The Draft 2045 CAP would be a policy document intended to reduce unincorporated countywide GHG emissions and would support development already allowed under the General Plan land use assumptions with adoption of the 2021-2029 Housing Element. The 2019 County of Los Angeles All-Hazards Mitigation Plan does not include specific evacuation routes to be used in the event of an emergency (County of Los Angeles 2019). However, the General Plan includes a map of freeway and highway Disaster Routes, many of which cross through portions of the unincorporated County (Los Angeles County 2015). Depending on the nature of projects implementing Draft 2045 CAP measures, they may require construction in major roadways or the closure of major roadways to facilitate construction activities. If construction activities within major roadways or road closures were required to facilitate projects implementing Draft 2045 CAP measures, then activities could obstruct major roadways and could hinder evacuation procedures.

Although the locations and details of potential projects implementing Draft 2045 CAP measures are not known at the time of this analysis, such projects would be subject to individual project review pursuant to the grading or building permit application process. If, based on such review, it is determined that a specific project could conflict with an emergency response or evacuation plan, then a project-specific traffic control plan would be required to avoid such conflicts. Because any potential impacts to the implementation of an emergency response or evacuation plan would be identified and addressed before a related impact could occur, the impacts associated with implementation of the Draft 2045 CAP would be less than significant. Therefore, this consideration will not be analyzed further as part of the CEQA process for the Draft 2045 CAP.

18. TRIBAL CULTURAL RESOURCES

	<i>Less Than Significant</i>			
<i>Potentially Significant Impact</i>	<i>Impact with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	

a) **Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code § 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:**

- | | | | | |
|--|-------------------------------------|--------------------------|--------------------------|--------------------------|
| <p>i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code § 5020.1(k), or</p> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
|--|-------------------------------------|--------------------------|--------------------------|--------------------------|

Los Angeles County is situated on land traditionally occupied by indigenous people associated with five Native American groups: Gabrielino (including the Tongva and Kizh), Tataviam, Serrano, Kitanemuk, and Ventureño Chumash. These groups have rich heritage and deep traditional and cultural values associated with the natural environment and material culture.

Signed into law in September of 2014, Assembly Bill (AB) 52, established “tribal cultural resources” as a new class of resources under CEQA. Tribal cultural resources are defined in PRC 21074 as “site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe.” Pursuant to PRC Sections 21080.3.1, 21080.3.2, and 21082.3, where one or more California Native American Tribes has requested formal written notification of proposed projects from a lead agency, the lead agency shall provide formal written notification of proposed projects and engage in consultation with requesting tribes as prescribed in the statute.

The Draft 2045 CAP would be a policy document intended to reduce unincorporated county wide GHG emissions and would support development already allowed under General Plan land use assumptions with adoption of the 2021-2029 Housing Element. As a policy document, the Draft 2045 CAP itself would not result in direct impacts to tribal cultural resources.

On October 21, 2019, the County submitted notification and request to consult letters to five (5) individuals and organizations pursuant to AB 52. On October 21, 2019, the County also submitted notification and request to consult letters to twenty-four (24) individuals and organizations pursuant to SB 18. In particular, AB 52 letters were sent via mail to the following California Native American tribes and individuals:

- Andrew Salas, Gabrieleño Band of Mission Indians – Kizh Nation
- Anthony Morales, Gabrieleno Tongva San Gabriel Band of Mission Indians
- Jairo Avila, Fernandeño Tataviam Band of Mission Indians
- Lee Clauss, San Manuel Band of Mission Indians

- Octavio Escobedo, Tejon Indian Tribe

No responses were received from any of the individuals/organizations pursuant to AB 52.

SB 18 letters were sent via mail to the following California Native American tribes and individuals:

- Andrew Salas, Gabrieleño Band of Mission Indians – Kizh Nation
- Anthony Morales, Gabrieleno Tongva San Gabriel Band of Mission Indians
- Charles Alvarez, Gabrielino – Tongva Tribe
- Donna Yocum, San Fernando Band of Mission Indians
- Fred Collins, Northern Chumash Tribal Council
- Gino Altamirano, Coastal Band of the Chumash Nation
- Jairo Avila, Fernandeno Tataviam Band of Mission Indians
- Julie Tumamait-Stenslie, Barbareno/Ventureno Band of Mission Indians
- Julio Quair, Chumash Council of Bakersfield
- Kenneth Kahn, Santa Ynez Band of Chumash Indians
- Lee Clauss, San Manuel Band of Mission Indians
- Gino Altamirano, Coastal Band of the Chumash Nation
- Mark Cochrane, Serrano Nation of Mission Indians
- Mark Vigil, San Luis Obispo County Chumash Council
- Matias Belardes, Juaneno Band of Mission Indians Acjachemen Nation
- Mona Tucker, yak tityu tityu yak tithini-Northern Chumash Tribe
- Robert Dorame, Gabrielino Tongva Indians of California Tribal Council
- Robert L. Gomez, Tubatulabals of Kern Valley
- Robert Martin, Morongo Band of Mission Indians
- Robert Robinson, Kern Valley Indian Community
- Rudy Ortega, Fernandeno Tataviam Band of Mission Indians
- Sandonne Goad, Gabrielino/Tongva Nation
- Sonia Johnston, Juaneno Band of Mission Indians
- Teresa Romero, Juaneno Band of Mission Indians Acjachemen Nation – Romero
- Wayne Walker, Serrano Nation of Mission Indians

A total of five responses were received from the individuals/organizations pursuant to SB 18. The Juaneño Band of Mission Indians Acjachemen Nation-Belardes, Morongo Band of Mission Indians, and the San Manuel Band of Mission Indians indicated they had no concerns regarding the project and did not request consultation. The Santa Ynez Band of Chumash Indians also did not request consultation; however, they indicated that if supplementary literature reveals additional information, or if the scope of work were to change, that they would like to be notified. The Coastal Band of Chumash Indians requested consultation. In response, the County submitted emails on November 21, 2019 and January 8, 2020 to schedule a consultation meeting with the Coastal Band of Chumash Indians, but no response was received. The County also sent a letter via regular mail and email on March 11, 2020 to once again schedule a consultation call with the Coastal Band of the Chumash Nation; however, no response was received.

The AB 52 and SB 18 Native American consultation documentation is provided in Appendix A of this IS.

No tribal cultural resources were identified as a result of consultations that are either listed or eligible for listing in the California Register of Historical Resources (CRHR), or in a local register of historical resources.

Future projects to implement some GHG reduction measures contained in the Draft 2045 CAP would involve structural improvements and/or ground disturbing activities that could, depending on their location, result in direct or indirect adverse changes to the significance of a tribal cultural resource. Future projects would be required to comply with existing federal, State, and local regulations, and undergo the County’s discretionary review process, where applicable, including completion of subsequent project-level planning and environmental review under CEQA, including compliance with AB 52. Such projects could nonetheless result in significant impacts to tribal cultural resources either listed in or eligible for listing in the CRHR or local register and mitigation measures may be needed. Impacts to tribal cultural resources are considered to be potentially significant and will be further evaluated in the EIR.

- ii) **A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code § 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code § 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.**

The Draft 2045 CAP would be a policy document intended to reduce unincorporated countywide GHG emissions and would support development already allowed under the General Plan land use assumptions with adoption of the 2021-2021 Housing Element. As a policy document, the Draft 2045 CAP itself would not result in direct impacts to tribal cultural resources.

As mentioned above, no tribal cultural resources were identified as a result of consultations

Future projects to implement some GHG reduction measures contained in the Draft 2045 CAP would involve structural improvements and/or ground disturbing activities that could, depending on their location, result in direct or indirect adverse changes to the significance of a tribal cultural resource. Future projects would be required to comply with existing federal, State, and local regulations, and undergo the County’s discretionary review process, where applicable, including completion of subsequent project-level planning and environmental review under CEQA, including compliance with AB 52. Such projects could nonetheless result in significant impacts to tribal cultural resources determined by the lead agency in its discretion to be

significant. Impacts to tribal cultural resources are considered to be potentially significant and will be further evaluated in the EIR.

19. UTILITIES AND SERVICE SYSTEMS

	<i>Potentially Significant Impact</i>	<i>Less Than Significant Impact with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>
--	---	--	---	----------------------

Would the project:

a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects?

<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
--------------------------	--------------------------	-------------------------------------	--------------------------

The Draft 2045 CAP would be a policy document that would support development already allowed under the General Plan land use assumptions with adoption of the 2021-2029 Housing Element. The Draft 2045 CAP does not include specific proposed projects that could directly result in new or expanded facilities. However, Draft 2045 CAP Strategies could promote the construction of new facilities in order to achieve water conservation and recycling goals, energy efficiency goals, renewable energy goals, and waste diversion goals. Some of the measures may result in retrofitting, plumbing and electrical modifications in existing buildings or the installation of new features such as rooftop solar or water recycling systems (Measure E2, Measure E7, Measure E8, Measure E9, and Measure W3). In general, projects implementing Draft 2045 CAP measures are expected to result in beneficial environmental impacts to utilities by reducing water demand, reducing the demand on water recycling facilities, and reducing the demand for natural gas and electrical power through energy efficiency measures and measure to achieve low-carbon energy use (Measures E1 through E4 and Measure E7).

As described above, the Draft 2045 CAP would result in primarily beneficial impacts with regard to the use of water wastewater treatment, electric power, natural gas, stormwater drainage. The Draft 2045 CAP could promote the construction of new facilities such as new water recycling facilities, EV charging stations, composting facilities, and solar energy generation facilities which have the potential to result in environmental impacts. Development of potential future projects supported by Draft 2045 CAP measures would be evaluated on an individual basis once details are known. No changes to General Plan land use designations are proposed. Therefore, the Draft 2045 CAP would not result in an unanticipated increase in density or population growth outside of what was accounted for in the General Plan that could result in increased demand for utilities. As such, implementing the Draft 2045 CAP would not create new demand related to water, wastewater, stormwater drainage, electric power, natural gas power, or telecommunications utilities. Impacts to this criterion are considered less than significant. Accordingly, this consideration will not be analyzed further as part of the CEQA process for the Draft 2045 CAP.

b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
--------------------------	--------------------------	-------------------------------------	--------------------------

The Draft 2045 CAP includes a number of actions to increase the use of alternate water sources and reduce water consumption. Included within Measure E8 are implementing actions to develop a net zero water ordinance, remove barriers for retrofitting on-site gray water recycling systems, and to partner with LA County

to explore the potential for indirect potable reuse. The performance goals for Measure 8 include the following: 1) 100% of new development is net zero water by 2030; and 2) achieve 80% use of recycled water for agricultural and industrial uses by 2045. Measure E9 which is intended to reduce indoor and outdoor water consumption includes the following performance goals: 1) reduce water consumption by 50% by 2045; 2) adopt a water efficiency ordinance for existing buildings; 3) reduce outdoor landscaping water use by 50% by 2045; and 4) reduce municipal water consumption by 50% by 2045. As demonstrated by the performance metrics, implementation of Measure E8 and E9 would reduce municipal, agricultural, industrial, and outdoor landscaping water use substantially. While the Draft 2045 CAP may promote development that may require water for construction and operation, these developments would be required to comply with the Draft 2045 CAP measures that require net zero water in new development and significant reductions in indoor and outdoor water use for municipal, commercial, and industrial development. Therefore, overall, the strategies and measures proposed in the Draft 2045 CAP would result in reductions in water demand. While the Draft 2045 CAP may result in the development of facilities that would require water for construction and operation, these developments would be required to comply with the adopted Draft 2045 CAP and; therefore, would be required to be net zero water and would not result in additional water demand. Therefore, the Draft 2045 CAP would have a beneficial impact with regard to water supply, impacts would be less than significant this consideration will not be analyzed further as part of the CEQA process for the Draft 2045 CAP.

c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

The Draft 2045 CAP would be a policy document that would support development already allowed under the General Plan land use assumptions with the 2021-2029 Housing Element. The Draft 2045 CAP does not include specific proposed projects that could directly result in increased demand on wastewater treatment facilities. Increases in the demand for wastewater treatment is generally associated with an increase in population. As described in Section 14, *Population and Housing*, the Draft 2045 CAP would be consistent with the General Plan and the 2021-2029 Housing Element and would not result in population growth outside of what was accounted for in the General Plan. Therefore, the buildout assumptions that inform the measures in the Draft 2045 CAP would be consistent with the population growth planned for in the General Plan and 2021-2029 Housing Element.

The Draft 2045 CAP would include measures to increase water conservation which could result in a slight decrease in the amount of wastewater required to be treated by wastewater treatment providers. Some measures in the Draft 2045 CAP would promote the development of facilities which could include mixed use development, water recycling facilities, or compost processing facilities (Measure E8, Measure W1, and Measure W3). These facilities could result in an increase in demand for wastewater treatment. Development of potential future projects supported by Draft 2045 CAP measures would be evaluated on an individual basis once details are known. Individual proposals for projects supported by CAP measures would be required to undergo project-level CEQA review and disclose any potential impacts related to wastewater treatment and provide mitigation of any significant impacts, if necessary. Impacts are considered less than significant.

d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

The Draft 2045 CAP would be a policy document that would support development already allowed under the General Plan land use assumptions with adoption of the 2021-2029 Housing Element. The Draft 2045 CAP does not include specific proposed projects that could directly generate solid waste. The Draft 2045 CAP encourages the reduction of solid waste and includes Strategy 9 to reduce GHG emissions associated with solid waste generation. The intent is to increase solid waste diversion in order to reduce the amount of solid waste placed in landfills. Strategy 9 includes Measure W1, which includes implementing actions to increase organic composting in non-residential buildings and within communities. The performance goal for Measure W1 is to reach an organic diversion rate of 95% by 2045. Measure W2 includes implementing actions in order to increase the diversion of recyclable materials. Measure W3 includes implementing measures to incorporate sustainable waste systems and practices with a goal of decreasing per capita waste by 35% by 2045. The implementation of these measures would reduce solid waste generation within the County and impacts would be beneficial. While the Draft 2045 CAP could indirectly promote the construction of facilities in order to meet water recycling, waste diversion, and renewable energy goals which could result in minor amount of waste generated by project construction and operation, these implementing projects would also be required to comply with the waste management measures proposed in the Draft 2045 CAP. Therefore, adoption of the Draft 2045 CAP would not generate substantial solid waste or impair attainment of solid waste reduction goals and impacts would be less than significant. Accordingly, this criterion will not be evaluated further as part of the CEQA process for the Draft 2045 CAP.

e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

As mentioned above, the adoption of the Draft 2045 CAP would result in beneficial impacts with regard to solid waste management and the diversion of waste from landfills. Any new facilities required to support the measures in the Draft 2045 CAP would be required to comply with existing regulations for solid waste management including the permitting requirements of CalRecycle. Requisite compliance with management and reduction statutes and regulations related to solid waste would ensure that the impacts of the Draft 2045 CAP would be less than significant. Accordingly, this criterion will not be evaluated further as part of the CEQA process for the Draft 2045 CAP.

20. WILDFIRE

	<i>Less Than Significant</i>		
<i>Potentially Significant Impact</i>	<i>Impact with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>

If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:

- a) Substantially impair an adopted emergency response plan or emergency evacuation plan?**

According to fire hazard mapping by the California Department of Forestry and Fire Protection (CAL FIRE), as part of the Fire and Resource Assessment Program (FRAP), there are several areas classified as Very High Fire Hazard Severity Zones (VHFHSZ) within the unincorporated County (CAL FIRE 2012). Fire Protection within unincorporated LA County is provided by the Los Angeles County Fire Department (LACoFD). Areas designated as VHFHSZs are located in the Santa Monica Mountains, the Palos Verdes Peninsula, the San Gabriel Mountains, and portions of the Angeles National Forest and Los Padres National Forest. Within the portions of the County designated as VHFHSZs, there are areas designated as Federal Responsibility Areas, State Responsibility Areas, and Local Responsibility Areas. LACoFD responds to wildland fires and urban fires. In recent year, the LACoFD has faced planning issues related to the recent increase in the frequency and severity of wildland fires and changes to urban fire considerations due to increases in the intensity of development and the number of potentially affected populations (LA County 2015). The LA County Fire District’s 2017-2021 Strategic Fire Plan includes strategies to meet three overarching goals related to emergency operations, public service, and organizational effectiveness. Most of the strategies included in this plan are administrative in nature and aimed at building the LACoFD’s capacity to respond to hazards. The Draft 2045 CAP would be a policy document and does not propose any specific projects that could conflict with the Strategic Plan (LA County 2018). All projects that would be indirectly encouraged by the Draft 2045 CAP would be required to be consistent with this plan and any future LACoFD emergency response or planning documents.

As described in Section 9, *Hazards and Hazardous Materials* under criterion f), the Draft 2045 CAP would be a policy document intended to reduce unincorporated county wide GHG emissions and would support development already allowed under the General Plan land use assumptions with adoption of the 2021-2021 Housing Element. The Draft 2045 CAP itself does not include any specific projects or proposals that could directly conflict with adopted emergency response or emergency evacuation plans.

The 2019 County of Los Angeles All-Hazards Mitigation Plan does not include specific evacuation routes to be used in the event of an emergency (County of Los Angeles 2019). However, the General Plan includes a map of freeway and highway Disaster Routes, many of which cross through portions of the unincorporated County (Los Angeles County 2015). Depending on the nature of projects implementing Draft 2045 CAP measures, there may be activities that require construction in major roadways or may require the closure of major roadways to facilitate construction activities. If construction activities within major roadways or road closures were required to facilitate projects implementing Draft 2045 CAP measures, then activities could obstruct major roadways and could hinder evacuation procedures.

Although the locations and details of potential projects implementing Draft 2045 CAP measures are not known at the time of this analysis, such projects would be subject to individual project review pursuant to the grading or building permit application process. If, based on such review, it is determined that a specific project could conflict with an emergency response or evacuation plan, then a project-specific traffic control plan would be required to avoid such conflicts. Because any potential impacts to the implementation of an emergency response or evacuation plan would be identified and addressed before a related impact could occur, the impacts associated with implementation of the Draft 2045 CAP would be less than significant. Therefore, this consideration will not be analyzed further as part of the CEQA process for the Draft 2045 CAP.

b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

LA County is large, and the topography, vegetation and climate vary across the County. Large portions of the undeveloped areas of the County (particularly in the Santa Monica Mountains, Santa Clarita Valley, and Antelope Valley) include the following vegetation types: coastal sage, riparian oak woodlands, and chaparral. Fire risk in LA County is particularly high in the undeveloped areas of the County that are designated as VHFHSZ. These areas typically contain chaparral ecosystems as they contain volatile oils that are particularly flammable. Additionally, chaparral communities are typically located in mountainous areas where the steep terrain can fuel the spread of wildfire (LA County 2021).

The Draft 2045 CAP would be a policy document intended to reduce unincorporated county wide GHG emissions and would support development already allowed under General Plan land use assumptions with adoption of the 2021-2029 Housing Element. The Draft 2045 CAP does not include any specific projects that could directly expose structures or occupants to wildfire risks. Since no changes to land use designations or specific projects are proposed as part of the Draft 2045 CAP, no new or substantially increased risks associated with wildfires are anticipated.

Projects promoted by the Draft 2045 CAP that could include housing would likely be developed in urban areas which are already developed and not located in undeveloped areas with high fire risk. Some projects implementing Draft 2045 CAP measures such as composting facilities, water recycling facilities, or renewable generation facilities could be located in areas designated as VHFHSZs. Depending on the location and site-specific conditions of implementing projects, such projects could increase the risk of an ignition during construction due to the use of equipment, vehicles, and tools and the storage of fuels and other flammable materials. As described in Section 9, *Hazard and Hazardous Materials*, under criterion g), new development would be required to comply with Title 32 of the Los Angeles County Code (the Los Angeles County Fire Code). Compliance with the County Fire Code would ensure that any new development in the unincorporated County would be in an area with adequate access (for emergency vehicles/personnel) and adequate water and pressure to meet flow standards (in the event that a fire needs to be extinguished). Compliance with the County Fire Code also would ensure developments that are within mapped VHFHSZs are properly inspected, obtain the applicable permits, and abide by fire prevention techniques. The operation of most facilities that would be promoted by the Draft 2045 CAP would not be expected to substantially increase wildfire risk. Projects also would be required to comply with the California Building Code which identifies building fire safety requirements such as sprinklers, resistance standards, and the clearance of debris and vegetation within a prescribed distance from structures in wildfire hazard areas.

Furthermore, future projects would be required to comply with the General Plan policies, which are intended to reduce the potential for development to be located in high fire hazard areas and encourage mitigation to ensure that developments are built to be fire resistant and have the capacity to ensure proper ingress, egress, and sufficient fire suppression resources onsite:

- Policy S 3.1:** Discourage high density and intensity development in VHFHSZs.
- Policy S 3.2:** Consider climate change implications in planning for FHSZs.
- Policy S 3.3:** Ensure that the mitigation of fire related property damage and loss in FHSZs limits impacts to biological and other resources.
- Policy S 3.4:** Reduce the risk of wildland fire hazards through the use of regulations and performance standards, such as fire-resistant building materials and vegetation.
- Policy S 3.5:** Encourage the use of fire-resistant vegetation that is compatible with the area’s natural vegetative habitats in fuel modification activities.
- Policy S 3.6:** Ensure adequate infrastructure, including ingress, egress, and peak load water supply availability for all projects located in FHSZs.
- Policy S 3.7:** Consider siting and design for developments located within FHSZs, particularly in areas located near ridgelines and on hilltops, to reduce the wildfire risk.
- Policy S 3.8:** Support the retrofitting of existing structures in FHSZs to help reduce the risk of structural and human loss due to wildfire.

Compliance with the LA County Fire Code, California Building Code, and the LA County General Plan would reduce the risk that future projects would be in fire-prone areas and would ensure that developments contain proper fire prevention measures and capacity for fire suppression during construction and operation. While the Draft 2045 CAP itself would not result in any direct impacts to wildfire risk, compliance with these codes and policies would significantly reduce the potential for the Draft 2045 CAP to indirectly result in projects that could expose people to the risks from the spread of wildfire. Requisite compliance with independently enforceable provisions of laws, regulations, plans and standards (including those set forth in the LA County Fire Code, California Building Code, and the General Plan) would assure that the adoption and implementation of the Draft 2045 CAP would result in a less than significant impact relating to the potential exposure of project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. Accordingly, this criterion will not be evaluated further as part of the CEQA process for the Draft 2045 CAP.

c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

The Draft 2045 CAP would be a policy document intended to reduce unincorporated county wide GHG emissions and would support development already allowed under the General Plan land use assumptions with

adoption of the 2021-2021 Housing Element. The Draft does not include any specific project proposal and therefore, would not result in any direct increases in wildfire risk that would necessitate the installation of fire prevention infrastructure such as fuel breaks, and emergency water sources. Individual proposals for project supported by Draft 2045 CAP measures would be required to undergo project-level review and disclose any potential impacts related to wildfire risk and provide mitigation of any significant impacts, if necessary. If fuel breaks, emergency water sources, or other fire prevention features are required to reduce wildfire risks, then the environmental impacts of those features would be evaluated as part of the project-level CEQA review. In addition to any project-specific fire-related mitigation recommendations, any new development within Los Angeles County (including the unincorporated areas) would be subject to Title 32 of the Los Angeles County Code (the Los Angeles County Fire Code). Compliance with the County Fire Code would ensure that any new development in the unincorporated County would be in an area with adequate access (for emergency vehicles/personnel) and adequate water and pressure to meet flow standards (in the event that a fire needs to be extinguished). Compliance with the County Fire Code would also ensure developments that are within mapped VHFHSZs are properly inspected, obtain the applicable permits, and abide by fire prevention techniques. Further, any project that would result from the adoption of the Draft 2045 CAP would be required to address fire risks before the potential impact could result. Accordingly, this topic will not be evaluated further as part of the CEQA process for the Draft 2045 CAP.

d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

As described under criterion b), the portions of the County that are designated as VHFHSZs are characterized by steep slopes that could create the potential for downslope or downstream flooding, landslides, or runoff. Also as described under criterion b), the Draft 2045 CAP would not directly result in any projects that would increase wildfire risk or alter slopes or drainage patterns in a manner that could increase the risk for post fire downslope or downstream flooding or landslides. Projects implementing Draft 2045 CAP measures could, depending on the location and site-specific conditions of projects, increase the risk of wildfire and post-fire flooding or landslides. As described above, all future projects would be required to comply with the County Fire Code, California Building Code, and the General Plan policies which would reduce the extent to which future projects would increase fire risk. Additionally, future projects would be subject to project-level review where site specific fire risk would be evaluated and mitigation, if necessary, would be applied to address significant impacts. Therefore, the potential for future implementing projects to result in the ignition of a fire which could result in downstream flooding or landslides would be less than significant at the project level as well as cumulatively.

Additionally, As discussed in Section 7, *Geology and Soils*, under criterion a.iv), if projects implementing the CAP measures were to be proposed in susceptible areas, significant effects due to the impacts of landslides could result. However, all new developments would be required to comply with the California Building Code and the County Building Code. Requisite compliance with these codes would ensure that each new development would not result in a potential significant impact either at the project level or cumulatively.

Requisite compliance with applicable laws, regulations, and ordinances would assure that new projects implementing Draft 2045 CAP measures would not result in a significant impact. Therefore, this consideration will not be analyzed further as part of the CEQA process for the Draft 2045 CAP.

e) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

The Draft 2045 CAP would be a policy document intended to reduce unincorporated county wide GHG emissions and would support development already allowed under the General Plan land use assumptions with adoption of the 2021-2021 Housing Element. The Draft 2045 CAP does not include any specific projects that could directly expose structures or occupants to a significant risk of loss, injury or death involving wildland fires. Since no changes to land use designations or specific projects are proposed as part of the Draft 2045 CAP, no new or substantially increased risks associated with wildfires are anticipated.

Some projects implementing Draft 2045CAP measures such as composting facilities, water recycling facilities, or renewable energy generation facilities could be located in areas designated as VHFHSZs. Depending on the location and site-specific conditions of implementing projects, they could increase the risk of an ignition during project construction due to the use of equipment, vehicles, and tools and the storage of fuels and other flammable materials. As described in Section 9, *Hazard and Hazardous Materials*, under criterion g), and further analyzed above under criterion b), new development would be required to comply with the Los Angeles County Fire Code, the California Building Code, and policies in the General Plan that require that fire prevention measures be incorporated into development and that developments include proper ingress and egress and equipment to respond to fire hazards. Compliance with these requirements would ensure that any new development in the unincorporated County would be in an area with adequate access (for emergency vehicles/personnel) and adequate water and pressure to meet flow standards (in the event that a fire needs to be extinguished). Compliance also would ensure that any future developments that are proposed within mapped VHFHSZs are properly inspected, obtain the applicable permits, and abide by fire prevention techniques. The operation of most facilities that would be promoted by the Draft CAP would not be expected to substantially increase wildfire risk.

For these reasons, any new projects implementing Draft 2045 CAP measures would not result in a significant impact relating to this criterion. Therefore, it will not be analyzed further as part of the CEQA process for the Draft 2045 CAP.

21. MANDATORY FINDINGS OF SIGNIFICANCE

	<i>Potentially Significant Impact</i>	<i>Less Than Significant Impact with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>
--	---	--	---	----------------------

a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
-------------------------------------	--------------------------	--------------------------	--------------------------

As disclosed in Section 4, Biological Resources under criterion a), projects implementing Draft 2045 CAP measures have the potential to result in impacts to candidate, sensitive, or special status species such as Swainson’s hawk and Arroyo toad. Impacts to candidate, sensitive, and special status species are considered to be potentially significant and will be further evaluated in the EIR. Similarly, the potential for the Draft 2045 CAP to result in substantial adverse effects on sensitive natural communities (evaluated in Section 4, Biological Resources under criterion b) is considered to be potentially significant and will be evaluated further in the EIR. Section 4, Biological Resources also identified the potential for projects implementing Draft 2045 CAP measures to impact federally protected wetlands (evaluated in criterion c), interfere with the movement of migratory fish, native resident, or wildlife species (evaluated under criterion d), or convert oak woodlands or other unique native woodlands (evaluated under criterion e) to be potentially significant. Therefore, the potential for the Project to result in impacts to these biological resources will be evaluated further in the EIR.

As analyzed in Section 5, Cultural Resources, the Draft 2045 CAP has the potential to impact historical resources and archaeological resources. As analyzed in Section 13, the Draft 2045 CAP has the potential to impact tribal cultural resources. Therefore, potential impacts related to cultural resources and tribal cultural resources will be evaluated further in the EIR.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
-------------------------------------	--------------------------	--------------------------	--------------------------

The Draft 2045 CAP would be a policy document intended to reduce unincorporated countywide GHG emissions and would support development already allowed under the General Plan land use assumptions with adoption of the 2021-2029 Housing Element. According to CEQA Guidelines Section 15130(e), if a cumulative impact was adequately addressed in a prior EIR for a community plan, zoning action, or general plan, and the project is consistent with that plan or action, then an EIR for such a project should not further

analyze that cumulative impact. Potential cumulative impacts would result if the Draft 2045 CAP promotes growth in the County in excess of what was accounted for in the General Plan and the 2021-2029 Housing Element. The potential for cumulative effects will be considered in the EIR.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

The Draft 2045 CAP would be a policy document intended to reduce unincorporated countywide GHG emissions and would support development already allowed under the General Plan land use assumptions with the 2021-2029 Housing Element. The Draft 2045 CAP does not include any specific projects that could directly result in adverse effects on human beings. However, projects implementing Draft 2045 CAP measures could result in potentially significant impacts as disclosed throughout this Initial Study. Therefore, the potential for Air Quality, Noise, and Transportation and other potentially significant impacts to result in a potentially significant impact to human beings will be evaluated further in an EIR.

NOTICE OF PREPARATION OF A DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING PROJECT NAME:

Los Angeles County 2045 Climate Action Plan (Draft 2045 CAP) PROJECT LOCATION : Unincorporated areas of Los Angeles County The County of Los Angeles (County) is the Lead Agency pursuant to the California Environmental Quality Act (CEQA) and its implementing regulations, the CEQA Guidelines. The County intends to prepare a Program Environmental Impact Report (PEIR) for the 2045 Climate Action Plan (CAP) that would be an implementing component of the Air Quality Element of the Los Angeles County General Plan. The County has prepared this Notice of Preparation to provide Responsible Agencies, Trustee Agencies, potentially affected federal agencies, organizations, and other interested parties with information regarding this project and its potential environmental effects, and to solicit your input on the scope and content of the PEIR. PROJECT DESCRIPTION : The Draft 2045 CAP would require a General Plan Amendment to replace the Los Angeles County Community Climate Action Plan (2020 CCAP), which is an implementing component of the Air Quality Element of the Los Angeles County General Plan. In early 2020, the Department of Regional Planning ("DRP") released a Public Discussion Draft of the Draft 2045 CAP (Public Discussion Draft). After receiving significant comments from stakeholders, DRP determined the need to substantially revise and update the Public Discussion Draft. Revisions will include an updated GHG emissions inventory for 2018; new emissions forecasts for 2030, 2035, and 2045; new GHG emissions targets for 2030, 2035, and 2045; a revised suite of GHG reduction strategies, measures, and actions in response to public comments to be more clear, specific, feasible, and quantifiable; a technical modeling appendix to explain the Draft 2045 CAP's GHG reduction estimates; a consideration of environmental justice and equity concerns; and a new development review consistency checklist to allow projects to streamline CEQA compliance for by using the CAP, per CEQA Guidelines Section 15183.5. POTENTIAL ENVIRONMENTAL EFFECTS : The County has prepared an Initial Study, which is being circulated with this Notice of Preparation. Because the Initial Study indicates that the proposed project may have a significant impact to the environment in one or more resource areas, the County has determined that preparation of a PEIR is re-

quired. The PEIR will focus on the potentially significant effects of the project, and briefly discuss any effects found not to be significant. The PEIR will include a more detailed evaluation of the following environmental issues:

Air Quality Biological Resources Cultural Resources Noise Tribal Cultural Resources PUBLIC REVIEW PERIOD : The County invites interested parties to provide written comments as to your specific concerns about the project's potential environmental effects. The County requests that any Responsible or Trustee Agency responding to this notice do so in a manner consistent with Section 15082(b) of the State CEQA Guidelines. A 30-day review period starts on January 3, 2022, and ends on February 1, 2022. Due to the time limits mandated by state law, please send your written response to the address or email below at the earliest possible date, but no later than February 1, 2022, at 5:00 p.m. Please include your name and address for all written correspondence. Please send written comments to the following address: Thuy Hua, Supervising Regional Planner Los Angeles County Department of Regional Planning 320 West Temple Street, 13th Floor Los Angeles, CA 90012 For email submittal of your comment letter, send to: climate@planning.lacounty.gov Any comments provided should identify specific topics of environmental concern and your reason for suggesting the study of these topics in the PEIR. All written comment letters/emails will be included in an appendix in the Draft PEIR and the contents considered in the preparation of the PEIR. DOCUMENT AVAILABILITY AND PROJECT WEBSITE : This Notice of Preparation and the Initial Study are available for view online at: <https://planning.lacounty.gov/climate>. NOTICE OF PUBLIC SCOPING MEETING: The County will conduct a public scoping meeting to solicit oral and written comments from interested parties on the scope and content of the PEIR. All interested parties are invited to attend the scoping meeting to assist in identifying issues to be addressed in the PEIR. The scoping meeting will include a brief presentation of the project scope to be addressed in the PEIR, a summary of the PEIR process, and will provide attendees with an opportunity to provide input to the scope and content of the PEIR. The scoping meeting will be held online via Zoom on January 13, 2022 at 5:00 p.m. PST. Please visit <https://planning.lacounty.gov/site/climate/meetings-hearings/> to register for the meeting.

NOTICE OF PREPARATION OF A DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING PROJECT NAME: Los Angeles County 2045 Climate Action Plan (Draft 2045 CAP) PROJECT LOCATION: Unincorporated areas of Los Angeles County The County of Los Angeles (County) is the Lead Agency pursuant to the California Environmental Quality Act (CEQA) and its implementing regulations, the CEQA Guidelines. The County intends to prepare a Program Environmental Impact Report (PEIR) for the 2045 Climate Action Plan (CAP) that would be an implementing component of the Air Quality Element of the Los Angeles County General Plan. The County has prepared this Notice of Preparation to provide Responsible Agencies, Trustee Agencies, potentially affected parties, interested organizations, and other interested parties with information regarding this project and its potential environmental effects, and to solicit your input on the scope and content of the PEIR. PROJECT DESCRIPTION: The Draft 2045 CAP would require a General Plan Amendment to replace the Los Angeles County Community Climate Action Plan (2020 CCAP), which is an implementing component of the Air Quality Element of the Los Angeles County General Plan. In early 2020, the Department of Regional Planning (DRP) released a Public Discussion Draft of the Draft 2045 CAP (Public Discussion Draft). After receiving advisory comments from stakeholders, DRP determined the need to substantially review and update the Public Discussion Draft. Revisions will include an updated GHG emissions inventory for 2015, 2020, 2035, and 2045; new GHG emissions targets for 2025, 2035, and 2045; a revised suite of GHG reduction strategies, measures, and policies in response to public concerns to be more clear, specific, feasible, and quantifiable; a technical modeling appendix to assess the Draft 2045 CAP's GHG reduction estimates; a quantification of environmental justice and equity concerns; and a new development review consistency checklist to allow projects to streamline CEQA compliance by using the CAP per CEQA Guidelines, Section 15183.5. POTENTIAL ENVIRONMENTAL EFFECTS: The County has prepared an Initial Study, which is being circulated with this Notice of Preparation. Because the Initial Study indicates that the proposed project may have a significant impact to the environment in one or more resource areas, the County has determined that preparation of a PEIR is required. The PEIR will focus on the potentially significant effects of the project, and briefly discuss any effects found not to be significant. The PEIR will include a more detailed evaluation of the following environmental issues: AIR QUALITY; Biological Resources; Cultural Resources; Noise; Initial Cultural Resources; PUBLIC REVIEW PERIOD: The County invites interested parties to provide written comments on the Draft 2045 CAP's GHG reduction estimates about the project's potential environmental effects. The County requests that any Responsible or Trustee Agency responding to this notice do so in a manner consistent with Section 15082(b) of the State CEQA Guidelines. A 30-day review period starts on January 3, 2022, and ends on February 1, 2022. Due to the time limits mandated by state law, please send your written response to the address or email below at the earliest possible date, but no later than February 1, 2022, at 5:00 p.m. Please include your name and address for all written correspondence. Please send written comments to the following address: Tudy Hui, Supervising Regional Planner, Los Angeles County, Department of Regional Planning, 350 West Temple Street, 11th Floor, Los Angeles, CA 90012. For email submittal of your comment letter, send to: climate@planning.lacounty.gov. Any comments provided should identify specific topics of environmental concern and your reason for suggesting the study of those topics in the PEIR. All written comment letters must be included in an appendix to the Draft PEIR and the contents considered in the preparation of the PEIR. DOCUMENT AVAILABILITY AND PROJECT WEBSITE: This Notice of Preparation and the Initial Study are available for view online at: https://planning.lacounty.gov/2045-cap. NOTICE OF PUBLIC SCOPING MEETING: The County will conduct a public scoping meeting to solicit oral and written comments from interested parties on the scope and content of the PEIR. All interested parties are invited to attend the scoping meeting to assist in identifying issues to be addressed in the PEIR. The scoping meeting will include a brief presentation of the project scope to be addressed in the PEIR, a summary of the PEIR process, and will provide attendees with an opportunity to provide input to the scope and content of the PEIR. The scoping meeting will be held online via Zoom on January 13, 2022 at 5:00 p.m. PST. Please visit https://planning.lacounty.gov/submittals/meetings/hearings to register for the meeting. 12/30/21 CNS-3541830 GLENDALE INDEPENDENT

AVISO DE PREPARACIÓN DE UN BORRADOR DE PROGRAMA DE INFORME DE IMPACTO AMBIENTAL Y REUNIÓN DEL ALCANCE PÚBLICO DEL PROYECTO: Plan de Acción Climática de 2045 (Borrador 2045 CAP) del Condado de Los Angeles
UBICACIÓN DEL PROYECTO: Áreas no incorporadas del Condado de Los Angeles
El Condado de Los Angeles (Condado) es la Agencia Líder de conformidad con la Ley de Calidad Ambiental de California (CEQA, por sus siglas en inglés) y sus regulaciones de implementación, las Directrices de CEQA. El Condado tiene la intención de preparar un Programa de Informe de Impacto Ambiental (PEIR, por sus siglas en inglés) para el Plan de Acción Climática de 2045 (CAP) que sería un componente de implementación del Elemento de Calidad del Aire del Plan General del Condado de Los Angeles. El Condado ha preparado este Aviso de Preparación para proporcionar a las Agencias Responsables, Agencias Fiduciarias,

agencias federales potencialmente afectadas, organizaciones, y otras partes interesadas con información correspondiente a este proyecto y sus efectos ambientales potenciales, y solicitar su opinión sobre el alcance y contenido del PEIR.
DESCRIPCIÓN DEL PROYECTO: El Borrador 2045 CAP requerirá una Enmienda al Plan General para reemplazar el Plan de Acción Climática de la Comunidad del Condado de Los Angeles (2020 CCAP), que es un componente de implementación del Elemento de Calidad del Aire del Plan General del Condado de Los Angeles. A principios de 2020, el Departamento de Planificación Regional ("DRP", por sus siglas en inglés) publicó un Borrador de Debate Público del Anteproyecto 2045 CAP (Borrador de Debate Público). Después de recibir comentarios importantes de las partes interesadas, DRP determinó la necesidad de revisar y actualizar sustancialmente el Borrador de Debate Público. Las revisiones incluirán un inventario de emisiones y GHG para 2018; nuevas pronósticos de emisiones para 2030, 2035, y 2045; nuevos objetivos de emisiones GHG para 2030, 2035, y 2045; una serie revisada de estrategias, medidas y acciones de reducción de GHG en respuesta a los comentarios públicos para que sea más claro, específico, factible, y cuantificable; un apéndice de modelado técnico para explicar los estimados de reducción de GHG del Borrador 2045 CAP; una consideración de las preocupaciones de justicia y equidad; y una nueva lista de verificación de consistencia de revisión de desarrollo para permitir que los proyectos optimicen el cumplimiento de CEQA para el uso del CAP, según la Sección 15183.5 de las Directrices de CEQA.
POSIBLES EFECTOS AMBIENTALES: El Condado ha preparado un Estudio Inicial, que está siendo distribuido con este Aviso de Preparación. Debido a que el Estudio Inicial indica que el proyecto propuesto puede tener un impacto significativo en el medio ambiente, los recursos, el Condado ha determinado que se requiere la preparación de un PEIR. El PEIR se enfocará en los efectos potencialmente significativos del proyecto, discutirá brevemente cualquier efecto que se considere no significativo. El PEIR incluirá una evaluación más detallada de los siguientes problemas ambientales: Calidad del Aire, Recursos Biológicos, Recursos Culturales, Ruido, Recursos Culturales
el 13 de enero de 2022 a las 5:00 p.m. PST. Por favor visite <https://planning.lacounty.gov/site/climate/meetings-hearings/> para registrarse en la reunión. 12/29/21

NOTICE OF PREPARATION OF A DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING PROJECT NAME :

Los Angeles County 2045 Climate Action Plan (Draft 2045 CAP) PROJECT LOCATION : Unincorporated areas of Los Angeles County The County of Los Angeles (County) is the Lead Agency pursuant to the California Environmental Quality Act (CEQA) and its implementing regulations, the CEQA Guidelines. The County intends to prepare a Program Environmental Impact Report (PEIR) for the 2045 Climate Action Plan (CAP) that would be an implementing component of the Air Quality Element of the Los Angeles County General Plan. The County has prepared this Notice of Preparation to provide Responsible Agencies, Trustee Agencies, potentially affected federal agencies, organizations, and other interested parties with information regarding this project and its potential environmental effects, and to solicit your input on the scope and content of the PEIR. PROJECT DESCRIPTION : The Draft 2045 CAP would require a General Plan Amendment to replace the Los Angeles County Community Climate Action Plan (2020 CCAP), which is an implementing component of the Air Quality Element of the Los Angeles County General Plan. In early 2020, the Department of Regional Planning ("DRP") released a Public Discussion Draft of the Draft 2045 CAP (Public Discussion Draft). After receiving significant comments from stakeholders, DRP determined the need to substantially revise and update the Public Discussion Draft. Revisions will include an updated GHG emissions inventory for 2018; new emissions forecasts for 2030, 2035, and 2045; new GHG emissions targets for 2030, 2035, and 2045; a revised suite of GHG reduction strategies, measures, and actions in response to public

comments to be more clear, specific, feasible, and quantifiable; a technical modeling appendix to explain the Draft 2045 CAP's GHG reduction estimates; a consideration of environmental justice and equity concerns; and a new development review consistency checklist to allow projects to streamline CEQA compliance for by using the CAP, per CEQA Guidelines Section 15183.5. POTENTIAL ENVIRONMENTAL

EFFECTS : The County has prepared an Initial Study, which is being circulated with this Notice of Preparation. Because the Initial Study indicates that the proposed project may have a significant impact to the environment in one or more resource areas, the County has determined that preparation of a PEIR is required. The PEIR will focus on the potentially significant effects of the project, and briefly discuss any effects found not to be significant. The PEIR will include a more detailed evaluation of the following environmental issues:

Air Quality Biological Resources Cultural Resources Noise Tribal Cultural Resources PUBLIC REVIEW PERIOD : The County invites interested parties to provide written comments as to your specific concerns about the project's potential environmental effects. The County requests that any Responsible or Trustee Agency responding to this notice do so in a manner consistent with Section 15082(b) of the State CEQA Guidelines. A 30-day review period starts on January 3, 2022, and ends on February 1, 2022. Due to the time limits mandated by state law, please send your written response to the address or email below at the earliest possible date, but no later than February 1, 2022, at 5:00 p.m. Please include your name and address for all written correspondence. Please send written comments to the following address: Thuy Hua, Supervising Regional Planner

Street, 13th Floor Los
Angeles, CA 90012 For email
submittal of your comment
letter, send to:
climate@planning.lacounty.g
ov Any comments provided
should identify specific topics
of environmental concern and
your reason for suggesting
the study of these topics in
the PEIR. All written
comment letters/emails will
be included in an appendix in
the Draft PEIR and the
contents considered in the
preparation of the PEIR.
DOCUMENT AVAILABILITY
AND PROJECT WEBSITE :
This Notice of Preparation
and the Initial Study are
available for view online at:
[https://planning.lacounty.gov/
climate](https://planning.lacounty.gov/climate). NOTICE OF PUBLIC
SCOPING MEETING: The
County will conduct a public
scoping meeting to solicit oral
and written comments from
interested parties on the
scope and content of the
PEIR. All interested parties
are invited to attend the
scoping meeting to assist in
identifying issues to be
addressed in the PEIR. The
scoping meeting will include a
brief presentation of the
project scope to be
addressed in the PEIR, a
summary of the PEIR
process, and will provide
attendees with an opportunity
to provide input to the scope
and content of the PEIR. The
scoping meeting will be held
online via Zoom on January
13, 2022 at 5:00 p.m. PST .

NOTICE OF PREPARATION OF A DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING PROJECT NAME:

Los Angeles County 2045 Climate Action Plan (Draft 2045 CAP) PROJECT LOCATION: Unincorporated areas of Los Angeles County The County of Los Angeles (County) is the Lead Agency pursuant to the California Environmental Quality Act (CEQA) and its implementing regulations, the CEQA Guidelines. The County intends to prepare a Program Environmental Impact Report (PEIR) for the 2045 Climate Action Plan (CAP) that would be an implementing component of the Air Quality Element of the Los Angeles County General Plan. The County has prepared this Notice of Preparation to provide Responsible Agencies, Trustee Agencies, potentially affected federal agencies, organizations, and other interested parties with information regarding this project and its potential environmental effects, and to solicit your input on the scope and content of the PEIR. PROJECT DESCRIPTION: The Draft 2045 CAP would require a General Plan Amendment to replace the Los Angeles County Community Climate Action Plan (2020 CCAP), which is an implementing component of the Air Quality Element of the Los Angeles County General Plan. In early 2020, the Department of Regional Planning ("DRP") released a Public Discussion Draft of the Draft 2045 CAP (Public Discussion Draft). After receiving significant comments from stakeholders, DRP determined the need to substantially revise and update the Public Discussion Draft. Revisions will include an updated GHG emissions inventory for 2018; new emissions forecasts for 2030, 2035, and 2045; new GHG emissions targets for 2030, 2035, and 2045; a revised suite of GHG reduction strategies, measures, and actions in response to public comments to be more clear, specific, feasible, and quantifiable; a technical modeling appendix to explain the Draft 2045 CAP's GHG reduction estimates; a consideration of environmental justice and equity concerns; and a new development review consistency checklist to allow projects to streamline CEQA compliance for by using the CAP, per CEQA Guidelines Section 15183.5. POTENTIAL ENVIRONMENTAL EFFECTS: The County has prepared an Initial Study, which is being circulated with this Notice of Preparation. Because the Initial Study indicates that the proposed project may have a significant impact to the environment in one or more resource areas, the County has determined that preparation of a PEIR is required. The PEIR will focus on the potentially significant effects of the project, and briefly discuss any effects found not to be significant. The PEIR will include a more detailed evaluation of the following environmental issues:

Air Quality Biological Resources Cultural Resources Noise Tribal Cultural Resources PUBLIC REVIEW PERIOD: The County invites interested parties to provide written comments as to your specific concerns about the project's potential environmental effects. The County requests that any Responsible or Trustee Agency responding to this notice do so in a manner consistent with Section 15082(b) of the State CEQA Guidelines. A 30-day review period starts on January 3, 2022, and ends on February 1, 2022. Due to the time limits mandated by state law, please send your

NOTICE OF PREPARATION OF A DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING PROJECT NAME: Los Angeles County 2045 Climate Action Plan (Draft 2045 CAP) PROJECT LOCATION: Unincorporated areas of Los Angeles County The County of Los Angeles (County) is the Lead Agency pursuant to the California Environmental Quality Act (CEQA) and its implementing regulations, the CEQA Guidelines. The County intends to prepare a Program Environmental Impact Report (PEIR) for the 2045 Climate Action Plan (CAP) that would be an implementing component of the Air Quality Element of the Los Angeles County General Plan. The County has prepared this Notice of Preparation to provide Responsible Agencies, Trustee Agencies, potentially affected federal agencies, organizations, and other interested parties with information regarding this project and its potential environmental effects, and to solicit your input on the scope and content of the PEIR. PROJECT DESCRIPTION: The Draft 2045 CAP would require a General Plan Amendment to replace the Los Angeles County Community Climate Action Plan (2020 CCAP), which is an implementing component of the Air Quality Element of the Los Angeles County General Plan. In early 2020, the Department of Regional Planning (DRP) released a Public Discussion Draft of the Draft 2045 CAP (Public Discussion Draft). After receiving significant comments from stakeholders, DRP determined the need to substantially revise and update the Public Discussion Draft. Revisions will include an updated GHG emissions inventory for 2018; new emissions forecasts for 2030, 2035, and 2045; new GHG emissions targets for 2030, 2035, and 2045; a revised suite of GHG reduction strategies, measures, and actions in response to public comments to be more clear, specific, feasible, and quantifiable; a technical modeling appendix to explain the Draft 2045 CAP's GHG reduction estimates; a consideration of environmental justice and equity concerns; and a new development review consistency checklist to allow projects to streamline CEQA compliance for by using the CAP, per CEQA Guidelines Section 15183.5. POTENTIAL ENVIRONMENTAL EFFECTS: The County has prepared an Initial Study which is being circulated with this Notice of Preparation. Because the Initial Study indicates that the proposed project may have a significant impact to the environment in one or more resource areas, the County has determined that preparation of a PEIR is required. The PEIR will focus on the potentially significant effects of the project, and briefly discuss any effects found not to be significant. The PEIR will include a more detailed evaluation of the following environmental issues: Air Quality Biological Resources Cultural Resources Noise Tribal Cultural Resources PUBLIC REVIEW PERIOD: The County invites interested parties to provide written comments as to your specific concerns about the project's potential environmental effects. The County requests that any Responsible or Trustee Agency responding to this notice do so in a manner consistent with Section 15082(b) of the State CEQA Guidelines. A 30-day review period starts on January 3, 2022, and ends on February 1, 2022. Due to the time limits mandated by state law, please send your written response to the address or email below at the earliest possible date, but no later than February 1, 2022, at 5:00 p.m. Please include your name and address for all written correspondence. NOTICE OF PREPARATION OF A DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING PROJECT NAME: Los Angeles County 2045 Climate Action Plan (Draft 2045 CAP) PROJECT LOCATION : Unincorporated areas of Los Angeles County The County of Los Angeles (County) is the Lead Agency pursuant to the California Environmental Quality Act (CEQA) and its implementing regulations, the CEQA Guidelines. The County intends to prepare a Program Environmental Impact Report (PEIR) for the 2045 Climate Action Plan (CAP) that would be an implementing component of the Air Quality Element of the Los Angeles County General Plan. The County has prepared this Notice of Preparation to provide Responsible Agencies, Trustee Agencies, potentially affected federal agencies, organizations, and other interested parties with information regarding this project and its potential environmental effects, and to solicit your input on the scope and content of the PEIR. PROJECT DESCRIPTION : The Draft 2045 CAP would require a General Plan Amendment to replace the Los Angeles County Community Climate Action Plan (2020 CCAP), which is an implementing component of the Air Quality Element of the Los Angeles County General Plan. In early 2020, the Department of Regional Planning ("DRP") released a Public Discussion Draft of the Draft 2045 CAP (Public Discussion Draft). After receiving significant comments from stakeholders, DRP determined the need to substantially revise and update the Public Discussion Draft. Revisions will include an updated GHG emissions inventory for 2018; new emissions forecasts for 2030, 2035, and 2045; new GHG emissions targets for 2030, 2035, and 2045; a revised suite of GHG reduction strategies, measures, and actions in response to public comments to be more clear, specific, feasible, and quantifiable; a technical modeling appendix to explain the Draft 2045 CAP's GHG reduction estimates; a consideration of environmental justice and equity concerns; and a new development review consistency checklist to allow projects to streamline CEQA compliance for by using the CAP, per CEQA Guidelines Section 15183.5. POTENTIAL ENVIRONMENTAL EFFECTS : The County has prepared an Initial Study, which is being circulated with this Notice of Preparation. Because the Initial Study indicates that the proposed project may have a significant impact to the environment in one or more resource areas, the County has determined that preparation of a PEIR is required. The PEIR will focus on the potentially significant effects of the project, and briefly discuss any effects found not to be significant. The PEIR will include a more detailed evaluation of the following environmental issues: Air Quality Biological Resources Cultural Resources Noise Tribal Cultural Resources PUBLIC REVIEW PERIOD : The County invites interested parties to provide written comments as to your specific concerns about the project's potential environmental effects. The County requests that any Responsible or Trustee Agency, responding to this notice do so in a manner consistent with Section 15082(b) of the State CEQA Guidelines. A 30-day review period starts on January 3, 2022, and ends on February 1, 2022. Due to the time limits mandated by state law, please send your written response to the address or email below at the earliest possible date, but no later than February 1, 2022, at 5:00 p.m. Please include your name and address for all written correspondence. Please send written comments to the following address: Thuy Hua, Supervising Regional Planner Los Angeles County Department of Regional Planning 320 West Temple Street, 13th Floor Los Angeles, CA 90012 For email submittal of your comment letter, send to: climate@planning.lacounty.gov Any comments provided should identify specific topics of environmental concern and your reason for suggesting the study of these topics in the PEIR. All written comment letters/emails will be included in an appendix in the Draft PEIR and the contents considered in the preparation of the PEIR. DOCUMENT AVAILABILITY AND PROJECT WEBSITE : This Notice of Preparation and the Initial Study are available for view online at: https://planning.lacounty.gov/climate/ NOTICE OF PUBLIC SCOPING MEETING: The County will conduct a public scoping meeting to solicit oral and written comments from interested parties on the scope and content of the PEIR. All interested parties are invited to attend the scoping meeting to assist in identifying issues to be addressed in the PEIR. The scoping meeting will include a brief presentation of the project scope to be addressed in the PEIR, a summary of the PEIR process, and will provide attendees with an opportunity to provide input to the scope and content of the PEIR. The scoping meeting will be held online via Zoom on January 13, 2022 at 5:00 p.m. PST. Please visit https://planning.lacounty.gov/site/climate/meetings-hearings/ to register for the

NOTICE OF PREPARATION OF A DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING PROJECT NAME :

Los Angeles County 2045 Climate Action Plan (Draft 2045 CAP). PROJECT LOCATION : Unincorporated areas of Los Angeles County The County of Los Angeles (County) is the Lead Agency pursuant to the

California Environmental Quality Act (CEQA) and its implementing regulations, the CEQA Guidelines. The County intends to prepare a Program Environmental Impact Report (PEIR) for the 2045 Climate Action Plan (CAP) that would be an implementing component of the Air Quality Element of the Los Angeles County General Plan. The County has prepared this Notice of Preparation to provide Responsible Agencies, Trustee Agencies, potentially affected federal agencies, organizations, and other interested parties with information regarding this project and its potential environmental effects, and to solicit your input on the scope and content of the PEIR. PROJECT DESCRIPTION : The Draft 2045 CAP would require a General Plan Amendment to replace the Los Angeles County Community Climate Action Plan (2020 CCAP), which is an implementing component of the Air Quality Element of the Los Angeles County General Plan. In early 2020, the Department of Regional Planning ("DRP") released a Public Discussion Draft of the Draft 2045 CAP (Public Discussion Draft). After receiving significant comments from stakeholders, DRP determined the need to substantially revise and update the Public Discussion Draft. Revisions will include an updated GHG emissions inventory for 2018; new emissions forecasts for 2030, 2035, and 2045; new GHG emissions targets for 2030, 2035, and 2045; a revised suite of GHG reduction strategies, measures, and actions in response to public comments to be more clear, specific, feasible, and quantifiable; a technical modeling appendix to explain the Draft 2045 CAP's GHG reduction estimates; a consideration of environmental justice and equity concerns; and a new development review consistency checklist to allow projects to streamline CEQA

compliance for by using the CAP, per CEQA Guidelines Section 15183.5. POTENTIAL ENVIRONMENTAL EFFECTS : The County has prepared an Initial Study, which is being circulated with this Notice of Preparation. Because the Initial Study indicates that the proposed project may have a significant impact to the environment in one or more resource areas, the County has determined that preparation of a PEIR is required. The PEIR will focus on the potentially significant effects of the project, and briefly discuss any effects found not to be significant. The PEIR will include a more detailed evaluation of the following environmental issues: Air Quality Biological Resources Cultural Resources Noise Tribal Cultural Resources PUBLIC REVIEW PERIOD : The County invites interested parties to provide written comments as to your specific concerns about the project's potential environmental effects. The County requests that any Responsible or Trustee Agency responding to this notice do so in a manner consistent with Section 15082(b) of the State CEQA Guidelines. A 30-day review period starts on January 3, 2022, and ends on February 1, 2022. Due to the time limits mandated by state law, please send your written response to the address or email below at the earliest possible date, but no later than February 1, 2022, at 5:00 p.m. Please include your name and address for all written correspondence. Please send written comments to the following address: Thuy Hua, Supervising Regional Planner Los Angeles County Department of Regional Planning 320 West Temple Street, 13th Floor Los Angeles, CA 90012 For email submittal of your comment letter, send to: climate@planning.lacounty.gov Any comments provided should identify specific topics of environmental concern and your reason for suggesting the study of these topics in the PEIR. All written comment letters/emails will be included in an appendix in the Draft PEIR and the contents considered in the preparation of the PEIR. DOCUMENT AVAILABILITY AND PROJECT WEBSITE : This Notice of Preparation and the Initial Study are available for view online at: <https://planning.lacounty.gov/climate>. NOTICE

OF PUBLIC SCOPING MEETING: The County will conduct a public scoping meeting to solicit oral and written comments from interested parties on the scope and content of the PEIR. All interested parties are invited to attend the scoping meeting to assist in identifying issues to be addressed in the PEIR. The scoping meeting will include a brief presentation of the project scope to be addressed in the PEIR, a summary of the PEIR process, and will provide attendees with an opportunity to provide input to the scope and content of the PEIR. The scoping meeting will be held online via Zoom on January 13, 2022 at 5:00 p.m. PST. Please visit <https://planning.lacounty.gov/site/climate/meetings-hearings/> to register for the meeting.

Draft 2045 CAP would require a General Plan Amendment to replace the Los Angeles County Community Climate Action Plan (2020 CCAP), which is an implementing component of the Air Quality Element of the Los Angeles County General Plan. In early 2020, the Department of Regional Planning ("DRP") released a Public Discussion Draft of the Draft 2045 CAP (Public Discussion Draft). After receiving significant comments from stakeholders, DRP determined the need to substantially revise and update the Public Discussion Draft. Revisions will include an updated GHG emissions inventory for 2018; new emissions forecasts for 2030, 2035, and 2045; new GHG emissions targets for 2030, 2035, and 2045; a revised suite of GHG reduction strategies, measures, and actions in response to public comments to be more clear, specific, feasible, and quantifiable; a technical modeling appendix to explain the Draft 2045 CAP's GHG reduction estimates; a consideration of environmental justice and equity concerns; and a new development review consistency checklist to allow projects to streamline CEQA compliance for by using the CAP, per CEQA Guidelines Section 15183.5. POTENTIAL ENVIRONMENTAL EFFECTS: The County has prepared an Initial Study, which is being circulated with this Notice of Preparation. Because the Initial Study indicates that the proposed project may have a significant impact to the environment in one or more resource areas, the County has determined that preparation of a PEIR is required. The PEIR will focus on the potentially significant effects of the project, and briefly discuss any effects found not to be significant. The PEIR will include a more detailed evaluation of the following environmental issues: Air Quality Biological Resources Cultural Resources Noise Tribal Cultural Resources PUBLIC REVIEW PERIOD: The County invites interested parties to provide written comments as to your specific concerns about the project's potential environmental effects. The County requests that any Responsible or Trustee Agency responding to this notice do so in a manner consistent with Section 15082(b) of the State CEQA Guidelines. A 30-day review period starts on January 3, 2022, and ends on February 1, 2022. Due to the time limits mandated by state law, please send your written response to the address or email below at the earliest possible date, but no later than February 1, 2022, at 5:00 p.m. Please include your name and address for all written correspondence. Please send written comments to the following address: Thuy Hua, Supervising Regional Planner Los Angeles County Department of Regional Planning 320 West Temple Street, 13th Floor Los Angeles, CA 90012 For email submittal of your comment letter, send to: climate@planning.lacounty.gov Any comments provided should identify specific topics of environmental concern and your reason for suggesting the study of these topics in the PEIR. All written comment letters/emails will be included in an appendix in the Draft PEIR and the contents considered in the preparation of the PEIR. DOCUMENT AVAILABILITY AND PROJECT WEBSITE: This Notice of Preparation and the Initial Study are available for view online at: https://planning.lacounty.gov/climate. NOTICE OF PUBLIC SCOPING MEETING: The County will conduct a public scoping meeting to solicit oral and written comments from interested parties on the scope and content of the PEIR. All interested parties are invited to attend the scoping meeting to assist in identifying issues to be addressed in the PEIR. The scoping meeting will include a brief presentation of the project scope to be addressed in the PEIR, a summary of the PEIR process, and will provide attendees with an opportunity to provide input to the scope and content of the PEIR. The scoping meeting will be held online via Zoom on January 13, 2022 at 5:00 p.m. PST. Please visit https://planning.lacounty.gov/site/climate/meetings-hearings/ to register for the meetings. 12/30/21 CNS-3541839# WHITTIER DAILY NEWS #11509202

NOTICE OF PREPARATION

Climate Action Plan (Draft 2045 CAP)

**NOTICE OF PREPARATION
OF A DRAFT PROGRAM ENVIRONMENTAL IMPACT
REPORT**

AND PUBLIC SCOPING MEETING

PROJECT NAME: Los Angeles County 2045 Climate Action Plan (Draft 2045 CAP)

PROJECT LOCATION: Unincorporated areas of Los Angeles County

The County of Los Angeles (County) is the Lead Agency pursuant to the California Environmental Quality Act (CEQA) and its implementing regulations, the CEQA Guidelines. The County intends to prepare a Program Environmental Impact Report (PEIR) for the 2045 Climate Action Plan (CAP) that would be an implementing component of the Air Quality Element of the Los Angeles County General Plan. The County has prepared this Notice of Preparation to provide Responsible Agencies, Trustee Agencies, potentially affected federal agencies, organizations, and other interested parties with information regarding this project and its potential environmental effects, and to solicit your input on the scope and content of the PEIR.

PROJECT DESCRIPTION: The Draft 2045 CAP would require a General Plan Amendment to replace the Los Angeles County Community Climate Action Plan (2020 CCAP), which is an implementing component of the Air Quality Element of the Los Angeles County General Plan. In early 2020, the Department of Regional Planning ("DRP") released a Public Discussion Draft of the Draft 2045 CAP (Public Discussion Draft). After receiving significant comments from stakeholders, DRP determined the need to substantially revise and update the Public Discussion Draft. Revisions will include an updated GHG emissions inventory for 2018; new emissions forecasts for 2030, 2035, and 2045; new GHG emissions targets for 2030, 2035, and 2045; a revised suite of GHG reduction strategies, measures, and actions in response to public comments to be more clear, specific, feasible, and quantifiable; a technical modeling appendix to explain the Draft 2045 CAP's GHG reduction estimates; a consideration of environmental justice and equity concerns; and a new development review consistency checklist to allow projects to streamline CEQA compliance for by using the CAP, per CEQA Guidelines Section 15183.5.

POTENTIAL ENVIRONMENTAL EFFECTS: The County has prepared an Initial Study, which is being circulated with this Notice of Preparation. Because the Initial Study indicates that the proposed project may have a significant impact to the environment in one or more resource areas, the County has determined that preparation of a PEIR is required. The PEIR will focus on the potentially significant effects of the project, and briefly discuss any effects found not to be significant. The PEIR will include a more detailed evaluation of the following environmental issues:

- Air Quality
- Biological Resources
- Cultural Resources
- Noise
- Tribal Cultural Resources

PUBLIC REVIEW PERIOD: The County invites interested parties to provide written comments as to your specific concerns about the project's potential environmental effects. The County requests that any Responsible or Trustee Agency responding to this notice do so in a manner consistent with Section 15082(b) of the State CEQA Guidelines.

A 30-day review period starts on January 3, 2022, and ends on February 1, 2022. Due to the time limits mandated by state law, please send your written response to the address or email below at the earliest possible date, but no later than February 1, 2022, at 5:00 p.m. Please include your name and address for all written correspondence.

Please send written comments to the following address:

Thuy Hua, Supervising Regional Planner
Los Angeles County Department of Regional Planning
320 West Temple Street, 13th Floor
Los Angeles, CA 90012

For email submittal of your comment letter, send to: climate@planning.lacounty.gov

Any comments provided should identify specific topics of environmental concern and your reason for suggesting the study of these topics in the PEIR. All written comment letters/ emails will be included in an appendix in the Draft PEIR and the contents considered in the preparation of the PEIR.

DOCUMENT AVAILABILITY AND PROJECT WEBSITE: This Notice of Preparation and the Initial Study are available for view online at: <https://planning.lacounty.gov/climate>.

NOTICE OF PUBLIC SCOPING MEETING: The County will conduct a public scoping meeting to solicit oral and written comments from interested parties on the scope and content of the PEIR. All interested parties are invited to attend the scoping meeting to assist in identifying issues to be addressed in the PEIR.

The scoping meeting will include a brief presentation of the project scope to be addressed in the PEIR, a summary of the PEIR process, and will provide attendees with an opportunity to provide input to the scope and content of the PEIR.

The scoping meeting will be held online via Zoom on **January 13, 2022 at 5:00 p.m. PST.**

A.4 Scoping Meeting Materials

Los Angeles County

Department of Regional Planning

Public Scoping Meeting for the Proposed **Los Angeles County 2045 Climate Action Plan**

January 13, 2022

Agenda

- **Introductions**

- Thuy Hua, Supervising Regional Planner, DRP
- Iris Chi, Regional Planner, DRP
- Cameron Robertson, Regional Planner, DRP
- Janna Scott, Director, ESA
- Brian Schuster, Senior Managing Associate, ESA

- **Project Description**

- **California Environmental Quality Act (CEQA) Process**
- **Purpose of CEQA Scoping meeting**
- **CEQA Environmental Issue Areas**
- **Project Timeline**
- **Scoping Comments & Public Review**

Project Description

What is a Climate Action Plan?

- Comprehensive roadmap that outlines the specific activities that an agency will undertake to reduce greenhouse gas emissions.

Project Description

The 2045 Climate Action Plan (CAP) would:

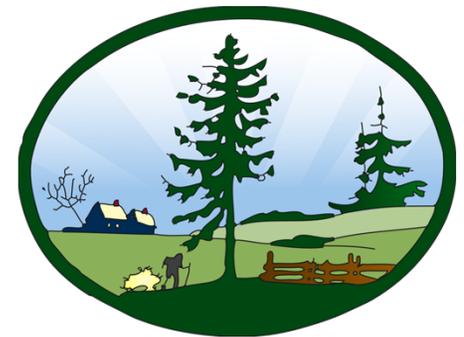

- Amend the Los Angeles County General Plan and replace the 2020 Community Climate Action Plan with the 2045 CAP

Project Description

The 2045 Climate Action Plan would (continued):

- Include a new 2018 greenhouse gas (GHG) emission inventory
- Include emissions forecasts and targets for 2030, 2035, and 2045
- Update the GHG emission reduction strategy for unincorporated areas of the County with equity at the forefront through these sectors:

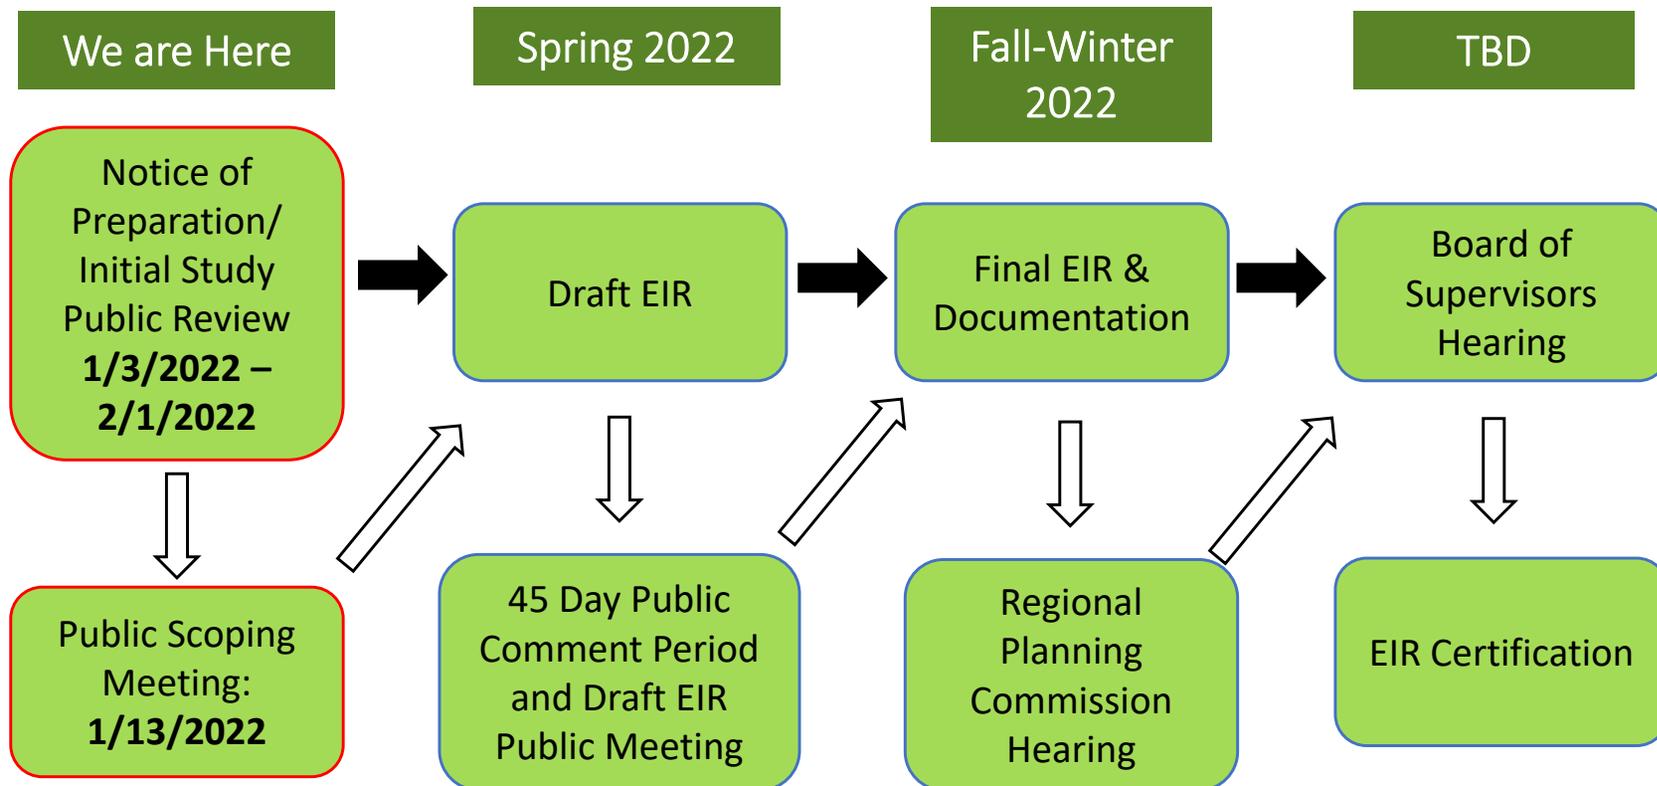

CEQA Process

- Required by law for all discretionary actions
- Informs public & decision makers
- Feasible ways to avoid, reduce, and/or mitigate impacts
- Considers alternatives
- Discloses significant & unavoidable impacts
- Opportunity to comment on the environmental issues

CEQA EIR Process & Schedule

EIR Milestones

Purpose of CEQA Scoping Meeting

- Receive information on the proposed project elements
- Review findings of the Notice of Preparation/Initial Study (NOP/IS)
- Obtain comments on specific environmental topics
- Inform the scope & nature of the Environmental Impact Report (EIR) analysis prepared under the California Environmental Quality Act (CEQA)

CEQA Environmental Issues Areas

Environmental Issue Areas Determined to have a Less Than Significant Impact:

- Aesthetics
- Agriculture / Forestry
- Energy
- Geology/Soils
- Greenhouse Gas Emissions
- Hazards/Hazardous Materials
- Hydrology/Water Quality
- Land Use/Planning
- Mineral Resources
- Population/Housing
- Public Services
- Recreation
- Transportation
- Utilities/Service Systems
- Wildfire

CEQA Environmental Issues Areas

Environmental Issue Areas with Potential Impacts:

- Air Quality
- Biological Resources
- Cultural Resources
- Noise
- Tribal Cultural Resources

Project Timeline and Public Comment

Jan 3, 2022 -
Feb 1, 2022

- Notice of Preparation Comment Period

Spring/Summer
2022

- Draft 2045 Climate Action Plan
- Draft EIR

Fall-Winter 2022

- Draft 2045 Climate Action Plan
- Final EIR
- Public Hearings

NOP Location and Contact Information

The NOP and Initial Study are available online at:

<https://planning.lacounty.gov/site/climate/los-angeles-county-cap>

Written comments are due by: **February 1, 2022 at 5:00 p.m.**

Please direct all responses to:

Thuy Hua

Los Angeles County Department of Regional Planning

320 W Temple St 13th Floor

Los Angeles, CA 90012

Email: climate@planning.lacounty.gov

Project website: planning.lacounty.gov/climate

Comment Period & Conclusion

A.5 Scoping Input Received

February 1, 2022

Subject: Acton Town Council Scoping Comments Regarding the Climate Action Plan.

Reference: Solicitation of Public Input on the Scope Program Environmental Impact Report for the Climate Action Plan Initiated January 3, 2022.

Dear Ms. Hua;

The Acton Town Council ("ATC") appreciates this opportunity to provide scoping comments on the Climate Action Plan ("CAP"). These comments are submitted within the 30-day time limit established by the Department of Regional Planning ("DRP") for the Scoping Interval that began on January 3, 2022; therefore, they are deemed timely filed.

As a preliminary comment, the ATC is concerned that the scope of the CAP as described in the Initial Study ("IS") is vague and therefore troubling. For instance, in the "Community" and "Zoning Designation" sections on page 1, the IS states that the CAP is applicable only in unincorporated areas of the County and will be implemented only in unincorporated areas of the County. Yet, page 2 states that the CAP will provide Greenhouse Gas ("GHG") emission reductions for regional GHG Reduction Actions ("GRAs") and page 41 states that the CAP establishes County-wide GHG emission reduction targets to achieve carbon neutrality by 2045. Additionally, the IS relies heavily on the Sustainability Plan (which is a County-wide document) and even the first CAP "strategy" that is identified in the IS refers to "Lead by Example". All of this indicates that the CAP will serve as a County-wide benchmark and will have a "County-wide" focus rather than an "unincorporated" focus. This is of substantial concern because it means that CAP goals, policies, and strategies will **not** be geared toward the rural communities that must comply with them and which comprise most of the County's unincorporated area; rather, they will be tailored to the "urban form" and urban land uses that predominate within the cities of Los Angeles

County. We see this trend clearly on page 4 of the IS which identifies Strategy 5 and directs the "transition of existing buildings to all-electric." This may be a perfectly reasonable approach in urban areas where temperatures do not drop much below freezing in winter, however it is a dangerous proposition for rural mountain communities where snow and freezing temperatures are common and where electrical service is highly unreliable (particularly over the last few years)¹. Therefore, "transitioning" existing buildings in these areas to all-electric service **will** lead to catastrophic results particularly in winter.

This example demonstrates the importance of clearly establishing that the CAP is only applicable to unincorporated areas, thus its scope is limited to circumstances that pertain to unincorporated areas. In other words, county-wide GHG emission targets, and the emphasis on regional GRAs and the county-wide Sustainability Plan have no place in the CAP. This is critical, because the rural communities which comprise the largest unincorporated area and are most affected by the CAP have development profiles, environmental circumstances, and land use policies that have nothing in common with the rest of the County. In other words, CAP strategies that are appropriate for cities and urban populations are neither suitable for, nor transferable to, rural unincorporated areas within the County; accordingly, the CAP must be specifically tailored to unincorporated communities and not used as a tool to decarbonize the entire County. Unfortunately, none of this is reflected in the IS. In fact, the IS demonstrates that the CAP will not include policies that are appropriate to rural unincorporated areas because it clarifies that the County intends to use the CAP to "Lead by Example" and show urban cities how to force change regardless of extant circumstances. It seems that the County is singularly disinterested in tailoring CAP strategies to rural unincorporated areas or ensuring that CAP policies are appropriate for the unincorporated communities which they govern.

Another general concern with the IS is that it consistently minimizes and erroneously trivializes the significantly adverse environmental impacts that CAP implementation will create. The IS downplays every environmental factor that it addresses by stating that the CAP is merely a "policy document" and claiming that it will not directly result in any impacts because it merely supports development already approved under the General Plan and because projects that implement the CAP will undergo CEQA review in the future. It is clear from these statements that the County does not grasp the scope, purpose, or intent of CEQA. First, adopted County policies *always* create environmental impacts because they direct County activities, ordinances, and decisions, and thereby clearly mandate change;

¹ For example, many Acton residents were without electrical power throughout the recent Thanksgiving holiday. Southern California Edison cut power to Acton residents on the day before Thanksgiving and did not restore service for two days. There was no reason for it; meteorological data taken for the area demonstrate that wind speeds were quite low. Yet, SCE cut power to Acton residents for 48 hours anyway and ruined their Thanksgiving; SCE did not restore power until late Friday afternoon. For more information on this incident, please see the comments submitted by the ATC to the California Public Utilities Commission provided as Attachment A.

that is why General Plans, Climate Action Plans, and other plans are always required to undergo CEQA review. The IS errs in declaring that the CAP will not directly result in impacts because if that were true, then the CAP itself would serve no purpose and its policies and targets would be utterly meaningless. Clearly, this is not the case because the IS states the County intends to use the CAP to create substantial changes in the County and thus "lead by example". Accordingly, it is categorically incorrect for the IS to claim that, as a mere "policy document", the CAP will not directly result in any impacts. Second, the CAP does not support development already approved by the General Plan; in fact, it radically alters adopted General Plan policies by mandating full decarbonization of every sector within every element of the adopted General Plan. The current General Plan does not envision full decarbonization and it never contemplated the environmental impacts of full decarbonization, so the IS factually errs in stating that the CAP merely supports development already approved under the General Plan. Third, it is a multifold violation of CEQA for the County to sidestep its obligation to conduct environmental review of CAP policies simply because the projects that implement these policies will undergo CEQA review at a later date; specifically:

- CEQA requires environmental review of CAP policies and targets and it explicitly mandates that the County consider alternative targets that will reduce environmental impacts while still achieving broad project objectives. So, for example, CEQA requires the County to consider alternatives to the CAP's 100% decarbonization target which will reduce significant environmental impacts while still achieve important decarbonization objectives. Simply put, CEQA requires the County to address the environmental impacts of CAP policies and CAP targets and consider alternative policies and targets *before the CAP is adopted*. This requirement is not satisfied by merely conducting CEQA reviews of individual projects which are implemented in the future to achieve CAP targets.
- CEQA requires the County to consider the cumulative effects of implementing CAP policies, and it does not permit the County to "silo" its environmental impact analysis by individually considering CAP implementation projects on a stand-alone basis and thereby ignore the extent to which these impacts are cumulatively considerable.
- CEQA does not permit a Lead Agency to defer CEQA review, yet that is precisely the outcome that will result if the County fails to conduct an adequate CEQA review of CAP policies simply because the individual projects that will eventually implement these CAP policies will someday undergo environmental review.

Accordingly, the ATC respectfully disagrees with IS conclusions regarding potentially significant adverse environmental effects of the CAP. Contrary to what the IS asserts, the CAP has the potential to create many significant adverse environmental impacts, thus CAP strategies and targets warrant proper environmental review.

In the interest of brevity, the remaining ATC comments are provided below and arranged according to topic.

The CAP Environmental Review Must Consider Alternatives to Decarbonization Targets, Waste Diversion Rates, and Other Strategies.

The IS asserts that, though not required by law, the CAP will achieve "carbon neutrality" by 2045 (page 1) and that this target is "county-wide" (page 41). Additionally, the IS asserts that the CAP will incorporate waste diversion strategies, water conservation measures, etc. (though it does not appear to identify actual targets for any of these strategies). Among other things, CEQA requires that the County identify alternatives to each of these CAP strategies (including "no project" alternatives) and assess the environmental impacts of each alternative and the climate change benefits that each alternative provides. These CEQA-mandated alternative analyses are critically important because they identify opportunities for reducing project impacts while still achieving broad project objectives.

To ensure a legally sufficient CEQA review, the County will have to consider various GHG emission reduction strategies, including those that do not achieve carbon neutrality by 2045. The IS indicates that the CAP environmental review will consider ""high and low" emission scenarios, and it mentions a "business as usual" forecast, but these terms are vague and not defined. The GHG reduction target alternatives that the County must consider to ensure a legally sufficient CAP environmental review (aside from the 2045 carbon neutral target) include a "no project" alternative (which is perhaps what the IS means by "business as usual") as well as a GHG emission reduction target that complies with current regulations but goes no further. Another GHG reduction alternative that should be considered is one which establishes a 2045 target that is midway between carbon neutrality and whatever is mandated by law. And, for each GHG reduction alternative, the County must identify the potentially significant adverse environmental impacts that it will create (including an analysis of the total acreage of solar panels, energy storage facilities, and transmission infrastructure required to achieve it) as well as the climate change reduction potential that it will provide so that the County can meaningfully determine whether the climate change benefits achieved by each alternative truly outweigh the adverse environmental impacts that it creates.

In a similar manner, the County must consider various alternatives to the waste diversion strategy, the water conservation strategy, and all the other CAP strategies identified in the IS to ensure an adequate CEQA review. For example, the ATC understands that the County is required to meet minimum waste diversion requirements over the next few decades, so an alternative that the county must consider in the CAP environmental review is one which achieves these regulatory requirements but goes no further. Another alternative that should be addressed is one that achieves diversion rates that are midway between the

minimum required by law and the actual target established by the CAP (which the IS fails to identify). And, for each alternative, the County must identify the adverse environmental impacts that it will create (such as the extent and location of all the new facilities that will be required to achieve them) and quantify the climate change benefit that it will provide so that a meaningful determination can be made regarding whether the benefits of each alternative truly outweigh its impacts. This is the only way to ensure a legally sufficient CEQA review.

The IS Improperly Ignores the Environmental Impacts of Expanding Utility Scale Solar Facilities in Rural Communities to Achieve CAP Decarbonization Goals.

According to the IS, a centerpiece of the CAP will be the full decarbonization of energy usage within 23 years through the expansion of renewable energy (particularly solar energy). According to the IS, there is no regulatory driver for achieving 100% decarbonization; it is merely something that the County wishes to accomplish. It is estimated that at least 43,000 acres of solar panels will be required to fully decarbonize the unincorporated areas of Los Angeles County²; accordingly, and to ensure compliance with the California Environmental Quality Act ("CEQA"), the environmental document prepared for the CAP must, *at a minimum*, consider the impacts of this solar panel development as well as the energy storage and transmission facilities that they will require for feasible operation. However, the IS makes it clear that the GHG emission reduction targets established by the CAP will actually be "county-wide" because the County wants to "lead by example"; this means that the CAP itself will be the foundation upon which county-wide

² According to the California Energy Commission ("CEC"), Los Angeles County consumed 65649.87 GWhr of electricity in 2020 (<https://ecdms.energy.ca.gov/elecbycounty.aspx>). Since unincorporated residents comprise approximately 10% of the population in Los Angeles County, unincorporated electrical consumption is approximately 6565 GWh per year. Since 30% of this consumption is already renewable, 70% (or 4596 GWhr) will have to be served by new solar facilities just to decarbonize the existing energy use profile (i.e., it does not account for the electrification of all future buildings and all existing buildings) According to the National Renewable Energy Laboratory ("NREL"), utility scale solar requires 3.4 acres per GWhr·year (<https://www.nrel.gov/docs/fy13osti/56290.pdf>), which means that more than 15,624 acres of new solar facilities will be required just to de-carbonize existing electrical consumption in unincorporated Los Angeles County. To achieve other CAP decarbonization goals (transportation electrification, building electrification, electric cars, etc.) it is estimated that twice as much solar facilities will be required; this brings the total up to 31,250 acres. And, according to the Southern California Association of Governments ("SCAG"), population in the County will grow by 20% by 2045, (https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocial_demographics-and-growth-forecast.pdf?1606001579) so the actual amount of new solar facilities required to achieve CAP goals in unincorporated Los Angeles County will be at least 37,500 acres. And, since "storage losses" of 10% and "transmission losses" of 5% are common, the actual number of acres required to fully decarbonize unincorporated Los Angeles County will be at least 43,000 acres.

decarbonization is achieved. As such, the environmental document prepared for the CAP must address the environmental impacts of achieving this county-wide decarbonization outcome. Specifically, CEQA demands that the CAP environmental document consider the impacts of developing more than 430,000 acres (or 672 square miles) of new solar panels as well as the energy storage and transmission facilities that these facilities will require to decarbonize all of Los Angeles County³. In other words, because the County will use the CAP as the primary tool for advancing decarbonization throughout the County, the CAP environmental review must consider the environmental impacts of achieving this county-wide decarbonization outcome.

Notably, the CAP's decarbonization goal can be achieved in one of two ways: either by directing renewable energy generation and storage to occur locally so that power is sustainably created where it is used (typically referred to as "distributed generation") or by directing renewable energy generation and storage to occur remotely in massive solar farms that are typically located in the desert and require the construction of extensive high voltage transmission lines through Very High Fire Hazard Severity Zones to deliver power to urban "load". It is certainly feasible to achieve the CAP's decarbonization goals via distributed generation because 1470 square miles of the County are already developed⁴ and can therefore easily accommodate 672 square miles of solar panels that are required to achieve CAP decarbonization goals county-wide.

Obviously, the environmental impacts of directing renewable energy generation and storage to occur locally will be relatively low because it will only affect the existing "built" environment (since it relies on existing roof tops using existing distribution lines and substations). Accordingly, a CAP that directs the expansion of distributed generation to achieve its renewable energy target can be reasonably deemed to create "less than

³ The CEC reports that Los Angeles County consumed 65649.87 GWhr of electricity in 2020 (<https://ecdms.energy.ca.gov/elecbycounty.aspx>). Assuming that 30% of this consumption is already renewable, 70% (or 45955 GWhr) will have to be served by new solar facilities just to decarbonize the County's existing energy use profile (i.e., it does not account for the electrification of all future buildings and all existing buildings). This will require more than 156,000 acres of new solar panels according to NREL data which reports that 3.4 acres of solar panels are required to produce a GWhr per year of solar energy (<https://www.nrel.gov/docs/fy13osti/56290.pdf>). This will double to more than 300,000 to accommodate all other CAP decarbonization goals (transportation electrification, elimination of natural gas for heating and cooking, electric vehicles, etc.). And, factoring the 20% population growth that SCAG projects for 2045 increases the number of acres of solar panels to achieve CAP goals county wide to more than 370,000. Factoring in the 10% storage loss and the 5% transmission loss that is always associated with renewable generation and transmission increases the total required solar panel area to more than 430,000 acres.

⁴ According to Page 90 of the Sustainability Plan, 64.4% of the County is classified as "natural area" which means that 35.6% is developed. And, according to page 15, Los Angeles County is 4,084 square miles in area. Together, these statistics demonstrate that more than 1,400 square miles of Los Angeles County is developed (.356 x 4084 = 1454).

significant" environmental impacts. However, if the CAP does not direct the development of distributed generation to achieve its decarbonization goals, then the environmental document will be required to consider the substantially adverse environmental impacts of developing more than 430,000 acres of remote utility scale generation and storage facilities in the pristine deserts of Southern California to achieve county-wide decarbonization as well as the new transmission facilities that will be required to serve these remote solar "farms". Under this circumstance, the impacts that will have to be addressed in the CAP environmental review are diverse, substantial, and they include (but are not limited to) aesthetics, transmission line wildfire ignitions, biological resource destruction⁵, farmland conversion, open space conversion, dust storms, valley fever, and increased asthma and respiratory insults in the rural communities of the Antelope Valley.

For example, the Audubon Society has clearly shown that utility-scale solar facilities in broad, open space areas that are rich with wildlife habitat (like the Antelope Valley) is particularly deadly to birds because they mistake the masses of solar panels as water bodies and the birds then collide with the panels when they try to land. Birds are also killed by the transmission lines that serve these utility scale facilities. That is why the Audubon Society supports "rooftop solar" over utility scale solar in open space areas as "ecologically ideal because it doesn't disrupt any habitat, but rather makes use of already-built space that would otherwise not go to productive use."⁶

The health impacts of the ambient dust generated by the construction and operation of utility scale solar farms are also of significant concern, particularly in the Antelope Valley where (according to health statistics compiled by Los Angeles County) the County's highest childhood asthma rates and COPD rates are found⁷ (actually, the incidence of these diseases in the Antelope Valley are among the highest in the nation). All of these existing health concerns will be substantially exacerbated by development of the additional utility scale solar facilities that will be required to achieve CAP decarbonization goals. CEQA does not permit the County to ignore these health impacts or any other adverse impacts posed by the 430,000 acres of solar panels that will be required to achieve CAP decarbonization goals county-wide.

⁵ The County is fully aware of the destruction to biological resources, habitat, and corridors that are created by remote solar farms in the Antelope Valley desert area. For example, solar project in the Antelope Valley have destroyed hundreds of Joshua Trees that are supposed to be "protected", and the Silverado project approved by the County destroyed large areas of burrowing owl habitat and relocated many burrowing owls with only limited success. Solar farms have fenced off tens of thousands of acres of desert lands, eliminated entire wildlife corridors, dislocated wildlife, and destroyed extensive habitats.

⁶ <https://www.audubon.org/news/solar-power-and-birds>

⁷ "Los Angeles County Indicators of Health" found here: http://publichealth.lacounty.gov/ha/docs/2015LACHS/KeyIndicator/PH-KIH_2017-sec%20UPDATED.pdf

The County seems to be at least dimly aware that CAP implementation could result in extensive new solar farms in the Antelope Valley. For instance, the IS affirms that the CAP will "incentivize" the development of solar facilities in rural areas (at 10, 15) and it specifically identifies the Antelope Valley as an area that will be targeted for such programs. (10, 12, 14, 15, 20). However, the CAP must avoid "incentivizing" the development of solar facilities in rural areas by directing the expansion of new solar facilities in developed areas only. If the CAP does not include such directives, then the County is *obligated* to address the environmental impacts of the 430,000 acres of remote utility scale solar facilities that will be required to achieve CAP decarbonization goals county wide.

Remarkably, the IS makes it clear that the County intends to *ignore* all the adverse environmental impacts posed by the 430,000 acres of solar panels that will result from CAP implementation because the IS only identifies Air Quality, Noise, Biological Resources, and Cultural Resources as environmental factors that will be considered in the CAP environmental review. Worse yet, the IS indicates that even these impacts will be given scant consideration. For example, neither the "Cultural Resources" section nor the "Tribal Cultural Resources" section give any consideration to the potential cultural resource impacts of the 430,000 acres of new solar panels that will result from CAP implementation county wide; these impacts are completely ignored. It is entirely implausible to presume that the installation of 430,000 acres of solar panels will not have any impacts on cultural or tribal cultural resources, yet that is precisely the premise adopted by the IS. The *only way* to ensure that CAP decarbonization goals do not impact cultural resources is for the CAP to direct new renewable resources toward developed areas; if the CAP does not include such directions, then the "Cultural Resources" section and the "Tribal Cultural Resources" section of the CAP environmental document must properly address the impacts of destroying 430,000 acres of land to achieve CAP decarbonization goals county wide. The "Air Quality" section of the IS is similarly deficient because it completely ignores the terrible dust storms and attendant valley fever concerns that will be created by expanding utility scale solar farms in the Antelope Valley to achieve CAP decarbonization goals. The IS section on "Biological Resources" is even worse: it indicates that the impacts of remote utility scale solar facilities will not be analyzed in the CAP environmental document at all because in the future, individual utility scale solar projects will "undergo site-specific review and CEQA analysis to analyze and mitigate potential significant impacts to candidate, sensitive, or special status species and their habitats". This approach violates CEQA in several ways. First, CEQA prohibits Lead Agencies from deferring analysis of potentially significant biological resource impacts, so the CEQA document prepared for the CAP must address "head on" the 430,000 acres of remote utility scale generation that will result from implementation of CAP decarbonization goals county wide if they are not met via distributed generation. Second, analyzing the environmental impacts of each utility scale solar project individually ignores the extent to which they pose cumulatively considerable impacts, thus it utterly violates CEQA.

The ATC cannot fathom why the IS completely ignores the environmental impacts of securing the renewable energy resources that will be required to achieve CAP decarbonization goals; perhaps the County is simply unaware of the enormous quantity of solar panels that these renewable energy resources will require. If this is the case, then this letter provides material factual evidence demonstrating that at least 43,000 acres of new solar panels will be required to achieve CAP decarbonization goals in unincorporated Los Angeles County, and at least 430,000 acres will be required to fully decarbonize Los Angeles County. Unless the CAP specifically directs these new solar facilities to be constructed in developed areas, they will cause significant adverse environmental impacts that must be addressed in the CAP environmental document. Anything less will constitute a gross violation of CEQA.

The IS Wrongly Eliminates Aesthetic Impacts from the List of Environmental Factors that Must be Considered in the CAP Environmental Analysis.

According to the IS, the County has concluded that CAP implementation will not result in any "Aesthetic Impacts" and thus does not intend to consider aesthetic impacts in the CAP environmental document. This is a mistake. The following paragraphs identify the errors noted in the IS, and demonstrate that aesthetic impacts must be fully addressed in the CAP environmental document.

Page 10 of the IS states "Other potential projects promoted by Draft 2045 CAP Strategies could include composting facilities, renewable energy generation facilities, or water recycling facilities which could be located in more rural areas of the County and, depending on the design and location, create a greater level of visual contrast compared with existing conditions." The ATC agrees that converting 430,000 acres in rural areas into solar farms and substantially expanding waste handling and composting facilities in rural areas will create a substantially "greater level of visual contrast in the rural areas where they will be constructed"; the waste facilities will also contribute significantly to odor problems as well. The Antelope Valley is already home to more than 50,000 acres of solar farms and two enormous dumps that serve the County of Los Angeles, so any incremental increase in such facilities in the Antelope Valley will be significant. Yet, and despite this clear acknowledgment that the CAP will pose significant aesthetic impacts in rural areas, the IS nonetheless declares that aesthetic impacts will be "less than significant" and it explicitly omits them from consideration in the CAP environmental document. This constitutes a grievous CEQA error which can only be rectified by ensuring that the CAP environmental review properly considers the significant adverse environmental impacts that CAP implementation will have in rural areas including (but not limited to) those pertaining to renewable energy generation and waste reduction.

Page 11 of the IS states "utility-scale solar energy generation projects would be required to comply with the Renewable Energy Ordinance (REO), which regulates ground-mounted solar projects to address community concerns and minimize environmental impacts. The REO requires that any ground-mounted solar project obtain a Minor Conditional Use Permit or Conditional Use Permit. Both permits require that ground-mounted solar be analyzed for negative visual impacts and the potential for the facility to impact the viewshed (LA County Office of the County Counsel, 2016). Compliance with the REO and the enforcement of conditions listed as part of the REO would ensure that the potential for small-scale and utility-scale solar energy generation projects to impact visual resources would be minimized." This statement is factually incorrect. The REO does **not** "ensure that the potential for utility scale solar energy projects to visual resources would be minimized" and County Counsel is flat out wrong to claim that it does. This is because the REO does not address impacts of utility scale renewable energy projects to visual resources; to the contrary, the REO only requires a "landscape buffer" in small areas which are never maintained so on the rare occasion when a few straggling bushes are planted, they quickly die and blow away. More importantly, the REO does not consider the cumulative aesthetic impacts of the 50,000+ acres of solar farms already in the Antelope Valley, and it will never address the cumulative aesthetic impacts of adding 430,000 acres of additional solar farms required to achieve CAP goals county-wide. Equally important, none of the CUPs issued for solar farms in the Antelope Valley have *ever* considered the cumulative impacts of the 50,000+ acres of solar farms that have already torn up the Antelope Valley, caused unbearable dust problems and turned entire sections of the desert into a sea of black glass. Therefore, the IS materially errs in declaring that the REO will adequately address the aesthetic impacts of all the new solar facilities required to achieve CAP decarbonization goals.

Page 12 of the IS states "The compliance of future projects with the General Plan and County Code would reduce the potential impact of future projects on scenic vistas." This statement is categorically false. Neither the General Plan nor the County Code ever contemplated 430,000 acres of new solar panels or even 43,000 acres of new solar panels because neither are founded on the full decarbonization profile that is established by the CAP. Because the CAP greatly expands decarbonization programs far beyond what was ever considered in the General Plan or is now contemplated by the County Code, it is a gross error for the County to declare that scenic vista impacts of new solar facilities developed to achieve CAP decarbonization goals will be reduced by merely complying with the General Plan and Zoning Code. Therefore, the IS materially errs in declaring that compliance with the General Plan and County Code is sufficient to protect scenic vistas from the massive solar farms that will result from CAP implementation.

