest), while other designations such as SEAs have been established through policy or planning processes.

Ordinance: A law set forth by a governmental authority; a municipal regulation.

Significant Ecological Areas (SEAs): Officially designated areas within Los Angeles County with irreplaceable biological resources.⁷ The County's SEA Program objective is to conserve genetic and physical diversity within the County by designating biological resource areas that are capable of sustaining themselves into the future.

Zoning Designation: The regulation of the use of real property by local government, which restricts a particular territory to residential, commercial, industrial, or other uses. The local governing body considers the character of the property as well as its fitness for particular uses. It must enact the regulations in accordance with a well-considered and comprehensive plan intended to avoid arbitrary exercise of government power. A comprehensive plan is a general design to control the use of properties in the entire municipality, or at least in a large portion of it. Individual pieces of property should not be singled out for special treatment. For example, one or two lots may not be placed in a separate zone and subjected to restrictions that do not apply to similar adjoining lands.

	<i>Potentially Significant Impact</i>	<i>Less than Significant Impact with Mitigation Incorporated</i>	<i>Less than Significant Impact</i>	<i>No Impact</i>
Would the project:				
a) Physically divide an established community?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Cause a significant environmental impact due to a conflict with any County land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Conflict with the goals and policies of the General Plan related to Hillside Management Areas or Significant Ecological Areas?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
a) Physically divide an established community?				

Existing Conditions

As discussed in Section 1, *Project Description*, the zoning designations that are the subject of the proposed Ordinance fall within 11 Planning Areas described in the Land Use Element of the adopted County General Plan (see Figure 1.IV-1, *Los Angeles County Planning Areas*, and Table 1.IV-5, *Green Zones Program County Planning Areas*).⁸

Threshold of Significance

A significant impact would occur if existing linkages within communities were blocked, such as roads, bike lanes, or sidewalks, resulting in a physical divide in an established community.

Impact Analysis

The proposed program would result in no impacts to land use and planning through the physical division of an established community. The potential for impacts to land use in regard to physically dividing an established community has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, *Project Description*, Table 1.IV-1, *Planning and Permitting Requirements*, and Table 1.IV-2, *Development Standards*). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment with regard to division of an established community include the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

⁸ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Chapter 6: Land Use Element. In the Los Angeles County General Plan 2035. <http://planning.lacounty.gov/generalplan/generalplan>

Element 1 – Green Zone Districts

Green Zone Districts would result in no impacts to land use and planning through the physical division of an established community. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum floor area ratio (FAR) requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, ~~27~~ ~~28~~ parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, ~~14~~ ~~45~~ of the ~~27~~ ~~28~~ parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to ~~7~~ ~~40~~ years of adoption of the Ordinance. The Green Zone Districts would be located within the 11 communities of Avocado Heights, East Los Angeles, East Rancho Dominguez, Florence-Firestone, South San Jose Hills, Walnut Park, West Athens-Westmont, West Carson, West Rancho Dominguez-Victoria, West Whittier-Los Nietos, and Willowbrook. Additionally, the County General Plan 2035 identifies 11 Planning Areas, which allow local communities to work with the County to develop plans. The Green Zone Districts are located within 1,875 acres of five Planning Areas: Metro Planning Area, Gateway Planning Area, South Bay Planning Area, West San Gabriel Valley Planning Area, and East San Gabriel Valley Planning Area (see Table 1.IV-5). The Ordinance does not require or facilitate blocking existing linkages within communities, such as roads, bike lanes, or sidewalks. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in the division of an established community. The new development standards and/or more stringent entitlement processes for specific industrial, recycling and solid waste, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts in regard to the division of an established community. Therefore, the new development standards and/or more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties would result in no impacts in regard to the division of an established community. No further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in no impacts in regard to the division of an established community. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, in close proximity to existing industrial uses permitted in the zones where they are located. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 1, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required

where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity adjacent to or adjoining legally-established,~~ existing industrial, ~~recycling or solid waste, or vehicle-related~~ uses. In the case of updated standards for new sensitive uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in the division of an established community. These measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not require or facilitate blocking existing linkages within communities, such as roads, bike lanes, or sidewalks resulting in the division of an established community. The new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in no impacts in regard to the division of an established community. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in no impacts in regard to the division of an established community. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, ~~an MCUP, and/or an SPR,~~ and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions would prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ These revisions would not require or facilitate blocking existing linkages within communities, such as roads, bike lanes, or sidewalks resulting in the division of an established community. In the case of recycling and waste management revisions, the construction of these measures would not differ substantially from existing conditions, such that they would result in the division of an established community. Therefore, impacts to Recycling and Waste Management Revisions in regard to the division of an established community would result in no impacts in regard to the division of an established community. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in no impacts in regard to the division of an established community. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical

stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County's waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ on existing parking lots, and no new structures will be built. These revisions would not require or facilitate blocking existing linkages within communities, such as roads, bike lanes, or sidewalks resulting in the division of an established community. Therefore, the Supermarket Accessory Recycling Collection Centers would result in no impacts in regard to the division of an established community. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts in regard to the division of an established community. Any new development or expansion of existing development would be required to meet the current development standards of the zone in which they are permitted. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. These revisions would not require or facilitate blocking existing linkages within communities, such as roads, bike lanes, or sidewalks resulting in the division of an established community. In the case of recycling and waste management revisions, the construction of these measures would not differ substantially from existing conditions, such that they would result in the division of an established community. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in no impacts in regard to the division of an established community. No further analysis is warranted.