Page 12 of the IS also states "some projects could result in more noticeable visual contrast and changes, especially if projects are located in more rural areas of the County such as solar projects proposed in the Antelope Valley" but "solar energy generation projects

would be required to comply with the REO, which includes conditions to reduce the visual impacts of solar projects". The extent to which this statement trivializes the conversion of at least 43,000 acres, and in reality, more than 430,000 acres of acres of desert land into solar farms is *stunning*, as is its vague and understated acknowledgement that these solar farms will create a "more noticeable visual contrast". The IS then compounds this grossly insupportable statement by wrongly declaring that the REO will reduce these visual impacts. Nothing could be further from the truth; the "landscape buffer" that the REO requires along small sections of a solar farm (which consists of a few straggling shrubs that provide no screening, are never maintained, and die within a few months anyway) does nothing to "reduce visual impacts of solar projects" and it will certainly not address the cumulative aesthetic impacts of the 43,000 - 430,000 additional acres of solar panels that will be required to meet CAP goals. Therefore, the IS materially errs in concluding that CAP implementation will not result in significant visual impacts.

Page 14 of the IS addresses whether the CAP will substantially degrade existing visual character because of the bulk or scale of the project, and the IS concludes that this concern will be less than significant because "The potential for utility-scale or other sized solar energy generation projects to be proposed in more rural areas such as the Antelope Valley would continue to be analyzed on a project-specific basis for purposes of CEQA." Notably, this statement does not support a finding of "less than significant" aesthetic impacts; in fact, it seems to suggest the opposite because it acknowledges that the CAP will result in new large utility scale solar projects in the Antelope Valley and that such projects warrant CEQA review (albeit in the future). On that basis alone, the County has a statutory obligation to conclude that the CAP poses potentially significant aesthetic impacts in the Antelope Valley. Worse yet, by declaring that the aesthetic impacts of solar projects in the Antelope Valley will be analyzed later on a "project specific basis", the County evinces a clear intent to improperly defer analysis of these potentially significant aesthetic impacts and improperly avoid addressing whether they are cumulatively considerable. The County is reminded that CEQA does not permit a Lead Agency to defer the analysis of potentially significant impacts to a later time and it certainly does not allow the Lead Agency to ignore cumulatively considerable impacts by separately analyzing individual projects in a "piecemeal" fashion.

In summary, the CAP GHG goals will require more than 43,000 acres of new solar panels just to decarbonize unincorporated areas and more than 430,000 acres to achieve county-wide decarbonization; if the CAP does not direct the expansion of these new solar facilities toward already developed areas, the CAP will cause devastating aesthetic impacts on remote rural areas. These aesthetic impacts, along with the associated aesthetic impacts of massive new transmission lines and energy storage facilities, must be addressed in the CAP environmental review because they will not be mitigated by merely complying with the General Plan (which never considered 43,000 acres of new solar farms let alone 430,000 acres) or complying with the REO (which fails to adequately address aesthetic concerns

and completely ignores cumulatively considerable aesthetic impacts). The ATC challenges the conclusion set forth in the IS that the aesthetic impacts of CAP implementation are "less than significant". We further assert that it is entirely unacceptable for the County to proceed with CAP development without a thorough examination of the significant aesthetic (and other) environmental impacts that CAP implementation will have on the rural residents of Los Angeles County as a result of the solar farms, transmission lines, storage facilities, and other accoutrement required to achieve compliance with CAP GHG targets.

The IS Ignores Many Environmental Impacts Because It Wrongly Asserts That Projects Implementing the CAP will be Located Within the Urban Environment.

The conclusions presented in the IS regarding potential environmental impacts are largely contingent on the assumption that projects implementing the CAP will occur in developed or "urban" areas⁸. However, this assumption is only valid if the CAP specifically directs that implementation of its policies occur in urban areas. Unfortunately, nothing in the IS states (or even suggests) that the CAP will direct the implementation of its policies to urban areas; in fact, the IS specifically identifies rural communities in the Antelope Valley as a likely location where solar development will occur to achieve CAP targets. In other words, there are significant contradictions in the assumptions which underlie the IS; as a result, IS conclusions regarding environmental factors that are based on these contradictory assumptions are completely erroneous. Accordingly, the CAP environmental review must address all the environmental factors that the IS wrongly removed from consideration because of erroneous assumptions including impacts that were eliminated based on the premise that projects implementing the CAP will occur in developed and "urban" areas".

Other Environmental Factors Wrongly Eliminated by the Initial Study.

According to page 8 of the IS, the following environmental factors are deemed to not be potentially significant impacts affected by CAP decarbonization goals: Energy, Geology/Soils, GHG Emissions, Hazards, Hydrology, Land Use, Minerals, Population and Housing, Public Services, Transportation, and Wildfire. The ATC disputes these conclusions for the reasons set forth below.

Energy: Achieving county-wide decarbonization in Los Angeles County will create profound changes in energy generation and delivery in the County, and these changes have the potential to create significant adverse impacts. The IS errs in concluding that, just because the CAP will not result in wasteful, inefficient, or unnecessary energy use or

⁸ For example, the IS analyses of aesthetic impacts, agriculture/forest impacts, biological resource impacts, population and housing impacts, and wildfire impacts all presume that projects implementing the CAP will be located within the urban environment.

conflict with a local plan, it poses no significant adverse energy impacts. For example, the CAP substantially increases our dependence on electrical energy; this will result in more blackouts and brown outs, particularly during the summer when peak loads cannot be met by available energy resources. This is not opinion, it is fact⁹. Additionally, the CAP strategy to decarbonize existing development by transitioning to all-electric facilities will substantially impact rural residents that do not have reliable electrical service and even expose them to life-threatening conditions (as discussed above). Furthermore, the existing distribution grid in Los Angeles County will likely require additional switchgear installations and other upgrades to accommodate the 430,000 acres of new rooftop solar that will be installed if the CAP directs county-wide decarbonization targets to be achieved via distributed generation. On the other hand, if the CAP directs its decarbonization targets to be met by remote utility scale generation facilities, then the existing transmission and subtransmission system that delivers power to the urban core of Los Angeles County will require substantial upgrades to accommodate remote generation from the 430,000 acres of new solar facilities that the targets require. In other words, the CAP's 2045 decarbonization target will require substantial alterations in the County's energy system and these alterations must be evaluated for their environmental impacts; thus, the IS errs substantially in eliminating energy as an environmental factor that must be addressed in the CAP environmental review.

Geology/Soils: The IS concludes that the CAP will not "Result in substantial soil erosion or the loss of topsoil" (page 37). This conclusion is incorrect. The installation of 430,000 acres of remote utility scale generation will result in extensive, permanent vegetation removal in fragile desert areas. This in turn will increase wind-blown dust and substantially alter topsoil profiles wherever solar farms are installed. This is a substantial concern in the Antelope Valley where soil stability is highly variable and where regulatory agencies including the AVAQMD and the Antelope Valley Resource Conservation District have struggled to address wind-blown dust from existing solar farms. The potentially significant topsoil impacts that will be created by the installation of 430,000 acres of new solar panels necessary to achieve CAP decarbonization targets must be addressed in the CAP environmental review; the only way the County can avoid addressing these impacts is if the CAP directs its decarbonization goals to be achieved through the expansion of distributed generation in already developed areas.

Hazards: The IS concludes that the CAP will not pose any significant hazard risk. The ATC disagrees. Achieving CAP decarbonization goals will require the addition of extensive new battery storage facilities to ensure power delivery when the sun is not shining and the wind is not blowing; it is estimated that thousands of megawatts of battery storage facilities will be required to decarbonize Los Angeles County. These battery storage facilities are prone

⁹ [https://www.nbcnews.com/news/us-news/california-warned-brace-another-summer-energy-blackouts-n1268879'](https://www.nbcnews.com/news/us-news/california-warned-brace-another-summer-energy-blackouts-n1268879)

to overheating, ignition and even explosion¹⁰, and once ignited, take days to burn out¹¹. Accordingly, they pose a significant hazard wherever they are located. The significant hazards posed by the extensive battery storage facilities that will be required to achieve the CAP's decarbonization target must be addressed in the CAP environmental review. Additionally, the development of 430,000 acres of solar farms in remote areas will substantially increase ambient dust levels and, by extension, increase the threat of Valley Fever and other respiratory insults to residents who will be exposed to the increased dust levels. These hazards must also be addressed in the CAP environmental review.

Hydrology: The IS concludes that CAP implementation will not substantially decrease groundwater supplies (page 49) or substantially alter existing drainage pattern (page 50). The ATC disagrees. If CAP decarbonization goals are achieved via remote utility scale generation, the 430,000 acres of solar farms that will be constructed will require significant quantities of water to wash and maintain the panels (panel washing must be done at least several times per year, particularly in desert areas where ambient dust degrades panel performance). Since these remote locations do not have access to recycled water resources, the solar farms will rely on groundwater resources. Washing 430,000 acres (or 672 square miles) of solar panels located in the desert several times a year will require significant quantities of groundwater, and the CAP environmental review must consider the impacts this will have on groundwater supplies. Additionally, utility-scale solar facilities require extensive grading to level the ground for optimum panel configuration; thus, installing the 630,000 acres of solar panels required to achieve CAP targets will result in significant grading and, by extension, significantly alter to drainage courses. Accordingly, the IS is wrong to conclude that the CAP will not alter existing drainage patterns.

Transportation: The IS concludes that CAP implementation will not substantially impact transportation. The ATC disagrees. CAP targets will de-carbonize all modes of transportation in Los Angeles County within 23 years and electrify all transit and vehicle facilities; this will expose the County's transportation system to new risks that have not heretofore been encountered. For example, events which affect the transmission grid will impede power deliveries to the County's urban areas and bring portions of the County's transportation network to a standstill. This is not hypothetical; in fact, a small fire at the Vincent transmission substation actually caused power flows on a major energy

¹⁰ <https://cleanenergynews.ihsmarket.com/research-analysis/vistra-battery-storage-facility-in-california-remains-shut-aft.html>
<https://www.genre.com/knowledge/publications/pmint21-3-en.html>
<https://www.insurancejournal.com/magazines/mag-features/2020/09/07/581175.htm>.

¹¹ <https://www.usatoday.com/story/money/cars/2021/08/02/tesla-megapack-battery-ignites-fire-australia-burns-4-days/5453874001/>

transmission corridor to be cut by more than 50%¹². The urban portions of Los Angeles County are served by only a handful of high voltage transmission substations; this makes Los Angeles County residents incredibly vulnerable to power disruptions. And, as the County's electrical dependence increases through implementation of the CAP, these vulnerabilities will become magnified, and they will become exponentially large if the CAP's decarbonization goals are met through expansion of remote utility scale renewable generation rather than local distributed generation. In other words, implementing the CAP via remote renewable generation will pose significant operational risks to the County's transportation infrastructure; these risks must be addressed in the CAP environmental review.

Wildfire: The IS concludes that CAP implementation will not pose significant wildfire risks and in particular the IS asserts that the CAP will not "exacerbate fire risk" (page 76) or require the construction of power lines or other utilities "that may exacerbate fire risk" (page 77). These conclusions are absurd. Implementation of CAP decarbonization targets will require massive increases in utility facilities that pose significant fire risks, including battery storage facilities (as discussed above). And, if the CAP does not direct new renewable energy facilities to be constructed in already developed areas, then achieving CAP decarbonization goals will require massive new transmission lines to deliver power from the 430,000 acres of new, remotely sited, utility scale solar facilities. These lines will be constructed within the Angeles Forest and in other mountainous areas that are designated as "Very High Fire Hazard Severity Zones" and as such will greatly increase wildfire risks. The IS wrongly concludes otherwise, and these risks must be addressed in the CAP environmental review.

Utilities: The IS concludes that CAP implementation will not result in the construction of new electric power facilities "the construction or relocation of which could cause significant environmental effects" (page 72). This conclusion is absurd. Implementation of the CAP's county-wide decarbonization targets will require the construction of more than 430,000 acres of new solar panels, thousands of megawatts of energy storage facilities, and extensive new grid facilities; accordingly, the construction and operation of these facilities will cause significant environmental effects. The environmental document prepared for the CAP must address the significant adverse environmental impacts of these facilities particularly if the CAP fails to direct new renewable energy development to occur in already developed areas.

¹² The Vincent substation connects the Los Angeles Basin to renewable resources located in the Antelope Valley and is a primary energy "node" serving Los Angeles County. It is also the southern terminus of the "Path 26" energy corridor connecting Southern and Northern California. A transformer fire at this facility caused Path 26 to be de-rated from 3000 MW to only 1400 MW. <http://www.caiso.com/Documents/DMAReportApril2003.pdf>

Specific Comments Regarding CAP Strategies, GHG Targets, and Other Matters Presented in the Initial Study.

The ATC offers the following specific comments pertaining to the various CAP strategies and GHG reduction measures identified in the IS.

- Strategy 2 identifies a Measure to "Develop Land Use Plans Addressing Jobs/Housing Balance & Increase Mixed Use". The problem is, the adopted County General Plan and the adopted Antelope Valley Area Plan already provide land use plans that address jobs/housing and establish appropriate "Mixed-Use" profiles. If different land use plans or new "mixed-use" profiles are established in the CAP, then the CAP itself will be in conflict with existing land use policies already adopted into the County General Plan and the Antelope Valley area Plan; this would violate the statutory purpose of the General Plan¹³. The ATC is particularly concerned by this measure because "mixed use" development is intrinsically contrary to the type of low density land uses that are established for the rural unincorporated areas which are subject to the CAP.
- Strategy 2 also asserts "Reduce single-occupancy vehicle trips". There is no justification for this strategy since the CAP GHG goals will be met by decarbonization. In other words, there is no need to deprive people of the freedom to drive where they wish and when they wish because they will be driving electric vehicles and therefore "single-occupancy vehicle trips" will not contribute to GHG emissions.
- Strategy 3 asserts "Expand Bicycle & Pedestrian Network to Serve Residential, Employment, & Recreational Trips". The ATC objects to the limitations that are placed on this strategy and the extent to which it ignores equestrian uses. It is unacceptable to limit the active transport policies established by the CAP to only address bicycle and pedestrian modes, particularly within Acton and in the other rural communities that will be subject to the CAP. This strategy must be expanded to address equestrian uses and secure an equestrian network to serve residential, employment, and recreational trips.
- Strategy 3 also asserts "Removal of Parking Minimums". This strategy will eliminate EV charging locations, reduce driving enjoyment, and it is not needed to achieve GHG reductions because GHG goals will be met through decarbonization. Therefore, there is no justification for "Removal of Parking Minimums".

¹³ "If a general plan is to fulfill its function as a 'constitution' guiding 'an effective planning process,' a general plan must be reasonably consistent and integrated on its face. A document that, on its face, displays substantial contradictions and inconsistencies cannot serve as an effective plan because those subject to the plan cannot tell what it says should happen or not happen." (*Concerned Citizens of Calaveras County v. Board of Supervisors* (1985) 166 Cal.App.3d 90, 97.)

- Strategy 5 includes " Transition Existing Buildings to All-Electric" and "Standardize All-Electric New Development". As indicated above, this strategy will not work in rural areas where electrical service is unreliable; it will result in casualties and even fatalities.
- Strategy 6 includes "Increase Renewable Energy Production". As indicated above, there are two ways to implement this strategy: either via distributed generation within already developed areas or via remote utility scale generation in rural and open space areas. Because the former poses relatively smaller environmental impacts, and the latter creates significant environmental impacts, it is essential that the CAP clearly articulate which of these two approaches will be incorporated in Strategy 6 implementation; it is also critical that the environmental document prepared for the CAP properly addresses the impacts corresponding to the Strategy 6 implementation program established by the CAP.
- Strategy 8 includes "Increase Use of Recycled Water and Gray Water Systems" and "Reduce Indoor and Outdoor Water Consumption". The IS provides no information regarding this strategy or the targets that it will establish for recycling water and reducing consumption, thus it is impossible for the public to provide meaningful scoping comments regarding this Strategy 8. And, without further information pertaining to this strategy or how it will be implemented, the public cannot comment on its implication or impacts. What is meant by "reduce indoor and outdoor water consumption"? Does the County plan to restrict water usage to meet the state goal of 50 gallons per person per day? If so, then the animal rescues, equestrian uses, and other uses in Acton will be eliminated by this strategy. Also, what does it mean to "Increase Use of Recycled Water and Gray Water Systems" particularly in unincorporated rural areas that do not have sewage facilities and are not supposed to have sewage facilities? The lack of detail provided by the County regarding Strategy 8 has prevented the ATC from providing substantive comments regarding its potential environmental impacts and thus thwarted the purpose and intent of CEQA scoping.
- Strategy 9 includes "Increase Organic Waste Diversion", "Maximize Countywide Diversion Rate", and "Institutionalize Sustainable Waste Systems & Practices". The IS provides no information regarding this strategy or the targets¹⁴ that it will establish for waste diversion and waste practices. As a result, the public cannot meaningfully comment on the implications or impacts of Strategy 9. Presumably, this strategy will increase the number of waste facilities in the County; it is also likely to increase trip rates because instead of having one trash pickup a week, residences will have three or more (organic waste, recyclable waste, and trash). If these facilities are located in remote areas, that will add to the transportation impacts of this strategy and it will

¹⁴ Page 74 of the IS states that Measure W3 includes a goal of "decreasing per capita waste by 35% by 2045" but this target is not described in the strategy details provided on pages 3-5 and it is not mentioned anywhere else in the IS, so it is not certain whether this is even an actual CAP target.

create adverse environmental impacts in the areas where they are located. Consideration must also be given to where the recycled/diverted waste will go. The ATC understands that the County is eager to increase mulch generation as a means of increasing diversion rates, but most mulch that is currently produced by facilities in Los Angeles County is contaminated with trash and it often has a terrible stench; this is because current standards allow a considerable amount of trash in organic material before it is mulched. Unfortunately, due to the lack of detail provided by the County regarding Strategy 9, the ATC is uncertain whether these comments are even relevant to the CAP scoping effort. In any event, we have been prevented from providing substantive comments regarding the potential environmental impacts of Strategy 9 in a manner that thwarts the purpose and intent of CEQA scoping.

- Page 2 of the IS states that the CAP will include revisions to address "locating new housing developments away from existing sources of air pollution". It is the ATC's understanding that matters pertaining to the location of new housing and the proximity of housing to air pollution sources lie within the purview of the General Plan Land Use Element, Air Pollution Element, and Safety Element (and perhaps the AVAQMD and SCAQMD); such matters do not belong in the CAP. The purpose of the CAP is to focus on climate action and not air pollution. If the CAP does include policies which locate new housing away from existing sources of air pollution, then the environmental document prepared for the CAP must address the displacement impacts that will be created by such policies. Additionally, any new CAP housing policies will have to be compared to policies already adopted in various General Plan and Area Plan elements to ensure they do not introduce any contradictions or pose increased environmental impacts beyond those considered when the elements were adopted.

Conclusion

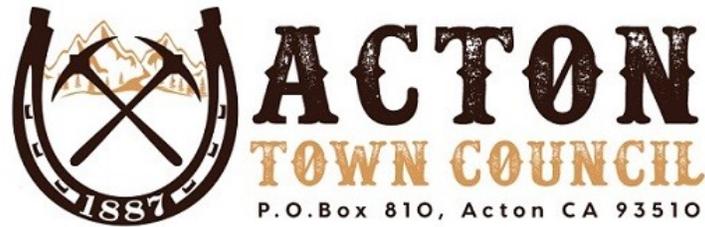

The ATC respectfully requests that the County incorporate the comments offered above in the CEQA review that will be conducted for the CAP. If you have any questions or require additional information, please do not hesitate to contact us at atc@actontowncouncil.org.

Sincerely;

Jeremiah Owen, President
The Acton Town Council

Subject: The Acton Town Council Comments on the Southern California Edison's
Post Event Report dated December 10, 2021.

Reference: SCE De-energization Events of November 24-26, 2021

Dear Director Palmer;

The Acton Town Council ("ATC") respectfully submits the following comments on the "Post-Event Report" ("Report") addressing the "Public Safety Power Shutoff" ("PSPS") event of November 24 to November 26, 2021 that was prepared by Southern California Edison ("SCE"). The 15-day deadline established by D.19-05-042 for submitting comments on this PSPS event fell on Saturday, December 25; accordingly, and consistent with Commission Rule 1.15, these comments are being submitted on the next business day and are thus deemed timely filed. These comments will also be distributed to those on the Service List for R.18-12-005.

The Acton Town Council only recently became aware of the fact that portions of Acton are served by the Sand Canyon circuit; specifically, the entire east half of Segment 7 of the Sand Canyon circuit lies in Acton and serves Acton residents. As a result of the lengthy PSPS power shutoff that SCE recently initiated on this circuit, many Acton residents did not have electrical service before, during, and after Thanksgiving Day. Because this PSPS event greatly affected Acton residents, the Acton Town Council reviewed SCE's PSPS Post Event Report that was served to stakeholders late in the evening on December 10, 2021, and we noted several significant problems. Our concerns are provided below in a sectionalized format to facilitate review by Commission staff.

"Our lives begin to end the day we become silent about things that matter" Martin Luther King, Jr.

SCE's Post Event Report Fails to Accurately Describe PSPS Events Affecting Acton:

SCE's Post Event Report gives an inaccurate and arguably false description of the PSPS event experienced by Acton residents served by the Sand Canyon circuit. For instance, it states on page 36 that "On Wednesday night, November 24, (as discussed in Section 2.5) 428 customers on the Impala circuit were brought back online by a backup generator at 6:18 pm. Customers on the Sand Canyon, Energy, and Blackhills circuits (608 total) were restored to service around 8 pm". This is incorrect. Service to Acton residents on the Sand Canyon circuit was not restored until 2 days later on November 26. These Acton residents had no power either before, during, or after Thanksgiving Day.

SCE Did Not Utilize Sectionalization Effectively to Reduce PSPS Impacts in Acton

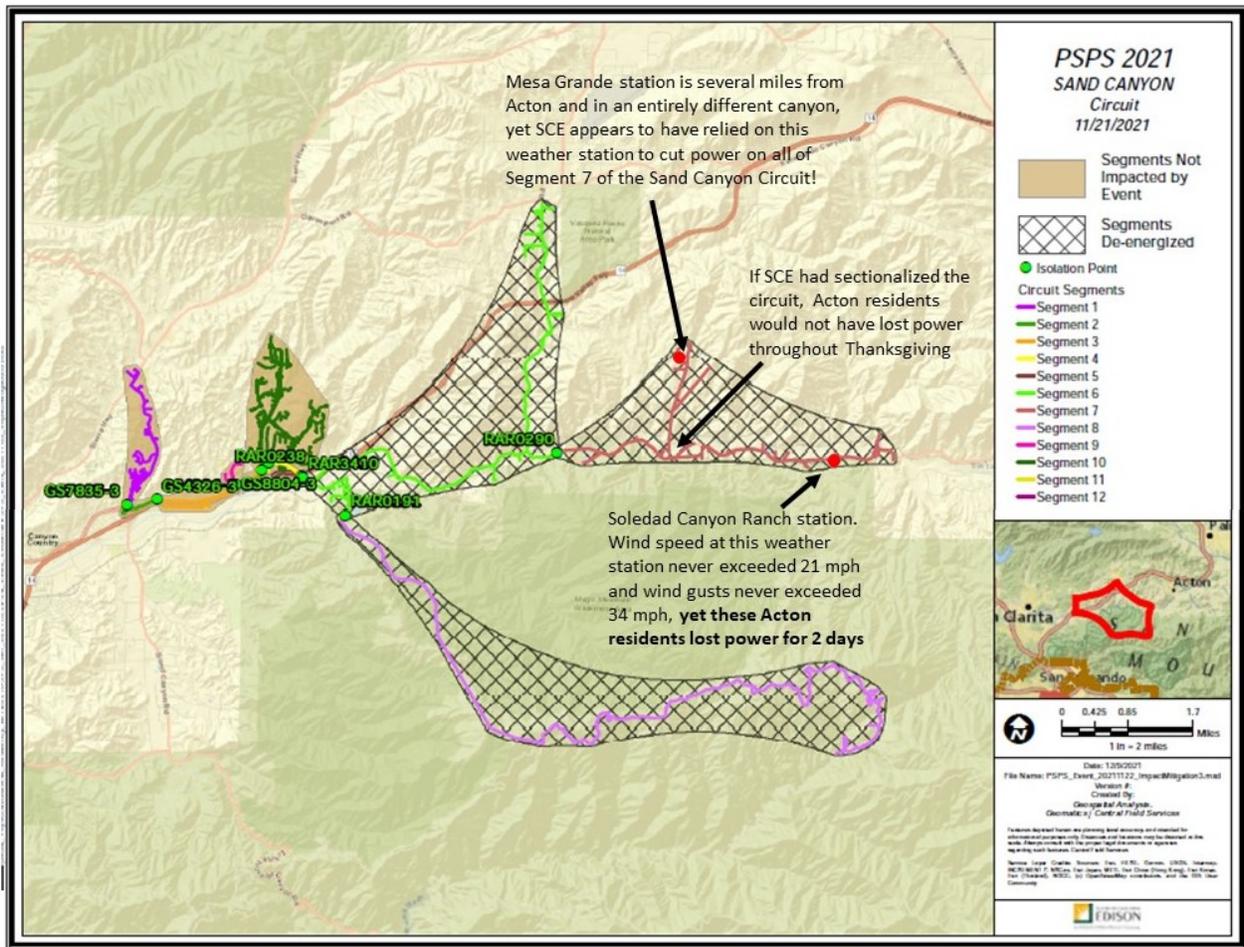

The ATC could find no reference to the weather station data that SCE relied upon to de-energize Acton residents before, during, and after the Thanksgiving holiday. Nonetheless, the ATC downloaded all the data from the weather station along the portion of Segment 7 of the Sand Canyon circuit that serves Acton (referred to as the "Soledad Canyon Ranch" station), and found that, for the entire 46-hour period during which Acton residents were de-energized over the Thanksgiving holiday, *sustained wind speeds never exceeded 20.6 mph and wind gusts never exceeded 33.5 mph* (see data provided in Attachment 1). In other words, *wind speeds on the portion of Segment 7 of the Sand Canyon circuit that serves Acton never even approached SCE's PSPS thresholds at any time before, during, or after Thanksgiving yet our residents lost power for 2 days anyway*. Notably, windspeeds of 27 mph were measured several miles northwest of Acton at the "Mesa Grande" station that is located in an entirely different canyon and is served by a branch off Segment 7 (see data provided in Attachment 2); however, this does not justify SCE's power shutoff to Acton residents because SCE should have segmented the Sand Canyon circuit at the branch point and thus only de-energized customers in the vicinity of the "Mesa Grande" station. This fact is shown more clearly in Figure 1 below, which reproduces the Sand Canyon circuit map provided on page 113 of SCE's post Event Report and shows where SCE should have deployed sectionalization to prevent Acton residents from losing power throughout the Thanksgiving holiday.

SCE Relies on Unreasonable Windspeed Thresholds to Initiate PSPS in Acton.

SCE continues to cut power in Acton based on unreasonably low windspeed thresholds; according to the "Event Data Workbook" spreadsheet that SCE submitted with its Post Event Report dated December 10, 2021, SCE denied power to Acton residents over the Thanksgiving holiday based on a sustained windspeed threshold of only 26 mph and a wind gust threshold of only 39 mph. As the ATC has repeatedly pointed out in numerous documents filed with the Commission¹, cutting power to customers at such

Application for Rehearing of Decision D.21-06-014 by the Acton Town Council submitted on July 7, 2021 at 10. See "The Acton Town Council Opening Comments on the Proposed Decision Adopting Phase 3 Revised (cont'd.)

Figure 1. SCE's Sand Canyon Circuit with Annotations Indicating Where Sectionalization Should Have Been Deployed.

low windspeed thresholds violates the reasonableness standard established by Commission Resolution ESRB-8 because such de-energization events are driven by structural deficiencies on SCE's distribution system rather than the presence of "strong

and Additional Guidelines and Rules for Public Safety Power Shutoffs (Proactive De-Energizations) of Electric Facilities to Mitigate Wildfire Risk Caused by Utility Infrastructure" filed June 10, 2021 in Proceeding R.18-12-005 at 3, 5. See also "Application for Rehearing of Decision D.21-06-014 by The Acton Town Council" filed July 7, 2021 in Proceeding I.19-11-013 at 15-17, 22. See also ATC Supplemental Comments on 2021 Wildfire Mitigation Plan Updates submitted to the Commission March 29, 2021; see also all ATC comments on all SCE PSPS post-event reports filed in 2020 and 2021, particularly those dated March 1, 2021.

winds"²; this renders SCE's PSPS events *intrinsically and explicitly unreasonable*. SCE openly admits that its PSPS windspeed thresholds are driven by "circuit health" concerns (see page 10 of the December 10, 2021 Post Event report); SCE defines "circuit health" based on the number and extent of structural deficiencies existing on the circuit. Specifically, SCE's "circuit health" factors are derived from the number of structures that are either "imminently about to fail" (referred to as "P1" structures) or will fail within 6 months (referred to as "High P2" structures)³. SCE also openly admits that it utilizes low windspeed thresholds on circuits that have "a history of local circuit outages at lower wind speeds" (see page 10 of the December 10, 2021 Post Event report). At the very least, this assertion proves that portions of SCE's distribution facilities are demonstrably incapable of reliable operation under moderate wind speeds and therefore violates Commission-adopted structural standards codified in General Order 95 ("GO95"). Equally important, the application of low windspeed thresholds to facilities that have "a history of local circuit outages at lower wind speeds" demonstrates that SCE prefers to simply de-energize its customers rather than maintain circuits in a manner that serves customers reliably. Finally, this statement is an open admission that at least some of SCE's equipment is neither constructed nor maintained to a standard that is sufficient to accommodate "known local conditions" as required by GO95⁴ because if it were, there would be no "history of local circuit outages at lower wind speeds".

All of this demonstrates conclusively that SCE does not maintain its distribution equipment in compliance with adopted Commission orders; as a result, SCE's distribution equipment poses wildfire risks to Acton residents and others. Since 2019, SCE has reduced its exposure to the wildfire liability risk posed by its own deficient equipment by simply cutting power; in so doing, SCE has routinely increased

² Resolution ESRB-8 establishes that a de-energization event is "reasonable" only if there is an imminent and significant and significant risk that "strong winds" will topple power lines or cause major vegetation related impacts [at 4]. The Commission has determined that electrical facilities which comply with General Order 95 ("GO-95") are capable of withstanding wind loads greater than 56 miles per hour (D.09-09-0309 and D.14-02-015), so winds less than 56 mph do not pose a "danger" of toppling power lines. Regarding the risk of "vegetation related impacts": The National Weather Service recognizes the "Beaufort" Scale which establishes winds must exceed 39 mph before twigs come off trees thus an "imminent and significant risk" of "major vegetation related impacts" does not exist when winds are below 40 mph. [<https://www.weather.gov/mfl/beaufort>],

³ See page 5 of discovery response from SCE to the ATC dated March 23, 2021 that was provided to the Commission in Attachment 1 of the "Application for Rehearing of Decision D.21-06-014 by the Acton Town Council" filed July 7, 2021 in Proceeding I.19-11-013.

⁴ Rule 31.1 of General Order 95 states (with emphasis added) "A supply or communications company is in compliance with this rule if it designs, constructs, and maintains a facility in accordance with the particulars specified in General Order 95, except that if an intended use or *known local conditions* require a higher standard than the particulars specified in General Order 95 to enable the furnishing of safe, proper, and adequate service, the company *shall follow the higher standard*."

public safety hazards significantly. These de-energization events have violated SCE's statutory obligation under the Public Utilities Code; specifically, §399.2 (which requires SCE to operate their distribution equipment in a safe and reliable manner) and §451 (which requires SCE to furnish and maintain adequate electrical service necessary to promote public safety). These de-energization events have also controverted the Commission's express directive that "Under no circumstances may the utilities employ de-energization solely as a means of reducing their own liability risk from utility-infrastructure wildfire ignitions"⁵.

Despite the extensive evidence provided by the ATC to the Commission since 2019 which demonstrates that SCE equipment deficiencies violate Commission Orders, and despite its own statutory obligation under §2101 of the Public Utilities Code to enforce statutes affecting public utilities and see "that violations thereof are promptly prosecuted", the Commission has persistently declined to initiate any reasonableness reviews of SCE de-energization activities⁶ *even though its own adopted decisions and directives require such reviews*⁷. This lack of Commission interest in enforcing its own standards and ensuring compliance with basic reliable electrical service requirements imposed by the Public Utilities Code is inexplicable. It is also astounding, given the scope of SCE distribution equipment deficiencies that were revealed in various Commission reports that were released just last month⁸. The Commission cannot stand by any longer; it has a statutory obligation to investigate the reasonableness of SCE's de-energization events and assess the extent to which these events violated §399.2 and §451 by denying customers safe and reliable power because they were initiated to mask equipment deficiencies and thereby avoid liability. The salient issue that the Commission has persistently failed to address is that SCE initiates PSPS events in Acton and elsewhere because its distribution equipment is deficient; this fact is demonstrated by SCE's persistent use of a 26 mph or less windspeed threshold for cutting power to Acton residents. Notably, it is not just the community of Acton that is saddled by these low windspeed thresholds; 20 of the circuits that were affected by SCE's PSPS event over

⁵ D.19-05-042 at 68.

⁶ The Commission recently affirmed that it "has not to date undertaken a review of the reasonableness of **a utility's decision to call a PSPS event**" [D.21-06-034 at 23].

⁷ D.19-05-042 at 107. Also, ESRB-8 affirms the need to "assess the reasonableness of all electric IOU de-energization events in order to ensure that the power shut off is executed only as a last resort and for a good reason" [at 4]. Also, the Scoping Memo issued on August 3, 2020 in Proceeding I.19-11-013 affirms that the Commission's Safety Enforcement Division will "engage in a reasonableness review of all PSPS events" [page 5 at FN11].

⁸ See Commission investigation reports released November 2021 on the Liberty, Meyers, Rye, Thomas and Woolsey fires found here: <https://www.cpuc.ca.gov/industries-and-topics/wildfires/wildfires-staff-investigations>.

the Thanksgiving holiday have windspeed thresholds of 26 mph or less⁹. And, as the ATC has previously pointed out, nearly 50 of SCE's distribution circuits have sustained windspeed thresholds less than 31 mph¹⁰.

Finally, it must be clarified that *the ATC does not object* to cutting power on structurally deficient equipment to prevent wildfire ignitions; to the contrary, de-energization under such circumstances is critical to protecting life and property. If SCE had de-energized its equipment in a timely manner, the Thomas, Woolsey, Rye, Meyers, and Liberty conflagrations may have been avoided. Similarly, the Kincade, Zogg, and Camp fires could perhaps have also been avoided if PGE had de-energized its equipment. What concerns the ATC is that every de-energization event that SCE initiates to avoid wildfire ignitions on substandard or structurally deficient equipment constitutes a failure to operate distribution equipment in a safe and reliable manner and is therefore a direct violation of §399.2 of the Public Utilities Code. This is because SCE sacrifices reliability for safety if it de-energizes a distribution circuit when deficiencies on the circuit pose a wildfire risk. Additionally, every de-energization event poses a substantial public safety risk¹¹; thus, every time SCE cuts power to prevent wildfire ignitions on deficient or substandard equipment, it violates §451 by failing to maintain adequate electrical service necessary to promote public safety. *What the ATC does object to* is that SCE is never held accountable for these violations. More specifically, the ATC objects to the manner in which SCE continually violates Public Utility Code provisions pertaining to public safety and electrical reliability; we further object to the Commission's object refusal to conduct "reasonableness reviews" of SCE's PSPS events and thereby investigate these violations. SCE's actions can perhaps be accounted for by the fact that, as a corporation, it avoids the destruction and attendant liability of a wildfire sparked by deficient equipment by simply cutting power at low windspeeds. However, the Commission's persistent refusal to conduct any "reasonableness reviews" of the numerous and extensive PSPS events that have occurred over the last three wildfire seasons cannot be accounted for, particularly in light of its prior commitment to "assess the reasonableness of all electric IOU de-energization events in order to ensure that the power shut off is executed only as a last resort and for a good reason"¹². Furthermore, the Commission's willful abrogation of its statutory duty under the Public Utilities Code to promptly prosecute violations of statutes affecting public utilities is bizarre and unfathomable. The Commission's inaction has substantially undermined public

⁹ See the "Event Data Workbook" spreadsheet that SCE submitted with its PSPS Post Event Report filed December 10, 2021 [Tab T03].

¹² Resolution ESRB-8 at 4.

safety¹³ and contemporaneously served the interests of utilities like SCE because it permits them to sidestep their obligation to provide safe and reliable power and maintain adequate electrical service to promote public safety; it bears all the hallmarks of "regulatory capture"¹⁴. The Commission must shake off the deference that it has shown and continues to show to SCE and other utilities and begin to act in the interest of the public by conducting reasonableness reviews of PSPS events and holding utilities accountable when they violate the Public Utilities Code by shutting off power to mask equipment deficiencies and thereby protect themselves from liability.

SCE Fails to Identify and Weigh the Public Safety Risks Posed by its PSPS Events.

The Commission has repeatedly ordered utilities like SCE to include in every PSPS Post Event Report an "explanation of how the utility determined that the benefit of de-energization outweighed potential public safety risks"¹⁵; these orders were driven by the utility's statutory obligation under Public Utilities Code §451 to promote the safety of their customers. The public safety risks that SCE is supposed to consider were carefully laid out in D.09-09-030 and include, but are not limited to: wildfire risks due to the widescale use of generators, barbeques, camp stoves, candles, and lanterns; disruption in communication networks; loss of customer communication access; disruption to emergency communication and evacuation procedures; endangering customers with disabilities, adversely impacting schools, adversely impacting water supply to fight fires and serve domestic needs, impairment of traffic control measures, and diversion of public safety personnel. Notably, every one of these adverse impacts occurred as a result of SCE's PSPS activities in 2019 (as the ATC pointed out in all of our filings submitted in Proceeding I.19-11-013). Instead of addressing these risks and showing that they were outweighed by a discernible public safety benefit, SCE's December 10 2021 Post Event Report contrives something called a "PSPS Risk" that is based on unidentified studies and undisclosed information pertaining to the "2003 Northeast Blackout" and the "2011 Southwest Blackout" addressing consequences from "food spoilage" and "underlying health conditions" in terms of "fatalities and serious injuries per customer minutes interrupted". Notably, the "2011 Southwest Blackout lasted only 13 hours, and the 2003 Northeast Blackout was largely resolved within 14 hours; neither of these events provide any indication of the real public safety risks that result from multiple days without power (which are so common in SCE PSPS events). The Commission is aware that the public safety risks posed by PSPS events are not linear

¹³ By failing to hold utilities accountable for unreasonable power shutoffs, the Commission permits such activities to persist unfettered and thereby directly and substantially contributes to increased public safety risks.

¹⁴ Regulatory Capture is evidenced by a body of commission actions or inactions where "what the regulated entity wants has more influence than what the public interest requires." Scott Hempling, *"Regulatory Capture: Sources and Solutions"*; EMORY LAW CORPORATE GOVERNANCE & ACCOUNTABILITY REVIEW. 25 (2014).

¹⁵ D.19-05-042 at 108; D.21-06-014 at 49; D.21-06-034 at 23.

with time; risks increase substantially with every incremental hour of power shutoff because people become more desperate¹⁶. However, none of this is accounted for in SCE's "PSPS Risk". Moreover, SCE claims that its "PSPS Risk" value is informed by Post Event Reports submitted by investor-owned utilities in 2019, but provides no corroborating information. In fact, the risk parameters that SCE used are not quantified anywhere in the report and the formula that SCE contrived to derive the infinitesimally small "PSPS Risk" that it claims for each circuit is not even disclosed in the spreadsheet that was filed with its Post Event Report¹⁷. In other words, the Commission has insufficient information to conclude that SCE did in fact comply with Commission directive and "weigh" the actual and material public safety risks posed by its PSPS events before cutting power over the Thanksgiving holiday. And, given the widespread public safety risks that materially resulted from SCE's previous PSPS events, it is a certainty that the infinitesimally small public safety risk that SCE claims was posed by its November 24-26 power shutoff event is absurdly underpredicted.

SCE's December 10, 2021 Post Event Report also presents something called a "Wildfire Risk" parameter that appears to be an amalgamation of a projected wildfire "footprint" (i.e., the size a fire could become if it were to ignite) and the number of structures and residents that would be affected within that footprint. SCE then factors in an estimated number of fatalities and injuries that could result if such a wildfire were to occur; this value is then normalized to derive a number which is less than 1 and represents fatalities and injuries that will result if a wildfire were ignited in the vicinity of a particular circuit. Unfortunately, SCE's "wildfire risk" is substantially over predictive for a number of reasons, not the least of which is that it presumes no firefighting resources are deployed to combat the wildfire that is assumed to occur; the wildfire is assumed to rage unabated for 24 hours without any fire suppression or structure protection activities. Moreover, SCE's "wildfire risk" parameter does not factor in the risk that an ignition event will even occur; instead, SCE just assumes that a wildfire is ignited on every circuit. As a result of these and other assumptions, SCE's "wildfire risk" model substantially overstates the "benefits" that are derived from its PSPS events; the extent to which these "benefits" are grossly overstated is revealed by putting SCE's "wildfire risk" model in proper context. For instance, SCE projects the "wildfire risk" posed by the "Stubby" circuit during a single 24-hour wind event is 0.2362¹⁸; mathematically speaking, this

¹⁶ As the ATC has previously pointed out, customer behavior becomes more risky as the length of time they were without power increases. For instance, we have informed the Commission that an Acton resident reported seeing a person at a local gas station who was so desperate for fuel to operate their generator during a lengthy SCE PSPS event that they were pumping gasoline into all sorts of containers, including a glass jar. [Comments on the Safety and Enforcement Division's "Public Report on The Late 2019 Public Safety Power Shutoff Events" From the Acton Town Council (FN 12)].

¹⁷ See "Event Data Workbook" spreadsheet that SCE submitted with its Post Event Report dated December 10, 2021 (tab T04).

¹⁸ Ibid.

means that an injury or fatality is projected to result from a wildfire ignition on the "Stubby" circuit once every four years if it experiences one wind event per year. If the "Stubby" circuit experiences four wind events per year, then SCE's model predicts that a wildfire-related injury or fatality will occur once per year. Such projections are completely insupportable by historical evidence; the "Stubby" circuit has existed for decades, and insofar as the ATC is aware, no injury or fatality ever resulted from a catastrophic ignition on the "Stubby" circuit during a wind event prior to 2019 (when PSPS events became commonplace). As another example, consider the "Sand Canyon" circuit that serves Acton residents and was de-energized by SCE due to "high winds" at least 4 times in 2020 and 4 times in 2021: SCE projects the "wildfire risk" posed by the "Sand Canyon " circuit during a single 24-hour wind event is 0.0703¹⁹; mathematically speaking, this means that an injury or fatality is projected to result from a wildfire ignition on the "Sand Canon " circuit approximately once every three years if it experiences four wind event per year. This risk projection is absurdly over-predictive: the Sand Canyon circuit dates back to the middle of the last century and it experiences frequent wind events every year; yet, insofar as the ATC is aware, it has never caused any wildfire ignitions that resulted in any injuries or fatalities.

Another reason SCE's PSPS risk/wildfire risk model is so erroneous is because it considers each de-energized circuit individually and fails to consider the cumulative impacts of cutting power on multiple circuits in a large area. As the ATC has previously pointed out, SCE's PSPS events cut power from Palmdale to Santa Clarita, and affect an area that is more than 200 square miles; the cumulative disruptions and attendant public safety risks posed by such widespread power shutoffs is completely ignored by SCE's risk methodology.

SCE's "wildfire risk" values are so over-predictive and its "PSPS Risk" values are so under-predictive that they do not represent anything real and they are certainly not consistent with historical data. For instance, the Commission is aware that SCE's PSPS events in 2019 resulted in wildfires that forced the evacuation of tens of thousands of people, burned thousands of acres and numerous structures, prevented wildfire suppression, impeded access and egress, prevented emergency evacuation orders from being received, and caused numerous injuries²⁰. Based on this evidence, it is certain that PSPS events pose substantial public safety risks that are at least on par with the public safety risks they are intended to prevent; yet, SCE's model contrives completely opposite results which conclude that risks posed by any PSPS is several orders of magnitude less than risks posed by a utility-ignited wildfire. Nothing could be further from the truth, and the magnitude of errors that are imbedded in SCE's model is

¹⁹ Ibid.

²⁰ See ATC comments submitted to the Commission in Proceeding I.19-05-042, R18-12-005, and R.18-10-007. See also personal experiences relayed by Acton residents to SCE on November 4, 2019 found here: <https://www.youtube.com/watch?v=Og9cJJZ61Mk&t=2101s>.

revealed through a simple comparison of SCE's claimed "PSPS Risks" to SCE's claimed "Wildfire risks". For instance, consider the "Acosta" circuit that serves approximately 3,800 people and which was de-energized for nearly 48 hours over the Thanksgiving holiday: according to page 15 of SCE's Post Event Report, cutting power on the "Acosta" circuit on Thanksgiving eliminated the risk of 213 wildfire-related injuries/fatalities compared to the risk of a single injury/fatality posed by the PSPS event itself. It is certainly likely that a 48-hour PSPS event on the "Acosta" circuit would result in at least one injury or fatality (if not more). However, it is absurdly implausible to conclude that an ignition on the Acosta circuit is likely to result in 213 fatalities/injuries (which is more fatalities/injuries than have occurred in recent wildfire events). In other words, SCE's model is so grossly over-predictive of the wildfire risk posed by its circuits, and it is so grossly under-predictive of the very real and demonstrably significant public safety risks that were created by its PSPS events over the Thanksgiving holiday that SCE's Post Event Report does not comply with the Commission directive that SCE demonstrate that PSPS risks were outweighed by clearly quantified benefits. Accordingly, SCE has failed to demonstrate that it complied with its statutory mandate under Pub. Util. Code § 451 to furnish and maintain adequate electrical service necessary to promote public safety; accordingly, the Commission must censure SCE for its most recent PSPS event.

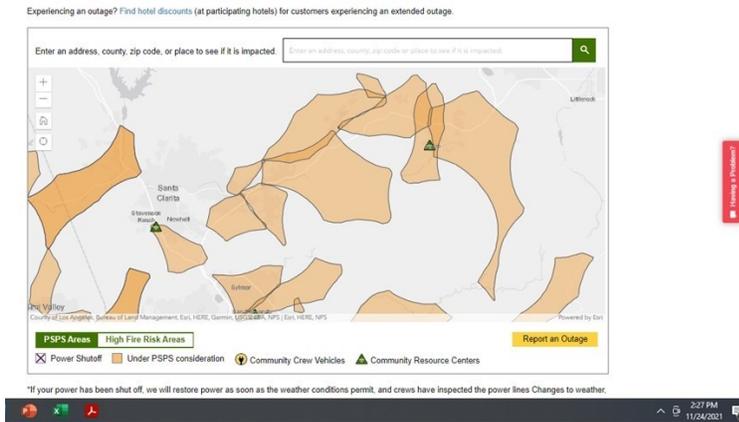

SCE's Notification Process Continues to be Substandard and Deficient.

SCE's Post Event Report dated December 10, 2021 states that more than 30,000 customers did not receive a "1- to 4-hour imminent notification" and more than 3,500 entities did not receive any notification before de-energization. SCE also reports that more than 3,000 customers did not receive any notification before re-energization. These numbers are abysmal. The ATC is particularly concerned about the failure to notify customers before re-energization because of the risk to life and property that such failures create; customers who rely on generators must be notified in advance before re-energization occurs so that they can disconnect their generator before power is restored. This is important; generators that are operated without a transfer switch pose a significant fire danger if they are still operating when system power is restored. It is noted that generators are not supposed to be operated without a transfer switch, however it is naively unrealistic to assume that all of SCE's customers have the knowledge and expertise to properly configure and connect their generator.

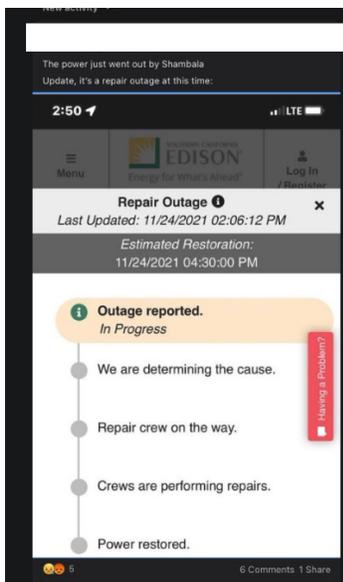

The ATC also notes that SCE's Post Event Report dated December 10, 2021 fails to disclose the abysmal notification process that Acton residents experienced. On November 24 at approximately 2:15, power was cut in southwest Acton; SCE's website was accessed by an Acton resident, but it showed that there were no de-energization activities anywhere in the area. The following is a screenshot of the text trail:

The SCE website was accessed at 2:27; it showed no PSPS activities in or near Acton:

By 2:50, SCE reported the power shutoff in Acton as a "repair"; here is the screenshot:

The power remained off for 2 days.

Conclusion

Naturally, Acton residents are grateful that SCE's multiday power shutoff over the 2021 Thanksgiving holiday was not as widespread in our community as its power shutoff event during the 2020 Thanksgiving holiday. However, the very fact that our residents are grateful to SCE for not cutting their power and ruining their Thanksgiving *is extremely troubling*, and it warrants Commission action. Utility customers are not supposed to be grateful when a utility deigns to sell them power; this is particularly true in rural communities like Acton where individual property owners are forced to pay enormous developer fees to SCE for extending distribution facilities to provide electrical service to their properties. Customers should expect reliable electrical service and the Commission has a statutory obligation to do everything in its power to see that such customer expectations are met; however, this is not the case today. Since 2019, SCE has routinely cut power to customers and thereby endangered lives and property because of inexcusable infrastructure deficiencies, and it does so with impunity because the Commission refuses to assess the reasonableness of SCE's de-energization decisions. The magnitude of the Commission's commitment to not enforce the Public Utilities Code and compel SCE to provide reliable electricity was recently revealed in D.21-06-014 which concluded that no deterrence measures were warranted even though SCE and other utilities extensively violated Public Utilities Code §451 when they initiated PSPS events in 2019. Worse yet, D.21-06-014 provides financial incentives to utilities for simply improving their conduct in PSPS events²¹; it does not even try to compel compliance – it merely hopes that improvements will happen. By "incentivizing" compliance rather than enforcing it, D.21-06-014 turns the Commission's entire enforcement program on its head and lets utilities choose whether they will comply with the Public Utilities Code, and if so, the extent to which they will comply. Because of the appalling deference that the Commission has persistently shown to SCE since the Fall of 2019, Acton residents are now in the untenable position of being grateful when their power is *not* cut off. The absurd situation created by the Commission's failure to hold utilities accountable flies in the face of the entire legislative intent behind the Public Utilities Code which affirms "Reliable electric service is of utmost importance to the **safety, health, and welfare of the state's citizenry and economy**"²².

The Commission now has a fresh opportunity to rectify its previous errors and hold utilities accountable by conducting a "reasonableness review" of SCE's most recent PSPS event. As we have shown above, there is nothing "reasonable" in a 25 mph or less windspeed threshold or a 39 mph or less wind gust threshold or the continued existence of infrastructure that has "a history of local circuit outages at lower wind speeds"; these circumstances violate General Order 95 because they are driven by either structural deficiencies or infrastructure that is not configured to accommodate local conditions. What makes the power shutoff that occurred in Acton over the Thanksgiving holiday

²¹ D.21-06-014 at 60 and Conclusion of Law #16.

²² §330 of the Public Utilities Code.

even more unreasonable is that wind levels on the Acton portion of the Sand Canyon circuit never even exceeded SCE's paltry thresholds, and had SCE had just sectionalized the Briggs Road portion of Segment 7 of the Sand Canyon circuit, our residents on Segment 7 would have lost power for just a few hours the night before Thanksgiving and then been re-energized at the same time that Segment 6 was re-energized. Instead, Acton residents lost power for two days. This, coupled with the fact that SCE did not properly consider the documented public safety risks posed by the power shutoff initiated over Thanksgiving holiday and the fact that it grossly overstated the wildfire risk that its power shutoff avoided, renders the entire PSPS event completely unreasonable. Given these factors, a "reasonableness review" of SCE's most recent PSPS event by the Commission is warranted.

Respectfully submitted;

/s/ Jacqueline Ayer

SENT VIA EMAIL

Los Angeles County Department of Regional Planning
Thuy Hua, Supervising Regional Planner
320 West Temple Street, 13th Floor
Los Angeles, CA 90012
climate@planning.lacounty.gov

Dear Ms. Hua,

Subject: Notice of Preparation of a Program Environmental Impact Report and Public Scoping Meeting for the Los Angeles County 2045 Climate Action Plan

The Association of Rural Town Councils (ARTC) appreciates the opportunity to comment on the revised Climate Action Plan (CAP) component of the General Plan's Air Quality Element. The ARTC commented on the March 2020 CAP, and continues to experience concerns regarding the implementation of target reductions in greenhouse gases and the ultimate goal of carbon neutrality by 2045, and how implementation will affect rural communities of the Antelope Valley (AV).

Firstly, there are references to "Draft 2045 Climate Action Plan" which is nowhere to be found on any Regional Planning websites or pages. In fact, the Initial Study (IS) states, "The Draft 2045 CAP includes 11 overarching strategies and 26 measures, each of which has multiple implementing actions (GRAs)." This has caused confusion because there is no 2045 plan to reference, and alludes to the Draft 2045 CAP having been completed, with the Initial Study fashioned around the 2045 Draft Plan. If the NOP and IS include evaluation of the Draft 2020 CAP, then it must be indicated in this effort, and time extended for additional evaluation and opportunity for comment.

Page one of the IS states, "Implementation of the Draft 2045 CAP, once approved, would occur throughout unincorporated Los Angeles County in all zoning designations." This is particularly concerning when considering the statements provided by Ms. Kristin Pawling of the Chief Sustainability Office during the March 2020 CAP Webinar, which indicated the 2020 plan—because of jurisdictional issues could only be imposed upon unincorporated areas of the County, but the office would like all 88 cities outside county jurisdiction to participate voluntarily in order to reach the OurCounty Sustainability Plan goals, and the County would exhibit "climate leadership." Ms. Pawling described the Plan as "aspirational, but informs "direct action at the county level," and "many targets in the CAP are directly informed by the Sustainability Plan." Furthermore, she stated the Green House Gas (GHG) Emissions Inventory that evaluated current levels of GHG were "largely countywide" (Webinar 15:36-25:20). This means a large contingent of the County's population, producing GHG, will not be legally bound by the CAP or the Sustainability Plan goals. This also means the 2045 CAP GHG reduction goals' impacts will disproportionately affect many unincorporated and rural communities. The 500,000 Antelope Valley residents will bear the largest burden of proposed GHG measures, informed by an inflated Emissions Inventory that will most benefit the south county, and jurisdictions that do not partake in the CAP efforts.

AESTHETICS

The ARTC and other town councils have submitted many letters and participated in public hearings regarding the placement of utility-scale renewable energy projects that cover thousands of acres of rural lands surrounding our communities. It is clear from our experience that the drive to “net-zero” carbon emissions has come at the expense of rural communities and other populations at large in the AV. The IS discusses ordinances already in place that would address any visual impacts created by implementation of the Draft 2045 CAP, i.e., the Hillside management Ordinance, which states, “[C]omponents of the County Code that relate to the protection of Hillside Management Areas would ensure that the scenic character of ridgelines and hillsides would be preserved. As most of the scenic vistas in LA County are available from hillsides and ridgelines, compliance with the Hillside Management Areas Ordinance would ensure that visual impacts from scenic vistas would be reduced” (11). However, *all* of the solar projects in the AV have been built on the valley floor. Moreover, if one believes that the General Plan Policies cited in this section on aesthetics has actually preserved and enforced GP/Antelope Valley Area Plan goals and policies driving (AVAP) CUP actions related to visual impacts mitigation agreed to by solar projects, then you are misled. Supplied below are photographs that are representative of what happens to our scenic vistas when utility-scale renewable energy and transmission towers are built to transport renewable energy to the LA basin. Hillside management will not reduce view impacts from hillsides and ridgelines.

View looking north from Land Veritas Mitigation Bank (2016) CA Aqueduct at 110th St. West

Environmental Impact Reviews often state similarly, that there are no significant impacts to scenic areas, as thousands of acres of chain link and barbed wire fencing intrude on the open spaces of recovering agricultural lands, as industrial commercial projects are incongruously thrust into rural areas and communities. The road transecting the two solar projects on the left has been identified for years as a Scenic Highway in the General Plan’s Scenic Highway Element 1974, and most recently in the Antelope Valley Area Plan’s Scenic Drives Map 4.2.

Below are three additional photographs showing an instance of detrimental, and likely permanent visual impacts from construction of AV Solar Ranch 1.

Before AV Solar Ranch 1, Fairmont

After the construction of AVSR 1, note the chainlink and barbed wire fencing, impermeable to ground dwelling wildlife.

The Silverado Project area, pre-construction, 110th St. West, Avenue K, TRTP and Barren Ridge Transmission lines in background. (2014)

During the construction of the Silverado Projects, as mitigation, a portion of the county-designated “Poppy Trail” was created, with fabulous views of the finished solar project, also visible from the State of California Poppy Reserve. Mitigation which certainly does not include preservation of the wildflower fields destroyed to construct the project.

Many of the RE projects currently built are along scenic routes identified in the AVAP, with inadequate mitigation for impacts created by these projects. Also, explain how the REO has protected viewshed piecemealed, project by project. Drive across the Antelope Valley for a first person look. There is very real potential for implementation of the CAP Plan to open the floodgates for thousands more acres of utility-scale solar projects. For the IS to claim less than significant impacts from the implementation of the CAP Plan is disingenuous, especially with incentives offered by the county and the federal governments, and especially by the hundreds of thousands of acres of solar necessary for current and future “fossil fuel free” LA County. The ARTC requests this be reconsidered and impacts identified as significant and explored in the Environmental Review. The mandate to bring the county into a carbon neutral state with 100 percent renewable energy will, as mentioned, be perpetrated at the expense of rural communities, residents, and natural environments across the AV, which often provide great economic benefits to local businesses.

Several times in the NOP, under various headings, the statement is made: “The Draft 2045 CAP does not include specific proposed development, and it would be speculative to guess where any specific future development might be proposed in furtherance of Draft 2045 CAP goals. For the reasons discussed . . . this criterion will not be evaluated further as part of the CEQA process for the Draft 2045 CAP.” The ARTC disagrees, and posits that the policies for the decarbonization, including streamlined review under the PEIR as stated under the “Background” heading, describes a “new development review consistency checklist to allow projects to streamline CEQA compliance for their projects by using the CAP, per CEQA Guidelines § 15183.5”(3). Furthermore, “The Draft 2045 CAP could also indirectly incentivize

the development of solar facilities in rural areas (such as the Antelope Valley), where they could be more visible from roads, trails and other at-grade elevations” (15). There is nothing indirect about this 2045 CAP. It is forthright in discussing policy efforts, strategies and measures, and eliminating GHG. The AV has already, and continues to be targeted for renewable energy with federal incentives; Bureau of Land Management and public lands policies; California’s Renewable Energy Portfolio and executive orders; California’s Desert Renewable Energy Conservation Plan; the county’s REO; SCE and LA Water & Power transmission and renewable energy projects; Joint Powers Authority Clean Power Alliance; City of Lancaster’s Net Zero Program; 2045 CAP’s Measure E1: Procure Zero-Carbon Electricity and Measure E5: Increase Renewable Energy Production; and the streamlining and incentives directed to projects through this ordinance via the CAP PEIR are the only proof needed to determine the designation of the AV as the place to build utility-scale renewable energy. How many utility-scale projects have been built in the south county?

AGRICULTURE AND FOREST

For several years, the ARTC has promoted the preservation of agriculture, as food source, as a way to improve air quality, and preserve important habitat. The water adjudication finalized in 2016 spelled a notable decline in agricultural development, and essentially took water from farmers to guarantee water for residential and commercial development, and seems to have provided a set-up for the proliferation of utility-scale solar projects.

As noted in the IS, there is little specially designated farmland. However, farm fields of the AV have provided not only food for people and livestock, but a haven for migratory birds traveling the Pacific Flyway which feed and nest in open fields, cultivated or not. The Audubon Society has designated the AV as an Important Bird Area, part of its list of places of worldwide importance. Worldwide, a coalition of organizations including the America Audubon Society has identified over 8,000 IBAs or Important Bird Areas.

The purpose of the IBA Program is to set “science-based” priorities for habitat conservation to “promote positive action to safeguard vital bird habitats.” According to the Audubon’s IBA website, “IBA inventories provide a scientifically defensible method for prioritizing conservation activities and allocating limited conservation dollars to ensure the maximum benefit to birds.” A subset of these 8,000 sites has been given the higher status of “Globally Important Bird Areas.” These 424 worldwide sites have special status due to “global conservation concern” (<http://web4.audubon.org/bird/iba/>). One of these 424 areas is in Los Angeles County, in the Western Antelope Valley. This site, the Antelope Valley Important Bird Area provides breeding, foraging and nesting habitat for Swainson’s Hawk, Golden and Bald Eagles, Northern Harriers, Burrowing Owls, Le Conte’s Thrasher, Tricolored Blackbirds and other sensitive species, including the California Condor. Describing this IBA, the Audubon Society states that, "The grassland bird community is most impressive in winter, when large numbers of raptors concentrate in the area. Large flocks of Vesper Sparrows, Horned Lark and Mountain Bluebirds also occur here, widely extirpated elsewhere in the Los Angeles area. The agricultural fields, especially alfalfa, are productive year round. Winter brings Mountain Plover, whose flocks are among the last in southern California. After wet winters, nesting grassland species like Northern Harrier linger well into spring, and occasionally even breed. Swainson's Hawk maintains its southernmost breeding outpost in the state here. As this IBA lies in the path of a major spring migrant route for songbirds, these windbreaks can host hundreds of vireos, thrushes and warblers during April and May."

Furthermore, IBAs are indicators of wide biological value for many species of flora and fauna. Again quoting the Audubon society, "Our data demonstrates that IBAs are also excellent indicators of biodiversity richness and are therefore also important for a wide range of species." This globally

important IBA is now threatened by what has been called an "alternative energy gold rush." The Antelope Valley IBA, rimmed by the Angeles Forest, the Tehachapi Mountains and year-round wetlands along the San Andreas Fault, is already home to AV Solar Ranch I, one of the largest solar plants in the world. Without a comprehensive plan in place to provide adequate mitigation for the foraging areas, i.e., loss of open, formerly agricultural lands, that will be lost due to alternative energy development, this biologically important area will be obliterated piece by piece until a tipping point is reached and threatened species like Tricolored Blackbirds, Burrowing Owls and Swainson's Hawk disappear from this area forever. The IS states:

Implementation of Draft 2045 CAP GHG reduction measures that involve ground disturbance could, depending on the location, result in the conversion of farmland to non-agricultural use. *For most types of development projects that may be proposed in furtherance of Draft 2045 CAP goals, construction is anticipated to occur primarily within developed areas such as parking lots, improvements to existing structures, and urban areas near public transportation.* However, other types of new projects encouraged by Draft 2045 CAP measures could occur in previously undeveloped areas such as facilities to increase waste diversion or renewable energy. *Measure E1: Procure Zero-Carbon Electricity and Measure E5: Increase Renewable Energy Production could result in the development of photovoltaic solar or other renewable energy generation facilities in undeveloped areas, which development could result in the conversion of farmland to a non-agricultural use.*

The ARTC argues that "most *types* of development" will occur in developed areas might be true, but particular large-scale projects allowed on A-2 zoned lands will likely occur in the AV, such as waste facilities, or open areas for waste diversion, or renewable energy. The AV already receives millions of tons of trash-filled green waste in the form of mulch, spread across fields that previously provided habitat for birds and other species reliant on our open fields for forage and nesting. For some reason, the decomposition of such waste is not considered a pollutant or a cause of significant impact and is promoted by our state and county. In addition, large mulch berms are used as a visual shield to obscure views of illegal marijuana growing operations. They are also a fire hazard, and are quite difficult to extinguish once ignited—ironically, no impact option is chosen in the IS.

It is also interesting that the IS states, "as a general matter, forest land would not be suitable for the implementation of actions in furtherance of the Draft 2045 CAP. For example, solar energy generation requires access to sun; forested areas do not provide that resource and would not be deforested to serve a solar energy generation use." While forested areas would not be deforested, and environmental impact study in the IS is not warranted, the anticipated influx of solar energy projects would, in fact, destroy tens of thousands of acres in the quest to achieve net-zero energy; it is repeatedly stated that this will not be addressed by the PEIR, whose subject is promotion of renewable energy. There will be significant impacts to "agriculturally zoned" lands.

Preservation of rural character is important to many rural town council areas, since many arose out of agricultural activity during the nineteenth and twentieth centuries. The 2045 CAP might not propose land use designations that would require zone changes. Unfortunately, zone change and a nearly blanket conversion of A-1 to A-2 during the development of the Antelope Valley Area Plan opened the door for ease in imposing utility-scale renewable energy upon rural residents, and all the destruction—including visual and scenic impacts, air quality issues, and lost biological value.

AIR QUALITY

The ARTC has had continuing concerns regarding air quality in the AV. It has been such a concern that the ARTC collaborated with the AVAQMD to submit a State of California Community Air Protection Program grant request in 2018 (enclosed). While there are many sources of particulate pollution in the AV, the introduction of utility-scale renewable energy has contributed mightily to an ongoing dust particulate problem; along with sand, rock and gravel production; fallow agricultural fields (lack of water); further sources of particulate pollution include two major highways, freight and passenger rail lines, and commercial/industrial activities.

The AV is an air quality nonattainment area for PM₁₀. Over the past ten years, residents in communities of the AV have experienced increasingly unhealthful air and property destruction akin to the Dust Bowl era of the 1930s and resulting threat of pulmonary illness. Predictable drought, water adjudication, diminishing agricultural activity, and renewable energy development have proven dust control measures and “Best Management Practices”(BMPs) like Antelope Valley Air Quality Management District's (AVAQMD) Rule 403, unsuccessful in preventing fugitive dust.

Fugitive dust can affect “sensitive receptors”—children, asthmatics, the elderly, those with pulmonary disease, cardiovascular disease, as well as the general public at large, because it can carry the spores of *Coccidioides immitus*—better known as Valley Fever. Failure of dust control plans puts residents all over the Antelope Valley at risk for this fungal infection, which can impose large public costs in lost productivity, disability, and healthcare. This concerns residents every time a utility-scale solar project is proposed. Since the AV is an air quality non-attainment area for PM₁₀, this leaves the question of whether current non-attainment of air quality levels of particulates combined with projects previously mentioned, plus Centennial, the National Cement Plant, and reasonably foreseeable massive solar and wind development will bring attention from the United States Environmental Protection Agency.

Because of cumulative effects of other utility-scale solar construction and operations, we see the need for expanded monitoring across the AV, through additional monitoring stations nearer to sources of pollution, with more encompassing, accurate quantification and analysis of Antelope Valley air quality to determine levels of PM₁₀ and PM_{2.5}. These actions are necessary to protect the health and well being of not only rural residents, but all residents of the AV.

The ARTC and other entities have repeatedly commented on air quality issues and the public health implications that are detailed in LA County Public Health Indicators 2018. The AV has the highest childhood asthma rate in the county, along with cardiovascular death rates, and low birth weight. This is a serious public health issue that must be evaluated in environmental impact review.

BIOLOGICAL RESOURCES

Many letters have been submitted on a variety of renewable energy projects that have impacted the natural environment, for which mitigation has proved insufficient. There are also many other impacts associated with biological resources related to renewable energy and various other development activities. The IS states, “There are currently no adopted Habitat Conservation Plans, Natural Community Conservation Plans, or other approved state, regional, or local habitat conservation plans in effect in unincorporated Los Angeles County. Therefore, no impact would occur.”

Conveniently, there are no *adopted* conservation plans in LA County. However, the County declined to support the State of California Fish and Wildlife's Antelope Valley Regional Conservation Investment Strategy, even though it is non-regulatory. There are issues with wildlife movement, and fragmentation of conservation land, which individual EIRs for projects are allowed to perpetrate. Regional Planning allows projects to set aside part of their development sites for conservation purposes, which are not connected to any other conservation lands, corridors, etc., Lacking are documented monitoring and evaluation of the success or failure of mitigation efforts for not only "Biology" concerns, but all of the issues discussed throughout this letter and listed in the IS. Biologist and raptor expert, K. Shawn Smallwood, of U. C. Davis, has also commented on the lack of monitoring and enforcement for conditions of approval for renewable energy projects, including the West Antelope Solar Project:

It has long been known that mitigation pursuant to CEQA has often either failed or has not been implemented, but with no consequences to the take-permit holder (Silva 1990). There should be consequences for not achieving mitigation objectives or performance standards. The project proponents should be required to provide a performance bond in an amount that is sufficient for an **independent party** to achieve the mitigation objectives originally promised, and in this case, the promises should be much more substantial. A fund is needed to support named individuals or an organization to track the implementation of mitigation measures. Report deadlines should be listed, and who will be the recipients of the reports. In my professional opinion . . . lack of specific monitoring details renders [environmental review] inadequate and uncertain and makes it impossible to gauge whether to what extent any mitigation measures will lessen potentially significant impacts on species. If these measures are not clearly laid out . . . then there will be no basis to determine that impacts will be less than significant once implemented. Furthermore, without adequate funding allocated in advance, there is no certainty that any proposed mitigation will actually take place.

Unfortunately, solar fields in the Antelope Valley destroy foraging areas and habitat for what Audubon has identified as a "Globally Important Bird Area." Non-native grassland and recovering vegetation provide cover, nesting, and foraging for indigenous and migratory waterfowl, song birds, and raptors alike, some of which are special status species. Air quality in the Antelope Valley has caused the highest incidence of respiratory disease in Los Angeles County according to their Health Department publication "Key Indicators of Health 2017." Many residents have stated their opposition to solar development, fearing respiratory disease and valley fever, which is ignored. It is more important to become net-zero and provide popularized feel-good "green energy" than be concerned about residents' health. This green energy touted by the State of California, Los Angeles County, and the City of Lancaster, to reduce electrical generation carbon emissions, is misleading. The costs include not only public health issues, but also real estate--desert environments that the Bureau of Land Management says could take 3,000 years to recover; the carbon exchanging qualities of undisturbed desert soils; the industrial pollution and carbon created by mining, processing, and manufacture of solar panels (in China, not in our backyard)--all produced with fossil fuels; difficulty recycling panels and its energy costs; inefficiency of solar electricity production; and industrializing our rural desert communities.

There are documented instances of destruction by sPower of an occupied Red Tailed Hawk nest, and Red Dawn Sunpower, LLC's wholesale removal of 95.44 acres of Joshua Trees of which 63.86 acres were within the Joshua Tree SEA #60 (unfortunately before their protected listing by CDFW).

HAZARDOUS MATERIALS

The ARTC requests that the PEIR evaluate the release of hazardous materials related to solid waste disposal, renewable energy projects—including battery storage facilities, organic waste processing facilities, sewage and/or mulch spreading operations, etc. The North County possesses large areas considered for Areas Potentially Suitable for Siting Alternative Technology Facilities in Los Angeles County (<https://dpw.lacounty.gov/epd/swims/News/swims-more-links.aspx?id=4#>).

UTILITIES AND SERVICE SYSTEMS, ENERGY

Implementation of the 2045 CAP would promote the construction of energy transmission, which has been instrumental in the ignition of fires during high wind events and have caused the most destructive fires in California history. Areas that are targeted for transmission rights-of-way are stretched across miles from the source of energy production; fine examples exist from the AV to the South County—Barren Ridge Transmission Project, and the TRTP. The areas traversed are put at great risk of fire, and include our rural communities, many of which are in Very High Fire Hazard Zones. PSPS reduces our communities' ability to remain resilient in the face of fire danger through loss of ability to pump water for personal use, for fire suppression, and to communicate during these outages. Please evaluate significant impacts to our communities from related risk of additional transmission that will be required for the achievement of net zero emissions mandated by the 2045 CAP.

Perhaps foremost among concerns is the “Fossil Fuel Free LA County.” Retrofitting buildings—our homes with all electric appliances would also reduce rural residents' ability to maintain and protect our lives and property in the event of power failure. We are often last to receive repairs to services, and we know we must remain independent, and really, present prime examples of resilience touted by the OurCounty Sustainability Plan. Taking away fuel sources for pumping water, for warmth and cooking in the extreme weather conditions predominant in the AV is a very, very significant impact, and must be evaluated in the PEIR.

Respectfully,

Susan Zahnter

RE: NOP COMMENTS - CLIMATE ACTION PLAN UPDATE

From: Kathy Knight, Board Member
Ballona Ecosystem Education Project
1122 Oak St., Santa Monica, CA 90405
(310) 450-5961
kathyknight66@gmail.com

Ballona Ecosystem Education Project has the following comments on the Climate Action Plan Update:

1. This proposed plan includes the area of unincorporated Marina del Rey (pg. 5). Marina del Rey
Is directly adjacent to the north side of the Ballona Wetlands Ecological Reserve (BWER).
This wetland
Is a very important reserve for many reasons including:
 - a. It is a rare mostly freshwater wetland on the California coast that was saved years ago by local citizens
and purchased in 2003 by the State of California. It is currently under the supervision of the California
Dept. of Fish & Wildlife.
 - b. There are endangered species that live at the BWER, including the California Least Tern, Belding's Savannah Sparrow, and El Segundo Blue Butterfly.
 - c. It is the opportunity to do a slow careful restoration of this wetland to preserve its original ecology.
 - d. There are 3 drinking water quality aquifers below the surface at Ballona that are critical to future sources of water for humans, and for the wildlife at Ballona. They need to be strongly protected.
 - e. There needs to be a Groundwater Sustainability Plan for the aquifers and other ground water of the BWER, so there is a plan on how to protect the underground water there. There

also needs to be a hydrology study of the Ballona Wetlands Ecological Reserve done before any other action is taken. There has never been one done, so we do not know the ramifications of work in the area.

For these reasons and many more that we do not have time to write in since we just found out about this Climate Action

Plan Update yesterday evening, please do not plan any actions that would negatively impact the Ballona Wetlands Ecological Reserve.

And finally, please send us any information, updates, hearings on your notification list, to our email or address as posted above.

Thank you.

Re: Comments on the Notice of Preparation of a Draft Program Environmental Impact Report and Initial Study for the Los Angeles County 2045 Climate Action Plan

Dear Ms. Hua:

We are contacting you on behalf of BizFed, the Los Angeles County Business Federation. An alliance of over 200 business organizations who represent over 400,000 employers in Los Angeles County. We are writing to provide brief comments on the Notice of Preparation ("NOP") of a Draft Program Environmental Impact Report ("PEIR") and Initial Study ("IS") for the Los Angeles County 2045 Climate Action Plan ("2045 CAP" or "CAP").

We appreciate the county giving the community an opportunity to provide comments. However, we would like to respectfully note that the NOP and IS do not contain enough information to respond adequately to the County's request. The only draft of the 2045 CAP available to review is from two years ago and the County recognizes that the new, unreleased draft will be "substantially" revised. Without an updated CAP to review, it is impossible for the public to fully consider and comment on the CAP's potential environmental impacts.

We look forward to working with the county in developing a revised CAP that meets the state and county's clean air goals while balancing economic stability, job growth, population growth, housing, homelessness, and other pressing issues. As such, we believe the revised 2045 CAP must include a detailed economic impact analysis and cost analysis that can give regulators, residents, businesses, developers, and others a realistic scope as to how the plan will impact them.

As the County notes, since the release of the 2045 CAP in March of 2020, our region has changed considerably. We have learned just how fragile our supply chain is and believe it is necessary for the county to also consider a resiliency study that shows our dependency on the goods movement and how much the CAP can increase or decrease that dependency.

Further, recent new housing developments in the County have been at the forefront of climate resiliency. The LA Times reported that the County has "the most environmentally friendly suburban developments ever planned in California."¹ Tejon Ranch recently entered into a settlement agreement that included a commitment to reduce its GHG emissions to zero. Newhall Ranch was the first housing development of its size to commit to net-zero GHGs and was recognized in the California Air Resources Board's Scoping Plan as a model of sustainability. The 2045 CAP should recognize that projects may reduce GHG emissions through means other than those included in the CAP. For example, projects that commit to a net-zero GHG strategy should not have new GHG mitigation requirements imposed on them.

¹ Louis Sahagún, Environmental group and Tejon Ranch agree on plan to build 19,300 zero-emission homes, Los Angeles Times (Dec. 1, 2021), available at: <https://www.latimes.com/california/story/2021-12-01/tejon-ranch-will-build-19-300-zero-emission-homes>.

We appreciate your attention to these matters and look forward to reviewing a new draft 2045 CAP when available. We respectfully request that the County recirculate the NOP and IS for another round of public comment when the draft CAP is made available, which is necessary for the public to provide meaningful input on the PEIR.

If you have any questions regarding this letter, please contact sarah.wiltfong@bizfed.org.

Sincerely,

Brissa Sotelo-Vargas

Subject: Unincorporated East os Angeles County Climate Action Plan
Date: Tuesday, February 1, 2022 4:56:39 PM

CAUTION: External Email. Proceed Responsibly.

Supervisor, Hilda Solis,

We are requesting that you extend the deadline for the LA County Climate Action Plan until our county is back to normal.

The plan itself violates the California Environmental Quality Act. Los Angeles County bears responsibility for sanctioning the proceeding of this current County Climate Action Plan. The pandemic has severely impacted disenfranchised communities. The meetings that took place excluded these very communities by denying us the ability to participate in this process. Furthermore, when we expressed our objections to these proceedings do to the lack of outreach in our communities and based on the digital divide and language barriers the response was to proceed. The response to our concerns was to email people and to have volunteers do the outreach work with no plan, materials or resources to do so. We requested that we be contacted and that did not happen. Failing to conduct a proper scoping process is a violation of CEQA. To proceed with this Climate Action Plan you are enabling the environmental justice issues that are killing us and it enables the segregation and continued racial inequality of our disenfranchised communities.

That data of the meeting participants proves our point. Furthermore, people outside of Unincorporated East LA attended the meetings. In these online meetings there is no way to distinguish who is from the community. According to a moderator there were participants from other areas of the state and outside of the state participating. We are requesting that your staff meet with the Boyle Heights East Los Angeles Coalition before you approve this Climate Action Plan. That you meet with other disenfranchised communities and those living in rural areas that were excluded from participating. Failing to hold inclusive meetings not only negatively impacts our environment it compounds the racial wealth gap. It enables predatory banks to exploit us and further enables multinational corporations to monopolies industries. Our coalition is calling for a moratorium on all proposed roundabouts in Unincorporated East LA and across the county were the outdated infrastructure has not been replaced and were the number of cars does not meet the vehicle threshold for a roundabout In East LA we have over 11,000,000 million cars a year going through our neighborhoods and the East LA Interchange. We can improve our intersections and provide safer pedestrian and vehicle intersections without increasing our carbon foot print. The roundabouts in our community were built wrong. They pose an eminent threat to pedestrians and motorist. The disabled ramps lead directly into the path of vehicles in the roundabouts. They remove much needed parking and now residents have to drive around searching for parking. They also negatively impact emergency response time. Roundabouts that were designed prior to the construction of an intersection are safer and more efficient than the ones that have been recently popping up everywhere. Finding loop holes to build them is not about safety at all. We

hope you contact us so that we can submit proper responses because now the information provided to the public was incomplete and fails to include data that we need in order to provide an adequate response to the issues that have killed us, are killing us and will continue to harm us if not remedied.

Por Mi Raza Habla Mi Espiritu!

Re: Building Industry Association (BIA-LAV) Comment Letter – 2045 Climate Action Plan – The Scope of the Pending Draft EIR based on the Initial Study; Need to Review Land Use Policies and Their Climate Change Implications vis-à-vis Housing and Population.

Dear Ms. Hua and Regional Planning Staff,

The Los Angeles/Ventura Chapter of the Building Industry Association of Southern California, Inc. (BIA-LAV) is a non-profit trade association that promotes and supports homebuilding activities in the Los Angeles and Ventura Counties. BIA-LAV and our members have long supported reasonable and balanced environmental policies, and sought to harmonize (i) the increasing need for additional housing to support our growing population with (ii) environmental sustainability, resiliency and goals. On behalf of our membership, we respectfully provide these comments concerning the scope of the pending environmental review of the County's update of its climate action plan, which will be referred to as the "2045 CAP." Specifically, the comments below respond to the initial study that was posted by the County.

There is increasing general acceptance of the reality that anthropogenic, global climate change ("GCC") is one of the most dire pressing challenges and that it must be addressed urgently and boldly. The State of California has long been ahead of the rest of our nation and most of the world's other nations in articulating such recognition. That said, the steps that could possibly be undertaken to address GCC would themselves each have myriad and profound consequences for our society and our citizenry at large.

As homebuilders, BIA-LAV's membership understands how challenging it will be to both address climate change and maintain standards of living. Moreover, we need to do more to raise standards of living for a great many citizens. Our society will need to undertake bold steps even if we were all to choose the best possible steps to address GCC. We will pay far more, however, if we were to take missteps, impose ill-considered measures, or adhere to existing public policies that are proven wrong in light of new data.

With that in mind, the County's pending study in advance of the 2045 CAP needs to be both circumspect and thorough so that all of the County's policies will (i) cohere and point accurately toward desired GCC benefits, while also (ii) best serve our region's population and benefit the economy on which we all depend. BIA-LAV respectfully asserts that the County would shirk its responsibilities under the California Environmental Quality Act (CEQA) if the draft environmental impact report (EIR) for the 2045 CAP were to not include a serious, thorough study of the impacts the Climate Action Plan will have on (i) **population and housing**, (ii) **land use and planning**, and (iii) all other potential environmental impacts (direct, indirect and cumulative) identified in Appendix G of the CEQA Guidelines. All such impacts should be scrutinized specifically through the lens of GCC and the need to reduce greenhouse gases (GHG) emissions.

There are three primary reasons why potentially significant environmental effects of the 2045 CAP on population and housing must be studied and reflected in the draft EIR for the 2045 CAP:

First, the preferred initial study for the pending 2045 CAP indicates that the County will study and potentially propose eliminating natural gas and propane heating and cooking from all new development in the unincorporated county. We recognize that such a general goal has been ambitiously embraced even before it has been studied in the context of more rigorous CEQA environmental review. Undoubtedly, however, any such measure would have profound impacts particularly on housing and population, as well as on land use and other impacts concerning which study is required pursuant to Appendix G of the CEQA Guidelines. Therefore, these considerations must be studied in the pending EIR.

Presently, the only available practical, large scale alternative to natural gas or propane heating is to use electric heat pumps. Federal studies have long indicated that electric heat pumps operate relatively inefficiently when ambient temperatures fall. One such federal study last decade indicated that efficiency drops when ambient temperatures fall below 45°. ¹ Although gradual technological improvements have been made and will presumably continue, it is nonetheless entirely foreseeable that electric heat pumps will continue to have relatively limited efficacy when ambient temperatures drop to low levels, which is inevitable by degree in many parts of the county. When this fact is combined with the fact that electrical power outages at different scales are inevitable from time to time, the County must recognize that such de-carbonization will inevitably require citizens to flee their homes from time to time for warmth. Homeowners already have limited or no use of wood burning fireplaces to comply with other environmental concerns.

¹ U.S. Department of Energy Office of Energy Efficiency & Renewable Energy, Measure Guideline: Heat Pump Water Heaters in New and Existing Homes (Feb. 2012), at 8 <https://www.nrel.gov/docs/fy12osti/53184.pdf>.

Therefore, any County mandate to “de-carbonized” heating will foreseeably have profound effect on (i) the utility of all new housing that is built subject to the proposed mandate (especially in colder parts of the county such as the more elevated north county), (ii) the quantum of new housing production, (iii) the consumer acceptance thereof, and (iv) population. We can all foresee inevitable disruptions – of different durations and however localized or widespread – in the electrical power supplies which would necessarily power electric heat pumps. Consequently, any requirement that all new housing in the unincorporated areas of the County must be “de-carbonized” would create serious life-safety issues for citizens who would reside in such housing. Such a policy would also have a profound impact on both the consumer-desirability and general economic viability of such new housing. For these reasons alone, the foreseeable effect of the projected 2045 CAP on housing, population and land use must be studied.

Second, the County’s ongoing land use policies, particularly as they relate to so-called “edge” or “greenfield” development (e.g., “new town” development or new suburban development), have evolved and been extended thus far without any meaningful and informed consideration of their GCC implications. The County continues to assume, for example, that heroic reductions in per capita vehicle miles traveled (VMT) should be pursued through increasingly constrictive land use restrictions and related incentives, and that concomitant GHG reductions will result from compelling far more transit-oriented urban redevelopment and largely curtailing suburban and exurban (new town) development. Such assumptions underlie the County’s recent update to the housing element of its general plan.

The most recent data show, however, that the County’s assumptions and conclusions about the GCC environmental effects of its land use policies are demonstrably incorrect. A growing body of compelling evidence shows that both jobs and housing demand are fleeing the more urbanized areas in favor of suburban and relatively bucolic “work from home” environs, accelerating a trend that was growing before the pandemic.² One recent study shows that COVID-19 pandemic has accelerated an antecedent trend towards urban exodus toward the suburbs, the exurbs, and significantly smaller cities – primarily in sunbelt states with less constrictive land use policies but also substantially higher per capita GHG emission rates.³ For

² Stephan D. Whitaker, “Did the COVID-19 Pandemic Cause an Urban Exodus?” Federal Reserve Bank of Cleveland, February 5, 2021, <https://www.clevelandfed.org/newsroom-and-events/publications/cfed-district-data-briefs/cfddb-20210205-did-the-covid-19-pandemic-cause-an-urban-exodus>.

³ Families and individuals are rapidly fleeing California in great numbers to move to far less GCC-caring states. Mark Calvey, “Census Finds Almost 1% of Californians Left the Golden State in Past Year,” San Francisco Business Times, December 21, 2021, <https://www.bizjournals.com/sanfrancisco/news/2021/12/21/census-finds-almost-1-of-californians-left-golden.html>.

example, between 2019 and 2021, U.S. consumer preference for larger homes in less dense areas grew from 53% to 60%.⁴

No new CAP can be thoughtfully completed without studying and taking into account its impact in light of Angelenos' evolving preferences for housing and lifestyle preferences, because the interplay of the CAP with these popular preferences will unquestionably affect both the County's population growth and retention and the potential realization of additional housing stock in the County, which themselves affect climate action. Moreover, given California's and the county's relatively superior transition to electric vehicle use and other vehicular fleet and fuel change, the County should, in order to best address GCC, be pursuing positive land use policies which accommodate potential population growth and discourage out-migration in concert with promoting fleet and fuel change.⁵

Third, new data has been garnered recently by the scientists worried about the increasingly ominous outlook for GCC concerning the GHG implications of different housing typologies and densities. One recent study on the topic of urban sustainability shows the life-cycle, per capita GHG impacts of taller buildings, such as those which are being strongly promoted by the existing land use policies throughout the County and the cities located within it, are GCC-harmful on a per capita, life-cycle basis when compared lower, less intense development.⁶ The study strongly indicates that the type of mid-rise and high-rise downtown development that is now being hyped by governmental regional planners is harmful from a life-cycle, per capita GHG standpoint. The study thus also indicates the need for Los Angeles County and its Department of Regional Planning to reconsider and reverse their singularly constrictive, centripetal, and urban-centric policies.

Such emerging data on land use patterns and GHG impacts call for a new, exhaustive and open-minded look at the County's land use policies. Given that the County must want to make the 2045 CAP as sound and effective as it can be, the County must carefully study, disclose to the public in the draft EIR, and take into account emerging data of the type discussed above. Thus,

⁴ Vianney Gomez, "More Americans now say they prefer a community with big houses, even if local amenities are farther away," Pew Research Center, August 26, 2021, <https://www.pewresearch.org/fact-tank/2021/08/26/more-americans-now-say-they-prefer-a-community-with-big-houses-even-if-local-amenities-are-farther-away/>.

⁵ As reflected in relatively recent studies by the federal government, California has the second lowest per capita energy-related CO₂ emissions amongst the 50 states. U.S. Energy Info. Admin., "Energy-Related Carbon Dioxide Emissions by State, 2005-2016," February 27, 2019, <https://www.eia.gov/environment/emissions/state/analysis/>.

⁶ Francesco Pomponi, "Decoupling Density from Tallness in Analysing the Life Cycle Greenhouse Gas Emissions of Cities," Nature Partners Journal – Urban Sustainability, July 5, 2021, <https://doi.org/10.1038/s42949-021-00034-w>.

Thuy Hua, Supervising Regional Planner

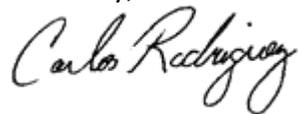

January 31, 2022

Page 5 of 5

when preparing the draft EIR for the 2045 CAP, the County should both study broadly and reconcile the County's housing, population, land use, and achievable GHG reductions.

Notably, the County's policymakers will always retain discretion concerning county regional planning, housing policy and land use approvals. Their ongoing discretion will apply to general plan amendments and all relevant policies, as well as to all individual project approvals made and conditioning imposed – or not imposed – under CEQA (i.e., overriding considerations). Given the critical need to put in place the best and most carefully balanced policies to address GCC consistent with the broader goal of general betterment, BIA-LAV respectfully requests that the County study carefully and thoroughly the housing, population, land use and planning implications of the measures that are appropriate for the 2045 CAP. Thank you for your consideration and we look forward to the opportunity for further discussion.

Sincerely,

A handwritten signature in black ink that reads "Carlos Rodriguez". The signature is written in a cursive, flowing style.

Subject: Notice of Preparation of a Draft Programmatic Environmental Impact Report for the Los Angeles County 2045 Climate Action Plan (Draft 2045 CAP), SCH #2021120568, Los Angeles County Department of Regional Planning, Los Angeles County

Dear Ms. Hua:

The California Department of Fish and Wildlife (CDFW) has reviewed a Notice of Preparation (NOP) of Draft Programmatic Environmental Impact Report (PEIR) from the Los Angeles County Department of Regional Planning (DRP) for the Los Angeles County 2045 Climate Action Plan (Draft 2045 CAP) (Project). CDFW appreciates the opportunity to provide comments regarding aspects of the Project that could affect fish and wildlife resources and be subject to CDFW's regulatory authority under the Fish and Game Code.

CDFW's Role

CDFW is California's Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State [Fish & G. Code, §§ 711.7, subdivision (a) & 1802; Pub. Resources Code, § 21070; California Environmental Quality Act (CEQA) Guidelines, § 15386, subdivision (a)]. CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Id., § 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect State fish and wildlife resources.

CDFW is also submitting comments as a Responsible Agency under CEQA (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code, including lake and streambed alteration regulatory authority (Fish & G. Code, § 1600 *et seq.*). Likewise, to the extent implementation of the Project as proposed may result in "take", as defined by State law, of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 *et seq.*), or CESA-listed rare plant pursuant to the Native Plant Protection Act (NPPA; Fish & G. Code, § 1900 *et seq.*), CDFW recommends the Project proponent obtain appropriate authorization under the Fish and Game Code.

Conserving California's Wildlife Since 1870

Thuy Hua
 Los Angeles County Department of Regional Planning
 January 31, 2022
 Page 2 of 18

Project Description and Summary

Objective: The Project proposes a General Plan Amendment to replace the Los Angeles County (County) Community Climate Action Plan with the Draft 2045 CAP. The Draft 2045 CAP would be a policy document intended to reduce unincorporated County-wide greenhouse gas (GHG) emissions. The Draft 2045 CAP would demonstrate how local actions can support goals to reduce GHG emissions and ensure that the County's reduction of GHG emissions aligns with State goals to reduce GHG emissions and the Our County Sustainability Plan.

The Draft 2045 CAP would be modeled with the land use assumptions, policies and implementation programs found within the General Plan (including the current 6th Cycle 2021-2029 Housing Element), as well as within other County projects and programs. The Draft 2045 CAP would include an updated GHG emissions inventory for 2018; new emissions forecasts for 2030, 2035, and 2045; new GHG emissions targets for 2030, 2035, and 2045; a revised suite of GHG reduction strategies, measures, and actions; a technical modeling appendix to explain the Draft 2045 CAP's GHG reduction estimates; a consideration of environmental justice and equity concerns; and a new development review consistency checklist to allow projects to streamline CEQA compliance by using the Draft 2045 CAP (CEQA Guidelines, § 15183.5). The Draft 2045 CAP is anticipated to include approximately 26 recommended GHG reduction measures. The recommended GHG reduction measures are to be organized under five main categories and 11 strategies listed below.

- 1) Climate Leadership
 - Strategy 1: Lead by example towards carbon neutrality
- 2) Transportation
 - Strategy 2: Increase densities and diversity of destinations with an emphasis near transit
 - Strategy 3: Reduce single-occupancy vehicle trips
 - Strategy 4: Institutionalize low-carbon transportation
- 3) Building Energy & Water
 - Strategy 5: Decarbonize buildings and energy use
 - Strategy 6: Increase generation and resilience of renewable energy
 - Strategy 7: Improve efficiency of building energy use
 - Strategy 8: Promote water conservation
- 4) Waste
 - Strategy 9: Reduce and divert waste
- 5) Agriculture, Forestry, and Other Land Use
 - Strategy 10: Conserve Forests and Working Lands
 - Strategy 11: Promote Carbon Sequestration and Sustainable Agriculture

Individual projects implementing Draft 2045 CAP measures are anticipated to be located primarily within the urban environments and on disturbed areas with existing infrastructure. These include a majority of the Draft 2045 CAP measures promoting transportation option, institutionalizing low-carbon transportation, promoting water conservation, and increasing renewable energy. However, some of the Draft 2045 CAP measures would promote implementation projects including transit routes, electric vehicle chargers, water recycling systems, solar energy generation facilities, and waste management facilities. Depending on the

Thuy Hua
 Los Angeles County Department of Regional Planning
 January 31, 2022
 Page 3 of 18

location of the implementing projects, construction could result in impacts on biological resources.

Location: Implementation of the Project would occur throughout unincorporated Los Angeles County in all General Plan, Community Plan, Area Plan, and zoning designations.

Comments and Recommendations

CDFW offers the comments and recommendations below to assist DRP in adequately identifying, avoiding, and/or mitigating the Project's significant, or potentially significant, direct, and indirect impacts on fish and wildlife (biological) resources. The PEIR should provide adequate and complete disclosure of the Project's potential impacts on biological resources [Pub. Resources Code, § 21061; CEQA Guidelines, §§ 15003(i), 15151]. CDFW looks forward to commenting on the PEIR when it is available.

Specific Comments

- 1) Biological Resources Assessment for Individual Projects. CDFW recommends the PEIR include a requirement where projects implementing Draft 2045 CAP measures provide a biological resources assessment (see General Comment #3). A biological resources assessment should include a discussion of a project's potential impact on biological resources including, but not limited to, biological resources discussed in Comments #2 through 9 below. Based on the results of the biological resources assessment, a qualified biologist should prepare species- and site-specific measures to avoid, minimize, and/or mitigate for a project's potentially significant impacts on biological resources.
- 2) Biological Resources in the Antelope Valley. The Project could potentially result in installation of new solar energy generation facilities on County-owned land. Siting, construction, decommissioning, and operational activities associated with solar array installations, as well as transmission facilities, result in loss of native vegetation and habitat for wildlife (ICF 2019). CDFW is concerned that new solar energy generation facilities installed in the Antelope Valley region could result in significant habitat loss and impact special status, rare, and sensitive species of plants and wildlife, including (but not limited to) the following: Swainson's hawk (*Buteo swainsonii*), Mohave ground squirrel (*Xerospermophilus mohavensis*), desert tortoise (*Gopherus agassizii*), burrowing owl (*Athene cunicularia*), western Joshua tree (*Yucca brevifolia*), and alkali mariposa lily (*Calochortus striatus*).
 - a) Analysis and Disclosure. As part of the PEIR's evaluation of the Project's impact on biological resources, CDFW recommends the PEIR provide a focused discussion on the Project's potential impact on biological resources in the Antelope Valley. At a minimum, the PEIR should discuss the Project's impact on focal species identified on Table 2-2 in the CDFW-approved final [Antelope Valley Regional Conservation Investment Strategy](#) (AVRCIS) (ICF 2019). The PEIR should also discuss the Project's impact on other conservation elements identified in the AVRCIS, which includes habitat connectivity, farmlands, rangelands, and natural communities.
 - b) Mitigation. CDFW recommends the PEIR include measures that require individual projects to mitigate for impacts on special status, rare, and sensitive species of plants

Thuy Hua
 Los Angeles County Department of Regional Planning
 January 31, 2022
 Page 4 of 18

and wildlife and natural communities in the AVRCIS area. Mitigation measures should be consistent with conservation strategies identified in the AVRCIS. If the DRP proposes in-lieu fees or a form of mitigation payment as mitigation, the PEIR should thoroughly discuss why DRP's proposal is adequate to mitigate for impacts to these biological resources. At a minimum, the PEIR should discuss the following: 1) how the fee/fund is designed to (and will) mitigate the effects at issue at a level meaningful for purposes of CEQA; 2) why the fee/fund is appropriate for mitigating the cumulative loss of habitat; 3) why the fee/fund is sufficient to purchase land or credits at a mitigation bank; 4) where land may be acquired or where credits may be purchased; 5) when fee/fund would occur/be used; and, 6) why the fee/fund would be adequate such that no impacts would occur/no net loss of habitat. Adequate disclosure is necessary to identify the nexus between the mitigation proposed and the impacts that may occur and allow CDFW to review and provide comments on the adequacy of the mitigation proposed.