b) Cause a significant environmental impact due to a conflict with any County land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Existing Conditions

The Green Zones Program would be implemented countywide, throughout all County unincorporated areas that contain applicable zoning designations. Most of these zoning designations include multiple land use designations due to the variety of land ownership and uses in the County. Los Angeles County is divided into 11 different planning areas, including the Antelope Valley, Santa Clarita Valley, San Fernando Valley, Santa Monica Mountains, Coastal Islands, Westside, South Bay, Metro, Gateway, West San Gabriel Valley, and East San Gabriel Valley planning areas (see Table 1.IV-5, *Green Zones Program County Planning Areas*) (Figure 1.IV-3, Figure 1.IV-4).

Threshold of Significance

A significant impact would occur if the proposed program conflicted with a County land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

Impact Analysis

The proposed program would result in potentially significant impacts to land use and planning in relation to an environmental impact due to conflict with adopted or proposed land use plans, policies, or regulations. The potential for impacts in regard to conflicting with adopted or proposed land use plans, policies, or regulations has been evaluated in relation to all program components that could result in a physical change to the environment. Specifically, potential impacts associated with the first four elements of the proposed program, and the proposed change to the General Plan land use designations for select parcels located within the Green Zone Districts are evaluated (please see Section 1, Table 1.IV-1, and Table 1.IV-2). The analysis considers the incremental changes to the physical environment as a result of new and/or revised development standards, in relation to the historic and anticipated permits for affected uses. The proposed revisions to the development standards that have the potential result in physical changes in the environment have been evaluated in regard to conflicting with the goals and policies of the General Plan related to HMAs or SEAs. The Ordinance includes the allowed use of alternative fencing materials, required solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, air filtration devices, building height and screening standards,

storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2).

Element 1 – Green Zone Districts

The Green Zone Districts would result in potentially significant impacts to land use and planning in relation to an environmental impact due to conflict with adopted or proposed land use plans, policies, or regulations. The new development standards would result in a more stringent entitlement processes for specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses on other properties. Currently the zoning and land use designations for the 11 districts under consideration for proposed revision, allow some industrial uses in these communities by-right and others with a CUP and include standards for limited parking, signage, tree planting, and maximum FAR requirements. In order to retain consistency with the General Plan and Title 22 zoning code, as part of the General Plan Amendment Revisions, 27 28 parcels are proposed for a zone change from M-2, to M-1. Similarly, as part of the General Plan Amendment Revisions, 14 45 of the 27 28 parcels proposed for a zone change within the Green Zone Districts area are proposed to be changed from the land-use designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation. The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The new development standards and/or more stringent entitlement process would be retroactive to the 11 districts, and to future entitlements subject to a CUP. The new development standards would apply to specific industrial, recycling, or vehicle-related uses within Green Zone Districts within a 500-foot radius of existing sensitive uses, requiring the use of alternative fencing materials, solid wall screening where certain facilities are not enclosed, expanded landscaping buffers between incompatible uses, required paving, lighting standards, signage standards, maintenance and operations standards, building height and screening standards, storage enclosure standards, access and vehicle circulation standards, and open space standards within subject properties (see Table 1.IV-2). The program requires the nonconforming uses to come into compliance within 3 to 7 40 years of adoption of the Ordinance. In the case of updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in an impact land use in regard to impacts to land use and planning in relation to an environmental impact due to conflict with adopted or proposed land use plans, policies, or regulations. These revisions are compatible with the existing environment and County Land Use and Planning Goals. The purpose of the Green Zone Districts and New Sensitive Uses Adjacent to Industrial, Recycling and Solid Waste, or Vehicle-Related Uses is to implement to the County General Plan 2035, and it does not conflict with any of the 11 Land Use and Planning Goals established by the Land Use Element of the County General Plan (Table 2.11-1, *Land Use Plan Consistency with the Green Zones Ordinance*).⁹ Additionally, the Green Zone Districts and New Sensitive Uses Adjacent to Industrial, Recycling and Solid Waste, or Vehicle-Related Uses are not located within the Antelope Valley and Santa Clarita Valley Area Plans. The Green Zone Districts are not located within a County Airport Influence Area or a California Coastal Commission Coastal Zone, and therefore are not required to comply with the County Airport Land Use Commission (ALUC) computability plan, Coastal Development Permit, or Local Coastal Program.^{10,11,12}