- 3) Wildlife Corridors. The Project area may overlap with wildlife corridors and linkages identified in the [South Coast Missing Linkages Project](#) (SCW 2021). Some of these corridors such as the San Gabriel Castaic corridor have experienced some connectivity loss or is threatened due to development and transportation projects. Development including installation of solar energy generation facilities potentially proposed by the Project, especially on undeveloped County-owned land, could introduce new/additional barriers to dispersal and constrain wildlife corridors and pinch points leading to severed migration.
 - a) Analysis and Disclosure: The PEIR should discuss the Project's potential impact and cumulative impact on wildlife corridors. The PEIR should discuss impacts from the standpoint of the following: 1) introducing new/additional barriers to dispersal; 2) constraining wildlife corridors and pinch points leading to severed migration; 3) habitat loss, fragmentation, and encroachment; and 4) increased human presence, noise, and lighting.
 - b) Avoidance. The PEIR should include a measure whereby individual projects should first avoid impacts wildlife corridors through planning efforts to locate projects outside of wildlife corridors.
 - c) Mitigation. If avoidance is not feasible, CDFW recommends the PEIR include measures that require individual projects to provide compensatory mitigation for impacts on wildlife corridors. If the DRP proposes in-lieu fees or a form of mitigation payment as mitigation, the PEIR should thoroughly discuss why DRP's proposal is adequate to mitigate for impacts to these biological resources (see Comment #2b).

- 4) Impact on Mountain Lion (*Puma concolor*). Mountain lion occurs in the Project area. Installation of solar energy generation facilities potentially proposed by the Project, especially on undeveloped County-owned land, could impact mountain lion through habitat loss and fragmentation, as well as introduce new/additional barriers to mountain lion dispersal.
 - a) Protection Status: The mountain lion is a specially protected mammal in the State (Fish and G. Code, § 4800). In addition, on April 21, 2020, the California Fish and Game Commission accepted a petition to list the Southern California/Central Coast Evolutionary Significant Unit of mountain lion as threatened under CESA (CDFW 2020).

Thuy Hua
Los Angeles County Department of Regional Planning
January 31, 2022
Page 5 of 18

As a CESA candidate species, the mountain lion in southern California is granted full protection of a threatened species under CESA.

- b) Analysis and Disclosure. The PEIR should discuss the Project's potential impact on mountain lion. The PEIR should discuss impacts from the standpoint of the following: 1) introducing new/additional barriers to dispersal; 2) constraining wildlife corridors and pinch points leading to severed migration; 3) habitat loss, fragmentation, and encroachment; and 4) increased human presence, noise, and lighting.
- c) Individual Project-Level Impact Assessment. CDFW recommends the PEIR include a measure that requires individual projects to evaluate impacts on mountain lion. Individual project-level evaluations should be supported by an analysis on mountain lion movement, territory size, and habitat use within and surrounding the project vicinity. CDFW recommends using wildlife cameras to aid in identification of areas that may be important to mountain lion movement.
- d) Avoidance and Mitigation. CDFW recommends avoidance and mitigation consistent with Comment #3b and 3c.
- e) Use of Rodenticides. CDFW recommends DRP prohibit all subsequent projects implementing Draft 2045 CAP measures from using any second generation anticoagulant rodenticides. Second generation anticoagulant rodenticides are known to have harmful effects on the ecosystem and wildlife. Assembly Bill 1788 prohibits the use of any second generation anticoagulant rodenticides because second generation anticoagulant rodenticides have a higher toxicity and are more dangerous to nontarget wildlife such as mountain lions, bobcats, foxes, and coyotes (California Legislative Information 2020).
- f) CESA. CDFW considers adverse impacts to a species protected by CESA to be significant without mitigation under CEQA. As to CESA, take of any endangered, threatened, candidate species, or CESA-listed plant species that results from a project is prohibited, except as authorized by State law (Fish & G. Code, §§ 2080, 2085; Cal. Code Regs., tit. 14, §786.9). Consequently, if a project and any project-related activity during the life of a project will result in take of a species designated as endangered or threatened, or a candidate for listing under CESA, CDFW recommends that the project proponent seek appropriate take authorization under CESA prior to implementing the project. Appropriate authorization from CDFW may include an Incidental Take Permit (ITP) or a Consistency Determination in certain circumstances, among other options [Fish & Game Code, §§ 2080.1, 2081, subds. (b) and (c)]. Early consultation is encouraged, as significant modification to the project and mitigation measures may be required to obtain an ITP. Revisions to the Fish and Game Code, effective January 1998, may require that CDFW issue a separate CEQA document for the issuance of an ITP unless the project's CEQA document addresses all project impacts to CESA-listed species and specifies a mitigation monitoring and reporting program that will meet the requirements of an ITP. For these reasons, biological mitigation monitoring and reporting proposals should be of sufficient detail and resolution to satisfy the requirements for an ITP.

Thuy Hua
Los Angeles County Department of Regional Planning
January 31, 2022
Page 6 of 18

- 5) Woodlands. The Project area (unincorporated Los Angeles County) encompasses native woodlands that include (but are not limited to) California walnut groves (*Juglans californica* Woodland Alliance); oak woodlands (*Quercus* genus Woodland Alliance); California bay forest (*Umbellularia californica* Forest Alliance); California sycamore woodlands (*Platanus racemosa* Woodland Alliance); Fremont cottonwood forest (*Populus fremontii* Forest Alliance); and willow thickets (*Salix* Shrubland or Woodland Alliance).
- a) Sensitive Natural Communities. Natural communities, alliances, and associations with a State-wide rarity ranking of S1, S2, and S3 should be considered sensitive and declining at the local and regional level (see General Comment #3a). CDFW considers sensitive natural communities as threatened habitats having both regional and local significance.
- i. California walnut groves is a sensitive natural community with a rarity ranking of S3.2 (CDFW 2022a; Sawyer et al. 2009). California walnut groves are only found in southern California where this natural community has been significantly reduced due to urban development, type conversion, and agriculture.
 - ii. Some oak woodland alliances have a rarity ranking of S1, S2, or S3. While the coast live oak (*Quercus agrifolia* Woodland Alliance) has a rarity ranking of S4, some associations are rare (S1, S2, or S3) (Sawyer et al. 2009). Oak woodlands serve several important ecological functions such as protecting soils from erosion and land sliding, regulating water flow in watersheds, and maintaining water quality in streams and rivers. Oak woodlands also have higher levels of biodiversity than any other terrestrial ecosystem in California. Over 330 species of birds, mammals, reptiles, and amphibians depend on oak woodlands in California at some stage in their life cycle (CalPIF 2002). Moreover, oak woodlands are protected by the Oak Woodlands Conservation Act (pursuant under Fish and Game Code sections 1360-1372) and Public Resources Code section 21083.4 due to the historic and on-going loss of these resources. The percentage of oak woodlands that are developed in southern California is higher than in any other part of the State (Gaman and Firman 2006).
- b) Analysis and Disclosure. The PEIR should discuss the Project's potential impact on Sensitive Natural Communities occurring within the Project area. Natural community names should be provided in accordance with the [Manual of California Vegetation](#) (MCV), second edition (Sawyer et al. 2009).
- c) Avoidance. CDFW recommends the PEIR include measures that require individual projects to avoid impacts on sensitive natural communities. Mitigation may include avoiding impacts by establishing effective setbacks. If the DRP proposes buffers/setbacks as mitigation for all subsequent individual projects, the PEIR should provide justification for the effectiveness of chosen buffer/setback distances to avoid impacts on sensitive natural communities. An appropriate buffer/setback should avoid direct and indirect impacts on sensitive natural communities, allow for population connectivity and expansion, and protect processes supporting sensitive natural communities such as hydrological processes in the case of California walnut groves.
- d) Compensatory Mitigation. If avoidance is not feasible, the PEIR should require individual projects to provide compensatory mitigation for impacts on sensitive natural communities at no less than 2:1. DRP should require higher mitigation for project-level impacts on S1

Thuy Hua
 Los Angeles County Department of Regional Planning
 January 31, 2022
 Page 7 of 18

and S2-ranked natural communities and natural communities that are locally rare. Impacts due to fuel modification or trimming should also be mitigated as these impacts would result in permanent loss and perpetual impacts on habitat function and quality. There should be no-net loss of individual trees and habitat acres for California walnut groves and oak woodland. Mitigation should be provided for both individual trees and habitat acres. The replacement of individual trees is inadequate to mitigate for the loss of habitat.

- 6) Stream Delineation and Impact Assessment. The Project area (unincorporated Los Angeles County) encompasses many watersheds, rivers, waterbodies, and tributaries including (but not limited to) the Los Angeles River watershed, Northern Mojave River watershed, Ventura–San Gabriel Coastal watershed, Los Angeles River, Santa Clara River, San Gabriel River, Tujunga Creek, Castaic Creek, and desert dry washes in the Antelope Valley region.
- a) Fish and Game Code section 1600 et. seq. CDFW exercises its regulatory authority as provided by Fish and Game Code section 1600 et seq. to conserve fish and wildlife resources which includes rivers, streams, or lakes and associated natural communities.
 - b) Analysis and Disclosure. The PEIR should discuss the Project's potential impact on rivers, streams, or lakes¹ and associated natural communities. Impacts may include (but not limited to) the following: channelizing or diverting a stream; impairing a watercourse; Project-related activities causing erosion; removing vegetation adjacent to a water course; and degrading vegetation through habitat modification (e.g., loss of water source, encroachment, and edge effects leading to introduction of non-native plants). CDFW recommends the PEIR include a fine-scale stream delineation within the Project area to the extent feasible as part of the PEIR's evaluation of the Project's impact on rivers, streams, or lakes and a list of associated natural communities. Natural community names should be provided in accordance with the MCV, second edition (Sawyer et al. 2009).
 - c) Individual Project-Level Impact Assessment. CDFW recommends the PEIR include a measure that require individual projects to provide a stream delineation and evaluate impacts on any river, stream, or lake and associated natural communities. The delineation should be conducted pursuant to the U.S Fish and Wildlife Service's (USFWS) wetland definition adopted by CDFW (Cowardin et al. 1979). Be advised that some wetland and riparian habitats subject to CDFW's authority may extend beyond the jurisdictional limits of the U.S. Army Corps of Engineers' Section 404 permit and Regional Water Quality Control Board Section 401 Certification.
 - d) Mitigation. CDFW recommends the PEIR include measures that require individual projects to mitigate for impacts on streams and associated natural communities. Mitigation may include avoiding impacts by establishing effective unobstructed vegetated buffers and setbacks adjoining streams and associated natural communities. If the DRP proposes buffers and setbacks as mitigation for all subsequent individual projects, the

¹ "Any river, stream, or lake" includes those that are dry for periods of time (ephemeral/episodic) as well as those that flow year-round (perennial). This includes ephemeral streams, desert washes, and watercourses with a subsurface flow. It may also apply to work undertaken within the flood plain of a water body.

Thuy Hua
 Los Angeles County Department of Regional Planning
 January 31, 2022
 Page 8 of 18

PEIR should provide justification for the effectiveness of chosen buffer and setback distances to avoid impacts on the stream and associated natural communities. If avoidance is not feasible, the PEIR should require individual projects to provide compensatory mitigation for impacts on streams and associated natural communities at no less than 2:1. DRP should require higher mitigation for project-level impacts on sensitive natural communities (see General Comment #3a) and presence of rare, sensitive, or special status flora and fauna.

- e) Lake and Streambed Alteration (LSA) Agreement. As a Responsible Agency under CEQA, CDFW has authority over activities in streams and/or lakes that will divert or obstruct the natural flow, or change the bed, channel, or bank (including vegetation associated with the stream or lake) of a river or stream or use material from a streambed. For any such activities, CDFW recommends the PEIR include a measure that requires individual projects to notify CDFW pursuant to Fish and Game Code section 1602. CDFW should be notified prior to starting activities that may impact streams, and the project should obtain an LSA Agreement² prior to starting project activities. Please visit CDFW's [Lake and Streambed Alteration Program](#) webpage for more information (CDFW 2022b).
- 7) Water Recycling Systems. Some of the Draft 2045 CAP measures would promote implementation projects including water recycling systems. Water recycling systems that would capture and infiltrate local dry and wet season runoff would divert water from local watercourses. A reduction in dry and wet season flow could impact biological resources depending on the flow. Impacts on biological resources could occur in the immediate project area and downstream from the project area.
- a) Analysis and Disclosure. The PEIR should discuss the Project's potential impact of water recycling systems on watercourses and biological resources. The PEIR should provide information on the type(s) of water recycling systems that would be installed; where water recycling systems would be located in relation to rivers, streams, and lakes in the Project area; the approximate volume of water that would be captured and diverted resulting from the Project; and what biological resources could be impacted by water recycling systems.
- b) Individual Project-Level Impact Assessment. CDFW recommends the PEIR include a measure that requires individual projects resulting in water recycling systems to provide an analysis of impacts on flow and evaluate changes in flow and hydraulics on biological resources. An adequate analysis should provide the following information at a minimum: 1) an adequate study reach in order to analyze changes in flow in the immediate project area and downstream; 2) flow and hydraulics (e.g., water depth, wetted perimeter, and velocity) during the wet season (November through March), dry season (April through October), and both above-average and below-average water year (i.e., wet

² CDFW's issuance of a LSA Agreement for a project that is subject to CEQA will require CEQA compliance actions by CDFW as a Responsible Agency. As a Responsible Agency, CDFW may consider the environmental document of the local jurisdiction (lead agency) for the project. To minimize additional requirements by CDFW pursuant to section 1600 et seq. and/or under CEQA, the environmental document should fully identify the potential impacts to the stream or riparian resources and provide adequate avoidance, mitigation, monitoring, and reporting commitments for issuance of the LSA Agreement.

Thuy Hua
 Los Angeles County Department of Regional Planning
 January 31, 2022
 Page 9 of 18

season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year) under pre-project (i.e., baseline conditions) and post-project conditions; 3) percent changes in flow, water depth, wetted perimeter (acres gained/lost), and velocity (percent change) under project condition; 4) a list of sensitive and special status plant and wildlife species, including natural communities that could be impacted; and 5) project-related impacts on biological resources in relation to cumulative flow reductions. CDFW recommends such analysis and evaluation apply a [function flows approach](#) to evaluate impacts on biological resources. The functional flows approach provides the basis for guidance provided in the [California Environmental Flows Framework](#) (UC Davis 2022). Functional flows are distinct aspects of a natural flow regime that sustain ecological, geomorphic, or biogeochemical functions, and that support the specific life history and habitat needs of native aquatic species. Retaining key functional flow components in managed flow regimes is thus expected to support foundational physical and ecological processes that sustain biological communities

- c) Mitigation. CDFW recommends the PEIR include measures that require individual projects to mitigate for impacts on biological resources resulting from water recycling systems. Mitigation may include notifying CDFW and obtaining an LSA Agreement pursuant to Fish and Game Code section 1602 (see Comment #6).
- 8) Nesting Birds. Individual projects implementing Draft 2045 CAP measures that would require vegetation removal and/or disturbance could impact nesting birds. Construction could create elevated levels of noise, human activity, dust, ground vibrations, and vegetation disturbance. These activities occurring near potential nests could cause birds to abandon their nests and a decrease in feeding frequency, both resulting in the loss of fertile eggs or nestlings.
- a) Protection Status. Migratory nongame native bird species are protected by international treaty under the Federal Migratory Bird Treaty Act (MBTA) of 1918 (Code of Federal Regulations, Title 50, § 10.13). Sections 3503, 3503.5, and 3513 of the California Fish and Game Code prohibit take of all birds and their active nests including raptors and other migratory nongame birds (as listed under the MBTA). It is unlawful to take, possess, or needlessly destroy the nest or eggs of any raptor.
 - b) Analysis and Disclosure. The PEIR should discuss the Project's potential impact on nesting birds and raptors. A discussion of potential impacts should include impacts that could occur during construction, ground-disturbing activities (e.g., mobilizing, staging, drilling, and excavating), and vegetation removal associated with implementation of individual projects.
 - c) Avoidance. CDFW recommends that the PEIR include measures that require individual projects to fully avoid impacts on nesting birds and raptors. To the extent feasible, no construction, ground-disturbing activities (e.g., mobilizing, staging, drilling, and excavating), and vegetation removal should occur during the avian breeding season which generally runs from February 15 through September 15 (as early as January 1 for some raptors) to avoid take of birds, raptors, or their eggs.
 - d) Minimizing Potential Impacts. If impacts on nesting birds and raptors cannot be avoided, CDFW recommends the PEIR include measures that require individual projects to

Thuy Hua
Los Angeles County Department of Regional Planning
January 31, 2022
Page 10 of 18

minimize impacts on nesting birds and raptors during implementation of individual projects. Prior to starting ground-disturbing activities and vegetation removal, CDFW recommends a qualified biologist conduct nesting bird and raptor surveys to identify nests. The qualified biologist should establish no-disturbance buffers to minimize impacts on those nests. CDFW recommends a minimum 300-foot no-disturbance buffer around active bird nests. For raptors, the no-disturbance buffer should be expanded to 500 feet and 0.5 mile for special status species, if feasible. Personnel working on a project, including all contractors working on site, should be instructed on the presence of nesting birds, area sensitivity, and adherence to no-disturbance buffers. Reductions in the buffer distance may be appropriate depending on the avian species involved, ambient levels of human activity, screening vegetation, or possibly other factors determined by a qualified biologist.

- 9) Bats. Numerous bat species are known to roost in trees and structures throughout Los Angeles County. Individual projects implementing Draft 2045 CAP measures that would require removal and/or disturbance of vegetation and other potential roosting structures could impact bats. Removal of trees, vegetation, and/or structures supporting roosting bats could result in injury and/or mortality of bats, as well as loss of roosting habitat. Bats and roosts could also be impacted by increased noise, human activity, dust, and ground vibrations during construction and ground-disturbing activities.
 - a) Protection Status. Bats are considered non-game mammals and are afforded protection by State law from take and/or harassment (Fish & G. Code, § 4150; Cal. Code of Regs., § 251.1). In addition, some bats are considered California Species of Special Concern (SSC). CEQA provides protection not only for CESA-listed species, but for any species including but not limited to SSC which can be shown to meet the criteria for State listing. These SSC meet the CEQA definition of endangered, rare, or threatened species (CEQA Guidelines, § 15380). Take of SSC could require a mandatory finding of significance (CEQA Guidelines, § 15065).
 - b) Analysis and Disclosure. The PEIR should discuss the Project's potential impact on bats and habitat supporting roosting bats. A discussion of potential impacts should include impacts that may occur during Project construction, ground-disturbing activities (e.g., mobilizing, staging, drilling, and excavating), and vegetation removal.
 - c) Avoidance and Minimization. CDFW recommends that the PEIR include measures that require individual projects to avoid and/or minimize impacts on bats during implementation of individual projects. Prior to project implementation, CDFW recommends that DRP require individual projects to retain a qualified bat specialist to identify potential daytime, nighttime, wintering, and hibernation roost sites within the project site, and conduct bat surveys within these areas (plus a 100-foot buffer as access allows) to identify roosting bats and any maternity roosts. CDFW recommends using acoustic recognition technology to maximize detection of bats. The PEIR should incorporate mitigation measures in accordance with [California Bat Mitigation Measures](#) (Johnston et al. 2004).

Thuy Hua
Los Angeles County Department of Regional Planning
January 31, 2022
Page 11 of 18

General Comments

- 1) Disclosure. The PEIR should provide an adequate, complete, and detailed disclosure about the effect which the proposed Project is likely to have on the environment (Pub. Resources Code, § 20161; CEQA Guidelines, § 15151). Adequate disclosure is necessary so CDFW may provide comments on the adequacy of proposed avoidance, minimization, or mitigation measures, as well as to assess the significance of the specific impact relative to plant and wildlife species impacted (e.g., current range, distribution, population trends, and connectivity).
- 2) Mitigation Measures. Public agencies have a duty under CEQA to prevent significant, avoidable damage to the environment by requiring changes in a project through the use of feasible alternatives or mitigation measures [CEQA Guidelines, §§ 15002(a)(3), 15021]. Pursuant to CEQA Guidelines section 15126.4, an environmental document “shall describe feasible measures which could mitigate for impacts below a significant level under CEQA.”
 - a) Level of Detail. Mitigation measures must be feasible, effective, implemented, and fully enforceable/imposed by the lead agency through permit conditions, agreements, or other legally binding instruments (Pub. Resources Code, § 21081.6(b); CEQA Guidelines, § 15126.4). A public agency “shall provide the measures that are fully enforceable through permit conditions, agreements, or other measures” (Pub. Resources Code, § 21081.6). CDFW recommends DRP provide mitigation measures that are specific, detailed (i.e., responsible party, timing, specific actions, location), and clear in order for a measure to be fully enforceable and implemented successfully via a mitigation monitoring and/or reporting program (Pub. Resources Code, § 21081.6; CEQA Guidelines, § 15097).
 - b) Disclosure of Impacts. If a proposed mitigation measure would cause one or more significant effects, in addition to impacts caused by the proposed Project, the PEIR should include a discussion of the effects of proposed mitigation measures [CEQA Guidelines, § 15126.4(a)(1)]. In that regard, the PEIR should provide an adequate, complete, and detailed disclosure about the Project’s proposed mitigation measure(s). Adequate disclosure is necessary so CDFW may assess the potential impacts of proposed mitigation measures.
- 3) Biological Baseline Assessment. An adequate biological resources assessment should provide a complete assessment and impact analysis of the flora and fauna within and adjacent to the Project area and where the Project may result in ground disturbance. The assessment and analysis should place emphasis on identifying endangered, threatened, rare, and sensitive species; regionally and locally unique species; and sensitive habitats. An impact analysis will aid in determining the Project’s potential direct, indirect, and cumulative biological impacts, as well as specific mitigation or avoidance measures necessary to offset those impacts. CDFW also considers impacts to an SSC a significant direct and cumulative adverse effect without implementing appropriate avoidance and/or mitigation measures. The PEIR should include the following information:
 - a) Information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis on resources that are rare or unique to the region [CEQA Guidelines, § 15125(c)]. The PEIR should include measures to fully avoid and otherwise

Thuy Hua
Los Angeles County Department of Regional Planning
January 31, 2022
Page 12 of 18

protect Sensitive Natural Communities. CDFW considers Sensitive Natural Communities as threatened habitats having both regional and local significance. Natural communities, alliances, and associations with a State-wide rarity ranking of S1, S2, and S3 should be considered sensitive and declining at the local and regional level. These ranks can be obtained by visiting the [Vegetation Classification and Mapping Program - Natural Communities](#) webpage (CDFW 2022a);

- b) A thorough, recent, floristic-based assessment of special status plants and natural communities following CDFW's [Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities](#) (CDFW 2018). Adjoining habitat areas should be included where the Project's construction and activities could lead to direct or indirect impacts off site;
- c) Floristic alliance- and/or association-based mapping and vegetation impact assessments conducted in the Project area and within adjacent areas. The [Manual of California Vegetation](#), second edition, should also be used to inform this mapping and assessment (Sawyer et al. 2009). Adjoining habitat areas should be included in this assessment where the Project's construction and activities could lead to direct or indirect impacts off site;
- d) A complete and recent assessment of the biological resources associated with each habitat type in the Project area and within adjacent areas. CDFW's [California Natural Diversity Database](#) in Sacramento should be contacted to obtain current information on any previously reported sensitive species and habitat (CDFW 2022c). An assessment should include a minimum nine-quadrangle search of the CNDDDB to determine a list of species potentially present in the Project area. A lack of records in the CNDDDB does not mean that rare, threatened, or endangered plants and wildlife do not occur. Field verification for the presence or absence of sensitive species is necessary to provide a complete biological assessment for adequate CEQA review [CEQA Guidelines, § 15003(i)];
- e) A complete, recent, assessment of endangered, rare, or threatened species and other sensitive species within the Project area and adjacent areas, including SSC and California Fully Protected Species (Fish & G. Code, §§ 3511, 4700, 5050, and 5515). Species to be addressed should include all those which meet the CEQA definition of endangered, rare, or threatened species (CEQA Guidelines, § 15380). Seasonal variations in use of the Project area should also be addressed such as wintering, roosting, nesting, and foraging habitat. Focused species-specific surveys, conducted at the appropriate time of year and time of day when the sensitive species are active or otherwise identifiable, may be required if suitable habitat is present. See CDFW's [Survey and Monitoring Protocols and Guidelines](#) for established survey protocol for select species (CDFW 2022d). Acceptable species-specific survey procedures may be developed in consultation with CDFW and USFWS; and,
- f) A recent wildlife and rare plant survey. CDFW generally considers biological field assessments for wildlife to be valid for a one-year period, and assessments for rare plants may be considered valid for a period of up to three years. Some aspects of the proposed Project may warrant periodic updated surveys for certain sensitive taxa, particularly if Project implementation build out could occur over a protracted time frame

Thuy Hua
Los Angeles County Department of Regional Planning
January 31, 2022
Page 13 of 18

or in phases.

- 4) Biological Direct, Indirect, and Cumulative Impacts. The PEIR should provide a thorough discussion of direct, indirect, and cumulative impacts expected to adversely affect biological resources with specific measures to offset such impacts. The PEIR should address the following:
 - a) A discussion regarding Project-related indirect impacts on biological resources, including resources in nearby public lands, open space, adjacent natural habitats, riparian ecosystems, and any designated and/or proposed or existing reserve lands [e.g., preserve lands associated with a Natural Community Conservation Plan (Fish & G. Code, § 2800 et. seq.)]. Impacts on, and maintenance of, wildlife corridor/movement areas, including access to undisturbed habitats in areas adjacent to the Project, should be fully analyzed and discussed in the PEIR;
 - b) A discussion of both the short-term and long-term effects of the Project on species population distribution and concentration, as well as alterations of the ecosystem supporting those species impacted [CEQA Guidelines, § 15126.2(a)];
 - c) A discussion of potential adverse impacts from lighting, noise, temporary and permanent human activity, and exotic species, and identification of any mitigation measures;
 - d) A discussion of post-Project fate of drainage patterns, surface flows, and soil erosion and/or sedimentation in streams and water bodies. The discussion should also address the potential water extraction activities and the potential resulting impacts on habitat (if any) supported by the groundwater. Measures to mitigate such impacts should be included;
 - e) An analysis of impacts from proposed changes to land use designations and zoning, and existing land use designation and zoning located nearby or adjacent to natural areas that may inadvertently contribute to wildlife-human interactions. A discussion of possible conflicts and mitigation measures to reduce these conflicts should be included in the PEIR; and,
 - f) A cumulative effects analysis as described under CEQA Guidelines section 15130. General and specific plans, as well as past, present, and anticipated future projects, should be analyzed relative to their impacts on similar plant and wildlife species, habitat, and natural communities. If DRP determines that the Project would not have a cumulative impact, the PEIR should indicate why the cumulative impact is not significant. DRP's determination should be supported by facts and analyses [CEQA Guidelines, § 15130(a)(2)].
- 5) Project Description and Alternatives. To enable adequate review and comment on the proposed Project from the standpoint of the protection of fish, wildlife, and plants, CDFW recommends the following information be included in the PEIR:
 - a) A complete discussion of the purpose and need for, and description of the proposed Project;

Thuy Hua
 Los Angeles County Department of Regional Planning
 January 31, 2022
 Page 14 of 18

- b) Pursuant to CEQA Guidelines section 15126.6(a), an environmental document “shall describe a reasonable range of potentially feasible alternatives to the Project, or to the location of the Project, which would feasibly attain most of the basic objectives of the Project but would avoid or substantially lessen any of the significant effects of the Project.” CEQA Guidelines section 15126.6(f)(2) states if the lead agency concludes that no feasible alternative locations exist, it must disclose the reasons for this conclusion; and,
- c) A range of feasible alternatives to the Project location to avoid or otherwise minimize direct and indirect impacts on sensitive biological resources and wildlife movement areas. CDFW recommends DRP select Project designs and alternatives that would avoid or otherwise minimize direct and indirect impacts on biological resources. CDFW also recommends DRP consider establishing appropriate setbacks from sensitive and special status biological resources. Setbacks should not be impacted by ground disturbance or hydrological changes from any future Project-related construction, activities, maintenance, and development. As a general rule, CDFW recommends reducing or clustering a development footprint to retain unobstructed spaces for vegetation and wildlife and provide connections for wildlife between properties and minimize obstacles to open space.

Project alternatives should be thoroughly evaluated, even if an alternative would impede, to some degree, the attainment of the Project objectives or would be more costly (CEQA Guidelines, § 15126.6). The PEIR “shall” include sufficient information about each alternative to allow meaningful evaluation, public participation, analysis, and comparison with the proposed Project (CEQA Guidelines, § 15126.6).

- d) Where the Project may impact aquatic and riparian resources, CDFW recommends DRP select Project designs and alternatives that would fully avoid impacts to such resources. CDFW also recommends an alternative that would not impede, alter, or otherwise modify existing surface flow, watercourse and meander, and water-dependent ecosystems and natural communities. Project designs should consider elevated crossings to avoid channelizing or narrowing of watercourses. Any modifications to a river, creek, or stream may cause or magnify upstream bank erosion, channel incision, and drop in water level and cause the watercourse to alter its course of flow.
- 6) Data. CEQA requires that information developed in environmental impact reports be incorporated into a database which may be used to make subsequent or supplemental environmental determinations [Pub. Resources Code, § 21003, subd. (e)]. Accordingly, please report any special status species and natural communities detected by completing and submitting [CNDDDB Field Survey Forms](#) (CDFW 2022e). To submit information on special status native plant populations and sensitive natural communities, the [Combined Rapid Assessment and Releve Form](#) should be completed and submitted to CDFW’s Vegetation Classification and Mapping Program (CDFW 2022f). DRP should ensure data collected for the preparation of the PEIR be properly submitted, with all data fields applicable filled out.
 - 7) Use of Native Plants and Trees. CDFW supports the use of native plants for any project proposing revegetation and landscaping. CDFW strongly recommends avoiding non-native, invasive plants for landscaping and restoration, particularly any species listed as ‘Moderate’

Thuy Hua
Los Angeles County Department of Regional Planning
January 31, 2022
Page 15 of 18

or 'High' by the [California Invasive Plant Council](#) (Cal-IPC 2022). CDFW supports the use of native species found in naturally occurring plant communities within or adjacent to the Project area. In addition, CDFW supports planting species of trees, such as oaks (*Quercus* genus), and understory vegetation (e.g., ground cover, subshrubs, and shrubs) that create habitat and provide a food source for birds. CDFW recommends retaining any standing, dead, or dying tree (snags) where possible because snags provide perching and nesting habitat for birds and raptors. Finally, CDFW supports planting species of vegetation with high insect and pollinator value.

- 8) Translocation/Salvage of Plants and Animal Species. Translocation and transplantation is the process of removing plants and wildlife from one location and permanently moving it to a new location. CDFW generally does not support the use of translocation or transplantation as the primary mitigation strategy for unavoidable impacts to endangered, rare, or threatened plants and animals. Studies have shown that these efforts are experimental and the outcome unreliable. CDFW has found that permanent preservation and management of habitat capable of supporting these species is often a more effective long-term strategy for conserving plants and animals and their habitats.
- 9) Compensatory Mitigation. The PEIR should include compensatory mitigation measures for the Project's significant direct and indirect impacts to sensitive and special status plants, animals, and habitats. Mitigation measures should emphasize avoidance and minimization of Project-related impacts. For unavoidable impacts, on-site habitat restoration or enhancement should be discussed in detail. If on-site mitigation is not feasible or would not be biologically viable and therefore inadequate to mitigate the loss of biological functions and values, off-site mitigation through habitat creation and/or acquisition and preservation in perpetuity should be addressed. Areas proposed as mitigation lands should be protected in perpetuity with a conservation easement and financial assurance and dedicated to a qualified entity for long-term management and monitoring. Under Government Code, section 65967, the Lead Agency must exercise due diligence in reviewing the qualifications of a governmental entity, special district, or nonprofit organization to effectively manage and steward land, water, or natural resources on mitigation lands it approves.
- 10) Long-term Management of Mitigation Lands. For proposed preservation and/or restoration, the PEIR should include measures to protect the targeted habitat values from direct and indirect negative impacts in perpetuity. The objective should be to offset Project-induced qualitative and quantitative losses of wildlife habitat values. Issues that should be addressed include (but are not limited to) restrictions on access, proposed land dedications, monitoring and management programs, control of illegal dumping, water pollution, and increased human intrusion. An appropriate non-wasting endowment should be set aside to provide for long-term management of mitigation lands.
- 11) Wetland Resources. CDFW, as described in Fish and Game Code section 703(a), is guided by the Fish and Game Commission's (Commission) policies. The [Wetlands Resources](#) policy the Commission "...seek[s] to provide for the protection, preservation, restoration, enhancement and expansion of wetland habitat in California" (CFGF 2020). Further, it is the policy of the Fish and Game Commission to strongly discourage development in or conversion of wetlands. It opposes, consistent with its legal authority, any development or conversion that would result in a reduction of wetland acreage or wetland habitat values. To that end, the Commission opposes wetland development proposals unless, at a minimum,

Thuy Hua
Los Angeles County Department of Regional Planning
January 31, 2022
Page 16 of 18

project mitigation assures there will be ‘no net loss’ of either wetland habitat values or acreage. The Commission strongly prefers mitigation which would achieve expansion of wetland acreage and enhancement of wetland habitat values.”

- a) The Wetlands Resources policy provides a framework for maintaining wetland resources and establishes mitigation guidance. CDFW encourages avoidance of wetland resources as a primary mitigation measure and discourages the development or type conversion of wetlands to uplands. CDFW encourages activities that would avoid the reduction of wetland acreage, function, or habitat values. Once avoidance and minimization measures have been exhausted, a project should include mitigation measures to assure a “no net loss” of either wetland habitat values, or acreage, for unavoidable impacts to wetland resources. Conversions include, but are not limited to, conversion to subsurface drains, placement of fill or building of structures within the wetland, and channelization or removal of materials from the streambed. All wetlands and watercourses, whether ephemeral, intermittent, or perennial, should be retained and provided with substantial setbacks, which preserve the riparian and aquatic values and functions benefiting local and transient wildlife populations. CDFW recommends mitigation measures to compensate for unavoidable impacts be included in the PEIR and these measures should compensate for the loss of function and value.
- b) The Fish and Game Commission’s Water policy guides CDFW on the quantity and quality of the waters of this State that should be apportioned and maintained respectively so as to produce and sustain maximum numbers of fish and wildlife; to provide maximum protection and enhancement of fish and wildlife and their habitat; encourage and support programs to maintain or restore a high quality of the waters of this State; prevent the degradation thereof caused by pollution and contamination; and, endeavor to keep as much water as possible open and accessible to the public for the use and enjoyment of fish and wildlife. CDFW recommends avoidance of water practices and structures that use excessive amounts of water, and minimization of impacts that negatively affect water quality, to the extent feasible (Fish & G. Code, § 5650).

Conclusion

We appreciate the opportunity to comment on the NOP for the Los Angeles County 2045 Climate Action Plan to assist the Los Angeles County Department of Regional Planning in preparing the Project’s environmental document and identifying and mitigating the Project’s potential impacts on biological resources. If you have any questions or comments regarding this letter, please contact Ruby Kwan-Davis, Senior Environmental Scientist (Specialist), at Ruby.Kwan-Davis@wildlife.ca.gov or (562) 619-2230.

Sincerely,

DocuSigned by:

February 1, 2022

Dear LA County Board of Supervisors:

On behalf of the County's independent oil and natural gas producers and the thousands of essential oil and gas workers who work and live here, the California Independent Petroleum Association is submitting these comments outlining our serious concerns regarding the draft Climate Action Plan (CAP). In its current form, the CAP would not only have severe impacts on the region's economy and industries that support good paying labor jobs, but would also have unintended consequences on our most underserved and vulnerable communities. We urge you to reject any actions that would increase energy prices and imported resources, destabilize the region's energy reliability, or eliminate local living wage jobs.

The County of Los Angeles continues to be the epicenter of our nation's affordability and homelessness crises. The cost of everyday necessities like housing, childcare and transportation are crushing working families. As it stands, California has the highest-in-the-nation gas prices at nearly \$5 per gallon and our nation is facing inflation rates we have not seen in 40 years.

The Los Angeles County Department of Regional Planning (DRP) has released its Notice of Preparation and Initial Study for its draft CAP. Under Strategy 1, Measure CL 1 would develop a sunset strategy for all oil and gas operations. In its Initial Study, the applicant (DRP) does not address the potentially significant environmental impacts to energy, population/housing and land use/planning. In addition, as we continue to address inequity, it seems short-sighted to not include the scope of "quality of life and workforce impacts" as part of its environmental analysis.

This Initial Study does not address the energy dependence and instability caused to the County by shutting down local production. As noted before, we continue to have serious concerns that this recommendation will put millions of Angelenos' access to affordable and reliable energy at risk. A shutdown of local oil and gas production will increase the region's dependency on expensive foreign oil imports from regimes that do not hire Angelenos, pay California taxes or operate under our stringent environmental, safety and labor standards. The truth is that despite having enormous energy resources in the County and the State, California is now more

dependent than ever on imported foreign energy. Our state imports more than 60% of its crude oil consumption from foreign sources – a 1,200% increase since the 1980s.

In 2018, Californians sent \$24 billion to foreign countries to pay for imported oil. That figure will increase if the County shuts down local production. In fact, what we have learned from our current health pandemic is that we must ensure we can deliver daily necessities across industrial sectors, including energy, to avoid shortages that can quickly become life-threatening. Further curtailing oil and gas production in the County would leave the County and the State completely beholden to foreign countries that do not share our same environmental, labor and safety protections to meet our energy needs.

These foreign imports would deprive us of the local economic benefits generated by utilizing nearby energy sources and would also add to our deteriorating air quality. As noted by the *Los Angeles Times* Editorial Board during the start of the supply chain crisis, “The ports of Los Angeles and Long Beach are the single latest source of pollution in the nation’s smoggiest area. The communities around the ports have the highest cancer risk from air pollution in the region...And air quality has been getting worse, not better, in recent years.”

Banning production statewide would translate into an additional 160 million barrels of oil imports to California annually. At minimum, that would require an additional 80 oil tankers to unnecessarily traverse the planet and idle in Southern California ports, adding to our region’s air pollution.

In addition to the environmental impacts, an analysis released by the State Building and Construction Trades Council of California earlier this year found that gas prices would increase by a minimum of \$1.70 per gallon under a statewide shutdown. Gas prices could soar to \$10 or more per gallon if foreign supply challenges emerge after production shutdowns are implemented. Global energy markets are currently facing turmoil thanks to concerns that Russia may invade Ukraine. Markets were also recently rattled by attacks on tankers exiting the Middle East as well as delays caused by blocked shipping routes.

Lastly, the County’s Sustainability Office still has not performed a much needed data-based study/report on the County’s resiliency or lack thereof. The County should have a data-driven understanding of its ability to produce and deliver food, water, energy, medicine, building materials, transportation and daily necessities to 10 million County residents in good times and during disasters. We continue to highlight the need for staff to measure strategies against resiliency and the County’s ability to recover from unforeseen circumstances. As already mentioned, without local production of oil and gas, the region will become solely dependent on foreign crude oil, which during times of crisis is not dependable and leaves Angelenos vulnerable to price spikes or supply disruptions at the whim of foreign countries. We are seeing firsthand the inflation rates that disproportionately impact disadvantaged communities and communities of color.

The Board of Supervisors unanimously recognized the importance of resiliency in its motion of August 13, 2019. Noting the need for “further analysis of the resiliency of the County’s energy supply against natural disasters, international turmoil, power outages, cyber-attacks, transportation disruptions and price spikes,” the Board required a report on “both the current status of resiliency of the County’s energy supply and infrastructure and ... the potential ... impacts of decarbonization.” The study that was generated by the Chief Sustainability Office was a “literature review” without any substantive analysis and research. Given the multiple and widespread infrastructure and supply chain failures we have seen just in the last couple of years during this unprecedented global pandemic, it is more vital than ever to ensure that the County takes resiliency and crisis planning into consideration as part of its environmental analysis.

We recognize that California is transitioning its energy economy, but the County cannot allow energy policies to jump ahead of its energy reality and consumption. California still demands massive amounts of oil – and will for decades to come – to fuel transportation, provide reliable electricity to the grid, grow and transport food, power businesses that provide jobs, and produce thousands of consumer products that make our lives possible. To jump ahead of reality means eliminating thousands of high-skilled labor jobs and ignoring the environmental impact of import logistics, all while everyday Angelenos still recovering from the pandemic bear the burden of an inevitable increase in costs.

Sincerely,

A handwritten signature in black ink, appearing to read 'Rock Zierman', with a stylized flourish extending to the right.

Rock Zierman

Re: Comments on Notice of Preparation of a Program Environmental Impact Report for the Los Angeles County 2045 Climate Action Plan

Dear Department of Regional Planning:

The Center for Biological Diversity (“Center”) submits the following comments on the Notice of Preparation (“NOP”) of a Program Environmental Impact Report (“PEIR”) for the Los Angeles County 2045 Climate Action Plan (“CAP”). The Center submitted comments on an earlier version of the draft CAP on April 30, 2020 (the “April 2020 Letter”), which is attached here as Exhibit 1. We hereby incorporate the comments in the April 2020 Letter by reference and request that the issues raised in that letter be considered in preparing the Draft EIR and revised CAP. We appreciate that the upcoming draft of the CAP will include “more clear, specific, feasible, and quantifiable” greenhouse gas (“GHG”) reduction strategies, as we requested in the April 2020 Letter.

The Center is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has over one million members and online activists throughout California and the United States. The Center has worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in Los Angeles County (“County”).

I. The Draft PEIR and CAP Should Explain How It is Consistent with Statewide Goals.

CEQA Guidelines section 15183.5(b)(1)(D) require that a climate action plan demonstrate that it will achieve planned reductions on a project by project basis. In *Cleveland National Forest Foundation v. San Diego Association of Governments*, the California Supreme Court provided more clarity on what facts, data, and goals projects should analyze in their greenhouse gas analyses under CEQA. ((2017) 3 Cal.5th 497.) The Court found that although an “Executive Order ‘is not an adopted GHG reduction plan’ and that ‘there is no legal requirement to use it as a threshold of significance[,]’ ... [t]he Executive Order’s 2050 goal of reducing California’s greenhouse gas emissions to 80 percent below 1990 levels expresses the pace and magnitude of reduction efforts that the scientific community believes necessary to stabilize the climate. This scientific information has important value to policymakers and citizens in considering the emission impacts of a project like SANDAG’s regional transportation plan.” (*Id.* at 515-516.) Therefore, the Draft CAP should include further discussion on measures that could ensure the County meets statewide goals, including in the Scoping Plan published by California Air Resources Board (“CARB”) and in executive orders on GHGs.

II. The Draft PEIR and CAP Should Include Binding and Enforceable Measures.

We appreciate that the County intends that the Draft PEIR and CAP include “more clear, specific, feasible, and quantifiable” GHG reduction strategies. We look forward to reviewing these strategies in the Draft PEIR and CAP and proposing recommendations to further improve and refine them. As outlined in the Draft CAP, a CAP must “[s]pecify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level...” (Draft CAP at 15.) We again caution that the Draft CAP should not include non-binding language in its mitigation measures (e.g., “encourage,” “promote,” “support” or “whenever feasible”).

The Draft PEIR and CAP should also include evidence describing how they will include sufficient funding and staff to carry out the programs and mitigation strategies included in the Draft PEIR and CAP. (See, e.g., *Gray v. County of Madera* (2008) 167 Cal.App.4th 1099, 1116-1118 [EIR invalid because agency offered no evidence that measures for reducing impacts would actually be effective].)

III. The Draft PEIR and CAP Should Demonstrate How They Are Consistent with the LA County Sustainability Plan.

CEQA requires that EIRs disclose and discuss the project or program’s inconsistencies with an applicable regional plan, such as a habitat conservation plan or natural community conservation plan. (CEQA Guidelines § 15125(d); 1 Kostka & Zischke, Practice Under the Cal. Env. Quality Act (2d ed. 2015) § 6.56, p. 6-60.1.) The EIR should thus include a detailed analysis of the CAP’s consistency with the LA County Sustainability Plan, including how the CAP meets or exceeds the Goals, Strategies, Targets, and Actions set forth in the Plan.

IV. The Draft PEIR and CAP Should Include Strategies to Substantially Reduce VMT.

As noted in our April 2020 Letter, the CAP and Draft PEIR should include robust strategies to significantly reduce vehicle miles travelled (“VMT”) within LA County region and consider measures proposed by CARB including within the Scoping Plan. Such strategies should include limiting new large-scale development in areas that generate disproportionately high levels of VMT, including areas far from existing job centers. Consistent with the policies in the Draft LA County Safety Element, the CAP and Draft PEIR should reiterate that new subdivisions in very high fire hazard severity zones are prohibited and inconsistent with the CAP or the LA County General Plan.

V. The Draft PEIR and CAP Should Include Robust Strategies to Achieve Zero Net Energy for All New Development.

As outlined in the April 2020 Letter, the CAP offers LA County an opportunity become a leader in setting standards on requiring zero net energy (“ZNE”) for new (and existing) development. The Draft PEIR and CAP should require zero net energy on all new commercial and residential construction. ZNE is feasible, as other projects in the County have recently been approved include a goal of zero net GHGs.¹ The Draft PEIR and CAP should include a ZNE Program that establishes clear standards for meeting ZNE for various sizes of commercial and residential development, and pair such standards with County programs to dramatically increase ZNE infrastructure including free or low-cost EV chargers throughout the county.

Consistent with statewide goals² on ZNE buildings, the Draft PEIR and CAP should include plans, incentives, and programs to retrofit at least 50 percent of commercial buildings to ZNE by 2030. This could include a crediting system to incentivize the retrofitting of existing commercial and residential developments with EV chargers and other ZNE infrastructure.

VI. The Draft PEIR and CAP Should Include Strategies to Increase Energy Resilience.

The Center supports the Draft CAP’s goal to shift to a renewables-based electricity supply which ensures equitable access to affordable, local, and reliable energy sources. However, the Draft PEIR and CAP should include far more ambitious strategies to increase energy resilience through the widespread adoption of renewable energy. While the April 2020 Letter cites studies demonstrating the feasibility of distributed energy resources, the even more recent results of National Renewable Energy Laboratory (“NREL”)’s Los Angeles 100% Renewable Energy Study (“LA100”)³ further demonstrate that achieving 100 percent reliable renewable energy is feasible in the near-term (e.g., by 2035).

¹ See California Department of Fish and Wildlife, *Newhall Ranch Resource and Development Management and Development Plan, Final Additional Environmental Analysis*, Appendix 2.1, available at http://planning.lacounty.gov/assets/upl/case/tr_53108_appendix-2-0-cdfw-final-aea-excerpts.pdf.

² California Public Utilities Commission, *Zero Net Energy*, available at <https://www.cpuc.ca.gov/ZNE/>.

³ The full report is available here: <https://maps.nrel.gov/la100/report>.

The Draft PEIR and CAP should also include a program or ordinance to fund and facilitate photovoltaic energy and storage, including through microgrid development, especially for unincorporated and fire-prone areas.

VII. Conclusion

Thank you for the opportunity to submit comments on the NOP. We look forward to reviewing the analysis and mitigation strategies in the Draft PEIR and CAP and proposing suggestions to refine and strengthen them. We also are happy to meet with County Planning staff to discuss any of the recommendations in this letter or the April 2020 Letter.

Sincerely,

J.P. Rose

Re: Comments on Public Review Draft of Los Angeles County Climate Action Plan

Dear Department of Regional Planning:

The Center for Biological Diversity (“Center”) submits the following comments on the Los Angeles County Climate Action Plan Public Review Draft (“Draft CAP”). While the Draft CAP includes some laudable goals, it suffers from a lack of clear and enforceable measures to ensure significant reductions in regional greenhouse gas (“GHG”) emissions. Many of our concerns were also reflected in our comments on the Draft Sustainability Plan, which is included as Attachment 1 and incorporated by reference.

The Center is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has over one million members and online activists throughout California and the United States. The Center has worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in Los Angeles County (“County”).

I. Climate Change Is an Urgent and Existential Concern.

Recent science has made clear that human-caused climate change is causing widespread harms to human society and natural systems, and climate change threats are becoming increasingly dangerous. In its 2018 *Special Report on Global Warming of 1.5°C*, the Intergovernmental Panel on Climate Change (“IPCC”)—the leading international scientific body for the assessment of climate change—describes the devastating harms that would occur at 2°C warming. The report highlights the necessity of limiting warming to 1.5°C to avoid catastrophic impacts to people and life on Earth (IPCC 2018). The report also provides overwhelming evidence that climate hazards are more urgent and more severe than previously thought, and that aggressive reductions in emissions within the next decade are essential to avoid the most devastating climate change harms.

The impacts of climate change are already being felt by humans and wildlife. Thousands of studies conducted by researchers around the world have documented changes in surface, atmospheric, and oceanic temperatures; melting glaciers; diminishing snow cover; shrinking sea ice; rising sea levels; ocean acidification; and increasing atmospheric water vapor (USGCRP 2017). In California, climate change will transform our climate, resulting in impacts including, but not limited to, increased temperatures and wildfires and a reduction in snowpack and precipitation levels and water availability.

II. The County Has a Responsibility to Reduce GHG Emissions.

California gives local authorities like the County significant responsibility over land use and planning decisions within their jurisdictions. But with that responsibility comes a corresponding obligation to account for the negative environmental impacts of those decisions—especially when it comes to controlling GHG emissions. As the California Air Resources Board (“CARB”) explains:

Local governments are essential partners in achieving California’s goals to reduce GHG emissions. Local governments can implement GHG emissions reduction strategies to address local conditions and issues and can effectively engage citizens at the local level. Local governments also have broad jurisdiction, and sometimes unique authorities, through their community-scale planning and permitting processes, discretionary actions, local codes and ordinances, outreach and education efforts, and municipal operations. Further, local jurisdictions can develop new and innovative approaches to reduce GHG emissions that can then be adopted elsewhere.

(CARB 2017.) California’s Scoping Plan, which lays out the statewide blueprint for meeting the legislature’s greenhouse gas reduction targets, also specifically calls out local governments as essential to meeting these targets:

[L]ocal governments and agencies are critical leaders in reducing emissions through actions that reduce demand for electricity, transportation fuels, and natural gas, and improved natural and working lands management. . . . Over the last 60 years, development patterns have led to sprawling suburban neighborhoods, a vast highway system, growth in automobile ownership, and under-prioritization of infrastructure for public transit and active transportation. Local decisions about these policies today can establish a more sustainable built environment for the future.

(CARB 2017.) Thus, the County must take seriously its obligation to do its utmost to ensure that it is reducing GHG emissions and contributing to the state’s achievement of its emissions reduction targets.

III. The Draft CAP Fails to Explain How It Will Meet State Goals.

While the Draft CAP acknowledges statewide climate goals (Draft CAP at 6-8 & 36), it does not explain how measures in the Draft CAP will actually meet these statewide climate goals. For instance, statewide targets require GHG emissions to be reduced to 1990 levels by 2020, 40 percent below 1990 levels by 2030, and 80 percent below 1990 levels by 2050, and achieve statewide carbon neutrality by 2045. (Draft CAP at 17 & 36.)

In contrast, the Draft CAP includes a different set of goals: by 2025, reduce GHG emissions by 25 percent below 2015 levels; by 2035, reduce GHG emissions by 50 percent below 2015 levels; and by 2045, achieve carbon neutrality in unincorporated Los Angeles County. (Draft CAP at 8.) The Draft CAP fails to explain how these goals are either consistent or inconsistent with each of the statewide goals.

The Draft CAP therefore does not qualify as a CEQA “streamlining” document. CEQA Guidelines section 15183.5(b)(1)(D) require that a climate action plan demonstrate that it will achieve planned reductions on a project by project basis. In *Cleveland National Forest Foundation v. San Diego Association of Governments*, the California Supreme Court provided more clarity on what facts, data, and goals projects should analyze in their greenhouse gas analyses under CEQA. ((2017) 3 Cal.5th 497.) The Court found that although an “Executive Order ‘is not an adopted GHG reduction plan’ and that ‘there is no legal requirement to use it as a threshold of significance[,]’ ... [t]he Executive Order’s 2050 goal of reducing California’s greenhouse gas emissions to 80 percent below 1990 levels expresses the pace and magnitude of reduction efforts that the scientific community believes necessary to stabilize the climate. This scientific information has important value to policymakers and citizens in considering the emission impacts of a project like SANDAG’s regional transportation plan.” (*Id.* at 515-516.) Therefore, the Draft CAP should include further discussion on measures that could ensure the County meets statewide goals.

IV. The Draft CAP’s GHG Emissions Inventory Is Incomplete.

The Draft CAP lists five categories of GHG emissions in its GHG inventory: transportation, stationary energy, waste, industrial processes and product use (“IPPU”), and agriculture, forestry and, other land use (“AFOLU”). (Draft CAP at 30-32.) The CAP should set forth the emissions categories in more detail. A guide prepared by the Bay Area Air Quality Management District (“BAAQMD”) recommends, for example, listing the GHG emissions of specific items such as streetlights and traffic signals. (BAAQMD 2009.)

The Draft CAP also does not explain whether “transportation” emissions include emissions outside the County by activity within the County (for example, from exported goods or tourist travel to County from outside the County). This very shortcoming led to a judge invalidating Sonoma County’s CAP last year, after the judge determined that it failed to account for all of the County’s emissions by excluding transboundary emissions.¹ (Attachment 2.)

¹ The court also held that the CAP’s GHG reduction measures were not clearly defined or enforceable, which is also an issue with the Draft CAP here.

V. The Draft CAP's Reduction Strategies and Measures Are Non-Binding And Unenforceable.

The Draft CAP states that if future projects “tier” off of it, then compliance will negate the need for a qualitative analysis of future projects’ GHG emissions. (Draft CAP at 15.) The Draft CAP also correctly lays out the legal requirements of a climate action plan. (Draft CAP at 15.) For instance, a CAP must “Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level....” (Draft CAP at 15.) Therefore, the Final CAP, and any such plan prepared pursuant to CEQA Guidelines 15183.5, must meet the requirements for all first-tier environmental review documents and thus must impose enforceable requirements and measures with defined performance standards.²

Unfortunately, many of the Draft CAP’s reduction measures are largely non-binding and unenforceable, and generally lack performance standards. Notably, the words “encourage,” “promote,” “support” or “whenever feasible” occur many times in the sections describing the Draft CAP’s implementation measures. These measures are legally inadequate and cannot be considered mitigation under CEQA and applicable case law. (*Lincoln Place Tenants Assn. v. City of Los Angeles* (2007) 155 Cal.App.4th 425, 445 [“A ‘mitigation measure’ is a suggestion or change that would reduce or minimize significant adverse impacts on the environment caused by the project as proposed”]); *Preserve Wild Santee v. City of Santee* (2012) 210 CA 4th 260, 281 [mitigation measures that are so undefined that their effectiveness is impossible to determine are legally inadequate].) The California Attorney General has also expressly disapproved such an approach for measures upon which an agency relies:

Can a lead agency rely on policies and measures that simply “encourage” GHG efficiency and emissions reductions?

No. Mitigation measures must be “fully enforceable.” *Adequate mitigation does not, for example, merely “encourage” or “support” carpools and transit options, green building practices, and development in urban centers.* While a menu of hortatory GHG policies is positive, it does not count as adequate mitigation because there is no certainty that the policies will be implemented.

(CA Attorney General 2009.) The California Attorney General further states that programmatic plans to reduce GHG emissions pursuant to CEQA Guidelines section 15183.5 must “[i]dentify a set of specific, enforceable measures that, collectively, will achieve the emissions targets....” (CA Attorney General 2019.)

In *Sierra Club v. County of San Diego* (2014) 231 Cal.App.4th 1152, the Fourth District Court of Appeal criticized the County of San Diego for including measures in its CAP that were not backed up by a firm commitment by the County that they would be implemented. The Court noted that many of the measures in the CAP “are not currently funded,” such that the County of San Diego could not rely upon such unfunded programs to meet GHG reductions. (*Id.* at 1168-

² Specifically, CEQA Guidelines section 15183.5(b)(1)(D) states that measures should have “performance standards” which demonstrate they will achieve the planned reductions on a project by project basis.

1169.) The *Sierra Club* opinion also questioned whether people would actually participate in various programs outlined in the CAP, given that the record contained no evidence of such participation. (*Id.* at 1170.) Here, the Draft CAP suffers from similar defects – there is no evidence of funding for many of the various programs set forth in the Final CAP, nor evidence in the record that people or industry will actually participate in the voluntary programs described in the Draft CAP.

Accordingly, although the Draft CAP’s reduction measures may generally be worthwhile objectives for the County to pursue, the Draft CAP fails as a CEQA compliance tool because it relies upon non-enforceable measures. The Draft CAP also does not have adequate mechanisms to monitor progress towards achieving verifiable reduction targets.

VI. Strategy 2 Fails to Include Sufficient Measures to Support Transit Oriented Communities.

The Center generally supports the goals of Strategy 2 to support transit oriented communities. However, the targets are unclear, inadequate, and do not provide a path to actually achieve this goal. For instance, the 2025 target is to (1) “increase new housing built within 1/2 mile of high frequency transit to 50%” and (2) “reduce VMT per capita to 20 miles.” This target does not specify what the “50%” is a percent of – does this mean 50% of all new housing units in the County? This needs to be clarified in the Final CAP. In addition, it is unclear whether the County is intending to reduce VMT per capita to 20 miles *per day* or some other amount of time. More importantly, VMT per capita of 20 miles a day is still an extremely high number; the CAP should have more aggressive goals to reduce VMT per capita by 2025. As described in further detail in our comment letter on the Draft Sustainability Plan, significant reductions in VMT are required if the state is to meet its GHG reduction goals. (See Attachment 1 at p. 9-10.)

Unfortunately, the Actions supporting Strategy 2 provide no concrete requirements or criteria, or way to measure success. For instance, Action T1 states “Expand the number and extent of transit oriented communities, by encouraging development within High Quality Transit Areas, while ensuring vital public amenities such as parks and active transportation infrastructure are included.” (Draft CAP at 50.) Action T1 fails to contain a clear plan how such development will be “encouraged” such that it is little more than a hortatory statement. Likewise, Action T2 states “Develop community plans that will increase the percentage of residents who could live and work within the same community, and that could decrease the vehicle miles traveled.” (*Id.*) This action suffers from the same defects as Action T1. It also fails to specify any target increase in percentage of residents who live or work in the same community, or elements of such “community plans.”

VII. Strategy 3 Fails to Include Sufficient Measures to Reduce VMT.

Strategy 3 aims to reduce single occupancy vehicle (“SOV”) vehicle trips. However, the Draft CAP does not contain sufficiently aggressive goals. For instance, the Draft CAP only seeks 15 percent of trips to be non-SOV trips by 2025. (Draft CAP at 51.) As we noted in our comments on the Draft Sustainability Plan (Attachment 1), even if this target is met, in five years 85 percent of trips in the County will still be by car. The Draft CAP should call for much stronger measures to reduce SOV trips and VMT. The best way to do this is to limit development

in areas far from existing cities, as remote developments generate disproportionately high levels of VMT.

The actions within Strategy 3 are similarly inadequate. For instance, Action T5 states “develop a transportation technology strategy to proactively address how evolving tech-enabled mobility options can support public transit and advance OurCounty goals.” (Draft Plan at 51.) This is extremely vague and suffers from the defects outlined in Section V above. Similarly, Action T8 generally refers to “expand[ing] shade along and over pedestrian networks through zoning code revisions that encourage shade-providing building features,” but provides no enforceable requirements or metrics as to how much “shade expansion” will be required. (Draft CAP at 52.) Also illustrative of this problem is Action T11, which states, “Develop and implement a transportation demand management (TDM) ordinance that requires developers to incorporate measures such as subsidized transit passes and car share.” (Draft CAP at 53.) The time and opportunity to develop measures to require of developers for future projects is here in the CAP, if the County wishes to use the CAP as a CEQA streamlining document.

VIII. Strategy 4 Does Not Include A Clear Plan to Institutionalize Low-Carbon Transportation.

The Center supports Strategy 4 – institutionalize low-carbon transportation. (Draft CAP at 44.) However, the related “Targets” are woefully inadequate – the Draft Plan only seeks 500 EV and 200 ZEV charging stations at County-owned or public properties, and contains no targets for the remainder of the County (e.g., private businesses, residential developments). (Draft CAP at 55.) Likewise, the “Actions” provide no actual mandate for developers or landowners to incorporate charging stations into infrastructure.

If the County is serious about institutionalizing low carbon transportation, it needs to do far more than simply add a few hundred EV chargers at public venues. The CAP should instead include aggressive mandates for every new development (commercial and residential) to include an adequate number of EV chargers, as well as a crediting system in order to incentivize the retrofitting of existing commercial and residential developments with EV chargers.

The CAP should also require installation of charging stations at *all* County-owned properties and public venues, as well as in appropriate public right-of-ways.

And as with the other sections of the CAP, the “Actions” are vague, unenforceable, and do not include any performance criteria. For instance, Action T20 states: “Partner with a car or ride-sharing organization to provide access to EVs for low-income and disadvantaged community residents.” (Draft CAP at 57.) Action T20 does not provide any guidance as to what “partnering” means, nor does it provide any benchmark for success. How much expanded access to EVs will the County pursue via this measure? By failing to include any actual target or goal to measure success, the Draft CAP dooms this (and many other Actions) to failure.

IX. Strategy 5 Does Not Contain Clear Plan To Accelerate Freight Decarbonization.

The Center supports the goal to accelerate freight decarbonization. Unfortunately, once again, the Draft CAP’s Targets and Actions are not sufficient to meaningfully support this goal.

The Draft CAP does not even clear targets for medium-duty delivery trucks – it simply states that 25-50 percent of medium-duty delivery trucks should be electric or zero emission by 2025. (Draft CAP at 58.) This renders it unclear whether the goal is 25 percent or 50 percent. And the Draft CAP simply has no corresponding and more aggressive targets for 2035 and 2045.

Likewise, the Actions are untenably vague. By way of example, Action T25 states: “Implement freight decarbonization technologies along highway corridors passing through unincorporated communities ...” (Draft CAP at 59.) No specifics, enforceable mandates, or performance criteria are used to define this purportedly “Major Action.”

X. Strategy 6 Contains No Plan to Implement Zero Emissions Technologies for Off-road Vehicles and Equipment.

The Draft CAP should include concrete plans to implement and eventually require zero emissions technologies off-road vehicles and equipment. Instead, the Action items include non-binding language like: “Partner with SCAQMD and AVAQMD to *encourage* the use of zero-emission and near-zero-emission construction, agriculture, and manufacturing equipment.” (Draft CAP at 60, emphasis added.) The CAP can, and should, require zero emission or near-zero emission equipment by a specific date.

XI. Strategy 7 Does Not Provide A Plan To Decarbonize Building Energy Use.

The Center supports decarbonizing building energy use, but finds that the Draft CAP squanders an opportunity to establish the County as a leader in this area. The Final CAP should require zero net energy on all new commercial and residential construction. Zero net energy is feasible, as other projects in the County that have recently been approved include a goal of zero net greenhouse gas emissions.³

Indeed, the Draft CAP does not even contain goals that are consistent with state-wide goals. The California Energy Efficiency Strategic Plan provides:

All new residential construction will be zero net energy (ZNE) by 2020.
All new commercial construction will be ZNE by 2030
50% of commercial buildings will be retrofit to ZNE by 2030
50% of new major renovations of state buildings will be ZNE by 2025.⁴

In contrast, the Draft CAP only sets a target of 50 percent of all new buildings and major building renovations being “net zero carbon” by 2025 and 100 percent by 2045. (Draft CAP at 63.) The Draft Plan should contain far more aggressive goals that are consistent with climate science; the entire building sector should achieve zero emissions no later than later than 2045,

³ See California Department of Fish and Wildlife, *Newhall Ranch Resource and Development Management and Development Plan, Final Additional Environmental Analysis*, Appendix 2.1, available at http://planning.lacounty.gov/assets/upl/case/tr_53108_appendix-2-0-cdfw-final-aea-excerpts.pdf.

⁴ California Public Utilities Commission, *Zero Net Energy*, available at <https://www.cpuc.ca.gov/ZNE/>.

with interim enforceable benchmarks.⁵ Moreover, the Draft CAP also does not explain whether term “net zero carbon” is consistent with the state definition of zero net energy.

Strategy 7’s Actions fair no better. For instance, Action SE2 simply states “Establish carbon intensity limits for buildings over 20,000 square feet.” (Draft CAP at 64.) This contains no objection performance criteria – at best, it is a promise to develop performance criteria at some unspecified time in the future. As such, it fails as a CEQA mitigation measure. (See discussion in Section V above.)

Action SE4 also vaguely promises to “Adopt building code requirements for electric water and space heating and encourage alternatives to other natural gas uses in new and existing buildings.” (Draft CAP at 64.) The CAP needs to actually describe building code requirements or provide performance criteria. And “encouraging alternatives” is not a CEQA mitigation measure. Action SE7 likewise promises collaboration with the City of Los Angeles and Santa Monica to “develop building energy and emissions performance standards,” but provides no specifics on what those standards will entail, or what level of emissions reductions they would be expected or required to provide. (Draft CAP at 65.)

Action SE5 states “Adopt CALGreen Tier 1 green building standards and identify which Tier 2 standards could be adopted as code amendments.” (Draft CAP at 64.) However, significant portions of the California Green Building Standards are already mandatory. Such that it is unclear whether there is simply a restatement of existing law.⁶

Action SE6 is problematic for other reasons. This Action states, “Incentivize net zero energy residential and commercial buildings through streamlined development reviews.” (Draft CAP at 65.) First, as noted above, zero net energy should be *required*, not simply incentivized. Second, the Action does not explain what or how development review will be “streamlined.” While a CAP that complies with CEQA can streamline some aspects of development, development review should not be streamlined in a way that overlooks other non-climate impacts of a project, such as impacts on air quality, public health, wildlife, and traffic.

In contrast to the vague and unenforceable Actions in the Draft CAP, there are number of enforceable policies that can be used to reach achieve zero emissions by 2045 for all buildings. The Sierra Club’s *Building Electrification Action Plan for Climate Leaders* outlines various proposals, including a zero emission building code, local ordinances restricting gas and requiring all-electric new construction for all building types, GHG performance benchmarking, and air pollution standards for appliances. (See footnote 5.)

⁵ Rachel Golden, *Building Electrification Action Plan for Climate Leaders* <https://www.sierraclub.org/sites/www.sierraclub.org/files/Building%20Electrification%20Action%20Plan%20for%20Climate%20Leaders.pdf> (Dec. 2019).

⁶ See California Building Standards Commission, “California’s Green Building Code,” available at <https://www.dgs.ca.gov/BSC/Resources/Page-Content/Building-Standards-Commission-Resources-List-Folder/CALGreen>.

XII. Strategy 9 Does Not Provide A Concrete Plan To Increase Energy Resilience.

The Center supports the Draft CAP's goal to shift to a renewables-based electricity supply which ensures equitable access to affordable, local, and reliable energy sources. (Draft CAP at 69.) The Center urges the County to include more ambitious targets for distributed energy resources ("DER"). The Draft CAP calls for a 200 megawatt increase in DER capacity by 2025 and a 1 gigawatt increase by 2045. The Center urges the County to incorporate a target of 1 gigawatt in photovoltaic ("PV") energy by 2025 and 4 gigawatts by 2045. The Draft CAP should include a target for 500 megawatts of distributed storage capacity by 2045 and 2 gigawatts by 2045.

DER plays a unique and vital role in creating a renewable energy future that not only promotes deeper renewable penetration, but also advances fundamental goals of equal access to clean energy, social justice, and biodiversity protection. With minimal water use, no emissions from generation, and minimal land use impacts, distributed solar is the most sustainable energy source currently in production.⁷ Further, building up distributed solar allows communities to gain local control over their energy system rather than leaving that control in the hands of investor-owned monopoly utilities. This shift empowers communities to make their own energy choices and gives them access to cheaper and cleaner energy, driving energy democracy. Progressive community solar policy can also enable renters and individuals who cannot afford to buy solar energy systems to invest in renewable energy, which in turn creates economic growth and local employment opportunities.

Studies show that far more ambitious targets for DER are currently feasible. A study by the National Renewable Energy Laboratory found that Los Angeles could support 9 gigawatts of rooftop solar, or 60 percent of its estimated total energy demand, using fairly conservative estimates.⁸ Another study by the Institute of the Environment and Sustainability at the University of California, Los Angeles ("UCLA") found that rooftop solar can provide 7200 gigawatt hours of on-site building demands in a study area of 1.2 million parcels in L.A. County, which would meet approximately 29 percent of on-site building demands.⁹

The UCLA study found that remaining building demand that would be met by grid sources is approximately 18,000 gigawatt hours, and the potential solar output to export to the grid that is not used on-site is 16,400 gigawatt hours – this significant amount of additional electricity could be available for use by neighboring properties or elsewhere. The UCLA study also found that existing policies regulating grid operations limit potential rooftop solar output; in 20 percent of communities, current policies would reduce the technical potential of net solar generation by limiting the size of the arrays that can be installed. Moreover, the UCLA study found that lower-income and at-risk communities have greatest capacity for solar energy exports

⁷ Wiser, R. et al., "The environmental and public health benefits of achieving high penetrations of solar energy in the United States," *Nature Energy* Vol. 113, pp. 472-486 (2016); Hernandez, R.R., Hoffacker, M.K. and C. Fields, "Efficient Use of Land to Meet Sustainable Energy Needs," *Nature Climate Change*, Vol. 5: 353-358, (2015).

⁸ Pieter Gagnon, et al., *Rooftop Solar Photovoltaic Technical Potential in the United States: A Detailed Assessment* (Jan. 2016), available at <https://www.nrel.gov/docs/fy16osti/65298.pdf>.

⁹ Erik Porse, et al., *Net solar generation potential from urban rooftops in Los Angeles*, Energy Policy (July 2020).

to the grid. In short, the County should take a hard look at the actual solar capacity of the County based upon existing studies and include policies to meet or exceed the actual solar capacity.

The proposed Actions are also insufficient to address either the targets in the Draft CAP or the more aggressive targets proposed by the Center. Action SE14 proposes developing a community energy map that identifies opportunities for deploying distributed energy resources and microgrids in order to improve energy resiliency in disadvantaged communities. (Draft CAP at 69.) Instead of merely generating a map, the County should develop a program or ordinance to fund and facilitate PV and storage microgrid development, especially for unincorporated and fire-prone areas. The County could begin this program in fire-prone communities, and aim for a minimum of 10 percent PV and storage microgrids instead of simply 10 percent DER installation in fire-prone communities.

XIII. Strategy 10 Fails to Provide a Plan To Reach the Target Renewable Energy Goals.

The Center supports the general goal of Strategy 10 to increase renewable energy, but notes that much stronger targets should be incorporated into the Draft CAP. The Draft CAP calls for installation of solar on only 20 percent of commercial buildings over 50,000 square feet and at least 10 percent of single family residential buildings by 2025, and higher targets for 2035 and 2045.

The Draft CAP should set far more ambitious targets. It should require solar on 60 percent of commercial buildings of any size that are solar compatible and 50 percent of residential buildings by 2025, and 100 percent of all solar compatible buildings by 2030.

The Draft CAP also does not specify *how much* solar must be installed on buildings; by its own terms, a single small panel could be installed on a building, and that building could potentially count towards the goals. As with other sections of the Draft CAP, the Draft CAP does not explain or provide data (e.g., in appendices) how the anticipated GHG mitigation potential is supported by the target.

Once again, the proposed mitigation strategies or “Actions” fall far short of even meeting the Draft CAP’s existing targets. For instance, Action SE17 simply promises that the County will “encourage 100% renewable energy resource mix by 2025.” (Draft CAP at 72.) The severity and urgency of the climate crisis requires governments to do far more than simply “encourage” positive steps—the climate crisis (and state laws and policies) *requires* far more aggressive actions.

Moreover, the Draft CAP should strengthen the County’s role in supporting the community choice aggregation program. More specifically, the Draft CAP should include a no-cost subscription program for low-income families as well as tenants to participate. Such programs could be funded by creating a Community Energy Benefits Fund that would then be overseen by citizen task force or other non-governmental body—the Portland Clean Energy Fund illustrate of how such a program could function. Another example is East Bay Community Energy, which serves Alameda County.

XIV. The Draft CAP Fails to Contain Any Clear Plan To Support Strategy 16, Conserve Forests and Working Lands

The Center supports the conservation of forests and working lands. The Center also supports the targets to increase urban tree canopy. However, the Draft CAP fails to acknowledge how this plan fits into other related plans and programs. In particular, the City of Los Angeles is currently moving forward with a “Safe Sidewalks” initiative that will likely result in the destruction of many thousands of urban trees.¹⁰

Moreover, the Center supports Action A1 – supporting “the preservation of agricultural and working lands, including rangelands, and restore forest lands, by limiting the conversion of these lands to residential or other uses through tools such as the creation of agricultural easements, particularly within high climate-hazard areas and SEAs.” (Draft CAP at 87.) Yet, as outlined in our comments on the Draft Sustainability Plan, the County has a pattern and practice of *approving* large-scale development in rangelands and forest lands, particularly in high fire hazard areas. (See Attachment 1 at p. 4.) Action A1’s unenforceable promise to “limit” such conversion is unavailing and fails as a CEQA mitigation measure. (Draft CAP at 87.)

XV. The Draft CAP Fails to Identify Funding Sources for Mitigation Strategies.

As noted above, in *Sierra Club v. County of San Diego* (2014) 231 Cal.App.4th 1152, the Court of Appeal determined that measures in a CAP were insufficient when they were not adequately funded. (*Id.* at 1168-1169.) Here, the various “actions” in the Draft CAP acknowledge that funding will be required (using icons ranging from a \$ to \$\$\$\$\$), but fail to include a specific estimate of how much funding may cost, or identify an available source of funding. Similarly, the handful of sentences in the Implementation Plans “identification of funding sources” provide no specificity nor commitment for funding any of the Draft CAP’s Actions. (See Draft CAP at 92.) This renders the Draft CAP inadequate as a CEQA streamlining document. Moreover, this omission calls into question whether any of the programs outlined in the Draft CAP will ever be implemented.

XVI. The Draft EIR Should Provide Further Detail on Mitigation Measures for Individual Projects.

The Center understands that the County will be preparing an EIR for the CAP. (See, e.g., Draft CAP at 15 [“With the adopted CAP, project-specific environmental documents that incorporate applicable CAP actions can “tier off” the environmental document adopted for the CAP to meet project-level CEQA evaluation requirements for GHG emissions.”].) In addition, CEQA Guidelines section 15183.5(b)(1)(F) requires that a climate action plan be adopted in a public process “after environmental review.” Subdivision (b)(2) provides that “[a] plan for the reduction of greenhouse gas emissions, once adopted following certification of an EIR or adoption of an environmental document, may be used in the cumulative impacts analysis of later project.”

¹⁰ Safe Sidewalks LA, Draft Environmental Impact Report, available at <https://sidewalks.lacity.org/environmental-impact-report>.

The Center hereby requests a minimum 90-day comment period for the Draft EIR in order to allow for adequate review by the public, particularly given the importance of the document for region-wide planning and the complexity of the issues. We hope that the Draft EIR and next draft of the CAP include and evaluate clear and enforceable measures to put the County on track to reach each of the statewide goals.

XVII. Conclusion

Thank you for the opportunity to submit comments on the Draft CAP. The Center strongly supports many of the goals of the Draft CAP. But these goals are not supported by clear, enforceable, and funded policies. The Center urges the County to significantly revise the CAP in order to address these deficiencies.

Please do not hesitate to contact us if you would like to meet to further discuss these issues.

Sincerely,

J.P. Rose

Re: Comments on Discussion Draft of Los Angeles Countywide Sustainability Plan

Dear Los Angeles County Chief Sustainability Office:

These comments are submitted on behalf of the Center for Biological Diversity (“Center”) regarding the Discussion Draft of the Los Angeles Countywide Sustainability Plan (“Draft Plan”). The Center appreciates the Chief Sustainability Office’s efforts in developing the Draft Plan and generally supports the goals of the Draft Plan. We urge the Chief Sustainability Office and the Los Angeles County Board of Supervisors (“Board”) to ensure that the strategies and policies supporting these goals are clear and enforceable.

A. Background on the Center for Biological Diversity.

The Center for Biological Diversity (“Center”) is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has over one million members and online activists throughout California and the United States. The Center has worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in Los Angeles County.

B. The Center Urges Stronger Buffers to Ensure Healthy Community Environments.

We strongly support Goals 1 and 4—“resilient and healthy community environments where residents thrive in place” and opportunities for residents and businesses to “transition to clean economy sectors.” (Draft Plan at 20 & 72.) We also support strong efforts to decrease the public health problems generated by freeways and oil and gas drilling, but are concerned that the proposed targets and actions do not go far enough.

The Plan Should Require Larger Buffers between Sensitive Uses and Freeways

We support “siting of new sensitive uses, such as playgrounds, daycare centers, schools, residences, or medical facilities” farther from freeways, but are concerned that the proposed 500-foot buffers are insufficient. Studies indicate even people **900 to 1200 feet** from freeways experience health impacts and sensitive receptors such as children and the elderly suffer the most. (Lin 2002.) A review of 700 studies concluded that pollution causes asthma attacks in children, the onset of childhood asthma, impaired lung function, premature death and death from cardiovascular diseases, and cardiovascular morbidity. (Health Effects Institute 2010.) The Health Effects Institute study concluded that the “exposure zone” was 300 to 500 meters from the highways (984 feet to 1640 feet). (*Id.*) Other studies have reached similar conclusions. (Suglia 2008.) Living near expressways also increases the likelihood that residents will suffer from dementia. (Chen 2017.) The University of Southern California’s Environmental Health Centers have also collected data and studies showing risks and health impacts to pregnant women, babies, children, teenagers, adults, and seniors of living by a freeway.¹

The Plan Should Require 2500-foot Setbacks to Separate Oil and Gas Facilities from Homes

We would like to emphasize our support for the Draft Plan’s inclusion of a series of actions to address the disproportionate exposure of low-income communities of color to fossil fuel extraction and refining (Actions 2, 3, 4, 5 and 7). In addition, we support Action 78 that calls for collaborating with the City of Los Angeles to develop a sunset strategy for oil and gas operations that prioritizes disproportionately impacted neighborhoods. In the final adoption of the plan, we urge the County to incorporate a more specific, concrete and common sense measure that we have supported at the City and County as an ally of the STAND-LA coalition: a 2500-foot setback (or buffer zone) to separate oil and gas facilities from homes, schools and other sensitive land uses, with a plan to phase out existing oil and gas within no more than five years. We are also supportive of the Draft Plan’s inclusion of a commitment to a “Just Transition” that examines the impact of the transition to a cleaner economy and develops strategies for supporting displaced workers and connecting them with meaningful job training and employment opportunities (Actions 56 and 57).

¹ University of Southern California Environmental Health Centers, *References: Living Near Busy Roads or Traffic Pollution*, available at <http://envhealthcenters.usc.edu/infographics/infographic-living-near-busy-roads-or-traffic-pollution/references-living-near-busy-roads-or-traffic-pollution> (collecting studies). See also Tony Barboza and Jon Schleuss, “L.A. keeps building near freeways, even though living there makes people sick,” *Los Angeles Times* (Mar. 2, 2017), available at <http://www.latimes.com/projects/la-me-freeway-pollution/>.

Reducing Asthma and Toxic Emissions through Less VMT

The Center strongly supports decreasing child asthma rates as proposed by the Draft Plan. However, this will not be possible if the Board continues to approve projects that add more unnecessary freeway traffic and air pollution to the region. An example of this is the recently-approved Centennial development approved by the Board, which will add 75,000 new long distance car commuters onto our freeways, increasing air pollution and hindering efforts to reduce toxic emissions.

C. The Center Supports Goal 2 and Urges Implementation of Zero Net Energy Standards.

We support the Plan’s Goal 2—ensuring that “[b]uildings and infrastructure that support human health and resilience.” (Draft Plan at 42.) The Center notes that Action Item 30 envisions the County will “Pilot high performance building standards for new County buildings beyond the current LEED Gold standard, such as Passive House, Zero Net Energy, Net Zero Water, Net Zero Waste...” (Draft Plan at 50.) The Center urges the Plan to require more than just a “pilot” for Zero Net Energy and instead move forward with policies and standards to require zero net energy for new construction.

Zero net energy is feasible, as other projects in the County that have recently been approved include a goal of zero net greenhouse gas emissions. Such projects intend to achieve that goal through reducing onsite greenhouse gas emissions to the greatest extent practicable, but also by offsetting any other emissions through local emissions reductions projects.²

D. The Center Supports Goal 3 and Urges Concrete and Enforceable Policies to Limit Sprawl Development.

The Center strongly supports the Draft Plan’s goal of equitable and sustainable land use and development without displacement. (Draft Plan at 58.) The Center agrees that the way the County “choose[s] to direct that growth has huge implications for the environment, the economy and social equity.” (*Id.*) Likewise, the Center agrees:

Patterns of exurban sprawl and development in high-hazard areas can place major burdens on our infrastructure and public budgets, especially for unincorporated communities where the County of Los Angeles acts as the municipal service provider. Outward growth limits the resources we could otherwise be investing in our existing communities, where we can promote sustainability, health and well-being by improving walkability and promoting a mixture of uses.

(Draft Plan at 58.) The Draft Plan is correct that exurban sprawl imposes a hidden tax on existing communities. Studies recognize that sprawl “may deprive the poor of economic

² See California Department of Fish and Wildlife, *Newhall Ranch Resource and Development Management and Development Plan, Final Additional Environmental Analysis*, Appendix 2.1, available at http://planning.lacounty.gov/assets/upl/case/tr_53108_appendix-2-0-cdfw-final-aea-excerpts.pdf.

opportunity...when jobs, stores, good schools and other resources migrate outward from the core city, poverty is concentrated in the neighborhoods that are left behind.” (Frumkin 2002.) Studies also show that sprawl disproportionately increases costs on local government through increased infrastructure costs. (Litman 2015.) One study found that the external costs of sprawl are around \$500 billion annually and \$650 billion internally. (*Id.*) Sprawl also has significant equity implications—“the abandonment of the metropolitan core leaves inner cities and first-ring suburbs struggling to provide adequate services with an eroded tax base even as growth continues on the periphery.” (Belzer 2002.)

The Draft Plan is also correct that “[u]rban sprawl generally requires expensive and expansive infrastructure networks that drain resources and contribute significantly to greenhouse gas emissions.” (Draft Plan at 60.)

Unfortunately, with the exception of Supervisor Kuehl, the Board has not shown they are serious about curbing urban sprawl. County supervisors just approved one of the biggest urban sprawl projects in California history last month, the 12,000-acre Centennial Specific Plan, on remote wildlands in the northern corner of the County. The Center informed the County that Centennial would result in less investment in existing communities and—as observed by the developer’s own consultants—draw demand away from existing communities in Santa Clarita and San Fernando. The development would also require the construction of a new six-lane freeway (the Northwest 138 Corridor “Improvement Project”), at an initial cost to taxpayers of \$830 million.

The Board also just approved the 1,300-acre Northlake development over the objection of the Santa Monica Mountains Conservancy (and the Center). That project will pave over pristine wildlands, inhibit wildlife connectivity in the region, and disproportionately contribute to greenhouse gas emissions, traffic, and air pollution.

If the County is serious about ending its historical pattern of approving more development in the county’s diminishing wildlands and rangelands, then it needs to adopt strong enforceable policies to meet this goal. Action 44 is a step in the right direction. The Draft Plan states, “Prohibit the conversion of working lands to residential uses, including farms and rangelands.” (Draft Plan at 60.) Such a policy—if it were actually consistently enforced—would be a strong step forward in protecting the County’s natural resources.

E. The Center Supports the Draft Plan’s Target to Limit Discretionary Development in High Fire Areas.

We support Strategy 3E—limiting development in high fire areas. The science is clear that we can no longer continue building new large-scale development in high fire areas. In Southern California, sprawl developments with low/intermediate densities extending into chaparral and sage scrub habitats that are prone to fire have led to more frequent wildfires caused by human ignitions, like arson, improperly disposed cigarette butts, debris burning, fireworks, campfires, or sparks from cars or equipment (Keeley et al. 1999; Keeley and Fotheringham 2003; Syphard et al. 2007; Syphard et al. 2012; Bistinas et al. 2013; Balch et al. 2017; Radeloff et al. 2018). Human-caused fires account for 95% of all fires in Southern California (Syphard et al.

2013), and homes filled with petroleum-based products, such as wood interiors, paint, and furniture, provide additional fuel for the fires to burn longer and spread farther (Keeley et al. 2007). The most numerous and largest fires in Southern California have been caused by equipment and powerlines in the wildland-urban interface, where housing density is low to intermediate (Syphard and Keeley 2015), and leapfrog developments have been found to have the highest predicted fire risk in the County (Syphard et al. 2013).

More development in high fire areas such as chaparral and sage scrub would lead to a dangerous feedback loop of deadly fires and habitat destruction. These habitats are adapted to infrequent (every 30 to 150 years), large, high-intensity crown fire regimes (Pyne et al. 1996; Keeley and Fotheringham 2001), and if these regimes are disrupted, the habitats become degraded (Keeley 2005, 2006a,b; Syphard et al. 2018). When fires occur too frequently, type conversion occurs and the native shrublands are replaced by non-native grasses and forbs that burn more frequently and more easily, ultimately eliminating native habitats and biodiversity while increasing fire threat over time (Keeley 2005, 2006a,b; Syphard et al. 2009; Safford and Van de Water 2014; Syphard et al. 2018). Thus, placing developments in these high fire-prone areas will lead to more frequent fires while degrading the health and biodiversity of Southern California's ecosystems.

Nonetheless, the "actions" in the Draft Plan do not set forth a clear plan to actually limit development in high fire areas. In particular, while the Countywide "Target" states "no new discretionary development in high hazard areas" by 2025, there is no "action" proposed to meet this target. (Draft Plan at 70.) Instead, as mentioned above, the County has been approving large-scale development such as Centennial and Northlake in high fire areas. By approving entitlements for these projects now despite the science showing such development is dangerous, costly, and environmentally harmful, the County is ensuring large-scale development will continue in fire-prone areas for many years.

F. The Center Strongly Supports Goal 5 and Urges The County To Develop a Wildlife Connectivity Ordinance

The Center strongly supports the Draft Plan's goal of thriving ecosystems, habitats, and biodiversity. (Draft Plan at 78.) To realize this goal, the Plan must consider the issue of wildlife connectivity and the effects of suburban development on wild areas, as explained below.

Habitat Connectivity Is Essential for Wildlife Movement and Biodiversity Conservation.

Habitat connectivity is vital for wildlife movement and biodiversity conservation. Limiting movement and dispersal with barriers (*e.g.*, development, roads, or fenced-off croplands) can affect animals' behavior, movement patterns, reproductive success, and physiological state, which can lead to significant impacts on individual wildlife, populations, communities, and landscapes (Trombulak and Frissell 2000; Tewksbury et al. 2002; Cushman 2006; van der Ree et al. 2011; Haddad et al. 2015; Ceia-Hasse et al. 2018). Individuals can die off, populations can become isolated, sensitive species can become locally extinct, and important ecological processes like plant pollination and nutrient cycling can be lost. In addition, connectivity between high quality habitat areas in heterogeneous landscapes is important to

allow for range shifts and species migrations as climate changes (Heller and Zavaleta 2009, Cushman et al. 2013). Lack of wildlife connectivity results in decreased biodiversity and degraded ecosystems. Thus, preserving and maintaining natural and created corridors is critical for species and habitat conservation in fragmented landscapes (Gilbert-Norton et al., 2010).

Wildlife connectivity and migration corridors are important at the local, regional, and continental scale. Local connectivity that links aquatic and terrestrial habitats would allow various sensitive species to persist, including state- and federally-protected California red-legged frogs (*Rana draytonii*), arroyo toads (*Anaxyrus californicus*), and other species. At a regional scale, medium- and large-sized mammals that occur in Los Angeles County, such as mountain lions (*Puma concolor*), bobcats (*Lynx rufus*), gray foxes (*Urocyon cinereoargenteus*), ring-tailed cats (*Bassariscus astutus*), and mule deer (*Odocoileus hemionus*), require large patches of heterogeneous habitat to forage, seek shelter/refuge, and find mates.

Climate Change Is Likely to Significantly Alter Wildlife Behavior and Movement.

A strong, international scientific consensus has established that human-caused climate change is causing widespread harms to human society and natural systems, and climate change threats are becoming increasingly dangerous. In a 2018 *Special Report on Global Warming of 1.5°C* from the Intergovernmental Panel on Climate Change (IPCC), the leading international scientific body for the assessment of climate change describes the devastating harms that would occur at 2°C warming, highlighting the necessity of limiting warming to 1.5°C to avoid catastrophic impacts to people and life on Earth (IPCC 2018). In addition to warming, many other aspects of global climate are changing. Thousands of studies conducted by researchers around the world have documented changes in surface, atmospheric, and oceanic temperatures; melting glaciers; diminishing snow cover; shrinking sea ice; rising sea levels; ocean acidification; and increasing atmospheric water vapor (USGCRP, 2017).

Climate change is increasing stress on species and ecosystems, causing changes in distribution, phenology, physiology, vital rates, genetics, ecosystem structure and processes, and increasing species extinction risk (Warren et al., 2011). A 2016 analysis found that climate-related local extinctions are already widespread and have occurred in hundreds of species, including almost half of the 976 species surveyed (Wiens 2016). A separate study estimated that nearly half of terrestrial non-flying threatened mammals and nearly one-quarter of threatened birds may have already been negatively impacted by climate change in at least part of their distribution (Pacifici et al. 2017). A 2016 meta-analysis reported that climate change is already impacting 82 percent of key ecological processes that form the foundation of healthy ecosystems and on which humans depend for basic needs (Scheffers et al. 2016). Genes are changing, species' physiology and physical features such as body size are changing, species are moving to try to keep pace with suitable climate space, species are shifting their timing of breeding and migration, and entire ecosystems are under stress (Cahill et al., 2012; Chen et al., 2011; Maclean & Wilson, 2011; Parmesan, 2006; Parmesan & Yohe, 2003; Root et al., 2003; Warren et al., 2011). As such, it is imperative that current and future land use planning consider the impacts of climate change on wildlife movement.

Corridor Redundancy Helps Retain Functional Connectivity and Resilience.

Corridor redundancy (*i.e.* the availability of alternative pathways for movement) is important in regional connectivity plans because it allows for improved functional connectivity and resilience. Compared to a single pathway, multiple connections between habitat patches increase the probability of movement across landscapes by a wider variety of species, and they provide more habitat for low-mobility species while still allowing for their dispersal (Mcrae et al., 2012; Olson & Burnett, 2013; Pinto & Keitt, 2008). In addition, corridor redundancy provides resilience to uncertainty, impacts of climate change, and extreme events, like flooding or wildfires, by providing alternate escape routes or refugia for animals seeking safety (Cushman et al., 2013; Mcrae et al., 2008; Mcrae et al., 2012; Olson & Burnett, 2013; Pinto & Keitt, 2008).

Human Development and Associated Noise and Lighting Can Interfere with the Behavior of Local Wildlife Such as Mountain Lions.

Human development and associated noise can degrade adjacent wildlife habitat and behavior. (*See, e.g.,* Slabbekoorn 2008.) For instance, field observations and controlled laboratory experiments have shown that traffic noise can significantly degrade habitat value for migrating songbirds. (Ware et al. 2015.) This finding followed lab results indicating that subjects exposed to 55 and 61 dBA simulated traffic noise exhibited decreased feeding behavior and duration, as well as increased vigilance behavior. (*Id.*) Such behavioral shifts increase the risk of starvation, thus decreasing survival rates. A recent study also highlighted the detrimental impacts of siting development near areas protected for wildlife. The study noted that “Anthropogenic noise 3 and 10 dB above natural sound levels . . . has documented effects on wildlife species richness, abundance, reproductive success, behavior, and physiology.” (Buxton, et al.) The study further noted that “there is evidence of impacts across a wide range of species [] regardless of hearing sensitivity, including direct effects on invertebrates that lack ears and indirect effects on plants and entire ecological communities (e.g., reduced seedling recruitment due to altered behavior of seed distributors).” (*Ibid.*) Moreover, human transportation networks and development resulted in high noise exceedances in protected areas. (*Ibid.*)

There also is strong evidence documenting the effects of human activity specifically on mountain lions. One study found that mountain lions are so fearful of humans and noise generated by humans that they will abandon the carcass of a deer and forgo the feeding opportunity just to avoid humans. (Smith 2017.)³ The study concluded that even “non-consumptive forms of human disturbance may alter the ecological role of large carnivores by affecting the link between these top predators and their prey.” (Smith 2017.) In addition, the study found that mountain lions respond fearfully upon hearing human vocalizations. Another study demonstrates that mountain lions exposed to other evidence of human presence (lighting, vehicles, dogs) will impact mountain lion behavior. (Wilmers 2013.) Other studies documented diet shifts in mountain lions near human development, and recommended minimizing any development in mountain lion habitat. (Smith 2016; *see also* Smith 2015.)

³ *See also* Sean Greene, “How a fear of humans affects the lives of California's mountain lions,” *Los Angeles Times* (June 27, 2017), available at <http://beta.latimes.com/science/sciencenow/la-sci-sn-pumas-human-noise-20170627-story.html>.

Additional studies similarly documented that mountain lions avoid “urban, agricultural areas, and roads and prefer[] riparian areas and more rugged terrain.” (Zeller 2017; *see also* Vickers 2015.) One study found that over half (55 percent) of radio collared mountain lions in urban areas did not survive, and the majority were killed by humans either by vehicle strikes or using depredation permits. (Vickers 2015.) As such, the Plan should include policies to minimize development in open space areas, as “edge effects” from such development can interfere with animal behavior and movement.

Creating and Enhancing Wildlife Crossings Is Critical to Maintaining Healthy Ecosystems.

We recommend that the Draft Plan include stronger policies to promote wildlife movement and/or include a goal to develop a county wildlife connectivity ordinance. Enhanced connectivity helps sustain functional ecosystems and ensure public safety. Although natural, existing corridors in fragmented landscapes have been shown to have more wildlife movement compared to created corridors (Gilbert-Norton et al., 2010), crossing structures combined with setbacks at the entrances and exits are useful as retroactive restoration in areas where existing roads have high incidence of wildlife vehicle conflict or where species movement has been severely impacted. When appropriately implemented, wildlife crossing infrastructure has been shown to improve wildlife permeability and reduce wildlife vehicle collisions (Bissonette & Rosa, 2012; Dodd Jr. et al., 2004; Dodd et al., 2012; Kintsch et al., 2018; Sawaya et al., 2014; Sawyer et al., 2012).

Outside of California many other states and jurisdictions have been proactively addressing wildlife connectivity issues. For example, Arizona, Colorado, and Wyoming have seen 80-96% reductions in wildlife vehicle collisions while gradually increasing the level of wildlife permeability over time (it appears that some species take more time than others to adapt to crossings) on sections of highways where they have implemented wildlife crossing infrastructure, such as underpasses, culverts, overpasses, wildlife fencing, and escape ramps (Dodd et al., 2012; Kintsch et al., 2017; Kintsch et al., 2018; Sawyer et al., 2012). Utah just completed the state’s largest wildlife overpass at Parleys Canyon for moose, elk, and deer. Washington State is about to complete its largest wildlife overpass on I-90, which is anticipated to provide habitat connectivity for a wide variety of species between the North and South Cascade Mountains. The overpass cost \$6.2 million as part of a larger \$900 million expansion project that will include multiple wildlife crossings along a 15-mile stretch of highway. Savings from less hospital bills, damage costs, and road closures from fewer wildlife vehicle collisions will make up those costs in a few years (Valdes 2018). State and local officials are actively pursuing these types of projects because of the benefits for wildlife connectivity, public safety, and the economy. And in neighboring Ventura County, the Board of Supervisors recently adopted a first-of-its-kind ordinance to protect wildlife connectivity.

The Draft Plan Should Provide Clear Action Items To Support Wildlife Connectivity

We are concerned that the action items proposed in the Draft Plan are insufficient to support Goal 5. In particular, lacking from the action items is any clear plan for ensuring habitat connectivity within the region.

Instead, it appears that the County has not prioritized this issue. For instance, the County General Plan EIR anticipated a significant adverse effect on wildlife movement.⁴ The California Department of Fish and Wildlife (“CDFW”) urged the County to develop mitigation opportunities for wildlife connectivity, since such “opportunities for wildlife corridors and nursery sites are best established during large scale planning efforts such as this General Plan.” CDFW noted that “Wildlife corridor areas can be delineated and set aside in the General Plan for current and future conservation efforts. An assessment could be placed on development within the Project area to secure the acquisition of these critical linkages and sites, therefore reducing impacts to wildlife corridors and nursery sites and ensuring biological diversity.”⁵ The County did not implement CDFW’s recommendations.

The Plan should include a goal to develop a wildlife connectivity ordinance. Moreover, while the proposed “actions” to support Goal 5 are all helpful measures, more is needed. The Plan should incorporate policies that support an “urban growth boundary.” Urban growth boundaries have been used in other jurisdictions as a tool to encourage development in or near existing communities while leaving natural areas undeveloped. Without a clearly defined urban growth boundary, developers will continue to propose—and the Board will continue to approve—development in wild and fire-prone areas, which will further inhibit wildlife connectivity while increasing traffic and air pollution.

G. The Center Supports Goals 7 and 8 and Encourages Stronger Policies To Reduce VMT.

We support Goals 7 and Goal 8—a fossil fuel-free LA County with convenient, safe and affordable transportation that reduces car dependency. However, the targets and associated actions do not include sufficiently ambitious goals to reduce vehicle miles travelled (“VMT”). The Draft Plan’s aims for “[a]t least 15% of all trips will be by foot, bike, micromobility, or public transit.” (Draft Plan at 108.) This means that even if this target is met, in six years 85 percent of trips in the County will still be by car. The Draft Plan should call for much stronger measures to reduce single occupancy vehicle trips and VMT. The best way to do this is to limit development in areas far from existing cities that generate high VMT and limit new freeway development, which induces additional VMT.

The December 2018 Technical Advisory issued by the Governor’s Office of Planning and Research (the “VMT Report”)⁶ contains helpful guidance and analysis that could be

⁴ County of Los Angeles, *Los Angeles County General Plan Update Draft Environmental Impact Report* (June 2014), available at http://planning.lacounty.gov/assets/upl/project/gp_2035_deir.pdf.

⁵ County of Los Angeles, *Los Angeles County General Plan Update Final Environmental Impact Report* (March 2015), available at http://planning.lacounty.gov/assets/upl/project/gp_2035_lac-gpu-final-eir-final.pdf.

⁶ The VMT Report is available at http://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf.

incorporated into the Draft Plan. For instance, the VMT Report states that land use decisions to reduce GHG emissions associated with the transportation sector are crucial in order to meet the GHG reductions set forth in SB 375. (VMT Report at 3.) The VMT Report further notes that California cannot meet its climate goals without curbing single-occupancy vehicle activity; land use patterns and transportation options will need to change to support reductions in VMT. (*Id.* at 10.) The VMT Report also proposes a “per capita” or “per employee” threshold of 15 percent below existing development as a reasonable threshold. (*Id.* at 10.) The VMT Report reiterates the conclusion of the California Air Resources Board that “there is a gap between what SB 375 can provide and what is needed to meet the State’s 2030 and 2050 goals.” (*Id.*)

The VMT Report confirms that VMT-intensive development impacts human health and the environment: “Human health is impacted as increases in vehicle travel lead to more vehicle crashes, poorer air quality, increases in chronic diseases associated with reduced physical activity, and worse mental health. Increases in vehicle travel also negatively affect other road users, including pedestrians, cyclists, other motorists, and many transit users. The natural environment is impacted as higher VMT leads to more collisions with wildlife and fragments habitat. Additionally, development that leads to more vehicle travel also tends to consume more energy, water, and open space (including farmland and sensitive habitat). This increase in impermeable surfaces raises the flood risk and pollutant transport into waterways.” (VMT Report at 3.) As such, if the County took strong steps to reduce VMT, it would have co-benefits of better air quality, decreased chronic disease, decreased wildlife-vehicle collisions, and less habitat fragmentation.

The VMT Report further states that roadway expansion projects can induce substantial VMT such that the environmental reviews should incorporate quantitative estimates of induced VMT. (VMT Report at 23.) The VMT Report explains that “[b]uilding new roadways, adding roadway capacity in congested areas, or adding roadway capacity to areas where congestion is expected in the future, typically induces additional vehicle travel.” (*Id.* at 24.) The Plan should thus contain policies to discourage unnecessary highway development and instead focus infrastructure resources on alternative transportation projects.

H. Conclusion

Thank you for the opportunity to submit comments on the Draft Plan. Again, the Center strongly supports the goals of the Draft Plan. But if the goals in the plan are not supported by clear and enforceable policies, then the final Plan will be ineffective in achieving these goals.

Los Angeles County’s traffic jams, air pollution, fragmented wildlife habitat, and diminishing wildlands are a legacy of poor planning decisions made by local officials, often made under pressure from profit-driven developers. Unfortunately Los Angeles County and its Board have continued to approve costly, dangerous, and environmentally-damaging development despite (1) strong public opposition and (2) science confirming that such development is inappropriate in light of the climate crisis, extinction crisis, and the risks of building in fire-prone landscapes.

The Center urges the Chief Sustainability Office and Board to use this Plan as a means to establish a new vision for Los Angeles County that supports healthy communities and healthy wildlands. For such a vision to become reality, it must be supported by clear, binding, and legally enforceable policies. As long as such policies are vague or absent, developers will continue proposing—and officials will likely keep approving—projects that take the county in the wrong direction.

Please do not hesitate to contact the Center at the number or email listed below.

Sincerely,

A handwritten signature in blue ink, appearing to read 'J.P. Rose', with a stylized flourish at the end.

FILED
SUPERIOR COURT OF CALIFORNIA
COUNTY OF SONOMA

JUL 20 2017

BY M. Conley
Deputy Clerk

8 SUPERIOR COURT FOR THE STATE OF CALIFORNIA
9 COUNTY OF SONOMA

11 CALIFORNIA RIVERWATCH,
12 Petitioner,
13 v.
14 COUNTY OF SONOMA, ET AL.
15 Defendants.
16

Case No.: SCV-259242

ORDER GRANTING PETITION
FOR WRIT OF MANDATE

18 This matter was tried to the court on March 23, 2017, the Honorable Nancy Case
19 Shaffer presiding. The Law Office of Jack Silver and Jerry Bernhaut and Jack Silver
20 appeared on behalf of Petitioner; the Office of Sonoma County Counsel and Bruce Goldstein
21 and Verne Ball appeared on behalf of Respondent Sonoma County Regional Climate
22 Protection Authority. At the conclusion of the hearing, the court ordered further briefing.
23 The matter was deemed submitted on April 21, 2017, when all briefs were submitted.

24 I. SUMMARY OF RULING

25 The court finds that the Sonoma County Regional Climate Protection Authority's Final
26 Programmatic EIR ("the PEIR") for Climate Action 2020 and Beyond, its Climate Action
27 plan ("CAP") and the County of Sonoma's approval of the CAP violate CEQA, in that the
28 inventory of greenhouse gas emissions is based on insufficient information; the PEIR fails to

1 include effectively enforceable, clearly defined performance standards for the mitigation
2 measures regarding Green House Gas ("GHG") emissions, identified as "GHG Reduction
3 Measures;" and fails to develop and fully analyze a reasonable range of alternatives.

4 Accordingly, the approval of the PEIR was a prejudicial abuse of discretion by
5 Respondent. Given the lack of information and other material defects, as a matter of law the
6 PEIR cannot fulfill its basic CEQA purpose as an information document.

7 The court finds that there is insufficient information in the administrative record to
8 support the factual conclusion that the CAP will achieve its fundamental purpose of reducing
9 Respondent's countywide GHG emissions to the stated target of 25% below 1990 levels by
10 2020.

11 I. FACTS

12 Petitioner seeks a writ of mandate overturning Respondent's certification and of a
13 Final Programmatic EIR (the PEIR) for its Climate Action Aplan (CAP) and the approval of
14 the CAP on the grounds that the approvals violate CEQA.

15 A. The Project

16 The CAP Project is a planning-level document to guide analysis of the greenhouse gas
17 (GHG) impacts of future projects in the county.

18 In 2006, the California legislature passed AB 32, the Global Warming Solutions Act
19 (the Act) which, among other things, establishes a statewide goal of achieving 1990-level
20 GHG impacts by 2020.

21 CEQA Guideline 15183.5 allows agencies to adopt an overall long-range plan such as
22 a general plan or similar plan governing GHG analysis of subsequent projects. Respondent
23 adopted the CAP in accord with Guideline 15183.5 as a method of providing an overall *tiered*
24 *analysis* of GHG impacts in subsequent projects as a method of complying with the Act's
25 mandate. (1 AR 4, 10.)
26
27
28

1 of the California Supreme Court, “the heart of CEQA.” *Laurel Heights Improvement Assn. v.*
2 *Regents of the University of California* (1988) 47 Cal.3d 376, 392 (*Laurel Heights I*).

3 The ultimate mandate of CEQA is “to provide public agencies and the public in
4 general with *detailed information* about the effect [of] a proposed project” and to minimize
5 those effects and choose possible alternatives. (emphasis added) (PRC 21061.) The public
6 and public participation hold a “privileged position” in the CEQA process based on
7 fundamental “notions of democratic decision-making.” (*Concerned Citizens of Costa Mesa,*
8 *Inc. v. 32nd District Agricultural Association* (1986) 42 Cal.3d 929, 936.)

9 As a fundamental benchmark that generally applies to all issues in CEQA the court, is
10 that the court, in considering an issue, should look to see if “the public could discern... the
11 ‘analytic route the... agency traveled from evidence to action.’” (See *Al Larson Boat Shop*
12 *Inc. v. Bd. of Harbor Commissioners* (1993) 18 Cal.App.4th 729, 749; see also *Topanga Assn.*
13 *for a Scenic Community v. County of Los Angeles* (1974) 11 Cal.3d 506, 513-514, 522.)

14 The burden of investigation rests with the government and not the public. (*Lighthouse*
15 *Field Beach Rescue v. City of Santa Cruz* (2005) 131 Cal.App.4th 1170, 1202.)

16 **C. Standard of review**

17 **1. Preliminary Basis for Standard of Review**

18 The standard of review is in dispute here. This dispute arises out of the divergent
19 characterizations of the issues by the parties.

20 Public Resources Code section 21168 provides that when a court reviews a
21 determination, finding, or decision of a public agency, "as a result of a proceeding in which
22 by law a hearing is required to be given, evidence is required to be taken and discretion in the
23 determination of facts is vested in a public agency ... the court shall not exercise its
24 independent judgment on the evidence but shall only determine whether the act or decision is
25 supported by substantial evidence in the light of the whole record." However, review is *de*
26 *novo* when the court must determine whether the agency has prejudicially abused its
27 discretion either by failing to proceed in the manner required by law or by reaching a decision
28 that is not supported by substantial evidence. (*Laurel Heights I, supra* 47 Cal.3d 392, fn.5.)

1 “[A] reviewing court must adjust its scrutiny to the nature of the alleged defect, depending on
2 whether the claim is predominantly one of improper procedure or a dispute over the facts.”
3 *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40
4 Cal.4th 412, 435 (“*Vineyard*”).

5 As the court explained in *Vineyard*:

6 [A]n agency may abuse its discretion under CEQA either by failing to proceed in the
7 manner CEQA provides or by reaching factual conclusions unsupported by substantial
8 evidence. (§21168.5.) Judicial review of these two types of error differs significantly:
9 while we determine de novo whether the agency has employed the correct procedures,
10 “scrupulously enforc[ing] all legislatively mandated CEQA requirements” (*Citizens of*
11 *Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564...), we accord greater
12 deference to the agency's substantive factual conclusions. In reviewing for substantial
13 evidence, the reviewing court “may not set aside an agency's approval of an EIR on
14 the ground that an opposite conclusion would have been equally or more reasonable,”
15 for, on factual questions, our task “is not to weigh conflicting evidence and determine
16 who has the better argument.”(*Laurel Heights I, supra*, 47 Cal.3d at p. 393....)²

17 While courts must give deference as to substantive factual decisions, courts demand
18 strict compliance with “legislatively mandated CEQA requirements.” (*Citizens of Goleta*
19 *Valley v. Bd. of Supervisors* (1990) 52 Cal.3d 553, 564 (*Goleta II*)). A Respondent is entitled
20 to no deference where the law has been misapplied, or where the decision was based on “an
21 erroneous legal standard.” (*East Peninsula Educ. Council, Inc. v. East Peninsula Unif. Sch.*
22 *Dist.* (1989) 210 Cal.App.3d 155, 165.)

23 Courts must ‘determine de novo whether the agency has employed the correct
24 procedures, “scrupulously enforc[ing] all legislatively mandated CEQA requirements”....’
25 (*Vineyard Area Citizens for Responsible Growth, supra*, 40 Cal.4th 435, citing *Goleta II*, 52
26 Cal.3d at 564.) *Failure to include required information is a failure to proceed in the manner*
27

28

² *Laurel Heights I* is *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 400 (*Laurel Heights I*

1 required by law and demands strict scrutiny. (*Sierra Club v. State Bd. of Forestry* (1994) 7
2 Cal.4th 1215, 1236; *Vineyard, supra*, 40 Cal.4th at 435.) The court reviews the PEIR here de
3 novo.

4 Nevertheless, agency actions are presumed to comply with applicable law unless the
5 petitioner presents proof to the contrary. (Evid. Code § 664; *Foster v. Civil Service*
6 *Commission of Los Angeles County* (1983) 142 Cal.App.3d 444, 453.) The petitioner in a
7 CEQA action thus has the burden of proving that an EIR is insufficient. (*Al Larson Boat*
8 *Shop, Inc. v. Board of Harbor Commissioners* (1993) 18 Cal.App.4th 729, 740.)

9 **2. Standard of Review: Substantial-Evidence Test**

10 The substantial-evidence test applies to substantive issues in a decision certifying an
11 EIR. The court must uphold the decision if it is supported by substantial evidence in the
12 record as a whole. (*Bowman v. City of Petaluma* (1986) 185 Cal.App.3d 1065, 1075; see
13 *River Valley Preservation Project v. Metropolitan Transit Dev. Bd.* (1995) 37 Cal.App.4th
14 154, 166; see *Santa Teresa Citizen Action Group v. City of San Jose* (2003) 114 Cal.App.4th
15 689, 703. The “substantial evidence” test requires the court to determine “whether the act or
16 decision is supported by substantial evidence in the light of the whole record.” (*Chaparral*
17 *Greens v. City of Chula Vista* (1996) 50 Cal.App.4th 1134, 1143; *River Valley Preservation*
18 *Project v. Metropolitan Transit Develop. Bd.* (1995) 37 Cal.App.4th 154, 168.)

19 When applying the substantial-evidence standard, the court must focus not upon the
20 “correctness” of a report’s environmental conclusions, but only upon its “sufficiency as an
21 informative document.” (*Laurel Heights I* 47 Cal.3d at 393.) The findings of an administrative
22 agency are presumed to be supported by substantial evidence. (*Taylor Bus. Service, Inc. v.*
23 *San Diego Bd. of Education* (1987) 195 Cal.App.3d 1331.) The court must resolve reasonable
24 doubts in favor of the findings and decision. (*Id.*)

25 A claim that the EIR lacks *sufficient* information regarding an issue will be treated as
26 an argument that the EIR is not supported by substantial evidence. (*Barthelemy v. Chino*
27 *Basin Munic. Water Dist.* (1995) 38 Cal.App.4th 1609, 1620.) The petitioners in *Barthelemy*
28

1 asserted that it was a failure to proceed in the manner required by law where an EIR did not
2 include key information. The court rejected that argument.

3 **a) The Definition of “Substantial Evidence”**

4 Substantial evidence is “enough relevant information and reasonable inferences” to
5 allow a “fair argument” supporting a conclusion, in light of the whole record before the lead
6 agency. (14 CCR § 15384(a); PRC §21082.2; *City of Pasadena v. State of California* (2nd
7 Dist.1993) 14 Cal.App.4th 810, 821-822.) Other decisions define “substantial evidence” as
8 that with “ponderable legal significance,” reasonable in nature, credible, and of solid value.
9 (*Stanislaus Audubon Society, Inc., v. County of Stanislaus* (1995) 33 Cal.App.4th 144.)

10 Substantial evidence includes facts, reasonable assumptions predicated upon facts,
11 and expert opinion supported by facts. (PRC §21082.2(c); see also Guidelines 15064(g)(5),
12 15384.) It does not include argument, speculation, unsubstantiated opinion or narrative,
13 clearly incorrect evidence, or social or economic impacts not related to an environmental
14 impact. (Guideline 15384.)

15 **3. Prejudicial Abuse of Discretion**

16 A court may only issue a writ in a CEQA case for an abuse of discretion, including
17 making a finding without substantial evidence, if the error was *prejudicial*. (*Chaparral*
18 *Greens v. City of Chula Vista* (1996) 50 Cal.App.4th 1134, 1143.) The court must defer to the
19 agency’s substantive conclusions and uphold the determination unless. ((Id); see PRC §
20 21168, 21168.5, *Laurel Heights I, supra*, 47 Cal.3d at 392, fn.5; Remy, et al., Guide to the
21 California Environmental Quality Act (10th Ed.1999) Chapter XI (D), p.590.)

22 **4. Tiered EIRs**

23 As discussed further below, the PEIR here is a tiered EIR prepared in accordance with
24 Guideline 15183.5, which specifically allows for preparation of an overall, first-tier EIR and
25 planning document to govern analysis of GHG emissions and control GHG emissions in order
26 to comply with the statewide mandates to reduce GHG emissions.
27

28 A tiered EIR scheme allows an agency to produce a general EIR focusing on an
overall plan or policy and later conduct more limited, narrow subsequent EIR review for

1 individual projects within the broad plan or scope of the original, general EIR. (PRC 21068.5,
2 21093(a); Guideline 15152; *Koster v. County of San Joaquin* (1996) 47 Cal.App.4th 29, 36.)

3 “Tiering” is defined in PRC 21068.5 as:

4 coverage of general matters and environmental effects in an [EIR] prepared for a
5 policy, plan, program or ordinance followed by narrower or site-specific [EIRs] which
6 incorporate by reference the discussion in any prior [EIR] and which concentrate on
7 the... effects which (a) are capable of being mitigated, or (b) were not analyzed... in
8 the prior [EIR].

9 In other words, it is ‘a process by which agencies can adopt programs, plans, policies, or
10 ordinances with EIRs focusing on “the big picture” and can use streamlined CEQA review for
11 individual projects that are consistent with such... [first tier plans]....’ (*Koster v. County of*
12 *San Joaquin* (3d Dist. 1996) 47 Cal.App. 4th 29, 36.) The later EIRs need not repeat the
13 analysis or revisit the issues from the original EIR. (Guideline 15385.)

14 Guideline 15152 is the overall provision governing first-tier documents in general and
15 in its detailed discussion demonstrates clearly what such documents must do, what they must
16 include, and how they may be used.ⁱ Environmental impact reports “shall be tiered whenever
17 feasible, as determined by the lead agency.” (PRC 21093(b).) This “is needed in order to
18 provide increased efficiency in the CEQA Process. It allows agencies to deal with broad
19 environmental issues in EIRs at planning stage and then to provide more detailed examination
20 of specific effects....These later EIRs are excused by the tiering concept from repeating the
21 analysis of the broad environmental issues examined in the [first tier] EIRs.” (Discussion
22 following Guideline 15385.)

23 PRC 21094(c) states that “[f]or purposes of compliance with this section, an initial
24 study shall be prepared to assist the lead agency in making the determinations required by this
25 section.”

26 27 **C. GREENHOUSE GAS EMISSIONS**

28 The Global Warming Solutions Act (“the Act”) ‘implements deep reductions in
greenhouse gas emissions, recognizing that “[g]lobal warming poses a serious threat to the

1 economic well-being, public health, natural resources, and the environment of California...”
2 (Health & Saf.Code, § 38501, subd. (a).) Through this enactment, the Legislature has
3 expressly acknowledged that greenhouse gases have a significant environmental effect.’
4 (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 91
5 (*CEB*).) Guideline 15183.5 governs tiering and streamlining the analysis of GHG
6 emissions.ⁱⁱ Subdivision (b) sets forth the specific things such a plan should do.

7 **1. The Role of the CAP in Subsequent GHG Analysis**

8 A key issue is the ultimate role this CAP will play in subsequent GHG analysis of
9 future projects. Here neither party clearly addresses the intended role and effect of the CAP
10 in the review of subsequent projects.

11 The CAP at 1013-1016 generally indicates that the CAP is intended to eliminate any
12 need to conduct any GHG analysis in future discretionary projects that comply with the CAP.
13 Specifically, the introduction to the checklist of standards and measures, states that:

14 Discretionary projects that utilize the checklist, as modified by the individual agency,
15 and can demonstrate consistency with all applicable mandatory local or regional
16 measures in the CAP, can conclude that their impacts related to [GHG] emissions
17 would be less than significant under CEQA because the project would be consistent
18 with a qualified GHG reduction plan under... Guidelines Section 15183.5.

19 The introduction then quotes 15183.5(b) and (b)(2) in part as follows:

20 (b) Pursuant to sections 15064(h)(3) and 15130(d), a lead agency may determine that a
21 project's incremental contribution to a cumulative effect is not cumulatively
22 considerable if the project complies with the requirements in a previously adopted
23 plan or mitigation program under specified circumstances.

24 ...

25 (b)(2) A plan for the reduction of greenhouse gas emissions, once adopted following
26 certification of an EIR or adoption of an environmental document, may be used in the
27 cumulative impacts analysis of later projects. An environmental document that relies
28 on a greenhouse gas reduction plan for a cumulative impacts analysis must identify

1 those requirements specified in the plan that apply to the project, and, if those
2 requirements are not otherwise binding and enforceable, incorporate those
3 requirements as mitigation measures applicable to the project.

4 It reiterates that the ‘significance threshold for projects using the checklist for streamlining is
5 “consistency with an applicable plan for the reduction of [GHG] emissions meeting the
6 requirements of...15183.5” ’ All of this indicates an intent that a future project complying
7 with this CAP and its standards and measures need include no independent GHG analysis.

8 **2. Respondent’s Contention That Petitioner Imposes Non-Existent Requirements**

9 Respondent argues, that Petitioner is improperly trying to impose requirements on the
10 CAP that do not exist in Guideline 15183.5. This argument is expressly stated at the start of
11 its brief and is repeated throughout its papers. This argument is itself groundless; it is
12 contrary to the fundamental purpose of CEQA requirements.

13 First, Respondent contends that the Guideline merely gives a list of what such a plan
14 “should” do; not what it “must” do. Although the Guideline does only state what such a plan
15 “should” include, (see end note ii, Guideline 15183.5), it expressly states that it is a tiering
16 mechanism and that it must comply with the standards for first-tier programs or plan EIRs. It
17 is *titled* “Tiering and Streamlining the Analysis of Greenhouse Gas Emissions.” (Emphasis
18 added.) It begins by explaining that agencies may develop a GHG plan or standards in a plan
19 using a tiering method, governed by the standards for tiering. It states that agencies *may*
20 handle GHG analysis:

21 at a *programmatic* [i.e., first-tier] level, such as in a general plan, a long range
22 development plan, or a separate plan to reduce greenhouse gas emissions. *Later*
23 project-specific environmental documents *may tier from* and/or incorporate by
24 reference that existing programmatic review. Project-specific environmental
25 documents *may* rely on an EIR containing a programmatic analysis of greenhouse gas
26 emissions as provided in *section 15152 (tiering), 15167 (staged EIRs) 15168*
27 *(program EIRs), 15175-15179.5 (Master EIRs), 15182 (EIRs Prepared for Specific*
28 *Plans), and 15183 (EIRs Prepared for General Plans, Community Plans, or Zoning).*

1 (emphasis added.)

2 As noted above, the CAP also makes it clear that, as a first-tier document, it is to be
3 used in such a manner that, if complied with, will excuse the analysis of a future project from
4 revisiting GHG emissions. Therefore, the CAP, and any such plan prepared under 15183.5,
5 must meet the requirements for all first-tier documents and thus must impose effectively
6 enforceable requirements and measures with defied performance standards.

7 Second, although Respondent is correct that the requirements on which Petitioner
8 relies are not necessarily in the Guideline itself, they are applicable to *all* CEQA review and,
9 specifically, to first-tier documents, as explained above. Petitioner's further arguments, such
10 as that the CAP must provide a clear, complete, and accurate GHG "inventory," i.e., the
11 existing GHG emissions associated with activities in the county, are consistent with a
12 standard CEQA mandate, which is that an environmental document must present clear,
13 meaningful information sufficient to allow the agency and public to make an intelligent,
14 informed decision, or, stated another way, sufficient to make clear the analytic route of the
15 agency. (*Concerned Citizens of Costa Mesa, Inc. v. 32nd District Agricultural Association*
16 (1986) 42 Cal.3d 929, 936; *Al Larson Boat Shop Inc. v. Bd. of Harbor Commissioners,*
17 *supra*, 18 Cal.App.4th at 749; *Topanga Assn. for a Scenic Community v. County of Los*
18 *Angeles* (1974) 11 Cal.3d 506, 513-514, 522. Therefore, it must be based on substantial
19 evidence. (See section C.2., above.)
20

21 **3. Existing Conditions**

22 Petitioner first argues that the PEIR fails to describe existing conditions accurately
23 because it limits the range of emissions from vehicles miles traveled (VMT) associated with
24 land-use activities in the county and to and from 18 nearby regional locations. Petitioner
25 contends that the baseline or current GHG emissions level associated with the county should
26 include all VMT for trips associated with activities in the county, not only within the county
27 and to and from the 18 nearby regional locations used in the PEIR and that Respondent thus
28 understates the current GHG emissions. Respondent focuses on two general categories of
VMT omitted from the PEIR: VMTs generated by goods exported from the county to

1 locations beyond (produce, medical equipment, beer, and wine) , and tourist travel to Sonoma
2 County.

3 **a) CEQA Baselines and Quantifying Current GHG Levels**

4 Ordinarily, an EIR must clearly and consistently describe the baseline, which is
5 *normally* the *existing* environmental setting or conditions. The existing conditions, at the time
6 the notice of preparation ("NOP") is published, "normally constitute the baseline physical
7 conditions by which the lead agency determines whether an impact is significant." (Guideline
8 15125(a).) Guideline 15126.2(a) states that the agency "should normally limit its examination
9 to changes in the existing physical conditions in the affected area as they exist at the
10 time...environmental analysis is commenced."

11 Guideline 15183.5(b)(1)(A) sets forth special requirements for GHG first-tier plans
12 such as the CAP. Such plans are required to "[q]uantify greenhouse gas emissions, both
13 existing and projected over a specified time period, resulting from activities within a defined
14 geographic area."

15 Respondent notes that the ordinary requirements governing determination of the
16 "baseline" apply where there is a project that may alter this in of itself in order to determine
17 the extent of any impact which a project will have. (See Guideline 15126.2(a).)

18 **b) VMT Data**

19 The CAP explanation of how it determined the GHG inventory is found at AR 1050,
20 et seq. It used 2010 data because that year includes largely complete or complete activity data
21 for all sectors as needed to calculate GHG levels; this is not challenged by Petitioner. (See
22 AR 1052; Memorandum of Points and Authorities in Support of Petition for Writ of Mandate,
23 9:1-3.) The response to comment at AR 1084 explains that the VMTs were determined by
24 considering the travel in the county plus travel between the county and 18 external "traffic
25 analysis zones" ("TAZ").
26

27 Respondent relies on Guideline 15130(b) which provides that studies of cumulative
28 impacts are guided by "standards of practicality and reasonableness." According to Guideline
15364, "Feasible" means capable of being accomplished in a successful manner within a

1 reasonable period of time, taking into account economic, environmental, legal, social, and
2 technological factors.’ Thus, “[a]n evaluation of the environmental effects of a proposed
3 project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of
4 what is reasonably feasible The courts have looked not for perfection but for adequacy,
5 completeness, and a good faith effort at full disclosure.” (Guideline 15151; see also *Citizens*
6 *to Preserve the Ojai v. County of Ventura, supra*, 176 Cal.App.3d at 429.) Petitioner argues
7 that an agency is “not required to engage in sheer speculation as to future environmental
8 consequences [Citations], [but an] EIR [is] required to set forth and explain the basis for any
9 conclusion that analysis of the cumulative impact of offshore emissions [is] wholly infeasible
10 and speculative.” (*Citizens to Preserve the Ojai, supra*, 176 Cal.App.3d at 430.)

11 Respondent correctly argues that ultimately GHG emissions must be considered in
12 light of their cumulative worldwide impact because of their nature. The Supreme Court in
13 *Center for Biological Diversity v. California Dept. of Fish and Wildlife* (2015) 62 Cal.4th 204,
14 at 219-220, considered a challenge to an agency’s GHG analysis. The Court explained:

15 [W]e address two related aspects of the greenhouse gas problem that inform our
16 discussion of CEQA significance.

17 First, because of the global scale of climate change, *any one project's contribution is*
18 *unlikely to be significant by itself. The challenge for CEQA purposes is to determine*
19 *whether the impact of the project's emissions of greenhouse gases is cumulatively*
20 *considerable*, in the sense that “the incremental effects of [the] individual project are
21 considerable when viewed in connection with the effects of past projects, the effects of
22 other current projects, and the effects of probable future projects.” (§ 21083, subd.
23 (b)(2); see Guidelines, § 15064, subd. (h)(1).) “With respect to climate change, an
24 individual project's emissions will most likely not have any appreciable impact on the
25 global problem by themselves, but they will contribute to the significant cumulative
26 impact caused by greenhouse gas emissions from other sources around the globe. *The*
27 *question therefore becomes whether the project's incremental addition of greenhouse*
28 *gases is ‘cumulatively considerable’ in light of the global problem, and thus*

1 significant.” (Crockett, Addressing the Significance of Greenhouse Gas Emissions
2 Under CEQA: California's Search for Regulatory Certainty in an Uncertain World
3 (July 2011) 4 Golden Gate U. Env'tl. L.J. 203, 207–208 (hereafter Addressing the
4 Significance of Greenhouse Gas Emissions).)

5 Second, the global scope of climate change and the fact that carbon dioxide and other
6 greenhouse gases, once released into the atmosphere, are not contained in the local
7 area of their emission means that *the impacts to be evaluated are also global rather*
8 *than local. For many air pollutants, the significance of their environmental impact*
9 *may depend greatly on where they are emitted; for greenhouse gases, it does not.* For
10 projects, like the present residential and commercial development, which are designed
11 to accommodate long term growth in California's population and economic activity,
12 this fact gives rise to an argument that a certain amount of greenhouse gas emissions is
13 as inevitable as population growth. Under this view, a significance criterion framed in
14 terms of efficiency is superior to a simple numerical threshold because CEQA is not
15 intended as a population control measure.

16 (emphasis added.)

17 Consistent with the Supreme Court’s discussion in that case, the EIR here expressly
18 discusses the global nature of GHG emissions, explaining that “unlike other resource areas
19 that are primarily concerned with localized project impacts... the global nature of climate
20 change requires a broader analytic approach. Although this section focuses on GHG
21 emissions generated as a result of the CAP, the analysis considered them in the context of
22 potential state, national, and global GHG impacts.” (AR 314.) It also noted global GHG
23 concentrations. (AR 81, 106, 316.)

24 The PEIR analysis considered VMT for the county and the 18 TAZs in the region, and
25 only for automobile traffic and “emissions that local governments have primary influence or
26 control over.” (AR 85.) It did not consider travel by other means such as by airplane or
27 emissions over which the local entities have no direct control. (AR 85.) The PEIR explained
28

1 at AR 82 and 85 that it was relying on the International Council for Local Environmental
2 Initiatives (ICLEI) Protocol and that:

3 the ICLEI Community Protocol does not require air travel emissions to be included in
4 the basic emissions necessary for protocol-compliance GHG inventories because it
5 recognizes that local governments have less control over such sources as air travel and
6 that information is often not available to precisely describe an airport's emissions to a
7 specific community.

8 Similarly, it noted that methodologies exist to estimate emissions further afield but associated
9 with local activities but rejected these methodologies because the information might be
10 difficult to obtain or are not "common" approaches. (AR 85-86.) For example, the response
11 to the comment at AR 85-86 stated:

12 [w]hile there are methodologies to estimate upstream emissions..., these
13 methodologies are commonly used to prepare what is known as a "consumption-
14 based" inventory, which estimate the life cycle "carbon footprint" of everything
15 households (and...other consumers) consume. There are also methodologies to
16 estimate "downstream" emissions associated with the transportation, end use, and
17 disposal of goods produced in a jurisdiction, but such methodologies require highly
18 detailed information about the entire downstream supply chain, including the ultimate
19 geographical destination of goods that can be difficult to come by, especially if such
20 data is privately held. While one could estimate emissions using a consumption-based
21 approach of a "downstream" emissions method, these are not the common approach
22 used for community emissions, or national emissions at present, and if used, would
23 make it impossible to compare regional inventories.

24 As a result, the response contends, "nearly every" national, state, and local agency preparing a
25 CAP has used the "activity-based" approach to calculate and define the GHG inventories.
26 (AR 86.) Respondent asserts that by avoiding the methodologies which include upstream or
27 downstream data, and instead using the ICLEI Protocol, the CAP inventory "can be compared
28 to those other communities, using a common standard..." (Ibid.)

1 The question before the court is whether there is information in the record showing
2 that Respondent might or might not feasibly have included the additional data as Petitioner
3 contends, or whether Respondent did not need to include it.

4 Respondent's primary argument that it did not need to include additional emissions
5 estimates is based on its assertion that CEQA only requires an agency to do what is feasible,
6 and further that it need not, and should not, engage in speculation over data that is
7 unknowable. The basic that a public agency is only required to do what is feasible, discussed
8 above, is correct, but Respondent has not persuasively shown that it defeats Petitioner's
9 arguments regarding the need for more information about MVT. The response to comments
10 at AR 84-86 expressly admits that there are methodologies to quantify the additional sources
11 of GHG emissions Petitioner identifies, but did not use them because they are not
12 "commonly" used or the information "can be difficult to come by." This argument does not
13 establish that Respondent had substantial evidence to support its approval.

14 The record, including the admissions in the PEIR shows that Respondent had a
15 feasible ability to include the additional GHG data. Respondent compares the data used in
16 this CAP to that used by other agencies. (AR 86; generally AR 84-86.) This is a logical
17 explanation for employing the ICLEI Protocol used, but it does not demonstrate that it was
18 "infeasible" to obtain the additional MVT data, especially given that Respondent
19 acknowledges that the methodologies exist.

20 Had the EIR explained that it was unable to obtain the necessary information, or that
21 there were no methodologies that it could have used to obtain/include it, Respondent's would
22 have been justified in failing to obtain this data. However, here, Petitioner complains that
23 Respondent appears merely to have avoided including greater, more complete, information
24 based on the assumption that it would be "too much work."

25 The court grants the petition on this point.

26
27 **D. MITIGATION MEASURES**

28 Petitioner also argues that Respondent failed to adopt "definite, clearly defined and
enforceable" mitigations measures. It contends that at least some of the mitigation measures

1 and standards it sets forth are unclear, vague, and not fully enforceable. Petitioner points out
2 that the EIR concludes that the CAP would be “beneficial” and would thus support applicable
3 regulatory plans for reducing GHG emissions, so, it contends, no mitigation for GHG
4 emissions is necessary. (AR 204.)

5 Respondent argues that the CAP is not intended as a mitigation measure. No
6 mitigation is needed because it is a plan to reduce GHG emissions in subsequent projects.

7 What Petitioner contends is not that the CAP and EIR need to adopt mitigation
8 measures for the CAP itself, but instead that the CAP, in setting forth purported mitigation
9 measures for future analysis and handling of GHG emissions, fails to present sufficient clearly
10 defined and enforceable mitigation measures and standards.

11 Respondent points out this is not a “project” in the sense of an activity that will do
12 anything that might create GHG emissions but instead is a plan for handling analysis and
13 mitigation of GHG emissions in future projects. Therefore, there is clearly nothing about this
14 Project to mitigate. Petitioner's contention that the PEIR should imposing sufficiently defined
15 and enforceable mitigations measures, is a different issue.

16 Guideline 15183.5(b)(1)(D) and (E) are instructive. Subdivision (D) states that the
17 plan should “[s]pecify measures or a group of measures, including performance standards,
18 that substantial evidence demonstrates, if implemented on a project-by-project basis, would
19 collectively achieve the specified emissions level. Subdivision (E) states that the plan should
20 “[e]stablish a mechanism to monitor the plan's progress toward achieving the level and to
21 require amendment if the plan is not achieving specified levels.” (Emphasis added.)
22

23 **1. Role and Purpose of Mitigation Measures in CEQA**

24 Mitigation measures are needed, even required, where a project may have a significant
25 impact and the purpose of the measures is to reduce any impact to less than significant. (PRC
26 21003.1(b); Guideline 15002(a)(3).)

27 **2. Deferral of Mitigation**

28 In general, it is improper for an agency to rely on *deferred* mitigation. (*Sundstrom v.*
County of Mendocino (1988) 202 Cal.App.3d 296, 306; *Defend the Bay v. City of Irvine*

1 (2004) 119 Cal.App.4th 1261, 1275-1276.) An agency cannot find a significant impact to be
2 mitigated to a less-than-significant level based on a deferred mitigation measure. (*Sundstrom*
3 *v. County of Mendocino, supra*, 202 Cal.App.3d at 306. It is a violation of CEQA when an
4 agency “simply requires a project applicant to obtain a biological report and then comply with
5 any recommendations that may be made in the report. [Citation.]” (*Defend the Bay v. City of*
6 *Irvine* (2004) 119 Cal.App.4th 1261, 1275; see also *Endangered Habitats League, Inc. v.*
7 *County of Orange* (2005) 131 Cal.App.4th 777, 793.)

8 “Deferral of the specifics of mitigation is permissible where the local entity commits
9 itself to mitigation and lists the alternatives to be considered, analyzed and possibly
10 incorporated in the mitigation plan.” (*Defend the Bay v. City of Irvine* (2004) 119 Cal.App.4th
11 1261, 1275-1276; see also *Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d
12 1011, 1028-1030.) This applies where “mitigation is known to be feasible, but where the
13 practical considerations prohibit devising such measures early,” so that “[w]here future action
14 to carry a project forward is contingent on devising means to satisfy such criteria, the agency
15 should be able to rely on its commitment as evidence that significant impacts will in fact be
16 mitigated.” (*Sacramento Old City Assn., supra*, 229 Cal.App.3d at 1028-1029.)

17 Because of the nature of first-tier tier EIRs, in particular, deferral of the specifics of
18 mitigation measures, as long as they contain clear performance standards, is particularly
19 appropriate and logical. (See, e.g., *Rio Vista Farm Bureau Center v. County of Solano* (1st
20 Dist.1992) 5 Cal.App.4th 351 (“*Rio Vista Farm Bureau*”); *Al Larson Boat Shop Inc. v. Bd. of*
21 *Harbor Commissioners, supra*, 18 Cal.App.4th 729.) In *Rio Vista Farm Bureau*, a first-tier
22 “program EIR” serving as “primary planning document for hazardous waste management in
23 the county” was found to contain sufficient mitigation measures adopted as policies to guide
24 subsequent projects. The court rejected a challenge based on the assertion that the mitigation
25 measures were “vague, inconclusive, and even inconsistent,” finding the measures sufficient
26 “given the broad, nebulous scope of the project under evaluation.” (*Rio Vista Farm Bureau,*
27 *supra*, 5 Cal.App.4th at 376.) The court found that the specificity of mitigation measures
28

1 should be proportionate to the specificity of the underlying project, which in that case was a
2 broad planning document to guide later site-specific projects.

3 The court in *Coastal Hills Rural Preservation v. County of Sonoma* (2016) 2
4 Cal.App.5th 1234, 1258, upholding the trial court's order denying a CEQA petition for writ of
5 mandate, explained that although "CEQA usually requires mitigation measures to be defined
6 in advance" and not deferred, "deferral [of mitigation measures] is permitted if, in addition to
7 demonstrating some need for deferral, the agency (1) commits itself to mitigation; and (2)
8 spells out, in its environmental impact report, the possible mitigation options that would meet
9 "specific performance criteria" contained in the report."

10 In *Sundstrom, supra*, the county required future hydrological studies as conditions of a
11 use permit and required that any mitigation measures that the study suggested would become
12 mandatory. This was held to be improper because the impacts and mitigation measures were
13 not determined.

14 The court in *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359 found an Negative
15 Declaration defective because it improperly relied on deferred formulation of specific
16 mitigation measures. There, the city required the applicant to comply with any existing
17 ordinance protecting the Stephens' kangaroo rat and allowed the city to require a biological
18 report on the rat and compliance with any recommendations in the report. The court found
19 this to be insufficient because it, like the approval in *Sundstrom*, was based on compliance
20 with a report that had not yet even been performed.

21 By contrast, the court in *Schaeffer Land Trust v. San Jose City Council* (1989) 215
22 Cal.App.3d 612, upheld an Negative Declaration for a general plan amendment for a parcel of
23 land which, regarding traffic issues, required any future development to comply with
24 applicable "level of service" standards. Unlike the other cases mentioned above, here the
25 mitigation measures were delayed because the development and impacts were not concrete,
26 but the mitigation was fixed to set standards which, by definition, ensured that there would be
27 no significant impact. Mitigation with deferred specifics was found to satisfy CEQA where
28 the lead agency had committed to mitigation meeting a specified range of criteria and project

1 approval required the developer to obtain permits and adopt seven itemized measures in
2 coordination and consultation with relevant agencies. *Defend the Bay, supra*, 1276.

3 In *Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th
4 777, 794, the court found a mitigation measure that required replacement habitat preservation
5 to satisfy CEQA even though the specifics were not fully determined but where the approval
6 set forth *specific possibilities and parameters that the mitigation needed to meet*.

7 **3. The Role of the CAP in Subsequent GHG Analysis**

8 The key issue here in determining the sufficiency of mitigation measures is the role
9 this CAP is intended to play in a GHG analysis of future projects. As noted above, one aspect
10 of first-tier plans and EIRs is that they may obviate the need for later projects falling within
11 their ambit to conduct new CEQA review on certain issues where the future projects comply
12 with the first-tier plan. Any later discretionary project that complies with its criteria, such as
13 the standards and requirements it imposes, would not need to do further study of GAG
14 emissions. Accordingly, the standards and requirements the CAP imposes for reducing or
15 minimizing GHG emissions must be considered mitigation measures for purposes of CEQA
16 and must comply with the CEQA requirements. This means that they must set forth clearly
17 defined and enforceable performance standards to be met. Because of the intended
18 streamlining, Petitioner correctly contends that the performance standards and measures set
19 forth the PEIR must be clear, definite, and enforceable.
20

21 Here also, Respondent contends that Petitioner is imposing requirements and standards
22 that do not exist in Guideline 15183.5. Respondent ignores the fundamental CEQA
23 requirements which underlie Petitioner's claims. Respondent contends that Guideline 15183.5
24 does not require mitigation measures for the CAP or within the CAP imposed on future
25 projects. This position not only conflicts with 15183.5 itself, it is fundamentally contrary to
26 the principles of CEQA review.

27 It is axiomatic in CEQA that any measures or requirements imposed be sufficiently
28 defined to be enforceable and that, in the context of tiering, any subsequent project may avoid
analysis of an issue only if it complies with a first-tier document that satisfies CEQA

1 requirements. As noted above, PRC 21094(a) states that where a prior first-tier EIR has been
2 certified and applies to a subsequent project, the agency “*need not examine those effects*
3 *which ... were either (1) mitigated or avoided... as a result of the prior [EIR] or (2) examined*
4 *at a sufficient level of detail in the prior [EIR] to enable those effects to be mitigated or*
5 *avoided by site specific revisions, the imposition of conditions, or by other means....”*

6 Accordingly, to obviate the need to address an issue or impact as part of a later project’s
7 CEQA review, a first-tier plan or program document and EIR must sufficiently analyze that
8 issue or impact to determine that compliance with the document and its mitigations will
9 mitigate or avoid the impact. The mitigation requirements in a first-tier document for
10 avoiding or mitigating the impact *must* include performance standards that are mandatory and
11 include specific, and effectively enforceable performance standards. (*Coastal Hills Rural*
12 *Preservation v. County of Sonoma* (2016) 2 Cal.App.5th 1234, 1258.)

13 The prior discussion of Guideline 15183.5 addresses the impact of tiering
14 mechanisms. Again, the CAP, and any such plan prepared under 15183.5, must meet the
15 requirements for all first-tier documents and thus must impose effectively enforceable
16 requirements and measures with defied performance standards.

17 Further, Guideline 15183.5 *does require the CAP to impose mitigation measures on*
18 *future projects.* As both Respondent and the CAP itself acknowledge, and as noted above,
19 subdivision (b) expressly states that “a lead agency may determine that a project's incremental
20 contribution to a cumulative effect is not cumulatively considerable *if* the project complies
21 with *the requirements* in a previously *adopted plan or mitigation program* under specified
22 circumstances.” This plan or mitigation program, i.e., the CAP, according to (b)(2), “*may be*
23 *used in the cumulative impacts analysis of later projects”* which clearly means that it need not.
24 However, (b)(2) continues to state that *if it is* so used for a later project, that project must
25 comply with the requirements and mitigation measures from the CAP. Once again, in the
26 Guideline’s words, a later project that in fact “relies on [the CAP] for a cumulative impacts
27 analysis *must* identify those *requirements specified in the plan* that apply to the project, and, *if*
28

1 *those requirements are not otherwise binding and enforceable, incorporate those*
2 *requirements as mitigation measures....”*

3 In countering Petitioner's complaint that some of the so-called measures or standards
4 are too vague or loose or ill-defined to be properly enforceable, Respondent asserts that this
5 will be “cured” because Guideline 15183.5(b)(2) states that any requirements that are not
6 “binding and enforceable” will be incorporated as mitigation measures in the project’s CEQA
7 document. This “interpretation” does not withstand scrutiny. As explained above, a first-tier
8 document, in order to be used to avoid revisiting analysis of an issue in a later project, must
9 have sufficiently analyzed the issue and found any significant impact to be mitigated or
10 avoided by complying with the document. That means that any requirement, such as
11 mitigation, must have sufficiently defined, clear, and mandatory performance standards to be
12 effectively enforceable and to have predictable results. If the requirements or measures are so
13 ill-defined as to be unenforceable as a practical matter, and effectively meaningless, merely
14 “incorporating” them into the later project’s CEQA document will obviously not fix that
15 problem. What the state in the Guideline must mean, therefore, is not that an ineffective
16 measure may simply be incorporated into a later project’s document, as Respondent asserts,
17 but that a measure or requirement must be incorporated in the document *if it is not enforced*
18 *independently, or through some other mechanism.*

20 **4. The Measures in the CAP**

21 The CAP sets forth requirements and standards or mitigation measures at AR 1015-
22 1048.

23 Respondent primarily argues that under Guideline 15183.5(b)(2), any measure which
24 the CAP imposes and which is “not otherwise binding and enforceable” must be incorporated
25 into future projects. As addressed above, this argument is not meritorious. Guideline
26 15183.5(b)(2) expressly requires that:

27 *"An environmental document that relies on a greenhouse gas reduction plan for a*
28 *cumulative impacts analysis must identify those requirements specified in the plan that*
apply to the project, and, if those requirements are not otherwise binding and

1 *enforceable, incorporate those requirements as mitigation measures* applicable to the
2 project. *If there is substantial evidence that the effects of a particular project may be*
3 *cumulatively considerable notwithstanding the project's compliance with the specified*
4 *requirements in the plan for the reduction of greenhouse gas emissions, an EIR must*
5 *be prepared for the project.*

6 (emphasis added.)

7 Petitioner singles out three of the specific measures or requirements in the CAP for
8 discussion as demonstrating a lack of meaningful enforceability and clear standards.

9 **a) 5-R4 (AR 1026)**

10 The first is 5-R4 (AR 1026.) This “trip-reduction ordinance” requires employers with
11 50+ employees to offer one of several options to employees in order to reduce GHG
12 emissions: “pre-tax transit expenses, transit or vanpool subsidy, free or low cost shuttle, *or an*
13 *alternative benefit.*” (Emphasis added.) It is the latter to which Petitioner objects, arguing
14 that it is vague and undefined either in what it must be like or what it must achieve, so that
15 there is no way to enforce this. As a result, Petitioner contends, a project could offer as
16 “alternative benefit” which no-one can at this point predict, and argue that it need not do GHG
17 analysis because it has “complied” with this measure. Respondent contends that an
18 alternative of purchasing GHG offsets is considered and this is correct but this is not the
19 definition of “an alternative benefit,” which is left open and could be anything. Petitioner is
20 correct on this point.

21 Respondent contended that Petitioner failed to exhaust administrative remedies on this
22 specific issue.

23 According to PRC section 21177, “[a] person shall not maintain an action or
24 proceeding unless that person objected to the approval of the project orally or in writing
25 during the public comment period provided by this division or prior to the close of the public
26 hearing on the project before the filing of the notice of determination.” This does not,
27 however, bar an association or organization formed after approval from raising a challenge
28 which one of its constituent members had raised, directly or by agreeing with or supporting

1 another's comments. (PRC section 21177(c).) Moreover, someone may file a legal challenge
2 based on an issue as long as "any person" raised that issue during the review process. PRC
3 section 21177(a); see *Friends of Mammoth v. Board of Supervisors* (1972) 8 Cal.3d 247, 267-
4 268. It also does not apply to any grounds of which the agency did not give required notice
5 and for which there was no hearing or opportunity to be heard. PRC section 21177(e).

6 A party challenging decision under CEQA cannot, to exhaust administrative remedies,
7 rely merely on "general objections" or "unelaborated comments." *Sierra Club v. City of*
8 *Orange* (2008) 163 Cal.App.4th 523, 535; *Coalition for Student Action v. City of Fullerton*
9 (1984) 153 Cal.App.3d 1194, 1197. However, "[l]ess specificity is required to preserve an
10 issue for appeal in an administrative proceeding than in a judicial proceeding...." *Citizens*
11 *Association for Sensible Development of Bishop Area v. County of Inyo* (1985) 172
12 Cal.App.3d 151, 163.

13 Petitioner responds that only the substance of the issue must be raised at the
14 administrative level, relying on *Save Our Residential Environment v. City of West Hollywood*
15 (1992) (Cal.App.4th 1745, 1750.) And further that less specificity is required to exhaust an
16 issue in an administrative proceeding than in a judicial one, relying on *Woodward park*
17 *Homeowners Assn. v. City of Fresno* (2007) 150 Cal.app.4th 683, 712 and *Brothers Real*
18 *Estate Group v. City of Los Angeles* (2008) 153 Cal.App.4th 1385, 1395. The court finds that
19 Petitioner did articulate this as a basic contention in the underlying administrative
20 proceedings. (AR 66 and AR 67.)

21 **b) 4-L-1 (AR 1024)**

22 Petitioner's attack 4-L-1, at AR 1024, which requires consistency with applicable
23 "adopted policies" on mixed-use and transit-oriented development, such as zoning codes,
24 general plans, etc., and states that agencies must "support mixed use [sic] development in
25 city-centers and transit-oriented development locations through their General Plans, etc." is
26 not persuasive. Petitioner contends that this is too vague because "mixed-use" has been
27 interpreted to allow hotels and tourist destinations built downtown or near rail stations.
28 Petitioner focuses on one portion of this requirement that is open-ended. Nothing indicates

1 that the type of use that could be allowed in a mixed-use development, whether store,
2 museum, eatery, office, or hotel, has any bearing on GHG emissions. Petitioner cites no
3 evidence or explanation in support of this claim and does not explain how this is material.
4 What matters is that there are clear, adopted standards mandating such development and
5 Petitioner does not challenge that portion of the measure at all.

6 It is possible that the measure could be found too vague and Petitioner may be
7 challenging it on that basis as well. Petitioner refers to it when mentioning how an
8 “undefined alternative... lacks the required specificity” and Petitioner again mentions it on the
9 following page with reference to “tentative plans” for future mitigation in ill-defined
10 subsequent regulation to be adopted. This, merely requires each jurisdiction to “identify such
11 appropriate areas and include unspecified policies and incentives to encourage development
12 near high-quality transit service.” It requires the jurisdiction to define requirements and
13 identify potential incentives, giving a list of the types that these “may include,” the last being
14 “other related items.” Again, this does not give any clear performance standards regarding
15 how to achieve this or what the parameters are. As Petitioner argues, for the third measure,
16 the court in *Communities for a Better Environment v. City of Richmond*, 184 Cal.App.4th 70,
17 92, found a measure insufficiently specific where it required reduction of mobile emission
18 sources though “transportation smart” development because “reliance on tentative plans for
19 future mitigation... significantly undermines CEQA’s goals of full disclosure and informed
20 decision making.” Under this analysis, this measure is also defective.

21
22 **c) 2-L-1 (AR 1021)**

23 Lastly, Petitioner argues that 2-L-1, at AR 1021, is defective. This measure mandates
24 that the project “comply with local requirement(s) for rooftop solar PV on new residential
25 development. It states that each jurisdiction “will define which new development must
26 provide rooftop solar [PV] by defining qualifying criteria... and the amount of solar
27 required...” As Petitioner argues, this sets no standards at all, just like 4-L-1, but instead
28 merely general principles and future possibilities. This violates CEQA.

1 Petitioner further argues that the measures in general do not guarantee any likelihood
2 of implementation. This is clear from the ones discussed above. Petitioner cites 1-R2 as
3 another example. It states that two named agencies “will work with the participating
4 communities to implement energy efficient retrofits. Actions may include: Implementing a...
5 weatherization program, expanding energy efficiency outreach/education campaigns...,
6 promoting the smart grid,” etc. Again, none of this goes beyond stating wishful thinking,
7 good intentions, and an intent to “work” with others. Measures that fall into this category
8 violate CEQA as well.

9 Petitioner also generally attacks the measures as lacking meaningful enforceability.
10 Petitioner also contends that of all of them, only 1-S1 and 1-S2 are actually enforceable
11 because they govern building energy and lighting efficiency, both controlled by state
12 regulation. The court finds a few others in addition to 1-S1 and 1-S2 to be similarly
13 enforceable. These include 1-L1, based on Windsor’s building code, 1-L2, requiring LED
14 lights in new development.

15 Aside from those few, Petitioner is correct that most are not enforceable, either
16 because they are too vague and lacking in meaningful mandatory requirements such as those
17 already discussed, which only “require” some “alternative” that is not specified or governed
18 by set parameters. Others, such as 1-L3 through 2-L2, state mitigation measures but then state
19 that these are “voluntary,” or “encouraged,” or only necessary where “applicable” based on
20 circumstances or criteria that are not defined. Others again rely on other jurisdictions such as
21 the cities creating applicable requirements that in some unspecified manner promote the
22 stated, vague, open-ended policies that lack any parameters or requirements. These are too
23 numerous to list them all here but this general characteristic dominates almost all of the
24 measures from what I have read.

25 Accordingly, the court grants the petition with respect to mitigation. Because the
26 record does not provide adequate information about extraterritorial emissions the agency and
27 the public could not and the court cannot determine whether the CAP would achieve its stated
28 goal to reduce GAG impacts to pre-1990 levels by 2020.

1 **E. ALTERNATIVES**

2 Petitioner asserts that Respondent violated CEQA by adopting as the “environmentally
3 superior alternative” the Zero Net Energy Buildings Alternative because it fails to address
4 GHG emissions from transportation while Respondent declined to evaluate an alternative with
5 a moratorium on, or significant reduction of, new or expanded vineyards, wineries and tourist
6 destinations. (AR 94; 426-427.)

7 Respondent contends that the analysis is sufficient because Petitioner believes that
8 reducing or stopping growth, and in particular growth that involves travel of people and goods
9 to and from the county, is necessary, and Petitioner cannot impose such mandates on R;
10 Respondent considered a range of alternatives; and choosing the moratorium alternative
11 would require the court to “dramatically substitute” its judgment for Respondent’s.

12 CEQA requires all EIRs to consider alternatives to the project. (*Friends of the Old*
13 *Trees v. Dept. of Forestry & Fire Protection* (1st Dist.1997) 52 Cal.App.4th 1383, 1393-1395
14 (*Friends of Old Trees*.)

15 **1. Importance and Central Role of Alternatives Analysis**

16 PRC section 21002 states that “it is the policy of the state that public agencies should
17 not approve projects as proposed if there are feasible alternatives or feasible mitigation
18 measures available which would substantially lessen the significant environmental effects...”
19 An agency may not approve a project that will result in significant impacts *unless it first finds*
20 *that mitigation measures or alternatives are infeasible*. (PRC section 21081; Guidelines
21 15091, 15093.)

22 The Supreme Court decided that considering alternatives is one of the most important
23 functions of an EIR. (*Wildlife Alive v. Chickering* (1976) 18 Cal.3d 190, 197.) In fact, “[t]he
24 core of the EIR is the mitigation and alternatives sections.” (*Citizens of Goleta Valley v. Bd.*
25 *of Supervisors* (1990) 52 Cal.3d 553, 564, 566 (*Goleta II*.)

26 Without evidence regarding why the alternatives are insufficient to meet the project or
27 CEQA goals, meaningful analysis is impossible. An EIR must “explain in meaningful detail
28 the reasons and facts supporting [the] conclusion.” (*Marin Municipal Water Dist. v. KG Land*

1 *Corp. California* (1991) 235 Cal.App.3d 1652, 1664.) Failure to provide sufficient analysis
2 or alternatives makes it impossible for the court to “intelligently examine the validity of the...
3 action.” (*Topanga Assn. for a Scenic Community v. County of Los Angeles* (1974) 11 Cal.3d
4 506, 513-514, 522.)

5 The alternatives must be discussed in the EIR itself, provided for public review, and
6 subject to analysis, and the agency cannot cure defects by providing analysis in its official
7 response. (See *Friends of the Old Trees, supra*, 52 Cal.App.4th at 1403-1405.)

8 **2. Authority on Analyzing Alternatives and Feasibility**

9 The discussion should evaluate the relative merits of each alternative 14 CCR
10 §15126.6(a). Respondents need not analyze or adopt alternatives that are not feasible. 14
11 CCR ' 15126.6(c), (f); *Citizens of Goleta Valley v. Bd. of Supervisors* (1990) 52 Cal.3d 553,
12 564, 566 (*Goleta II*). However, the document *must* consider alternatives that *are* feasible.
13 *EPIC v. Johnson* (1985) 170 Cal.App.3d 604, 610; *Friends of the Old Trees, supra*, 52
14 Cal.App.4th 1404.

15 Ultimately, determining if alternatives are suitable involves a three-part test governed
16 by the “rule of reason” as set forth in Guideline 15126.6. (See *Citizens of Goleta Valley v.*
17 *Bd. of Supervisors* (1990) 52 Cal.3d 553, 564, 566 (*Goleta II*); *Save San Francisco Bay*
18 *Association v. San Francisco Bay Conservation and Development Commission* (1992) 10
19 Cal.App.4th 908, 919.) The analysis must consider alternatives that 1) may “attain most of the
20 basic objectives of the project,” 2) reduce or avoid the project’s impacts, and 3) are
21 “potentially feasible.” (Guideline 15126.6(a), (f).)

22 The analysis of alternatives is required to set forth facts and “*meaningful analysis*” of
23 these alternatives rather than “just the agency’s bare conclusions or opinions.” (*Laurel*
24 *Heights I, supra*, 47 Cal.3d 376, 404-405; *Goleta II, supra*, 52 Cal.3d 569; *Preservation*
25 *Action Council v. City of San Jose* (2006) 141 Cal.App.4th 1336, 1353.) All analysis must
26 include “detail sufficient to enable those who did not participate... to understand and to
27 consider meaningfully” the alternatives. (*Laurel Heights I, supra*, 404-405.)
28

1 As notes above, “feasible” means able to be “accomplished in a successful manner
2 within a reasonable period... taking into account economic, environmental, social, and
3 technological factors.” (PRC section 21061.1.)

4 When the agency determines that alternatives are infeasible, it “shall describe the
5 specific reasons for rejecting identified...project alternatives.” (Guideline 15091(a), (c).) The
6 analysis of alternatives is required to set forth facts and “*meaningful analysis*” of these
7 alternatives rather than ““just the agency’s bare conclusions or opinions.”” (*Laurel Heights I*,
8 *supra*, 47 Cal.3d 376, 404-405; *Goleta II, supra*, 52 Cal.3d 569; *Preservation Action Council*
9 *v. City of San Jose* (2006) 141 Cal.App.4th 1336, 1353.) All analysis must include “detail
10 sufficient to enable those who did not participate... to understand and to consider
11 meaningfully” the alternatives. (*Laurel Heights I, supra*, 404-405.)

12 The agency must make findings identifying specific considerations making an
13 alternative infeasible and the specific benefits of the Project that outweigh the relative harm.
14 (PRC § 21002.1(b), 21081, Guideline 15092(b); *Preservation Action Council, supra*, 1353.)

15 On the other hand, as usual, the requirement is one of reasonableness and a “crystal
16 ball” inquiry is not necessary. (*Residents Ad Hoc Stadium Committee v. Bd. of Trustees* (3d
17 Dist.1979) 89 Cal.App.3d 272, 286.) The key, as with most aspects of an EIR is that the
18 agency must provide enough information about the analytical path taken to allow the court to
19 “intelligently examine the validity of the administrative action.” (*Topanga Assn. for a Scenic*
20 *Community v. County of Los Angeles* (1974) 11 Cal.3d 506, 513-514, 522.) However, no
21 “ironclad rule” other than the “rule of reason” governs the decision. (Guideline 15126.6(a).)

22 An agency cannot find an alternative infeasible simply because the developer does not
23 want to do it. (*Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 601.)
24 In fact, the analysis must include alternatives that are reasonable “even if they substantially
25 impede the project or are more costly.” (*San Bernardino Valley Audubon Society v. County of*
26 *San Bernardino* (1984) 155 Cal.App.3d 738, 750; see also *Preservation Action Council v.*
27 *City of San Jose* (2006) 141 Cal.App.4th 1336.)
28

1 An EIR or decision thereon also cannot merely state that an alternative is infeasible
2 simply because it is too expensive or will not lead to sufficient return without providing
3 supporting analysis. (*Preservation Action Council v. City of San Jose* (2006) 141 Cal.App.4th
4 1336.) “The fact that an alternative may be more expensive or less profitable is not sufficient
5 to show that the alternative is financially infeasible. What is required is evidence that the
6 *additional costs or lost profitability* are sufficiently severe as to render it impractical to
7 proceed with the project.” (*Citizens of Goleta Valley v. Board of Supervisors* (1988) 197
8 Cal.App.3d 1167, 1181; *Uphold Our Heritage, supra*, 599; (emphasis added).)

9 An alternative should be capable of “substantially lessening” adverse impacts but it
10 need only have fewer impacts and it need not be impact free. PRC 21002; Guideline
11 15126.6(a); *Citizens of Goleta Valley v. Board of Supervisors (Goleta II)* (1990) 52 Cal.3d
12 553, 566.

13 **3. Reasonable Range**

14 An EIR must describe a reasonable range of alternatives to the proposed project or its
15 location that would feasibly achieve most of the project’s objectives, while reducing or
16 avoiding any of its significant effects. (Guideline 15126.6(a), (d).)

17 The EIR “shall focus on alternatives... which are capable of avoiding or substantially
18 lessening any significant effects of the project, even if these alternatives would impede to
19 some degree the attainment of the project objective, or would be more costly.” (Guideline
20 15126.6(b).)

21 The EIR must set forth the alternatives necessary to permit a reasoned choice and in a
22 manner that will allow “meaningful evaluation.” (Guideline 15126.6(a), (d), (f); *Goleta II*;
23 see also *Laurel Heights I, supra*; see also *San Bernardino Valley Audubon Soc., Inc. v. County*
24 *of San Bernardino* (1984) 155 Cal.App.3d 738, 750-751 (the detail must allow a reasonable
25 choice “so far as environmental aspects are concerned.”).)

26 If an EIR excludes certain alternatives, it should identify the alternatives and set forth
27 the reasons. (*Goleta II, supra*, 569; Guideline 15126.6(b).) The court in determining if the
28

1 EIR included a reasonable range of alternatives may consider the entire record to determine if
2 alternatives were properly excluded from consideration. (*Goleta II, supra*, 569.)

3 Alternatives that would eliminate or reduce significant environmental impacts *must* be
4 considered even if they would cost more or “to some degree” impede attainment of the
5 project’s objectives. (Guideline 15126.6(b).)

6 **4. Detail of Relevant Decisions on the Adequacy of Alternatives**

7 In *Friends of the Old Trees, supra*, 52 Cal.App.4th 1383, an extreme case, there was
8 no discussion of alternatives in the versions submitted for public review. The agency argued
9 that the fact it considered mitigation should suffice, while the real party marked a box
10 selecting a certain method of cutting. The court also noted that the *public* brought forth “the
11 only true alternatives,” and that these were discussed only after the document was approved.
12 (*Friends of the Old Trees, supra*, 52 Cal.App.4th 1405.) The court found the discussion
13 inadequate. (*Id.*, 1403-1405.)

14 In *Citizens of Goleta Valley v. Board of Supervisors (Goleta I)*, (1988) 197
15 Cal.App.3d 1167, the EIR considered a smaller hotel to be an economically infeasible
16 alternative to the proposed hotel at issue. Because the EIR lacked *evidence* that the smaller
17 hotel was economically infeasible, the court considered it error to deny the writ of mandate.
18 The court found that although the EIR contained estimated figures of costs, the record did not
19 reveal any *evidence* which *analyzed* the alternative in terms of comparative costs, comparative
20 profits or losses, or comparative economic benefit to the project proponent, residents, or the
21 community at large. (*Id.*, 1180.)

22 The court in *Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587,
23 at 599, addressed a project to demolish an historic mansion in order to construct a new,
24 smaller single-family residence. The court found that evidence that alternatives of historic
25 rehabilitation or rehabilitation with a new addition, would cost between \$4.9 million and \$10
26 million was not substantial evidence that alternatives were not economically feasible since
27 there was no evidence of the likely cost of a proposed replacement home or average cost of
28

1 building the proposed 6,000 square foot home in the city. It also found that whether the
2 developer wanted to do the alternative was irrelevant to determining if it is not feasible.

3 *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus (Arambel and*
4 *Rose Development, Inc.)* (1994) 27 Cal.App.4th 713, also dealt with alternatives analysis.
5 The court found, in the context of a proposed housing development, that the discussion of
6 housing density alternatives was inadequate. The DEIR stated that a lower density would
7 “lessen the impacts,” but failed to identify which impacts it meant or to what degree. The
8 court ruled that “[s]uch a bare conclusion without an explanation of its factual and analytical
9 basis is insufficient.” *Id.*, at 736. The court went on to state:

10 That lower density might not be “economically feasible,” is not sufficient
11 justification for the failure to give basic information as to density alternatives
12 which were considered and rejected. Contrary to [respondent’s] argument,
13 [petitioners] are not required to show there are reasonable alternatives. *It is the*
14 *project proponent’s responsibility to provide an adequate discussion of*
15 *alternatives....* If the project proponent concludes there are no feasible
16 alternatives, it must explain in *meaningful detail* in the EIR the basis for that
17 conclusion. Thus, even if alternatives are rejected, an EIR *must explain why*
18 each suggested alternative either does not satisfy the goals of the proposed
19 project, does not offer substantial environmental advantages or cannot be
20 accomplished.

21
22 *Id.*, at 737 (emphasis added).

23 **5. Whether Feasibility Finding Is Necessary**

24 As noted above, PRC sections 21002, 21081, and Guidelines 15091, 15093 together
25 forbid approval of a project that *will result in significant impacts without first finding that*
26 *any environmentally superior alternatives are infeasible*. Petitioner argues that Respondent
27 failed to consider an alternative that is environmentally superior.

1 **6. The Alternatives Analysis for the CAP**

2 The alternatives analysis is at AR 425-438. The PEIR explains that it developed and
3 analyzed only *one* other alternative, the Carbon Offset Alternative, in addition to the chosen
4 Zero Net Energy Buildings plan and the mandatory no-project alternative. It expressly
5 rejected a growth moratorium, reduced density, greater density, increased Sonoma Clean
6 Power, expanded transit service, 1990 Levels by 2020 (AB32), and 80% Below 1990 Levels
7 by 2020.

8 The real issue here is whether the Respondent, in rejecting formulating other
9 alternatives, has considered a reasonable range, as required, and whether Respondent has
10 provided sufficient explanation of infeasibility or other reasoning to support not considering
11 other proposed alternatives.

12 Respondent's analysis is insufficient. Respondent considered almost no range at all,
13 and only one other alternative that essentially is one that does nothing other than to authorize
14 Respondent to buy GHG offsets for all GHG impacts from projects. Although Respondent
15 argues to the contrary, this alternative seems both infeasible and at the same time would not
16 actually do anything to control or limit actual GHG production. As an alternative, this
17 appears to be one of form, but not of substance.

18 By contrast, the moratorium or reduced-development alternative which Petitioner
19 proposes, and which was presented to Respondent in public comments (see, e.g., AR 93-94,
20 response to comment) along with others noted but rejected without being developed, include
21 real solutions that differ significantly from the chosen CAP. At least some, like the
22 moratorium or growth limit, also address issues of GHG production from travel. While it is
23 logical that some may be infeasible or incompatible with goals of growth, this is not alone,
24 without explanation or support, a basis for not even considering those alternatives, or
25 modified versions. For example, Respondent noted a moratorium on growth of wineries or
26 housing “until the jobs-housing balance in the County is more equitable,” but this does not
27 even address the issues of Petitioner's proposed moratorium, it is arbitrarily limited, and it
28 does not even seem to make much sense. There is no evidence or explanation for what it

1 would be or why Respondent could not consider a similar, but different one, such as Petitioner
2 proposed. That is the purpose of actually developing and considering alternatives. Given
3 that there are available alternatives that differ drastically from what Respondent has
4 considered and given that Respondent has, in effect, considered only one other option that is
5 perhaps only nominally an alternative, this analysis fails to consider a reasonable range of
6 alternatives, or even any range at all.

7 The court Grants the petition on this issue.

8 **F. RESPONSE TO PUBLIC COMMENTS**

9 Petitioner next argues that Respondent's response to public comments was insufficient
10 in violation of Guideline 15088(c).

11 The “evaluation and response to public comments is an essential part of the CEQA
12 process.” (Discussion following CEQA Guideline 15088.) The final EIR must include
13 evaluation and responses to all comments received in the public-comment period. PRC
14 section 21091(d)(2)(A). Guideline 15088 governs responses to comments and subdivision (c)
15 governs the substance of such responses. It requires responses to address issues “in detail”
16 and demonstrate “why specific comments and suggestions were not accepted.” Most
17 importantly, perhaps, the responses must explain the reasons for rejecting suggestions with a
18 “good faith, reasoned analysis” and must not rely on “[c]onclusory statements unsupported by
19 factual information.” Guideline 15088(c).

20 **1. Exhaustion of Administrative Remedies**

21 Respondent first contends that Petitioner failed to exhaust administrative remedies on
22 this issue. The court has found, above, that Petitioner exhausted its administrative remedies.

23 Petitioner's argument here is collateral and not persuasive. Although Petitioner points
24 out that a few responses may not sufficiently resolve issues, that is of little importance in of
25 itself. What matters are the fundamental defects that have not been cured as discussed above:
26 failure to properly determine GHG inventory, or demonstrate that Respondent could not
27 practically have done more or did not need to do more; ill-defined mitigation measures
28 lacking enforceable criteria or parameters; and lack of reasonable range of alternatives.

1 The court denies the Petition with respect to the comments..

2 **G. WHETHER RESPONDENTS' ERROR WAS PREJUDICIAL**

3 Respondent contends that even if Petitioner demonstrated error, it was not prejudicial.

4 As noted at the outset, in order for the court to issue a writ of mandate, it must find not only
5 error, i.e., a violation of CEQA, but that error was prejudicial. (*Chaparral Greens v. City of*
6 *Chula Vista* (1996) 50 Cal.App.4th 1134, 1143; see PRC 21168, 21168.5, *Laurel Heights I,*
7 *supra* 47 Cal.3d 392, fn.5; Remy, et al., Guide to the California Environmental Quality Act
8 (10th Ed.1999) Chapter XI(D), p.590.)

9 Respondent's failure to impose meaningful, effectively enforceable mitigation
10 measures, when presenting compliance with the CAP as a way for future projects to avoid any
11 other GHG analysis, is fundamentally and on its face, prejudicial. The failure to present a
12 reasonable range of alternatives or to properly inventory GHG emissions as required are also
13 on, their face, prejudicial because they prevent informed decision making or public review,
14 the very bases of CEQA. (*Sierra Club v. State Bd. of Forestry* (1994) 7 Cal.4th 1215, 1228-
15 1230, 1235-1237 (failure to put critical information in an environmental document was in of
16 itself a prejudicial abuse of discretion partly because it "frustrated the purpose of the public
17 comment provisions"); *Save Cuyama Valley v. County of Santa Barbara* (2013) 213
18 Cal.App.4th 1059, at 1073 ("[a]n error is prejudicial when an agency fails to comply with a
19 mandatory CEQA procedure or when a report omits information and thereby precludes
20 informed decision making); *Lighthouse Field Beach Rescue v. City of Santa Cruz* (2005) 131
21 Cal.App.4th 1170, 1182.; *Schoen v. Dept. of Forestry & Fire Protection* (1997) 58
22 Cal.App.4th 556, 565 ("We cannot overlook a prejudicial error by surmising that the project
23 would have gone forward anyway.")) .)

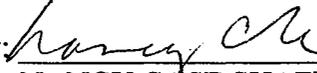

24
25 Based on the foregoing,
26
27
28

1 NOW, THEREFORE,

2 ORDER

3 1. The Petition for Mandamus is granted as stated above.

4 Dated: 7/20/17

5 By: 
6 NANCY CASE SHAFFER
7 Judge of the Superior Court

8 END NOTES

9 (a) "Tiering" refers to using the analysis of general matters contained in a broader EIR (such
10 as one prepared for a general plan or policy statement) with later EIRs and negative
11 declarations on narrower projects; incorporating by reference the general discussions from the
broader EIR; and concentrating the later EIR or negative declaration solely on the issues
specific to the later project.

12 (b) Agencies are encouraged to tier the environmental analyses which they prepare for
13 separate but related projects including general plans, zoning changes, and development
14 projects. This approach can eliminate repetitive discussions of the same issues and focus the
15 later EIR or negative declaration on the actual issues ripe for decision at each level of
16 environmental review. Tiering is appropriate when the sequence of analysis is from an EIR
17 prepared for a general plan, policy, or program to an EIR or negative declaration for another
18 plan, policy, or program of lesser scope, or to a site-specific EIR or negative declaration.
Tiering does not excuse the lead agency from adequately analyzing reasonably foreseeable
significant environmental effects of the project and does not justify deferring such analysis to
a later tier EIR or negative declaration. However, the level of detail contained in a first tier
EIR need not be greater than that of the program, plan, policy, or ordinance being analyzed.

19 (c) Where a lead agency is using the tiering process in connection with an EIR for a large-
20 scale planning approval, such as a general plan or component thereof (e.g., an area plan or
community plan), the development of detailed, site-specific information may not be feasible
21 but can be deferred, in many instances, until such time as the lead agency prepares a future
22 environmental document in connection with a project of a more limited geographical scale, as
long as deferral does not prevent adequate identification of significant effects of the planning
approval at hand.

23 (d) Where an EIR has been prepared and certified for a program, plan, policy, or ordinance
24 consistent with the requirements of this section, any lead agency for a later project pursuant to
or consistent with the program, plan, policy, or ordinance should limit the EIR or negative
25 declaration on the later project to effects which:

26 (1) Were not examined as significant effects on the environment in the prior EIR; or
27 (2) Are susceptible to substantial reduction or avoidance by the choice of specific revisions in
the project, by the imposition of conditions, or other means.

28 (e) Tiering under this section shall be limited to situations where the project is consistent with
the general plan and zoning of the city or county in which the project is located, except that a
project requiring a rezone to achieve or maintain conformity with a general plan may be
subject to tiering.

1
2 (f) A later EIR shall be required when the initial study or other analysis finds that the later
3 project may cause significant effects on the environment that were not adequately addressed
4 in the prior EIR. A negative declaration shall be required when the provisions of Section
5 15070 are met.

6 (1) Where a lead agency determines that a cumulative effect has been adequately addressed in
7 the prior EIR, that effect is not treated as significant for purposes of the later EIR or negative
8 declaration, and need not be discussed in detail.

9 (2) When assessing whether there is a new significant cumulative effect, the lead agency shall
10 consider whether the incremental effects of the project would be considerable when viewed in
11 the context of past, present, and probable future projects. At this point, the question is not
12 whether there is a significant cumulative impact, but whether the effects of the project are
13 cumulatively considerable. For a discussion on how to assess whether project impacts are
14 cumulatively considerable, see Section 15064(i).

15 (3) Significant environmental effects have been "adequately addressed" if the lead agency
16 determines that:

17 (A) they have been mitigated or avoided as a result of the prior environmental impact report
18 and findings adopted in connection with that prior environmental report; or

19 (B) they have been examined at a sufficient level of detail in the prior environmental impact
20 report to enable those effects to be mitigated or avoided by site specific revisions, the
21 imposition of conditions, or by other means in connection with the approval of the later
22 project.

23 (g) When tiering is used, the later EIRs or negative declarations shall refer to the prior EIR
24 and state where a copy of the prior EIR may be examined. The later EIR or negative
25 declaration should state that the lead agency is using the tiering concept and that it is being
26 tiered with the earlier EIR.

27 (h) There are various types of EIRs that may be used in a tiering situation. These include, but
28 are not limited to, the following:

(1) General plan EIR (Section 15166).

(2) Staged EIR (Section 15167).

(3) Program EIR (Section 15168).

(4) Master EIR (Section 15175).

(5) Multiple-family residential development/residential and commercial or retail mixed-use
development (Section 15179.5).

(6) Redevelopment project (Section 15180).

(7) Projects consistent with community plan, general plan, or zoning (Section 15183).

One specific example of a first-tier EIR is a "program" EIR as set forth in Guideline
15168. This details the nature and requirements and uses of such a first-tier EIR, in a manner
similar to that set forth in 15152, and gives another good picture of how they are to be used
and what they must do to be so used in compliance with CEQA. It states, in full,

(a) General. A program EIR is an EIR which may be prepared on a series of actions
that can be characterized as one large project and are related either:

(1) Geographically,

(2) As logical parts in the chain of contemplated actions,

(3) In connection with issuance of rules, regulations, plans, or other general criteria to
govern the conduct of a continuing program, or

1
2 (4) As individual activities carried out under the same authorizing statutory or
3 regulatory authority and having generally similar environmental effects which can be
4 mitigated in similar ways.

(b) Advantages. Use of a program EIR can provide the following advantages. The
5 program EIR can:

(1) Provide an occasion for a more exhaustive consideration of effects and alternatives
6 than would be practical in an EIR on an individual action,

(2) Ensure consideration of cumulative impacts that might be slighted in a case-by-
7 case analysis,

(3) Avoid duplicative reconsideration of basic policy considerations,

(4) Allow the lead agency to consider broad policy alternatives and program wide
8 mitigation measures at an early time when the agency has greater flexibility to deal with basic
9 problems or cumulative impacts,

(5) Allow reduction in paperwork.

(c) Use With Later Activities. Subsequent activities in the program must be examined
10 in the light of the program EIR to determine whether an additional environmental document
11 must be prepared.

(1) If a later activity would have effects that were not examined in the program EIR, a
12 new initial study would need to be prepared leading to either an EIR or a negative declaration.

(2) If the agency finds that pursuant to Section 15162, no new effects could occur or
13 no new mitigation measures would be required, the agency can approve the activity as being
14 within the scope of the project covered by the program EIR, and no new environmental
15 document would be required.

(3) An agency shall incorporate feasible mitigation measures and alternatives
16 developed in the program EIR into subsequent actions in the program.

(4) Where the subsequent activities involve site specific operations, the agency should
17 use a written checklist or similar device to document the evaluation of the site and the activity
18 to determine whether the environmental effects of the operation were covered in the program
19 EIR.

(5) A program EIR will be most helpful in dealing with subsequent activities if it deals
20 with the effects of the program as specifically and comprehensively as possible. With a good
21 and detailed analysis of the program, many subsequent activities could be found to be within
22 the scope of the project described in the program EIR, and no further environmental
23 documents would be required.

(d) Use With Subsequent EIRS and Negative Declarations. A program EIR can be
24 used to simplify the task of preparing environmental documents on later parts of the program.
25 The program EIR can:

(1) Provide the basis in an initial study for determining whether the later activity may
26 have any significant effects.

(2) Be incorporated by reference to deal with regional influences, secondary effects,
27 cumulative impacts, broad alternatives, and other factors that apply to the program as a whole.

(3) Focus an EIR on a subsequent project to permit discussion solely of new effects
28 which had not been considered before.

(e) Notice With Later Activities. When a law other than CEQA requires public notice
when the agency later proposes to carry out or approve an activity within the program and to

1
2 rely on the program EIR for CEQA compliance, the notice for the activity shall include a
statement that:

- 3 (1) This activity is within the scope of the program approved earlier, and
4 (2) The program EIR adequately describes the activity for the purposes of CEQA.

5 ii (a) Lead agencies may analyze and mitigate the significant effects of greenhouse gas
6 emissions at a programmatic level, such as in a general plan, a long range development plan,
7 or a separate plan to reduce greenhouse gas emissions. Later project-specific environmental
8 documents may tier from and/or incorporate by reference that existing programmatic review.
9 Project-specific environmental documents may rely on an EIR containing a programmatic
analysis of greenhouse gas emissions as provided in section 15152 (tiering), 15167 (staged
EIRs) 15168 (program EIRs), 15175-15179.5 (Master EIRs), 15182 (EIRs Prepared for
Specific Plans), and 15183 (EIRs Prepared for General Plans, Community Plans, or Zoning).

10 (b) Plans for the Reduction of Greenhouse Gas Emissions. Public agencies may *choose to*
11 *analyze and mitigate significant greenhouse gas emissions in a plan for the reduction of*
12 *greenhouse gas emissions or similar document.* A plan to reduce greenhouse gas emissions
13 may be used in a cumulative impacts analysis as set forth below. Pursuant to sections
14 15064(h)(3) and 15130(d), a lead agency may determine that a project's incremental
contribution to a cumulative effect is not cumulatively considerable if the project complies
with the requirements in a previously adopted plan or mitigation program under specified
circumstances.

15 (1) *Plan Elements. A plan for the reduction of greenhouse gas emissions should:*

16 (A) Quantify greenhouse gas emissions, both existing and projected over a specified
time period, resulting from activities within a defined geographic area;

17 (B) Establish a level, based on substantial evidence, below which the contribution to
greenhouse gas emissions from activities covered by the plan would not be cumulatively
considerable;

18 (C) Identify and analyze the greenhouse gas emissions resulting from specific actions
or categories of actions anticipated within the geographic area;

19 (D) Specify measures or a group of measures, including performance standards, that
substantial evidence demonstrates, if implemented on a project-by-project basis, would
collectively achieve the specified emissions level;

20 (E) Establish a mechanism to monitor the plan's progress toward achieving the level
and to require amendment if the plan is not achieving specified levels;

21 (F) Be adopted in a public process following environmental review.

22 (2) Use with Later Activities. A plan for the reduction of greenhouse gas emissions,
23 once adopted following certification of an EIR or adoption of an environmental document,
24 may be used in the cumulative impacts analysis of later projects. An environmental document
25 that relies on a greenhouse gas reduction plan for a cumulative impacts analysis must identify
26 those requirements specified in the plan that apply to the project, and, if those requirements
27 are not otherwise binding and enforceable, incorporate those requirements as mitigation
28 measures applicable to the project. If there is substantial evidence that the effects of a
particular project may be cumulatively considerable notwithstanding the project's compliance
with the specified requirements in the plan for the reduction of greenhouse gas emissions, an
EIR must be prepared for the project.

(c) Special Situations. As provided in Public Resources Code sections 21155.2 and 21159.28, environmental documents for certain residential and mixed use projects, and transit priority projects, as defined in section 21155, that are consistent with the general use designation, density, building intensity, and applicable policies specified for the project area in an applicable sustainable communities strategy or alternative planning strategy need not analyze global warming impacts resulting from cars and light duty trucks.

A lead agency should consider whether such projects may result in greenhouse gas emissions resulting from other sources, however, consistent with these Guidelines.

PROOF OF SERVICE BY MAIL

I certify that I am an employee of the Superior Court of California, County of Sonoma, and that my business address is 600 Administration Drive, Room 107-J, Santa Rosa, California, 95403; that I am not a party to this case; that I am over the age of 18 years; that I am readily familiar with this office's practice for collection and processing of correspondence for mailing with the United States Postal Service; and that on the date shown below I placed a true copy of Order Granting Petition for Writ of Mandate in an envelope, sealed and addressed as shown below, for collection and mailing at Santa Rosa, California, first class, postage fully prepaid, following ordinary business practices.

BRUCE D GOLDSTEIN
COUNTY COUNSEL
575 Administration Dr Rm 105a
Santa Rosa Ca 95403

Thank you for inviting comments on the scoping plan. I have the following recommendations from NOP https://planning.lacounty.gov/site/climate/wp-content/uploads/2021/12/NOP_CAP-Initial-Study_Final.pdf:

1. **it is critical to include a groundwater sustainability EIR in the climate plan!**

Why? To address the following needs:

Potentially significant impact on our aquifers and on Ballona Wetlands

The proposed reconstructed levees that the Playa Vista development intended to help that development, will in effect allow millions of gallons of critically needed potable water to flow into the ocean.

Currently the Ballona Wetlands (in lay person's terms) serves as a bladder for rainwater capture. As the wetlands get saturated, this natural bladder allows the critically needed stormwater from our once or twice a year storms to replenish the aquifers underlying Santa Monica, Culver City, Beverly Hills, Los Angeles, and unincorporated County areas.

The Ballona Wetlands are a Groundwater Dependent Ecosystem which requires evaluation. Although the County and aforementioned municipalities have formed a Groundwater Sustainable Planning Agency, there has been **NO meaningful evaluation of Ballona as a Groundwater Dependent Ecosystem.**

2. Re 4. **BIOLOGICAL RESOURCES** in respect to the Ballona Wetlands:

P 24 a) **Have a substantial adverse effect**, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife (CDFW) or U.S. Fish and Wildlife Service (USFWS)? - YES

P 25 b) Have a substantial adverse effect on any sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS? - YES

As you address the substantial adverse effect on our biological resources, I recommend you reach out to the expert "*Margot Griswold, Ph.D., a restoration ecologist with over 27 years of experience in habitat restoration. Soils, landscape position, and hydrology, coupled with existing and historic vegetation guide her work in restoration. She participated in consensus planning for plant and wildlife habitat within the Habitat Work Group of the Owens Lake Dust Control Project, Inyo County, California. She is past president of the Society for Ecological Restoration California and the Los Angeles Audubon Society.*" Her integrity and work speaks for itself, especially to counter prevailing private interests, that unchecked will lead to an inhabitable planet for human and all breathing beings existence! *Los Angeles Audubon Society, Western Tanager, Vol. 88 No. 2, Nov-Dec 2021* <https://www.laaudubon.org/blog/2021/10/30/inconsistencies-and-missed-opportunities->

Here are her conclusions regarding the proposed plan for the Ballona wetlands:

“Furthermore, the current proposed plan results in outcomes that are inconsistent with Governor Newsom’s goals for the State.

The proposed {CDFW} plan will:

- Make the wetlands less resilient to sea-level rise, losing existing rare coastal habitats almost from the outset. It is the only project on the Pacific coast that proposes to lower a coastal wetland and open it to full tidal influence and existing sea level, to protect the wetland from future sea level rise.
- There will be a loss of existing species diversity both in terms of the soil ecosystem and the above the ground ecosystem, from the start of the project, including the loss of increasingly rare regional coastal wetland habitats.
- The removal of 3.2 million cubic yards of soil will result in the loss of carbon currently sequestered in the soil (which was not considered in the Final EIR) as well as loss through the massive operations to move that much soil which is acknowledged as an impact in the Final EIR. It is unlikely that the project, as described, can replace the carbon loss through sequestration.”

Dr. Griswold concludes: “How could such an approach have been developed by a resource protection agency {CA Dept of Fish and Wildlife}? As a social ethics analyst for the past 45 years, my conclusion is that either CDFG has not carefully watched and has not corrected the agencies and nonprofits that have managed the development of the project or there is a level of ineptitude prevailing at CDFW.

I trust the LACO CAP will use the Precautionary Principle to address these adverse effects (vs. catering to private interests that will push to prevail for their own benefit, not the public good.

As climate crises escalate, only the committed integrity of YOU who represent Los Angeles County, renowned as the creative capital of the world, can take the lead to give us hope as you model for the world what must happen NOW for meaningful climate remediation!

Our County enacted through the forthcoming Climate Action Plan can serve as the exemplar for every city, state, or nation to use. COP 26 provided reiterations of empty promises. From my analysis, only the power of an entity like Our/LA County can reverse the trajectory to our escalating extinction and resultant hopelessness. If we act with due diligence we can rekindle hope as we work to renew the face of this earth. Shall we?

Dr. Suzanne De Benedittis, PhD social ethics & environmental analyst

February 1, 2022

Please contact me if I can be of further support. Both Supervisor Holly Mitchell and her communications director, Lenee Richards know me on a first name basis as I was one of the lead activists in getting Culver City to end urban drilling. Let’s work together to begin to end the climate crisis. Yes!

RE: Los Angeles County 2045 Climate Action Plan Update, Notice of Preparation

Dear Ms Hua:

Endangered Habitats League (EHL) appreciates the opportunity to review the NOP for the 2045 CAP. For your reference, EHL is a Southern California regional conservation group.

We have two comments on the scope of the project:

1) For the "Transportation" category, strategies should include reducing vehicle miles traveled (VMT) and GHG emissions by *limiting new development in high-VMT locations*. A variety of land use measures should be evaluated to achieve this goal.

2) For the "Agriculture, Forestry, and Other Land Use" sector, natural (habitat) lands should be added to added as target lands, as they also sequester carbon, particularly in roots and soils.

Comments on the prior iteration of the draft CAP are also enclosed for reference. If convenient, acknowledgement of receipt would also be appreciated.

Thank you for your consideration, and we look forward to working with you.

With best wishes for the New Year,
Dan

Dan Silver, Executive Director

climate@planning.lacounty.gov

Dear Ms. Baldwin:

RE: Comments on Draft Climate Action Plan, March 2020 Public Review Draft

Endangered Habitats League (EHL) appreciates the opportunity to comment. This review will focus on two sections – Transportation and Agriculture, Forestry, and Other Land Use. These correspond to EHL’s concerns over 1) the relationship of land use to vehicle miles travelled and 2) over ongoing loss of carbon-sequestering habitat lands.

Purpose and use of the CAP

We note that the projects EIR is intended to serve as a programmatic EIR for future projects.

With the adopted CAP, project-specific environmental documents that incorporate applicable CAP actions can “tier off” the environmental document adopted for the CAP to meet project-level CEQA evaluation requirements for GHG emissions. Project-specific environmental documents that incorporate applicable CAP actions, are consistent with the General Plan (development density established by existing zoning, community plan, or General Plan policies), and are consistent with CEQA, can rely on the CAP for quantitative analysis and a separate quantitative analysis will not need to be conducted. A qualitative analysis will still be required to demonstrate compliance with the CAP.

It should be clarified that the CAP and its analyses cannot be used by non-General Plan-consistent projects for purposes of tiering under CEQA. Also, the CAP EIR should develop quantifiable and enforceable mitigation measures for General Plan-consistent projects. These should incorporate the principle of “additionality,” that is, are in addition to what might have occurred absent the measure.

Transportation

The document *correctly* stresses the overarching role of GHG emissions from this sector and the need to markedly reduce VMTs. Such reduction has been clearly stated by CARB as essential to meeting the state’s targets.¹ The extent of called-for reductions in VMT appear adequate. *However, the ultimate role of the measures the draft proposes to attain such reductions is unclear, specifically, which are aspirational planning endeavors and which are mitigation measures under CEQA for GHG reduction.*

A sound approach starts with an understanding of the role the County *must* play if land use planning is to reduce carbon emissions on a *regional* basis. That proper role is to *limit* high-VMT development in the *unincorporated* area so that growth is *directed into* the incorporated municipalities where low-VMT development is far more achievable. While the draft CAP does include this vital concept, it is not fleshed out with any substance.

The County will focus on increasing density near transit and not in transit-inaccessible areas while limiting displacement of existing residents. (p. 49)

Instead, the draft CAP *over-relies* on an aggressive program of transit-oriented development, or TOD, in the unincorporated area.

Strategy 2: Promote transit oriented communities

T2: Develop community plans that will increase the percentage of residents who could live and work within the same community, and that could decrease the vehicle miles traveled.

EHL strongly supports a strategy of building low-VMT development, but it must be an action that complements—and *does not substitute for*—the unincorporated area’s *essential* goal of reducing its own new high-VMT development.

Also, what is the true potential for TOD in the *unincorporated* area? Where are the community plans which will be revised? Where is the transit network to support TOD in these locations? Very large GHG reduction benefits are assumed to derive from TOD implementation,² yet there is no *analytical chain* in the draft CAP that links *realistic* attainment of TOD in the unincorporated area to the assumptions in Table 11.

¹ “California *cannot* meet its climate goals without curbing growth in single-occupancy vehicle activity.” Air Resources Board, 2018 Progress Report, California’s Sustainable Communities and Climate Protection Act (2018) p. 28 (emphasis added).

² Table 11 (p. 113)

- VMT decrease from 17.8 miles per capita in 2015 to 10 miles per capita in 2045 because of new housing development in HQTAs and reduction in single occupancy trips (see Strategy 3).

*The vast majority of TOD potential lies within cities, and given the finite financial resources that the region has at its disposal to expand transit, inevitable prioritization will direct this investment to prime locations within cities. Also, the well-known obstacles to implementation of TOD are greater in the unincorporated area in comparison with the municipalities.*³

The draft CAP has not demonstrated that TOD adoption in the unincorporated area can achieve the mobility shifts and vehicle-miles-traveled reductions assumed. It is better considered as achievable in some part. TOD's role as an enforceable *mitigation measure* for GHG emissions under CEQA is therefore limited, and would need coupling with performance standards. This is in contrast to tangible steps like investment in transit facilities.

Rather, what the County can do *unequivocally and with absolute certainty* is to use its land use authority to *disallow* high-VMT sprawl outside of cities and thereby direct growth into cities. *How can single occupancy vehicle trip reduction goals be met and shift to transit modes occur if the County continues to sprawl with high-VMT development?* On the other hand, if the unincorporated area curtails high-VMT growth, then developers will turn to TOD in the cities—a shift which otherwise will not happen due to the higher and easier profits in sprawl. Unless the County stops approving high-VMT development, its efforts to foster TOD—whether inside or outside cities—will be undermined.

Reduction of high-VMT development can be achieved in at least three ways:

-
- As a result of new housing built within 1/2 mile of high frequency transit, it is estimated that population residing within HQTAs increases from 0.3 million in 2015 to 0.6 million by 2045.
 - Daily VMT by individuals residing in HQTAs is 25 percent lower than those in non-HQTA areas.
 - 50 percent of all trips by 2045 are taken by public transit and other modes including biking, walking, and micromobility transit. This shift in mode share reduces the dependence on light duty vehicles, thus decreasing single occupancy trips and GHG emissions.
 - Mode shift increases trips and utilization of public transit (rail and bus) and ride sharing services, increasing public transit mode share from 6 percent in 2015 to 22 percent by 2045.

³ Due to the baseline of a dispersed urban form, complete and convenient transit networks hard to attain. Getting people out of cars and into buses has not succeeded to date, as evidenced by declining transit ridership. There are also numerous poorly controllable contingencies in building and operating TOD, from local opposition to rezoning at higher density (e.g., in single-family neighborhoods close to transit corridors) to unappealing conditions in transit vehicles. Further, paradoxically, if developers are incentivized with market-rate housing—even multifamily—near transit stops, gentrification will push out the core of transit ridership, the transit-dependent.

1. Curtailing or stopping altogether *amendments* to the General Plan that produce high VMT per capita, e.g., by a GPA initiation “filter.”
2. Adopting a mandatory transfer of development rights (TDR) program that transfers existing General Plan density in high-VMT locations to low-VMT locations either in the unincorporated area or within cities.
3. Adopting a substantial VMT fee for General Plan-consistent projects, which, if properly set, will incentivize lower-VMT development and discourage the type of development which undermines the CAP.

The CPA and its EIR should include these and other mechanisms as mitigation measures for projects whose GHG emissions—including vehicle-miles-traveled—cannot be mitigated on-site. These measure would provide more substance to Strategy 3:

Strategy 3: Reduce single occupancy vehicle trips (p. 51)

Agriculture, Forestry and Other Land Use (AFOLU)

The strategies for Agriculture, Forestry and Other Land Use are positive in that the benefits of habitat land conservation are acknowledged.

Forests, chaparral shrublands, and wetlands serve as carbon sinks that can sequester carbon dioxide that result from human activity. When these natural and working lands are converted to residential and other urbanized uses, that stored carbon dioxide is released into the atmosphere. Conserving and restoring these lands keeps carbon in the ground and provides a multitude of benefits from maintaining biodiversity in Significant Ecological Areas (SEA) to preserving the character of the unincorporated County’s rural areas. (p. 87)

There is also suggested action:

Support the preservation of agricultural and working lands, including rangelands, and restore forest lands, by limiting the conversion of these lands to residential or other uses through tools such as the creation of agricultural easements, particularly within high climate-hazard areas and SEAs.

Yet the program for AFOLU remains incomplete in several ways. First, the carbon benefits of natural lands preservation are not limited to *sequestration* as the document implies, but extend to the “avoided conversion” of natural land to GHG-intensive uses. This benefit was been quantified and certified by CARB in its Sustainable Agricultural Lands Conservation (SALC) Program.⁴ Based on underlying zoning, CARB

⁴ See <http://www.sgc.ca.gov/programs/salc/resources/>

http://www.sgc.ca.gov/programs/salc/docs/20190514-SALC_FactSheet.pdf

https://www.conservation.ca.gov/dlrp/grant-programs/SALCP/Documents/2018-19%20Application%20Materials/FINAL%2018-19_SALCP%20Guidelines.pdf

has off-the-shelf metrics and methods for calculating the GHG benefit of avoided conversion.

The CAP EIR should incorporate the SALC avoided-conversion benefit into a mitigation measure for GHG emissions for new development. In other words, projects can mitigate those unavoidable GHG impacts which cannot be mitigated on-site, including VMTs, by purchasing a property interest in habitat (or farmland) that prevents conversion to developed uses. Such a measure could be implemented via the VMT fee discussed above.

The AFOLU section should also be improved in the follow ways:

1. There should be more specificity given to our prevalent vegetation types, such as coastal sage scrub, desert scrub, and oak and Joshua woodlands. It should also be noted that these lands sequester carbon in extensive root systems which are immune to wildfires which release carbon stored above ground.
2. Acreage targets should be set, such as for Significant Ecological Area (SEA) protection.
3. Mechanisms such as TDR should be established, as well as new funding sources.
4. The CAP EIR should establish a specific mitigation pathways—such as VMT mitigation banks and the VMT fee described above—whereby new development can mitigate for VMTs and other GHG impacts by preserving land.

Carbon offsets

The use of carbon offsets is proposed as a mitigation option when not enough can be done on-site:

If residual emissions cannot be eliminated through new technologies, or be reduced over time in response to changes in community-wide activities, the County will consider the purchase of certified carbon credits (or offsets) to achieve carbon neutrality by 2045. Purchased offsets will be registered in a carbon offsets registry approved by the State of California and/or the U.S. Government for that purpose. Offsets will be prioritized according to proximity to Los Angeles County with a preference for local offsets when available, followed by offsets within California.