As discussed in Section 1, the Green Zones Program includes a general plan amendment for 15 parcels within the Green Zone Districts. These parcels are proposed to be changed from the designation of Heavy Industrial (IH) to the Light Industrial (IL) General Plan designation, which is a lower intensity industrial designation. Similarly, in order to retain consistency with the General Plan and Title 22 zoning code, 27 28 parcels are proposed for a zone change from M-2, to M-1 (see Figure 1.IV-1, *Zone Changes and General Plan Amendments*). The purpose of the general plan amendment and zone change is to ensure that the current general plan and zoning designations are consistent with the revisions proposed

⁹ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Chapter 6: Land Use Element. In the Los Angeles County General Plan 2035. <http://planning.lacounty.gov/generalplan/generalplan>

¹⁰ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Chapter 6: Land Use Element. In the Los Angeles County General Plan 2035. <http://planning.lacounty.gov/generalplan/generalplan>

¹¹ Los Angeles County GIS Data Portal. Airport Land Use Commission (ALUC) Layers. Accessed April 9, 2020. <https://egis3.lacounty.gov/dataportal/2019/12/23/airport-land-use-commission-aluc-layers/>

¹² Los Angeles County GIS Data Portal. California Coastal Commission Zone Boundaries. Accessed April 9, 2020. <https://egis3.lacounty.gov/dataportal/2011/06/06/california-coastal-commission-zone-boundaries/>

with Title 22, Green Zone Districts with regard to intensity of permitted industrial land uses. The 15 parcels included in the general plan amendment and the 17 parcels in the zone change are proposed to occur in the same geographic locations as the Green Zone Districts Element (see Figure 1.IV-1).

Although significant impacts to land use and planning in relation to an environmental impact due to conflict with adopted or proposed land use plans, policies, or regulations are not anticipated as the proposed revisions to Title 22 are being undertaken to ensure consistency with the General Plan, the general plan amendment and zone change in the Green Zone Districts may have the potential to result in significant impacts in regard to conflict with adopted or proposed land use plans, policies, or regulations. Therefore, the Green Zone Districts may result in potentially significant impacts to land use and planning in relation to an environmental impact due to conflict with adopted or proposed land use plans, policies, or regulations. Further analysis is warranted.

Element 2 – New Sensitive Uses

The new development standards for New Sensitive Uses adjacent to or adjoining existing industrial, recycling and solid waste, or vehicle-related uses would result in less than significant impacts to land use in regard to resulting in an environmental impact due to conflict with adopted or proposed land use plans, policies, or regulations. Currently the zoning and land use designations that permit sensitive uses do not have requirements for remediating the effects of incompatible adjacent uses. The Ordinance establishes the definition of sensitive uses to include dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory to a place of worship, ~~in close proximity to existing industrial uses permitted in the zones where they are located~~. The existing zoning designations currently include development standards applicable to the above listed sensitive uses. However, the Ordinance expands these requirements to include development of new sensitive uses where these uses are adjacent to, or adjoining industrial, recycling or solid waste, or vehicle-related uses. The Ordinance includes standards for requiring the use of solid wall screening; expanded landscaping buffers between incompatible uses; standards for windows; placement of balconies; and air filtration devices (see Table 1.IV-2). ~~As discussed in Section 4, construction activities for the proposed program would include landscaping barriers, enclosures, fencing, solid walls, signage, lighting, and air filtration as measures that would decrease impacts to new sensitive uses near or adjacent to existing industrial, recycling and solid waste, or vehicle-related uses (Chapter 22.130).~~ These measures would be required where the Title 22 Ordinance implements new development standards for new sensitive uses, such as dwelling units, schools and school yards, parks, playgrounds, daycare centers, preschools, nursing homes, hospitals, shelters, and daycares, or preschools as accessory use to a place of worship, ~~in close proximity~~ adjacent to or adjoining legally-established, existing industrial, recycling or solid waste, or vehicle-related uses.

The Land Use Element of the County of Los Angeles General Plan establishes 11 goals related to land use and planning. The New Sensitive Uses element of the Green Zones Program is intended to implement the County General Plan 2035 and would not conflict with these policies such that it would result in a significant environmental impact. A review of all 11 goals of the Land Use Element shows that none are in conflict with the Ordinance (see Table 2.11-1).¹³ Additionally, the Ordinance specifically achieves the following County General Plan 2035 goals and policies:

- **Goal LU 7:** Compatible land uses that complement neighborhood character and the natural environment.
 - *Policy LU 7.1:* Reduce and mitigate the impacts of incompatible land uses, where feasible, using buffers and other design techniques.
 - *Policy LU 7.2:* Protect industrial parks and districts from incompatible uses.
 - *Policy LU 7.3:* Protect public and semi-public facilities, including but not limited to major landfills, natural gas storage facilities, and solid waste disposal sites from incompatible uses.