However, offsets are *highly* problematic. Studies have shown them to be unreliable at best and fraudulent at worst, often without demonstrated additionality and enforceability.⁵

⁵ See https://ec.europa.eu/clima/sites/clima/files/ets/docs/clean_dev_mechanism_en.pdf
<https://insideclimatenews.org/news/19042017/carbon-emissions-credits-paris-climate-agreement>
<https://www.technologyreview.com/s/614216/whoops-californias-carbon-offsets-program-could-extend-the-life-of-coal-mines/>

Therefore, if used at all, they should be local, verifiable, and enforceable. Limiting them to California is a step in the right direction. Also, “mitigation” is a preferable term to “offsets.”

Importantly, the requirement that offsets be from a California-approved registry is *in itself* meaningless and *not* analogous to how the State Cap-and-Trade program uses offsets to verifiably attain reductions.

Purchased offsets will be registered in a carbon offsets registry approved by the State of California and/or the U.S. Government for that purpose. (p. 37)

CARB does not accept credits supplied by a certified registry *unless* it has independently verified their protocols for efficacy, additionality, enforceability, etc. *Simply being listed on an approved registry guarantees none of the above.*⁶

Miscellaneous comments

Given the currently low rates of transition to ZEVs, are the CAP’s projected future rates of use realistic?

Zero-emission vehicle (ZEV) adoption rate: 40 percent of all sales by 2030 and 100 percent of all sales by 2050.

The Antelope Valley section includes the following proposed action (p. 128) but its intent is unclear.

Actions targeting zero carbon energy in wildfire-prone areas

However, wildfires release enormous amounts of stored carbon into the atmosphere. *The CAP should therefore include measures to reduce expansion of the urban-wildland interface, which is the dominant source of fire ignitions.* Development at the WUI is also typically high-VMT in nature, so this strategy has synergistic co-benefits.

<https://www.technologyreview.com/s/613326/californias-cap-and-trade-program-may-vastly-overestimate-emissions-cuts/>

⁶ As an example, the CAPCOA registry does not warrant that listed credits satisfy state standards. On the contrary, CAPCOA has explicitly disclaimed “any representations, warranties or guarantees of any kind as to the use or applicability of any GHG credit listed on the CAPCOA GHG Rx for ... compliance with [CEQA], or for any other use.” Rather, “if a GHG credit listed on the CAPCOA GHG Rx is proposed to be used as part of a CEQA mitigation measure, the respective CEQA lead agency ... is responsible for determining if the use of such GHG credit is appropriate (as mitigation).... The CAPCOA GHG Rx only lists available GHG credits so that interested parties may make private inquiries into obtaining those GHG credits. CAPCOA does not offer any other services beyond this listing service.”

In conclusion, the draft CAP sets good goals but should be improved to achieve implementation and to function as a programmatic EIR for future projects mitigation under CEQA. EHL would look forward to collaborating as the CAP evolves.

Yours truly,

Patricia McPherson President
Jeanette@SaveBallona.org (310) 721-3512

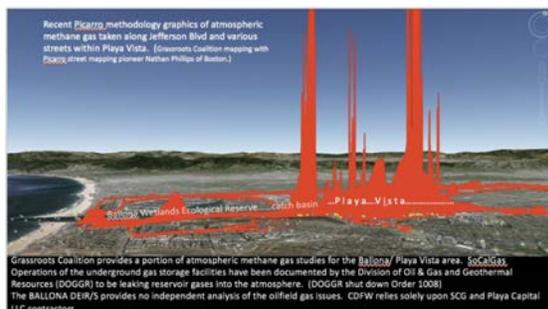

Grassroots Coalition, in review of the planning strategies does not see anything pertinent to the cessation of ongoing outgassing via gas mitigation devices that expel the oilfield gas contents into the atmosphere. Large quantities of oilfield gases are being channeled through collection devices and vented into the atmosphere rather than utilizing available SCRUBBER TECHNIQUES to scrub the outgassing of potent climate change gases which would remove the gases from venting into the atmosphere and adding to global warming.

The Picarro image below is one example of outgassing occurring via Playa Vista venting of oilfield gases via piping that simply allows gathering and transfer of oilfield gases to the surface and atmosphere. Scrubbers can and should be utilized to remove these harmful greenhouse gases from entering the atmosphere and contributing to global warming as well as stopping the conversion of these funneled gases from mixing with sunlight to become other harmful gases.

Poorly abandoned, leaky oil/gas wells need to also be properly reabandoned to prevent their outgassing of oilfield gases into the atmosphere. University City Syndicate is one such leaky well shown as outgassing voluminous amount of greenhouse gases into the atmosphere in the Picarro gas imaging attached herein.

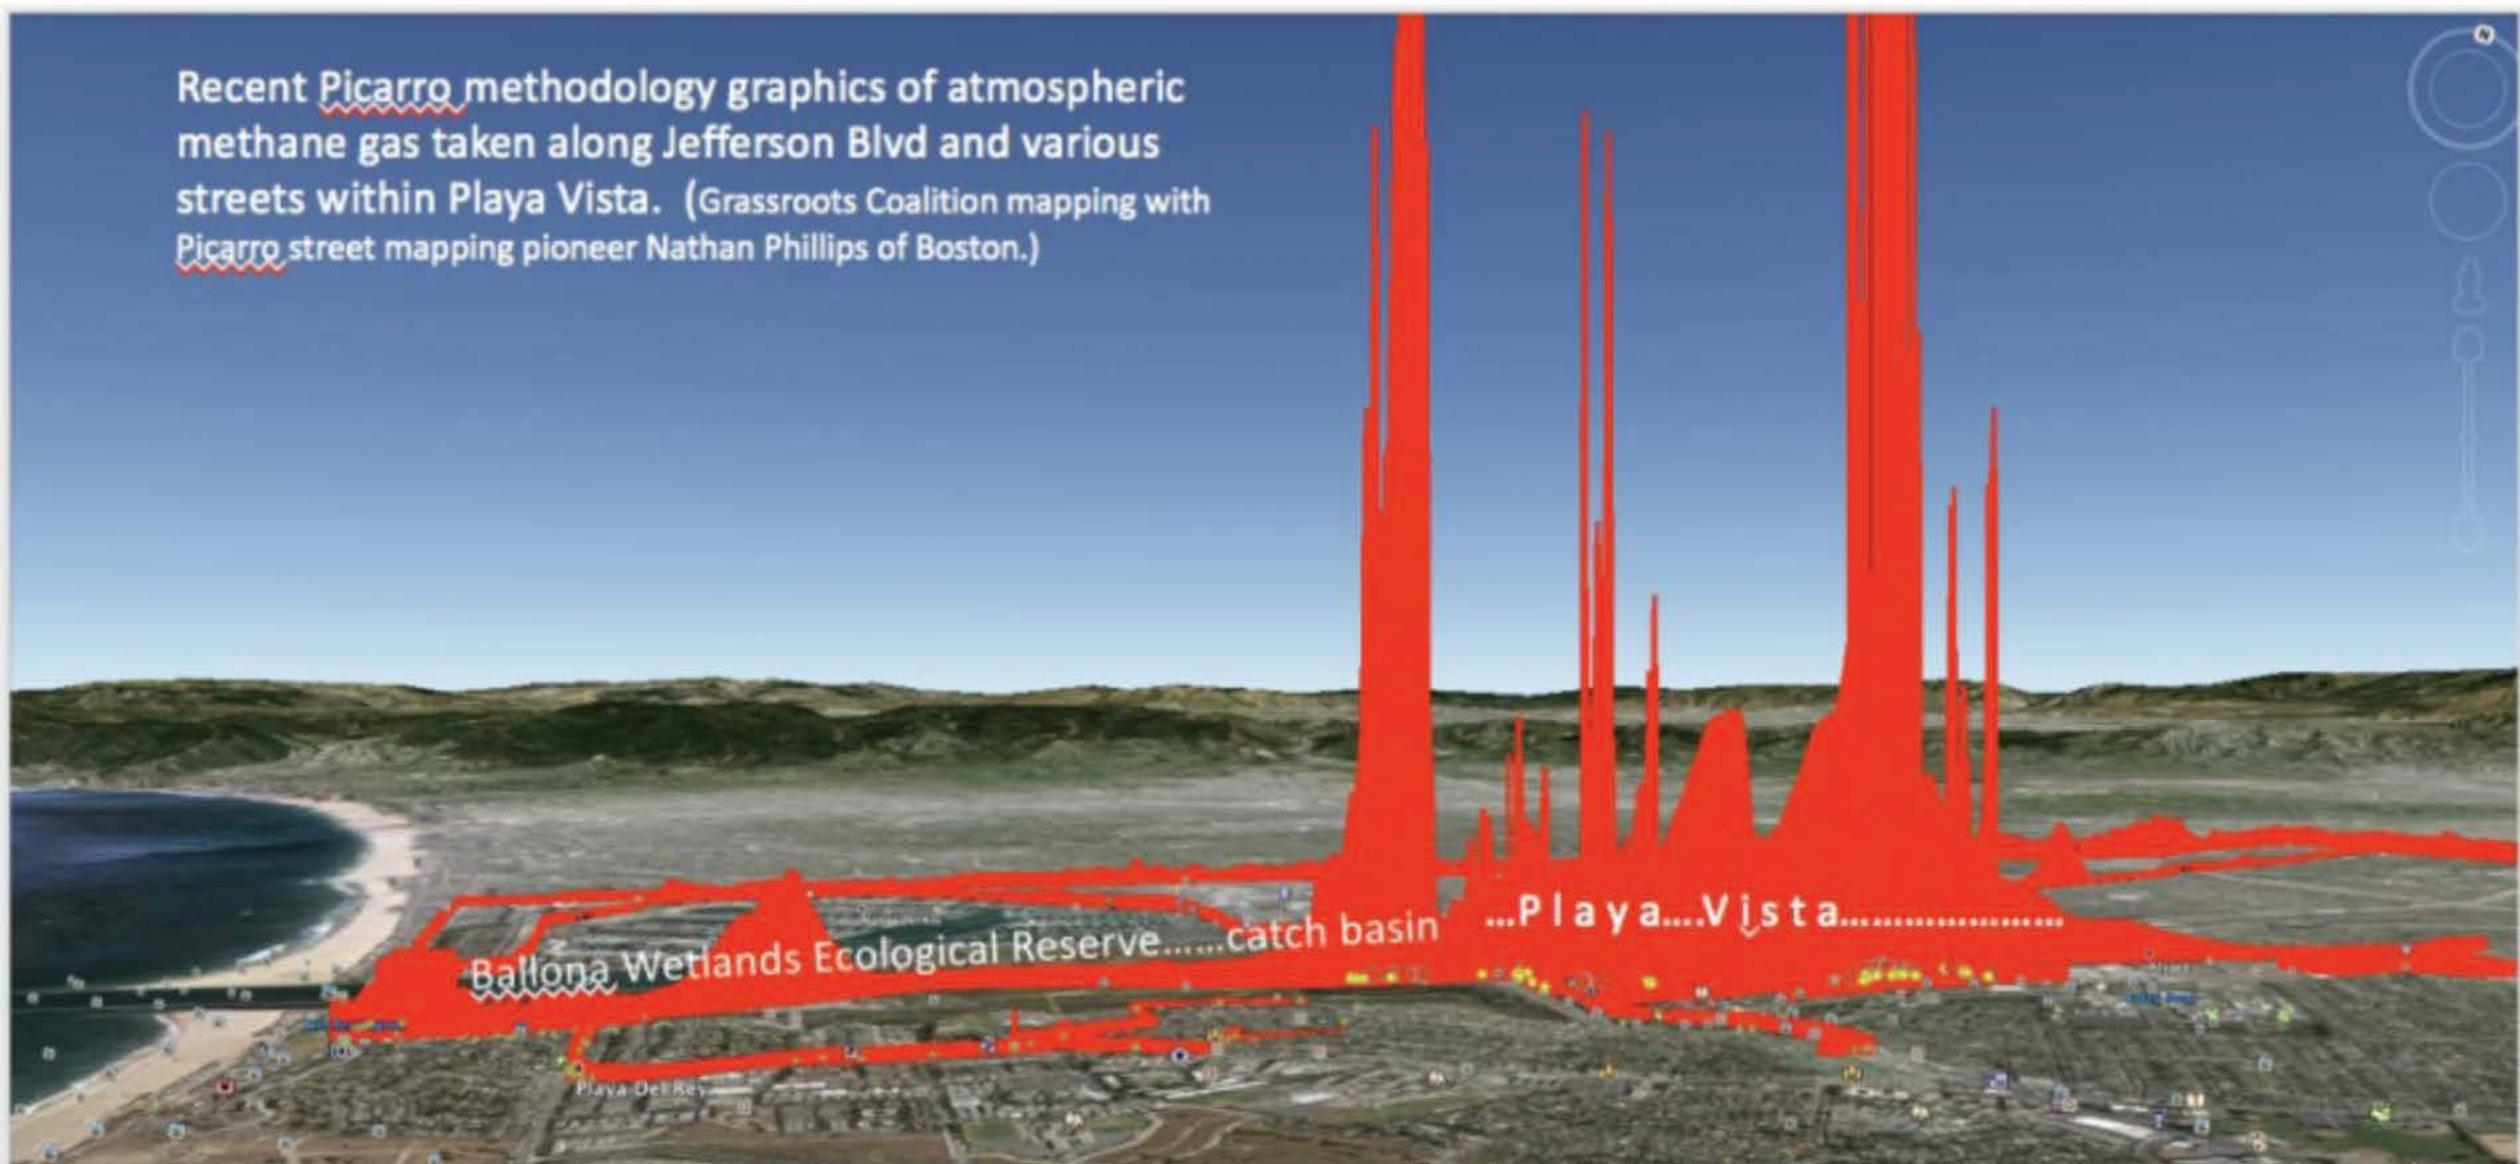

Please include acknowledgement of and attention to these issues as contributing to greenhouse gas emissions and global warming that can and should be ended.

Thank you,

Patricia McPherson, Grassroots Coalition

Recent Picarro methodology graphics of atmospheric methane gas taken along Jefferson Blvd and various streets within Playa Vista. (Grassroots Coalition mapping with Picarro street mapping pioneer Nathan Phillips of Boston.)

Grassroots Coalition provides a portion of atmospheric methane gas studies for the Ballona/ Playa Vista area. SoCalGas Operations of the underground gas storage facilities have been documented by the Division of Oil & Gas and Geothermal Resources (DOGGR) to be leaking reservoir gases into the atmosphere. (DOGGR shut down Order 1008)
The BALLONA DEIR/S provides no independent analysis of the oilfield gas issues. CDFW relies solely upon SCG and Playa Capital LLC contractors.

CAUTION: External Email. Proceed Responsibly.

Dear Ma'am/Sir:

Comment on LA County 2045 Draft Climate Action Plan

Building Energy & Water

Strategy 5

Measure E3: “Standardize All-Electric New Development”
and

Strategy 7

Measure E7: “Improve Energy Efficiency of Existing Buildings”

I applaud your multiple strategies for reducing GHG emissions, *e.g.* transitioning both new and existing buildings to all-electric modes. However the CAP needs to be mindful of operation costs of all-electric buildings. Natural gas molecules are cheaper than electrons, and that disparity will likely remain for the foreseeable future. Thus it is crucial to reduce electricity demand as much as possible in order to forestall user-complaints about high power bills.

Building shells (envelopes) need to be improved significantly in parallel with building electrification. Reducing heat transmission through building walls, roofs, and windows is necessary so as to maintain stable interior temperatures while minimizing demand for heating and/or cooling. That means super-insulating walls and upgrading glazing with higher performing windows. Setting robust goals like this will tamp-down power bills of residents and occupants. Otherwise bills will soar as outdoor temperatures rise. This is the way to enhance energy efficiency in buildings and reduce GHG emissions — and do it in a passive way.

Several organizations exist for promoting the design of high performance buildings (both new construction and refurbishments). Two of the best known with high standards are:

1. Passive House Institute (begun in Germany, but now very popular world-wide):

<https://passivehouse.com/index.html>

Also Passive House California: passivehousecal.org

1. LEEDv4.1 Platinum (their highest level) usgbc.org/leed

(LEED also offers certification for neighborhood developments.)

A procedure to actually accomplish these kinds of building upgrades at scale is outlined in the following Department of Energy report:

<https://www.nrel.gov/docs/fy20osti/76142.pdf>

In summary, to achieve high energy efficiencies in the built environment, add rigorous building envelope guidelines to the 2045 Climate Action Plan. Environmental effects can be mitigated by minimizing upfront material carbon emissions of the construction materials *e.g.* insulate with cellulose, not spray foam.

Sincerely,
Robert Haw

Subject: LA County CAP EIR Notice Comments
Date: Tuesday, February 1, 2022 4:58:02 PM

CAUTION: External Email. Proceed Responsibly.

Greetings,

Please accept the following comments regarding the LA County CAP EIR Notice of Preparation and Initial Study:

- * The Initial Study discussion of greenhouse gas emissions is somewhat confusing as it indicates a comprehensive review of emissions but then heavily focuses on carbon. To be relevant and adaptable, the county will need to very clearly show how it is addressing multiple types of greenhouse gases, including methane, nitrous oxide, etc.
- * Despite discussion of expanding tree canopy and green spaces, the discussion of increasing development density/infill needs to more specifically include review of how to also meet goals to increase health and decrease pollution including increasing urban forests, localized community farming, more parks, rooftop solar, etc. It should also be emphasized that infill should not lead to increasing heat island effects or reduce green space.
- * Forests are mentioned regarding protection and restoration, but protection and restoration of other ecosystem types need to be discussed in greater detail, especially chaparral, woodlands, riparian habitat, canyon corridors, wetlands, desert, and grasslands.
- * Potential impacts on biodiversity, ecosystems and species is of deep concern. Ecosystems in LA County are already strained to a near breaking point. The utmost care should be taken to ensure that there is zero impact on vulnerable species, key ecosystems like oak woodlands, and habitat of concern for migratory species.
- * Further review should be taken to, as per the point above, ensure that infrastructure designed to combat climate change does not harm species and ecosystems, and that nature-based solutions are of primary importance, including solutions that align with the state's Pathways to 30x30.

Via email: climate@planning.lacounty.gov

Dear Ms. Hua,

Comments on NOP and Initial Study for Draft 2045 Climate Action Plan

I strongly support the County's efforts to develop and adopt an enforceable Climate Action Plan that meets or exceeds the State's target of carbon neutrality by 2045. However, I am dismayed that the NOP and Initial Study attempt to narrow the scope of the EIR analyses without defining the measures, actions, performance standards and timelines that are inherent in the CAP. The measures listed in the Initial Study do not include mention of any local electricity generation including solar roofs, community solar or microgrids. There are no measures that indicate that public charging stations for electric vehicles will be included in unincorporated areas of the County. Further, the Initial Study states that new development will be required to meet a net zero water standard, but this isn't stated in the measures or identified as an existing policy. As a result, I request that the revised draft CAP be published prior to or simultaneously with the Draft EIR and that the EIR analyze a fully disclosed description of the CAP.

The County appears to be proposing to meet the State target of carbon neutrality by 2045. Alternatives in the EIR should include more aggressive timelines for carbon neutrality so that the public and decisionmakers can evaluate the feasibility of moving more quickly. Alternatives should also address the feasibility of zero emissions for many sectors, rather than carbon neutrality which implies that purchasing carbon credits will be used to achieve the target.

The Initial Study indicates that impacts to gas and electric utilities will not be addressed in the EIR. I question the analysis that led to this conclusion, and request that these impacts be addressed in the EIR. If the County is going to propose to electrify buildings and transportation instead of relying on natural gas and gasoline, it is likely that there will be an effect on electricity infrastructure. The EIR should evaluate the degree to which local solar electric generation and energy efficiency measures can offset increased demands for electricity. The net effects on local and regional electricity distribution and transmission need to be identified. Cumulative effects on electrical infrastructure throughout Los Angeles County should also be evaluated. It is important to determine when and where upgrades to electrical infrastructure will be needed as mitigation for electrification.

The EIR should also address the impacts of electrification on natural gas and gasoline station infrastructure. Changes to land use, phaseout of underground fuel storage tanks, need for cleanup of fuel leaks by responsible parties should be identified along with effects on air and groundwater quality. Phaseout of oil and gas operations in the County also needs to have

timeline and strategy to avoid adverse effects and limit public assumption of oil well capping and remediation of industrial pollution.

Thank you for the opportunity to provide input to this important scoping process for review of environmental effects of the 2045 CAP.

Sincerely,

Kathleen Kunysz
32-Year Resident of Altadena

Thuy Hua, Supervising Regional Planner
Los Angeles County Department of Regional Planning
320 West Temple Street, 13th Floor
Los Angeles, CA 90012
Via email: climate@planning.lacounty.gov

Dear Ms. Hua,

Comments on NOP and Initial Study for Draft 2045 Climate Action Plan

The League of Women Voters of Los Angeles County supports updating the 2020 Climate Action Plan (CAP).

The proposed 2045 CAP uses new Greenhouse Gas (GHG) emissions inventory data, new emissions forecasts and revises measures to reduce GHG emissions. All of these elements are important and needed. In general, LWV US and California support conservation of energy, water and biodiversity; GHG and Vehicle Miles Traveled (VMT) reduction; climate change adaptation; and meeting the basic needs of all people, particularly the vulnerable.

In addition to the areas specified for focus in the Programmatic Environmental Impact Report (PEIR), we are requesting that the PEIR evaluate the impact of the 2045 emission reduction strategies on the following areas, with continued attention to environmental justice and equity:

- Housing
 - Support policies to provide a decent home and a suitable living environment for every American family.
 - Support equal opportunity in housing.
- Utilities
 - Ensure the reliability of energy resources and protections of the environment and public health and safety.
- Climate Change
 - Promote a clean, low-carbon energy economy that is sustainable, including all forms of renewable energy and transportation infrastructure.
 - Promote energy conservation and efficiency in transportation, buildings, and infrastructure, including energy efficiency standards and land use policies that reduce vehicle miles traveled.

We read the Notice of Preparation (NOP) and Initial Study and do not see the detail needed for the evaluation and elimination of EIR study areas. We request that the EIR fully describe the proposed greenhouse gas reduction measures including specific actions, performance standards and timelines.

In particular, we request that the EIR evaluate the effect of electrification of energy used in buildings and vehicles upon utility infrastructure in the unincorporated areas and cumulatively throughout Los Angeles County. The EIR should identify the effect of local solar energy generation and microgrids and energy efficiency measures to offset increases in electrical energy demands and effects on regional electrical energy transmission infrastructure. The EIR should also evaluate the effect of reduced demand for natural gas and gasoline stations and increased demand for electric vehicle charging and their effects on land use, transportation patterns and air quality. The EIR should also have a plan to seal oil and gas wells, and to decommission refineries and gas pipelines.

We understand that the Department of Regional Planning is currently revising the Draft 2045 CAP and including more detailed descriptions of mitigation projects. However, those detailed projects should be fully reviewed for possible impacts and be subject to public comment within the EIR process.

Sincerely,

Thuy Hua
 Los Angeles Department of Regional Planning
 320 W. Temple Street 13th Floor
 Los Angeles, CA 90012

Re: 2021120568, Los Angeles County 2045 Climate Action Plan (Draft 2045 CAP) Project, Los Angeles County

Dear Ms. Hua:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015. If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). Both SB 18 and AB 52 have tribal consultation requirements. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

- 1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project:** Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:
 - a.** A brief description of the project.
 - b.** The lead agency contact information.
 - c.** Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
 - d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

- 2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report:** A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subs. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).
 - a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

- 3. Mandatory Topics of Consultation If Requested by a Tribe:** The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
 - a.** Alternatives to the project.
 - b.** Recommended mitigation measures.
 - c.** Significant effects. (Pub. Resources Code §21080.3.2 (a)).

- 4. Discretionary Topics of Consultation:** The following topics are discretionary topics of consultation:
 - a.** Type of environmental review necessary.
 - b.** Significance of the tribal cultural resources.
 - c.** Significance of the project's impacts on tribal cultural resources.
 - d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

- 5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process:** With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

- 6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document:** If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
 - a.** Whether the proposed project has a significant impact on an identified tribal cultural resource.
 - b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

- 7. Conclusion of Consultation:** Consultation with a tribe shall be considered concluded when either of the following occurs:
- a.** The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
 - b.** A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).
- 8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document:** Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).
- 9. Required Consideration of Feasible Mitigation:** If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).
- 10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:**
- a.** Avoidance and preservation of the resources in place, including, but not limited to:
 - i.** Planning and construction to avoid the resources and protect the cultural and natural context.
 - ii.** Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
 - b.** Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
 - i.** Protecting the cultural character and integrity of the resource.
 - ii.** Protecting the traditional use of the resource.
 - iii.** Protecting the confidentiality of the resource.
 - c.** Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
 - d.** Protecting the resource. (Pub. Resource Code §21084.3 (b)).
 - e.** Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).
 - f.** Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).
- 11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource:** An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:
- a.** The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.
 - b.** The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
 - c.** The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

- 1. Tribal Consultation:** If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe. (Gov. Code §65352.3 (a)(2)).
- 2. No Statutory Time Limit on SB 18 Tribal Consultation.** There is no statutory time limit on SB 18 tribal consultation.
- 3. Confidentiality:** Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
- 4. Conclusion of SB 18 Tribal Consultation:** Consultation should be concluded at the point in which:
 - a.** The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
 - b.** Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: <http://nahc.ca.gov/resources/forms/>.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

- 1.** Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
 - a.** If part or all of the APE has been previously surveyed for cultural resources.
 - b.** If any known cultural resources have already been recorded on or adjacent to the APE.
 - c.** If the probability is low, moderate, or high that cultural resources are located in the APE.
 - d.** If a survey is required to determine whether previously unrecorded cultural resources are present.
- 2.** If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
 - a.** The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.

- b.** The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

- 3.** Contact the NAHC for:
 - a.** A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
 - b.** A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

- 4.** Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
 - a.** Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
 - b.** Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
 - c.** Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address:

Subject: DEIR Los Angeles County 2045 Climate Action Plan (Draft 2045 CAP)
Date: Tuesday, February 1, 2022 2:28:36 PM

CAUTION: External Email. Proceed Responsibly.

Hello Thuy Hua,

Thank you for inviting San Manuel into the discussion over unincorporated Los Angeles county's management of greenhouse gas emissions. We have no overt concerns concerning the management of the emissions created by community activities, unless however, this plan would include the development of carbon reduction projects within tribal territory. These projects could include community parks, forests/preserves, carbon capture plants, etc.. Additionally, the tribe is interested in any educational, land acknowledgement, or interpretive opportunities that would result in this DEIR. Once again, San manuel thanks you for this opportunity to comment on the 2045 Climate Action Plan.

Respectfully,
Ryan Nordness

RE: SCAG Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Los Angeles County 2045 Climate Action Plan [SCAG NO. IGR10549]

Dear Ms. Hua,

Thank you for submitting the Notice of Preparation of a Draft Environmental Impact Report for the Los Angeles County 2045 Climate Action Plan (“proposed project”) to the Southern California Association of Governments (SCAG) for review and comment. SCAG is responsible for providing informational resources to regionally significant plans, projects, and programs per the California Environmental Quality Act (CEQA) to facilitate the consistency of these projects with SCAG’s adopted regional plans, to be determined by the lead agencies.¹

Pursuant to Senate Bill (SB) 375, SCAG is the designated Regional Transportation Planning Agency under state law and is responsible for preparation of the Regional Transportation Plan (RTP) including the Sustainable Communities Strategy (SCS). SCAG’s feedback is intended to assist local jurisdictions and project proponents to implement projects that have the potential to contribute to attainment of Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) goals and align with RTP/SCS policies. Finally, SCAG is also the authorized regional agency for Inter-Governmental Review (IGR) of programs proposed for Federal financial assistance and direct Federal development activities, pursuant to Presidential Executive Order 12372.

SCAG staff has reviewed the Notice of Preparation of a Draft Environmental Impact Report for the Los Angeles County 2045 Climate Action Plan in Los Angeles County. The proposed project consists of a General Plan Amendment to replace the Los Angeles County Community Climate Action Plan (CAP). Revisions include an updated GHG emissions inventory; new emissions forecasts; new GHG emissions targets; a revised suite of GHG reduction strategies, measures, and actions; a technical modeling; consideration of environmental justice and equity concern; and a new development review consistency checklist to allow projects to streamline CEQA compliance for by using the CAP.

When available, please email environmental documentation to IGR@scag.ca.gov providing, at a minimum, the full public comment period for review.

If you have any questions regarding the attached comments, please contact the Intergovernmental Review (IGR) Program, attn.: Anita Au, Senior Regional Planner, at (213) 236-1874 or IGR@scag.ca.gov. Thank you.

Sincerely,

Frank Wen, Ph.D.
Manager, Planning Strategy Department

¹ Lead agencies such as local jurisdictions have the sole discretion in determining a local project’s consistency with the 2020 RTP/SCS (Connect SoCal) for the purpose of determining consistency for CEQA.

**COMMENTS ON THE NOTICE OF PREPARATION OF A
DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE
LOS ANGELES COUNTY 2045 CLIMATE ACTION PLAN [SCAG NO. IGR10549]**

CONSISTENCY WITH CONNECT SOCIAL

SCAG provides informational resources to facilitate the consistency of the proposed project with the adopted 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS or Connect SoCal). For the purpose of determining consistency with CEQA, lead agencies such as local jurisdictions have the sole discretion in determining a local project’s consistency with Connect SoCal.

CONNECT SOCIAL GOALS

The SCAG Regional Council fully adopted [Connect SoCal](#) in September 2020. Connect SoCal, also known as the 2020 – 2045 RTP/SCS, builds upon and expands land use and transportation strategies established over several planning cycles to increase mobility options and achieve a more sustainable growth pattern. The long-range visioning plan balances future mobility and housing needs with goals for the environment, the regional economy, social equity and environmental justice, and public health. The goals included in Connect SoCal may be pertinent to the proposed project. These goals are meant to provide guidance for considering the proposed project. Among the relevant goals of Connect SoCal are the following:

SCAG CONNECT SOCIAL GOALS	
Goal #1:	<i>Encourage regional economic prosperity and global competitiveness</i>
Goal #2:	<i>Improve mobility, accessibility, reliability and travel safety for people and goods</i>
Goal #3:	<i>Enhance the preservation, security, and resilience of the regional transportation system</i>
Goal #4:	<i>Increase person and goods movement and travel choices within the transportation system</i>
Goal #5:	<i>Reduce greenhouse gas emissions and improve air quality</i>
Goal #6:	<i>Support healthy and equitable communities</i>
Goal #7:	<i>Adapt to a changing climate and support an integrated regional development pattern and transportation network</i>
Goal #8:	<i>Leverage new transportation technologies and data-driven solutions that result in more efficient travel</i>
Goal #9:	<i>Encourage development of diverse housing types in areas that are supported by multiple transportation options</i>
Goal #10:	<i>Promote conservation of natural and agricultural lands and restoration of habitats</i>

For ease of review, we encourage the use of a side-by-side comparison of SCAG goals with discussions of the consistency, non-consistency or non-applicability of the goals and supportive analysis in a table format. Suggested format is as follows:

SCAG CONNECT SOCIAL GOALS	
Goal	Analysis
Goal #1: <i>Encourage regional economic prosperity and global competitiveness</i>	<i>Consistent: Statement as to why; Not-Consistent: Statement as to why; Or Not Applicable: Statement as to why; DEIR page number reference</i>
Goal #2: <i>Improve mobility, accessibility, reliability and travel safety for people and goods</i>	<i>Consistent: Statement as to why; Not-Consistent: Statement as to why; Or Not Applicable: Statement as to why; DEIR page number reference</i>
etc.	etc.

Connect SoCal Strategies

To achieve the goals of Connect SoCal, a wide range of land use and transportation strategies are included in the accompanying twenty (20) technical reports. Of particular note are multiple strategies included in Chapter 3 of Connect SoCal intended to support implementation of the regional Sustainable Communities Strategy (SCS) framed within the context of focusing growth near destinations and mobility options; promoting diverse housing choices; leveraging technology innovations; supporting implementation of sustainability policies; and promoting a Green Region. To view Connect SoCal and the accompanying technical reports, please visit the [Connect SoCal webpage](#). Connect SoCal builds upon the progress from previous RTP/SCS cycles and continues to focus on integrated, coordinated, and balanced planning for land use and transportation that helps the SCAG region strive towards a more sustainable region, while meeting statutory requirements pertinent to RTP/SCSs. These strategies within the regional context are provided as guidance for lead agencies such as local jurisdictions when the proposed project is under consideration.

SCAG staff would like to call your attention to resources available from SCAG’s [Regional Climate Adaptation Framework](#) including the [Southern California Climate Adaptation Planning Guide](#), [Communication and Outreach Toolkit](#), [Library of Model Policies](#), and [SB 379 Compliance Curriculum for Local Jurisdictions](#).

DEMOGRAPHICS AND GROWTH FORECASTS

A key, formative step in projecting future population, households, and employment through 2045 for Connect SoCal was the generation of a forecast of regional and county level growth in collaboration with expert demographers and economists on Southern California. From there, jurisdictional level forecasts were ground-truthed by subregions and local agencies, which helped SCAG identify opportunities and barriers to future development. This forecast helps the region understand, in a very general sense, where we are expected to grow, and allows SCAG to focus attention on areas that are experiencing change and may have increased transportation needs. After a year-long engagement effort with all 197 jurisdictions one-on-one, 82 percent of SCAG’s 197 jurisdictions provided feedback on the forecast of future growth for Connect SoCal. SCAG also sought feedback on potential sustainable growth strategies from a broad range of stakeholder groups – including local jurisdictions, county transportation commissions, other partner agencies, industry groups, community-based organizations, and the general public. Connect SoCal utilizes a bottom-up approach in that total projected growth for each jurisdiction reflects feedback received from jurisdiction staff, including city managers, community development/planning directors, and local staff. Growth at the neighborhood level (i.e., transportation analysis zone (TAZ) reflects entitled projects and adheres to current general and specific plan maximum densities as conveyed by jurisdictions (except in cases where entitled projects and development agreements exceed these capacities as calculated by SCAG). Neighborhood level growth projections also feature strategies that help to reduce greenhouse gas emissions (GHG) from automobiles and light trucks to achieve Southern California’s GHG reduction target, approved by the California Air Resources Board (CARB) in accordance

with state planning law. Connect SoCal’s Forecasted Development Pattern is utilized for long range modeling purposes and does not supersede actions taken by elected bodies on future development, including entitlements and development agreements. SCAG does not have the authority to implement the plan -- neither through decisions about what type of development is built where, nor what transportation projects are ultimately built, as Connect SoCal is adopted at the jurisdictional level. Achieving a sustained regional outcome depends upon informed and intentional local action. To access jurisdictional level growth estimates and forecasts for years 2016 and 2045, please refer to the [Connect SoCal Demographics and Growth Forecast Technical Report](#). The growth forecasts for the region and applicable jurisdictions are below.

	Adopted SCAG Region Wide Forecasts				Adopted County of Los Angeles Forecasts			
	Year 2020	Year 2030	Year 2035	Year 2045	Year 2020	Year 2030	Year 2035	Year 2045
Population	19,517,731	20,821,171	21,443,006	22,503,899	10,407,326	10,899,849	11,173,987	11,673,937
Households	6,333,458	6,902,821	7,170,110	7,633,451	3,471,759	3,749,346	3,884,871	4,119,336
Employment	8,695,427	9,303,627	9,566,384	10,048,822	4,838,458	5,059,615	5,171,618	5,382,235

MITIGATION MEASURES

SCAG staff recommends that you review the [Final Program Environmental Impact Report](#) (Final PEIR) for Connect SoCal for guidance, as appropriate. SCAG’s Regional Council certified the PEIR and adopted the associated Findings of Fact and a Statement of Overriding Considerations (FOF/SOC) and Mitigation Monitoring and Reporting Program (MMRP) on May 7, 2020 and also adopted a PEIR Addendum and amended the MMRP on September 3, 2020 (please see the [PEIR webpage](#) and scroll to the bottom of the page for the PEIR Addendum). The PEIR includes a list of project-level performance standards-based mitigation measures that may be considered for adoption and implementation by lead, responsible, or trustee agencies in the region, as applicable and feasible. Project-level mitigation measures are within responsibility, authority, and/or jurisdiction of project-implementing agency or other public agency serving as lead agency under CEQA in subsequent project- and site- specific design, CEQA review, and decision-making processes, to meet the performance standards for each of the CEQA resource categories.

To Alejandrina Baldwin

Dear Alexandrina,

I watched the recording of your last webinar and I am planning on attending the meeting this afternoon. I am a member of a neighborhood group that has been working for several years on local air quality issues in Altadena and Pasadena. One of our main points of focus is on gas-powered lawn/yard maintenance equipment, specifically the use of gas-powered mowers and blowers. We are aware that several cities in the Los Angeles area have successfully banned the use of such gas-powered lawn equipment while providing financial support to yard maintenance companies who have to transition to electric and solar equipment.

We would very much like to see this instituted across all of Los Angeles County particularly as reports indicate that carbon emissions from this type of equipment are set to exceed emissions from cars this year. People have been talking about emissions from this type of equipment for well over two decades now and yet the equipment is still in wide use almost everywhere, which is extremely frustrating.

It seems to us that this type of equipment, in the face of our looming and urgent climate crisis, and the numerous alternative, non-polluting alternatives available for yard maintenance measures, should be phased within the year, rather than within the decade. There is plentiful data and public interest that support making this change.

We would like to hear from your vantage point today why this is taking so long and what, specifically, are the current plans to address the urgent issue of gas-powered yard maintenance equipment.

Thank you for the work you do for us and future generations!

Re Comment on Los Angeles County Climate Action Plan (CAP) December 2021 Draft 2045

By Kathleen Trinity

Acton, C A.

While it is the responsibility of Los Angeles County is addressing Climate Change in our area, several parts of the Climate Action Plan, Draft 2045, December 2021, are not well thought out when addressing the unincorporated areas of the north east County. I specifically object to Element 14 as applied to Acton, CA. CAP Element 14 Population and Housing, section a, is judged as “less than significant impact,” p. 59 of the NOP. Since Metrolink has a train station at the foot of the Angeles National Forest, CAP will attract high density housing within the vicinity of the Metrolink Station. This is a very poor idea for the following reasons:

1. Dense housing in that area would compromise the safety and integrity of the wildlife and its resources in the adjacent hills, mountains, and riparian areas. Density of housing also reduces contiguous areas of open space necessary for wildlife corridors. Traffic, noise, the increased risk of fire, trash and toxins come with dense population. The proximity of dense housing development will disturb and stress burrowing animals, deer, birds, mountain lions, bobcats, and small mammals in the area. More vermin are likely to congregate in and around dense housing units with the inevitable use of toxic materials even if they are banned. More raptors are likely to hunt vermin in and around such an area, thus threatening smaller birds and their nests as well as migrating birds.
2. The more stressed water supply in Acton and the AV has now become severe. Some wells have gone dry and drought is predicted to continue well into the future. Dense housing in Acton will further stress the water supply. The water supply in Action is a moving source in much of the area, not an aquifer. Therefore, transfer of water to or from Acton will not ameliorate the problem.
3. Wildfires have not only destroyed densely spaced housing developments, but densely populated housing developments in or at the interface of wilderness. The Paradise Fire in Northern California created such intensity of heat and rapid movement that many residents became trapped within its rapidly changing perimeter. The study, “The Spatial and Temporal Pattern of Wildfires in California 2000 to 2019,” Journal Nature, November 2021 ([nature.com/articles/841598-021-88131-4](https://www.nature.com/articles/841598-021-88131-4)), finds

that “the greater the density of housing and population (in these areas), the greater the density of fires.” The study also notes that California’s fire season has increase by more than two months and that the increase in smaller fires caused by human activity has fed into the increase in wildfires. We place an ever increasing burden upon our fire services by building dense housing in and near wilderness, whether or not it is part of the General Plan. We must place common sense about fire prevention over development if we are serious about preserving human life as well as wilderness and wildlife.

Antelope Valley Air Quality Management District

Significance Thresholds

From: Antelope Valley AQMD California Environmental
Quality Act (CEQA) and Federal Conformity Guidelines,
pages 6 and 7, and Table 6 (August 2016).

Significance Thresholds

Any project is significant if it triggers or exceeds the most appropriate evaluation criteria. The District will clarify upon request which threshold is most appropriate for a given project; in general, the emissions comparison (criteria number 1) is sufficient:

1. Generates total emissions (direct and indirect) in excess of the thresholds given in Table 6;
2. Generates a violation of any ambient air quality standard when added to the local background;
3. Does not conform with the applicable attainment or maintenance plan(s) ¹;

¹ A project is deemed to not exceed this threshold, and hence not be significant, if it is consistent with the existing land use plan. Zoning changes, specific plans, general plan amendments and similar land use plan changes which do not increase dwelling unit density, do not increase vehicle trips, and do not increase vehicle miles traveled are also deemed to not exceed this threshold.

4. Exposes sensitive receptors to substantial pollutant concentrations, including those resulting in a cancer risk greater than or equal to 10 in a million and/or a Hazard Index (HI) (non-cancerous) greater than or equal to 1.*

**Refer to the Sensitive Receptor Land Use discussion above*

A significant project must incorporate mitigation sufficient to reduce its impact to a level that is not significant. A project that cannot be mitigated to a level that is not significant must incorporate all feasible mitigation. Note that the emission thresholds are given as a daily value and an annual value, so that a multi-phased project (such as a project with a construction phase and a separate operational phase) with phases shorter than one year can be compared to the daily value.

Table 6 – Significant Emissions Thresholds

Criteria Pollutant	Annual Threshold (tons)	Daily Threshold (pounds)
Greenhouse Gases (CO ₂ e)	100,000	548,000
Carbon Monoxide (CO)	100	548
Oxides of Nitrogen (NO _x)	25	137
Volatile Organic Compounds (VOC)	25	137
Oxides of Sulfur (SO _x)	25	137
Particulate Matter (PM ₁₀)	15	82
Particulate Matter (PM _{2.5})	12	65
Hydrogen Sulfide (H ₂ S)	10	54
Lead (Pb)	0.6	3

Appendix C

Biological Resources

Special-Status Species Known to Occur in Los Angeles County

Common Name	Scientific Name	Federal Status¹	State Status²	CRPR³	NatureServe⁴
Plants					
red sand-verbena	<i>Abronia maritima</i>	None	None		4.2 S3?
heart-leaved thorn-mint	<i>Acanthomintha obovata ssp. cordata</i>	None	None		4.2 S3
Abrams' oxlytheca	<i>Acanthoscyphus parishii var. abramsii</i>	None	None	1B.2	S1S2
Parish's oxlytheca	<i>Acanthoscyphus parishii var. parishii</i>	None	None		4.2 S3S4
San Clemente Island bird's-foot trefoil	<i>Acmispon argophyllus var. adsurgens</i>	None	SE	1B.1	S2
island broom	<i>Acmispon dendroideus var. dendroideus</i>	None	None		4.2 S3
San Clemente Island lotus	<i>Acmispon dendroideus var. traskiae</i>	FT	SE	1B.3	S3
Mt. Pinos onion	<i>Allium howellii var. clokeyi</i>	None	None	1B.3	S2
Watson's amaranth	<i>Amaranthus watsonii</i>	None	None		4.3 S3
California androsace	<i>Androsace elongata ssp. acuta</i>	None	None		4.2 S3S4
slender silver moss	<i>Anomobryum julaceum</i>	None	None		4.2 S2
aphanisma	<i>Aphanisma blitoides</i>	None	None	1B.2	S2
Santa Catalina Island manzanita	<i>Arctostaphylos catalinae</i>	None	None	1B.2	S2?
Santa Cruz Island manzanita	<i>Arctostaphylos crustacea ssp. subcordata</i>	None	None		4.2 S3
San Gabriel manzanita	<i>Arctostaphylos glandulosa ssp. gabrielensis</i>	None	None	1B.2	S3
interior manzanita	<i>Arctostaphylos parryana ssp. tumescens</i>	None	None		4.3 S3S4
marsh sandwort	<i>Arenaria paludicola</i>	FE	SE	1B.1	S1
island sagebrush	<i>Artemisia nesiotica</i>	None	None		4.3 S3
western spleenwort	<i>Asplenium vesperinum</i>	None	None		4.2 S4
crested milk-vetch	<i>Astragalus bicristatus</i>	None	None		4.3 S3
Braunton's milk-vetch	<i>Astragalus brauntonii</i>	FE	None	1B.1	S2
Horn's milk-vetch	<i>Astragalus hornii var. hornii</i>	None	None	1B.1	S1
San Antonio milk-vetch	<i>Astragalus lentiginosus var. antonius</i>	None	None	1B.3	S2
Big Bear Valley woollypod	<i>Astragalus leucolobus</i>	None	None	1B.2	S2
San Miguel Island milk-vetch	<i>Astragalus miguelensis</i>	None	None		4.3 S4
San Clemente Island milk-vetch	<i>Astragalus nevinii</i>	None	None	1B.2	S3
Lancaster milk-vetch	<i>Astragalus preussii var. laxiflorus</i>	None	None	1B.1	S1
Ventura Marsh milk-vetch	<i>Astragalus pycnostachyus var. lanosissimus</i>	FE	SE	1B.1	S1
coastal dunes milk-vetch	<i>Astragalus tener var. titi</i>	FE	SE	1B.1	S1
Coulter's saltbush	<i>Atriplex coulteri</i>	None	None	1B.2	S1S2
south coast saltscale	<i>Atriplex pacifica</i>	None	None	1B.2	S2
Parish's brittlescale	<i>Atriplex parishii</i>	None	None	1B.1	S1
Davidson's saltscale	<i>Atriplex serenana var. davidsonii</i>	None	None	1B.2	S1
Malibu baccharis	<i>Baccharis malibuensis</i>	None	None	1B.1	S1
Plummer's baccharis	<i>Baccharis plummerae ssp. plummerae</i>	None	None		4.3 S3
Nevin's barberry	<i>Berberis nevinii</i>	FE	SE	1B.1	S1
golden-spined cereus	<i>Bergerocactus emoryi</i>	None	None	2B.2	S2
scalloped moonwort	<i>Botrychium crenulatum</i>	None	None	2B.2	S3
thread-leaved brodiaea	<i>Brodiaea filifolia</i>	FT	SE	1B.1	S2
San Clemente Island brodiaea	<i>Brodiaea kinkiensis</i>	None	None	1B.2	S2
Brewer's calandrinia	<i>Calandrinia breweri</i>	None	None		4.2 S4
Catalina mariposa lily	<i>Calochortus catalinae</i>	None	None		4.2 S3S4
club-haired mariposa lily	<i>Calochortus clavatus var. clavatus</i>	None	None		4.3 S3
slender mariposa-lily	<i>Calochortus clavatus var. gracilis</i>	None	None	1B.2	S2S3
late-flowered mariposa-lily	<i>Calochortus fimbriatus</i>	None	None	1B.3	S3
Palmer's mariposa-lily	<i>Calochortus palmeri var. palmeri</i>	None	None	1B.2	S2
Plummer's mariposa-lily	<i>Calochortus plummerae</i>	None	None		4.2 S4
alkali mariposa-lily	<i>Calochortus striatus</i>	None	None	1B.2	S2S3
intermediate mariposa-lily	<i>Calochortus weedii var. intermedius</i>	None	None	1B.2	S3
lucky morning-glory	<i>Calystegia felix</i>	None	None	1B.1	S1
island morning-glory	<i>Calystegia macrostegia ssp. amplissima</i>	None	None		4.3 S4

Special-Status Species Known to Occur in Los Angeles County

Common Name	Scientific Name	Federal Status¹	State Status²	CRPR³	NatureServe⁴
Peirson's morning-glory	<i>Calystegia peirsonii</i>	None	None		4.2 S4
San Clemente Island evening-primrose	<i>Camissoniopsis guadalupensis ssp. clementina</i>	None	None	1B.2	S2
Lewis' evening-primrose	<i>Camissoniopsis lewisii</i>	None	None		3 S4
white pygmy-poppy	<i>Canbya candida</i>	None	None		4.2 S3S4
western sedge	<i>Carex occidentalis</i>	None	None	2B.3	S3
Mt. Gleason paintbrush	<i>Castilleja gleasoni</i>	None	Rare	1B.2	S2
San Clemente Island paintbrush	<i>Castilleja grisea</i>	FT	SE	1B.3	S3
Mojave paintbrush	<i>Castilleja plagiotoma</i>	None	None		4.3 S4
island ceanothus	<i>Ceanothus megacarpus var. insularis</i>	None	None		4.3 S4
southern tarplant	<i>Centromadia parryi ssp. australis</i>	None	None	1B.1	S2
smooth tarplant	<i>Centromadia pungens ssp. laevis</i>	None	None	1B.1	S2
island mountain-mahogany	<i>Cercocarpus betuloides var. blanchaeae</i>	None	None		4.3 S4
Catalina Island mountain-mahogany	<i>Cercocarpus traskiae</i>	FE	SE	1B.1	S1
Orcutt's pincushion	<i>Chaenactis glabriuscula var. orcuttiana</i>	None	None	1B.1	S1
coastal goosefoot	<i>Chenopodium littoreum</i>	None	None	1B.2	S1
salt marsh bird's-beak	<i>Chloropyron maritimum ssp. maritimum</i>	FE	SE	1B.2	S1
Peninsular spineflower	<i>Chorizanthe leptotheca</i>	None	None		4.2 S3
San Fernando Valley spineflower	<i>Chorizanthe parryi var. fernandina</i>	None	SE	1B.1	S1
Parry's spineflower	<i>Chorizanthe parryi var. parryi</i>	None	None	1B.1	S2
Mojave spineflower	<i>Chorizanthe spinosa</i>	None	None		4.2 S4
compact cobwebby thistle	<i>Cirsium occidentale var. compactum</i>	None	None	1B.2	S2
seaside cistanthe	<i>Cistanthe maritima</i>	None	None		4.2 S3
California saw-grass	<i>Cladium californicum</i>	None	None	2B.2	S2
Kern Canyon clarkia	<i>Clarkia xantiana ssp. parviflora</i>	None	None	1B.1	S3?
Peirson's spring beauty	<i>Claytonia peirsonii ssp. peirsonii</i>	None	None	1B.2	S2
monkey-flower savory	<i>Clinopodium mimuloides</i>	None	None	1B.2	S3
Nevin's woolly sunflower	<i>Constancea nevinii</i>	None	None	1B.3	S3
small-flowered morning-glory	<i>Convolvulus simulans</i>	None	None	1B.3	S4
island rush-rose	<i>Crocantemum greenii</i>	FT	None	1B.2	S3
Catalina crossosoma	<i>Crossosoma californicum</i>	None	None	1B.2	S3
Clokey's cryptantha	<i>Cryptantha clokeyi</i>	None	None	1B.2	S3
Trask's cryptantha	<i>Cryptantha traskiae</i>	None	None	1B.1	S2
Wiggins' cryptantha	<i>Cryptantha wigginsii</i>	None	None	1B.2	S1
Peruvian dodder	<i>Cuscuta obtusiflora var. glandulosa</i>	None	None	2B.2	SH
desert cymopterus	<i>Cymopterus deserticola</i>	None	None	1B.2	S2
island tarplant	<i>Deinandra clementina</i>	None	None	2B.2	S4
Santa Susana tarplant	<i>Deinandra minthornii</i>	None	Rare	1B.2	S2
paniculate tarplant	<i>Deinandra paniculata</i>	None	None		4.3 S4
Colorado Desert larkspur	<i>Delphinium parishii ssp. subglobosum</i>	None	None		4.3 S4
Mt. Pinos larkspur	<i>Delphinium parryi ssp. purpureum</i>	None	None	1B.3	S4
San Clemente Island larkspur	<i>Delphinium variegatum ssp. kinkiense</i>	FE	SE	1B.1	S2
Thorne's royal larkspur	<i>Delphinium variegatum ssp. thornei</i>	None	None	1B.1	S1
south island bush-poppy	<i>Dendromecon harfordii var. rhamnoides</i>	None	None		3.1 S1
western dichondra	<i>Dichondra occidentalis</i>	None	None		4.3 S3S4
Johnston's monkeyflower	<i>Diplacus johnstonii</i>	None	None		4.3 S4
island bush monkeyflower	<i>Diplacus parviflorus</i>	None	None		4.3 S4
Santa Catalina Island monkeyflower	<i>Diplacus traskiae</i>	None	None	1A	SX
California dissanthelium	<i>Dissanthelium californicum</i>	None	None	1B.2	S1
beach spectaclepod	<i>Dithyrea maritima</i>	None	ST	1B.1	S1
slender-horned spineflower	<i>Dodecahema leptoceras</i>	FE	SE	1B.1	S1
Ewan's woodbeauty	<i>Drymocallis cuneifolia var. ewanii</i>	None	None	1B.3	S2
Blochman's dudleya	<i>Dudleya blochmaniae ssp. blochmaniae</i>	None	None	1B.1	S2

Special-Status Species Known to Occur in Los Angeles County

³California Rare Plant Ranks (CRPR)

1A	<i>Plants presumed extirpated in California and either rare or extinct elsewhere</i>
1B	<i>Plants rare, threatened, or endangered in California and elsewhere</i>
2A	<i>Plants presumed extirpated in California but common elsewhere</i>
2B	<i>Plants rare, threatened, or endangered in California, but common elsewhere</i>
3	<i>Plants about which more information is needed, a review list</i>

Threat Code extensions and their meanings:

- 0.1 *Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)*
- 0.2 *Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)*
- 0.3 *Not very threatened in California (less than 20% of occurrences threatened / low degree and immediacy of threat or no current threats known)*

⁴NatureServe SRank Codes

		<i>A numeric range rank (e.g., S2S3 or S1S3) is used to indicate any range of uncertainty about the status of the species or ecosystem. Ranges cannot skip more than two ranks (e.g., SU is used rather than S1S4). By adding a "?" to the rank: e.g., S2?; this represents more certainty than S2S3, but less certainty than S2.</i>
S1	<i>Critically Imperiled</i>	<i>At very high risk of extirpation in the jurisdiction due to very restricted range, very few populations or occurrences, very steep declines, severe threats, or other factors.</i>
S2	<i>Imperiled</i>	<i>At high risk of extirpation in the jurisdiction due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.</i>
S3	<i>Vulnerable</i>	<i>At moderate risk of extirpation in the jurisdiction due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.</i>
S4	<i>Apparently Secure</i>	<i>At a fairly low risk of extirpation in the jurisdiction due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.</i>
SH	<i>Possibly Extirpated</i>	<i>Known from only historical records but still some hope of rediscovery. There is evidence that the species or ecosystem may no longer be present in the jurisdiction, but not enough to state this with certainty. Examples of such evidence include (1) that a species has not been documented in approximately 20-40 years despite some searching and/or some evidence of significant habitat loss or degradation; (2) that a species or ecosystem has been searched for unsuccessfully, but not thoroughly enough to presume that it is no longer present in the jurisdiction.</i>

Appendix D

Greenhouse Gas Emissions

APPENDIX A

Greenhouse Gas Accounting Methods, Business-as-Usual Forecast, and Emission Reduction Targets

Purpose

This Appendix describes the greenhouse gas (GHG) accounting and projections methods for calendar year 2015 and 2018 for unincorporated Los Angeles County (henceforth referred to as “Unincorporated Los Angeles County” unless otherwise specified). It also presents methods for the 1990 and 2010 emissions backcasts; the business-as-usual (BAU) forecasts for 2030, 2035, and 2045; and the derivation of the 2045 CAP’s emission reduction targets for 2030, 2035, and 2045. The document is organized into four sections corresponding with the following objectives:

Section A.1: Greenhouse Gas Emissions Inventory: 2015 and 2018

This section describes the methods for estimating baseline 2015 GHG emissions from community-induced activities and sources along with updated emission for the year 2018. The community-scale inventory includes emissions from transportation; stationary energy; industrial processes and product use (IPPU); waste and wastewater; and agriculture, forestry, and other land use (AFOLU) emissions.

Section A.2: 1990 and 2010 Greenhouse Gas Inventory and Backcasting Methods

This section describes the approach for estimating unincorporated Los Angeles County’s GHG emissions in the year 2010 and 1990. The backcast aligns the 2010 inventory with the updated methods and emission factors used in the 2015 and 2018 inventory updates, and projects emissions back to 1990 for purposes of aligning the 2045 CAP’s target with the statewide target for 2030.

Section A.3: 2018 to 2045 Business-as-Usual Forecasts

This section describes the approach for modeling the BAU scenario, which projects future emissions based on current population and regional growth trends, land use growth patterns, and regulations or policies introduced before the 2018 inventory year. The BAU scenario demonstrates the growth in GHG emissions that would occur if no further action were to be taken by the County of Los Angeles (County) or the State of California after 2018.

Section A.4: Derivation of the 2045 CAP's Emission Reduction Targets

This section describes the approach taken to derive the 2045 CAP's GHG emission reduction targets for 2030, 2035, and 2045, and how these targets align with the statewide targets codified in SB 32 for 2030 and EO B-55-18 for 2045. This section provides substantial evidence for CEQA purposes that the 2045 CAP's targets represent levels of significance for the cumulative impact of unincorporated Los Angeles County's GHG emissions.

A.1 Greenhouse Gas Emissions Inventory: 2015 and 2018

2015 & 2018 GHG Emissions Inventories

Introduction

The 2015 and 2018 Community-scale GHG emissions inventories for unincorporated Los Angeles County were developed using the Global Protocol for Community-scale GHG Emission Inventories (GPC).¹ This protocol is used for calculating and reporting emissions from community activities and sources from seven gases: carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), hexafluoride (SF₆), and nitrous trifluoride (NF₃). GHG emissions from these activities are organized into five sectors: transportation, stationary energy, waste (including wastewater), industrial processes and product use (IPPU) and agriculture, forestry and other land use (AFOLU). The protocol further offers two related frameworks—the Scopes Framework and the City-induced Framework—for reporting emissions from each sector:

Scopes Framework: This framework captures GHG emissions produced within a geographic boundary by categorizing emissions as scope 1, 2, and 3 emissions in each Sector:

- **Scope 1:** Emissions produced from activities and sources within unincorporated Los Angeles County boundaries.
- **Scope 2:** Emissions generated from the use of grid-supplied electricity, heat, steam and/or cooling within unincorporated Los Angeles County boundaries; and
- **Scope 3:** Emissions occurring outside unincorporated Los Angeles County boundaries due to activities taking place within unincorporated Los Angeles County boundaries.

¹ World Resources Institute, C40 Cities Climate Leadership Group, and ICLEI - Local Governments for Sustainability. *Global Protocol for Community-scale GHG Emission Inventories*, Version 1.1. December, 2014. Available at: <https://ghgprotocol.org/greenhouse-gas-protocol-accounting-reporting-standard-cities>. Accessed January 2021.

City-induced Framework: This framework measures GHG emissions attributable to activities and sources within a geographic boundary and covers selected scope 1, 2, and 3 emissions from each sector. This framework offers two reporting levels:

- **BASIC:** Includes emissions from transportation, stationary energy, and waste sectors.
- **BASIC+:** Includes all BASIC requirements as well as emissions from transmission and distribution grid losses, transboundary transportation, in-boundary generated waste emission sources, IPPU, and AFOLU.

The 2015 and 2018 GHG emissions inventories for unincorporated Los Angeles County use the City-induced BASIC+ Framework. This includes Scope 1, 2, and 3 emissions sources. In other words, the GHG inventories comprise emissions from activities occurring within unincorporated Los Angeles County areas, including emissions that occur elsewhere because of those activities. A good example is solid waste, which is generated locally but disposed of at a landfill outside the city, where it decomposes and generates GHGs. Solid waste is a Scope 3 emissions source.

The GHG inventories use global warming potential (GWP) values from the Intergovernmental Panel on Climate Change (IPCC) Fifth Assessment Report (AR5),² unless otherwise specified. The inventory is prepared using sector-specific generation and resource consumption data for relevant sub-sectors included in the BASIC+ protocol. The accounting methods, data sources and emission factors used for accounting 2015 and 2018 emissions are detailed in the subsequent sections.

The general methods used for the 2015 and 2018 inventories are the same and the descriptions herein apply to both of the inventory years.

It should also be noted that the Los Angeles County Sanitation Districts has prepared a separate GHG inventory using site-specific data rather than population-based estimates, which were used for certain sources in the Draft 2045 CAP's 2015 and 2018 inventories.^{3,4} Los Angeles County and the Sanitation Districts will work cooperatively to achieve carbon neutrality.

Stationary Energy

This sector includes emissions from energy use (natural gas and electricity) in residential, commercial/ institutional/agricultural, and manufacturing/industrial buildings, energy generation facilities owned by the County, off-road equipment, and fugitive emissions from oil and natural gas systems. **Table A-1** presents scopes, activity data, and emissions for the stationary energy sector. **Figure A-1** compares 2015 and 2018 GHG emissions from energy use by sub-sector.

Table A-1: Stationary Energy Scope, Activity, and GHG Emissions by Sub-sector

CATEGORY	SCOPE	ACTIVITY	2015 INVENTORY		2018 INVENTORY	
			EMISSIONS (MTCO ₂ E)	ACTIVITY	EMISSIONS (MTCO ₂ E)	ACTIVITY
Stationary Energy						
Residential Buildings	All	Natural Gas: 99,802,009 therms Electricity: 2,032,945,391 kWh	1,030,285		Natural Gas: 100,918,233 therms Electricity: 1,855,862,580 kWh	962,743
Commercial, Institutional, and Agricultural Buildings	All	Natural Gas: 18,162,374 therms Electricity: 1,181,331,358 kWh	386,753		Natural Gas: 35,862,112 therms Electricity: 1,342,822,146 kWh	349,373
Manufacturing and Construction Buildings	All	Natural Gas: 17,177,369 therms Electricity: 686,002,430 kWh	309,449		Natural Gas: 13,143,126 therms Electricity: 1,025,769,024 kWh	244,417
Energy Industries	1 & 3	2 CHP and District Energy facilities 1 Waste to Energy facility ^a 3 Biomass and Auxiliary Power facilities ^a	121,252		2 CHP and District Energy facilities 1 Waste to Energy facility ^a 3 Biomass and Auxiliary Power facilities ^a	98,554
Fugitive Emissions from Oil and Natural Gas Systems	1	1 Natural Gas Distribution and Transportation facility 1 Crude Petroleum & Natural Gas Extraction site	58,222		1 Natural Gas Distribution and Transportation facility 1 Crude Petroleum & Natural Gas Extraction site	41,066
Agriculture, Forestry and Other Fishing Activities	1	Off-road agricultural vehicles using diesel or gasoline	2,675		Off-road agricultural vehicles using diesel or gasoline	2,658
TOTAL			1,908,637			1,698,809

NOTES:

^a. Biogenic emissions from these facilities are not included in the inventory; only non-biogenic CH₄ and N₂O emissions are included, consistent with the GPC Protocol.

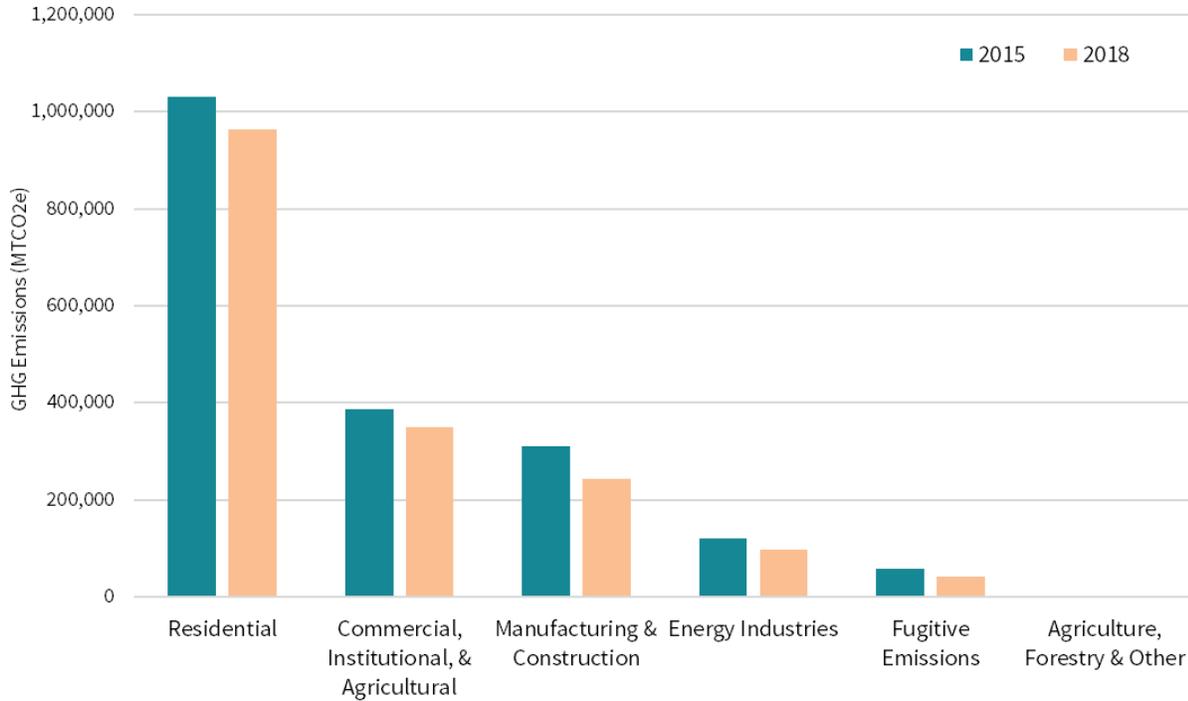

Figure A-1: 2015 & 2018 Energy Emissions by Sub-sector

RESIDENTIAL BUILDINGS

This category includes direct emissions from the consumption of natural gas and indirect emissions from grid-supplied electricity by residential buildings in unincorporated areas. Direct GHG emissions from natural gas consumption in residential buildings are calculated using SoCalGas natural gas consumption data and emission factors from the Climate Registry.⁵ Indirect GHG emissions from electricity consumption in residential buildings are calculated using data from SCE including electricity consumption, emission factors, and power mix. In 2018, SCE’s power mix was 36 percent eligible renewable, 10 percent hydropower and nuclear (carbon-free), 17 percent natural gas, and 37 percent unspecified fossil-fuel sources. SCE’s emission rate for 2018 electricity was 513 pounds per MWh.⁶ Emissions associated with transmission and distribution losses are accounted using a loss factor of 4.8 percent for California from EPA eGRID.⁷

COMMERCIAL AND INSTITUTIONAL BUILDINGS

This category includes direct emissions from the consumption of natural gas and indirect emissions from grid-supplied electricity by non-residential buildings including commercial, municipal, institutional (such as schools, hospitals, and other public facilities) and agricultural buildings. Direct GHG emissions from natural gas consumption in non-residential buildings are calculated using SoCalGas natural gas consumption data and emission factors from The Climate Registry.⁸

In June 2018, non-residential customers in unincorporated Los Angeles County were automatically enrolled in the Clean Power Alliance’s (CPA) “Clean” rate option. While participation data for 2018 were unavailable when the 2018 inventory was developed, a July 2021 member status report indicated a 98 percent participation rate for all non-residential customers in unincorporated Los Angeles County in 2021.⁹ For purposes of the 2018 GHG inventory, it is conservatively assumed that half the annual electricity consumption is attributed to SCE and half to CPA because full CPA enrollment for non-residential customers was not completely in effect until 2019. Under the Clean rate option in 2018, non-residential customers received 61 percent of their electricity from eligible renewable sources via the CPA, 26 percent from carbon-free sources like hydropower, and 13 percent from unspecified fossil-fuel sources like natural gas and coal. GHG emissions from CPA-provided electricity are calculated using CPA data including electricity consumption, emission factors, and power mix.¹⁰ CPA’s emission rates for 2018 were 10.6 pounds per MWh for the “Lean” rate and 9.8 pounds per MWh for the Clean rate.¹¹ GHG emissions from SCE-provided electricity are calculated using SCE data including electricity consumption, emission factors, and power mix. SCE’s emission rate for 2018 electricity was 513 pounds per MWh.¹² Emissions associated with transmission and distribution losses are accounted using a loss factor of 4.8 percent for California from the U.S. EPA’s eGRID2018 Summary Table (WECC California subregion).¹³

MANUFACTURING AND INDUSTRIAL BUILDINGS

This category includes direct emissions from the consumption of natural gas and indirect emissions from grid-supplied electricity consumption in manufacturing and industrial buildings. This category also includes direct emissions from fossil fuel combustion for electricity and heat generation by stationary equipment (such as boilers, furnaces, burners, turbines, heaters, incinerators, engines and flares) and off-road equipment (such as vehicle and mobile machinery) that are used inside building property premises.

GHG emissions from natural gas and electricity consumption are estimated using the same assumptions and methods stated under Commercial and Institutional Buildings above.

Emissions from fuel combustion of other energy sources in manufacturing facilities are documented using the California Air Resource Board's (CARB) Pollution Mapping Tool.¹⁴ This tool provides CH₄, CO₂ and N₂O from on-site combustion and industrial processes for each facility location. CARB's OFFROAD2017 ORION¹⁵ tool is used to estimate emissions from fuel consumption by industrial and construction equipment used inside building premises. This tool provides daily CO₂ emissions and annual fuel consumption of diesel, gasoline and natural gas by manufacturing and construction sectors for Los Angeles County as a whole, including cities. (This area is referred to herein as "Countywide.") Emissions from unincorporated Los Angeles County are estimated by scaling countywide GHG emissions based on the number of jobs in manufacturing and construction sectors in unincorporated areas in 2017.

Note: This category only reports fossil fuel combustion-related emissions from CARB's Pollution Mapping Tool. These emissions do not include fugitive process emissions from manufacturing facilities since they are reported under the IPPU category. Emissions reported in CARB's Pollution Mapping tool are largely informed by emissions reported under the CARB's Mandatory GHG Reporting Regulations (MRR).¹⁶ The MRR only requires facilities emitting more than 10,000 metric tons carbon dioxide equivalent (MTCO_{2e}) to report their emissions. Emissions from facilities emitting under 10,000 MTCO_{2e} are not available and have therefore not been accounted in this inventory.

ENERGY INDUSTRIES

The Energy Industries category includes emissions from primary fuel production (such as coal mining and oil and gas extraction), fuel processing and conversion (such as coal to coke in coke ovens) and on-site fuel combustion for auxiliary energy production (such as electricity generation and district heating).

Emissions from fuel and energy production in combined heat and power (CHP) plants, biomass power stations, and waste to energy facilities in unincorporated areas are documented using CARB's Pollution Mapping Tool.¹⁷ For CHP and district energy source, the inventory includes direct natural gas combustion emissions from the Pitchess Cogeneration Station in Saugus and the Olive View Medical Center Cogeneration Station in Sylmar. Pitchess Cogeneration Station and the Olive View Medical Center Cogeneration Station were included because these facilities are both within unincorporated Los Angeles County and owned and operated by the County. Emissions data for all three facilities were obtained from CARB's 2021 MRR database.

Waste-to-Energy facilities include Bradley Landfill in Sun Valley and the Calabasas Landfill in Agoura. These facilities convert landfill methane to energy. Only non-biogenic CH₄ and N₂O emissions from these facilities were included in the inventory because the CO₂ emissions from landfill gas combustion are considered biogenic (not anthropogenic) emissions sources by the GPC and should therefore be excluded.¹⁸ Biomass and auxiliary power facilities include Ameresco Chiquita Energy LLC in Castaic, Calabasas Landfill in Agoura, MM Lopez Energy LLC in Lake View Terrace, and Sunshine Gas Producers LLC in Sylmar. Similar to the waste to energy facilities above, only non-biogenic CH₄ and N₂O emissions from these facilities were included in the inventory.

¹⁷ Emissions reported under CARB's Pollution Mapping Tool are largely informed by emissions reported under CARB's Mandatory GHG Reporting Regulations (MRR). The MRR only requires facilities emitting more than 10,000 MTCO₂e to report their emissions. Emissions from facilities emitting under 10,000 MTCO₂e are not available and have therefore not been accounted in this inventory.

¹⁸ According to the GPC, "Biogenic emissions are those that result from the combustion of biomass materials that store and sequester CO₂, including materials used to make biofuels (e.g. trees, crops, vegetable oils, or animal fats)."

- CARB MRR Database
Link: <https://ww2.arb.ca.gov/mrr-data>

AGRICULTURE, FORESTRY AND OTHER FISHING ACTIVITIES

Emissions from direct fuel combustion associated with agricultural activities typically result from the operation of farm vehicles and machinery (stationary and mobile) and generators to power lights, pumps, heaters, coolers and other equipment. CARB's OFFROAD2017 ORION¹⁹ tool was used to estimate Countywide emissions from direct fuel consumption by agricultural equipment (including plant and animal cultivation, afforestation and reforestation activities, and fishery activities). GHG emissions from the unincorporated Los Angeles County areas were estimated by scaling countywide GHG emissions using the cropland acres in unincorporated areas in 2016.

Note: For the agricultural sector, this category only reports emissions associated with off-road vehicles and equipment. Emissions from agricultural buildings (natural gas and electricity consumption) are reported under the commercial and institutional buildings category.

Link: <https://nassgeodata.gmu.edu/CropScape/>

FUGITIVE EMISSIONS FROM OIL AND NATURAL GAS SYSTEMS

Fugitive emissions include all intentional and unintentional emissions from the extraction, processing, storage and transport of oil and natural gas to the point of final use. The primary sources of fugitive emissions from oil and natural gas systems include equipment leaks, evaporation and flashing losses, venting, flaring, incineration, and accidental releases. GHG emissions from oil and natural gas systems in unincorporated areas are documented using CARB's Pollution mapping tool.²⁰

²⁰ CARB, Pollution Mapping Tool. 2018. Available: https://ww3.arb.ca.gov/ei/tools/pollution_map/. Accessed January 2021.

Transportation

The transportation sector includes emissions from fuel (gasoline, diesel, and natural gas) and electricity consumption in on-road passenger vehicles (cars, light-, medium-, and heavy-duty trucks), buses, and rail systems. Note that while Metro and Metrolink have GHG inventories for the transportation services provided by the respective agencies, they do not estimate emissions by local jurisdiction. Therefore, bus and railway emissions are independently estimated for unincorporated Los Angeles County. **Table A-2** presents scopes, activity data, and emissions for the transportation sector. **Figure A-2** shows the contribution of each subsector to the Transportation sector for both the 2015 and 2018 inventories.

Table A-2: Transportation Scope, Activity, and GHG Emissions by Sub-sector

CATEGORY	SCOPE	2015 INVENTORY		2018 INVENTORY	
		ACTIVITY	EMISSIONS (MTCO ₂ E)	ACTIVITY	EMISSIONS (MTCO ₂ E)
Transportation					
Passenger Vehicles	1 & 3	18,982,668 miles/day	2,797,360	19,074,692 miles/day	2,665,824
Buses	1 & 3	1,392,461,970 miles/year	31,360	1,143,144,015 miles/year	29,371
Railway	1 & 3	Metro: 634,484,952 miles/year Metrolink: 24,798 riders/day	9,413	Metro: 689,995,896 miles/year Metrolink: 25,690 riders/day	9,490
TOTAL			2,838,133		2,704,685

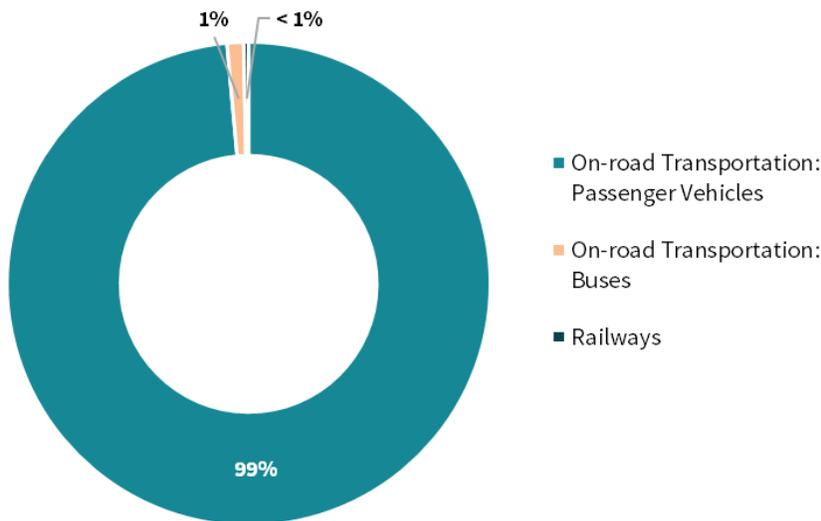

Figure A-2: 2015 & 2018 Transportation Emissions by Sub-sector

ON ROAD TRANSPORTATION: PASSENGER VEHICLES AND TRUCKS

Emissions from passenger vehicles and trucks are estimated based on daily vehicle trips and vehicle miles traveled (VMT) by each vehicle type. VMT for unincorporated Los Angeles County is estimated using a trip-based travel forecasting model developed by Southern California Association of Governments (SCAG). SCAG's 2016 Regional Travel Demand Model, the version for which a complete dataset was available at the time of modeling, was used by Fehr and Peers (F&P) to analyze the transportation network and socioeconomic data such as population, household, and employment, to forecast daily vehicle trips and VMT for each traffic analysis zone (TAZ) within unincorporated Los Angeles County.²¹

The 2016 SCAG model has a base year of 2012 and horizon year of 2040. VMT for the inventory years, including 2015 and 2016, was linearly interpolated from the 2012 and 2040 model values. Daily VMT are estimated using the origin-destination analysis approach (full accounting method). The Full Accounting Method accounts for VMT depending on where the trip is starting and ending. This method tracks (and "fully accounts" for) all the vehicle trips being generated by a geographic area (i.e., a city) across the entire regional network, and allows for the isolation of different types of VMT as follows.

- **Internal-internal (II) VMT:** Includes all trips that begin and end entirely within the geographic area of study.
- **One-half of internal-external (IX) VMT:** Includes one-half of trips with an origin within the geographic area of study and a destination outside of this area. This assumes that the geographic area under study shares half the responsibility for trips traveling to other areas.
- **One-half of external-internal (XI) VMT:** Includes one-half of trips with an origin outside of the geographic area of study and a destination within this area. Similar to the IX trips, the geographic area of study shares the responsibility of trips traveling from other areas.
- **External-external (XX) VMT:** Trips through the geographic area of study are not included. This approach is consistent with the concept used for the IX and XI trips. Therefore, the XX VMT would be assigned to other areas that are generating the trips.

The Full Accounting Method was utilized to develop the VMT estimates for unincorporated Los Angeles County because it more fully accounts for the length of regional travel generated in unincorporated Los Angeles County, not just the travel occurring on unincorporated Los Angeles County's in-boundary roadways. As noted above, the inventory includes emissions from trips that begin and/or end within unincorporated Los Angeles County. It does not include through trips that neither begin nor end within the unincorporated areas. Daily VMT is then multiplied by 347 to

²¹ VMT estimates for large urban areas are commonly developed using regional travel demand models. These models are developed and periodically updated, calibrated, and validated for use in long range infrastructure planning, environmental impact assessments, and air quality conformity analyses by local and regional agencies. Trip-based travel forecasting models generate (output) daily vehicle trips for each TAZ across various trip purposes based on inputs such as the transportation network and socioeconomic data such as population, household, and employment. SCAG staff maintain a regional travel demand model that uses a four-step model process to arrive at a set of forecast vehicle trips based on the data described above.

calculate annual VMT.²² VMT was estimated for passenger vehicles (light-duty cars and trucks) and trucks (medium- and heavy-duty trucks).

Emissions were calculated using CARB's Emission FACTors 2021 model (EMFAC2021).²³ EMFAC2021 generates vehicle emission rates by area, year, vehicle type, fuel type, speed, and other parameters. EMFAC2021 was run for Los Angeles County for 2015 and 2018 in "emission rate" mode to generate vehicle travel emission factors for all vehicle types and fuel types for aggregated (average) speeds. The EMFAC vehicle type categories were aligned with the two categories of VMT provided by Fehr & Peers (passenger and truck).²⁴ The EMFAC emission factors by vehicle type and fuel assigned to passenger VMT and truck VMT were then weighted using Countywide VMT and trip generation profiles for each vehicle type modeled in EMFAC2011.²⁵ GHG emissions were then calculated by multiplying the weighted emission factors for passenger vehicles and trucks by the origin-destination VMT for passenger vehicles and trucks supplied by Fehr & Peers.

Data Sources:

- 2016 SCAG Regional Travel Demand Model
Provided by SCAG
 - Fehr & Peers Modeling Analysis (July 29, 2019; December 2021; January 2022; February 2023)

ON ROAD TRANSPORTATION: BUSES

GHG emissions from fuel and energy consumption by bus transit systems and paratransit agencies are accounted from Federal Transit Administration's (FTA) National Transit database at the Countywide level (not for unincorporated Los Angeles County areas separately).²⁶ The agency included in the GHG inventory includes the Los Angeles County Metropolitan Transportation Authority (Metro). Electricity consumption was not available from the National Transit database. To account for electricity consumption and associated indirect GHG emissions, the total gasoline and diesel fuel use from the National Transit database was reapportioned based on the percentage of VMT by fuel type (diesel, gasoline, natural gas, electricity) from EMFAC2021 for the aggregated OBUS, SBUS, and UBUS categories in EMFAC. The CPA Clean emission factor is applied to all electricity consumption by electric buses serving unincorporated Los Angeles County areas. Emission factors for gasoline, diesel, and compressed natural (CNG) gas-powered buses are taken from EMFAC2021 to calculate CO₂ and N₂O emissions. Total estimated Countywide GHG emissions were then scaled by Metro ridership forecasts for unincorporated county areas to estimate GHG emissions for the unincorporated Los Angeles County areas.²⁷

²² The annualization factor of 347 was provided by Fehr & Peers to estimate annual vehicle activity based on daily vehicle activity generated by SCAG's 2016 Regional Travel Demand Model.

²³ CARB, EMFAC2021 Model. Version v.1.0.1. 2021. Available at: <https://arb.ca.gov/emfac/emissions-inventory/4c9f04282a1f85d62a27721058b5a3bb6fd22fb9>. Accessed October 2021.

²⁴ The "passenger vehicle" category corresponds to EMFAC vehicle categories LDA, LDT1, LDT2, MCY, and MD. The "trucks" category corresponds to EMFAC vehicle categories LHDT1, LHDT2, MHDT, HHDT, and MH.

²⁵ For example, if the LDA vehicle type represents 70% of VMT at an emission rate of 300 grams CO₂ per mile and the LDT1 vehicle type represents 30% of VMT at an emission rate of 350 grams CO₂ per mile, the VMT-weighted emission rate for LDA and LDT1 vehicles combined is calculated as follows: 70% * 300 + 30% * 350 = 315 grams CO₂ per mile.

RAILWAY

Diesel fuel and electricity consumed by commuter rail systems are obtained from FTA's NTD.²⁸ The database reports diesel fuel consumption by Southern California Regional Rail Authority (Metrolink) and electricity consumption by Metro Rail. GHG emission factors for diesel locomotives were obtained from the EPA national GHG inventory and emission factors for electric propulsion were obtained from the EPA's Emissions & Generation Resource Integrated Database (eGRID).²⁹ These emission factors were multiplied by the diesel fuel and electricity consumption values obtained from NTD to generate GHG emissions for Los Angeles County as a whole. Total Countywide GHG emissions were then scaled based on Metro and Metrolink ridership forecasts for unincorporated county areas to estimate GHG emissions for the unincorporated Los Angeles County areas.

Waste and Wastewater

Emissions generated at landfills, biological treatment (composting and anaerobic digestion) and incineration facilities, and wastewater treatment plants are reported under the waste sector. These subsectors are discussed in more detail below. **Table A-3** presents scopes, activity data, and emissions for the water and wastewater sector. **Figure A-3** compares 2015 and 2018 GHG emissions from waste and wastewater by sub-sector.

Table A-3: Waste and Wastewater Scope, Activity, and GHG Emissions by Sub-sector

CATEGORY	SCOPE	2015 INVENTORY		2018 INVENTORY	
		ACTIVITY	EMISSIONS (MTCO ₂ E)	ACTIVITY	EMISSIONS (MTCO ₂ E)
Waste and Wastewater					
Solid Waste Disposal	1 & 3	Disposal Tonnage: 721,493 tons	404,604	Disposal Tonnage: 935,512 tons	407,578
Biological Treatment of Solid Waste	1 & 3	Composting Tonnage: 51,111 tons	10,214	Composting Tonnage: 27,182 tons	5,309
Waste Incineration*	1 & 3	Incineration Tonnage: 3,303 tons	1,184	Incineration Tonnage: 1,876 tons	547
Wastewater Treatment	All	Population: 1,058,871	55,179	Population: 1,082,365	56,495
TOTAL			469,997		469,382

NOTE: Totals exclude Waste Incineration which is accounted for under Stationary Energy

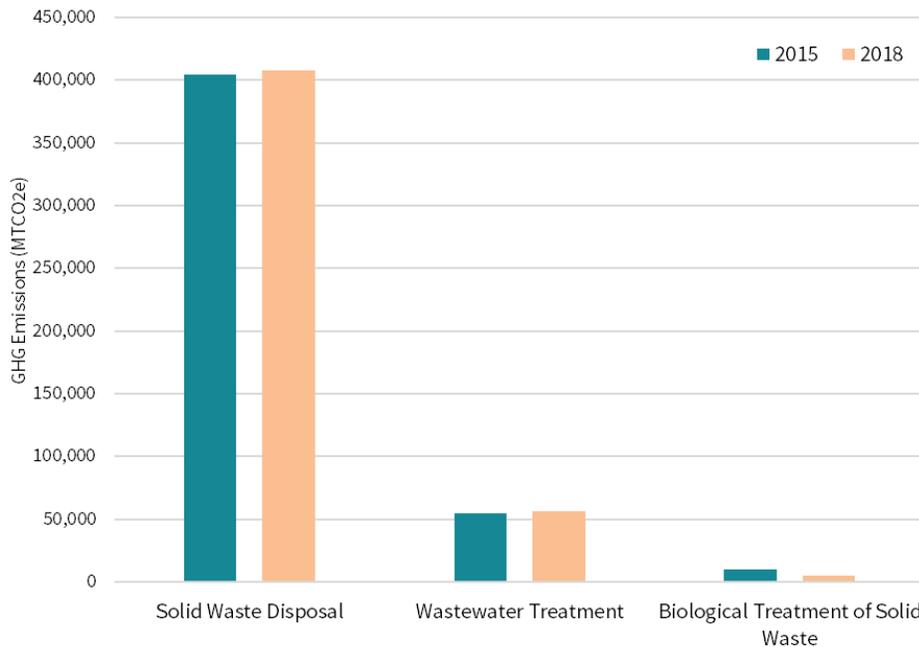

Figure A-3: 2015 & 2018 Waste and Wastewater Emissions by Sub-sector

SOLID WASTE DISPOSAL

Landfill-related emissions are estimated using CARB's first order of decay (FOD) model,³⁰ based on waste disposal tonnage and composition data from CalRecycle's Solid Waste Integrated System (SWIS)³¹ and County Public Works Solid Waste Information Management System (SWIMS) reports.³² Using these reports, unincorporated Los Angeles County disposal tonnage data were obtained for 62 open and closed landfills where unincorporated Los Angeles County residents and businesses disposed their municipal solid waste prior to 2018.

Most of the 62 in- and out-of-county landfills used by unincorporated Los Angeles County residents and businesses have landfill gas collection (LFG) systems with combustion control. These systems collect LFG for flaring, energy production, or for producing liquefied natural gas (LNG), CNG, and producer gas. GHG emissions from landfill gas collection are estimated based on LFG collection rate, LFG flow to energy, and methane content from CalRecycle's 2010 Landfill Gas Master.³³ To determine Los Angeles County's share of methane removal at these landfills (since many other jurisdictions contribute waste to these same landfills), total emissions from these landfills were apportioned based on waste disposed in the landfills by Los Angeles County versus California. California's disposal tonnage data are obtained using CalRecycle's SWIS reports for statewide disposal at the same facilities, where unincorporated Los Angeles County residents and businesses deposited municipal solid waste between 1998 and 2018. The same was done to estimate the unincorporated Los Angeles County's share of emissions at these landfills.

GHG emissions from landfills and landfill gas flaring for the unincorporated Los Angeles County are scaled based on waste volume directed to in- and out-of-county landfills between 1998 and 2018. Emissions associated with methane flaring and recovery from landfills are reported under the waste sector. However, if the methane is recovered (via biogas or digester gas) and used for electricity generation, then the emissions are reported under the stationary energy sector as waste-to-energy facilities or biomass and auxiliary power facilities.

BIOLOGICAL TREATMENT OF SOLID WASTE

Biological treatment of solid waste refers to the composting and anaerobic digestion of organic waste (such as food waste, garden and park waste, sludge, and other organic waste sources).

Composting

In 2018, the County diverted waste to eight in-county and over 50 out-of-county composting facilities. Waste volume diverted by unincorporated Los Angeles County areas for composting was obtained from County Public Works SWIMS reports for transfer stations and non-disposal facilities.³⁴ Waste composted at in-county facilities is assumed to be equivalent to annual waste processing capacity of in-county facilities. These data are obtained from 2019 Organics Waste Management Reports by County Department of Public Works. Waste composted at out-of-county facilities is considered to be the difference between total waste diverted and capacity of in-county facilities. GHG emissions are calculated using wet and dry waste parameters based on waste composition disposed at in and out-of-county recycling or diversion facilities. These data are obtained from Public Works Organics Waste Management Reports.³⁵ GHG emissions from composting for unincorporated Los Angeles County are scaled based on waste volume directed to in- and out-of-county facilities in 2018.

Anaerobic Digestion

The Joint Water Pollution Control Plant (JWPCP) serves 78 Cities as well as many unincorporated communities, also manages sewage sludge using Anaerobic Digester Units. Annual waste volume processed at these facilities is obtained from 2019 Organics Waste Management Reports by Public Works.³⁶ GHG emissions produced by this facility are estimated based on content of volatile solids in food waste and sewage sludge processed in respective facilities.

GHG emissions from anaerobic digestion facilities for unincorporated Los Angeles County are scaled based on population of unincorporated areas in 2018 compared to the total Countywide population. Since the JWPCP facility uses biogas or digester gas for energy production, emissions from anaerobic digestion are included under the waste sector for informational purposes, but they are reported under stationary energy (energy industries).

WASTE INCINERATION

Incineration is a controlled industrial process which is often paired with energy recovery. In 2018, the County diverted waste to three waste incineration facilities. Two of the facilities – the Commerce Refuse-to-Energy Facility (discontinued in June 2018) and the Southeast Resource Recovery Facility – are located in the county. Additionally, waste was diverted to Covanta

³⁴ LADPW, Solid Waste Information Management System (SWIMS). 2021. Available at: <https://dpw.lacounty.gov/epd/swims/OnlineServices/reports.aspx>. Accessed January 2021.

³⁵ Ibid

³⁶ Ibid

Stanislaus Inc., which is an out-of-county facility. GHG emissions from these facilities are obtained from CARB's MRR GHG database.³⁷

To estimate unincorporated Los Angeles County's emissions, total countywide GHG emissions from waste incineration facilities are scaled based on waste diverted by unincorporated communities to these facilities in 2018. CalRecycle's 2018 SWIS reports are used to determine the waste volume diverted to these facilities.³⁸ Since these facilities are used for energy production, emissions are reported under stationary energy (energy industries).

WASTEWATER TREATMENT

Emissions from wastewater treatment are estimated based on population served by sewer and septic systems in unincorporated areas. GHG emissions from wastewater treatment are estimated based on 2018 population data from the SCAG Growth and Forecast report.³⁹ Parameters and constants such as total organic carbon and protein consumption in wastewater are obtained from California GHG inventory documentation⁴⁰ and IPCC default parameters.⁴¹

Industrial Processes and Product Use

Emissions from the industrial processes and product use (IPPU) sector include HFC and PFC emissions from products such as refrigerants, foams, aerosols and fossil fuel-based lubricants and solvents are estimated by scaling statewide emissions from the product use category. Statewide GHG emissions from product use in residential, commercial, and transportation sectors are scaled based on unincorporated Los Angeles County's population.⁴² State-level HFC and PFC emissions from product use in industries including electronics, food processing, metal and

machinery manufacturing, and others, are scaled based on state and unincorporated Los Angeles County industry output from respective industries and unincorporated Los Angeles County’s population.⁴³ Impact Analysis For Planning (IMPLAN) data were used to tabulate the economic outputs by industry for Los Angeles County and the State of California, to estimate the emissions from industry sectors including the lime, cement, and nitrogenous fertilizer manufacturing sectors. GHG emissions are further adjusted based on HFC prohibitions for both Senate Bill 1013 and the CARB HFC Regulation by assuming that the use of prohibited HFCs are phase out over 30 years from prohibition date for all HFC policies before 2018.⁴⁴ **Table A-4** presents scopes, activity data, and emissions for the IPPU sector.

⁴⁵ Impact Analysis For Planning (IMPLAN) data contain 546 sectors representing all private industries in the United States (anything from grain farming to surgical appliance manufacturing) as defined by the North American Industry Classification System (NAICS) codes. Employment, employee compensation, industry expenditures, commodity demands, relationships between industries, and more are collected to form IMPLAN’s ever-growing database. For more information, see: <https://www.implan.com/data/>.

Agriculture, Forestry, and Other Land Use

The AFOLU sector accounts for emissions from land-related changes and includes agriculture, forestry and aggregate sources (including biomass burning and fertilizer use). This sector also includes emissions from forest land conversion. Urban tree canopy and land cover statistics were tabulated by the California Center for Sustainable Communities at the University of California, Los Angeles (UCLA) Institute of Environment and Sustainability, using a tree canopy analysis developed by TreePeople and the University of Vermont with 2014 Los Angeles Region Imagery Acquisition Consortium (LARIAC) land cover data. Based on historic land conversion data from 2007-2016, approximately 212 hectares of forest land is converted to urban land each year in unincorporated county areas. The conversion of a single hectare results in a one-time emission of 169 MTCO_{2e}; this value was multiplied by 212 to estimate total annual land conversion emissions.⁴⁶

This sector does not include natural carbon sequestration and storage in the unincorporated Los Angeles County's natural lands, working lands, and urban forests because these sinks are part of the natural carbon cycle and are not anthropogenic emissions sources. Further, forest sinks are not currently included in CARB's statewide inventory or SB 32's statewide GHG emission reduction target for 2030.^{47,48} The statewide GHG inventory includes the "AB 32 GHG Inventory Sectors," which are anthropogenic emissions sources, a framework that is consistent with international and national GHG inventory practices and is aligned with requirements in AB 32.⁴⁹ CARB accounts for the exchange of ecosystem carbon between the atmosphere and the plants and soils in land, which includes forest sinks, in the Natural and Working Lands Ecosystem Carbon Inventory, which also includes the amount of carbon impacted by wildfire.⁵⁰ The 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan), for the first time, incorporates the contribution of natural and working lands (NWL) to the state's GHG emissions, as well as their role in achieving carbon neutrality by 2045 as mandated by AB 1279.⁵¹ However, the 2045 CAP's target of reducing emissions 85 percent below 1990 levels by 2045 aligns with the AB 1279 statewide target of reducing *anthropogenic* emissions to 85 percent below 1990 levels by 2045. Neither this statewide target nor the 2045 CAP's target incorporate emissions and sinks from the NWL sectors.^{52,53} Achieving the County's aspirational goal of carbon neutrality by 2045 may include a full accounting of natural carbon sequestration and storage in unincorporated Los Angeles County's natural lands in a future update to the 2045 CAP. The County may consider strategies to increase natural carbon removals through land management activities that prioritize restoring and enhancing ecosystem functions to improve resilience to climate change impacts, including more stable carbon stocks.

⁵² Ibid.

⁵³ It should be noted that the statewide target of carbon neutrality by 2045 includes NWL sectors, and the state's CO₂ capture and removal target of 100 million MTCO_{2e} by 2045 must compensate for any residual emissions from the AB 32 GHG Inventory sectors and NWL emissions to support achieving carbon neutrality.

Emissions from biomass burning (post-harvest agricultural burning) and fertilizer use (including liming, urea, organic and synthetic fertilizer) are reported under aggregate sources. Emissions from post-harvest biomass burning (barley, corn, wheat and almond) in unincorporated areas are estimated using 2016 cropland area from NASS CropScape⁵⁴ and relevant emission factors from the CARB 2000-2019 California GHG inventory.⁵⁵

Emissions from fertilizer use for agriculture in Los Angeles County are estimated based on California Department of Food and Agriculture (CDFA) annual reports and scaled for unincorporated areas using 2016 cropland area from NASS CropScape.⁵⁶ **Table A-5** presents scopes, activity data, and emissions for the AFOLU sector. **Figure A-4** shows the contribution of each subsector to the AFOLU sector for both the 2015 and 2018 inventories.

TOTAL	5,531,155	5,173,240

NOTE: Waste and Wastewater totals exclude Waste Incineration which is accounted for under Stationary Energy.