The New Sensitive Uses element of the Green Zones Program also affect zoning designations that are located within the Antelope Valley Area Plan and Santa Clarita Valley Area Plan, neither of which contain policies that are in conflict with the Ordinance (see Table 2.11-1). In addition, per the County General Plan 2035 and Title 21 of the California

¹³ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Chapter 6: Land Use Element. In the Los Angeles County General Plan 2035. <http://planning.lacounty.gov/generalplan/generalplan>

Code of Regulations, all developments located within an Airport Influence Area are subject to review by the ALUC for compliance with noise and safety regulations. It is the policy of the County General Plan 2035 that all proposed programs located within Airport Influence Areas be reviewed for consistency with policies of the applicable airport land use compatibility plan (ALUCP). The California Coastal Commission designated coastal zones, and there are five unincorporated areas in the coastal zones. All development within coastal zones must first obtain a Coastal Development Permit. Additionally, there are two Local Coastal Programs (LCP) certified by the County (Santa Catalina Island and Marine Del Rey) which establish detailed land use policy and development standards within their respective coastal zone segments. The measures to reduce the incompatibility of new sensitive uses with existing industrial uses through development standards such as construction of landscaping and planting trees, buffering, and open space, would not conflict with an existing adopted or proposed land use plan, policy, or regulation. The New Sensitive Uses element of the Green Zones Program is consistent with the goals and policies of the General Plan. New Sensitive Uses element of the Green Zones Program does not conflict with any of the 11 Land Use and Planning Goals established by the Land Use Element of the County General Plan, or the Antelope Valley or Santa Clarita Valley Area Plans (see Table 2.11-1).

The New Sensitive Uses element of the Green Zones Program fall within four Airport Influence Areas; Los Angeles International Airport (LAX), Palmdale Regional Airport, General William J. Fox Airfield (Fox Airfield), and Brackett Field.^{14,15} LAX and Palmdale Regional Airport do not have their own ALUCPs, however, Fox Airfield and Brackett Field do, and the County has a County-wide ACULP. Generally, industrial and commercial uses are compatible within Airport Influence Areas. These revisions would comply with the regulations set forth in the ACLUPs.¹⁶ The Ordinance would result in no impact to these land use plans, as the proposed program would not change the existing land use designations on the existing parcels, which are already compatible to these plans. Additionally, these revisions would comply with any regulations set forth in the ACLUPs.

Regarding coastal zones, the New Sensitive Uses element of the Green Zones Program are not located within an LCP; however, they are located with the Santa Monica Mountains Coastal Zone.¹⁷ As stated in the County General Plan 2035, land use regulation and jurisdictional authority in the Santa Monica Mountains Coastal Zone involves many public entities. In the unincorporated areas, biological resource protection is implemented through the Malibu Land Use Plan, the Malibu Coastal Program District, the County, and the California Coastal Commission. The County also establishes nine Coastal Resource Areas (CRAs) in the County, one of which is the Santa Monica Mountains Coastal Zone.^{18,19} The Malibu Land Use Plan was adopted by the California Coastal Commission and contains provisions for new development, which the Recycling and Waste Management Revisions would comply with.²⁰ The Ordinance would result in no impact to any of these land use plans. In the case of the regulations for updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in a conflict with adopted or proposed regulations. Therefore, the new development standards for New Sensitive Uses near Industrial, Recycling and Solid Waste, or Vehicle-Related Uses would result in less than significant impacts in regard to conflicting with adopted or proposed land use plans, policies, or regulations. No further analysis is warranted.

Element 3 – Recycling and Waste Management Revisions

The Recycling and Waste Management Revisions, including supermarket accessory recycling collection centers, would result in less than significant impacts in regard to conflicting with adopted or proposed land use plans, policies, or regulations. The County currently regulates recycling facilities as junk and salvage and solid waste facilities, which are allowable in M-2 and M-2.5 designated zones. The Ordinance would allow for permitting of new types of facilities including organic waste that would aid in the reduction of greenhouse gases and comply with State requirements. The new development standards and/or more stringent entitlement process for future recycling and solid waste facilities would be subject to a CUP, an MCUP, and/or an SPR, and would include requirements for construction of improvements consisting of landscaping barriers, enclosures, fencing, solid walls, paving, signage, and lighting, air filtration, building height restrictions, vehicle circulation, and storage of materials, as well as cleaning and maintenance standards. These construction improvement requirements are already subject to current development standards. Countywide, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities would be prohibited in HMAs and SEAs. Additionally, pallet yards, chipping and grinding, mulching facilities would be prohibited in HFHSZs and VHFHSZs; solid waste landfills and inert debris landfills would be prohibited in FEMA Flood Zones and Los Angeles County Floodways; and anaerobic digestion, construction and demolition, inert debris processing, recycling conversion technology, and combustion and non-combustion biomass conversion organic waste facilities would be prohibited in ARAs. ~~The proposed revisions will prohibit automobile dismantling yards, pallet yards, recycling collection facilities, recycling processing facilities, organic waste, and solid waste facilities from HMAs, SEAs, and VHFHSZs. Additionally, in-vessel organic waste facilities are prohibited in ARAs.~~ A review of all 11 goals of the Land Use Element shows that none are in conflict with the Ordinance (see Table 2.11-1).²¹ The Recycling and Waste Management Revisions element of the Green Zones Program is consistent with the goals and policies of the General Plan. The Recycling and Waste Management Center Revisions do not conflict with any of the 11 Land Use and Planning Goals established by the Land Use Element of the County General Plan, or the Antelope Valley or Santa Clarita Valley Area Plans (see Table 2.11-1).

The Recycling and Waste Management Revisions fall within four Airport Influence Areas; LAX, Palmdale Regional Airport, Fox Airfield, and Brackett Field.^{22,23} LAX and Palmdale Regional Airport do not have their own ALUCPs; however, Fox Airfield and Brackett Field do, and the County has a County-wide ACULP. Generally, industrial and commercial uses are compatible within Airport Influence Areas. These revisions would comply with the regulations set forth in the ACLUPs.²⁴ The Ordinance would result in no impact to these land use plans, as the proposed program would not change the existing land use designations on the existing parcels, which are already compatible to these plans. Additionally, these revisions would comply with any regulations set forth in the ACLUPs.

Regarding coastal zones, the Recycling and Waste Management Revisions are not located within an LCP; however, they are located with the Santa Monica Mountains Coastal Zone.²⁵ As stated in the County General Plan 2035, land use regulation and jurisdictional authority in the Santa Monica Mountains Coastal Zone involves many public entities. In the unincorporated areas, biological resource protection is implemented through the Malibu Land Use Plan, the Malibu Coastal Program District, the County, and the California Coastal Commission. The County also establishes nine CRAs

²¹ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Chapter 6: Land Use Element. In the Los Angeles County General Plan 2035. <http://planning.lacounty.gov/generalplan/generalplan>

²² County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Chapter 6: Land Use Element. In the Los Angeles County General Plan 2035. <http://planning.lacounty.gov/generalplan/generalplan>

²³ Los Angeles County GIS Data Portal. Airport Land Use Commission (ALUC) Layers. Accessed April 9, 2020. <https://egis3.lacounty.gov/dataportal/2019/12/23/airport-land-use-commission-aluc-layers/>

²⁴ Los Angeles County Department of Regional Planning. Los Angeles County Airport Land Use Commission (ALUC): Airports, Plans, and Maps. Accessed April 9, 2020. <http://planning.lacounty.gov/aluc/airports>

²⁵ Los Angeles County GIS Data Portal. California Coastal Commission Zone Boundaries. Accessed April 9, 2020. <https://egis3.lacounty.gov/dataportal/2011/06/06/california-coastal-commission-zone-boundaries/>

in the County, one of which is the Santa Monica Mountains Coastal Zone.^{26,27} The Malibu Land Use Plan was adopted by the California Coastal Commission and contains provisions for new development, which the Recycling and Waste Management Revisions would comply with.²⁸ The Ordinance would result in no impact to any of these land use plans. In the case of the regulations for updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in a conflict with adopted or proposed regulations. Therefore, impacts to Recycling and Waste Management Revisions would be less than significant in regard to conflicting with adopted or proposed land use plans, policies, or regulations. No further analysis is warranted.