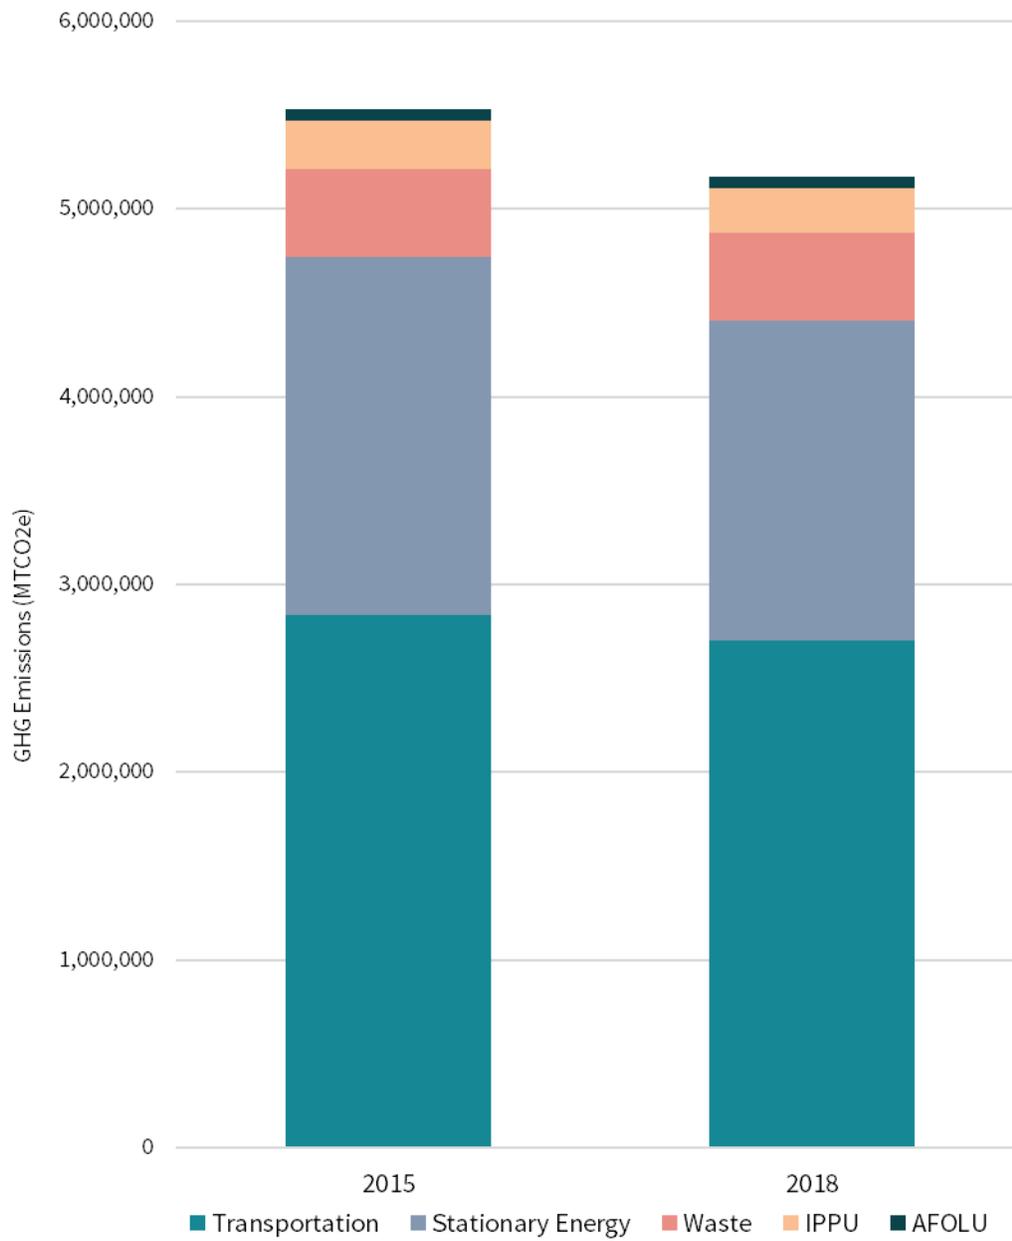

Figure A-5: 2015 and 2018 Emissions Inventory Comparison by Sector

A.2 1990 and 2010 Greenhouse Gas Inventory and Backcasting Methods

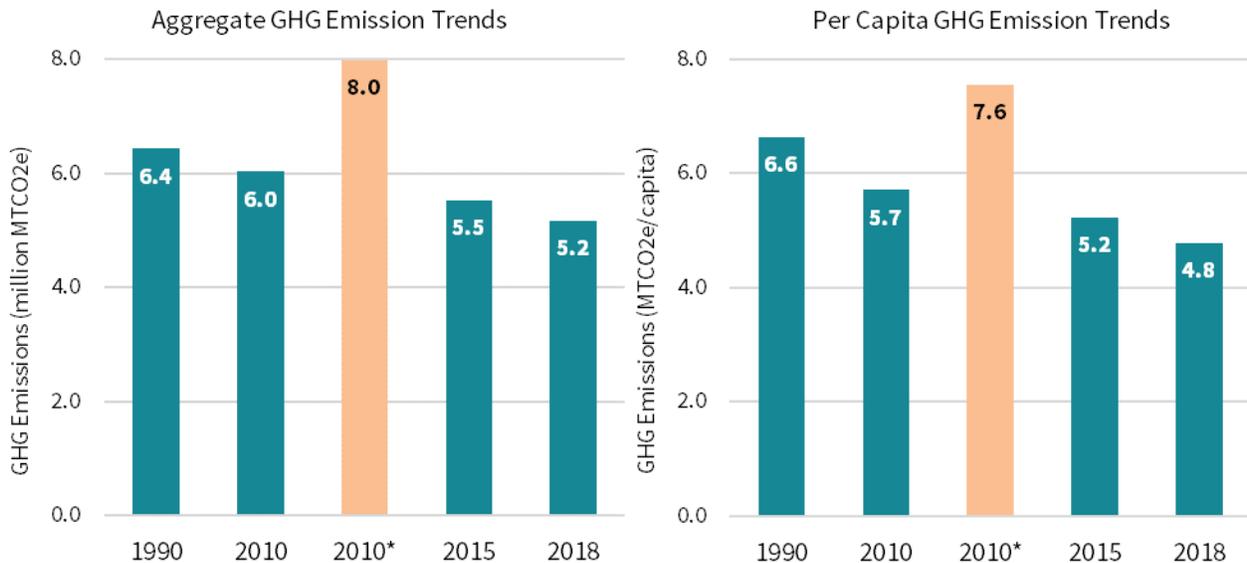

In 2015, the Los Angeles Regional Collaborative (LARC) and ICF International created a GHG emissions inventory for unincorporated Los Angeles County using the 2013 ICLEI U.S. Community Protocol.⁵⁷ The 2010 inventory accounted for Scope 1 and 2 emissions using AR4 GWP values. Additionally, Scope 3 emissions were estimated for additional sub-categories—including water conveyance, and water supply, treatment and distribution—that are not accounted for in the 2015 and 2018 GHG inventories. The 2015 and 2018 GHG emissions inventory methods follow the GPC protocol, as discussed above. The 2015 and 2018 inventories include GHG emissions from industrial processes, product use, fugitive emissions from oil and natural gas systems, and other aggregate carbon dioxide sources that were not included in the 2010 inventory. **Table A-7** shows the differences in sub-sectors included in the two protocols and respective inventories.

Table A-7: Sectors and Sub-sectors in ICLEI and GPC Protocol

⁵⁷ ICLEI – Local Governments for Sustainability USA, *U.S. Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions*, Version 1.1, July 2013.

Due to differences in the two GHG protocols and accounting methods used for the 2010 inventory and the 2015 and 2018 inventories, it is not possible to directly compare emissions from each sector and sub-sector. To monitor emissions reduction between 2010 and 2015/2018 and to ensure consistency with previous County commitments (dating back to 1990), the GPC protocol was used to develop a backcasting model for unincorporated Los Angeles County’s emissions. GHG emissions from each sector and sub-sector were scaled from 2015 to 1990 by using County and state parameters and datasets discussed in **Table A-8** below. Using the backcasting model, it is estimated that GHG emissions in 2015 are eight percent lower than 2010 and 14 percent lower than 1990. However, per-capita GHG emissions in 2015 are nine percent lower than 2010 and 21 percent lower than 1990 despite the increase in population, as illustrated in **Figure A-6**. 2018 emissions are estimated to be 14 percent below 2010 emissions and 20 percent below 1990 emissions; per-capita GHG emissions in 2018 are estimated to be 16 percent below 2010 emissions and 28 percent below 1990 emissions, illustrating a substantial decline in total emissions both at the aggregate level and at the per-capita level.

* 2010 GHG emissions inventory reported in unincorporated Los Angeles County 2020 CCAP.

Figure A-6: 1990 to 2018 GHG Emissions Trends

Table A-8: Assumptions for Backcasting GHG Emissions to 2010 and 1990

SECTOR/SUB-SECTOR	BACKCASTING PARAMETERS
Transportation	3,450,566 (1990); 3,015,442 (2010)
On-Road Transportation	<ul style="list-style-type: none"> • VMT from on-road vehicles are estimated by interpolating VMT in unincorporated Los Angeles County for the years 2016 and 2040 as reported by Fehr & Peers using SCAG's 2016 regional travel demand model. • Emission factors for on-road vehicles (including passenger vehicles, trucks, and buses) are estimated by linearly interpolating EMFAC2021 emission rates from 2000-2020 to extrapolate emission rates to 1990.
Railways	GHG emissions are assumed to be constant from 1990 to 2015.
Stationary Energy	2,226,141 (1990); 2,146,743 (2010)
Residential Buildings	Emissions from energy use in residential buildings are backcasted based on Countywide residential natural gas and electricity consumption as reported by CEC from 1990 to 2014.
Commercial and Institutional Buildings	Emissions from energy use in commercial buildings are backcasted based on Countywide non-residential natural gas and electricity consumption as reported by CEC from 1990 to 2014.
Manufacturing and Construction: Buildings	Emissions from energy use in commercial buildings are backcasted based on Countywide non-residential natural gas and electricity consumption as reported by CEC from 1990 to 2014.
Manufacturing and Construction: Equipment	<ul style="list-style-type: none"> • 2015 emissions from stationary equipment are scaled down using countywide GHG emissions based on construction and manufacturing jobs in unincorporated Los Angeles County. • GHG emissions are assumed to be constant from 1990 to 2015.
Energy Industries	GHG emissions for 1990-2010 are estimated as the average of reported emissions from 2011-2017.
Agriculture, Forestry and Other Fishing Activities	GHG emissions are assumed to be constant from 1990 to 2015.
Fugitive Emissions from Oil and Natural Gas Systems	GHG emissions are assumed to be constant from 1990 to 2015.
Waste	511,965 (1990); 564,503 (2010)
Solid Waste Disposal	<ul style="list-style-type: none"> • Emissions from organic waste disposal between 2010 and 2014 are scaled based on waste disposal tonnage reported by PW's SWIMS database. • GHG emissions from 1990 to 2009 are backcasted based on population.
Biological Treatment of Solid Waste	<ul style="list-style-type: none"> • Emissions from biological treatment between 2010 and 2014 are scaled based on waste disposal tonnage reported by PW's SWIMS database. • GHG emissions from 1990 to 2009 are backcasted based on population.
Waste Incineration	GHG emissions are assumed to be constant from 1990 to 2015.
IPPU	173,534 (1990); 243,456 (2010)
Product Use*	GHG emissions from 1990 to 2014 are backcasted based on population.
AFOLU	25,048 (1990); 60,860 (2010)
Land-use Change	Average land conversion rates from 2006-2015 were used to estimate emissions back to 2006. Emissions were assumed to be zero from 1990-2006.
Aggregate Sources and Non-CO ₂ Emissions Sources	GHG emissions are assumed to be constant from 1990 to 2015.

A.3 2018 to 2045 Business-as-Usual Forecasts

This section describes the approach for modeling business-as-usual (BAU) emissions, which represents future emissions based on current population and regional growth trends, land use growth patterns, and regulations or policies introduced before the 2018 baseline year. The BAU scenario demonstrates the growth in GHG emissions that would occur if no further action were to be taken by the County, the State of California, or the federal government after 2018.

The BAU forecast serves as a reference point for other forecasting scenarios, which include the Adjusted BAU that incorporates federal, state, and local actions (see CAP Appendix B: Adjusted Business-as-Usual Forecast and Emission Reduction Methods) and the GHG reductions from CAP implementation (see CAP Appendix B: GHG Reduction Measures and Actions). This section describes the BAU projections by sector, which are based on growth trends including current population and regional economic growth projections.

Additional details on the assumptions for each sector are included in the sections below.

Figure A-7 presents population and employment projections for unincorporated Los Angeles County from 2015 to 2045.

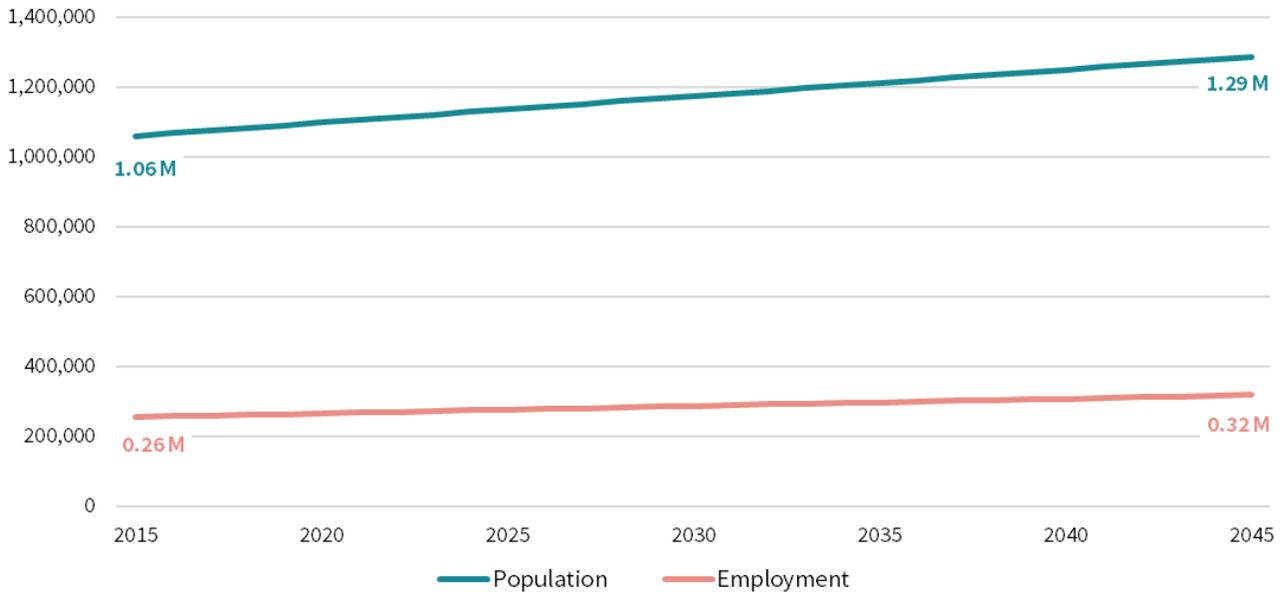

Figure A-7: Unincorporated Los Angeles County Population and Employment Projections

Stationary Energy

Table A-9 presents emissions for 2018 along with the BAU forecast for 2030, 2035, and 2045 for the stationary energy sector.

Table A-9: Stationary Energy GHG Emissions – 2018 Inventory and BAU Forecasts

STATIONARY ENERGY SUBSECTOR	ANNUAL GHG EMISSIONS (MTCO ₂ E)			
	2018	2030	2035	2045
Residential Buildings	962,743	869,099	889,314	944,823
Commercial, Institutional, and Agricultural Buildings	349,373	429,107	441,191	469,816
Manufacturing and Construction Buildings	244,417	301,729	309,350	324,331
Energy Industries	98,554	29,495	29,526	29,587
Fugitive Emissions from Oil and Natural Gas Systems	41,066	49,130	49,251	49,493
Agriculture, Forestry and Other Fishing Activities	2,658	2,600	2,580	2,562
TOTAL	1,698,809	1,681,160	1,721,212	1,820,612

Residential Buildings

Energy consumption (electricity and natural gas) in residential buildings is forecasted based on building footprint projections for residential building stock in unincorporated Los Angeles County. Building footprint projections are based on historical trends from the County Assessor Parcel Database (2006-2018).⁵⁸ In 2019, residential customers in unincorporated Los Angeles County were enrolled in CPA’s Clean Power rate option (50 percent eligible renewable), leading to an initial decline in residential building emissions through 2025, before they rise in 2030, 2035, and 2045 alongside population and economic growth. For purposes of the BAU projections it is assumed that CPA customers in unincorporated areas continue to receive 50 percent eligible renewable electricity until 2045 and the remaining customers continue to receive electricity from SCE with the emissions factors and participation rates held constant. GHG emissions in 2019 are calculated using 2018 natural gas and electricity emission factors with 2019 CPA participation rates. GHG emissions between 2020-2045 are calculated using 2020 electricity emission factors.

⁵⁸ UCLA Institute of Environmental Studies, Analysis of County Parcel Assessor’s Data. 2018.

Commercial and Institutional Buildings

Energy consumption in commercial, institutional, and agricultural buildings is forecasted based on building footprint projections for non-residential building stock in unincorporated Los Angeles County. Commercial and Institutional building footprint projections are based on historical trends from the County Assessor Parcel Database (2006-2018). In June 2018, non-residential customers in unincorporated Los Angeles County were enrolled in CPA's Clean Power option. Under this program, over 95 percent of non-residential customers started receiving 50 percent eligible renewable electricity from CPA. For purposes of the BAU projections it is assumed that CPA customers in unincorporated areas continue to receive 50 percent eligible renewable electricity until 2045 and the remaining customers continue to receive electricity from SCE with the emissions factors and participation rates held constant. GHG emissions in 2019 are calculated using 2018 natural gas and electricity emission factors with 2019 CPA participation rates. GHG emissions between 2020-2045 are calculated using 2020 electricity emission factors. GHG emissions from agricultural buildings are assumed to remain constant.

Manufacturing and Construction Buildings

ELECTRICITY AND NATURAL GAS

Energy consumption (electricity and natural gas) in manufacturing and industrial buildings is forecasted based on building footprint projections for non-residential building stock in unincorporated Los Angeles County. Building footprint projections are based on historical trends from the County Assessor Parcel Database (2006-2018).⁵⁹ In June 2018, non-residential customers in unincorporated Los Angeles County were enrolled in CPA's Clean Power option. Under this program, over 95 percent of non-residential customers started receiving 50 percent eligible renewable electricity from CPA. For purposes of the BAU projections it is assumed that CPA customers in unincorporated areas continue to receive 50 percent eligible renewable electricity until 2045 and the remaining customers continue to receive electricity from SCE with the emissions factors and participation rates held constant. GHG emissions in 2019 are calculated using 2018 natural gas and electricity emission factors with 2019 CPA participation rates. GHG emissions between 2020-2045 are calculated using 2020 electricity emission factors.

OFF-ROAD EQUIPMENT

Countywide GHG emissions from off-road equipment used in the manufacturing and construction sector are obtained from CARB's OFFROAD2017 ORION tool.⁶⁰ The tool provides countywide

⁵⁹ UCLA Institute of Environmental Studies, Analysis of Los Angeles County Parcel Assessor's Data. 2018.

Energy Industries

Emission projections from energy production at CHP plants, district cooling facilities, biomass power stations, and waste-to-energy facilities, are extrapolated based on 2008 to 2020 GHG emissions reported by the CARB Pollution Mapping Tool and the CARB 2021 MRR Database.⁶¹ For CHP facilities, emissions for Pitchess cogeneration station were assumed to remain constant (the facility was decommissioned in 2018); emissions for Olive View cogeneration station were forecasted using a linear trend in emissions from reported 2012-2020. Waste-to-energy facility biogenic emissions for 2019-2029 were forecasted using a linear trend in emissions reported from 2011-2018 and emission for 2030-2045 were forecasted assuming the Calabasas landfill shuts down and the remaining emissions decline following the trend from 2011 through the forecasting year. Biomass and auxiliary power facility biogenic emissions were forecasted using a linear trend in emissions reported from 2011-2018.

Link: <https://ww2.arb.ca.gov/mrr-data>

Agriculture, Forestry and Other Fishing Activities

Countywide GHG emissions from agricultural equipment are obtained from CARB's OFFROAD2017 ORION tool. The tool provides countywide carbon dioxide emissions and annual gasoline and diesel consumption by off-road equipment to 2045. Emission projections for unincorporated Los Angeles County are estimated by scaling Countywide emissions using 2016 crop acreage for unincorporated Los Angeles County from USDA's NASS Cropscape database.⁶²

Transportation

Table A-10 presents emissions for 2018 along with the BAU forecast for 2030, 2035, and 2045 for the transportation sector.

Table A-10: Transportation GHG Emissions – 2018 Inventory and BAU Forecasts

TRANSPORTATION SUBSECTOR	ANNUAL GHG EMISSIONS (MTCO ₂ E)			
	2018	2030	2035	2045
Passenger Vehicles	2,665,824	2,738,675	2,769,029	2,829,737
Buses	29,371	35,589	35,676	35,852
Railways	9,490	10,255	10,389	10,658
TOTAL	2,704,685	2,784,518	2,815,094	2,876,247

On-road Transportation: Passenger Vehicles and Trucks

VMT from passenger vehicles and trucks were estimated using SCAG’s 2016 Regional Travel Demand Model, which forecasts VMT for the year 2040. This model is a trip-based travel forecasting model that generates daily vehicle trips for each TAZ across various trip purposes based on inputs such as the transportation network and socioeconomic data such as population, household, and employment. VMT was provided by F&P for years 2016 and 2040 and was linearly interpolated for 2030 and 2035. VMT for years 2041 through 2045 were linearly extrapolated based on the 2016 to 2040 VMT projection.

GHG emissions from unincorporated areas are calculated using VMT and the weighted emission factors for 2018 by vehicle type (passenger vehicles and trucks)⁶⁴ from the EMFAC2021 model (see transportation section of A.1 above for discussion).⁶⁵ The 2018 emission factor was applied to every year from 2018 through 2045 to represent no changes in the vehicle fleet due to federal, state, or local action.

It should be noted that the transportation modeling for the 2045 CAP shows a five percent decrease in transportation emissions between 2015 and 2018. This decrease is due to declining emission factors from the EMFAC2021 model, which outpace the increase in total VMT as

⁶³ CARB, Pollution Mapping Tool. 2018. Available: https://www3.arb.ca.gov/ei/tools/pollution_map/. Accessed January 2021.

⁶⁴ Passenger vehicles correspond to EMFAC categories LDA, LDT1, LDT2, MCY, and MD. Trucks correspond to EMFAC categories LHDT1, LHDT2, MHDT, HHDT, and MH.

⁶⁵ CARB, EMFAC2021 Model. 2021. Available at: <https://arb.ca.gov/emfac/emissions-inventory/4c9f04282a1f85d62a27721058b5a3bb6fd22fb9>. Accessed October 2021.

modeled with SCAG's 2016 Regional Travel Demand Model. The California Department of Tax and Fee Administration reports that statewide taxable sales of gasoline and diesel fuel increased by two percent from 2015 to 2018.⁶⁶ This increase is also consistent with the statewide GHG inventory prepared by CARB, which also shows a two percent increase in total on-road transportation emissions from 2015 to 2018.⁶⁷ Statewide gasoline and diesel fuel sales may not trend precisely with unincorporated Los Angeles County gasoline and diesel fuel sales, and VMT apportioned to unincorporated Los Angeles County areas may not correlate perfectly with gasoline sales, which could explain the difference. In addition, the VMT used in the inventory is based on the SCAG model, not actual reported VMT or fuel sales data, consistent with the GPC Protocol.

Waste and Wastewater

BAU emissions are forecasted for years 2018 through 2045 for emissions generated at landfills, biological treatment (composting and anaerobic digestion) and incineration facilities, and wastewater treatment plants are reported under the waste sector. **Table A-11** presents emissions for 2018 along with the BAU forecast for 2030, 2035, and 2045 for the waste and wastewater sector.

Table A-11: Waste and Wastewater GHG Emissions – 2018 Inventory and BAU Forecast

WASTE & WASTEWATER SUBSECTOR	ANNUAL GHG EMISSIONS (MTCO ₂ E)			
	2018	2030	2035	2045
Solid Waste Disposal	407,578	386,285	386,541	410,702
Biological Treatment of Solid Waste	5,309	6,180	6,184	6,579
Waste Incineration*	547	647	687	711
Wastewater Treatment	56,495	59,454	61,372	65,208
TOTAL	469,382	451,919	454,097	482,489

NOTE: Totals exclude Waste Incineration which is accounted for under Stationary Energy

Solid Waste Disposal

Emissions from landfills are determined by extrapolating the 2018 GHG emissions intensity (MTCO₂e/person) based on solid waste and organic waste disposal projections from the Public Works SWIMS database⁷² and population projections by SCAG⁷³ and Caltrans.⁷⁴ Solid waste diversion rate and organics diversion rate are assumed to remain constant at 70 percent and 38 percent respectively, as is the future methane capture rates at all landfills.

Biological Treatment of Solid Waste

Emissions from composting and anaerobic digestion are estimated by extrapolating the 2018 GHG emissions intensity (MTCO₂e/person) based on solid waste and organic waste disposal projections from Public Works SWIMS database.⁷⁵ Solid waste diversion rate and proportion of organic waste diverted from landfills to composting and grinding/mulching facilities remains constant.

GHG emissions from Anaerobic Digestion at JWPCP are scaled based on population growth from 2018 to 2045. These emission projections are reported under Energy Industries.

TOTAL	60,860	60,860	60,860	60,860

Summary Emissions

Table A-14 and **Figure A-8** present GHG emissions for all sectors for the 2018 GHG inventory and the 2030, 2035, and 2045 BAU forecasts.

Table A-14: GHG Emissions by Sector – 2018 Inventory and BAU Forecast

SECTOR	ANNUAL GHG EMISSIONS (MTCO ₂ E)			
	2018	2030	2035	2045
Stationary Energy	1,698,809	1,681,160	1,721,212	1,820,612
Transportation	2,704,685	2,784,518	2,815,094	2,876,247
Waste	469,382	451,919	454,097	482,489
IPPU	239,505	259,605	267,981	284,731
AFOLU	60,860	60,860	60,860	60,860
TOTAL	5,173,240	5,238,062	5,319,243	5,524,939

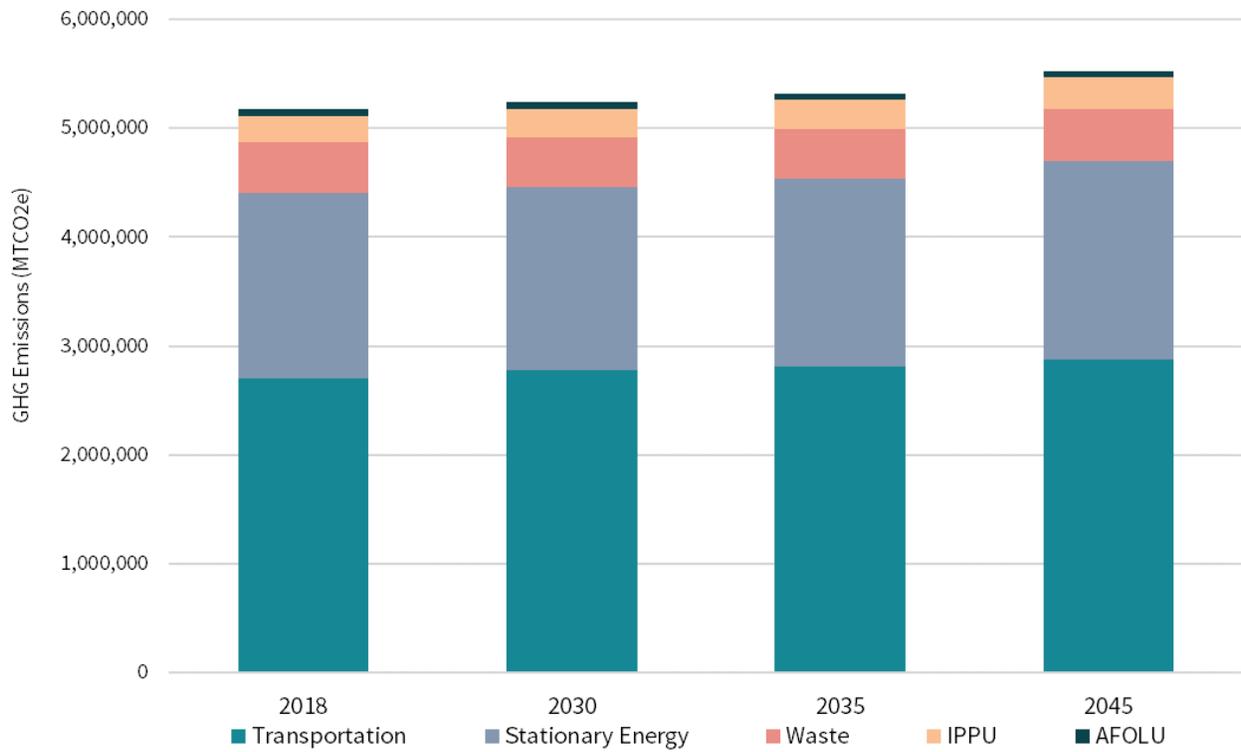

Figure A-8: GHG Emissions by Sector – 2018 Inventory and BAU Forecast

A.4 Derivation of the 2045 CAP's Emission Reduction Targets

Origin of Emission Reduction Targets

The 2045 CAP includes three separate targets and one aspirational goal for three future milestone years:

- By 2030, reduce unincorporated Los Angeles County GHG emissions 40 percent below 2015 baseline levels;
- By 2035, reduce unincorporated Los Angeles County GHG emissions 50 percent below 2015 baseline levels;
- By 2045, reduce unincorporated Los Angeles County GHG emissions 83 percent below 2015 baseline levels; and
- By 2045, achieve carbon neutrality in unincorporated Los Angeles County (long-term aspirational goal).

The 2045 CAP's targets and 2045 aspirational goal are based on the OurCounty Sustainability Plan and CARB's 2022 Scoping Plan. A primary objective of the 2045 CAP is to align with the OurCounty Sustainability Plan targets and state targets. The OurCounty Sustainability Plan conducted a community-wide, Countywide greenhouse gas emissions inventory. That process resulted in individual greenhouse gas inventories for all 88 cities and the unincorporated areas of Los Angeles County. At the time of the OurCounty Plan's preparation, 2015 was the year with the most up-to-date data for all 88 cities and the unincorporated areas, including account-level energy consumption data from the UCLA Energy Atlas. Thus, the OurCounty Plan used 2015 as the baseline year against which to set the Plan's greenhouse gas related targets. During the development of the OurCounty Plan, the County evaluated a series of GHG reduction target options. The targets selected represent the County's commitment to doing its fair share to help California achieve its ambitious statewide GHG targets.

In 2005, Governor Arnold Schwarzenegger's Executive Order (EO) S-3-05 established the 2050 statewide GHG reduction target of 80 percent below 1990 levels, expressing the intent of the State of California to address the issue of climate change by reducing GHGs. Following EO S-3-05, the California legislature passed Assembly Bill 32 (AB 32, Health and Safety Code § 38500, et seq.) in 2006. AB 32 requires the CARB to design and implement feasible and cost-effective emissions limits, regulations, and other measures, such that statewide GHG emissions are reduced to 1990 levels by 2020 (representing a 25 percent reduction in emissions). In 2015, Governor Edmund G. Brown, Jr.'s EO B-30-15 established the 2030 statewide GHG reduction target of 40 percent below 1990 levels. In 2016, Senate Bill (SB) 32 and its companion bill AB 197 amended the Health and Safety Code by establishing a new climate pollution reduction target of 40 percent below 1990 levels by 2030 and included provisions to ensure the benefits of state climate policies accrue to disadvantaged communities. Further, in 2018, Governor Brown signed EO B-55-18, committing California to total, economy-wide carbon neutrality by 2045. In December 2017, CARB approved the 2017 Climate Change Scoping Plan Update (2017 Scoping

Plan), which outlines the proposed framework of action for achieving the 2030 GHG target of 40 percent reduction in GHG emissions relative to 1990 levels as codified by SB 32.⁸⁰

In August 2022, the California Legislature enacted a package of significant climate legislation that included a codification of the state’s goal to reach net-zero GHG emissions by 2045. With the passage of AB 1279, California is committed to reach net zero by no later than 2045. Critically, this goal requires California to cut anthropogenic GHG emissions by 85 percent compared to 1990 levels, ensuring that the state uses all available solutions to sharply cut GHG emissions from industrial facilities, vehicles, power plants, and more. Governor Gavin Newsom signed AB 1279 into law on September 16, 2022.

On December 15, 2022, CARB adopted the 2022 Scoping Plan in response to AB 1279 and other legislation.⁸¹ The 2022 Scoping Plan lays out a path to achieve carbon neutrality no later than 2045 and to reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045, as directed by AB 1279. The actions and outcomes in the plan will achieve the following: significant reductions in fossil fuel combustion by deploying clean technologies and fuels; further reductions in short-lived climate pollutants; support for sustainable development; increased action on natural and working lands to reduce emissions and sequester carbon; and the capture and storage of carbon.⁸² Appendix D of the 2022 Scoping Plan includes recommendations for local government actions to align with the state’s climate goals, focusing on local GHG emissions reduction strategies.⁸³ According to CARB, “local government actions are crucial for supporting attainment of the state’s climate goals” and local government leadership is “critical to implementing State-level measures to address GHG emissions associated with transportation and the built environment.”

Table A-15 outlines the state’s GHG reduction targets.

The 2045 CAP retains OurCounty’s target for 2035 and identifies OurCounty’s 2045 carbon neutrality target as a long-term aspirational goal. The 2045 CAP adds a new GHG emission reduction target for 2030 to align with SB 32.⁸⁴ The Draft 2045 CAP’s 2030 target was selected based on guidance provided in the 2017 Scoping Plan and was developed to demonstrate consistency with the statewide 2030 target shown in Table A-15, above. The Draft 2045 CAP’s 2030 target is established based on a reduction from 2015 baseline levels (just like the OurCounty targets for 2025 and 2035) and is equal to 40 percent below 2015 emissions or 4.9 million MTCO₂e. This compares to unincorporated Los Angeles County’s 2030 BAU forecast of 5.2 million MTCO₂e, as presented in Table A-14 above. A 40 percent reduction below 2015 levels

⁸⁰ California Air Resources Board, *California’s 2017 Climate Change Scoping Plan: The Strategy for Achieving California’s 2030 Greenhouse Gas Target*. November 2017. Available at: <https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2017-scoping-plan-documents>. Accessed January 2022.

⁸¹ California Air Resources Board, *Resolution 22-21: 2022 Climate Change Scoping Plan for Achieving Carbon Neutrality*. Agenda Item No. 22-16-1. December 15, 2022. Available: <https://ww2.arb.ca.gov/sites/default/files/barcu/board/res/2022/res22-21.pdf>. Accessed December 2022.

⁸² California Air Resources Board, *2022 Scoping Plan for Achieving Carbon Neutrality*. November 16, 2022. Available: <https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2022-scoping-plan-documents>. Accessed December 2022.

⁸³ California Air Resources Board, *2022 Scoping Plan for Achieving Carbon Neutrality, Appendix D Local Actions*. November 16, 2022. Available: <https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2022-scoping-plan-documents>. Accessed December 2022.

⁸⁴ The 2045 CAP excludes OurCounty’s 2025 target because implementation of the CAP will barely be underway by 2025. Instead, the 2045 CAP focuses on the closest reasonable target timeframes of 2030 and 2035, and also to align with state planning for 2030 (SB 32 does not stipulate an interim target for 2025).

is also equivalent to a 48 percent reduction below unincorporated Los Angeles County’s 1990 GHG emissions levels, which is more stringent than the state target of a 40 percent reduction below 1990 levels by 2030 (for additional discussion, see section below).

Table A-15: State of California Greenhouse Gas Emission Reduction Targets

TARGET YEAR	STATE GHG TARGET	CORRESPONDING STATE LEGISLATION
2020	1990 levels	Assembly Bill 32, the California Global Warming Solutions Act (2006)
2030	40% below 1990 levels	Senate Bill 32, the Global Warming Solutions Act (2006)
2045	85% below 1990 levels and net zero GHG emissions ^a	Assembly Bill 1279, the California Climate Crisis Act (2022) ^b

NOTES:

^a. Net zero means that emissions of GHGs to the atmosphere are balanced by removals of greenhouse gases (GHGs) over a period of time, as determined by the California Air Resources Board. In other words, it means that GHG emissions generated by sources such as transportation, power plants, and industrial processes must be less than or equal to the amount of carbon dioxide that is removed from the atmosphere, both in natural sinks (such as trees) and through mechanical sequestration (such as direct air capture), over the same time period.

^b. Executive Order S-3-05 (2005) set a target of 80% below 1990 levels, which was superseded by Assembly Bill 1279.

The Draft 2045 CAP’s 2035 target was selected based on guidance provided in both the 2017 Scoping Plan and the 2022 Scoping Plan and was chosen as a milestone target to put unincorporated Los Angeles County on the trend to achieve the 2045 CAP’s 2045 target and the long-term aspirational goal of carbon neutrality by 2045. This 2035 target was developed to demonstrate consistency with the pathway needed to achieve the statewide 2045 targets shown in Table 2-4, above. The Draft 2045 CAP’s 2035 target is established based on a reduction from 2015 baseline levels and is equal to 50 percent below 2015 emissions (2.8 million MTCO_{2e}). This compares to unincorporated Los Angeles County’s 2035 BAU forecast of 5.3 million MTCO_{2e}. A 50 percent reduction below 2015 levels is also equivalent to a 57 percent reduction below unincorporated Los Angeles County’s 1990 GHG emissions levels.

The Draft 2045 CAP’s target for 2045 was selected based on guidance for CAP targets provided in the 2022 Scoping Plan and was developed to demonstrate consistency with the statewide 2045 target shown in Table A-15, above. It is based on a reduction from 2015 baseline levels and is equal to 83 percent below 2015 emissions (958,000 MTCO_{2e}). This compares to unincorporated Los Angeles County’s 2045 BAU forecast of 5.5 million MTCO_{2e}. An 83 percent reduction below 2015 levels is also equivalent to an 85 percent reduction below unincorporated Los Angeles County’s 1990 GHG emissions levels, which in turn is equivalent to the state target of an 85 percent reduction below 1990 levels by 2045. **Table A-16** presents a comparison between the 2045 CAP’s targets for 2030 and 2035, along with its aspirational 2045 goal, and the OurCounty Sustainability Plan targets for each future milestone year.

Table A-16: GHG Emissions Targets and Goals for the Draft 2045 Cap and OurCounty Sustainability Plan

YEAR	2045 CAP (UNINCORPORATED COUNTY ONLY)	OURCOUNTY SUSTAINABILITY PLAN (UNINCORPORATED COUNTY AND CITIES)	GHG EMISSIONS (MTCO ₂ E) (UNINCORPORATED COUNTY)
2025	n/a	25% below 2015 baseline levels	4,148,366
2030	40% below 2015 levels	n/a	3,318,693
2035	50% below 2015 levels	50% below 2015 levels	2,765,578
2045	83% below 2015 levels (85% below 1990 levels) Carbon neutrality ^a	Carbon neutrality by 2045 for county operations (by 2050 countywide)	958,088

NOTE:

^a. The Draft 2045 CAP includes an aspirational goal, rather than a target, of carbon neutrality by 2045.

The Targets as Levels of Significance for GHG Impacts under CEQA

CEQA Guidelines Section 15183.5(b) stipulates that project-specific environmental documents can find that project-level GHG emissions are not cumulatively considerable if the project complies with the requirements of a qualified GHG emissions reduction plan. As discussed in the Draft Environmental Impact Report for the 2045 CAP, upon certification of the EIR and approval of the 2045 CAP, the 2045 CAP would meet the requirements of a qualified GHG emission reduction plan per CEQA Guidelines Section 15183.5(b)(1) for projects through 2035.

To meet the requirements of CEQA Guidelines Section 15183.5(b), a qualified GHG emissions reduction plan must include several important elements, and must:

- Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable (§ 15183.5(b)(1)(B)).

The Draft 2045 CAP identifies a GHG emissions reductions target for the year 2030 that is 40 percent below baseline 2015 levels, which is equivalent to 47 percent below 1990 levels. This 2030 target for unincorporated Los Angeles County is therefore more stringent than the statewide target of 40 percent below 1990 levels by 2030 pursuant to SB 32. The Draft 2045 CAP’s 2035 target of 50 percent below 2015 levels puts unincorporated Los Angeles County on a pathway to achieve the Draft CAP’s 2045 target and the statewide 2045 target in AB 1279. The Draft 2045 CAP’s 2045 target of 83 percent below 2015 levels is equivalent to an 85 percent reduction below 1990 levels, which aligns with the State of California’s target of 85 percent below 1990 levels. The 2045 CAP’s long-term aspirational goal of carbon neutrality by 2045 is also consistent with AB 1279 and the 2035 target puts unincorporated Los Angeles County on a path to achieve carbon neutrality.

Consistency with State Target as a Threshold of Significance

While several state-level initiatives will help reduce GHG emissions, they alone will not be sufficient to meet the 2030 target mandated by SB 32. This is one of the many reasons why the

County has prepared the 2045 CAP: so it can contribute its fair share of emission reductions to achieve the statewide targets for 2030 and beyond.

Consistency with the CARB 2022 Scoping Plan and the state's statutory GHG emissions reduction targets is an appropriate metric by which to determine the significance of the Draft 2045 CAP's GHG emissions. CEQA Guidelines Section 15064.4(b)(3) states that a lead agency "may consider a project's consistency with the state's long-term climate goals or strategies" when determining the significance of a project's impacts. Additionally, in *Center for Biological Diversity v. Department of Fish and Wildlife* (2015) 62 Cal.4th 204 (Newhall), the California Supreme Court sanctioned the use of such a threshold: The Court stated that assessing a project's GHG impacts based on a "consistency with a GHG emission reduction plan" threshold of significance is legally permissible under CEQA.

The 2030 unincorporated Los Angeles County target above is derived using the 2017 Scoping Plan's recommendations for local land use development to contribute their "fair share" of emission reductions to the statewide GHG target for 2030. This is also consistent with the Association of Environmental Professionals (AEP) 2016 white paper recommendation for "Substantial Progress" thresholds for land use development to show consistency with statewide targets.⁸⁵ As discussed above, the Draft 2045 CAP's 2030 target of 40 percent below 2015 levels (a gross emissions target) exceeds the statewide 2030 target as codified in SB 32 and the 2017 Scoping Plan. Unincorporated Los Angeles County's emissions in 2015 are estimated to be 12 percent lower than 1990 emissions;⁸⁶ this compares to statewide emissions that were 2.3 percent higher in 2015 compared to 1990.⁸⁷ Additionally, unincorporated Los Angeles County's emissions in 2018 are estimated to be 20 percent lower than 1990 emissions; this compares to statewide emissions that were 1.3 percent lower in 2018 compared to 1990.⁸⁸ In other words, unincorporated Los Angeles County has been more successful than the state as a whole in reducing gross emissions since 1990. Consequently, the Draft 2045 CAP's gross emissions target is *more* stringent than the corresponding state target when comparing to 1990 levels and approximately equivalent when using a per-capita metric.⁸⁹ The Draft 2045 CAP's 2030 target also sets unincorporated Los Angeles County on a path to achieve California's 2045 GHG emission reduction target in AB 1279.

The Draft 2045 CAP's 2045 target of 83 percent below 2015 levels aligns with the statewide 2045 target, as codified in AB 1279 and implemented in the 2022 Scoping Plan. This is because the County's 2045 target of 85 percent below 2015 levels is equivalent to an 85 percent reduction below 1990 levels, which aligns with the State of California's target of 85 percent below 1990

⁸⁵ Association of Environmental Professionals (AEP). 2016, *Final White Paper - Beyond 2020 and Newhall: A Field Guide to New CEQA Greenhouse Gas Thresholds and Climate Action Plan Targets for California*, October 18. Available at: https://califaep.org/docs/AEP-2016_Final_White_Paper.pdf. Accessed December 2021.

⁸⁶ To demonstrate consistency with statewide targets, to assess unincorporated Los Angeles County's progress since 1990, and to ensure that interim emissions reduction targets align with commitments prior to 2015, a backcasting model was developed (see section A.2 of this appendix).

⁸⁷ California Air Resources Board, *California's Greenhouse Gas Inventory by Scoping Plan Category*, Fourteenth Edition: 2000 to 2019, Last updated on 6/1/2021. Available at: <https://ww2.arb.ca.gov/ghg-inventory-data>. Accessed January 2022.

⁸⁸ *Ibid.*

⁸⁹ Per-capita emissions for unincorporated Los Angeles County are 19 percent lower in 2015 (6.1 MTCO₂e/capita) compared to 1990 (7.6 MTCO₂e/capita) and 28 percent lower in 2018 (5.4 MTCO₂e/capita) compared to 1990. This compares to total statewide per-capita emissions that were 22 percent lower in 2015 (11.3 MTCO₂e/capita) compared to 1990 (14.5 MTCO₂e/capita) and 26 percent lower in 2018 (10.8 MTCO₂e/capita) compared to 1990. The 2030 statewide target of 6.2 MTCO₂e/capita is 57 percent below 1990 statewide levels, whereas the 2045 CAP's 2030 target of 3.3 MTCO₂e/capita is 56 percent below 1990 unincorporated Los Angeles County levels.

levels. Consequently, the Draft 2045 CAP's target is equivalent to the state target. The Draft 2045 CAP's 2045 target also sets unincorporated Los Angeles County on a trend to achieve California's 2045 carbon neutrality target. Consequently, pursuant to CEQA Guidelines Section 15064.4(b)(3), the Draft 2045 CAP's 2045 target represents the level below which GHG emissions would not be cumulatively considerable through the year 2045.

The Draft 2045 CAP's 2035 target of 50 percent below 2015 levels puts unincorporated Los Angeles County on a pathway to achieve the statewide 2045 targets as stipulated in AB 1279. Although the state does not have a target for 2035, the 2045 CAP's target for 2035 of 50 percent below 2015 levels is equivalent to a 57 percent reduction below 1990 levels, which puts unincorporated Los Angeles County on a path to achieve its 2045 targets. Consequently, pursuant to CEQA Guidelines Section 15064.4(b)(3), the Draft 2045 CAP's 2035 target represents the level below which GHG emissions would not be cumulatively considerable through the year 2035.

The Draft 2045 CAP's 2045 aspirational goal of carbon neutrality aligns with the statewide 2045 target of carbon neutrality stipulated in AB 1279.

GHG emissions and global climate change represent cumulative impacts of human activities and development projects locally, regionally, statewide, nationally, and worldwide. GHG emissions from all these sources cumulatively contribute to the significant adverse environmental impacts of global climate change. No single project could generate enough GHG emissions to noticeably change the global average temperature; instead, the combination of GHG emissions from past, present, and future projects around the world have contributed and will continue to contribute to global climate change and its associated environmental impacts. Given that analysis of GHG emissions is cumulative in context, the emissions targets discussed above represent the level by which the 2045 CAP's emissions are not cumulatively considerable.

APPENDIX B

Emissions Forecasting and Reduction Methods

Purpose

This appendix describes the greenhouse gas (GHG) accounting and projection methods for the Adjusted Business-as-Usual (BAU) forecasts for 2030, 2035, and 2045, and the methods for quantifying GHG emissions reductions for the measures and actions listed in the *2045 Los Angeles County Climate Action Plan (2045 CAP)*.

Section B.1: 2018–2045 Adjusted Business-as-Usual Forecasts

This section describes the approach for modeling an Adjusted BAU scenario that projects future emissions based on current population and regional growth trends; land use growth patterns; and implementation of federal, state, and County of Los Angeles (County) regulations and policies, including renewable-energy targets pursuant to the California Renewables Portfolio Standard (RPS) and Senate Bill (SB) 100, Title 24 Building Energy Efficiency updates, and the Advanced Clean Cars regulations and Pavley vehicle efficiency standards.

Section B.2: Greenhouse Gas Reduction Measures and Actions

This section describes the calculation methods for estimating local GHG emissions reductions for the 2045 CAP measures and actions. These emissions reductions occur beyond federal, state, and County regulations and policies accounted for in the Adjusted BAU forecast. The quantified measures and actions include:

- ES1: Develop a Sunset Strategy for All Oil and Gas Operations
- ES2: Procure Zero-Carbon Electricity
- ES3: Increase Renewable Energy Production
- E1: Transition Existing Buildings to All-Electric
- E2: Standardize All-Electric New Development

- E4: Improve Energy Efficiency of Existing Buildings
- E6: Reduce Indoor and Outdoor Water Consumption
- T1: Increase Density Near High-Quality Transit Areas
- T2: Develop Land Use Plans Addressing Jobs-Housing Balance and Increase Mixed Use
- T3: Expand Bicycle and Pedestrian Network to Serve Residential, Employment, and Recreational Trips
- T4: Broaden Options for Transit, Active Transportation, and Alternative Modes of Transportation
- T6: Increase ZEV Market Share and Reduce Gasoline and Diesel Fuel Sales
- T7: Electrify County Fleet Vehicles
- T8: Accelerate Freight Decarbonization
- T9: Expand Use of Zero-Emission Technologies for Off-Road Vehicles and Equipment
- W1: Institutionalize Sustainable Waste Systems and Practices
- A1: Conserve Agricultural and Working Lands, Forest Lands, and Wildlands
- A3: Expand Unincorporated Los Angeles County's Tree Canopy and Green Spaces

B.1 2018–2045 Adjusted Business-as-Usual Forecasts

Like the standard BAU forecast, the Adjusted BAU forecast provides an estimate of future emissions levels based on the continuation of existing trends in demographic growth (such as population and housing), activity or resource consumption (such as electricity use), technology changes, and regulation. Unlike the BAU forecast, the Adjusted BAU forecast accounts for expected outcomes of federal, state, and local measures. Specifically, the Adjusted BAU forecast includes the following programs and policies:

1. California's RPS program and SB 100 targets for renewable energy.
2. Updates to Title 24 standards.
3. Implementation of the Advanced Clean Cars regulations and Pavley standards.

These three adjustments are explained in the following sections.

Renewables Portfolio Standard and Senate Bill 100

The Clean Energy and Pollution Reduction Act of 2015, or SB 350 (Chapter 547, Statutes of 2015) was approved by then-Governor Jerry Brown on October 7, 2015. SB 350 increased the standards of the California RPS program by requiring that the amount of electricity generated and sold to retail customers per year from eligible renewable energy resources be increased from 33 percent to 50 percent by December 31, 2030. On September 10, 2018, Governor Brown signed SB 100, establishing that 100 percent of all electricity in California must be obtained from renewable and zero-carbon energy resources by December 31, 2045. SB 100 also creates new standards for the RPS goals that were established by SB 350 in 2015. Specifically, the bill increases required energy from renewable sources for both investor-owned utilities and publicly owned utilities from 50 percent to 60 percent by 2030. Incrementally, these energy providers must also have a renewable energy supply of 33 percent by 2020, 44 percent by 2024, and 52 percent by 2027. The updated RPS goals are considered achievable, because many California energy providers are already meeting or exceeding the RPS goals established by SB 350. The Adjusted BAU forecasts accounts for these renewable energy targets, as discussed below.

Electricity Emission Factors under the Renewables Portfolio Standard

To account for California’s RPS targets under SB 100 in the Adjusted BAU forecast, the GHG emission factors for electricity consumption were adjusted. These emissions factors represent indirect GHG emissions generated at power plants and are applied to electricity consumption in unincorporated Los Angeles County (see Appendix A for discussion). The RPS has the effect of lowering indirect emissions associated with electricity consumption because it mandates increasing percentages of renewable sources of power supplied by electricity utilities in future years. The RPS requires 60 percent eligible renewables by 2030 and 100 percent RPS-eligible renewable resources by 2045.¹

The two utilities supplying electricity to unincorporated Los Angeles County are Southern California Edison (SCE) and the Clean Power Alliance (CPA). To adjust for the RPS in future years, indirect electricity emission factors reported by SCE and CPA along with the energy power mix were collected for the years 2015–2020. SCE reports its emission factors in their annual sustainability reports and has values for 2015–2019. CPA reports its emission factors to the Climate Registry and has values for 2018–2020. The California Energy Commission (CEC) reports power mix data in Power Content Labels; these are available through 2020 for both SCE and CPA.²

Based on data reported for 2016–2020, a composite “non-RPS” emission intensity factor was generated for each year. This factor is calculated based on the reported total emission factor and the non-RPS power mix. For example, SCE’s total reported emission factor in 2019 is 396.8 pounds (lb) of carbon dioxide equivalent (CO₂e) per megawatt-hour (MWh) for a non-RPS power mix of 65 percent; the “non-RPS” emission intensity factor is therefore 612.4 lb CO₂e/MWh. Then, for each forecast year (2030, 2035, and 2045), an emission factor for total delivered electricity was calculated based on these composite “non-RPS” emission intensity factors for each reported year and the projected RPS requirement for eligible renewables for each year. For example, a 60 percent eligible renewable mix (required by 2030) applied to the “non-RPS” emission intensity factor of 612.4 lb CO₂e/MWh results in a total emission factor of 245 lb CO₂e/MWh.

Table B-1 presents the electricity power mix values reported (2016–2020) and forecasted (2030, 2035, 2045) for SCE and CPA, incorporating the RPS. **Table B-2** presents the electricity emission factors reported for SCE and CPA for 2016–2020 along with the Adjusted BAU forecast for 2030, 2035, and 2045, incorporating the RPS.

¹ RPS-eligible resources include solar, wind, geothermal, small hydroelectric, or biopower facilities that are located within the Western Electricity Coordinating Council (WECC) region, which encompasses 14 Western U.S. states and portions of Canada and Mexico. The majority of RPS-eligible electricity currently comes from solar and wind. Large hydroelectric dams and nuclear facilities, two major sources of carbon-free power, are not RPS-eligible.

² California Energy Commission. 2019. 2018 Power Content Label. July 2019. Available: https://www.energy.ca.gov/sites/default/files/2020-01/2018_PCL_Southern_California_Edison.pdf. Accessed January 2021.

Residential Buildings

Like the BAU Forecast, energy consumption in residential buildings is projected based on building footprint projections for residential stock in unincorporated Los Angeles County (see Appendix A). As discussed above, the electricity emission factors for electricity supplied by SCE are based on SCE’s historical power mix (2015–2019) and RPS targets.³ To account for the RPS and SB 100, SCE emission factors were applied to total residential electricity consumption for 2018, 2030, 2035, and 2045. As reported in Table B-2 above, SCE emission factors were estimated to be 513 lb CO₂e/MWh in 2018, 295.5 lb CO₂e/MWh in 2030, 197 lb CO₂e/MWh in 2035, and 0 lb CO₂e/MWh in 2045.

Beginning in 2019, residential customers in unincorporated Los Angeles County were automatically enrolled in the Clean Power Alliance’s (CPA) “Clean” electricity rate option. While participation data for 2019 were unavailable when the 2018 inventory was developed, a July 2021 member status report indicated a 96 percent participation rate for all residential customers in unincorporated Los Angeles County in 2021.⁴ Under the Clean rate option in 2019, residential customers received 61 percent of their electricity from eligible renewable sources via the CPA, 26 percent from carbon-free sources like hydropower, and 13 percent from unspecified fossil-fuel sources like natural gas and coal (see Table B-1 above). The remaining 4 percent of residential customers were enrolled in CPA’s “Lean” electricity rate option. Under the Lean rate option in 2019, residential customers received 65 percent of their electricity from eligible renewable sources via the CPA, 24 percent from carbon-free sources like hydropower, and 11 percent from unspecified fossil-fuel sources like natural gas and coal (see Table B-1 above).

GHG emissions from CPA-provided electricity are calculated using CPA data including electricity consumption, emission factors, and power mix.⁵ As reported in Table B-2 above, CPA’s Lean emission rates are estimated to be 10.6 lb CO₂e/MWh in 2018, 323.9 lb CO₂e/MWh in 2030, 215.9 lb CO₂e/MWh in 2035, and 0 lb CO₂e/MWh in 2045.⁶ CPA’s Clean emission rates are estimated to be 9.8 lb CO₂e/MWh in 2018, 205.6 lb CO₂e/MWh in 2030, 137 lb CO₂e/MWh in 2035, and 0 lb

CO₂e/MWh in 2045.⁷ CPA emission factors were applied to total residential electricity consumption in 2018, 2030, 2035, and 2045 and emissions for interim years were linearly interpolated.

For emissions associated with natural gas consumption, emission factors are held constant from 2018.⁸ RPS and SB 100 do not affect natural gas usage or emissions, and there are no federal, state, or local policies that would result in changes to the natural gas emission factors in the Adjusted BAU forecast.

Commercial and Institutional Buildings

Like the BAU Forecast, energy consumption in commercial, institutional, and agricultural buildings is forecasted based on building footprint projections for nonresidential building stock in unincorporated Los Angeles County (see Appendix A). In June 2018, nonresidential customers in unincorporated Los Angeles County were enrolled in CPA's Clean Power option, with less than 5 percent of customers opting out; the year-end CPA participation rate is held constant with the remaining customers continuing to receive electricity from SCE. The emission factors for CPA are based on historical power mix (2018–2020) and California's RPS targets, as discussed above and presented in Table B-1.⁹ Emission factors for SCE and CPA are described under *Electricity Emission Factors under the Renewables Portfolio Standard*, above. Natural gas emission factors are held constant from 2018.

Manufacturing and Industrial Buildings

ELECTRICITY AND NATURAL GAS

Like the BAU Forecast, energy consumption in manufacturing and industrial buildings are forecasted based on building footprint projections for nonresidential stock in unincorporated Los Angeles County (see Appendix A).¹⁰ As discussed above, beginning in 2018, nonresidential customers in unincorporated Los Angeles County were enrolled in CPA's Clean Power rate option (50 percent eligible renewable), with less than 5 percent of customers opting out; the year-end CPA participation rate is held constant with the remaining customers continuing to receive electricity from SCE. The emission factors for CPA are based on historical power mix (2018–2020) and California's RPS targets, as discussed above and presented in Table B-1.¹¹ Emission factors for SCE and CPA are the same as described under *Electricity Emission Factors under the Renewables Portfolio Standard*, above.

California Building and Energy Efficiency Standards (Title 24)

The CEC first adopted Energy Efficiency Standards for Residential and Nonresidential Buildings (California Code of Regulations Title 24, Part 6) in 1978 in response to a legislative mandate to reduce energy consumption in the state. Although not originally intended to reduce GHG emissions, increased energy efficiency and reduced consumption of electricity, natural gas, and other fuels would result in fewer GHG emissions from residential and nonresidential buildings subject to the standard. The standards are updated periodically (typically every three years) to allow for the consideration and inclusion of new energy efficiency technologies and methods (CEC, 2016). The current Title 24, Part 6 standards (2019 standards) were made effective on January 1, 2020. The new Title 24, Part 6 standards (2022 standards) were adopted by the CEC in August 2021 and will be made effective on January 1, 2023. The Adjusted BAU forecasts accounts for these updates to Title 24, as discussed below.

Residential Buildings

Under the Adjusted BAU scenario, energy use in residential buildings was adjusted to reflect the effects of Title 24 standards. Title 24 Building Efficiency Standards are updated every three years by the California Energy Commission. The model uses approximate increased energy efficiency percentages for the 2019 Title 24 standards¹² implemented in 2020, and the 2022 standards to be implemented in 2023.¹³ The 2019 percentages are based on CEC estimates for residential and nonresidential buildings and assume that the solar photovoltaic (PV) requirement is met. The 2022 percentages were calculated based on CEC's draft environmental impact report for the

2022 standards.¹⁴ This document outlined the changes in building energy use from the 2019 to 2022 standards on a project-by-project basis. Weighted averages were taken to generate efficiency change values for single-family and multifamily residential buildings for both electricity and natural gas. These efficiency changes are applied to 2019 energy use intensity (EUI) values to generate 2022 EUI values for each building type, which are then applied to the square footage of new construction. In the model, the adjusted EUI is also applied to 15 percent of the total square footage of existing buildings to account for the approximately 15 percent of buildings that are retrofitted each year. Because Title 24 is updated on a three-year cycle, the 2022 changes in energy efficiency are applied every three years in the model.

Advanced Clean Cars Regulations and Pavley Vehicle Efficiency Standards

In 2002, Governor Gray Davis signed Assembly Bill (AB) 1493. AB 1493 requires that the California Air Resources Board (CARB) develop and adopt, by January 1, 2005, regulations that achieve “the maximum feasible reduction of greenhouse gases emitted by passenger vehicles and light-duty trucks and other vehicles determined by CARB to be vehicles whose primary use is noncommercial personal transportation in the State.” To meet the requirements of AB 1493, in 2004 CARB approved amendments to the California Code of Regulations, adding GHG emissions standards to California’s existing standards for motor vehicle emissions. All mobile sources are required to comply with these regulations as they are phased in from 2009 through 2016. These regulations are known as the “Pavley standards” (named for the bill’s author, State Senator Fran Pavley).

In January 2012, pursuant to Recommended Measures T-1 and T-4 of the Original Scoping Plan, CARB approved the Advanced Clean Cars Program, an emissions-control program for model year 2017 through 2025. The program combines the control of smog, soot, and GHGs with requirements for greater numbers of zero-emission vehicles. By 2025, when the rules will be fully implemented, the new automobiles will emit 34 percent fewer global warming gases and 75 percent fewer smog-forming emissions. The program also requires car manufacturers to offer for sale an increasing number of zero-emission vehicles (ZEVs) each year, including battery electric, fuel cell, and plug-in hybrid electric vehicles. In December 2012, CARB adopted regulations allowing car manufacturers to comply with California’s GHG emissions requirements for model years 2017–2025 through compliance with the EPA GHG requirements for those same model years.¹⁵

The Adjusted BAU forecasts accounts for these vehicle fleet efficiency standards, as discussed below.

On-road Transportation: Passenger Vehicles and Trucks

Like the BAU forecast, vehicle miles traveled (VMT) from passenger vehicles and trucks were estimated using SCAG’s 2016 Regional Travel Demand Model, which forecasts VMT for the year 2040 (see Appendix A). GHG emissions under the Advanced Clean Cars regulations and Pavley standards in unincorporated Los Angeles County are calculated using VMT and corresponding weighted emission factors by vehicle type (passenger vehicles and trucks)¹⁶ for years 2018, 2030,

¹⁵ Advanced Clean Cars Program information available online: <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-cars-program/about>. Accessed on February 7, 2020.

¹⁶ Passenger vehicles correspond to EMFAC categories LDA, LDT1, LDT2, MCY, and MD. Trucks correspond to EMFAC categories LHDT1, LHDT2, MHDT, HHDT, and MH.

2035, and 2045 from the EMFAC2021 model.¹⁷ Interim year emissions were interpolated for 2019 through 2029, 2031 through 2034, and 2036 through 2044.

- SCAG Regional Travel Demand Model
Provided by SCAG

On-road Transportation: Buses

Fuel consumption from Metro buses for years 2019 through 2045 was calculated using fuel consumption and VMT data from the EMFAC2021 model. The EMFAC2021 model was run for years 2018, 2030, 2035, and 2045 and the fuel efficiency (miles per gallon, miles per gallon equivalent, or kWh/mile) were calculated.¹⁸ An efficiency factor for diesel, gasoline, compressed natural gas, and electricity was then developed by dividing the 2030, 2035, and 2045 fuel efficiency by the baseline fuel efficiency in 2018. The efficiency factor was then applied to the 2018 fuel consumption by fuel type to determine the project fuel consumption for years 2030, 2035, and 2045. Emission factors for gasoline, diesel and compressed natural (CNG) gas-powered buses are taken from EMFAC2021 database to calculate GHG emissions. Electricity emissions were calculated using CPA Clean option emission factors for the corresponding year. Emissions for interim years were interpolated for years 2019 through 2030, 2031 through 2034, and 2036 through 2044.

Compared to the BAU forecasts, the Adjusted BAU forecast only differs for the Stationary Energy and Transportation sectors. Waste, IPPU, and AFOLU are not changed.

Figure B-1 presents total emissions for 2018 along with the BAU and Adjusted BAU forecast for 2030, 2035, and 2045 for all sectors.

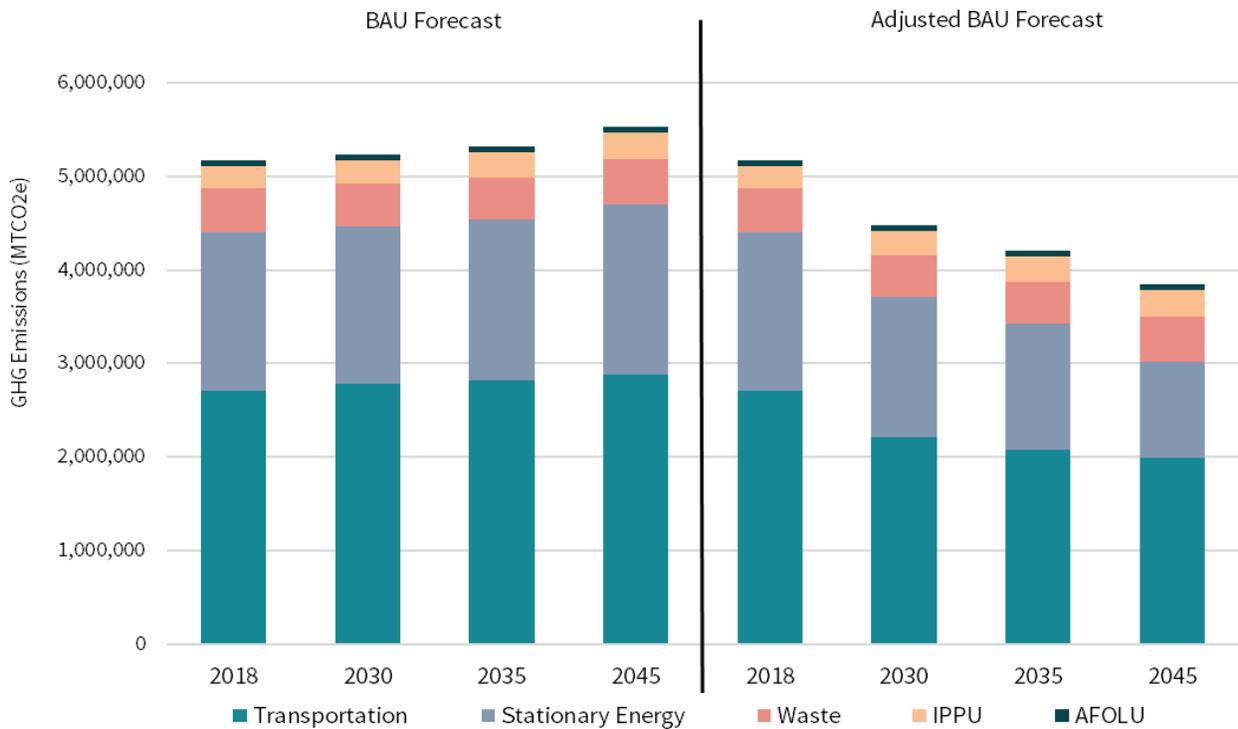

Figure B-1: GHG Emissions by Sector – 2018 Inventory, BAU Forecast, and Adjusted BAU Forecast

B.2 Greenhouse Gas Reduction Measures and Actions

Energy Supply

Strategy 1: Decarbonize the Energy Supply

MEASURE ES1: DEVELOP A SUNSET STRATEGY FOR ALL OIL AND GAS OPERATIONS

Table B-6: Measure ES1 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	28,368
2035	40,178
2045	52,148

*Abbreviations: GHG = greenhouse gas;
MTCO₂e = metric tons of carbon dioxide equivalent.*

Description

Develop a sunset strategy for all oil and gas operations that prioritizes disproportionately affected communities and develop a strategy for carbon removal.

Performance Objectives

The goal of Measure ES1 is to reduce oil and gas operations by 40 percent by 2030, 60 percent by 2035, and 80 percent by 2045 (compared to 2015 baseline levels). The aspirational goal of Measure ES1, based on the OurCounty Sustainability Plan, is to cease all oil and gas operations by 2040.

Modeling Approach

Measure ES1 would apply to emissions occurring in the Energy Industries subsector of the Stationary Energy sector of unincorporated Los Angeles County’s GHG inventory. Specifically, Measure ES1 would reduce emissions from combined heat and power facilities and fugitive emissions from oil and natural gas systems. There are two combined heat and power facilities that would reduce emissions under this measure: the Pitchess Cogeneration Station in Saugus and the Olive View Medical Center Cogeneration Station in Sylmar. Both facilities combust natural gas to generate heat and electricity.

Both the Pitchess Cogeneration Station and the Olive View Medical Center Cogeneration Station are owned and operated by the County. The Pitchess Cogeneration Station was decommissioned in 2018 and its emissions decreased by 90 percent from 2017 to 2018. Under Measure ES1, these emissions were assumed to remain constant through 2045. The Olive View Medical Center Cogeneration Station will be decommissioned by 2023, so its emissions were reduced by 90 percent consistent with the reduction in emissions achieved when the Pitchess Cogeneration Station was decommissioned.

Measure ES1 would also reduce fugitive emissions from oil and natural gas systems equivalent to the measure’s performance objectives: 40 below 2015 levels by 2030, 60 percent by 2035, and

80 percent by 2045. These percentages were multiplied by 2015 emissions to estimate emissions reductions for each future year.

Assumptions

- The decommissioning of the Olive View Medical Center Cogeneration Station would reduce natural gas-related GHG emissions by 90 percent.
- Under Measure ES1, both the Pitchess Cogeneration Station and the Olive View Medical Center Cogeneration Station would continue to combust residual natural gas at 10 percent of their fully operational levels through 2045.
- Measure ES1 will reduce fugitive emissions from oil and natural gas systems linearly with the measure’s overall performance objectives for each future year.

Link: <https://ww2.arb.ca.gov/mrr-data>

MEASURE ES2: PROCURE ZERO-CARBON ELECTRICITY

Table B-15: Measure ES2 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	477,188
2035	317,915
2045	0

Abbreviations: GHG = greenhouse gas; MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Supplying unincorporated Los Angeles County’s power demand with zero-carbon electricity¹⁹ is critical to achieving significant GHG emissions reductions. The CPA is a nonprofit and community choice energy provider that currently serves 32 communities across Southern California.

Performance Objectives

The goal of Measure ES2 is to enroll 100 percent of municipal facilities in CPA’s Green Power rate option (100 percent Renewables), SCE’s Green Rate option, or other available 100 percent zero carbon electricity service by 2030 and 96 percent of unincorporated Los Angeles County in CPA’s Green Power rate option, SCE’s Green Rate option, or other available 100 percent zero carbon electricity service by 2030 (4 percent opt-out rate).

Modeling Approach

The Measure ES2 calculations use Adjusted BAU electricity activity data and GHG emissions for residential and nonresidential uses in 2030, 2035, and 2045 as a baseline. The default participation rate in the CPA Lean and CPA Clean rate options was changed from 47 percent Clean and 48 percent Lean to 95.6 percent Green and 4.4 percent Lean by 2030 and 2035, and to 95.6 percent Green and 4.4 percent Clean by 2045. GHG emissions were calculated using the

¹⁹ “Zero-carbon electricity” means energy resources that either qualify as “renewable” in the most recent Renewables Portfolio Standard (RPS) Eligibility Guidebook or generate zero greenhouse gas emissions on-site, such as hydropower.

Measure ES2 participation rates and CPA emission factors for 2030, 2035, and 2045 (as described in B.1, *Stationary Energy*). GHG emissions after implementation of Measure ES2 were then subtracted from the Adjusted BAU forecast emissions to estimate the GHG emissions reductions produced by Measure ES2.

Assumptions

- CPA and SCE emission factors for electricity are the same as those reported in section B.1 above.
- CPA Lean and SCE emission factors are equal; the SCE emission factors are applied to the to the “Opt Out/CPA Lean” category of electricity use in unincorporated Los Angeles County.
- The overall CPA participation rate (95.6 percent) remains constant through 2045.
- Measure ES2 is the first energy measure implemented; therefore, GHG emissions reductions associated with electricity savings as calculated in subsequent energy measures incorporate Measure ES2 participation rates and electricity emission factors.

MEASURE ES3: INCREASE RENEWABLE ENERGY PRODUCTION

Table B-18: Measure ES3 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	5,919
2035	5,219
2045	0

Abbreviations: GHG = greenhouse gas; MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Expand local solar power generation on existing and new development and for County projects.

Performance Objectives

The goal of Measure ES3 is to increase on-site solar electricity production for existing and new multifamily residential buildings, existing commercial buildings, and municipal buildings. The measure aims to install rooftop PV on 20 percent of existing multifamily residential buildings by 2030, 25 percent by 2035, and 35 percent by 2045; install rooftop solar PV on 15 percent of existing commercial buildings by 2030, 22 percent by 2035, and 32 percent by 2045; install rooftop solar PV on 80 percent of new multifamily residential buildings by 2030, 85 percent by 2035, and 95 percent by 2045; install rooftop solar PV on 40 percent of new commercial buildings by 2030, 50 percent by 2035, and 70 percent by 2045; and install 20,000 kilowatts (kW) of rooftop solar PV at county facilities. This measure also aims to install solar PV for community use and rooftop solar PV at all affordable housing developments.

Modeling Approach

Residential

GHG emissions reductions from rooftop solar PV were calculated using multifamily and single-family housing data and projections from the California Department of Finance. The baseline year for existing residential buildings is assumed to be 2023 because this is the earliest date that the 2045 CAP could be adopted and go into effect. Installation of rooftop solar PV on existing multifamily and single-family residential buildings therefore assumes a baseline year of 2023, and installation of rooftop solar PV on new multifamily residential buildings in 2030, 2035, and 2045 is based on the cumulative number of new multifamily households constructed from 2023 through each target years (e.g., the number of new multifamily residential buildings in 2030 is equal to the sum of all new multifamily housing built between 2023 and 2030).

The total number of existing and new households for each target year was then multiplied by the solar PV installation rate for each target year to obtain the number of participating households installing rooftop solar PV through implementation of Measure ES3. The average multifamily solar system size of 6.1 kW was calculated using data from Center for Sustainable Energy's *Fostering a Future for Multifamily Solar* study for the City of Santa Monica.²⁰ The average annual system electricity production (or system output) in kWh was then determined by inputting the 6.1 kW average system size into the National Renewable Energy Laboratory (NREL) PVWatts calculator for a project located in Los Angeles.²¹ The average system output was then multiplied by the number of participating households for both existing and new multifamily development to determine the total solar production (in kWh) for each target year. GHG emissions reductions were calculated by multiplying the total solar production by the relevant SCE and CPA electricity emission factors, using the same participation rates and electricity emission factors implemented under Measure ES2.

For existing single-family residential buildings, the total number of households was multiplied by the solar PV installation rate for each target year to obtain the number of participating households installing rooftop solar PV through implementation of Measure ES5. The average single-family solar system size of 6.3 kW was calculated using data from using statewide data from Berkeley Laboratory's *Tracking the Sun* database.²² The average annual system electricity production (or system output) in kWh was then determined by inputting the 6.3 kW average system size into the NREL PVWatts calculator for a project located in Los Angeles.²³ The average system output was then multiplied by the number of participating households for existing single-family development to determine the total solar production (in kWh) for each target year. GHG emissions reductions were calculated by multiplying the total solar production by the relevant SCE and CPA electricity emission factors, using the same participation rates and electricity emission factors implemented under Measure ES2.

²⁰ Center for Sustainable Energy. 2018. *Fostering a Future for Multifamily Solar in Santa Monica, CA*. February 2018. Available: <https://energycenter.org/sites/default/files/docs/nav/programs/smp/SantaMonicaMarketProfile.pdf>. Accessed November 2021.

²¹ National Renewable Energy Laboratory. 2021. PVWatts Calculator. Available: <https://pvwatts.nrel.gov/>. Accessed November 2021.

²² Berkeley Laboratory. 2021. *Tracking the Sun*. September 2021. Available: <https://emp.lbl.gov/tracking-the-sun>. Accessed November 2021.

²³ National Renewable Energy Laboratory. 2021. PVWatts Calculator. Available: <https://pvwatts.nrel.gov/>. Accessed November 2021.

Measure E6 does not include rooftop solar PV installations on new single-family residential buildings because this is already required through the current 2019 Title 24 standards and also the new 2022 Title 24 standards and is therefore accounted for in the Adjusted BAU forecast.

Commercial

GHG emissions reductions from rooftop solar PV were calculated using existing and new commercial building square footage data from UCLA.²⁴ Like residential buildings above, the baseline year for existing commercial buildings is assumed to be 2023. Installation of rooftop solar PV on existing commercial buildings therefore assumes a baseline year of 2023, and installation of rooftop solar PV on new commercial buildings in 2030, 2035, and 2045 is based on the cumulative number of new commercial square footage constructed from 2023 through each target year (e.g., the number of new commercial square footage in 2030 is equal to the sum of all new commercial square footage built between 2023 and 2030).

Similar to residential buildings, the building square footage was multiplied by the solar PV installation rate for each target year to obtain the total participating commercial square footage installing rooftop solar PV through implementation of Measure ES3. The total number of commercial solar systems was determined by dividing the participating square footage by the average square footage of a commercial building in California of 15,599 square feet.²⁵ The average commercial solar system size was estimated using statewide data from Berkeley Laboratory's *Tracking the Sun* database; this value is 137.1 kW per commercial system.²⁶ The average annual electricity production (or system output) in kWh was then determined by inputting the average system size into the NREL PVWatts calculator for a project located in Los Angeles.²⁷ The average system output was then multiplied by the number of commercial solar systems for both existing and new development to determine the total solar production (in kWh) for each target year. GHG emissions reductions were calculated by multiplying the total solar production by the relevant SCE and CPA electricity emission factors, using the same participation rates and electricity emission factors implemented under Measure ES2.

Municipal

GHG emissions reductions from municipal solar PV installations assumes that the County will install a total of 30 solar systems on County facilities, producing a total capacity of 20 MW. The average system output was then determined by inputting a 20 MW production value into the NREL PVWatts calculator for a project located in Los Angeles.²⁸ The total system output for 20 MW of solar was then multiplied by the relevant SCE and CPA electricity emission factors, using the same participation rates and emission factors implemented under Measure ES2.

Assumptions

- CPA and SCE emission factors for electricity are the same as those reported in Section B.1 above.
- CPA participation rates after implementation of Measure ES2.
- Existing building stock represents the built environment through the year 2023.
- New building stock represents new development starting in 2025.
- The average multifamily solar PV system size is 6.1 kW; each system produces 10,067 kWh per year.
- The average single-family solar PV system size is 6.3 kW; each system produces 10,466 kWh per year.
- The average commercial building solar PV system size is 137.1 kW; each system produces 227,758 kWh per year.
- 20 MW of solar PV is installed at municipal facilities; these systems produce 36,068,108 kWh per year.
- Annual GHG emissions reductions for each target year (2030, 2035, and 2045) reflect all buildings electrified in all previous years (e.g., all buildings electrified from 2025–2030 contribute to annual emissions reductions in 2030).
- New single-family residential buildings are required to install solar PV pursuant to the 2019 and 2022 Title 24 standards.

Transportation

GHG emissions reductions modeled for Measures T1, T2, T3, and T4 are based on changes to planned land use and transportation infrastructure (such as bikeways and transit) already envisioned in existing County plans and programs, such as the 2021 Housing Element Update and its Program EIR, the Los Angeles County Bike Master Plan (2012), the LA Metro NextGen Plan (2020), and LA Metro Long Range Transportation Plan (2020). The 2045 CAP does not result in any new changes to land use or transportation infrastructure than what was already analyzed in these existing plans and their CEQA documents. Consequently, the 2045 CAP merely models the GHG emissions reductions associated with the changes to land use and transportation infrastructure that were already analyzed elsewhere.

Strategy 2: Increase Densities and Diversity of Land Uses Near Transit

MEASURE T1: INCREASE DENSITY NEAR HIGH-QUALITY TRANSIT AREAS

Table B-7: Measure T1 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	27,357
2035	26,019
2045	25,276

Abbreviations: GHG = greenhouse gas;
MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Increase housing opportunities that are affordable and near transit, to reduce VMT.

Performance Objectives

The goal of Measure T1 is to increase residential density by achieving a minimum of 20 dwelling units (DU) per acre (maximum of 30–150 DU/acre) for High Quality Transit Areas (HQTAs), locate residential and employment centers in unincorporated Los Angeles County within one mile of an HQTA, and increase the dwelling units within HQTAs by 27 percent.

Modeling Approach

VMT reductions were estimated using research documented in the 2021 California Air Pollution Control Officers Association (CAPCOA) publication *Quantifying Greenhouse Gas Mitigation Measures* (referred to herein as the “CAPCOA handbook”).²⁹ To quantify VMT reductions, appropriate equations were used based on factsheets in the CAPCOA handbook. Using data from a County GIS shapefile layer showing the 2021–2029 Housing Element Rezone Areas and a major transit stop GIS layer developed as part of the County’s SB 743 VMT Tool released in late 2020, along with CAPCOA equations, percent reductions in VMT were estimated for Measure T1. Specifically, it was assumed that the residential density within HQTAs as planned for in the 2021–2029 Housing Element would be 20 DU per acre (the Housing Element analyzed densities from 20 DU/acre to 50 du/acre) compared to the typical density value of 9.1 DU/acre, resulting in a 26.4 percent reduction in passenger vehicle VMT for affected areas. This reduction was applied to the specific home-based VMT occurring within the affected transit-oriented design (TOD) areas in unincorporated Los Angeles County.

VMT was calculated at the transportation analysis zone (TAZ) level.³⁰ Once the percent VMT reductions were determined, based on the geographic scope and VMT category of Measure T1, the appropriate VMT was aggregated across the relevant TAZs within which residential densities would increase. Percent reductions were then applied to appropriate VMT subtotals to obtain the VMT reduction estimates. The sum of these reductions was then subtracted from total light-duty

²⁹ California Air Pollution Control Officers Association. 2021. *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity*, California Air Pollution Control Officers Association. December 2021. Available: <http://www.airquality.org/air-quality-health/climate-change/ghg-handbook-calcemod>. Accessed January 2022.

³⁰ TAZs are comparable in size and shape to census tracts or block groups depending on the travel demand model used and level of modeling detail.

vehicle VMT to estimate adjusted daily VMT. This adjusted daily VMT was then projected to obtain VMT reductions and adjusted totals in each analysis year (2030, 2035, and 2045). These VMT calculations were prepared by Fehr & Peers and supplied to the County.

GHG reductions from Measure T1 are calculated using daily VMT reductions provided by Fehr & Peers, as described above.³¹ The average daily VMT reductions achieved through implementation of Measure T1 were annualized by multiplying by 347 days, consistent with the GHG Inventory and Adjusted BAU forecast (see Appendix A). GHG emissions reductions were then calculated by multiplying the annual VMT reductions by the Adjusted BAU passenger vehicle emission factors for each target year as derived from EMFAC2021 (see Section B.1 above).³²

Assumptions

- The residential density within HQTAs as planned for in the County’s 2021–2029 Housing Element would be 20 DU per acre.
- The typical residential density without the County’s 2021 Housing Element Update is 9.1 DU per acre.
- VMT reductions apply to home-based VMT occurring within the affected TOD and HQTA areas in unincorporated Los Angeles County.
- Daily VMT reductions are annualized by multiplying by 347 days.
- Passenger vehicle category corresponds to the EMFAC vehicle categories LDA, LDT1, LDT2, MCY, and MD.

MEASURE T2: DEVELOP LAND USE PLANS ADDRESSING JOBS-HOUSING BALANCE AND INCREASE MIXED USE

Table B-8: Measure T2 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	39,184
2035	37,267
2045	36,204

Abbreviations: GHG = greenhouse gas; MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Increasing density and the mix of land uses can help reduce single-occupancy trips, the number of trips, and trip lengths.

³¹ Fehr & Peers. 2021. County of Los Angeles CAP VMT Reduction Estimate Summary. February 22, 2023.

³² California Air Resources Board. 2021. EMFAC2021 Model. Version v1.0.1. Available: <https://arb.ca.gov/emfac/emissions-inventory/4c9f04282a1f85d62a27721058b5a3bb6fd22fb9>. Accessed October 2021.

Performance Objectives

The goal of Measure T2 is to increase job density to 300 jobs per acre by 2030.

Modeling Approach

To quantify VMT reductions for Measure T2, appropriate equations were used based on factsheets in the CAPCOA handbook. Using data from a County GIS shapefile layer showing the 2021–2029 Housing Element Rezone Areas and a major transit stop GIS layer developed as part of the County’s SB 743 VMT Tool released in late 2020, along with CAPCOA equations, percent reductions in VMT were estimated for Measure T2. Specifically, it was assumed that the transit mode share as planned for in the as planned for in the County’s SB 743 VMT Tool would be 27 percent compared to the typical transit mode share of 15 percent, resulting in a 31.8 percent reduction in passenger vehicle VMT for affected areas. This reduction was applied to the total VMT occurring within the affected TOD areas in unincorporated Los Angeles County.

VMT was calculated at the TAZ level. Once the percent VMT reductions were determined, based on the geographic scope and VMT category of Measure T2, the appropriate VMT was aggregated across the relevant TAZs within which transit mode shift would increase. Percent reductions were then applied to appropriate VMT subtotals to obtain the VMT reduction estimates. The sum of these reductions was then subtracted from total light-duty vehicle VMT to estimate adjusted daily VMT. This adjusted daily VMT was then projected to obtain VMT reductions and adjusted totals in each analysis year (2030, 2035, and 2045). These VMT calculations were prepared by Fehr & Peers and supplied to the County.

GHG reductions from Measure T2 are calculated using daily VMT reductions provided by Fehr & Peers, as described above.³³ The average daily VMT reductions achieved through implementation of Measure T2 were annualized by multiplying by 347 days, consistent with the GHG Inventory and Adjusted BAU forecast (see Appendix A). GHG emissions reductions were then calculated by multiplying the annual VMT reductions by the Adjusted BAU passenger vehicle emission factors for each target year as derived from EMFAC2021 (see Section B.1 above).³⁴

Assumptions

- The transit mode share would increase from 15 percent to 27 percent under this measure, based on the County’s 2021 Housing Element Update and the County’s SB 743 VMT Tool.
- VMT reductions apply to the total VMT occurring within the affected TOD areas in unincorporated Los Angeles County.
- Daily VMT reductions are annualized by multiplying by 347 days
- Passenger vehicle category corresponds to the EMFAC vehicle categories LDA, LDT1, LDT2, MCY, and MD.

Strategy 3: Reduce Single-Occupancy Vehicle Trips

MEASURE T3: EXPAND BICYCLE AND PEDESTRIAN NETWORK TO SERVE RESIDENTIAL, EMPLOYMENT, AND RECREATIONAL TRIPS

Table B-9: Measure T3 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	0
2035	2,811
2045	2,730

Abbreviations: GHG = greenhouse gas;
MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Travel options that serve a variety of land uses and trip purposes can help shift some trips away from single-occupancy vehicles.

Performance Objectives

The goal of Measure T3 is to increase bikeway miles by 300 percent by 2035.

Modeling Approach

To quantify VMT reductions for Measure T3, appropriate equations were used based on factsheets in the CAPCOA handbook. Using data from a County GIS shapefile layer showing the 2021–2029 Housing Element Rezone Areas and the 2012 County of Los Angeles Bicycle Master Plan, along with CAPCOA equations, percent reductions in VMT were estimated for Measure T3. Specifically, it was assumed that the bikeway network as planned for in the 2012 County of Los Angeles Bicycle Master Plan would be increased by more than threefold by 2035 as compared to existing conditions, resulting in a 0.5 percent reduction in Countywide passenger vehicle VMT. This reduction was applied to the total VMT occurring within unincorporated Los Angeles County. The sum of these VMT reductions was then subtracted from total light-duty vehicle VMT to estimate adjusted daily VMT. This adjusted daily VMT was then projected to obtain VMT reductions and adjusted totals in each analysis year (2030, 2035, and 2045). These VMT calculations were prepared by Fehr & Peers and supplied to the County.

GHG reductions from Measure T3 are calculated using daily VMT reductions provided by Fehr & Peers, as described above.³⁵ The average daily VMT reductions achieved through implementation of Measure T3 were annualized by multiplying by 347 days, consistent with the GHG Inventory and Adjusted BAU forecast (see Appendix A). GHG emissions reductions were

³⁵ Fehr & Peers. 2021. County of Los Angeles CAP VMT Reduction Estimate Summary, February 22, 2023.

then calculated by multiplying the annual VMT reductions by the Adjusted BAU passenger vehicle emission factors for each target year as derived from EMFAC2021 (see Section B.1 above).³⁶

Assumptions

- The County’s bikeway network as planned for in the 2012 County of Los Angeles Bicycle Master Plan would be increased by more than threefold by 2035 as compared to existing conditions.
- The reduction in VMT applies to the total VMT occurring within unincorporated Los Angeles County.
- Daily VMT reductions are annualized by multiplying by 347 days.
- Passenger vehicle category corresponds to EMFAC vehicle categories LDA, LDT1, LDT2, MCY, and MD.

MEASURE T4: BROADEN OPTIONS FOR TRANSIT, ACTIVE TRANSPORTATION, AND ALTERNATIVE MODES OF TRANSPORTATION

Table B-10: Measure T4 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	11,465
2035	10,904
2045	10,593

Abbreviations: GHG = greenhouse gas;
MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Transit service, micro mobility services (such as bike-share, scooter-share, and drone deliveries), and access to these transportation options can help reduce VMT.

Performance Objectives

The goal of Measure T4 is to, by 2030, double transit service hours from 560,000 to 1.12 million hours, install bus-only lanes on all major transit thoroughfares, and that 75 percent of unincorporated Los Angeles County residents will live within one-half mile of shuttle or mobility service. Measure T4 has several additional performance goals, such as that all transit corridors will have micro mobility service and to prioritize micro mobility along equity areas and high-quality transit corridors.

³⁶ California Air Resources Board. 2021. EMFAC2021 Model. Version v1.0.1. Available: <https://arb.ca.gov/emfac/emissions-inventory/4c9f04282a1f85d62a27721058b5a3bb6fd22fb9>. Accessed October 2021.

Modeling Approach

To quantify VMT reductions for Measure T4, appropriate equations were used based on factsheets in the CAPCOA handbook. VMT reductions and associated GHG emissions reductions were quantified for two separate implementing actions that support Measure T4: Action T4.1 (Expand and improve frequency of County shuttles and explore new mobility services, such as micro transit, autonomous vehicles, micro mobility, and on-demand autonomous shuttles) and Action T4.2 (Install bus-only lanes and signal prioritization along major thoroughfares, and work with transit agencies and neighboring jurisdictions to plan and install full bus rapid transit infrastructure along priority corridors, as appropriate).

To calculate VMT reductions from Action T4.1, Fehr & Peers used a major transit stop GIS layer developed as part of the County's SB 743 VMT Tool released in late 2020 and information from the LA Metro NextGen Bus Plan (2020) and the LA Metro Long Range Transportation Plan (2020), along with CAPCOA equations. Specifically, the transit mode share of 4.6 percent per the 2012 California Household Travel Survey was used, and it was assumed that implementation of Action T4.1 would increase the total number of transit service hours in unincorporated Los Angeles County from 560,000 to 1.12 million after transit expansion. This value is based on the Metro NextGen report. This increase in transit service hours would result in a 1.9 percent reduction in Countywide passenger vehicle VMT. This reduction was applied to the total VMT occurring within unincorporated Los Angeles County. This VMT reduction was then subtracted from total light-duty vehicle VMT to estimate adjusted daily VMT. This adjusted daily VMT was then projected to obtain VMT reductions and adjusted totals in each analysis year (2030, 2035, and 2045).

To calculate VMT reductions from Action T4.2, Fehr & Peers used a major transit stop GIS layer developed as part of the County's SB 743 VMT Tool released in late 2020 and information from the LA Metro NextGen Plan and LA Metro Long Range Transportation Plan, along with CAPCOA equations. Specifically, the transit mode share of 4.6 percent per the 2012 California Household Travel Survey was used, and it was assumed that implementation of Action T4.2 would result in 100 percent of all transit routes in unincorporated Los Angeles County will receive bus-only lanes, signal prioritization along major thoroughfares, and full bus rapid transit infrastructure along priority corridors. This value is based on the LA Metro NextGen Plan and LA Metro Long Range Transportation Plan. This infrastructure would result in a 0.6 percent reduction in total VMT occurring in unincorporated Los Angeles County's TOD areas and HQTAs. VMT was calculated at the TAZ level. Once the percent VMT reductions were determined, based on the geographic scope and VMT category of Measure T4.2, the appropriate VMT was aggregated across the relevant TAZs within which transit mode shift would increase. Percent reductions were then applied to appropriate VMT subtotals to obtain the VMT reduction estimates. The sum of these reductions was then subtracted from total light-duty vehicle VMT to estimate adjusted daily VMT. This adjusted daily VMT was then projected to obtain VMT reductions and adjusted totals in each analysis year (2030, 2035, and 2045).

GHG reductions from Measure T4 are calculated using daily VMT reductions provided by Fehr & Peers, as described above.³⁷ The average daily VMT reductions achieved through implementation of Measure T4 were annualized by multiplying by 347 days, consistent with the GHG Inventory and Adjusted BAU forecast (see Appendix A). GHG emissions reductions were

³⁷ Fehr & Peers. 2021. County of Los Angeles CAP VMT Reduction Estimate Summary, February 22, 2023.

then calculated by multiplying the annual VMT reductions by the Adjusted BAU passenger vehicle emission factors for each target year as derived from EMFAC2021 (see Section B.1 above).³⁸

Assumptions

- The baseline transit mode share is 4.6 percent, per the 2012 California Household Travel Survey.
- For Action T4.1, the total number of transit service hours in unincorporated Los Angeles County would increase from 560,000 to 1.12 million after transit expansion.
- For Action T4.1, the reduction in VMT applies to the total VMT occurring within unincorporated Los Angeles County.
- For Action T4.2, 100 percent of all transit routes in unincorporated Los Angeles County will receive bus-only lanes, signal prioritization along major thoroughfares, and full bus rapid transit infrastructure along priority corridors.
- For Action T4.2, VMT reductions apply to the relevant TAZs within which transit mode shift would increase.
- Daily VMT reductions are annualized by multiplying by 347 days.
- Passenger vehicle category corresponds to the EMFAC vehicle categories LDA, LDT1, LDT2, MCY, and MD.

Abbreviations: GHG = greenhouse gas;
MTCO₂e = metric tons of carbon dioxide equivalent.

³⁸ California Air Resources Board. 2021. EMFAC2021 Model. Version v1.0.1. Available: <https://arb.ca.gov/emfac/emissions-inventory/4c9f04282a1f85d62a27721058b5a3bb6fd22fb9>. Accessed October 2021.

Description

Increase unincorporated Los Angeles County's ZEV market share and vehicle penetration to the maximum extent feasible. Set targets for reducing total gasoline and diesel vehicle fuel sales.

Performance Objectives

The goal of Measure T6 is to increase the total amount of light-duty vehicles in unincorporated Los Angeles County that are ZEVs to 30 percent by 2030, 50 percent by 2035, and 90 percent by 2045; to increase the sales of new light-duty vehicles in unincorporated Los Angeles County that are ZEVs to 68 percent by 2030 and 100 percent by 2035; to install 38,000 total new public and private shared EVCS (including EVCS at County facilities and properties) by 2030, 74,000 total new EVCS by 2035, and 140,000 total new EVCS by 2045; and to install 5,000 total new EVCS at County facilities and properties, 10,000 total new EVCS by 2035, and 25,000 total new EVCS by 2045.

Modeling Approach

The Measure T6 calculations use Adjusted BAU GHG emissions from passenger vehicles as a baseline. To calculate the portion of the passenger vehicle fleet that are ZEVs under Measure T6, the passenger vehicle electrification performance goals for each future year were applied to the total vehicle population and Countywide VMT outputs of the applicable EMFAC2021 model passenger vehicle types (LDA, LDT1, LDT2, MCY, and MDV). The remaining non-ZEV population and Countywide VMT by fuel type (diesel, gasoline, and plug-in hybrid) was distributed proportionally for each vehicle type based on Countywide fuel type distribution data from EMFAC2021. The adjusted ZEV population and VMT values with implementation of Measure T6 were then factored back in to the VMT-weighted emission factor calculations used for the Adjusted BAU forecast (see section B.2 above) to calculate new fleetwide vehicle emission rates under Measure T6. The recalculated weighted emission factors for passenger vehicles were then applied to the total passenger vehicle VMT by year to estimate GHG emissions with implementation of Measure T6.

Electric vehicle miles traveled (e-VMT) were then calculated for the Adjusted BAU forecast and for the scenario with implementation of Measure T6 by multiplying the total passenger vehicle VMT for each year by the electric vehicle share under each scenario. The e-VMT was then multiplied by electricity factors (kWh/mile) derived from EMFAC2021 to determine the total electricity consumption from electric vehicles. GHG emissions associated with this electricity use were estimated using the same participation rates and emission factors implemented under Measure ES2, as described below. Total GHG emissions reductions from Measure T6 were calculated by subtracting GHG emissions associated with Measure T6 implementation for passenger vehicles and electric vehicle charging from GHG emissions under the Adjusted BAU forecast for passenger vehicles and electric vehicle charging.

Measure T6 substantially reduces GHG emissions in the county; this measure is the most effective measure in the 2045 CAP.

Assumptions

- Increased electric vehicle adoption displaces all other vehicle types (diesel, gasoline, plug-in hybrid) and non-ZEV VMT is redistributed proportional to each fuel type's share of total population and VMT (from EMFAC2011).
- The efficiency of electric vehicles remains constant throughout all future years.

- The County passenger fleet vehicle population remains constant through 2045.
- CPA and SCE emission factors for electricity are the same as those reported in section B.1 below.
- CPA participation rates after implementation of Measure ES2.

MEASURE T7: ELECTRIFY COUNTY FLEET VEHICLES

Table B-12: Measure T7 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	29,743
2035	24,335
2045	10,119

Abbreviations: GHG = greenhouse gas; MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Electrify the County bus, shuttle, and light-duty vehicle fleet and shuttles.

Performance Objectives

The goals of this measure are to increase the total amount of light-duty vehicles in the County-owned fleet that are ZEVs to 35 percent by 2030, 60 percent by 2035, and 100 percent by 2045; to electrify the entire County bus and shuttle fleet by 2035; and to electrify 15 of the County’s inmate buses by 2030, 30 inmate buses by 2035, and 68 inmate buses by 2045.