The Supermarket Accessory Recycling Collection Centers revisions would result in less than significant impacts in regard to conflicting with adopted or proposed land use plans, policies, or regulations. The proposed Ordinance defines a Supermarket Accessory Recycling Collection Center as a store that “contains a full-line, self-service store that sells dry grocery, canned goods, perishable items, or nonfood items, and also is certified by the California Department of Resources Recycling and Recovery per Section 14526.5 of the California Public Resources Code” (for definitions, please see pages 10–11 of the public draft ordinance, Appendix A to the Initial Study). The Recycling and Waste Management Revisions, except for Supermarket Accessory Recycling Collection Centers, would require an applicant to obtain a CUP for primary uses, which is subject to discretionary approval by the County. Collection centers do not involve the processing of the recyclable materials, which is only allowed with a CUP in applicable designated zones. Supermarket Accessory Recycling Collection Centers would be permitted in currently developed Supermarket locations in urbanized locations in the County. Supermarket Accessory Recycling Collection Centers proposed as an accessory use within zones C-1, C-2, C-3, C-M, as well as all industrial zones would be required to comply with CalRecycle requirements for the development of recycling collection centers. These uses would also be required to comply with existing development standards including setbacks from property lines; minimum distance from residential uses; avoidance of obstruction of pedestrian or vehicular circulation such that it is located on any parking spaces, driveway, aisles, vehicular back-up space, walkways, loading areas, fire lanes, trash enclosure areas, and landscape areas; and avoidance of the reduction of existing parking when accommodating square footage to be used for recycling collection facility. Additional requirements include that containers shall not be vertical stacked and be clearly labeled identifying materials stored, and materials for storage shall not exceed the total vertical height of the recycling collection facilities where materials will be visible. The CalRecycle requirements are set forth to meet the County’s waste diversion goals. The proposed revisions would allow Supermarket Accessory Recycling Collection Centers in the CMJ, CR, CRU, MXD, MXDRU designated zones. These uses would be ~~constructed~~ established on existing parking lots, and no new structures will be built. A review of all 11 goals of the Land Use Element shows that none are in conflict with the Ordinance (see Table 2.11-1).²⁹

The Supermarket Accessory Recycling Collection Centers revisions do not conflict with any of the 11 Land Use and Planning Goals established by the Land Use Element of the County General Plan, or the Antelope Valley or Santa Clarita Valley Area Plans (see Table 2.11-1).

The Supermarket Accessory Recycling Collection Centers revisions fall within four Airport Influence Areas; LAX, Palmdale Regional Airport, Fox Airfield, and Brackett Field.^{30,31} LAX and Palmdale Regional Airport do not have their own ALUCPs; however, Fox Airfield and Brackett Field do, and the County has a County-wide ACULP. Generally,

³⁰ County of Los Angeles Department of Regional Planning. Adopted October 6, 2015. Chapter 6: Land Use Element. In the Los Angeles County General Plan 2035. <http://planning.lacounty.gov/generalplan/generalplan>

³¹ Los Angeles County GIS Data Portal. Airport Land Use Commission (ALUC) Layers. Accessed April 9, 2020. <https://egis3.lacounty.gov/dataportal/2019/12/23/airport-land-use-commission-aluc-layers/>

industrial and commercial uses are compatible within Airport Influence Areas. These revisions would comply with the regulations set forth in the ACLUPs.³² The Ordinance would result in no impact to these land use plans, as the proposed program would not change the existing land use designations on the existing parcels, which are already compatible to these plans. Additionally, these revisions would comply with any regulations set forth in the ACLUPs.

Regarding coastal zones, the Supermarket Accessory Recycling Collection Centers revisions are not located within an LCP; however, they are located with the Santa Monica Mountains Coastal Zone.³³ As stated in the County General Plan 2035, land use regulation and jurisdictional authority in the Santa Monica Mountains Coastal Zone involves many public entities. In the unincorporated areas, biological resource protection is implemented through the Malibu Land Use Plan, the Malibu Coastal Program District, the County, and the California Coastal Commission. The County also establishes nine CRAs in the County, one of which is the Santa Monica Mountains Coastal Zone.^{34,35} The Malibu Land Use Plan was adopted by the California Coastal Commission and contains provisions for new development, which the Recycling and Waste Management Revisions would comply with.³⁶ The Ordinance would result in no impact to any of these land use plans. The Supermarket Accessory Recycling Collection Centers sub element of the Recycling and Waste Management Revisions element of the Green Zones Program is consistent with the goals and policies of the General Plan. In the case of the regulations for updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in a conflict with adopted or proposed regulations. Therefore, the Supermarket Accessory Recycling Collection Centers would have less than significant impacts in regard to conflicting with adopted or proposed land use plans, policies, or regulations. No further analysis is warranted.

Element 4 – Storage Enclosures for Recycling and Solid Waste Revisions

The Storage Enclosures for Recycling and Solid Waste Revisions would result in have less than significant impacts in regard to conflicting with adopted or proposed land use plans, policies, or regulations. Any new development or expansion of existing development would be required to meet the current development standards of the zone they are permitted in. The revisions would add additional requirements to current development requirements including increased enclosure wall height, a roof, paving, cleaning and maintenance, requirements for distance from adjoining doorway, and enhanced circulation. Additionally, the Ordinance would only apply to new development and expansion of existing development. A review of all 11 goals of the Land Use Element shows that none are in conflict with the Ordinance (see Table 2.11-1). The Storage Enclosures for Recycling and Solid Waste Revisions fall within four Airport Influence Areas; LAX, Palmdale Regional Airport, Fox Airfield, and Brackett Field. LAX and Palmdale Regional Airport do not have their own ALUCPs, however, Fox Airfield and Brackett Field do, and the County has a County-wide ACULP. Generally, industrial and commercial uses are compatible within Airport Influence Areas. These revisions would comply with the regulations set forth in the ACLUPs. The Ordinance would result in no impact to these land use plans, as the proposed program would not change the existing land use designations on the existing parcels, which are already compatible to these plans. Additionally, these revisions would comply with any regulations set forth in the ACLUPs. Regarding coastal zones, the Storage Enclosures for Recycling and Solid Waste Revisions are not located within an LCP; however, they are located with the Santa Monica Mountains Coastal Zone. As stated in the County General Plan 2035, land use regulation and jurisdictional authority in the Santa Monica Mountains Coastal Zone involves many public entities. In the unincorporated areas, biological resource protection is implemented through the Malibu Land Use Plan, the Malibu Coastal Program District, the County, and the California Coastal Commission. The County also establishes nine CRAs

³⁶ California Coastal Commission. Adopted 13 September 2002. City of Malibu Local Coastal Program Land Use Plan. <https://www.coastal.ca.gov/ventura/malibu-lup-final.pdf>

in the County, one of which is the Santa Monica Mountains Coastal Zone. The Malibu Land Use Plan was adopted by the California Coastal Commission and contains provisions for new development, which the Recycling and Waste Management Revisions would comply with. The Ordinance would result in no impact to any of these land use plans. The Storage Enclosures for Recycling and Solid Waste Revisions element of the Green Zones Program is consistent with the goals and policies of the General Plan. In the case of the regulations for updated standards for existing industrial uses, the construction of these measures would not differ substantially from existing conditions, such that they would result in a conflict with adopted or proposed regulations. Therefore, the Storage Enclosures for Recycling and Solid Waste Revisions would result in less than significant impacts in regard to conflicting with adopted or proposed land use plans, policies, or regulations. No further analysis is warranted.

TABLE 2.11-1
LAND USE PLAN CONSISTENCY WITH THE GREEN ZONES ORDINANCE

Consistent = The Ordinance is consistent with the policy or it fulfills the goal or objective listed in the respective land use plan.
No conflict = The Ordinance does not conflict with the goal/policy/objective list in the respective land use plan.
Potential conflict = The Ordinance has the potential to be incompatible with the goal/policy/objective list in the respective land use plan.

County General Plan 2035

Land Use Goals and Policies	Potential Conflict				Discussion
	Green Zone Districts	New Sensitive Uses	Recycling and Waste Management Revisions	Storage Enclosures for Recycling and Solid Waste Revisions	
Goal LU 1: A General Plan that serves as the constitution for development, and a Land Use Policy Map that implements the General Plan’s Goals, Policies and Guiding Principles.	Consistent	Consistent	Consistent	Consistent	The Green Zones Ordinance is intended to implement the County General Plan 2035
Goal LU 2: Community-based planning efforts that implement the General Plan and incorporate public input, and regional and community level collaboration.	No conflict	No conflict	No conflict	No conflict	
Goal LU 3: A development pattern that discourages sprawl and protects and conserves areas with natural resources and SEAs.	No conflict	No conflict	No conflict	No conflict	
Goal LU 4: Infill development and redevelopment that strengthens and enhances communities	No conflict	No conflict	No conflict	No conflict	
Goal LU 5: Vibrant, livable and healthy communities with a mix of land uses, services and amenities. <ul style="list-style-type: none">Policy LU 5.7: Direct resources to areas that lack amenities, such as transit, clean air, grocery stores, bikeways, parks, and other components of a healthy community.Policy LU 5.9: Preserve key industrially designated land for intensive, employment-based uses.Policy LU 5.10: Encourage employment opportunities and housing to be developed in proximity to one another.Policy LU 5.9 preserves industrial land for employment and Policy LU 5.10 encourages employment opportunities, such as industrial, to be developed near housing. The Ordinance improves communities with existing industrial uses next to sensitive uses such as housing.	Consistent	Consistent	Consistent	Consistent	Per Policy LU 5.7, the Ordinance would improve the air quality and livability of the communities which have industrial, commercial, or other uses, as they would be required to implement development standards to reduce impacts to nearby uses.
Goal LU 6: Protected rural communities characterized by living in a non-urban or agricultural environment at low densities without typical urban services. <ul style="list-style-type: none">Policy LU 6.1: Protect rural communities from the encroachment of incompatible development that conflict with existing land use patterns and service standards.	No conflict	No conflict	No conflict	No conflict	The Ordinance may result in development in rural communities with existing industrial, recycling, supermarket, or other uses; however, this development would not be conflict with existing land use patterns, as development would be minor additions to existing uses.
Goal LU 7: Compatible land uses that complement neighborhood character and the natural environment. <ul style="list-style-type: none">Policy LU 7.1: Reduce and mitigate the impacts of incompatible land uses, where feasible, using buffers and other design techniques.Policy LU 7.2: Protect industrial parks and districts from incompatible uses.Policy LU 7.3: Protect public and semi-public facilities, including but not limited to major landfills, natural gas storage facilities, and solid waste disposal sites from incompatible uses.Policy LU 7.4: Ensure land use compatibility in areas adjacent to military installations and where military operations, testing, and training activities occur.Policy LU 7.5: Ensure land use compatibility in areas adjacent to mineral resources where mineral extraction and production, as well as activities related to the drilling for and production of oil and gas, may occur.Policy LU 7.6: Ensure that proposed land uses located within Airport Influence Areas are compatible with airport operations through compliance with airport land use compatibility plans.Policy LU 7.7: Review all proposed programs located within Airport Influence Areas for consistency with policies of the applicable airport land use compatibility plan.*	Consistent	Consistent	Consistent*	Consistent*	<p>The purpose of the Ordinance is to reduce and mitigate the impacts of incompatible land uses, such as industrial and waste facilities, by using buffers and other design techniques, which fulfills Goal LU 7 and Policy LU 7.1-7.3.</p> <p>Additionally, the Ordinance would not change the land use designations of the existing parcels, and therefore would not result in incompatibility in or near military installations or mineral resource sites.</p> <p>*The Green Zone Districts do not fall within Airport Influence Areas, however, the Recycling and Waste Management Revisions and Supermarket Recycling Center Revisions do. These revisions would comply with the relevant airport land use computability plan(s).</p>
Goal LU 8: Land uses that are compatible with military operations and military readiness and enhance safety for military personnel and persons on the ground.	Consistent	Consistent	Consistent	Consistent	The Ordinance is compatible with this goal as the Ordinance would not change the land use designations of the existing parcels, and therefore would not result in incompatibility in or near military installations or mineral resource sites.

TABLE 2.11-1
LAND USE PLAN CONSISTENCY WITH THE GREEN ZONES ORDINANCE

Consistent = The Ordinance is consistent with the policy or it fulfills the goal or objective listed in the respective land use plan.
No conflict = The Ordinance does not conflict with the goal/policy/objective list in the respective land use plan.
Potential conflict = The Ordinance has the potential to be incompatible with the goal/policy/objective list in the respective land use plan.

Land Use Goals and Policies	Potential Conflict				Discussion
	Green Zone Districts	New Sensitive Uses	Recycling and Waste Management Revisions	Storage Enclosures for Recycling and Solid Waste Revisions	
Goal LU 9: Land use patterns and community infrastructure that promote health and wellness. Policy LU 9.1: Promote community health for all neighborhoods.	Consistent	Consistent	Consistent	Consistent	The Ordinance would improve the health and livability of the communities which have industrial, commercial, or other uses, as they would be required to implement development standards to reduce impacts to nearby uses, thereby promoting health for all neighborhoods.
Goal LU 10: Well-designed and healthy places that support a diversity of built environments.	No conflict	No conflict	No conflict	No conflict	
Goal LU 11: Development that utilize sustainable design techniques.	No conflict	No conflict	No conflict	No conflict	
Goal C/NR 3: Permanent, sustainable preservation of genetically and physically diverse biological resources and ecological systems including: habitat linkages, forests, coastal zone,* riparian habitats, streambeds, wetlands, woodlands, alpine habitat, chaparral, shrublands, and SEAs.	No conflict	No conflict	No conflict*	No conflict*	The Green Zone Districts are not located within a Coastal Zone and have no conflict with Goal C/NR 3. * The Recycling and Waste Management Revisions and the Supermarket Recycling Center Revisions are located in Coastal Zones, however, they would comply with the applicable plans and policies.

LAND USE PLAN CONSISTENCY WITH THE GREEN ZONES ORDINANCE

Consistent = The Ordinance is consistent with the policy or it fulfills the goal or objective listed in the respective land use plan.
No conflict = The Ordinance does not conflict with the goal/policy/objective list in the respective land use plan.
Potential conflict = The Ordinance has the potential to be incompatible with the goal/policy/objective list in the respective land use plan.

Antelope Valley Area Plan – Town and Country

Land Use Goals and Policies	Potential Conflict		Discussion
	Recycling and Waste Management Revisions	Storage Enclosures for Recycling and Solid Waste Revisions	
Goal LU 1: A land use pattern that maintains and enhances the rural character of the unincorporated Antelope Valley. <ul style="list-style-type: none">Policy LU 1.4: Ensure that there are appropriate lands for commercial and industrial services throughout the unincorporated Antelope Valley sufficient to serve the daily needs of rural residents and to provide local employment opportunities.	No conflict	No conflict	The Ordinance may result in development in rural areas of the Antelope Valley; however, the development would be minimal and limited to existing industrial, waste, supermarket, or other facilities.