Modeling Approach

GHG emissions reductions associated with electrification of County passenger fleet vehicles were calculated for Measure T7. The total number of County fleet passenger vehicles was provided by the County’s Internal Services Department (ISD).³⁹ Total VMT for these vehicles were estimated based on an annual average VMT per vehicle from the Alternative Fuels Data Center.⁴⁰ This average VMT value was then multiplied by the number of vehicles to estimate the total annual VMT for County fleet passenger vehicles. The baseline (Adjusted BAU) e-VMT was estimated based on the number of electric vehicle purchases in fiscal year 2019–20 as a percentage of total passenger fleet vehicles from the County’s Annual Clean Fuel Sustainability Report. e-VMT under implementation of Measure T6 was estimated using the total passenger fleet vehicle VMT and electric vehicle fleet goals specific to the County fleet (35 percent by 2030, 60 percent by 2035,

³⁹ County of Los Angeles Internal Services Department. 2021. *Annual Clean Fuel Sustainability Report*.

⁴⁰ Alternative Fuels Data Center. 2020. Annual Average VMT per Vehicle. February 2020. Available: <https://afdc.energy.gov/data/10309>. Accessed November 2021.

and 100 percent by 2045). GHG emissions for electrified passenger fleet vehicles with implementation of Measure T6 were then calculated by multiplying total VMT by adjusted VMT-weighted emission factors from EMFAC2021 using the same method as discussed above for the Countywide fleet, scaled to match the light-duty fleet electrification performance objectives of this measure. These emissions were subtracted from the Adjusted BAU forecast GHG emissions for the County passenger vehicle fleet in order to estimate GHG emissions reductions for Measure T7 for county light-duty fleet vehicles. Only the portion of GHG emissions reductions for county fleet vehicles that exceed the ZEV goals of Measure T6 were included in Measure T7, to avoid double-counting the effects of Measure T6 on the county-owned fleet.

The Measure T7 calculations use Adjusted BAU fuel use and GHG emissions from public transit buses as a baseline. Measure T7 assumes a 100 percent electrification rate of all County fleet buses by 2030. To calculate GHG emissions reductions associated with Measure T7, fuel use from diesel, gasoline, and compressed natural gas under the Adjusted BAU forecast was converted to electricity using specific energy effectiveness ratios (EERs) by fuel type and conversion factors from gallons to British thermal units (Btu) and Btu to electricity use.^{41,42} The EERs account for the change in vehicle energy efficiency when substituting one fuel for another. GHG emissions associated with implementation of Measure T7 were calculated using the same participation rates and emission factors implemented under Measure ES2, as discussed below. GHG emissions after implementation of Measure T7 were then subtracted from the Adjusted BAU GHG emissions to estimate the emissions reductions from Measure T7.

Measure T7 also includes electrification of the County's inmate bus fleet. The total number of inmate buses in the County's fleet (88) was provided by the Los Angeles County Sheriff's Department.⁴³ Annual VMT for the County's inmate bus fleet was estimated based on an annual average VMT value of 12,000 per bus from the Alternative Fuels Data Center.⁴⁴ The average inmate bus VMT was then multiplied by the total number of inmate buses to estimate the total annual VMT for inmate buses. The baseline e-VMT was assumed to be zero given that the Sheriff's Department does not currently operate any electric inmate buses. e-VMT from implementation of Measure T7 was determined using data provided by the Los Angeles County Sheriff's Department on planned electrification of the inmate bus fleet: 15 buses electrified by 2030, 30 buses electrified by 2035, and 68 buses electrified by 2045.⁴⁵ GHG emissions associated with the electrification of inmate buses under Measure T7 were calculated using weighted average bus emission factors from EMFAC2021 multiplied by the annual diesel VMT and e-VMT; these emissions were then subtracted from the GHG emissions in the Adjusted BAU forecast to determine emissions reductions.

Assumptions

- The County passenger fleet vehicle annual average VMT per vehicle value of 11,467 remains constant through 2045.
- Complete electrification of the transit bus fleet by 2030.
- CPA and SCE emission factors for electricity are the same as those reported in section B.1 below.
- CPA participation rates after implementation of Measure ES2.
- EERs applied to each non-electric fuel type to convert to electricity.
- The County inmate bus fleet vehicle annual average VMT per bus value of 12,000 remains constant through 2045.

MEASURE T8: ACCELERATE FREIGHT DECARBONIZATION

Table B-13: Measure T8 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	86,168
2035	103,528
2045	176,638

Abbreviations: GHG = greenhouse gas;
MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Incentivize and implement freight decarbonization technologies, specifically focusing on charging infrastructure.

Performance Objectives

The goal of this measure is to achieve a total market share of ZEVs for medium- and heavy-duty vehicles of 40 percent by 2030, 60 percent by 2035, and 90 percent by 2045; transition 50 percent of medium- and heavy-duty vehicles in the County-owned fleet to ZEVs by 2030, 70 percent by 2035, and 95 percent by 2045; ensure that 100 percent of the drayage truck fleet is ZEV by 2035; ensure that 100 percent of sales of medium- and heavy-duty trucks are ZEV by

2045; require that all new warehouse loading docks have EVCS by 2030; and require that all existing warehouse loading docks have EVCS by 2030.

Modeling Approach

The Measure T8 calculations use Adjusted BAU GHG emissions from medium- and heavy-duty trucks as a baseline. To calculate the portion of the medium- and heavy-duty truck fleet that are ZEVs under Measure T8, the truck electrification performance goals for each future year were applied to the total vehicle population and Countywide VMT outputs of the applicable EMFAC2021 model medium- and heavy-duty vehicle types (LHDT1, LHDT2, MHDT, HHDT, and MH). The remaining non-ZEV population and Countywide VMT by fuel type (diesel, gasoline, and natural gas) was distributed proportionally for each vehicle type based on Countywide fuel type distribution data from EMFAC2021. The adjusted ZEV population and VMT values with implementation of Measure T8 were then factored back into the VMT-weighted emission factor calculations used for the Adjusted BAU forecast (see section B.2 above) to calculate new fleetwide vehicle emission rates under Measure T8. The recalculated weighted emission factors for trucks were then applied to the total medium- and heavy-duty truck VMT by year to estimate GHG emissions with implementation of the Measure T8.

The e-VMT were then calculated for the Adjusted BAU forecast and for the scenario with implementation of Measure T8 by multiplying the total medium- and heavy-duty truck VMT for each year by the electric vehicle share under each scenario.⁴⁶ The e-VMT was then multiplied by electricity factors (kWh/mile) derived from EMFAC2021 to determine the total electricity consumption from electric vehicles. GHG emissions associated with this electricity use were estimated using the same participation rates and emission factors implemented under Measure ES2, as described below. Total GHG emissions reductions from Measure T8 were calculated by subtracting GHG emissions associated with Measure T8 implementation for medium- and heavy-duty trucks and electric vehicle charging from GHG emissions under the Adjusted BAU forecast for medium- and heavy-duty trucks and electric vehicle charging.

GHG emissions reductions associated with electrification of the County's medium- and heavy-duty fleet vehicles were also calculated for Measure T8. The total number of County fleet medium- and heavy-duty trucks was provided by ISD.⁴⁷ Total VMT for these vehicles were estimated based on an annual average VMT per truck from the Alternative Fuels Data Center.⁴⁸ This average VMT value was then multiplied by the number of trucks to estimate the total annual VMT for the County's medium- and heavy-duty fleet vehicles. The baseline (Adjusted BAU) e-VMT was estimated based on the number of electric truck purchases in fiscal year 2019–20 as a percentage of total medium- and heavy-duty fleet vehicles from the County's Annual Clean Fuel Sustainability Report. e-VMT under implementation of Measure T8 was estimated using the total medium- and heavy-duty fleet vehicle VMT and electric truck fleet goals specific to the County fleet (60 percent by 2030, 80 percent by 2035, and 95 percent by 2045). GHG emissions for electrified medium- and heavy-duty fleet vehicles with implementation of Measure T8 were then calculated by multiplying total VMT by adjusted VMT-weighted emission factors from EMFAC2011 using the same method as discussed above for the Countywide fleet. These

emissions were subtracted from the Adjusted BAU forecast GHG emissions for the County’s medium- and heavy-duty vehicle fleet to estimate GHG emissions reductions for Measure T8 for County fleet vehicles.

Assumptions

- Increased electric vehicle adoption displaces all other vehicle types (diesel, gasoline, natural gas) and VMT is redistributed proportional to the fuel type’s share of total population and VMT.
- The County’s medium- and heavy-duty fleet vehicle population remains constant through 2045.
- The County’s medium- and heavy-duty fleet vehicle annual average VMT per vehicle value of 16,326 remains constant through 2045.
- CPA and SCE emission factors for electricity are the same as those reported in section B.1 above.
- CPA participation rates after implementation of Measure ES2.

MEASURE T9: EXPAND USE OF ZERO-EMISSION TECHNOLOGIES FOR OFF-ROAD VEHICLES AND EQUIPMENT

Table B-14: Measure T9 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	8,373
2035	21,819
2045	44,964

Abbreviations: GHG = greenhouse gas;
MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Prohibit the use of gas- and diesel-powered small (≤25 horsepower) off-road equipment and increase the use of zero-emission and near-zero-emission construction, agriculture, and manufacturing equipment.

Performance Objectives

The goal of this measure is to increase the total amount of off-road fleet and equipment in unincorporated Los Angeles County that are ZEVs to 20 percent by 2030, 50 percent by 2035, and 95 percent by 2045; and to increase the fleetwide percentage of construction, agriculture, and manufacturing equipment in unincorporated Los Angeles County that are ZEVs to 50 percent by 2030, 75 percent by 2035, and 100 percent by 2045.

Modeling Approach

The Measure T9 calculations use Adjusted BAU off-road vehicle fuel consumption and GHG emissions as a baseline for estimating GHG emissions reductions. Measure T9 aims to electrify unincorporated Los Angeles County's off-road vehicles and equipment by an increasing percentage in each future year. To calculate GHG emissions reductions associated with Measure T9, fuel use from diesel, gasoline, and compressed natural gas under the Adjusted BAU forecast was multiplied by electrification rates by target year and then converted to electricity using specific EERs by fuel type and conversion factors from gallons to Btu and Btu to electricity use.^{49,50} GHG emissions from electricity under Measure T9 were calculated using the same participation rates and emission factors implemented under Measure ES2, as discussed below. Diesel, gasoline, and natural gas GHG emissions were calculated using emission factors derived from CARB's OFFROAD2017 ORION model.⁵¹ GHG emissions after implementation of Measure T9 were then subtracted from the Adjusted BAU GHG emissions to estimate the emissions reductions from Measure T9.

Assumptions

- Natural gas-fueled equipment is not displaced by electric equipment.
- CPA and SCE emission factors for electricity are the same as those reported in section B.1 below.
- CPA participation rates after implementation of Measure ES2.
- EERs applied to each non-electric fuel type to convert to electricity.

Building Energy and Water

Building Energy and Water Measure Order of Implementation

To avoid double counting GHG emissions reductions for measures that reduce emissions in building energy and water, these measures account for overlapping effects. For example, Measure ES2 (Procure Zero Carbon Electricity) is implemented first and includes electricity emission factors and CPA participation rates that are applied through the remaining building

⁴⁹ Navius Research. 2018. *Analysis of Energy Effectiveness Ratios for Light- and Heavy-Duty Vehicles*. November 6, 2018. Available: <https://www.naviusresearch.com/wp-content/uploads/2018/11/BC-EER-Review-Final-Report-2018-11-06.pdf>. Accessed November 2021.

⁵⁰ Alternative Fuels Data Center. 2021. Fuel Properties. January 2021. Available: <https://afdc.energy.gov/fuels/properties>. Accessed November 2021.

energy and water measures. Further, each measure’s baseline activity data (i.e., electricity and natural gas consumption) are affected by the ordering of the measures. For example, grid electricity savings from solar production under Measure ES3 (Increase Renewable Energy Production) are subtracted from the adjusted BAU electricity activity data for the relevant building sector and the resulting electricity usage is used as the new “baseline” activity data for the next measure, Measure E4 (Improve Energy Efficiency of Existing Buildings). After Measure E4 is implemented, the new “baseline” activity data are recalculated and used as the new “baseline” total electricity usage for Measure E1 (Transition Existing Buildings to All-Electric). For calculation purposes, measures were assumed to be implemented in the following order:

1. Measure ES2: Procure Zero Carbon Electricity
2. Measure ES3: Increase Renewable Energy Production
3. Measure E4: Improve Energy Efficiency of Existing Buildings
4. Measure E1: Transition Existing Buildings to All-Electric
5. Measure E2: Standardize All-Electric New Development
6. Measure E5: Increase Use of Recycled Water and Gray Water Systems

Note that Measure E2 (Standardize All-Electric New Development) is independent of the other measures because it exclusively applies to new development and therefore does not use the same baseline activity data as the other measures.

Strategy 5: Decarbonize Buildings

MEASURE E1: TRANSITION EXISTING BUILDINGS TO ALL-ELECTRIC

Table B-16: Measure E1 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	176,072
2035	280,988
2045	477,221

Abbreviations: GHG = greenhouse gas; MTCO₂e = metric tons of carbon dioxide equivalent.

Description

As the carbon intensity of grid-supplied electricity decreases, decarbonization must be combined with building electrification, shifting more load toward cleaner sources. This measure aims to electrify existing buildings. Biomethane is another preferred alternative to fossil natural gas; however, the existing opportunities for widespread use of biomethane are limited.

Performance Objectives

The goal of Measure E1 is to electrify 25 percent of all existing residential buildings by 2030, 40 percent by 2035, and 80 percent by 2045; to electricity 15 percent of all existing nonresidential buildings by 2030, 25 percent by 2035, and 60 percent by 2045; and to require Zero Net Energy (ZNE) for 50 percent of all major renovations by 2030, 75 percent by 2035, and 100 percent by 2045. Measure E1 has several additional performance goals, including adopting building

performance standards and reach code(s), adopting a ZNE ordinance, electrify County facilities to the maximum extent feasible, retrofit affordable housing units for efficiency, decarbonization, and resilience, and to ensure low-income households do not experience rent increases as result of first cost.

Modeling Approach

The performance objectives were derived using SCE's Pathway to 2045 Whitepaper electrification targets, as stated in Table 1 of the whitepaper's appendices. Targets are identified for the space and water heating end uses for both residential and commercial buildings. Using data from the 2012 Commercial Buildings Energy Consumption Survey (CBECS) and the 2015 Residential Energy Consumption Survey (RECS), these end use electrification targets were adjusted to overall residential and nonresidential natural gas consumption for buildings in the "Mixed-dry/Hot-dry" climate region as defined by the U.S. Energy Information Administration (which includes Los Angeles County).⁵²

The Measure E1 calculations use the activity data (electricity and natural gas) and GHG emissions for existing residential and nonresidential land uses after implementation of Measure ES2 (Procure Zero Carbon Electricity) as a baseline. The baseline year for existing development is assumed to be 2023 because this is the earliest date that the 2045 CAP could be adopted and go into effect. In other words, Measure E1 would apply to the built environment through the end of 2022. Electricity emissions before implementation of Measure E1 were calculated using the same participation rates and emission factors implemented under Measure ES2. To calculate the reduction in natural gas use and increase in electricity use under Measure E1, natural gas use in applicable buildings was converted to electricity use by multiplying the number of therms consumed by the electrification percentage for each building type (residential and nonresidential) for each target year, and then converting the displaced natural gas to electricity using a standard conversion factor of 29.3 kWh per therm.⁵³ GHG emissions after implementation of Measure E1 were then calculated using the same participation rates and emission factors implemented under Measure E1 and subtracted from the post-ES2 emissions to estimate the GHG reductions produced by Measure E1.

Assumptions

- Performance goals are based on SCE's Pathway to 2045 Whitepaper electrification goals for residential and commercial space and water heating, adjusted to average end use profiles for natural gas energy consumption in residential and commercial buildings in the "Mixed-dry/Hot-dry" climate region; the 2045 performance goals were further adjusted to help unincorporated Los Angeles County achieve its 2045 emissions reduction target.
- CPA and SCE emission factors for electricity are the same as those reported in section B.1 above.
- CPA participation rates after implementation of Measure ES2.
- There is no efficiency loss when converting natural gas to electricity.
- Existing development represents emissions and activity data in 2023.

⁵² For example, the SCE Pathway targets are 36 percent electric commercial space heating and 7 percent electric commercial water heating by 2035; in the Mixed-dry/Hot-dry climate region, space heating represents 35 percent of total commercial natural gas use and water heating represents 31 percent of total commercial natural gas use; the calculation for the total commercial building electrification target is 36 percent * 35 percent + 7 percent * 31 percent = 15 percent.

MEASURE E2: STANDARDIZE ALL-ELECTRIC NEW DEVELOPMENT

Table B-17: Measure E2 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	7,452
2035	12,588
2045	22,639

Abbreviations: GHG = greenhouse gas;
MTCO₂e = metric tons of carbon dioxide equivalent.

Description

This measure aims to electrify all new buildings.

Performance Objectives

The goal of Measure E2 is to start to electrify all applicable new residential and nonresidential buildings by 2030 and that most new development will be ZNE by 2030. For modeling purposes, the goal is to electrify 90 percent of new residential buildings (single-family and multifamily) by 2030, 95 percent by 2035, and 100 percent by 2045; and to electrify 90 percent of new nonresidential buildings (except large industry and food service) by 2030, 95 percent by 2035, and 100 percent by 2045. Measure E2 also has the performance goals that 90 percent of new residential buildings will be ZNE by 2030 and 90 percent of new nonresidential buildings (except large industry) will be ZNE by 2030.

Modeling Approach

The Measure E2 calculations use Adjusted BAU activity data (electricity and natural gas) and GHG emissions after implementation of Measure ES2 for new residential and nonresidential land uses as a baseline. New residential and nonresidential energy use was calculated by multiplying

the new building square footage⁵⁴ by the EUI for each land use type (single-family residential, multifamily residential, commercial, and manufacturing/industrial). GHG emissions for new development were then calculated using the same participation rates and emission factors implemented under Measure ES2. To calculate the reduction in natural gas use and increase in electricity use under Measure E2, natural gas use in applicable buildings was converted to electricity use by multiplying the number of therms consumed by the electrification percentage for each building type (residential and nonresidential) for each target year and then converting the displaced natural gas to electricity using a standard conversion factor of 29.3 kWh per therm.⁵⁵ GHG emissions after implementation of Measure E2 were then calculated using the same participation rates and emission factors implemented under Measure ES2 and subtracted from the post-ES2 emissions to estimate the GHG reductions produced by Measure E2. Electrification of new development starts in 2025 and emissions reductions in each of the target years are calculated as cumulative reductions; for example, total annual GHG emissions reductions in 2030 account for all new building electrification for the years 2025 through 2030.

Assumptions

- CPA and SCE emission factors for electricity are the same as those reported in Section B.1 above.
- CPA participation rates after implementation of Measure ES2.
- There is no efficiency loss when converting natural gas to electricity.
- Electrification of new development begins in 2025.
- Annual GHG emissions reductions for each target year (2030, 2035, and 2045) reflect all buildings electrified in all previous years (e.g., all buildings electrified from 2025–2030 contribute to annual emissions reductions in 2030).

Strategy 6: Improve Energy Efficiency of Existing Buildings

MEASURE E4: IMPROVE ENERGY EFFICIENCY OF EXISTING BUILDINGS

Table B-19: Measure E4 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	22,274
2035	41,255
2045	203,455

Abbreviations: GHG = greenhouse gas;
MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Retrofit existing building stock to reduce overall County energy use.

Performance Objectives

The goal of Measure E4 is to improve the energy efficiency of existing residential and nonresidential buildings by reducing the energy use intensity (EUI) of existing buildings in unincorporated Los Angeles County below 2015 levels as follows: 20 percent for residential, 15 percent for industrial, and 25 percent for commercial by 2030; 25 percent for residential, 25 percent for industrial, and 35 percent for commercial by 2035; and 50 percent for residential, 50 percent for industrial, and 50 percent for commercial by 2045.

Modeling Approach

The Measure E4 calculations use the activity data (electricity and natural gas) and GHG emissions for existing residential and nonresidential land uses after implementation of Measure ES2 (Procure Zero Carbon Electricity) and Measure ES3 (Increase Renewable Energy Production) as a baseline. The baseline year for existing development is assumed to be 2023 because that is the earliest date that the 2045 CAP could be adopted and go into effect. In other words, Measure E4 would apply to the built environment through the end of 2022. This new “baseline” energy use was then multiplied by an assumed eligibility rate (i.e., the portion of buildings eligible for retrofits [based on building vintage, incentives available, income level, etc.]) and then by the participation rate (i.e., the portion of eligible residential and nonessential buildings actually performing a retrofit) to determine the total building energy usage subject to energy retrofits under Measure E4. Electricity and natural gas savings resulting from implementation of Measure E4 were then calculated by multiplying these energy usage values (electricity and natural gas) by the percent improvement in EUI for each target year under Measure E4 implementation. Electricity and natural gas emissions before implementation of Measure E4 were calculated using the same participation rates and emission factors implemented under Measure ES2 and Measure ES3. GHG emissions after implementation of Measure E4 were then calculated using the same participation rates and emission factors implemented under Measure ES2 and Measure ES3 and subtracted from the post-ES3 emissions to estimate the GHG reductions produced by Measure E4. GHG emissions for natural gas savings were calculated using the emission factors of 0.00531 MTCO₂e per therm for residential and commercial buildings and 0.00532 MTCO₂e per therm for industrial buildings.

Assumptions

- CPA and SCE emission factors for electricity are the same as those reported in section B.1 above.
- CPA participation rates after implementation of Measure ES2.
- Existing building stock represents the built environment through the year 2023.
- The energy efficiency eligibility rate is 25 percent for both residential and nonresidential buildings in 2030 and 2035 and 50 percent for both residential and nonresidential buildings in 2045.
- The participation rate for eligible buildings is 40 percent in 2030, 60 percent in 2035, and 90 percent in 2045. When applied to the percentage of buildings that are eligible for a retrofit, 10 percent of buildings are retrofitted by 2030, 15 percent of buildings are retrofitted by 2035, and 45 percent of buildings are retrofitted by 2045.
- The reduction in EUI is based on 2015 average County EUI values.

Strategy 7: Conserve Water

MEASURE E6: REDUCE INDOOR AND OUTDOOR WATER CONSUMPTION

Table B-20: Measure E6 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	10,575
2035	15,122
2045	11,764

Abbreviations: GHG = greenhouse gas;
MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Reducing indoor and outdoor water consumption is essential as the state experiences longer and more severe droughts. Not only will water conservation improve regional resiliency, but it will also reduce GHG emissions through the reduction of energy consumption associated with processing, treatment, and the conveyance of water and wastewater.

Performance Objectives

The goal of Measure E6 is to reduce water use to less than 110 gallons per capita per day (GPCD) by 2030, less than 100 GPCD by 2035, and less than 75 GPCD by 2045.

Modeling Approach

Water use and the associated energy use (electricity and natural gas) to distribute and treat water supplied to unincorporated Los Angeles County were estimated for both the Adjusted BAU forecast scenario and the Measure E6 implementation scenario. Metropolitan Water District of

Southern California's (MWD's) historical water use was used as a proxy for unincorporated Los Angeles County.⁵⁶ Water use in gallons per capita per day (GPCD) under the Adjusted BAU forecast was projected for each future year using unincorporated Los Angeles County's population and MWD's 2019 per capita water use (121 GPCD), which was then converted to acre-feet per year (AF/yr). Water use associated with the implementation of Measure E9 was estimated using the target GPCD (listed above) and population, which was then converted to AF/yr.

The electricity and natural gas use resulting from each of the water use scenarios (Adjusted BAU and Measure E9 implementation) was estimated for both residential and nonresidential land uses. Energy intensity factors from The Pacific Institute's *The Future of California's Water-Energy-Climate Nexus* report were used to estimate the energy use associated with the treatment, distribution, end-use, and collection of water in the region, as well as the treatment of the resulting wastewater.⁵⁷ Data from the Los Angeles County Waterworks Districts 2020 Urban Water Management Plan were used to get the following regionally specific information, which was then applied to each water use scenario: the ratio of total water demand met by locally pumped groundwater (31 percent), the ratio of total water used that is collected as wastewater (59 percent), the ratio of collected wastewater that goes through secondary treatment (100 percent), and the water used by residential versus nonresidential land uses (76 percent and 24 percent, respectively).^{58,59} Averages were used to estimate the amount of residential water that is heated versus nonresidential water that is heated.^{60,61}

To estimate the GHG reductions associated with Measure E6, GHG emissions associated with following two scenarios were quantified and the difference between the two was taken: implementation of Measures ES2, E1, E2, and ES3 and implementation of Measures ES2, E1, E2, ES3, and E6. In each scenario, water use was assigned to existing or new development using forecasted residential and nonresidential land use percentages. To account for implementation of Measure E1, the appropriate percentage of natural gas use associated with water use in existing development was converted to electricity use. For example, 25 percent of residential natural gas use (therms) associated with water use in existing development was converted to kWh and added to existing residential development's electricity use associated with water. The electricity use resulting from implementation of Measure E1 (electricity use associated with water use in existing residential and nonresidential development) was then multiplied by emission factors which accounted for Measures ES2 and ES3; i.e., the percentage of electricity supplied by solar and the participation rate in each tier of CPA electricity. The natural gas use resulting from implementation of Measure E1 was multiplied by standard emission factors associated with each land use type. To account for implementation of Measure E2, all natural gas use associated with water use in new development was converted to electricity and added to new development's electricity use associated with water. The combined electricity use resulting from implementation of Measure E2 was then multiplied by emission factors which accounted for

Measures ES2 and ES3; i.e., the percentage of electricity supplied by solar and the participation rate in each tier of CPA electricity. Emissions associated with existing development were then summed with emissions associated with new development for each scenario.

Assumptions

- Unincorporated Los Angeles County’s water use profile is equivalent to that of MWD.
- The County falls within the South Coast and South Lahontan water regions, thus energy intensity factors for each region were averaged.
- The County’s water use profile can be represented by Los Angeles County Waterworks Districts data.
- No efficiency losses result from natural gas conversion to electricity (Measure E1).
- 33 percent of residential indoor water use is heated and 22 percent of nonresidential indoor water use is heated.
- CPA and SCE emission factors for electricity are the same as those reported in Section B.1 above.
- CPA participation rates after implementation of Measure ES2.

Waste

Strategy 8: Minimize Waste and Recover Energy and Materials from the Waste Stream

MEASURE W1: INSTITUTIONALIZE SUSTAINABLE WASTE SYSTEMS AND PRACTICES

Table B-21: Measure W1 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	154,514
2035	248,362
2045	342,934

Abbreviations: GHG = greenhouse gas;
MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Undertake actions that result in sustainable waste systems Countywide. Responsible and sustainable waste practices are learned behaviors, which the County can facilitate through outreach, education, and mandates. Increase diversion of recyclable materials and organics from landfills through ordinances, service improvements, education and outreach, and promotion of product stewardship and markets for material reuse. An increased diversion rate indirectly reduces the demand for virgin materials, which reduces the life-cycle carbon intensity of any resulting products. Through action taken at the County level, waste-conscious habits and thoughtful consumption can become the default.

Performance Objectives

The goal of Measure W1 is to increase the total unincorporated Los Angeles County waste diversion rate to 85 percent by 2030, 90 percent by 2035, and 95 percent by 2045.

Modeling Approach

Target waste disposal in units of tons per capita per year were estimated for each future year using the BAU annual waste generation rate per capita (3.0 tons per person per year in 2030 and 3.1 tons per person per year in 2035 and 2045), the BAU average diversion rates (75 percent for 2030, 2035, and 2045), and the target diversion rates (85 percent in 2030, 90 percent in 2035, and 95 percent in 2045). These target disposal rates were then converted to total reduction in landfilled waste in tons, compared to the BAU landfilled waste tonnages, using forecasted population. A ratio of BAU waste disposal and BAU emissions to targeted waste disposal was then used to estimate the emissions associated with waste disposal once Measure W1 has been implemented. To estimate reductions associated with new development versus existing development, a ratio of incremental population growth to total population in each of the target years was used.

Assumptions

- The BAU solid waste disposal rates are 3.0 tons per person per year in 2030 and 3.1 tons per person per year in 2035 and 2045.
- The BAU solid waste diversion rate is 75 percent in 2030, 2035, and 2045.
- Solid waste diversion rate and organics diversion rate are assumed to remain constant at 75 percent and 38 percent, respectively.
- For each ton of solid waste not placed in a landfill, 0.44 MTCO₂e is saved (based on the Adjusted BAU forecast for the waste sector; see Appendix A).

Agriculture, Forestry, and Other Land Use

Strategy 9: Conserve and Connect Wildlands and Working Lands

MEASURE A1: CONSERVE FORESTS, WOODLANDS, SHRUBLANDS, GRASSLANDS, DESERT, AND OTHER CARBON-SEQUESTERING WILDLANDS AND WORKING LANDS

Table B-22: Measure A1 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	8,953
2035	17,906
2045	26,858

Abbreviations: GHG = greenhouse gas; MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Preserve, conserve, and restore agricultural lands, working lands, rangelands, forest lands, wetlands, and other wildlands in unincorporated Los Angeles County.

Performance Objectives

The goal of Measure A1 is to reduce the amount of natural land converted for urban uses 25 percent below current (2018) levels by 2030, 50 percent by 2035, and 75 percent by 2045; this is equivalent to conserving natural lands that would have otherwise been converted for urbanized uses by 53 hectares annually by 2030, 106 hectares annually by 2035, and 159 hectares annually by 2045.

Modeling Approach

The Adjusted BAU forecast assumes that 212 hectares of forest land are converted to a new land use each year, which releases carbon stored in the removed biomass. GHG emissions reductions from Measure A1 were calculated by decreasing the amount of forest land conversion in each future year and multiplying by an emission factor for land conversion. For each hectare of natural land converted to other uses, a one-time emission of 169 MTCO₂e per hectare would occur (see Appendix A for discussion).⁶² The number of hectares saved from conversion under Measure A1 for each future year was multiplied by the one-time emission rate of 169 MTCO₂e to calculate GHG emissions reductions for this measure.

Assumptions

- 212 hectares of natural land is converted annually in the Adjusted BAU forecast.
- For each hectare of natural land saved from conversion, avoided emissions would be 169 MTCO₂e.

Strategy 10: Sequester Carbon and Implement Sustainable Agriculture

MEASURE A3: EXPAND UNINCORPORATED LOS ANGELES COUNTY’S TREE CANOPY AND GREEN SPACES

Table B-23: Measure A3 GHG Reductions

YEAR	GHG REDUCTIONS (MTCO ₂ E)
2030	4,602
2035	7,080
2045	10,310

Abbreviations: GHG = greenhouse gas;
MTCO₂e = metric tons of carbon dioxide equivalent.

Description

Create an Urban Forest Management Plan to plant trees, increase unincorporated Los Angeles County’s tree canopy cover, add green space, and convert impervious surfaces.

Performance Objectives

The goal of Measure A3 is to plant 130,000 total new trees by 2030, plant 200,000 total new trees by 2035, and plant 270,000 total new trees by 2045.

Modeling Approach

The performance goals for Measure A3 were developed using the following steps:

1. Unincorporated Los Angeles County’s current urban tree canopy cover is estimated to be 10.7 percent based on the Tree People 2016 LA Tree Canopy Report. Estimates by land use type are 13 percent residential, 9 percent commercial, 4 percent industrial, and 10 percent for public/semi-public, mixed use, specific plan, and other land use types.
2. The current urban area estimate is 158,889 acres from Table 6.1 of the General Plan Land Use Element for the categories above.
3. Applying the canopy cover of 10.7 percent to the total urban area acreage yields 16,943 acres of tree canopy.
4. The goal is to increase urban tree canopy cover 10 percent by 2030, 15 percent by 2035, and 20 percent by 2045. This yields an additional 1,694 new acres of tree canopy coverage by 2030, 2,542 acres by 2035, and 3,389 acres by 2045.
5. According to a 2015 study, one acre of tree canopy coverage has approximately 80.5 trees.
6. This yields 136,394 total new trees planted by 2030, 204,591 total new trees planted by 2035, and 272,788 total new trees planted by 2045 (rounded to the nearest 10,000).

Measure A3 GHG emissions reductions were calculated using assumptions from CALEEMod.⁶³ The calculations assume a carbon sequestration rate per tree planted (from CalEEMod) and an

⁶³ California Air Pollution Control Officers Association. 2021. *CalEEMod v 2020.4.0 User’s Guide*, Appendix A Calculation Details. May 2021. Available: <http://www.aqmd.gov/docs/default-source/caleemod/user-guide-2021/appendix-a2020-4-0.pdf?sfvrsn=6>. Accessed November 2021.

active growing period of 20 years for each tree, after which the tree no longer stores additional carbon. The calculation also assumes a total number of trees planted for each target year, based on the performance objectives above. The number of trees planted each year was then multiplied by the growing period and sequestration rate to estimate the overall GHG reductions from Measure A3 for each target year.

Assumptions

- Tree growing period of 20 years.
- The carbon sequestration rate remains constant for each year for each tree planted.
- The carbon sequestration rate is the average rate for all species classes included in CalEEMod.

Subject: LA County 2045 Climate Action Plan Update - VMT Technical Memorandum

LA21-3290

Introduction

Purpose of transportation analysis in Climate Action Plan Quantification

The Draft 2045 LA County Climate Action Plan (CAP) actions and targets are informed by a robust data and analysis process. Data was collected for each of the topic areas and analyzed to help inform and develop actions and targets, and create meaningful, measurable, and trackable indicators. Land use and transportation actions that help reduce VMT include bike, ped, and transit improvements, transportation demand management programs, and land use design and density.

This current effort is applying and quantifying estimated benefits of CAP strategies for VMT reductions using a state-of-the-practice approach from the California Air Pollution Control Officers Association (CAPCOA) GHG Handbook

The purpose of this technical memorandum is to present the methodology and assumptions applied for quantifying estimated VMT reductions of selected transportation demand management (TDM) strategies contained in the CAP. The project team developed a list of various TDM strategies as part of the CAP, the strategies were narrowed based on applicability and available data, and the corresponding VMT reductions were estimated using the CAPCOA GHG Reductions Handbook¹ (December 2021).

¹ Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity, California Air Pollution Control Officers Association, December 2021. Last accessed January 3, 2022, at <http://www.airquality.org/air-quality-health/climate-change/ghg-handbook-caleemod>

VMT from Prior CAP Effort

F&P developed an inventory of the VMT and GHG emitted in Los Angeles County in support of the previous Los Angeles County Sustainability Plan (OurCounty). The VMT and emissions analysis for the OurCounty utilized data inputs and outputs from the SCAG regional travel demand model. Emissions were calculated through use of the EMFAC model. The current update to the CAP builds off prior efforts and Buro Happold used the OurCounty VMT projections as the basis for providing forecasts for the year 2045.

VMT Reductions Approach

CAPCOA Overview

TDM strategies have been determined to be among the most effective for reducing VMT. TDM strategies are reductions available from certain types of project site modifications, programming, and operational changes. The effectiveness of identified TDM strategies builds on research documented in the 2010 California Air Pollution Control Officers Association (CAPCOA) publication, *Quantifying Greenhouse Gas Mitigation Measures* (CAPCOA, 2010). The 2010 CAPCOA GHG Handbook was recently updated and the final version was published in December 2021. The CAPCOA Handbook contains detailed equations to apply these TDM reductions given the land use type and built environment context. The Handbook provides a percentage range (minimum-maximum) on the expected VMT reduction for each individual TDM strategy. In addition, some TDM strategies have complementary benefits reducing VMT, and need to be considered in combination, and not individually.

Data Sources (land use, transit, and bike facilities)

In order to apply the appropriate VMT percent reduction for each TDM strategy listed below, certain inputs are required that describe the land use type, built environment context, and characteristics of the TDM strategy. The inputs were provided to Fehr &Peers by LA County staff, and where information was not available, assumptions were made based on the default values provided in the CAPCOA Handbook.

- **Land Use:**
 - Increase residential/job density
 - Provide transit-oriented development (TOD) near high-quality transit areas (HQTA)

- *Data sources:* LA County provided F&P a GIS shapefile layer showing the 2029 Housing Element Rezone Areas. F&P used a major transit stop² GIS layer that was developed as part of the LA County SB 743 VMT Tool released in late 2020.
- **Transit service:**
 - Increase transit service hours
 - Provide treatments to enhance existing transit routes
 - Improve county shuttle system
 - *Data sources :* LA Metro NextGen Plan³ and LA Metro LRTP⁴
- **Bike Facilities:**
 - Increase the number of bikeway miles
 - *Data sources:* Los Angeles County Bike Master Plan 2012.⁵

² "Major transit stop" is defined as a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods (CA Public Resource Code, § 21064.3).

Applying VMT reductions

Data Sources and Quantifying VMT Reductions with CAPCOA

To quantify VMT reductions, appropriate equations were used based on factsheets in the CAPCOA handbook. Using the data obtained from sources identified in the previous section as inputs, percent reductions in VMT were estimated. However, not all reductions can be applied to all or total VMT. VMT resulting from light-duty vehicles is often categorized by trip purpose. Different VMT measures based on their nature and scope of application may apply either to one or more categories of the total combined light-duty vehicle VMT. For example, commuter subsidies are most likely to reduce home-based work VMT for employees and less likely to reduce VMT for retail patrons. In a similar vein, VMT reduction benefits accrue based on the geographic extent and context in which the strategy is applied. For instance, providing bicycle, pedestrian, and transit infrastructure will likely have more benefit in an urban than rural area. Not all measures will have a countywide effect. After identifying data sources, VMT reduction strategies, and the scope of each reduction, the VMT reduction estimates were finalized.

To estimate VMT reductions, implementing actions in the Draft GHG Reduction Measures Recommendations Memo (June 16, 2021) were first screened to identify actions whose reduction can be quantified. While most actions can be quantified, the level of detail needed to provide a detailed VMT estimate was not available; therefore, five quantifiable actions across the three categories were used for the CAP's VMT reduction estimate. This is not to say that the screened-out actions hold little or no GHG reduction potential. Like Supporting or Non-Quantified Reduction Measures enlisted in the Handbook, non-quantified VMT reduction actions although not quantitatively evaluated "may achieve emissions reductions and co-benefits on their own or may enhance the ability of quantified measures to attain expanded reduction and co-benefits." Table 1 summarizes the final list of quantifiable measures and implementing actions under each strategy and corresponding information such as the applicable CAPCOA strategy maximum VMT reduction that can be claimed under the strategy, data inputs required to quantify the benefit, assumptions made where needed, the equation used to estimate VMT reduction, and scope of application for geography and trip purpose.

Table 1. Quantifiable GHG Reduction Measures and corresponding VMT Reduction Category and Scope

Description	Tracking Metrics	Applicable 2021 CAPCOA Strategy & VMT Reduction Range	CAPCOA User Inputs	F&P Input Assumptions	% GHG Reduction Quantification	VMT Category & Geographic Scope to which Reduction is Applied to
Strategy 2: Increase densities and diversity of destinations with an emphasis near transit						
Measure T1: Increase Density Near High-Quality Transit Areas						
Increasing residential density, particularly near transit and affordable housing, is shown to reduce VMT.	Number and percent of increase in DUs in HQTAs, Specific Plans, or Area Plans	T-1 – Increase Residential Density. Up to 30% GHG emissions from VMT, depending on project DU per acre	Project DU per acre & typical DU per acre	Densities range from 20 DU per acre to 50 to 70 DU per acre. 9.1 DU/acre for typical density	20 du/acre : $(20-9.1) / 9.1 \times -0.22 = \underline{-26.4\% \text{ reduction}}$	Home-Based VMT in TOD Areas
Implementing Actions						
T1.2 – Incentivize and prioritize development within	<ul style="list-style-type: none"> • Increase in DUs within HQTAs • DU per acre Change in number of jobs and housing in non- HQTAs	T-3 – Provide Transit-Oriented Development	(B) Transit & (D) auto mode share in surrounding City, and (C) Ratio of transit mode share for TOD	27% measure maximum (B x C) & 85% auto mode share based on 2012 CHTS (D)	$27\% / -85\% = \underline{-31.8\% \text{ reduction (use maximum 31\%)}}$	Total VMT in TOD Areas

Description	Tracking Metrics	Applicable 2021 CAPCOA Strategy & VMT Reduction Range	CAPCOA User Inputs	F&P Input Assumptions	% GHG Reduction Quantification	VMT Category & Geographic Scope to which Reduction is Applied to
(HQTA) ⁶ , while ensuring inclusion of vital public amenities such as parks and active transportation infrastructure.		(TOD) ⁷ . Up to 31% of GHG emissions from project VMT.	area with measure compared to existing transit mode share in surrounding city			
Measure T2: Develop Land Use Plans Addressing Jobs/Housing Balance & Increase Mixed Use						
Increasing density and diversity of destinations can help reduce single occupancy	Change in number of jobs and housing in non-HQTAs	T-2 – Increase Job Density. Up to 30% GHG emissions from VMT, depending on project jobs per acre	Job density of typical development = 145 jobs per acre, & Elasticity of VMT with respect	Project job density = 300 jobs per acre	$(300-145)/145 \times -0.07 =$ <u>-7.5% reduction</u>	This strategy overlaps with the TOD strategy above where we assume 31% Total VMT

⁶ High Quality Transit Areas: Areas within one half mile of a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.

⁷ To be considered TOD, a development must be within a 10-minute walk (0.5 mile) of a high frequency transit station (rail, or bus with headways less than 15 minutes)

Description	Tracking Metrics	Applicable 2021 CAPCOA Strategy & VMT Reduction Range	CAPCOA User Inputs	F&P Input Assumptions	% GHG Reduction Quantification	VMT Category & Geographic Scope to which Reduction is Applied to
trips, the number of trips, and trip lengths			to job density = -0.07			Reduction at TOD sites. No reduction here.
Strategy 3: Reduce single-occupancy vehicle trips						
Measure T3: Expand Bicycle & Pedestrian Network to Serve Residential, Employment, & Recreational Trips						
Travel options that serve a variety of land uses and trip purposes can help shift some trips away from single-occupancy vehicles.	T-17 – Provide Pedestrian Network Improvement. Up to 6.4% GHG emissions from vehicle travel, depending on length of existing and planned facilities T-19 – Expand Bikeway Network.	<ul style="list-style-type: none"> • Miles of bikeway type • Miles of transit routes • Headways 				
Implementing Actions

CAPCOA Analysis and Findings

VMT is calculated at the transportation analysis zone (TAZ) level. TAZs are comparable in size and shape to census tracts or block groups depending on the travel demand model used and level of modeling detail. Once the percent VMT reductions were determined, based on the geographic scope and VMT category of each implementation action, the appropriate VMT was aggregated across the county or specific geographic sub areas, such as the TAZs within which transit enhancements would take place. Actions T3.2 and T4.1 were applied countywide. For the remaining actions, only the VMT generated in TAZs whose geographic area overlapped with the location of the infrastructure or land use strategy were included. Percent reductions were then applied to appropriate VMT sub-totals to obtain the VMT reduction estimates. The sum of these reductions was then subtracted from total light-duty vehicle VMT to estimate adjusted daily VMT. This adjusted daily VMT was then projected to obtain VMT reductions and adjusted totals in each analysis year (2030, 2035, and 2045). Table 2 shows reductions for each quantifiable implementation action for the analysis years.

Based on the methodology outlined in the CAPCOA Handbook, when determining the overall VMT reduction, the VMT reduction is separately calculated for each of the individual strategies should be dampened, or diminished, according to a multiplicative formula to account for the fact that some of the strategies may be redundant or applicable to the same populations. The multiplicative equation to accomplish this adjustment is as follows:

$$\text{Overall \% VMT Reduction} = 1 - (1 - A) * (1 - B) * (1 - C) * (1 - D) \dots$$

where A, B, C, D ... = individual mitigation strategy reduction percentages

For example, if two strategies were proposed with corresponding VMT reductions of 20% and 10%, the equation would be $[1 - (1 - 20\%) * (1 - 10\%)]$ or $[1 - (80\% * 90\%)]$, which equates to a 28% reduction rather than the 30% reduction that would otherwise be seen with a direct sum. Therefore, the overall VMT reduction was calculated as a dampened, or diminished, total according to the equation above, which produces a conservative overall estimate.

$$A = 1.38\%; \quad B = 1.97\%; \quad C = 0.15\%; \quad D = 0.57\%; \quad E = 0.01\%$$

$$\text{Overall \% VMT Reduction} = 1 - (1 - 0.0138) * (1 - 0.0197) * (1 - 0.0015) * (1 - 0.0057) * (1 - 0.0001) = 4.03\%$$

Based on the application of VMT reductions and dampening factor, the reduction of 4.03% would result in a total adjusted total daily VMT of 18,798,031 VMT in 2035, for example.

Table 2. VMT Reductions per Quantifiable Implementation Action for Analysis Years 2030, 2035, and 2045

Reduction Category	Reduction Percent	VMT Applied to	Geography Applied to	Daily VMT Reduction			Reduction as a share of Total County VMT
				2030	2035	2045

Subtotal for VMT Reductions				764,128	798,128	808,231	
Total Daily VMT (Pre-VMT reductions)				19,442,787	19,596,159	19,902,905	4%
Total Daily VMT (Post-VMT reductions)				18,678,659	18,798,031	19,094,674	

5. Conclusion

The estimated benefits of CAP strategies for VMT reductions were quantified using a state-of-the-practice approach from the California Air Pollution Control Officers Association (CAPCOA) GHG Handbook. GHG reduction measures and Implementing actions were first screened to identify those that can be quantified. Using travel demand forecasting results from the SCAG regional travel demand model, County VMT data were used, based on trip purpose and geography, to estimate benefits from CAP actions.

While several strategies have significant reduction potential of up to 30%, like those that involve increasing residential density, the measures are applied to a portion of the unincorporated county and therefore accrue a net reduction of less than 2% countywide. When accounting for a combined effect, the effectiveness of each measure could be dampened by the existence of a similar overlapping measure. By estimating VMT that more closely reflects the travel to be likely affected by a certain measure, possibilities of overlaps have been minimized. Even then, a dampening factor was applied above to show the total reduction estimate that accounts for dampening arrives at a similar VMT reduction estimate. This analysis will support the analysis and quantification of benefits from the CAP for Los Angeles County and its residents.

Subject: LA County 2045 Climate Action Plan Update - VMT Technical Memorandum

LA21-3290

Introduction

Purpose of transportation analysis in Climate Action Plan Quantification

The Draft 2045 LA County Climate Action Plan (CAP) actions and targets are informed by a robust data and analysis process. Data was collected for each of the topic areas and analyzed to help inform and develop actions and targets, and create meaningful, measurable, and trackable indicators. Land use and transportation actions that help reduce VMT include bike, ped, and transit improvements, transportation demand management programs, and land use design and density.

This current effort is applying and quantifying estimated benefits of CAP strategies for VMT reductions using a state-of-the-practice approach from the California Air Pollution Control Officers Association (CAPCOA) GHG Handbook

The purpose of this technical memorandum is to present the methodology and assumptions applied for quantifying estimated VMT reductions of selected transportation demand management (TDM) strategies contained in the CAP. The project team developed a list of various TDM strategies as part of the CAP, the strategies were narrowed based on applicability and available data, and the corresponding VMT reductions were estimated using the CAPCOA GHG Reductions Handbook¹ (December 2021).

¹ Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity, California Air Pollution Control Officers Association, December 2021. Last accessed January 3, 2022, at <http://www.airquality.org/air-quality-health/climate-change/ghg-handbook-caleemod>

VMT from Prior CAP Effort

F&P developed an inventory of the VMT and GHG emitted in Los Angeles County in support of the previous Los Angeles County Sustainability Plan (OurCounty). The VMT and emissions analysis for the OurCounty utilized data inputs and outputs from the SCAG regional travel demand model. Emissions were calculated through use of the EMFAC model. The current update to the CAP builds off prior efforts and Buro Happold used the OurCounty VMT projections as the basis for providing forecasts for the year 2045.

VMT Reductions Approach

CAPCOA Overview

TDM strategies have been determined to be among the most effective for reducing VMT. TDM strategies are reductions available from certain types of project site modifications, programming, and operational changes. The effectiveness of identified TDM strategies builds on research documented in the 2010 California Air Pollution Control Officers Association (CAPCOA) publication, *Quantifying Greenhouse Gas Mitigation Measures* (CAPCOA, 2010). The 2010 CAPCOA GHG Handbook was recently updated and the final version was published in December 2021. The CAPCOA Handbook contains detailed equations to apply these TDM reductions given the land use type and built environment context. The Handbook provides a percentage range (minimum-maximum) on the expected VMT reduction for each individual TDM strategy. In addition, some TDM strategies have complementary benefits reducing VMT, and need to be considered in combination, and not individually.

Data Sources (land use, transit, and bike facilities)

In order to apply the appropriate VMT percent reduction for each TDM strategy listed below, certain inputs are required that describe the land use type, built environment context, and characteristics of the TDM strategy. The inputs were provided to Fehr &Peers by LA County staff, and where information was not available, assumptions were made based on the default values provided in the CAPCOA Handbook.

- **Land Use:**
 - Increase residential/job density
 - Provide transit-oriented development (TOD) near high-quality transit areas (HQTA)

- *Data sources:* LA County provided F&P a GIS shapefile layer showing the 2029 Housing Element Rezone Areas. F&P used a major transit stop² GIS layer that was developed as part of the LA County SB 743 VMT Tool released in late 2020.
- **Transit service:**
 - Increase transit service hours
 - Provide treatments to enhance existing transit routes
 - Improve county shuttle system
 - *Data sources :* LA Metro NextGen Plan³ and LA Metro LRTP⁴
- **Bike Facilities:**
 - Increase the number of bikeway miles
 - *Data sources:* Los Angeles County Bike Master Plan 2012.⁵

² "Major transit stop" is defined as a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods (CA Public Resource Code, § 21064.3).

Applying VMT reductions

Data Sources and Quantifying VMT Reductions with CAPCOA

To quantify VMT reductions, appropriate equations were used based on factsheets in the CAPCOA handbook. Using the data obtained from sources identified in the previous section as inputs, percent reductions in VMT were estimated. However, not all reductions can be applied to all or total VMT. VMT resulting from light-duty vehicles is often categorized by trip purpose. Different VMT measures based on their nature and scope of application may apply either to one or more categories of the total combined light-duty vehicle VMT. For example, commuter subsidies are most likely to reduce home-based work VMT for employees and less likely to reduce VMT for retail patrons. In a similar vein, VMT reduction benefits accrue based on the geographic extent and context in which the strategy is applied. For instance, providing bicycle, pedestrian, and transit infrastructure will likely have more benefit in an urban than rural area. Not all measures will have a countywide effect. After identifying data sources, VMT reduction strategies, and the scope of each reduction, the VMT reduction estimates were finalized.

To estimate VMT reductions, implementing actions in the Draft GHG Reduction Measures Recommendations Memo (June 16, 2021) were first screened to identify actions whose reduction can be quantified. While most actions can be quantified, the level of detail needed to provide a detailed VMT estimate was not available; therefore, five quantifiable actions across the three categories were used for the CAP's VMT reduction estimate. This is not to say that the screened-out actions hold little or no GHG reduction potential. Like Supporting or Non-Quantified Reduction Measures enlisted in the Handbook, non-quantified VMT reduction actions although not quantitatively evaluated "may achieve emissions reductions and co-benefits on their own or may enhance the ability of quantified measures to attain expanded reduction and co-benefits." Table 1 summarizes the final list of quantifiable measures and implementing actions under each strategy and corresponding information such as the applicable CAPCOA strategy maximum VMT reduction that can be claimed under the strategy, data inputs required to quantify the benefit, assumptions made where needed, the equation used to estimate VMT reduction, and scope of application for geography and trip purpose.

Table 1. Quantifiable GHG Reduction Measures and corresponding VMT Reduction Category and Scope

Description	Tracking Metrics	Applicable 2021 CAPCOA Strategy & VMT Reduction Range	CAPCOA User Inputs	F&P Input Assumptions	% GHG Reduction Quantification	VMT Category & Geographic Scope to which Reduction is Applied to
<i>Strategy 2: Increase densities and diversity of destinations with an emphasis near transit</i>						
Measure T1: Increase Density Near High-Quality Transit Areas						
Increasing residential density, particularly near transit and affordable housing, is shown to reduce VMT.	Number and percent of increase in DUs in HQTAs, Specific Plans, or Area Plans	T-1 – Increase Residential Density. Up to 30% GHG emissions from VMT, depending on project DU per acre	Project DU per acre & typical DU per acre	Densities range from 20 DU per acre to 50 to 70 DU per acre. 9.1 DU/acre for typical density	20 du/acre : $(20-9.1) / 9.1 \times -0.22 = \underline{-26.4\% \text{ reduction}}$	Home-Based VMT in TOD Areas
Implementing Actions						
T1.2 – Incentivize and prioritize development within	<ul style="list-style-type: none"> • Increase in DUs within HQTAs • DU per acre Change in number of jobs and housing in non- HQTAs	T-3 – Provide Transit-Oriented Development	(B) Transit & (D) auto mode share in surrounding City, and (C) Ratio of transit mode share for TOD	27% measure maximum (B x C) & 85% auto mode share based on 2012 CHTS (D)	$27\% / -85\% = \underline{-31.8\% \text{ reduction (use maximum 31\%)}}$	Total VMT in TOD Areas

Description	Tracking Metrics	Applicable 2021 CAPCOA Strategy & VMT Reduction Range	CAPCOA User Inputs	F&P Input Assumptions	% GHG Reduction Quantification	VMT Category & Geographic Scope to which Reduction is Applied to
(HQTA) ⁶ , while ensuring inclusion of vital public amenities such as parks and active transportation infrastructure.		(TOD) ⁷ . Up to 31% of GHG emissions from project VMT.	area with measure compared to existing transit mode share in surrounding city			
Measure T2: Develop Land Use Plans Addressing Jobs/Housing Balance & Increase Mixed Use						
Increasing density and diversity of destinations can help reduce single occupancy	Change in number of jobs and housing in non-HQTAs	T-2 – Increase Job Density. Up to 30% GHG emissions from VMT, depending on project jobs per acre	Job density of typical development = 145 jobs per acre, & Elasticity of VMT with respect	Project job density = 300 jobs per acre	$(300-145)/145 \times -0.07 =$ <u>-7.5% reduction</u>	This strategy overlaps with the TOD strategy above where we assume 31% Total VMT

⁶ High Quality Transit Areas: Areas within one half mile of a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.

⁷ To be considered TOD, a development must be within a 10-minute walk (0.5 mile) of a high frequency transit station (rail, or bus with headways less than 15 minutes)

Description	Tracking Metrics	Applicable 2021 CAPCOA Strategy & VMT Reduction Range	CAPCOA User Inputs	F&P Input Assumptions	% GHG Reduction Quantification	VMT Category & Geographic Scope to which Reduction is Applied to
trips, the number of trips, and trip lengths			to job density = -0.07			Reduction at TOD sites. No reduction here.
Strategy 3: Reduce single-occupancy vehicle trips						
Measure T3: Expand Bicycle & Pedestrian Network to Serve Residential, Employment, & Recreational Trips						
Travel options that serve a variety of land uses and trip purposes can help shift some trips away from single-occupancy vehicles.	T-17 – Provide Pedestrian Network Improvement. Up to 6.4% GHG emissions from vehicle travel, depending on length of existing and planned facilities T-19 – Expand Bikeway Network.	<ul style="list-style-type: none"> • Miles of bikeway type • Miles of transit routes • Headways 				
Implementing Actions						
T3.2 – Create a more connected and	<ul style="list-style-type: none"> • Miles of bikeway type 	T-19 – Expand Bikeway Network. Up to 0.5% GHG emissions from	Miles of existing & planned bikeways	LA County Bike Plan proposes significant	-0.5% Maximum Reduction	Total VMT Countywide

Description	Tracking Metrics	Applicable 2021 CAPCOA Strategy & VMT Reduction Range	CAPCOA User Inputs	F&P Input Assumptions	% GHG Reduction Quantification	VMT Category & Geographic Scope to which Reduction is Applied to
safer bikeway network by expanding bikeway facilities and deploying protected and separated lanes.	<ul style="list-style-type: none"> Additional employees or residents served Number of cities collaborated with to inform key areas for bicycle infrastructure expansion Number of funding sources identified or % of funding secured	vehicle travel, depending on length of existing and planned facilities		increases in bikeway miles. This analysis applies a 300% increase in bikeway miles by 2035. The maximum possible reduction of 0.5% is estimated based on the extent of network improvements outlined in the 2012 Bike Plan		(unincorporated areas)
Measure T4: Encourage Transit, Active Transportation, & Alternative Modes of Transportation						
Implementing Actions						
T4.1 – Expand and improve frequency of	<ul style="list-style-type: none"> Size of area served 	T-24 – Extend Transit Network Coverage or Hours. Up to 4.6% of	Total transit service hours	Assume transit mode share of 4.6% per 2012	$-1 \times (1.12M-560K)/560K \times 4.6\% \times 0.7 \times 57.8\% \times 1 =$ <u>-1.9% Reduction</u>	Total VMT Countywide

Description	Tracking Metrics	Applicable 2021 CAPCOA Strategy & VMT Reduction Range	CAPCOA User Inputs	F&P Input Assumptions	% GHG Reduction Quantification	VMT Category & Geographic Scope to which Reduction is Applied to
existing network of County shuttles and explore new mobility services, such as micro transit ⁸ , in unincorporated County areas.	<ul style="list-style-type: none"> • Number of employees and residents served • Service frequency and headways 	GHG emissions from vehicle travel, depending on increase in transit service hours or miles and the transit mode share in the community.	before & after expansion	CHTS; Assume 560,000 existing transit service hours in unincorporated county & 1.12 million after expansion based on Metro NextGen		(unincorporated areas)
T4.2 – Collaborate with Metro and other transit providers to install bus-only lanes and	<ul style="list-style-type: none"> • Increase in headways or frequencies • Increase in headways 	T-26 – Implement Transit-Supportive Roadway Improvements. Up to 0.6% GHG emissions from vehicle travel, depending on the	Percent of transit routes that receive treatments	Assume transit mode share of 4.6% per 2012 CHTS, 85% for auto; Assume major transit	$-1 \times (100\% \times -10 \times -0.4 \times 4.6\% \times 57.8\%) / 85\% =$ <p><u>-12.5% Reduction</u> (use maximum <u>-0.6%</u>)</p>	Total VMT in TOD Areas/HQTA Stops

⁸ Micro transit is public or private multi-passenger transportation services that serve passengers using dynamically generated routes; they provide transit-like service on a smaller, more flexible scale.

Description	Tracking Metrics	Applicable 2021 CAPCOA Strategy & VMT Reduction Range	CAPCOA User Inputs	F&P Input Assumptions	% GHG Reduction Quantification	VMT Category & Geographic Scope to which Reduction is Applied to
signal prioritization along major thoroughfares, and work with transit agencies and neighboring jurisdictions to plan and install full bus rapid transit infrastructure along priority corridors, as appropriate.	<ul style="list-style-type: none"> • Increase in residents/employees served • Travel time reliability • Creation of new HQTAs 	percent of transit routes that receive improvements.		thoroughfares in unincorporated county will receive treatments such as bus only lanes and/or signal prioritization		

CAPCOA Analysis and Findings

VMT is calculated at the transportation analysis zone (TAZ) level. TAZs are comparable in size and shape to census tracts or block groups depending on the travel demand model used and level of modeling detail. Once the percent VMT reductions were determined, based on the geographic scope and VMT category of each implementation action, the appropriate VMT was aggregated across the county or specific geographic sub areas, such as the TAZs within which transit enhancements would take place. Actions T3.2 and T4.1 were applied countywide. For the remaining actions, only the VMT generated in TAZs whose geographic area overlapped with the location of the infrastructure or land use strategy were included. Percent reductions were then applied to appropriate VMT sub-totals to obtain the VMT reduction estimates. The sum of these reductions was then subtracted from total light-duty vehicle VMT to estimate adjusted daily VMT. This adjusted daily VMT was then projected to obtain VMT reductions and adjusted totals in each analysis year (2030, 2035, and 2045). Table 2 shows reductions for each quantifiable implementation action for the analysis years.

Based on the methodology outlined in the CAPCOA Handbook, when determining the overall VMT reduction, the VMT reduction is separately calculated for each of the individual strategies should be dampened, or diminished, according to a multiplicative formula to account for the fact that some of the strategies may be redundant or applicable to the same populations. The multiplicative equation to accomplish this adjustment is as follows:

$$\text{Overall \% VMT Reduction} = 1 - (1 - A) * (1 - B) * (1 - C) * (1 - D) \dots$$

where A, B, C, D ... = individual mitigation strategy reduction percentages

For example, if two strategies were proposed with corresponding VMT reductions of 20% and 10%, the equation would be $[1 - (1 - 20\%) * (1 - 10\%)]$ or $[1 - (80\% * 90\%)]$, which equates to a 28% reduction rather than the 30% reduction that would otherwise be seen with a direct sum. Therefore, the overall VMT reduction was calculated as a dampened, or diminished, total according to the equation above, which produces a conservative overall estimate.

$$A = 1.38\%; \quad B = 1.97\%; \quad C = 0.15\%; \quad D = 0.57\%; \quad E = 0.01\%$$

$$\text{Overall \% VMT Reduction} = 1 - (1 - 0.0138) * (1 - 0.0197) * (1 - 0.0015) * (1 - 0.0057) * (1 - 0.0001) = 4.03\%$$

Based on the application of VMT reductions and dampening factor, the reduction of 4.03% would result in a total adjusted total daily VMT of 18,798,031 VMT in 2035, for example.

Table 2. VMT Reductions per Quantifiable Implementation Action for Analysis Years 2030, 2035, and 2045

Reduction Category	Reduction Percent	VMT Applied to	Geography Applied to	Daily VMT Reduction			Reduction as a share of Total County VMT
				2030	2035	2045	
M1T1 Increase Residential Density in HQTAs	26.4	Home-based VMT	TAZs intersecting TODs	267,982	269,689	273,103	1.38%
T1.2 Incentivizing and Promoting HQTAs	31	Total VMT	TAZs intersecting TODs	383,838	386,283	391,172	1.97%
T3.2 Pedestrian and Bikeway Network Improvements	0.5	Total VMT	Unincorporated County	0	29,133	29,502	0.15%
T4.1 County Shuttles	1.9	Total VMT	Unincorporated County	110,005	110,706	112,107	0.57%
T4.2 Bus-only and signal prioritization	0.6	Total VMT	TAZs intersecting TODs	2,303	2,318	2,347	0.01%
Subtotal for VMT Reductions				764,128	798,128	808,231	
Total Daily VMT (Pre-VMT reductions)				19,442,787	19,596,159	19,902,905	4%
Total Daily VMT (Post-VMT reductions)				18,678,659	18,798,031	19,094,674	

5. Conclusion

The estimated benefits of CAP strategies for VMT reductions were quantified using a state-of-the-practice approach from the California Air Pollution Control Officers Association (CAPCOA) GHG Handbook. GHG reduction measures and Implementing actions were first screened to identify those that can be quantified. Using travel demand forecasting results from the SCAG regional travel demand model, County VMT data were used, based on trip purpose and geography, to estimate benefits from CAP actions.

While several strategies have significant reduction potential of up to 30%, like those that involve increasing residential density, the measures are applied to a portion of the unincorporated county and therefore accrue a net reduction of less than 2% countywide. When accounting for a combined effect, the effectiveness of each measure could be dampened by the existence of a similar overlapping measure. By estimating VMT that more closely reflects the travel to be likely affected by a certain measure, possibilities of overlaps have been minimized. Even then, a dampening factor was applied above to show the total reduction estimate that accounts for dampening arrives at a similar VMT reduction estimate. This analysis will support the analysis and quantification of benefits from the CAP for Los Angeles County and its residents.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

LOS ANGELES COUNTY CLIMATE ACTION PLAN
(PREVIOUSLY “OURCOUNTY CLIMATE ACTION PLAN”)
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

Dear Gino Altamirano,

Thank you for your email of November 19, 2019, wherein you expressed an interest in a consultation between the Coastal Band of the Chumash Nation (Chumash Nation) and the County of Los Angeles (County) pursuant to SB 18 for the above-referenced project. The County emailed you on November 21, 2019 and on January 8, 2020 to inquire about your availability for a consultation. To date, the County has not heard back from you on this matter. The County had also tried to find the phone number for the Chumash Nation by contacting the Native American Heritage Commission (NAHC) and conducting an internet search. Unfortunately, our due diligence efforts did not produce a contact number, and thus the County was not able to contact the Chumash Nation by phone.

Please be advised that this letter serves as the County’s final attempt to contact the Chumash Nation in order to schedule and proceed with the consultation process. We kindly ask that the Chumash Nation respond to this letter by April 13, 2020. Our contact information is provided below for your convenience. If a response is not provided by the deadline date, the County will conclude the SB 18 process.

320 West Temple Street • Los Angeles, CA 90012 • 213-974-6411 • TDD: 213-617-2292

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

**RE: SENATE BILL (SB) 18 CONSULTATION (GOVERNMENT CODE §65352.3)
OURCOUNTY CLIMATE ACTION PLAN
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

The Native American Heritage Commission (NAHC) has identified your tribe as one with traditional lands or cultural places located within the proposed boundary of the above-referenced project. Because this project requires an amendment to the General Plan, it is subject to the SB 18 Tribal Consultation requirements (Government Code Section 65352.3). This letter serves as a formal notification and invitation to consult with the County of Los Angeles (County) on the proposed project identified above.

The project site is all unincorporated areas of the County of Los Angeles (County). Two maps depicting the unincorporated County areas are enclosed for your reference.

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The NAHC has provided the County Department of Regional Planning with a list of Native American Tribes with traditional lands or cultural places located within the unincorporated areas of the County. This letter was sent to each of the listed tribes.

Your participation in this local planning process is important. Pursuant to Government Code Section 65352.3(a)(2), you have 90 days from the receipt of this letter to request consultation with the County of Los Angeles. Please submit your request to the contact information listed below.

Hi Christina,

Thank you for contacting the San Manuel Band of Mission Indians (SMBMI) regarding the above referenced project. SMBMI appreciates the opportunity to review the project documentation, which was received by our Cultural Resources Management Department on 14 November 2019, pursuant to CEQA (as amended, 2015), CA PRC 21080.3.1, and Senate Bill 18. As SMBMI has no concerns with the proposed Project, the Tribe does not elect to consult on this project.

Re: Senate Bill (SB) 18 Consultation Our Country Climate Action

Dear Ms. Tran:

Thank you for contacting the Tribal Elders' Council for the Santa Ynez Band of Chumash Indians in regards to the above mentioned project.

At this time, the Elders Council requests no further consultation on this project; however, if supplementary literature reveals additional information, or if the scope of the work changes, we kindly ask to be notified.

If you decide to have the presence of a Native American monitor in place during ground disturbance to assure that any cultural items unearthed be identified as quickly as possible, please contact our office or Chumash of the project area.

Thank you for remembering that at one time our ancestors walked this sacred land.

Sincerely Yours,

The Tribal Elders' Council Governing Board

General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

Dear Gino Altamirano,

Thank you for your email of November 19, 2019, wherein you expressed an interest in a consultation between the Coastal Band of the Chumash Nation (Chumash Nation) and the County of Los Angeles (County) pursuant to SB 18 for the above-referenced project. The County emailed you on November 21, 2019 and on January 8, 2020 to inquire about your availability for a consultation. To date, the County has not heard back from you on this matter. The County had also tried to find the phone number for the Chumash Nation by contacting the Native American Heritage Commission (NAHC) and conducting an internet search. Unfortunately, our due diligence efforts did not produce a contact number, and thus the County was not able to contact the Chumash Nation by phone.

Please be advised that this letter serves as the County's final attempt to contact the Chumash Nation in order to schedule and proceed with the consultation process. We kindly ask that the Chumash Nation respond to this letter by April 13, 2020. Our contact information is provided below for your convenience. If a response is not provided by the deadline date, the County will conclude the SB 18 process.

RE: TRIBAL CULTURAL RESOURCES UNDER THE CALIFORNIA ENVIRONMENTAL QUALITY ACT, AB 52 (GATTO, 2014). FORMAL NOTIFICATION OF THE PROPOSED PROJECT PURSUANT TO PUBLIC RESOURCES CODE (PRC) §21080.3.1

The Los Angeles County Department of Regional Planning is issuing this formal notification of the proposed project. Below please find a description of the proposed project, two maps showing the project location, and our contact information along with the name of our point of contact, pursuant to PRC §21080.3.1(d).

**Proposed Project: OurCounty Climate Action Plan
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

Project Description:

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/ physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/ physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

Project Location: Countywide (all unincorporated areas of Los Angeles County)

RE: TRIBAL CULTURAL RESOURCES UNDER THE CALIFORNIA ENVIRONMENTAL QUALITY ACT, AB 52 (GATTO, 2014). FORMAL NOTIFICATION OF THE PROPOSED PROJECT PURSUANT TO PUBLIC RESOURCES CODE (PRC) §21080.3.1

The Los Angeles County Department of Regional Planning is issuing this formal notification of the proposed project. Below please find a description of the proposed project, two maps showing the project location, and our contact information along with the name of our point of contact, pursuant to PRC §21080.3.1(d).

**Proposed Project: OurCounty Climate Action Plan
Project No. 2019-002015
General Plan Amendment No. RPPL2019003630
Environmental Plan No. RPPL2019003635**

Project Description:

The proposed Project, the OurCounty Climate Action Plan (OurCounty CAP), is a comprehensive update to the Los Angeles County Community Climate Action Plan (CCAP) adopted in 2015. The Project entails a General Plan amendment to update the existing CCAP, which is a component of the Air Quality Element of the General Plan. The 2015 CCAP is an action plan that was created to reduce greenhouse gas (GHG) emissions from community activities in the unincorporated Los Angeles County by at least 11% below 2010 levels by 2020. For the update, OurCounty CAP utilizes 2015 data as the baseline year and 2025, 2035, and 2045 as the years for achieving GHG reduction targets. The OurCounty CAP GHG emissions from community activities and the reduction strategies and actions are organized into the following sectors: Stationary Energy; Transportation; Waste; Industrial Processes and Product Use; and Agriculture, Forestry and Other Land Use.

In developing the OurCounty CAP, an updated GHG emissions inventory and forecast was prepared. The GHG inventory provides the baseline from which the County will track GHG emissions reductions within the unincorporated areas of the County. The OurCounty CAP provides GHG reduction targets and includes actions that will help achieve those targets.

Specifically, the OurCounty CAP is designed to do the following:

- Provide an updated greenhouse gas (GHG) emission inventory by sectors using 2015 data as the baseline and forecast emissions for 2025, 2035, and 2045;
- Establish GHG emissions reduction targets as follows:
 - o by 2025, reduce GHG emissions by 25% below 2015 levels (aligned with 40% reduction below 1990 levels by 2030, consistent with SB 32);
 - o by 2035, reduce GHG emissions by 50% below 2015 levels (exceeding 19% reduction in per capita emissions from 2005 by 2035 and 21% reduction from 2005 by 2040, consistent with SB 375); and
 - o by 2045, achieve carbon neutrality in unincorporated LA County (consistent with Executive Order B-55-18).
- Incorporate certain actions from the 2015 CCAP that are necessary to achieve GHG emissions reduction targets;
- Establish new GHG emissions reduction actions;
- Outline the potential GHG emissions reduction through OurCounty CAP actions; and
- Establish procedures/protocols to monitor and verify the effectiveness of the actions to reduce GHG emissions.

The OurCounty CAP does not propose any change to the existing land use or zoning designations of the County General Plan or Zoning Ordinance, respectively. Furthermore, the OurCounty CAP does not directly involve any new construction/ physical development nor does it grant any entitlements for development. Any future site-specific discretionary project would require a project-level environmental review under the California Environmental Quality Act.

DRAFT CANDIDATE FINDINGS OF FACT
Public Resources Code Section 21081
For:
LOS ANGELES COUNTY 2045 CLIMATE ACTION PLAN
State Clearinghouse No. 2021120568

Lead Agency:
County of Los Angeles Department of Regional Planning

I. INTRODUCTION

This document presents the Findings of Fact (Findings) prepared by the County of Los Angeles Department of Regional Planning (County) for consideration of adoption by the Board of Supervisors of Los Angeles County (Board) regarding the Program Environmental Impact Report (PEIR) for the Los Angeles County 2045 Climate Action Plan (Project or 2045 CAP). The environmental effects of the Project are addressed in the Recirculated Draft PEIR dated March 2023 and a Final PEIR dated October 2023. The PEIR was prepared in compliance with the California Environmental Quality Act (CEQA, Pub. Resources Code, §§ 21000 *et seq.*) and its implementing regulations (CEQA Guidelines, Cal. Code Regs., tit. 14, §§ 15000 *et seq.*) and is incorporated by reference herein.

This document is organized as follows:

- Section I provides an introduction that describes the basis for these Findings and identifies the components of the record of proceedings as well as where to locate them.
- Section II describes the Project, including its location, objectives, and implementation timeline.
- Section III details the environmental review process and public participation.
- Section IV identifies the EIR certification process.
- Section V provides a summary of Project impacts, including which resource areas would have significant and unavoidable impacts, impacts that would be less than significant with mitigation incorporated, and less-than-significant impacts as a result of projects facilitated by the 2045 CAP.
- Section VI summarizes the Board's findings regarding significant and unavoidable impacts and impacts that would be less than significant with mitigation incorporated. Impact finding summaries are organized by environmental resource area with impacts, findings, and mitigation measures outlined.
- Section VII describes Findings relating to Project alternatives analyzed in the EIR, including the No Project Alternative, Alternative 1, Alternative 2, and Alternative 3.
- Section VIII summarizes additional CEQA Findings regarding the EIR.
- Section IX provides details about the Mitigation Monitoring and Reporting Plan.

Public Resources Code section 21081(a) and CEQA Guidelines section 15091(a) state that no public agency shall approve or carry out a project for which an environmental impact report has been completed that identifies one or more significant effects thereof, unless such public agency makes one or more of the following findings:

1. Finding 1: Changes or alterations have been required in, or incorporated into, the project which mitigate or avoid the significant environmental effects on the environment;
2. Finding 2: Those changes or alterations are within the responsibility and jurisdiction of another public agency and have been or can or should be adopted by that other agency¹; or
3. Finding 3: Specific economic, legal, social, technological, or other considerations, including considerations for the provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or alternatives identified in the environmental impact report.

CEQA requires that the Findings be supported by substantial evidence in the record. (CEQA Guidelines, § 15091(b).) Under CEQA, “substantial evidence” means enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached. (CEQA Guidelines, § 15384.) Substantial evidence must include facts, reasonable assumptions predicted upon facts, and expert opinion supported by facts. (CEQA Guidelines, § 15384(b).) Additional substantial evidence supporting all Findings made herein is contained in the EIR and/or the record of proceedings.

The Findings have been submitted by the County of Los Angeles Department of Regional Planning as Findings to be made by the decision-making body, the County of Los Angeles Board of Supervisors. The issuance of these Findings allows readers an opportunity to review them prior to a decision by the Board on the Project. It is the role of County staff to independently evaluate the proposed Findings, and to make a recommendation to the Board regarding their adequacy. It is the exclusive discretion of the Board, as decision-maker responsible for certifying the EIR, to determine the adequacy of the proposed Findings.

CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the project. (CEQA Guidelines, § 15093.) For a project that has significant impacts that cannot feasibly be avoided or substantially lessened, a public agency, after adopting proper findings, may nevertheless approve the project if the agency first adopts a Statement of Overriding Considerations setting forth the specific reasons why the agency found that the project's “benefits” render “acceptable” its “unavoidable adverse environmental effects”. (CEQA Guidelines, §§ 15093, 15043(b); Pub. Resources Code, § 21081(b).)

a. Record of Proceedings

The record of proceedings for the Project upon which the Board's Findings are based includes, but is not limited to, the following:

- The Notice of Preparation (NOP) and all other public notices issued by the County in conjunction with the project;
- All responses to the NOP received by the County;

¹ There are no changes or alterations within the responsibility of and jurisdiction of another public agency such that Finding 2 is not applied below.

- The Recirculated Draft PEIR;
- The Final PEIR;
- All written comments submitted by agencies or members of the public during the public review comment periods;
- All responses to the written comments included in the Final PEIR;
- The Mitigation Monitoring and Reporting Program;
- The reports and technical memoranda included or referenced in any responses to comments in the Final PEIR;
- All documents, studies, EIRs, or other materials incorporated by reference in, or otherwise relied upon during the preparation of, the Recirculated Draft PEIR and the Final PEIR;
- Any documents expressly cited in these Findings; and
- Any other relevant materials constituting the record of proceedings pursuant to Public Resources Code Section 21167.6(e).

b. Custodian and Location of Records

The following Findings of fact are based in part on the information contained in the EIR for the Project, as well as additional facts found in the complete record of proceedings. The County is the custodian of the Administrative Record for the Project. This information is provided in compliance with Public Resources Code section 21081.6(a)(2) and CEQA Guidelines section 15091(e).

The 2045 CAP Environmental Impact Report consists of:

1. Draft Program Environmental Impact Report dated May 2022;
2. Recirculated Draft Program Environmental Impact Report dated March 2023; and
3. Final Program EIR dated October 2023 consisting of the Recirculated Draft PEIR and the Final PEIR, which together provide in one place all clarifications, corrections, and minor revisions to the text, tables, figures, and appendixes of the Recirculated Draft PEIR generated either from responses to comments or independently by the County.

The EIR is hereby incorporated by reference and is available for review with all documents and other materials that constitute the record of proceedings for the County's actions related to the Project. The complete record of proceedings is available at Los Angeles County, Department of Regional Planning, 320 W. Temple Street 13th Floor, Los Angeles CA 900012. Copies of the documents that constitute the record of proceedings are also on the County's website. The Final PEIR, Notice of Availability, and Notice of Completion are also located on the County's website at <https://planning.lacounty.gov/long-range-planning/climate-action-plan/documents/>.

II. DESCRIPTION OF THE PROJECT

The Project, e.g., the Draft 2045 CAP as described in the Final PEIR, is up for approval. Subsections a., b., and c. below summarize the main components of the Project, including location, objectives, and implementation.

a. Project Location

The Project is not constrained to a single location within the region. Rather the Project area for the 2045 CAP consists of the unincorporated areas of Los Angeles County. These unincorporated areas occupy approximately 1,696,000 acres, or 2,650 square miles. Altogether, the Project area accounts for approximately 65 percent of the total land area of Los Angeles County.

b. Project Objectives

Overall, the 2045 CAP represents the County's plan to meet greenhouse gas (GHG) emissions reduction targets for unincorporated Los Angeles County by the years of 2030, 2035, and 2045. It was developed with the goal to implement the GHG emissions reduction policies of the General Plan Air Quality Element, and to ensure the County contributes its fair share to statewide GHG emissions reductions. The Project addresses the following objectives:

1. Identify detailed programs, actions, and performance goals to achieve the climate action policies of the General Plan.
2. Identify GHG emissions reduction targets tailored to the unincorporated County that closely align with state and County climate goals.
3. Provide a road map for reducing GHG emissions to achieve the County's GHG emissions reduction targets.
4. Encourage sustainable housing production at all levels of affordability, including increasing housing densities near transit to the extent allowed in the General Plan.
5. Demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects (serve as a "qualified CAP") via the 2045 Climate Action Plan Consistency Review Checklist (2045 CAP Checklist).

c. Project Overview and Implementation

The 2045 CAP now being considered for approval reflects the further development and refinement that resulted from public review of Draft 2045 CAP analyzed in the Draft PEIR and the Revised Draft 2045 CAP analyzed in the Recirculated Draft PEIR. See Section III, below, for details. The 2045 CAP identifies strategies, measures, and actions to effectively meet GHG emission reduction targets for 2030, 2035, and 2045. The 2045 CAP builds on previous County work and defines new reduction targets beyond the year 2020 that are consistent with the State of California's targets and legislative actions for GHG emissions reductions. The 2045 CAP details the GHG emissions reduction vision and goals of *OurCounty: Los Angeles Countywide Sustainability Plan* for the unincorporated Los Angeles County and implements the GHG emissions reduction strategies of the General Plan's Air Quality Element. Specifically, the 2045 CAP, once approved, would replace the existing implementation strategy of the Air Quality Element called the Unincorporated Los Angeles County Community Climate Action Plan 2020 (2020 CCAP). Approval of the 2045 CAP would require an amendment to the General Plan to replace the 2020 CCAP, an

implementing component of the General Plan's Air Quality Element. The 2045 CAP is a policy document intended to reduce community-wide GHG emissions and would support development allowed under the General Plan. No changes to General Plan land use designations, zoning, or land use, or specific projects, are proposed as part of the 2045 CAP.

Implementation of the 2045 CAP would occur over the following three phases, which takes advantage of easier short-term measures and actions to meet the 2030 target and then builds up to more complex solutions as the 2035 target and 2045 target dates approach:

- Phase 1: Short-Term Actions (2024–2030)—Short-term actions that are high-priority with large emissions reductions that would lay the foundation for longer term actions. The short-term target of the 2045 CAP is to reduce GHG emissions in the County by 40 percent below 2015 levels by 2030.
- Phase 2: Medium-Term Actions (2030–2035)—Actions needed to achieve the 2030 or 2035 GHG emissions reduction targets that may need additional time, funding, or new technology to implement. The medium-term target of the 2045 CAP is to reduce GHG emissions in the County by 50 percent below 2015 levels by 2035.
- Phase 3: Long-Term Actions (2035–2045)—Actions needed to achieve the 2045 GHG emissions reduction target that may need substantial time, funding, or new technology to implement. The long-term target of the 2045 CAP is to reduce GHG emissions in the County by 83 percent below 2015 levels by 2045. The long-term aspirational goal of the 2045 CAP is to achieve carbon neutrality in the County by 2045.

The Draft 2045 CAP includes the following:

- A GHG emissions inventory for 2018.
- Emissions forecasts for 2030, 2035, and 2045.
- GHG emissions targets for 2030, 2035, and 2045.
- A long-term aspirational goal for carbon neutrality by 2045.
- A suite of GHG emissions reduction strategies, measures, and actions to reduce GHG emissions from major sectors.
- A technical modeling appendix to explain the Draft 2045 CAP's GHG emissions reduction estimates.
- A consideration of environmental justice and equity concerns.
- Implementation and monitoring measures to ensure successful climate action.
- A new development review consistency checklist to allow future projects to streamline GHG emissions analyses pursuant to CEQA as anticipated by CEQA Guidelines section 15183.5 by using the 2045 CAP.

III. ENVIRONMENTAL REVIEW PROCESS AND PUBLIC PARTICIPATION

The County of Los Angeles is the lead agency responsible for conducting environmental review under CEQA and shall be primarily responsible for carrying out the Project. The County issued a Draft PEIR for the Draft 2045 CAP on May 25, 2022. After the July 18, 2022 conclusion of the comment period for the Draft PEIR, the County elected to revise the Draft 2045 CAP in response to public and other input received, and to transition the Draft 2045 CAP's aspirational goal of carbon neutrality by 2045 into a

target consistent with new legislation, Assembly Bill (AB) 1279. AB 1279 was enacted in September 2022 after the close of the Draft PEIR comment period.

The County released the Revised Draft 2045 CAP on March 16, 2023. The County issued a Recirculated Draft PEIR on the Revised Draft 2045 CAP on March 24, 2023, in compliance with CEQA. The Recirculated Draft PEIR describes changes to the Draft 2045 CAP in Chapter 2, *Project Description*, and analyzes the Project as revised on a resource-by-resource basis throughout Chapter 3, *Environmental Setting, Impacts, and Mitigation Measures*. It also adds content to address issues raised by public comments on the Draft PEIR and makes other minor clarifications. The Recirculated Draft PEIR wholly replaced the May 2022 Draft PEIR.

Pursuant to CEQA Guidelines section 15085, upon publication of the Recirculated Draft PEIR, the County filed a Notice of Completion with the Governor’s Office of Planning and Research, State Clearinghouse, indicating that the Recirculated Draft PEIR had been completed and was available for review and comment by the public. The County also posted a Notice of Availability of the Recirculated Draft PEIR at this time pursuant to CEQA Guidelines section 15087. During the public review period, beginning March 30, 2023 and ending on May 15, 2023, the County received comments on the environmental document. Comments were received via email to: climate@planning.lacounty.gov; and by mail at: Los Angeles County Department of Regional Planning 320 W. Temple Street 13th Floor, Los Angeles CA 90012. After the close of public review period, the County provided responses in writing to all comments received on the Recirculated Draft PEIR. See Table 1 below for a list of the parties who commented on the Recirculated Draft PEIR.

Name	Date(s)	Response to Comment
Agencies and Tribes		
California Air Resources Board	5/15/2023	Responses are provided in Section 2.3.1, Responses to Comments from Agencies and Tribes. See Letter A1.
San Manuel	4/26/2023	Responses are provided in Section 2.3.1, Responses to Comments from Agencies and Tribes. See Letter A2.
Los Angeles County Sanitation Districts	5/15/2023	Responses are provided in Section 2.3.1, Responses to Comments from Agencies and Tribes. See Letter A3.
Organizations		
Abundant Housing LA	5/15/2023	This comment on the Revised Draft 2045 CAP does not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses generally comments received on the Revised Draft 2045 CAP.
Acton Town Council	5/15/2023	Responses are provided in Section 2.3.2 Responses to Comments from Organizations. See Letter O2.
Altadena Town Council	5/15/2023	Responses are provided in Section 2.3.2 Responses to Comments from Organizations. See Letter O3.
Altadena Wild	5/15/2023	This comment on the Revised Draft 2045 CAP does not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses generally comments received on the Revised Draft 2045 CAP.
BizFed	5/9/2023 5/15/2023	Responses are provided in Section 2.3.2 Responses to Comments from Organizations. See Letter O5a and Letter O5b.

Name	Date(s)	Response to Comment
Building Industry Association	5/15/2023	Responses are provided in Section 2.3.2 Responses to Comments from Organizations. See Letter O6.
Center for Biological Diversity	5/15/2023	Responses are provided in Section 2.3.2 Responses to Comments from Organizations. See Letter O7.
Communities for a Better Environment	5/16/2023	Responses are provided in Section 2.3.2 Responses to Comments from Organizations. See Letter O8.
Endangered Habitats League	4/11/2023	Responses are provided in Section 2.3.2 Responses to Comments from Organizations. See Letter O9.
FivePoint Newhall Land and Farming Company	5/15/2023	Responses are provided in Section 2.3.2 Responses to Comments from Organizations. See Letter 10.
League of Women Voters	3/2023	Responses are provided in Section 2.3.2 Responses to Comments from Organizations. See Letter 12.
Santa Clarita Organization for Planning and the Environment	5/15/2023	Responses are provided in Section 2.3.2 Responses to Comments from Organizations. See Letter 13.
Southwest Mountain States Regional Council of Carpenters	5/12/2023	Responses are provided in Section 2.3.2 Responses to Comments from Organizations. See Letter 14.
Tejon Ranch Company	5/15/2023	Responses are provided in Section 2.3.2 Responses to Comments from Organizations. See Letter 15.
The Greenlining Institute	5/15/2023	This comment on the Revised Draft 2045 CAP does not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses generally comments received on the Revised Draft 2045 CAP.
Individuals		
Chelsea Katan	4/10/2023	Responses are provided in Section 2.3.3 Responses to Comments from Individuals. See Letter I1.
Emmanuel Alcantar		Responses are provided in Section 2.3.3 Responses to Comments from Individuals. See Letter I2.

The CEQA process includes public involvement at several steps, including consultation with California Native American Tribes consistent with AB 52. (Pub. Resources Code, § 21080.3.1). AB 52 establishes a process for CEQA lead agencies to consult with tribes that are traditionally and culturally affiliated with a project area—here, the unincorporated areas of Los Angeles County. For this Project, the County also invited public involvement in the form of public review of the Draft 2045 CAP and the Revised Draft 2045 CAP; and as part of the CEQA scoping process and following issuance of the Draft PEIR and Recirculated Draft PEIR.

IV. EIR CERTIFICATION PROCESS

The County released the Final PEIR on October 12, 2023 and posted the Final PEIR on its website. The County submitted the Final PEIR with the Governor’s Office of Planning and Research on October 23, 2023, per Cal. Code of Reg. Title 14 Chap. 3 ss 15089(b).

Prior to considering adoption of these Findings on November 15, 2023, pursuant to CEQA Guidelines section 15090, the Board certified that:

- The EIR has been completed in compliance with CEQA;

- The EIR was presented to the decision-making body of the lead agency – Los Angeles County Board of Supervisors – and that the decision-making body reviewed and considered the information contained in the EIR prior to approving the Project; and
- The EIR reflects the lead agency’s independent judgment and analysis.

Following publication of the Final PEIR, County staff has recommended the Board approve the Project as identified in the Final PEIR. The Findings and Statement of Overriding Considerations herein address the Project.

V. SUMMARY OF IMPACTS

Impacts associated with specific environmental resource areas resulting from the Project are summarized in Table ES-2 of the Recirculated Draft PEIR (p. ES-20 et seq.) and discussed below.

The EIR concludes that the Project will have a less-than-significant impact with mitigation measures incorporated on some components of the following issue areas:

- Aesthetics (Impacts 3.2-5 and 3.2-10)
- Air Quality (Impacts 3.4-3b and 3.4-7 [Valley Fever])
- Biological Resources (Impacts 3.5-1, 3.5-4, 3.5-6, and 3.5-9)
- Cultural Resources (All impacts)
- Hazards and Hazardous Materials (Impact 3.10-2, 3.10-3, 3.10-6, 3.10-8, 3.10-9, and 3.10-12)
- Hydrology and Water Quality (Impacts 3.11-5 and 3.11-11)
- Transportation (Impacts 3.15-1, 3.15-3, 3.15-4, and 3.15-6)
- Tribal Cultural Resources (All impacts)
- Wildfire (Impacts 3.18-1, 3.18-3, 3.18-5, 3.18-6, 3.18-8, and 3.18-10)

Section 15126.2(b) of the CEQA Guidelines requires an EIR to describe any significant impacts, including those that can be mitigated but not reduced to a less-than-significant level. The Project, as a result of the implementation of projects facilitated by the 2045 CAP, would have a significant and unavoidable impact on some components of the following environmental resource areas:

- Aesthetics (Impacts 3.2-1, 3.2-2, 3.2-3, 3.2-4, 3.2-6, 3.2-7, 3.2-8, and 3.2-9)
- Agriculture and Forestry (Impacts 3.3-1, 3.3-2, 3.3-5, 3.3-7, 3.3-8, and 3.3-11)
- Air Quality (Impacts 3.4-1, 3.4-2, 3.4-3a, 3.4-5, 3.4-6, and 3.4-7 [local Air Pollutant and toxic air contaminant {TAC} emissions])
- Biological Resources (Impacts 3.5-2, 3.5-3, 3.5-5, 3.5-7, 3.5-8, 3.5-10, and 3.5-11)
- Noise and Vibration (All impacts)
- Utilities and Service Systems (Impact 3.17-1, 3.17-3, 3.17-5, and 3.17-7)

CEQA does not require specific Findings to be made for impacts that would be less than significant without the incorporation of mitigation measures. The EIR concludes that the Project will have a less-than-significant impact and require no mitigation measures with respect to components of the following issue areas:

- Agriculture and Forestry (Impacts 3.3-3, 3.3-4, 3.3-6, 3.3-10, and 3.3-12)
- Air Quality (Impacts 3.4-4 and 3.4-8)
- Geology and Soils (All Impacts)
- Greenhouse Gas Emissions (All impacts)
- Hazards and Hazardous Materials (Impact 3.10-1, 3.10-4, 3.10-5, 3.10-7, 3.10-10, and 3.10-11)
- Hydrology and Water Quality (Impacts 3.11-1, 3.11-2, 3.11-3, 3.11-4, 3.11-6, 3.11-7, 3.11-8, 3.11-9, 3.11-10, and 3.11-12)
- Land Use and Planning (All impacts)
- Population and Housing (All impacts)
- Transportation (Impacts 3.15-2 and 3.15-5)
- Utilities and Service Systems (Impact 3.17-2, 3.17-4, 3.17-6, and 3.17-8)
- Wildfire (Impacts 3.18-2, 3.18-4, 3.18-7, and 3.18-9)

VI. FINDINGS OF FACT REGARDING THE PROJECT'S SIGNIFICANT AND LESS-THAN-SIGNIFICANT ENVIRONMENTAL IMPACTS

In making each of the findings below, the County has considered the plans, programs, and policies discussed in the PEIR.

a. Findings Regarding Project Impacts Determined to Be Less Than Significant with Mitigation Incorporated

The following significant impacts were analyzed in the PEIR. Because of the environmental analysis of the Project; presumed compliance with existing laws, codes, and statutes; and the identification and incorporation of feasible mitigation measures, the following significant impacts have been determined by the County to be reduced to a level of less than significant; and the County has found – in accordance with Public Resources Code section 21081(a)(1) and the CEQA Guidelines section 15091(a)(1) – that “Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant effects on the environment as identified in the final EIR.” This is referred to herein as “Finding 1.” Please refer to the PEIR for a further discussion of impacts within each resource section.

i) Aesthetics

Impact 3.2-5: Projects facilitated by the 2045 CAP would create a new source of substantial shadow, light, or glare, which would adversely affect day or nighttime views in the area.

Finding 1: Mitigation measures would reduce the Project's impacts due to the creation of a new source of substantial shadow, light, or glare, which would adversely affect day or nighttime views in the area to less-than-significant levels. The Board finds that Mitigation Measure 3.2-3, described below, is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The implementation of Mitigation Measure 3.2-3, Reduce Light and Glare Impacts, would ensure that lighting from projects facilitated by the 2045 CAP would not substantially intrude on daytime or nighttime views in the area because its provisions would

substantially limit light trespass and confine generated light to within project boundaries. Also, adhering to design and siting requirements would reduce the potential for glare. Accordingly, with the implementation of Mitigation Measure 3.2-3, Impact 3.2-5 would be reduced to less than significant.

Mitigation Measures:

Mitigation Measure 3.2-3: Reduce Light and Glare Impacts (Recirculated Draft PEIR, p. 3.2-18)

To reduce significant light and glare impacts of projects facilitated by the 2045 CAP, the County shall require the following measures to be incorporated: a) All lighting shall be focused toward the site and outdoor lighting shall be directed downward; b) The design of exterior light fixtures shall incorporate shielding to prevent glare and offsite light spillage; c) Outdoor lighting shall include non-glare fixtures; and d) Structure design shall include exterior finishes and materials that would be minimally reflective or sited or oriented in such a way as to direct glare away from sensitive receptors.

Impact 3.2-10: Projects facilitated by the 2045 CAP would not cause or contribute to a new source of substantial shadow, light or glare, which would result in a significant cumulative impact to views in the area.

Finding 1: Mitigation measures would reduce the Project's impacts related to causing or contributing to a new source of substantial shadow, light or glare, which would result in a significant cumulative impact to views in the area to less-than-significant levels. The Board finds that Mitigation Measure 3.2-3 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than cumulatively considerable and therefore, less than significant.

Facts in Support of Finding: Pre-mitigation, the cumulative impact attributable to nighttime lighting would be significant, and the Project's contribution to this impact would be cumulatively considerable as a result of the incremental impacts of the implementation of projects facilitated by the 2045 CAP. However, the implementation of Mitigation Measure 3.2-3 would ensure that nighttime lighting associated with projects facilitated by the 2045 CAP would not substantially intrude on daytime or nighttime views in the area because its provisions would substantially confine generated light to within the projects' boundaries. Accordingly, with the implementation of Mitigation Measure 3.2-3, the Project's contribution to cumulative impacts would be less than cumulatively considerable, and therefore less than significant.

Mitigation Measures:

Mitigation Measure 3.2-3. See Impact 3.2-5 for a discussion of this mitigation measure.

ii) Air Quality

Impact 3.4-3b: The Project, as a result of projects facilitated by the 2045 CAP measures and actions, would not expose sensitive receptors to substantial pollutant concentrations relating to Valley Fever.

Finding 1: Mitigation measures would reduce the Project's impacts relating to exposing sensitive receptors to substantial pollutant concentrations relating to Valley Fever to less-than-significant levels. The Board finds that Mitigation Measures 3.4-1, 3.4-2, and 3.4-8 described below, are feasible and hereby adopts them. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Projects facilitated by the 2045 CAP would result in a significant impact related to exposure of sensitive receptors to substantial pollutant concentrations related to Valley Fever. Implementation of Mitigation Measures 3.4-1 and 3.4-2 would control and reduce fugitive dust emissions and reduce potential off-site exposures. Mitigation Measure 3.4-8 would reduce potential exposures to construction workers located on-site and off-site, reducing this impact to a less-than-significant level. Because the exact specifications for projects that may be facilitated by the 2045 CAP are unknown, this determination applies to horizon years 2030, 2035, and 2045. Although the magnitude of long-term impacts would increase over time to the extent that more projects would be facilitated by CAP measures and actions to meet the 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets, the impact would remain less than significant for all horizon years.

Mitigation Measures:

Mitigation Measure 3.4-1: Construction Emissions (Recirculated Draft PEIR, p. 3.4-51 et seq.)

If, during subsequent project-level environmental review, construction-related criteria air pollutants are determined to have the potential to exceed the applicable air quality management district (AQMD) adopted thresholds of significance, the lead agency shall require applicants for new projects facilitated by the 2045 CAP measures and actions to incorporate mitigation measures to avoid or reduce air pollutant emissions during construction activities. Mitigation measures that may be identified during the environmental review include, but are not limited to:

- When wind gusts exceed 25 miles per hour, cease all active construction activities or follow the applicable guidelines outlined in Table 3 of SCAQMD Rule 403 or Sections (C)(10) through (C)(14) of AVAQMD Rule 403.
- Use construction equipment rated by the U.S. Environmental Protection Agency (USEPA) as having Tier 3 (model year 2006 or newer) or Tier 4 (model year 2008 or newer) emission limits, applicable for engines between 50 and 750 horsepower, as commercially available.
- Ensure that construction equipment is properly serviced and maintained to the manufacturer's standards.
- Limit nonessential idling of construction equipment to no more than five consecutive minutes.
- Where acceptable to the fire department, control weed growth by mowing instead of disking, thereby leaving the ground undisturbed and with a mulch covering.
- Water all active construction areas at least three times daily or four times daily if needed to control dust emissions. Watering should be sufficient to prevent airborne visible dust from leaving the site. Where local water supplies are not available in sufficient quantities within unincorporated areas of the County, use nontoxic chemical soil stabilizers or dust suppressants to control dust emissions in sufficient amounts to prevent airborne visible dust from leaving the site.
- Increase watering frequency and/or application frequency of nontoxic chemical soil stabilizers or dust suppressants whenever wind speeds exceed 25 miles per hour. Reclaimed water shall be used whenever possible.

- Cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least two feet of freeboard (i.e., the minimum required space between the top of the load and the top of the trailer).
- Pave, apply water three times daily or as often as necessary to control dust, or where local water supplies are not available in sufficient quantities within unincorporated areas of the County, apply (nontoxic) soil stabilizers or dust suppressants on all unpaved access roads, parking areas, and staging areas at construction sites.
- Sweep daily (with water sweepers using reclaimed water if possible), or as often as needed, all paved access roads, parking areas, and staging areas at the construction site to control dust.
- Sweep public streets daily (with water sweepers using reclaimed water if possible) in the vicinity of the Project site, or as often as needed, to keep streets free of visible soil material.
- Where local water supplies are not available in sufficient quantities within unincorporated areas of Los Angeles County, hydroseed or apply nontoxic chemical soil stabilizers or dust suppressants to inactive construction areas.
- Enclose, cover, water three times daily, or apply nontoxic chemical soil stabilizers or dust suppressants to exposed stockpiles (dirt, sand, etc.).
- In areas with existing vegetation, install the facility components with minimal disturbance. Take all necessary precautions to not use vehicles or machinery for grading or alter the existing grade in these areas.
- Design project facilities to limit ground disturbance or grading to only the access roads, substations and related underground transmission lines, tanks, basins, inverter pads, or other areas required by the County. Ensure that the facilities comply with all applicable grading standards.
- Site utility-scale renewable energy projects in a way that minimizes site disturbance, such as grading, brush clearance, and other forms of earthwork.
- In areas with existing vegetation, install facility components with minimal disturbance. Take all necessary precautions to avoid using vehicles or machinery for grading, or altering the existing grade in these areas.
- Establish and maintain a landscaped buffer:
 - Maintain a landscaped area at least 10 feet deep along any facility perimeter fencing and between such fencing and any public right-of-way or adjacent property with an existing residential or agricultural use.
 - Establish the landscaped area in such manner that adequate corner sight distance is maintained from all access roads to the public right-of-way to the satisfaction of the County of Los Angeles Department of Public Works.
 - Maintain the landscaped area throughout the life of the facility.

Mitigation Measure 3.4-2: Operational Fugitive Dust Emissions (Recirculated Draft PEIR, p. 3.2-53 et seq.)

If, during subsequent project-level environmental review, operational fugitive dust emissions are determined to have the potential to be significant, the lead agency shall require applicants for new projects facilitated by the 2045 CAP measures and actions to incorporate mitigation measures to avoid or reduce air pollutant emissions during operational activities. Mitigation measures that may be identified during the environmental review include, but are not limited to, the following:

- Unpaved main access roads for operational vehicle trips shall be paved or effectively stabilized using soil stabilizers that can be determined to be as efficient as or more efficient for fugitive dust control than California Air Resources Board–approved soil stabilizers, and that shall not increase any other environmental impacts, including loss of vegetation.
- All other unpaved roads shall be stabilized using water or soil stabilizers so that vehicle travel on these roads does not cause visible dust plumes.
- Gravel pads, grizzly strips, or other material track-out control methods approved for use by the local AQMD shall be installed where vehicles enter or exit unpaved roads onto paved roadways.
- Traffic speeds on unpaved roads shall be limited to no more than 10 miles per hour, except that vehicles may travel up to 25 miles per hour on stabilized unpaved roads as long as such speeds do not create visible dust emissions. Traffic speed signs shall be displayed prominently at all site entrances and at egress point(s) from the central maintenance complex.
- Where acceptable to the local and County fire departments, all unpaved, non-road surfaces that may potentially be disturbed shall be covered with a minimum of 3 inches of mulch. Where acceptable to the local and County fire departments, vegetation shall be maintained at 6 inches height.
- All trucks hauling dirt, sand, soil, or other loose materials shall be covered or shall maintain at least 6 inches of freeboard (minimum vertical distance between top of the load and top of the trailer) in accordance with California Vehicle Code Section 23114.
- A fugitive dust control plan that includes a dust plume response plan shall be prepared for review and approval by applicable agencies before any earthwork activities.
- Where acceptable to the local and County fire departments, weed control shall be accomplished by mowing instead of disking, thereby leaving the ground undisturbed and with a mulch covering.
- Existing vegetation may be mowed, but removal of existing vegetation root systems shall be prohibited, except where necessary for construction of access roads, substations and related underground transmission lines, tanks, basins, inverter pads, or other areas required by the County.
- Continuous particulate monitors shall be installed at the discretion of the lead agency.

Mitigation Measure 3.4-8: Valley Fever (Recirculated Draft PEIR, p. 3.4-71).

During heavy grading where the top 12–18 inches of soil would be disturbed, and in locations with potential Valley Fever fungal spores, applicants for projects facilitated by the 2045 CAP measures shall require construction contractors to comply with the following measures as feasible to reduce potential Valley Fever impacts:

- Require crews to use respirators during project clearing, grading, and excavation operations in accordance with California Division of Occupational Safety and Health regulations.
- Require that the cabs of grading and construction equipment be air-conditioned or enclosed with sufficient ventilation and particulate matter filtration systems.
- Require crews to work upwind from excavation sites where possible.
- Where acceptable to the fire department, control weed growth by mowing instead of disking, thereby leaving the ground undisturbed and with a mulch covering.
- During rough grading and construction, ensure that the access way into the project site from adjoining paved roadways is paved or treated with environmentally safe dust control agents.

Impact 3.4-7: The Project, as a result of projects facilitated by the 2045 CAP, could contribute to a significant cumulative impact, to air quality associated with Valley Fever.

Finding 1: Mitigation measures would reduce the Project's impacts relating to contributions of the projects facilitated by the 2045 CAP to a significant cumulative impact to air quality associated with Valley Fever to less-than-significant levels. The Board hereby makes Finding 1 and determines this impact to be less than cumulatively considerable and therefore, less than significant.

Facts in Support of Finding: Valley Fever cumulative impacts would be significant, and the Project's contribution would be cumulatively considerable; however, implementation of Mitigation Measures 3.4-1: Construction Emissions; 3.4-2: Operational Fugitive Dust Emissions; and 3.4-8: Valley Fever; would reduce Valley Fever cumulative impacts to less than significant.

Mitigation Measures:

Mitigation Measure 3.4-1: Construction Emissions. See Impact 3.4-3b for a discussion of this mitigation measure.

Mitigation Measure 3.4-2. Operational Fugitive Dust Emissions. See Impact 3.4-3b for a discussion of this mitigation measure.

Mitigation Measure 3.4-8. Valley Fever. See Impact 3.4-3b for a discussion of this mitigation measure.

iii) Biological Resources

Impact 3.5-1: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would have a substantial direct adverse impact on one or more species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS.

Finding 1: Mitigation measures would reduce the Project's substantial direct adverse impacts on one or more species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS to less-than-significant levels. The Board finds that Mitigation Measures 3.5-1, 3.4-2, and 3.4-8 described below are feasible and hereby adopts them. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: A total of 275 special-status plant species and 239 special-status wildlife species have been documented in Los Angeles County. While the 2045 CAP is a policy document and does not include specific projects that would have adverse impacts on special-status species and their habitat, various projects facilitated by the 2045 CAP measures and actions could adversely affect special-status species and their habitat. Measures to protect biological resources would come from two sources: the County's General Plan 2035 and the EIR for the Project.

The County adopted a General Plan update in 2015, which included biological resources mitigation measures General Plan Mitigation Measure BIO-1 and General Plan Mitigation Measure BIO-2. These measures would protect biological resources from impacts resulting from implementation of projects facilitated by the 2045 CAP measures and actions. Briefly, General Plan Mitigation Measure BIO-1 would require project-level surveys and analysis to characterize the project site and determine the presence/absence of special-status species in advance of a future discretionary project approval. If construction activities could cause direct impacts to special-status species, then General Plan Mitigation Measure BIO-2 requires the identification and implementation of mitigation measures and/or construction monitoring to ensure avoidance, relocation, or safe escape of special-status species from the construction activities. The text of General Plan Mitigation Measures BIO-1 and BIO-2 is set forth in full in the Mitigation Monitoring and Reporting Program for this Project.

Mitigation Measure 3.5-1 and Mitigation Measure 3.5-2 also would be followed and enforced to protect biological resources. Mitigation Measure 3.5-1 would ensure that, on a project-specific level, necessary surveys would be conducted, and a biological resources assessment prepared to analyze the specific impacts of projects facilitated by the 2045 CAP and would propose appropriate mitigation measures to offset those impacts. Mitigation Measure 3.5-2 would avoid direct mortality to special-status species from construction activities by requiring preconstruction surveys (and construction monitoring where warranted) for special-status species as necessary. Federal and state regulations would continue to apply. Mitigation measures would apply only if specific projects have significant impacts.

Mitigation Measures:

Mitigation Measure 3.5-1 (Recirculated Draft PEIR, p. 3.5-19)

The County shall require biological resources to be analyzed on a project-specific level by a qualified biological consultant. Prior to or during the preparation of project-level environmental documents, and prior to the start of construction activities, a biological resources assessment shall be conducted to characterize the project site. Suitable buffer areas surrounding the project site shall be included where native habitat is contiguous with off-site habitat areas. The assessment and analysis shall emphasize identifying endangered, threatened, rare, and other special-status species; regionally and locally unique species; and sensitive natural communities, jurisdictional waters, and oak woodlands. Focused surveys shall be conducted as necessary to

determine the presence of special-status species (e.g., focused sensitive plant or wildlife surveys). Focused surveys shall be conducted according to established CDFW or USFWS protocols, if available for the object species. Natural communities shall be mapped and identified according to floristic alliance- and/or association-based mapping protocols consistent with CDFW natural communities. A jurisdictional delineation may be required if there are signs of potentially regulated wetlands and non-wetland waters. A biological resources assessment report shall be prepared to characterize the biological resources on-site, analyze direct and indirect impacts on biological resources, and propose mitigation measures to offset those impacts. The report shall include site location, literature sources, methodology, timing of surveys, vegetation map, site photographs, and descriptions of biological resources on-site (e.g., observed and detected species as well as those species with potential to occur on-site).

Mitigation Measure 3.5-2 (Recirculated Draft PEIR, p. 3.5-19 et seq.)

If there is potential for direct impacts to special-status species with implementation of construction activities, the project-specific biological resources assessment report (as described in Mitigation Measure 3.5-1) shall include a mitigation measure requiring pre-construction surveys for special-status species and/or construction monitoring to ensure avoidance, relocation, or safe escape of special-status species from the construction activities, as appropriate. The mitigation measures shall also include consultation with and obtaining permits from USFWS or CDFW prior to construction, if required by FESA or CESA for listed endangered and threatened species. If special-status species are found to be nesting, brooding, denning, etc. on-site during the pre-construction survey or monitoring, construction activity shall be halted until offspring are weaned, fledged, etc. and are able to escape the site or be safely relocated to appropriate offsite habitat areas. Relocation of such species into areas of appropriate restored habitat would have the best chance of replacing/incrementing populations that are lost due to habitat converted to development. Relocation to restored habitat areas shall be the preferred goal of this measure. A qualified biologist shall be on site to conduct surveys, to perform or oversee implementation of protective measures, and to determine when construction activity may resume.

Impact 3.5-4: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would have a substantial adverse impact on state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.) through direct removal, filling, hydrological interruption, or other means.

Finding 1: Mitigation measures would reduce the Project's impacts on state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.) through direct removal, filling, hydrological interruption, or other means to less-than-significant levels. The Board finds that Mitigation Measures 3.5-1 and 3.5-3, described below, are feasible and hereby adopts them. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Impacts of projects facilitated by the 2045 CAP may be significant in the absence of mitigation measures. The Conservation and Natural Resources Element of the General Plan would continue to be followed and enforced to protect biological resources, including through General Plan Mitigation Measures BIO-1 and BIO-2. The implementation of Mitigation Measures 3.5-1 and 3.5-3 identified in the EIR also would be required. For example, Mitigation Measure 3.5-1 would ensure that surveys are conducted to identify any state or federally protected wetlands prior to any new development projects implemented under the 2045

CAP measures. Mitigation Measure 3.5-3 would ensure that new projects facilitated by 2045 CAP measures and actions would provide appropriate mitigation for impacts on state and federally protected wetlands. Federal and state regulations would continue to apply. Thus, with the implementation of the recommended mitigation measures, impacts on state or federally protected wetlands due to the implementation of projects facilitated by the 2045 CAP would be less than significant.

Mitigation Measures:

[Mitigation Measure 3.5-1](#). See Impact 3.5-1 for a description of this mitigation measure.

[Mitigation Measure 3.5-3 \(Recirculated Draft PEIR, p. 3.5-23\)](#)

Prior to the issuance of any grading permit for permanent impacts in the areas designated as jurisdictional features, the project applicant shall obtain a Clean Water Act Section 404 permit from USACE, a Clean Water Act Section 401 certification from the RWQCB, and a Streambed Alteration Agreement/LSAA permit under Section 1602 of the California Fish and Game Code from CDFW, where the project warrants.

Impact 3.5-6: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would convert oak woodlands (as defined by the state, oak woodlands are oak stands with greater than 10 percent canopy cover with oaks at least 5 inches in diameter measured at 4.5 feet above mean natural grade) or other unique native woodlands (juniper, Joshua tree, Southern California black walnut, etc.).

Finding 1: Mitigation measures would reduce the Project's impacts regarding the conversion of oak woodlands (as defined by the state, oak woodlands are oak stands with greater than 10 percent canopy cover with oaks at least 5 inches in diameter measured at 4.5 feet above mean natural grade) or other unique native woodlands (juniper, Joshua tree, Southern California black walnut, etc.) to less-than-significant levels. The Board finds that Mitigation Measures 3.5-1 and 3.5-5 are feasible and hereby adopts them. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Mitigation Measures 3.5-1 and 3.5-5 would reduce impacts to oak woodlands and other unique native woodlands by requiring surveys and impact analyses for these resources, and measures to reduce or compensate for impacts. With the implementation of these mitigation measures, impacts on oak woodlands and other unique native woodlands would be less than significant.

Mitigation Measures:

[Mitigation Measure 3.5-1](#). See Impact 3.5-1 for a description of this mitigation measure.

[Mitigation Measure 3.5-5 \(Recirculated Draft PEIR, p. 3.5-26\)](#)

Proponents of projects resulting in the loss of oak woodlands shall mitigate with in-kind replacement habitat at a minimum of 1:1 mitigation ratio documented through a County-approved habitat mitigation plan. The plan shall include the number of replacement trees (or acreage and average density of woodland), location of replacement woodland, understory habitat components, sequencing for any phased tree removal, and performance standards for mitigation. The plan shall include monitoring for a minimum of five years, with annual reports submitted to the County.

For oak woodlands impacts, project mitigation shall be consistent with recommendations in the County's Oak Woodland Conservation Management Plan and its 2014 Guide. If a project cannot be redesigned to avoid impacts to oak woodlands, an appropriate mitigation strategy would be developed by selecting from the Guide's list of recommended mitigation measures prioritizing the acquisition of oak woodland habitat comparable to the habitat that was affected over the restoration of degraded off-site and in-lieu fees. A Mitigation Monitoring Plan consistent with the Guide's recommendations would be prepared and implemented.

Impact 3.5-9: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would contribute to a substantial cumulative adverse impact on state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.) through direct removal, filling, hydrological interruption, or other means.

Finding 1: Mitigation measures would reduce the Project's contribution to a substantial cumulative adverse impact on state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.) through direct removal, filling, hydrological interruption, or other means to less-than-significant levels. The Board finds that Mitigation Measures 3.5-1 and 3.5-3 are feasible and hereby adopts them. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The 2045 CAP would contribute a significant incremental contribution to this significant cumulative impact that could be mitigated to a level that would be less than cumulatively considerable (i.e., less than significant) by the implementation of Mitigation Measures 3.5-1 and 3.5-3. With the implementation of these mitigation measures and compliance with the regulatory agencies of USACE, CDFW, and RWQCB implementing their "no net loss" of biological resource habitat policies, the Project-specific, incremental contribution, in combination with the cumulative projects' impacts on special-status species over the span of the 2045 CAP, would not be cumulatively considerable. A less-than-significant cumulative impact on wetlands would result.

Mitigation Measures:

Mitigation Measure 3.5-1. See Impact 3.5-1 for a description of this mitigation measure.

Mitigation Measure 3.5-3: See Impact 3.5-4 for a description of this mitigation measure.

Proponents for individual projects facilitated by the 2045 CAP provisions shall analyze impacts on wildlife movement and corridors that may introduce new or additional barriers to wildlife dispersal or constrain existing wildlife corridors to future movement, or indirect impacts constraining future wildlife movement. Where projects may interfere with wildlife movement, alternative designs shall be included in the analysis to reduce wildlife movement impacts. Corridors, linkages, and pinch points shall not be entirely closed by any development, and partial mitigation shall be mandatory for project-specific impacts on wildlife corridors and wildlife nursery sites. This shall include provision of a minimum of half the corridor width. (The width shall be at least what is needed to remain connective for the top predators using the corridor.) Mitigation can include preservation by deed in perpetuity of other parts of the wildlife corridor connecting through the development area; it can include native landscaping to provide cover on the corridor. For nursery site impacts, mitigation shall include preservation by deed in perpetuity for another comparable nursery site of the same species.

iv) Cultural Resources

Impact 3.6-1: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines section 15064.5.

Finding 1: Mitigation measures would reduce the Project's impacts relating to causing a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines section 15064.5 to less-than-significant levels. The Board finds that Mitigation Measures 3.6-1, 3.6-2, 3.6-3, 3.6-4, 3.6-5, and 3.6-6 are feasible and hereby adopts them. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The Project, due to projects facilitated by 2045 CAP measures and actions, would result in a less-than-significant impact on historical resources after implementation of Mitigation Measures 3.6-1 through 3.6-6. The implementation of these measures would reduce significant impacts on historical resources resulting from projects facilitated by 2045 CAP measures and actions by avoiding or reducing the significant impact. Mitigation Measure 3.6-1 requires identification of historical resources of a built nature that could be affected by a project to avoid or reduce inadvertent significant impacts on such resources. The measure further requires that projects be designed to conform with the Secretary of the Interior's Standards to avoid or reduce significant impacts on such resources. Mitigation Measure 3.6-2 requires identification of significant archaeological resources (i.e., resources considered historical resources or unique archaeological resources) to avoid or reduce inadvertent significant impacts on such resources. The measure further requires that archaeological/Native American monitoring be considered to ensure that there is an opportunity to avoid or reduce inadvertent significant impacts on such resources. Mitigation Measure 3.6-3 requires that construction personnel involved in ground-disturbing activities be trained in the identification of cultural resources to assist in avoidance or minimizing of inadvertent potentially significant impacts on such resources. Mitigation Measures 3.6-4 and 3.6-5 require that significant archaeological resources be avoided and preserved in place if feasible. If avoidance and preservation in place is not feasible, then data recovery is required to recover the scientifically consequential information contained in the resource, which would avoid or reduce significant adverse impacts on the resource. Mitigation Measure 3.6-6 provides for final disposition of archaeological materials, such as curation or donation to a Native American group or other entity, to reduce significant impacts on such resources by preserving the materials for those with research or educational interests.

Mitigation Measures:

Mitigation Measure 3.6-1: Historic Resources Assessment (Recirculated Draft PEIR, p. 3.6-24)

Prior to demolition or alteration of buildings and/or structures or the construction of aboveground infrastructure with potentially significant impacts on historic architectural resources, the project proponent shall retain an architectural historian meeting the minimum professional qualifications standards (PQS) set forth by the Secretary of the Interior (codified in 36 CFR Part 61; 48 FR 44738–44739) (Qualified Architectural Historian) to conduct a historic resources assessment of affected properties. The assessment shall include a records search at the South Central Coastal Information Center or review of a prior record search conducted within the previous one year; a review of other pertinent archives and sources; a pedestrian field survey; recordation of all identified historic architectural resources on California Department of Parks and Recreation (DPR) 523 forms; evaluation of resources which may be eligible for listing in the California

Register (i.e., meets the definition for historical resource in CEQA Guidelines Section 15064.5[a]), and for local listing; and preparation of a technical report documenting the methods and results of the assessment for each future project facilitated by 2045 CAP measures and actions. If a historic architectural resource is found eligible by the Qualified Architectural Historian, then the Qualified Architectural Historian shall coordinate with the project proponent and the County to ensure the project is constructed in conformance with the Secretary of the Interior's Standards. All reports resulting from implementation of this measure shall be filed with the South Central Coastal Information Center (including but not limited to historic resources assessments and Secretary of the Interior's Standards plan reviews).

Mitigation Measure 3.6-2: Archaeological Resources Assessment (Recirculated Draft PEIR, p. 3.6-24 et seq.)

Prior to conducting construction activities that would involve ground disturbance, the project proponent shall retain an archaeologist meeting the minimum PQS set forth by the Secretary of the Interior (codified in 36 CFR Part 61; 48 FR 44738–44739) (Qualified Archaeologist) to conduct an archaeological resources assessment. The assessment shall include a records search at the South Central Coastal Information Center or review of a prior record search conducted within the previous one year; a Sacred Lands File search at the California Native American Heritage Commission (NAHC); geoarchaeological review including a focused assessment of land use history and any available geotechnical data to assess the potential for subsurface archaeological resources; a pedestrian field survey in instances where ground surface is exposed; recordation of all identified archaeological resources on DPR 523 forms; evaluation of resources affected by the project for eligibility for listing in the California Register (i.e., meets the definition for historical resource in CEQA Guidelines Section 15064.5[a]), and for local listing; and preparation of a technical report documenting the methods and results of the assessment. Resources that do not qualify as historical resources shall be considered by the Qualified Archaeologist for qualification as unique archaeological resources as defined in Public Resources Code Section 21083.2(g). The technical report also shall provide recommendations as to whether additional studies are warranted to further identify or evaluate archaeological resources (i.e., Extended Phase I boundary delineation, Phase II testing and evaluation) and if archaeological monitoring and Native American monitoring of ground disturbing activities is warranted (e.g., in areas where there is a higher potential to encounter buried resources). Prior to the initiation of field work for any Extended Phase I or Phase II investigation, the Qualified Archaeologist shall prepare a work plan outlining the investigation's objectives, goals, and methodology. When developing a work plan for Native American resources, the County shall consult with local Native American tribes.

If archaeological/Native American monitoring is warranted, the Qualified Archaeologist shall determine the locations and duration of monitoring and reporting requirements. All reports resulting from implementation of this measure shall be filed with the South Central Coastal Information Center (including but not limited to archaeological resources assessments, Extended Phase I and Phase II reports, and monitoring reports).

Mitigation Measure 3.6-3: Construction Worker Cultural Resources Sensitivity Training (Recirculated Draft PEIR, p. 3.6-25)

For projects with ground-disturbing activities that may encounter potentially significant archaeological resources, the Qualified Archaeologist shall implement a cultural resources

sensitivity training program. The Qualified Archaeologist, or its designee, shall instruct all construction personnel of the types of archaeological resources that may be encountered, the proper procedures to be enacted in the event of an inadvertent discovery of archaeological resources or human remains, applicable laws protecting archaeological resources, and confidentiality of discoveries. Native American monitor(s) shall be invited to participate in presenting tribal perspectives as part of the training curriculum. In the event that construction crews are phased, additional trainings shall be conducted for new construction personnel. The project proponent or its contractors shall ensure construction personnel are made available for and attend the training. The project proponent shall retain documentation demonstrating attendance and provide it to the County.

Mitigation Measure 3.6-4: Archaeological Resources Discoveries (Recirculated Draft PEIR, p. 3.6-25)

In the event archaeological resources are encountered during construction of a project, the project proponent shall cease all activity within 50 feet of the find shall cease. The discovery shall be evaluated for significance by the Qualified Archaeologist. When assessing significance and developing treatment for resources that are Native American in origin, the County shall consult with local Native American tribes. If the Qualified Archaeologist determines that the resource is significant (i.e., meets the definition for historical resource in CEQA Guidelines Section 15064.5[a] or for unique archaeological resource in Public Resources Code Section 21083.2[g]), the Qualified Archaeologist shall provide a method for avoidance and preservation in place, which shall be the preferred manner of mitigating impacts. If avoidance is infeasible, the Qualified Archaeologist shall develop a Phase III Archaeological Resources Data Recovery and Treatment Plan consistent with Mitigation Measure 3.6-5. The Qualified Archaeologist also shall determine, based on the initial assessment of the discovery, whether the 50-foot buffer may be reduced. All reports resulting from implementation of this measure shall be filed with the South Central Coastal Information Center (including but not limited to Extended Phase I, Phase II, and Phase III reports).

Mitigation Measure 3.6-5: Treatment of Archaeological Resources (Recirculated Draft PEIR, p. 3.6-25 et seq.)

If the assessment conducted under Mitigation Measure 3.6-2 or Mitigation Measure 3.6-4 identifies significant archaeological resources (i.e., meets the definition for historical resource in CEQA Guidelines Section 15064.5[a] or for unique archaeological resource in Public Resources Code Section 21083.2[g]), then avoidance and preservation in place shall be the preferred manner of mitigating impacts. Preservation in place may be accomplished by, but is not limited to, avoidance, incorporating the resource into open space, capping, or deeding the site into a permanent conservation easement. If avoidance and preservation in place of significant archaeological resources is determined by the County to be infeasible, then the Qualified Archaeologist shall prepare a Phase III Archaeological Resources Data Recovery and Treatment Plan. The plan shall include: a detailed research design; justification for data recovery or other treatment methods depending on the nature of the resource's eligibility; excavation methodology; and, reporting and curation requirements. When developing treatment for resources that are Native American in origin, the County shall consult with local Native American tribes. All Phase III reports resulting from implementation of this measure shall be filed with the South Central Coastal Information Center.

Mitigation Measure 3.6-6: Curation and Disposition of Cultural Materials (Recirculated Draft PEIR, p. 3.6-26)

The project proponent shall arrange curation for all Native American archaeological materials, with the exception of funerary objects or grave goods (i.e., artifacts associated with Native American human remains). For significant Native American archaeological materials, the project proponent shall first consider repositories that are accredited by the American Association of Museums and that meet the standards outlined in 36 CFR 79.9. If a suitable accredited repository is not identified, then the project proponent shall consider nonaccredited repositories as long as they meet the minimum standards set forth by 36 CFR 79.9. If a suitable nonaccredited repository is not identified, then the project proponent shall donate the collection to a local California Native American tribe(s). Non-significant archeological materials shall be donated to a local California Native American tribe(s). If neither an accredited or nonaccredited repository or tribe accepts the collection, then the project proponent may offer the collection to a public, nonprofit institution with a research interest in the materials, or to a local school or historical society in the area for educational purposes. Disposition of Native American human remains and associated funerary objects or grave goods shall be determined by the landowner in consultation with the County and the MLD.

The project proponent shall curate all significant historic-period archaeological material, or portions thereof at the discretion of the Qualified Archaeologist, at a repository accredited by the American Association of Museums that meets the standards outlined in 36 CFR 79.9. If no accredited repository accepts the collection, then the project proponent may curate it at a nonaccredited repository as long as it meets the minimum standards set forth in 36 CFR 79.9. If neither an accredited nor a nonaccredited repository accepts the collection, then the project proponent may offer the collection to a public, nonprofit institution with a research interest in the materials, or to a local school or historical society in the area for educational purposes.

Impact 3.6-2: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would cause a substantial adverse change in the significance of a unique archaeological resource pursuant to CEQA Guidelines Section 15064.5

Finding 1: Mitigation measures would reduce the Project's impacts relating to causing a substantial adverse change in the significance of a unique archaeological resource pursuant to CEQA Guidelines Section 15064.5 to less-than-significant levels. The Board finds that Mitigation Measures 3.6-2, 3.6-3, 3.6-4, 3.6-5, and 3.6-6 are feasible and hereby adopts them. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The Project, as a result of projects facilitated by the 2045 CAP measures and actions, would result in less-than-significant impacts on unique archaeological resources after the implementation of Mitigation Measures 3.6-2 through 3.6-6. The implementation of these measures would reduce significant impacts on unique archaeological resources by avoiding or reducing the significant impact. Mitigation Measure 3.6-2 requires identification of unique archaeological resources to avoid or reduce inadvertent significant impacts on such resources. The measure further requires that archaeological/Native American monitoring be considered to ensure that there is an opportunity to avoid or reduce inadvertent significant impacts on such resources. Mitigation Measure 3.6-3 requires that construction personnel involved in ground-disturbing activities be trained in the identification of cultural resources to assist in avoidance or minimizing of inadvertent significant impacts on such

resources. Mitigation Measures 3.6-4 and 3.6-5 require that unique archaeological resources be avoided and preserved in place if feasible. If avoidance and preservation in place is not feasible, then data recovery is required to recover the scientifically consequential information contained in the resource, which would avoid or reduce significant adverse impacts on the resource. Mitigation Measure 3.6-6 provides for final disposition of archaeological materials, such as curation or donation to a Native American group or other entity, to reduce significant impacts on such resources by preserving the materials for those with research or educational interests.

Mitigation Measures:

[Mitigation Measure 3.6-2. Archaeological Resources Assessment.](#) See Impact 3.6-1 for a description of this mitigation measure.

[Mitigation Measure 3.6-3. Construction Worker Cultural Resources Sensitivity Training.](#) See Impact 3.6-1 for a description of this mitigation measure.

[Mitigation Measure 3.6-4. Archaeological Resources Discoveries.](#) See Impact 3.6-1 for a description of this mitigation measure.

[Mitigation Measure 3.6-5. Treatment of Archaeological Resources.](#) See Impact 3.6-1 for a description of this mitigation measure.

[Mitigation Measure 3.6-6. Curation and Disposition of Cultural Materials.](#) See Impact 3.6-1 for a description of this mitigation measure.

Impact 3.6-3: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

Finding 1: Mitigation measures would reduce the Project's impacts relating to directly or indirectly destroying a unique paleontological resource or site or unique geologic feature to less-than-significant levels. The Board finds that Mitigation Measures 3.6-7, 3.6-8, and 3.6-9 are feasible and hereby adopts them. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would result in less-than-significant impacts on unique paleontological resources and unique geologic features after implementation of Mitigation Measures 3.6-7 through 3.6-9. These measures would reduce significant impacts on unique paleontological resources by avoiding or reducing the significant impact. Mitigation Measure 3.6-7 requires, prior to any construction activities that involve ground disturbance, identification of unique paleontological resources and unique geologic features to avoid or reduce inadvertent potentially significant impacts on such resources. The measure further requires that paleontological monitoring be considered to ensure that there is an opportunity to avoid or reduce inadvertent potentially significant impacts on such resources. Mitigation Measure 3.6-8 requires that construction personnel involved in ground-disturbing activities be trained in the identification of paleontological resources to assist in avoidance or minimizing of inadvertent potentially significant impacts on such resources. Mitigation Measure 3.6-9 requires that unique paleontological resources are recovered and curated.

Mitigation Measures:

Mitigation Measure 3.6-7: Paleontological Resources Assessment and Monitoring (Recirculated Draft PEIR, p. 3.6-28 et seq.)

For projects facilitated by 2045 CAP measures and actions that involve ground disturbance, the project proponent shall retain a paleontologist who meets the Society of Vertebrate Paleontology's (SVP 2010) definition for qualified professional paleontologist (Qualified Paleontologist) to prepare a paleontological resources assessment report prior to the start of construction activities. The report shall include methods and results of the paleontological resources assessment, monitoring requirements (including depths, frequency, and reporting), and maps that outline where monitoring is required. Monitoring shall follow SVP Guidelines: no monitoring of ground-disturbing activities within units of Low Sensitivity or No Potential; monitoring of all ground-disturbing activities (with depths specified) in units of Low to High Significance; and at all depths within units of High Significance unless the Qualified Paleontologist's report identifies previous disturbances or the use of construction methods which do not warrant monitoring; and monitoring at the initiation of excavation in units of Undetermined Significance. The report also shall stipulate whether screen washing is necessary to recover small specimens following SVP Guidelines and determine whether unique geologic features are present onsite. If monitoring is conducted, then the Qualified Paleontologist shall prepare a final report summarizing monitoring results and submit it to the project proponent and the County.

Mitigation Measure 3.6-8: Paleontological Resources Sensitivity Training (Recirculated Draft PEIR, p. 3.6-29)

Prior to the start of ground-disturbing activities for projects facilitated by 2045 CAP measures and actions with potentially significant impacts on paleontological resources, the Qualified Paleontologist or its designee shall conduct construction worker paleontological resources sensitivity training (or may be provided via digital recording) for all construction workers. Construction workers shall be informed on how to identify the types of paleontological resources that may be encountered, the proper procedures to be enacted in the event of an inadvertent discovery of paleontological resources, and safety precautions to be taken when working with paleontological monitors. The project proponent shall ensure that construction workers are made available for and attend the training. The project proponent shall retain documentation demonstrating attendance and provide it to the County.

Mitigation Measure 3.6-9: Paleontological Discoveries (Recirculated Draft PEIR, p. 3.6-29 et seq.)

If a potential fossil is found, the paleontological monitor shall be allowed to temporarily divert or redirect grading and excavation activities in the area of the exposed fossil to facilitate evaluation of the discovery. An appropriate buffer area determined by the paleontological monitor shall be established around the find where construction activities shall not be allowed to continue. Work shall be allowed to continue outside of the buffer area. At the monitor's discretion, and to reduce any construction delay, the grading/excavation contractor shall assist, where feasible, in removing rock/sediment samples for initial processing and evaluation. If a fossil is determined to be significant, the Qualified Paleontologist shall implement a paleontological salvage program to remove the resources from their location, following the guidelines of the SVP (2010). Any fossils encountered and recovered shall be prepared to the point of identification, catalogued, and curated at a public, nonprofit institution with a research interest in the material and with retrievable storage, such as the Natural History Museum of Los Angeles County, if such an institution agrees to accept the fossils. Accompanying notes, maps, and photographs shall also

be filed at the repository. If no institution accepts the fossil collection, it may be donated to a local school or other interested organization in the area for educational purposes.

If construction workers discover any potential fossils during construction while the paleontological monitor is not present, regardless of the depth of work or location, work at the discovery location shall cease in a 50-foot radius of the discovery until the Qualified Paleontologist has assessed the discovery and recommended and implemented appropriate treatment as described earlier in this measure.

Any salvage reports resulting from implementation of this measure shall be filed with the Natural History Museum of Los Angeles County.

Impact 3.6-4: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would disturb any human remains, including those interred outside of dedicated cemeteries.

Finding 1: Mitigation measures would reduce the Project's impacts relating to disturbing any human remains, including those interred outside of dedicated cemeteries to less-than-significant levels. The Board finds that Mitigation Measure 3.6-10 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would result in less-than-significant impacts on human remains after implementation of Mitigation Measure 3.6-10. This measure would reduce significant impacts on human remains by immediately halting construction activities in the event of a possible discovery to avoid or reduce significant impacts. Mitigation Measure 3.6-10 requires the project proponent and the County to follow Health and Safety Code Section 7050.5(c) and Public Resources Code Section 5097.98 in the event Native American human remains are encountered. As a result, next steps would include halting work, notifying the County Coroner, and consulting with the Native California Indian group or person(s) that the Native American Heritage Commission designates as most likely descended from ancestral Native Americans in an area or region of California, i.e., the most likely descendant (MLD). Further, the measure requires the project proponent, the County, and the landowner to work with the MLD for treatment of the remains to avoid or reduce significant impacts, or the landowner to reinter the remains with appropriate dignity on the property in a location not subject to further and future subsurface disturbance if an agreement cannot be reached to avoid or reduce significant impacts.

Mitigation Measures:

Mitigation Measure 3.6-10: Human Remains Discoveries (Recirculated Draft PEIR, p. 3.6-30)

If human remains are encountered, then the project proponent or its contractor shall immediately halt work within 50 feet of the discovery and contact the County Coroner in accordance with Public Resources Code Section 5097.98 and Health and Safety Code Section 7050.5, which require that no further disturbance shall occur until the County Coroner has made the necessary findings as to the remains' origin and disposition. If the County Coroner determines that the remains are Native American, then the County Coroner will notify the NAHC within 24 hours in accordance with Health and Safety Code Section 7050.5(c), and Public Resources Code Section 5097.98. The NAHC shall then identify the person(s) thought to be the MLD. The MLD may, with the permission of the land owner, or their authorized representative, inspect the site of the discovery of the Native American remains and may recommend to the owner or the person

responsible for the excavation work means for treating or disposing, with appropriate dignity, the human remains and any associated grave goods. The MLD shall complete their inspection and make their recommendation within 48 hours of being granted access by the landowner to inspect the discovery. The recommendation may include the scientific removal and nondestructive analysis of human remains and items associated with Native American burials. The project proponent, the County, and the landowner shall discuss and confer with the MLD on all reasonable options regarding the MLD's preferences for treatment.

Until the project proponent, the County, and the landowner have conferred with the MLD, the contractor shall ensure that the immediate vicinity where the discovery occurred is not disturbed by further activity and is adequately protected according to generally accepted cultural or archaeological standards or practices (e.g., the NAHC's A Professional Guide for the Preservation and Protection of Native American Human Remains and Associated Grave Goods [NAHC 2022], which reiterates statutory requirements), and that further activities take into account the possibility of multiple burials.

If the NAHC is unable to identify an MLD, or the MLD identified fails to make a recommendation, or the landowner rejects the recommendation of the MLD and the mediation provided for in Public Resources Code Section 5097.94(k), if invoked, fails to provide measures acceptable to the landowner, the landowner or his or her authorized representative shall inter the human remains and items associated with Native American human remains with appropriate dignity on the property in a location not subject to further and future subsurface disturbance.

Impact 3.6-5: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would incrementally contribute to a significant cumulative impact on historical resources.

Finding 1: Mitigation measures would reduce the incremental contribution of projects facilitated by the 2045 CAP to a significant cumulative impact on historical resources to less-than-significant levels. The Board finds that Mitigation Measures 3.6-1 through 3.6-6 are feasible and hereby adopts them. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The Project, as a result of projects facilitated by the 2045 CAP measures and actions, would make a cumulatively considerable contribution to this significant cumulative impact that could be mitigated to a level that would be less than cumulatively considerable (i.e., less than significant) by the implementation of Mitigation Measures 3.6-1 through 3.6-6. With the implementation of these measures, the Project-specific, incremental contribution, combined with the cumulative projects' incremental impacts on historical resources over the timespan of the Project, would not be cumulatively considerable because they would specify that, before construction of aboveground infrastructure that might affect known historic architectural resources, an architectural historian must identify historical resources, provide recommendations, require archaeological monitoring, and prepare a plan for the treatment of historical resources. With the implementation of Mitigation Measures 3.6-1 through 3.6-6, a less-than-significant cumulative impact on historic resources would result.

Mitigation Measures:

Mitigation Measure 3.6-1. Historic Resources Assessment. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-2. Archaeological Resources Assessment. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-3. Construction Worker Cultural Resources Sensitivity Training. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-4. Archaeological Resources Discoveries. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-5. Treatment of Archaeological Resources. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-6. Curation and Disposition of Cultural Materials. See Impact 3.6-1 for a description of this mitigation measure.

Impact 3.6-6: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would incrementally contribute to a significant cumulative impact on unique archaeological resources.

Finding 1: Mitigation measures would reduce the Project's impacts relating to incrementally contributing to a significant cumulative impact on unique archaeological resources to less-than-significant levels. The Board finds that Mitigation Measures 3.6-2 through 3.6-6 are feasible and hereby adopts them. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would make a significant incremental contribution to this significant cumulative impact that could be mitigated to a level that would be less than cumulatively considerable (i.e., less than significant) by the implementation of Mitigation Measures 3.6-2 through 3.6-6. With the implementation of these measures, the Project-specific, incremental contribution, combined with the cumulative projects' impacts on unique archaeological resources over the span of the 2045 CAP, would not be cumulatively considerable because they would require identification and treatment of unique archaeological resources, and would thereby avoid or reduce significant impacts. With the implementation of these mitigation measures, a less-than-significant cumulative impact to unique archaeological resources would result.

Mitigation Measures:

Mitigation Measure 3.6-2. Archaeological Resources Assessment. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-3. Construction Worker Cultural Resources Sensitivity Training. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-4. Archaeological Resources Discoveries. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-5. Treatment of Archaeological Resources. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-6. Curation and Disposition of Cultural Materials. See Impact 3.6-1 for a description of this mitigation measure.

Impact 3.6-7: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would incrementally contribute to a significant cumulative impact on unique paleontological resources or sites or unique geologic features.

Finding 1: Mitigation measures would reduce the Project's impacts relating to incrementally contributing to a significant cumulative impact on unique paleontological resources or sites with unique geologic features to less-than-significant levels. The Board finds that Mitigation Measures 3.6-7 through 3.6-9 are feasible and hereby adopts them. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would make a significant incremental contribution to this significant cumulative impact that could be mitigated to a level that would be less than cumulatively considerable (i.e., less than significant) by the implementation of Mitigation Measures 3.6-7 through 3.6-9. With the implementation of these measures, the Project-specific, incremental contribution, combined with the cumulative projects' impacts on unique paleontological resources or sites or unique geologic features over the timespan of the Project, would not be cumulatively considerable because they would require identification and treatment of unique paleontological resources or sites or unique geologic features and would thereby avoid or reduce significant impacts. With the implementation of these mitigation measures, a less-than-significant cumulative impact on unique paleontological resources or sites or unique geologic features would result.

Mitigation Measures:

Mitigation Measure 3.6-7. Paleontological Resources Assessment and Monitoring. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-8. Paleontological Resources Sensitivity Training. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-9. Paleontological Discoveries. See Impact 3.6-3 for a description of this mitigation measure.

Impact 3.6-8: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would incrementally contribute to a significant cumulative impact on human remains, including those interred outside of dedicated cemeteries.

Finding 1: Mitigation measures would reduce the Project's impacts relating to incrementally contributing to a significant cumulative impact on human remains, including those interred outside of dedicated cemeteries to less-than-significant levels. The Board finds that Mitigation Measure 3.6-10 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would make a significant incremental contribution to this significant cumulative impact that could be mitigated to a level that would be less than cumulatively considerable (i.e., less than significant) by the implementation of Mitigation Measure 3.6-10. With the implementation of this measure, the Project-specific, incremental contribution, combined with the cumulative projects' impacts on human remains interred outside formal cemeteries over the timespan of the Project, would not be cumulatively considerable because the measure would require the project proponent and the County to follow the law governing such finds, including by halting work, notifying the County

Coroner, and consulting with the MLD or taking other specified, appropriate actions to assure treatment of the remains with appropriate dignity. If human remains of Native American origin are discovered during work associated with a project facilitated by the 2045 CAP, then the project proponent and/or the County would be required to comply with state laws related to the disposition of Native American burials (e.g., Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98). With the implementation of this mitigation measure, a less-than-significant cumulative impact would result.

Mitigation Measures:

[Mitigation Measure 3.6-10. Human Remains Discoveries](#). See Impact 3.6-4 for a description of this mitigation measure.

v) Hazards and Hazardous Materials

Impact 3.10-2: The Project, as a result of solar photovoltaic (PV) and other projects facilitated by the 2045 CAP measures and actions, could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment.

Finding 1: Mitigation measures would reduce the Project's impacts relating to creating a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment to less-than-significant levels. The Board finds that Mitigation Measure 3.10-2 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Implementation of Mitigation Measure 3.10-2 would ensure that hazardous waste from broken cadmium telluride (CdTe) modules is disposed of properly if not recycled. Implementing this measure would reduce the impact to a less-than-significant level.

Mitigation Measures:

[Mitigation Measure 3.10-2 \(Recirculated Draft PEIR, p. 3.10-23\)](#)

The County shall require applicants of solar PV installation projects that include the use of CdTe modules to dispose of panels or recycle panels in accordance with current local, state, and federal regulations. Broken and end-of-project life PV modules, materials, and components shall be:

- Stored on-site in a manner that complies with federal and state laws until recycling or disposal actions can be taken.
- Stored on-site no longer than allowed by federal and state laws.
- Recycled in accordance with federal and state laws applicable at that time.

Impact 3.10-3: Projects facilitated by the 2045 CAP would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of sensitive land uses.

Finding 1: Mitigation measures would reduce the Project's impacts relating to emitting hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of sensitive land uses to less-than-significant levels. The Board finds that Mitigation Measure

3.10-2 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Several sensitive receptors and receptor locations are situated within the unincorporated County areas, and it is not known at the time of PEIR preparation whether projects facilitated by 2045 CAP measures and actions would be constructed near one or more of them. Projects facilitated by 2045 CAP measures and actions could create hazardous emissions. Impacts generated by the release of hazardous emissions near sensitive receptors would temporarily occur during construction phases of such projects. However, compliance with the Education Code and Public Resources Code would ensure that any prospective school site would be reviewed to determine that it is not a current or former hazardous waste disposal site, a hazardous substance release site, or the site of a hazardous substance pipeline. This would ensure that prospective sites located within 0.25 mile of a school that handle or emit hazardous substances would not endanger sensitive receptors, including students. This portion of the impact would be less than significant.

In addition, projects facilitated by 2045 CAP measures and actions may include small-scale distributed solar facilities or utility-scale solar energy generation facilities. These projects may include the use of CdTe solar technology modules, which contain elemental cadmium. Although elemental cadmium is an acutely toxic substance, human exposure from CdTe PV modules would likely occur only if CdTe fine particles are inhaled. Fine particles would not be generated unless the modules were ground up or vaporized in a fire. This impact would be significant.

Compliance with applicable federal, state, and local laws and regulations would assure that impacts on sensitive receptors would be less than significant, except for impacts from solar PV installation projects that include the use of CdTe modules if the panels are ground to the level of dust particles or experience fire that reaches the CdTe melting point. Implementation of Mitigation Measure 3.10-2 would ensure that hazardous waste from broken CdTe modules is disposed of properly if not recycled. Implementing this measure would reduce the impact to a less-than-significant level.

Mitigation Measures:

Mitigation Measure 3.10-2. See Impact 3.10-2 for a description of this mitigation measure.

Impact 3.10-6: Projects facilitated by the 2045 CAP would not impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan.

Finding 1: Mitigation measures would reduce the Project's impacts relating to impairing implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan to less-than-significant levels. The Board finds that Mitigation Measure 3.15-1 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Implementing Mitigation Measure 3.15-1 would reduce the impact to a less-than-significant level because the traffic control plan would avoid or substantially reduce any potential impairment of an emergency response or evacuation plan that may result during construction activities associated with projects facilitated by the 2045 CAP measures and actions.

Mitigation Measures:

Mitigation Measure 3.15-1: Traffic Control Plan (Recirculated Draft PEIR, p. 3.15-22 et seq.)

LA County shall require project applicants and construction contractors to coordinate with relevant LA County departments, transit providers, and emergency service providers to develop a traffic control plan to reduce the impacts of construction traffic on transit service, roadway operations, emergency responders, pedestrian and bicycle facilities, and public safety in the surrounding area. (A traffic control plan may not be required for minor construction activities.) The project applicant shall be responsible for monitoring to ensure that the plan is effectively implemented by the construction contractor(s). Measures that may be employed throughout the course of the construction period include, but are not limited, to the following.

- Provide advance notice of lane and sidewalk closures, durations, and alternative routes to emergency service providers, motorists, bicyclists, and pedestrians.
- Provide clearly marked pedestrian detours if any sidewalk or pedestrian walkway closures are necessary.
- Provide clearly marked bicycle detours if heavily used bicycle routes must be closed, or if bicyclist safety may otherwise be comprised.
- Provide crossing-guards and/or flag persons as needed to avoid traffic conflicts and ensure pedestrian and bicyclist safety.
- Locate all stationary equipment as far as possible from areas used heavily by vehicles, bicyclists, and pedestrians.
- Use nonskid traffic plates over open trenches to reduce hazards.
- Implement traffic control measures to reduce vehicle travel delays through construction zones.
- Maintain acceptable response times and performance objectives for emergency response services.
- Avoid routing construction traffic through residential areas to the extent feasible.
- Prohibit mobilization and demobilization of heavy construction equipment during AM and PM peak traffic hours.
- Maintain access for driveways and private roads outside the immediate construction zone by using steel plates or temporary backfill, as necessary.
- Provide designated areas for construction worker parking wherever feasible to reduce use of parking on streets or in city center areas.

Impact 3.10-8: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would contribute to a significant cumulative adverse impact with regard to hazards to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment.

Finding 1: Mitigation measures would reduce the incremental contributions of projects facilitated by the 2045 CAP to a significant cumulative impact with regard to hazards to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment to less-than-significant levels. The Board finds that Mitigation Measure 3.10-2 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: If, one or more projects facilitated by the Project, in combination with past, present, and reasonably foreseeable future projects, accidentally released hazardous materials into the environment, then a potentially significant impact on the environment and/or public could result. Numerous laws and regulations regulate the transportation, handling, storage, and disposal of hazardous materials. Nonetheless, given the broad use and storage of hazardous materials, including panels containing CdTe at solar facilities in the Antelope Valley and other unincorporated areas of Los Angeles County, and the potential for their accidental release, the cumulative impact would be significant. However, the Project's incremental contribution would be brought to less than cumulatively considerable (i.e., less than significant) with the implementation of Mitigation Measure 3.10-2. This mitigation measure would ensure that hazardous waste from broken CdTe modules, the primary hazard generated by solar facilities, and likely hazard derived from projects facilitated by the 2045 CAP would be disposed of properly if not recycled. Thus, cumulative impacts would be less than significant.

Mitigation Measures:

Mitigation Measure 3.10-2. See Impact 3.10-2 for a description of this mitigation measure.

Impact 3.10-9: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would contribute to a significant cumulative adverse impact related to hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of sensitive land uses.

Finding 1: Mitigation measures would reduce the Project's impacts relating to contributing to a significant cumulative adverse impact related to hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of sensitive land uses to less-than-significant levels. The Board finds that Mitigation Measure 3.10-2 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Cumulative projects that include solar facilities may include the use of CdTe solar technology modules, which can be toxic if released to the environment. Given the broad use and storage of hazardous materials, including CdTe cells at solar facilities in Antelope Valley and other unincorporated areas of Los Angeles County, and for the potential for their accidental release in the vicinity of sensitive land uses, when the Project's impacts are added, the cumulative impact would be significant. However, the Project's incremental contribution would be less than cumulatively considerable (i.e., less than significant) with implementation of Mitigation Measure 3.10-2. This mitigation measure would ensure that any hazardous waste from broken CdTe modules, toxic byproducts from solar facilities, from projects facilitated by the 2045 CAP would be disposed of properly if not recycled and would not result in an incremental contribution to a significant cumulative impact.

Mitigation Measures:

Mitigation Measure 3.10-2. See Impact 3.10-2 for a description of this mitigation measure.

Impact 3.10-12: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would contribute to cumulative impairment of the implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan.

Finding 1: Mitigation measures would reduce the Project's impacts relating to contributing to cumulative impairment of the implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan to less-than-significant levels. The Board finds that Mitigation Measure 3.15-1 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The Project's incremental contribution would be less than cumulatively considerable (i.e., less than significant) because the traffic control plan required by Mitigation Measure 3.15-1 would avoid or substantially reduce any Project-specific potential impairment of an emergency response or evacuation plan that may result during construction activities associated projects facilitated by the 2045 CAP measures and actions.

Mitigation Measures:

Mitigation Measure 3.15-1: Traffic Control Plan. See Impact 3.10-6 for a description of this mitigation measure.

vi) Hydrology and Water Quality

Impact 3.11-5: Projects facilitated by the 2045 CAP would not, in flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation.

Finding 1: Mitigation measures would reduce the Project's impacts in flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation to less-than-significant levels. The Board finds that Mitigation Measure 3.10-2 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Projects facilitated by the 2045 CAP measures and actions would result in a less-than-significant impact regarding the potential to create a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials. However, Impact 3.10-2 concludes that a significant impact would result (pre-mitigation) regarding the potential for projects facilitated by the 2045 CAP measures and actions to create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste from solar PV projects, under specified circumstances (identified in Section 3.10) into the environment. Implementation of Mitigation Measure 3.10-2 would ensure that hazardous waste is properly managed. As a result, the impact resulting from a risk of release of pollutants due to project inundation flood hazard, tsunami, or seiche zones would be less than significant with mitigation incorporated.

Mitigation Measures:

Mitigation Measure 3.10-2. See Impact 3.10-2 for a description of this mitigation measure.

Impact 3.11-11: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would contribute to cumulative conditions of flood hazard, tsunami, or seiche zones, or risk release of pollutants due to project inundation.

Finding 1: Mitigation measures would reduce the Project's impacts contributing to cumulative conditions of flood hazard, tsunami, or seiche zones, or risk release of pollutants due to project inundation to less-than-significant levels. The Board finds that Mitigation Measure 3.10-2 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The 2045 CAP would result in a less than cumulatively considerable contribution to cumulative impacts related to flood, tsunami, or seiche water quality hazards in the County, with the exception of risk of pollutant releases from solar PV project hazardous waste that is improperly stored or disposed of, which would be significant impact that is cumulatively considerable. Implementation of Mitigation Measure 3.10-2 would ensure that hazardous waste is properly managed. The impact would be less than cumulatively considerable and less than significant with mitigation incorporated.

Mitigation Measures:

Mitigation Measure 3.10-2. See Impact 3.10-2 for a description of this mitigation measure.

vii) Transportation

Impact 3.15-1: The Project, as a result of projects facilitated by the 2045 CAP measures and actions, would conflict with an applicable program plan, ordinance, or policy addressing the circulation system.

Finding 1: Mitigation measures would reduce the Project's impacts relating to conflicting conflict with an applicable program plan, ordinance, or policy addressing the circulation system to less-than-significant levels. The Board finds that Mitigation Measure 3.15-1 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Projects facilitated by the 2045 CAP measures and goals could result in a significant impact with respect to consistency with applicable program plans, ordinances, or policies addressing the circulation system, including an emergency response or evacuation plan; thus, impacts would be significant. Mitigation Measure 3.15-1 would reduce this to a less-than-significant impact because the Traffic Control Plan would substantially reduce any safety and mobility concerns for motorists, transit operators, bicyclists, and/or pedestrians that may result during construction activities associated with projects facilitated by the 2045 CAP measures and actions.

Mitigation Measures:

Mitigation Measure 3.15-1: Traffic Control Plan. See Impact 3.10-6 for a description of this mitigation measure.

Impact 3.15-3: The Project, as a result of projects facilitated by the 2045 CAP measures and actions, would substantially increase hazards due to a road design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).

Finding 1: Mitigation measures would reduce the Project's impacts relating to substantially increasing hazards due to a road design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment) to less-than-significant levels. The Board finds that Mitigation Measure 3.15-1 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: During the construction period, the presence of construction or the increased amount of heavy-duty construction vehicles on roadways could substantially increase hazards due to incompatible uses with normal vehicles on roadways. This could result in a significant impact. However, with the implementation of Mitigation Measure 3.15-1, this would be reduced to a less-than-significant impact because the Traffic Control Plan would avoid or substantially reduce any hazardous conditions for motorists, transit operators, bicyclists, and/or pedestrians that may result during construction activities associated projects facilitated by the 2045 CAP measures and actions.

Mitigation Measures:

Mitigation Measure 3.15-1: Traffic Control Plan. See Impact 3.10-6 for a description of this mitigation measure.

Impact 3.15-4: The Project, as a result of projects facilitated by the 2045 CAP measures and actions, would not cause a cumulatively considerable contribution to a significant cumulative impact relating to conflict with an applicable program plan, ordinance or policy addressing the circulation system.

Finding 1: Mitigation measures would reduce the Project's impacts relating to causing a cumulatively considerable contribution to a significant cumulative impact relating to conflict with an applicable program plan, ordinance or policy addressing the circulation system to less-than-significant levels. The Board finds that Mitigation Measure 3.15-1 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: With the implementation of the Traffic Control Plan required by Mitigation Measure 3.15-1 the Project-specific, incremental contribution, combined with the cumulative projects' impacts to transportation resources over the span of the 2045 CAP, would not be cumulatively considerable because the mitigation measure would avoid or substantially reduce any safety and mobility concerns for motorists, transit operators, bicyclists, and/or pedestrians that may result during construction activities associated with projects facilitated by the 2045 CAP measures and actions.

Mitigation Measures:

Mitigation Measure 3.15-1: Traffic Control Plan. See Impact 3.10-6 for a description of this mitigation measure.

Impact 3.15-6: The Project, as a result of projects facilitated by the 2045 CAP measures and actions, would not cause a cumulatively considerable contribution to a significant cumulative impact relating to a substantial increase in hazards due to a road design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).

Finding 1: Mitigation measures would reduce the Project's impacts relating to causing a cumulatively considerable contribution to a significant cumulative impact relating to a substantial increase in hazards due to a road design feature (e.g., sharp curves or dangerous intersections)

or incompatible uses (e.g., farm equipment) to less-than-significant levels. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The number of traffic-related deaths and severe injuries that occur on unincorporated area roadways indicates that a significant cumulative impact exists regarding roadway hazards. Past, present, and reasonably foreseeable future projects, including projects implemented in accordance with the Regional Transportation Plan, General Plan, Vision Zero, and municipal code requirements have introduced or could introduce new roadways, roadway improvements, or incompatible uses that could result in substantially increased hazards that could result in significant impacts when cumulatively considered. However, with the implementation of the Traffic Control Plan required by Mitigation Measure 3.15-1 the Project-specific, incremental contribution, combined with the cumulative projects' impacts to transportation over the span of the 2045 CAP, would not be cumulatively considerable because the mitigation measure would avoid or substantially reduce any safety and mobility concerns for motorists, transit operators, bicyclists, and/or pedestrians that may result during construction activities associated with projects facilitated by 2045 CAP measures and actions.

Mitigation Measures:

Mitigation Measure 3.15-1: Traffic Control Plan. See Impact 3.10-6 for a description of this mitigation measure.

viii) Tribal Cultural Resources

Impact 3.16-1: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would cause a substantial adverse change in the significance of a tribal cultural resource or of a resource determined by the County, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in Public Resources Code section 5024.1(c).

Finding 1: Mitigation measures would reduce the Project's impacts relating to causing a substantial adverse change in the significance of a tribal cultural resource or of a resource determined by the County, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in Public Resources Code section 5024.1(c) to less-than-significant levels. The Board finds that Mitigation Measures 3.16-1 and 3.6-2 through 3.6-6 are feasible and hereby adopts them. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Implementation of Mitigation Measure 3.16-1 would reduce impacts of projects facilitated by the 2045 CAP on tribal cultural resources to a less-than-significant level because it would require the County to consult with California Native American tribes pursuant to AB 52 to identify tribal cultural resources that could be affected by a project facilitated by the 2045 CAP. Further, if a tribal cultural resource is identified as a result of consultation, the County will implement mitigation measures or consider alternatives capable of avoiding or minimizing significant impacts on the tribal cultural resource. Additionally, Mitigation Measures 3.6-2 through 3.6-6 (identified in Section 3.6, Cultural Resources) require archaeological monitoring and preparation of a plan for the treatment of archaeological resources, including those that may also qualify as tribal cultural resources, which would further reduce the impact's significance.

Mitigation Measures:

Mitigation Measure 3.16-1: AB 52 Consultation. (Recirculated Draft PEIR, p. 3.16-10 et seq.)

Consistent with AB 52, before the release of a negative declaration, mitigated negative declaration, or EIR, the County shall initiate consultation within 14 days of a decision to undertake a project facilitated by Draft 2045 CAP measures or actions. The County shall provide formal notification to the designated contact of, or a tribal representative of, each traditionally and culturally affiliated California Native American tribe that has requested notice. The County shall begin the consultation process within 30 days after receiving a California Native American tribe's request for consultation.

If tribal cultural resources are identified, the County shall implement mitigation measures that would avoid or substantially lessen significant impacts on such resources, including but not limited to the measures recommended in Public Resources Code section 21084.3, or shall implement alternatives that would avoid significant impacts on the tribal cultural resources. Such measures shall be implemented in consultation with the California Native American tribe.

Mitigation Measure 3.6-2. Archaeological Resources Assessment. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-3. Construction Worker Cultural Resources Sensitivity Training. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-4. Archaeological Resources Discoveries. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-5. Treatment of Archaeological Resources. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-6. Curation and Disposition of Cultural Materials. See Impact 3.6-1 for a description of this mitigation measure.

Impact 3.16-2: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would cause a cumulatively considerable contribution to a significant cumulative impact caused by an adverse change in the significance of a tribal cultural resource or of a resource determined by the County, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in Public Resources Code section 5024.1(c).

Finding 1: Mitigation measures would reduce the Project's impacts relating to causing a cumulatively considerable contribution to a significant cumulative impact caused by an adverse change in the significance of a tribal cultural resource or of a resource determined by the County, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in Public Resources Code Section 5024.1(c) to less-than-significant levels. The Board finds that Mitigation Measures 3.16-1 through 3.16-6 are feasible and hereby adopts them. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Mitigation Measure 3.16-1 and Mitigation Measures 3.6-2 through 3.6-6 would require the County to initiate consultation (within 14 days of a decision to undertake a project facilitated by 2045 CAP measures or actions) with California Native American tribes to avoid or lessen impacts on tribal cultural resources and would require archaeological monitoring and preparation of a plan for the treatment of such resources. As a result, with implementation of these measures, the Project-specific, incremental contribution, combined with the cumulative projects' impacts on tribal cultural resources over the span of the 2045 CAP, would not be cumulatively considerable, and therefore would be less than significant.

Mitigation Measures:

Mitigation Measure 3.16-1: See Impact 3.16-1 for a description of this mitigation measure.

Mitigation Measure 3.6-2. Archaeological Resources Assessment. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-3. Construction Worker Cultural Resources Sensitivity Training. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-4. Archaeological Resources Discoveries. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-5. Treatment of Archaeological Resources. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-6. Curation and Disposition of Cultural Materials. See Impact 3.6-1 for a description of this mitigation measure.

ix) Wildfire

Impact 3.18-1: Projects facilitated by the 2045 CAP would not substantially impair an adopted emergency response plan or emergency evacuation plan.

Finding 1: Mitigation measures would reduce the Project's impacts relating to substantially impairing an adopted emergency response plan or emergency evacuation plan to less-than-significant levels. The Board finds that Mitigation Measure 3.15-1 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Implementation of the traffic control plan required by Mitigation Measure 3.15-1 would avoid or substantially reduce any potential impairment of an emergency response or evacuation plan that may result during construction activities associated with projects facilitated by the 2045 CAP measures and actions. Because any impacts related to the implementation of an emergency response or evacuation plan would be identified and addressed before a related impact would occur, implementing this mitigation measure would reduce the impacts to a less-than-significant level.

Mitigation Measures:

Mitigation Measure 3.15-1: Traffic Control Plan. See Impact 3.10-6 for a description of this mitigation measure.

Impact 3.18-3: Projects facilitated by the 2045 CAP could require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, composting facilities, power lines, or other utilities) that may exacerbate fire risk or may result in temporary or ongoing impacts on the environment.

Finding 1: Mitigation measures would reduce the Project's impacts relating to requiring the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, composting facilities, power lines, or other utilities) that may exacerbate fire risk or may result in temporary or ongoing impacts on the environment to less-than-significant levels. The Board finds that Mitigation Measure 3.18-3 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The implementation of Mitigation Measure 3.18-3 would ensure that the risk of fire from infrastructure associated with projects facilitated by the 2045 CAP measures and actions would be managed through collaboration with the Los Angeles County Fire Department (LACoFD), and that the applicant and its contractors would implement fire safety measures to prevent wildland fire and would be prepared to respond immediately if a fire should ignite. Therefore, this impact of projects facilitated by the 2045 CAP would be reduced to a less-than-significant level.

Mitigation Measures:

Mitigation Measure 3.18-3: Fire Safety During Construction and Operation (Recirculated Draft PEIR, p. 3.18-23 et seq.).

Future applicants and/or their contractors shall prepare and implement project-specific fire protection plans for projects located in the VHFHSZ to ensure that wildfire-related hazards are not exacerbated by projects facilitated by the 2045 CAP measures or goals. The applicant shall prepare and submit a fire protection plan to the County for review and approval at least 60 days before the start of construction activities. The fire protection plan shall include or require, but not limited to, the following measures along with Fire Code compliance, as applicable to address construction and operation:

- A training module within the pre-construction worker training (e.g., Worker Environmental Awareness training, safety training, fire equipment and procedures) on the specifics of the approved plan for all construction crew members before the start of construction.
- List project site roles and responsibilities and identify appropriate emergency notification procedures and site-specific emergency response and evacuation measures and routes that would be followed during emergency situations. All construction vehicles shall have fire suppression equipment.
- Instruct construction personnel to park vehicles within roads, road shoulders, graveled areas, and/or cleared areas (i.e., away from dry vegetation) wherever such surfaces are present at the construction site. Protocol for the project contractor and/or the applicant to perform visual inspections daily to ensure that all ignition risks are reduced or eliminated before leaving the worksite. Identify fire safety and prevention measures for project-specific infrastructure that can ignite fires, such as power lines, battery storage facilities, and composting facilities.

Impact 3.18-5: Projects facilitated by the 2045 CAP could expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires.

Finding 1: Mitigation measures would reduce the Project's impacts relating to exposing people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires to less-than-significant levels. The Board finds that Mitigation Measure 3.18-3 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Implementation of Mitigation Measure 3.18-3 would ensure that the risks of fire from projects facilitated by the 2045 CAP measures and actions would be managed through collaboration with LACoFD and the California Department of Forestry and Fire Protection (CAL FIRE), and that the applicant and its contractors would implement fire safety measures to

prevent wildland fire and would be prepared to respond immediately if a fire should ignite. Therefore, this impact would be reduced to a less-than-significant level.

Mitigation Measures:

[Mitigation Measure 3.18-3: Fire Safety During Construction and Operation](#). See Impact 3.18-3 for a description of this mitigation measure.

Impact 3.18-6: Projects facilitated by the 2045 CAP could result in significant cumulative impacts with regard to impairing an adopted emergency response plan or emergency evacuation plan.

Finding 1: Mitigation measures would reduce the Project's impacts relating to resulting in significant cumulative impacts with regard to impairing an adopted emergency response plan or emergency evacuation plan to less-than-significant levels. The Board finds that Mitigation Measure 3.15-1 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: The traffic control plan required by Mitigation Measure 3.15-1 would avoid or substantially reduce the contribution of projects facilitated by the 2045 CAP measures and actions to impairment of an emergency response or evacuation plan to less than cumulatively considerable. The cumulative impact on emergency access and emergency response would be reduced to a less than cumulatively considerable and therefore less-than-significant level.

Mitigation Measures:

[Mitigation Measure 3.15-1: Traffic Control Plan](#). See Impact 3.10-6 for a description of this mitigation measure.

Impact 3.18-8: Projects facilitated by the 2045 CAP could require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, composting facilities, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing cumulative impacts on the environment.

Finding 1: Mitigation measures would reduce the Project's impacts relating to requiring the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, composting facilities, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing cumulative impacts on the environment to less-than-significant levels. The Board finds that Mitigation Measure 3.18-3 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Implementation of Mitigation Measure 3.18-3 would ensure that the incremental cumulative risk of wildfire from projects facilitated by the 2045 CAP measures and actions would be managed through collaboration with LACoFD, fire safety measures to prevent wildland fires, and preparations for immediate responses if a fire should ignite. This measure would reduce the contribution of projects facilitated by 2045 CAP measures and actions to less than cumulatively considerable, and therefore to a less-than-significant level.

Mitigation Measures:

[Mitigation Measure 3.18-3: Fire Safety During Construction and Operation](#). See Impact 3.18-3 for a description of this mitigation measure.

Impact 3.18-10: Projects facilitated by the 2045 CAP could expose people or structures, either directly or indirectly, to a significant cumulative risk of loss, injury, or death involving wildland fires.

Finding 1: Mitigation measures would reduce the Project's impacts relating to exposing people or structures, either directly or indirectly, to a significant cumulative risk of loss, injury, or death involving wildland fires to less-than-significant levels. The Board finds that Mitigation Measure 3.18-3 is feasible and hereby adopts it. The Board hereby makes Finding 1 and determines this impact to be less than significant.

Facts in Support of Finding: Implementation of Mitigation Measure 3.18-3 would ensure that the incremental cumulative risk of wildfire from projects facilitated by the 2045 CAP measures and actions would be managed through collaboration with LACoFD, implementation of fire safety measures to prevent wildland fires, and preparations for immediate responses if a fire should ignite. This measure would reduce the Project's incremental contribution to the cumulative impact to less than cumulatively considerable, and this cumulative impact would be reduced to a less-than-significant level.

Mitigation Measures:

Mitigation Measure 3.18-3: Fire Safety During Construction and Operation. See Impact 3.18-3 for a description of this mitigation measure.

b. Findings Regarding Project Impacts Determined to Be Significant and Unavoidable

Where, as a result of the environmental analysis of the Project, the County has determined that either: (1) even with compliance with existing laws, codes and statutes, and/or the identification of feasible mitigation measures, significant impacts cannot be reduced to a level of less than significant; or (2) no feasible mitigation measures or alternatives are available to mitigate the significant impact, the County has found in accordance with Public Resources Code section 21081(a)(3) and CEQA Guidelines section 15091(a)(3) that "Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR." This is referred to herein as "Finding 3."

i) Aesthetics

Impact 3.2-1: Projects facilitated by the 2045 CAP would have a substantial adverse effect on a scenic vista.

Finding 3: There are no feasible and reasonable mitigation measures that would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: The 2045 CAP is a policy document that does not include specific projects that would have a direct, adverse effect on scenic vistas. Nonetheless, many of the projects facilitated by 2045 CAP measures and actions would involve retrofitting of existing buildings, development along existing transit areas, infill projects in urban locations that are already developed, electric vehicle charging stations, or distributed energy resources like rooftop solar PV panels on existing structures. These projects would have significant impacts on the surrounding area due to the inherent change to scenic vistas that would result.

The implementation of Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2 would reduce the severity of impact on scenic vistas; however, these measures would not on their own merits

ensure that the impact would be less than significant. Therefore, the County finds that even with implementation of these mitigation measures, potential impacts of projects facilitated by the 2045 CAP would remain significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.2-1: Alternative Design (Recirculated Draft PEIR, p. 3.2-11)

Projects facilitated by the 2045 CAP that would obstruct views from publicly-accessible vantage points as defined in this analysis (such as from a vista point or a regional riding, hiking, or multiuse trail) shall identify and protect public views and significant landscape features or landforms visible from such views, and shall implement project-specific mitigation as applicable. If it is determined that a project would obstruct scenic views, the County shall consider alternative designs that seek to avoid and/or minimize these impacts. Project-specific design measures may include reduction in height of improvements or width of improvements to reduce obstruction of views or other adverse visual effects, or relocation of improvements to reduce obstruction of views. The County shall consider taking the following (or equivalent) actions: i) Require that the scale and massing of new development provide appropriate transitions in structure height and bulk that are sensitive to the physical and visual character of the affected area; ii) ensure structure heights are stepped back to maintain appropriate transitions in scale and to protect scenic views; and iii) avoid siting electric towers, solar power facilities, wind power facilities, communication transmission facilities and/or above ground lines where they could obstruct views from public vantage points, such as a regional riding, hiking, or multiuse trail, along scenic roadways and routes, or scenic vista points.

Mitigation Measure 3.2-2: Visual Screening and Other View Protection Measures (Recirculated Draft PEIR, p. 3.2-11)

To partially screen views of projects facilitated by 2045 CAP measures and actions in locations where they would be visible from publicly accessible vantage points (e.g., scenic vistas, trails, scenic roadways and routes) and affect visual character or quality, if feasible and effective, the County shall (and other implementing state or local agencies can and should) require the construction of a berm, vegetative screening, or other form of visual barrier of sufficient height to provide a visual transition from ground level to surrounding hills or ridgelines. The color of proposed building facades and roofs shall be designed to visually blend in and minimize the potential for visual contrast between the project elements and their natural landscape surroundings. Bright or very light colors (including white) shall be avoided. Re-contouring and revegetation of temporarily disturbed, graded areas shall be completed to provide a natural appearing landform upon completion of construction.

Impact 3.2-2: Projects facilitated by the 2045 CAP would be visible from or obstruct views from a regional riding, hiking, or multiuse trail.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: The implementation of Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2 would reduce the severity of an impact on a public regional riding, hiking, or multiuse trail by adjusting the scaling and massing of structures, using step-backs from sensitive

adjoining uses, planning for project/facility siting, and installing visual screening; however, these measures would not on their own merits ensure that the impact of projects facilitated by the 2045 CAP would be less than significant. The Board therefore finds that, even with implementation of Mitigation Measures 3.2-1 and 3.2-2, alternative design or visual screening measures may not be feasible or effective for every Project facilitated by the 2045 CAP measures and actions. Therefore, the Board finds that this impact would be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.2-1: Alternative Design. See Impact 3.2-1 for a discussion of this mitigation measure.

Mitigation Measure 3.2-2: Visual Screening and Other View Protection Measures. See Impact 3.2-1 for a discussion of this mitigation measure.

Impact 3.2-3: Projects facilitated by the 2045 CAP would substantially damage scenic resources, including, but not limited to, trees, rocks, outcropping, and historic building within a state scenic highway.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: The implementation of Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2 would reduce the severity of an impact relating to substantial damage to scenic resources within a state scenic highway by adjusting the scaling and massing of structures, using step-backs from sensitive adjoining uses, planning for project/facility siting, and installing visual screening; however, these measures would not on their own merits ensure that the impact of projects facilitated by the 2045 CAP would be less than significant. For example, details about the siting and design of future utility-scale solar PV projects facilitated by the 2045 CAP, and the feasibility and effectiveness of mitigation measures, are unavailable. No additional feasible mitigation measures are available. The Board, therefore, finds that even with implementation of Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2, impacts may include substantial damage to scenic resources. Therefore, the Board finds Impact 3.2-3 would remain significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.2-1: Alternative Design. See Impact 3.2-1 for a discussion of this mitigation measure.

Mitigation Measure 3.2-2: Visual Screening and Other View Protection Measures. See Impact 3.2-1 for a discussion of this mitigation measure.

Impact 3.2-4: Projects facilitated by the 2045 CAP would substantially degrade the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features and/or conflict with applicable zoning and other regulations of governing scenic quality.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: The implementation of Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2 would reduce the significance of project-caused changes to existing visual character or quality by adjusting the scaling and massing of structures, using step-backs from sensitive adjoining uses, planning for project/facility siting, and installing visual screening; however, these measures would not on their own merits ensure that the impact would be less than significant. For example, details about the siting of future utility-scale solar PV projects facilitated by the 2045 CAP, and the feasibility and effectiveness of mitigation measures, are unavailable. Therefore, the impacts of such projects relative to visual character or quality cannot be accurately assessed at this time, nor can project-specific mitigation be developed. No additional feasible mitigation measures are available. The Board, therefore, finds that even with implementation of these two mitigation measures, impacts may include substantial degradation of the existing visual character or quality of public views. Therefore, the Board finds Impact 3.2-4 would remain significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.2-1: Alternative Design. See Impact 3.2-1 for a discussion of this mitigation measure.

Mitigation Measure 3.2-2: Visual Screening and Other View Protection Measures. See Impact 3.2-1 for a discussion of this mitigation measure.

Impact 3.2-6: Projects facilitated by the 2045 CAP would cause or contribute to a significant cumulative impact to scenic vistas.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: In locations where scenic vistas are of exceptionally high quality, such as in the Antelope Valley, the addition of incremental impacts from projects facilitated by 2045 CAP measures and actions could be more likely to cause or make a cumulatively considerable contribution to a significant cumulative impact on scenic vistas. By contrast, in locations where the quality of scenic vistas is of lesser quality and more mundane, there is a decreased likelihood that projects facilitated by the 2045 CAP measures and actions would cause or contribute to a significant cumulative impact on scenic vistas. The Board, therefore, finds that even with implementation of these two mitigation measures, significant cumulative impacts on scenic vistas would remain. Therefore, the Board finds projects facilitated by the 2045 CAP would cause a cumulatively considerable contribution to significant cumulative impacts to scenic vistas. The Board, therefore, finds that even with implementation of Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2, a significant unavoidable impact to scenic vistas would remain. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.2-1: Alternative Design. See Impact 3.2-1 for a discussion of this mitigation measure.

Mitigation Measure 3.2-2: Visual Screening and Other View Protection Measures. See Impact 3.2-1 for a discussion of this mitigation measure.

Impact 3.2-7: Projects facilitated by the 2045 CAP would cause or contribute to significant cumulative impacts on views from a regional riding, hiking, or multiuse trail.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: The Project's incremental contribution to cumulative impacts, in combination with the incremental impacts of other cumulative projects, would cause (or result in a cumulatively considerable contribution to) a significant cumulative impact on views from regional trails. The Project's contribution to this impact would be cumulatively considerable. The implementation of Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2 would reduce the severity of the Project's incremental contribution to cumulative impacts but would not ensure that the Project's contribution would be less than cumulatively considerable. The Board, therefore, finds that even with implementation of these two mitigation measures, a significant cumulative impact to views from a regional riding, hiking, or multiuse trail would remain. Therefore, the Board finds that this cumulative impact would remain significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.2-1: Alternative Design. See Impact 3.2-1 for a discussion of this mitigation measure.

Mitigation Measure 3.2-2: Visual Screening and Other View Protection Measures. See Impact 3.2-1 for a discussion of this mitigation measure.

Impact 3.2-8: Projects facilitated by the 2045 CAP would cause or contribute to a significant cumulative impact due to substantial cumulative damage to scenic resources, including, but not limited to, trees, rocks, outcropping, and historic building within a state scenic highway.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: In combination with the incremental contributions of other closely related past, present, and reasonably foreseeable future projects that have been or may be approved within these state routes or within the areas to contribute to their eligibility for designation as a scenic highway, the incremental contribution of projects facilitated by the 2045 CAP could cause a significant cumulative impact to occur. The Project's contribution to this impact would be cumulatively considerable. The implementation of Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2 would reduce the severity of the Project's incremental contribution relating to substantial damage to scenic resources within a state scenic highway but would ensure that, in combination with the incremental impacts of other projects, the resulting cumulative impact would be less than significant. Accordingly, even with the implementation of these mitigation measures, the Project's contribution to significant cumulative impacts to scenic resources, including, but not limited to, trees, rocks, outcropping, and historic building within a state scenic highway would remain. Therefore, the Board finds this significant cumulative impact to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.2-1: Alternative Design. See Impact 3.2-1 for a discussion of this mitigation measure.

Mitigation Measure 3.2-2: Visual Screening and Other View Protection Measures. See Impact 3.2-1 for a discussion of this mitigation measure.

Impact 3.2-9: Projects facilitated by the 2045 CAP would cause or contribute to significant cumulative degradation of the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features and/or conflict with applicable zoning and other regulations governing scenic quality.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: The incremental impacts of the Project, in combination with the incremental contributions of other closely related past present and reasonably foreseeable future projects, could cause or contribute to a significant cumulative impact regarding the degradation of the existing visual character or quality of public views of the site and its surroundings as a result of the transformation of existing undeveloped landscape to a more industrial look and feel as would be associated with the development of a water recycling, waste management, or compost processing facility or with the development of utility-scale, ground-mounted renewable energy generation or infrastructure projects if proposed in more rural areas. The implementation of Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2 would reduce the Project's incremental contribution to cumulative impacts but would not ensure that the contribution would not be cumulatively considerable. The Board, therefore, finds that even with the implementation of these mitigation measures, impacts may include significant cumulative degradation of the existing visual character or quality of public views of the site and its surroundings. Therefore, the Board finds this cumulative impact to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.2-1: Alternative Design. See Impact 3.2-1 for a discussion of this mitigation measure.

Mitigation Measure 3.2-2: Visual Screening and Other View Protection Measures. See Impact 3.2-1 for a discussion of this mitigation measure.

ii) Agriculture and Forestry

Impact 3.3-1: Projects facilitated by the 2045 CAP would convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Implementing Mitigation Measure 3.3-1 would lessen the impact of the conversion of mapped Farmland to nonagricultural uses by avoiding the development of

actively farmed lands for purposes of utility-scale solar and energy storage when there is an otherwise suitable site available. However, this measure would not ensure that such conversion could be avoided. The Board, therefore, finds that even with implementation of Mitigation Measure 3.3-1, impacts may include the conversion of Farmland, as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use. Therefore, the Board finds that this significant cumulative impact would be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.3-1: Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar and Energy Storage Development (Recirculated Draft PEIR, p. 3.3-14)

To reduce the impacts of converting Farmland in physical use for agriculture to nonagricultural uses when a utility-scale solar development is proposed on actively farmed land, the County shall require renewable energy project applicants to demonstrate their consideration of alternate sites consisting of formerly developed and/or contaminated lands such as landfills and mine sites located within one mile of the proposed project site when such development is consistent with General Plan and zoning requirements.

Impact 3.3-2: Projects facilitated by the 2045 CAP would conflict with the existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Implementing Mitigation Measure 3.3-1 would lessen impacts caused by a conflict with a designated Agricultural Resource Area but would not ensure that no such conflict would occur. The Board, therefore, finds that even with implementation of Mitigation Measure 3.3-1, impacts may include conflicts with the existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract. Therefore, the Board finds Impact 3.3-2 would be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.3-1: Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar and Energy Storage Development. See Impact 3.3-1 for a description of this mitigation measure.

Impact 3.3-5: Projects facilitated by the 2045 CAP would involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Implementing Mitigation Measure 3.3-1 would lessen impacts related to the conversion of Farmland to utility-scale solar development (a nonagricultural use) but would not ensure that land in agricultural use would not be converted. The Board, therefore, finds that even with the implementation of Mitigation Measure 3.3-1, impacts may involve other changes in

the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use. Therefore, the Board finds Impact 3.3-5 would be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

[Mitigation Measure 3.3-1: Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar and Energy Storage Development.](#) See Impact 3.3-1 for a description of this mitigation measure.

Impact 3.3-7: Projects facilitated by the 2045 CAP would result in a significant cumulative impact related to the conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Implementing Mitigation Measure 3.3-1 would lessen the Project's contribution to the significant cumulative impact. However, implementation of this measure would not ensure that the conversion of mapped Farmland could be avoided and would have no impact on the conversion of mapped Farmland for residential or other uses of that land consistent with General Plan and zoning provisions. The Board, therefore, finds that even with implementation of Mitigation Measure 3.3-1, impacts may include a significant cumulative conversion of Farmland, as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use. Therefore, the Board finds that Impact 3.3-7 would be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

[Mitigation Measure 3.3-1: Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar and Energy Storage Development.](#) See Impact 3.3-1 for a description of this mitigation measure.

Impact 3.3-8: Projects facilitated by the 2045 CAP would result in a cumulative significant impact related to conflicts with existing zoning for agricultural use, or with a designated Agricultural Resource Area.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Implementing Mitigation Measure 3.3-1 would lessen the Project's contribution to the significant cumulative impact but would not ensure that a conflict with a designated Agricultural Resource Area would be avoided. The Board, therefore, finds that even with implementation of Mitigation Measure 3.3-1, the Project's incremental contribution to the cumulative impact to existing zoning for agricultural use, or with a designated Agricultural Resource Area would be cumulatively considerable. Therefore, the Board finds that Impact 3.3-8 would be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.3-1: Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar and Energy Storage Development. See Impact 3.3-1 for a description of this mitigation measure.

Impact 3.3-11: Projects facilitated by the 2045 CAP would involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Implementing Mitigation Measure 3.3-1 would lessen the Project's cumulative contribution to conversion-related impacts but would not ensure that other changes resulting in conversion would not occur. The Board, therefore, finds that even with the implementation of Mitigation Measure 3.3-1, the Project's incremental contribution to cumulative impacts involving other changes in the existing environment that could result in conversion of Farmland would be cumulatively considerable. Therefore, the Board finds that Impact 3.3-5 would be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.3-1: Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar and Energy Storage Development. See Impact 3.3-1 for a description of this mitigation measure.

iii) Air Quality

Impact 3.4-1: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would conflict with or obstruct implementation of the applicable air quality plan.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Future projects in the unincorporated County that would implement 2045 CAP measures and actions would result in a significant and unavoidable impact related to conflict with or obstruction of the implementation of the applicable air quality plan. Implementation of Mitigation Measures 3.4-1 through 3.4-3 would reduce the severity of construction and operational emissions. However, even with the implementation of the measures, these impacts are not accurately quantifiable at this time and may not be reduced to below the thresholds. As a result, the impact for construction and operation of projects facilitated by 2045 CAP would remain significant and unavoidable. No feasible mitigation measures are available that would reduce impacts below South Coast Air Quality Management District (SCAQMD) or Antelope Valley Air Quality Management District (AVAQMD) thresholds on a programmatic level, and feasible mitigation may not be available for individual projects facilitated by the 2045 CAP measures and actions. Impacts would be significant and unavoidable. No additional feasible mitigation measures are available. The magnitude of long-term impacts would increase over time to the extent that more projects would be facilitated by CAP measures and actions to meet the 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets. Because the exact specifications for projects that may be facilitated by the 2045 CAP are unknown, this determination applies to horizon years 2030, 2035, and 2045. The Board, therefore, finds that

even with implementation of the identified mitigation measures, impacts due to conflict with or obstruction of the implementation of the applicable air quality plan would remain. Therefore, the Board finds No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.4-1: Construction Emissions. See Impact 3.4-3b for a discussion of this mitigation measure.

Mitigation Measure 3.4-2: Operational Fugitive Dust Emissions. See Impact 3.4-3b for a discussion of this mitigation measure.

Mitigation Measure 3.4-3: Architectural Coating VOC Emissions (Recirculated Draft PEIR, p. 3.4-54)

If, during subsequent project-level environmental review, it is determined that VOC emissions impacts may be significant, the lead agency shall require Super-Compliant VOC-content architectural coatings (0 grams per liter to less than 10 grams per liter VOC) to be used during construction and operational application of paints and other architectural coatings to reduce ozone precursors. If paints and coatings with VOC content of 0 grams/liter to less than 10 grams/liter cannot be utilized, the developer shall avoid application of architectural coatings during days when the USEPA, CARB, or SCAQMD has forecasted the Air Quality Index for ozone to be greater than 100 for the project location.

Impact 3.4-2: The Project, as a result of projects facilitated by 2045 CAP measures and actions, could result in a cumulatively considerable net increase of a criteria pollutant for which the Project region is nonattainment under an applicable federal or state ambient air quality standard.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Future projects in the unincorporated areas of the County facilitated by 2045 CAP measures and actions would result in a significant and unavoidable impact related to a cumulatively considerable net increase of a criteria pollutant for which the region is nonattainment during construction and operations due to the potential for individual future projects facilitated by 2045 CAP measures and actions to exceed the significance thresholds. Implementation of Mitigation Measures 3.4-1, 3.4-2, 3.4-3, 3.4-4, and 3.4-5 would help to reduce the severity of the impacts. However, even with implementation of the measures, impacts may not be reduced to below the thresholds (and impacts would remain significant and unavoidable) because no feasible mitigation measures are available that would reduce impacts below SCAQMD's or AVAQMD's thresholds on a programmatic level and because feasible mitigation may not be available for individual projects facilitated by the 2045 CAP. Impacts would be significant and unavoidable. No additional feasible mitigation measures are available. Because the exact specifications for projects that may be facilitated by the 2045 CAP are unknown, this determination applies to horizon years 2030, 2035, and 2045. The magnitude of long-term impacts may increase over time to the extent that more projects would be facilitated by 2045 CAP measures and actions to meet the 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets. The Board, therefore, finds that even with implementation of the identified mitigation measures, a cumulatively considerable net increase of a criteria pollutant for which the

Project region is nonattainment would remain. Therefore, the Board finds Impact 3.4-2 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.4-1: Construction Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-2: Operational Fugitive Dust Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-3: Architectural Coating VOC Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-4: Enhanced Energy Conservation (Recirculated Draft PEIR, p. 3.4-61)

If, during subsequent project-level environmental review, it is determined that operational emissions impacts are significant, the lead agency shall require the project to incorporate enhanced energy conservation measures beyond those required by federal or state law, County ordinance, and the 2045 CAP measures and actions to reduce energy-related emissions. Enhanced energy conservation measures shall include one or more of the following as applicable:

- Install Energy Star rated heating, cooling, lighting, and appliances.
- Use of heating, ventilation, and air conditioning equipment with a Seasonal Energy Efficiency Ratio of 12 or higher.
- Installation of water heaters with an energy factor of 0.92 or higher.
- Install solar water heaters or tankless water heaters.
- Use passive solar cooling/heating.
- Reduce building natural gas infrastructure, use renewable natural gas in place of fossil fuel-derived natural gas, or eliminate building natural gas infrastructure and fully electrify buildings.

Mitigation Measure 3.4-5: Low-VOC/Green Cleaning Product Educational Program (Recirculated Draft PEIR, p. 3.4-61)

If, during subsequent project-level environmental review, it is determined that operational emissions impacts may be significant, the lead agency shall require the project applicant or developer to provide tenants and residents with information about low-VOC/green cleaning products and paints, including materials educating how to identify low-VOC cleaners and products.

Impact 3.4-3a: The Project, as a result of projects facilitated by the 2045 CAP measures and actions, would expose sensitive receptors to substantial pollutant concentrations for localized air pollutants and Toxic Air Contaminants (TAC) emissions.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: The 2045 CAP would result in a significant and unavoidable impact related to exposure of sensitive receptors to substantial pollutant concentrations. The implementation of Mitigation Measure 3.4-6 and Mitigation Measure 3.4-7 would help to reduce the severity of the impacts related to localized emissions and TAC emissions. However, impacts from construction- and operational-related localized emissions and TAC emissions may not be reduced to below the thresholds and, under such conditions, impacts would remain significant and unavoidable. No feasible mitigation measures are available that would reduce impacts related to construction-related localized emissions and TAC emissions to below SCAQMD's or AVAQMD's thresholds on a Program level and feasible mitigation may not be available for individual projects facilitated by 2045 CAP measures and actions. Impacts would be significant and unavoidable. No additional feasible mitigation measures are available. Because the exact specifications for projects that may be facilitated by the 2045 CAP are unknown, this determination applies to horizon years 2030, 2035, and 2045. The magnitude of long-term impacts would increase over time to the extent that more projects would be facilitated by CAP measures and actions to meet the 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets. The Board, therefore, finds that even with implementation of the identified mitigation measures, the Project would expose sensitive receptors to substantial pollutant concentrations for localized air pollutants and TAC emissions. Therefore, the Board finds Impact 3.4-3a to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.4-1: Construction Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-2: Operational Fugitive Dust Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-3: Architectural Coating VOC Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-4: Enhanced Energy Conservation. See Impact 3.4-2 for a description of this mitigation measure.

Mitigation Measure 3.4-5: Low-VOC/Green Cleaning Product Educational Program. See Impact 3.4-2 for a description of this mitigation measure.

Mitigation Measure 3.4-6: Stationary Sources (Recirculated Draft PEIR, p. 3.4-68)

Applicants for new or modified stationary sources facilitated by the 2045 CAP measures and actions that: (1) have the potential to generate 40 or more diesel trucks per day and (2) are located within 1,000 feet of a sensitive land use (e.g., residential, schools, hospitals, nursing homes), as measured from the property line of the project to the property line of the nearest sensitive use, shall submit a health risk assessment (HRA) to the County Department of Regional Planning prior to future discretionary project approval. The HRA shall be prepared in accordance with policies and procedures of the state Office of Environmental Health Hazard Assessment and the applicable air quality management district. If the HRA shows that the incremental cancer risk

exceeds ten in one million (10E-06), particulate matter concentrations would exceed 2.5 µg/m³, or the appropriate noncancer hazard index exceeds 1.0, the applicant will be required to identify and demonstrate that best available control technologies for toxics (T-BACTs) are capable of reducing potential cancer and noncancer risks to an acceptable level, including appropriate enforcement mechanisms. T-BACTs may include, but are not limited to, restricting idling onsite or electrifying warehousing docks to reduce diesel particulate matter, or requiring use of newer equipment and/or vehicles. T-BACTs identified in the HRA shall be identified as mitigation measures in the environmental document and/or incorporated into the site development plan as a component of the project.

Mitigation Measure 3.4-7: Health Risk Assessment (Recirculated Draft PEIR, p. 3.4-68 et seq.)

Applicants shall submit a health risk assessment (HRA) to the County prior to future discretionary project approval for sensitive land uses facilitated by the 2045 CAP measures and actions within the following distances as measured from the property line of the project to the property line of the source/edge of the nearest travel lane, from these facilities or similar types of facilities that produce TAC emissions:

- Industrial facilities within 1,000 feet
- Distribution centers (40 or more trucks per day) within 1,000 feet
- Major transportation projects (50,000 or more vehicles per day) within 1,000 feet
- Gasoline dispensing facilities within 300 feet

Applicants proposing projects facilitated by the 2045 CAP measures and actions which produce TAC emissions may be required to submit an HRA based on local rules and regulations, and/or at the discretion of the lead agency.

The HRA shall be prepared in accordance with policies and procedures of the applicable Air Quality Management District. If the HRA shows that the incremental cancer risk exceeds ten in one million (10E-06) or the appropriate noncancer hazard index exceeds 1.0, the applicant will be required to identify and demonstrate that mitigation measures are capable of reducing potential cancer and non-cancer risks to an acceptable level (i.e., below ten in one million or a hazard index of 1.0), including appropriate enforcement mechanisms. Measures to reduce risk may include but are not limited to:

- Air intakes located away from high-volume roadways and/or truck loading zones, unless it can be demonstrated to the County Department of Regional Planning that there are operational limitations.
- Heating, ventilation, and air conditioning systems of the buildings provided with appropriately sized maximum efficiency rating value (MERV) filters.

Mitigation measures identified in the HRA shall be identified as mitigation measures in the environmental document and/or incorporated into the site development plan as a component of the Project. The air intake design and MERV filter requirements shall be noted and/or reflected on all building plans submitted to the County and shall be verified by the County Department of Regional Planning.

Impact 3.4-5: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would make a cumulatively considerable contribution to a significant cumulative impact due to a conflict with or obstruction of implementation of the applicable air quality plan.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Future projects in the unincorporated County that would be facilitated by the 2045 CAP measures and actions would result in a significant and unavoidable cumulative impact related to construction emissions and conflict with or obstruction of the implementation of the applicable air quality plan. The implementation of Mitigation Measures 3.4-1, 3.4-2, and 3.4-3 would reduce the severity of construction emissions. However, even with the implementation of the measures, these cumulative impacts are not accurately quantifiable at this time and may not be reduced to below the thresholds. No feasible mitigation measures are available that would reduce impacts below SCAQMD's or AVAQMD's thresholds on a program level, and feasible mitigation may not be available for individual projects facilitated by the 2045 CAP measures and actions for horizon years 2030, 2035, and 2045. Impacts would be cumulatively considerable, and significant and unavoidable. The Board, therefore, finds that even with implementation of the identified mitigation measures, the Project would cause a cumulatively considerable contribution to a significant cumulative impact due to a conflict with or obstruction of implementation of the applicable air quality plan. Therefore, the Board finds Impact 3.4-5 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.4-1: Construction Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-2: Operational Fugitive Dust Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-3: Architectural Coating VOC Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Impact 3.4-6: The Draft 2045 CAP would make a cumulatively considerable contribution to a significant cumulative impact to air quality associated with criteria pollutants.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Future projects in the unincorporated areas of the County facilitated by 2045 CAP measures and actions would result in a significant and unavoidable impact related to a cumulatively considerable net increase of a criteria pollutant for which the region is nonattainment during construction and operations. The implementation of Mitigation Measures 3.4-1, 3.4-2, 3.4-3, 3.4-4, and 3.4-5 would help to reduce the severity of the impacts. However, even with implementation of these measures, impacts may not be reduced to below the thresholds (and impacts would remain significant and unavoidable) because no feasible mitigation measures are available that would reduce impacts below SCAQMD's or AVAQMD's thresholds on a program level and because feasible mitigation may not be available for individual

projects facilitated by the 2045 CAP for horizon years 2030, 2035, and 2045. Impacts would be significant and unavoidable. The magnitude of long-term impacts may increase over time to the extent that more projects would be facilitated by CAP measures and actions to meet the 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets. The Board, therefore, finds that even with implementation of the identified mitigation measures, the Project would cause a cumulatively considerable contribution to a significant cumulative impact to air quality associated with criteria pollutants. Therefore, the Board finds Impact 3.4-6 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.4-1: Construction Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-2: Operational Fugitive Dust Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-3: Architectural Coating VOC Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-4: Enhanced Energy Conservation. See Impact 3.4-2 for a description of this mitigation measure.

Mitigation Measure 3.4-5: Low-VOC/Green Cleaning Product Educational Program. See Impact 3.4-2 for a description of this mitigation measure.

Impact 3.4-7: The Project, as a result of projects facilitated by the 2045 CAP, could contribute to a significant cumulative impact to air quality associated with localized air pollutant and TAC emissions.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Future projects facilitated by 2045 CAP measures and actions may result in localized air pollutant and TAC emissions that could exceed the SCAQMD and AVAQMD significance thresholds for each of the horizon years. However, even with implementation of Mitigation Measures 3.4-1, 3.4-2, 3.4-3, 3.4-4, 3.4-5, 3.4-6, 3.4-7, and 3.4-8, the impacts related to fugitive dust, localized TAC emissions, and associated health risk impacts would be cumulatively considerable and thus significant and unavoidable. No feasible mitigation measures are available that would reduce impacts below SCAQMD's or AVAQMD's thresholds on a program level, and feasible mitigation may not be available for future projects facilitated by the 2045 CAP for horizon years 2030, 2035, and 2045. Impacts would be significant and unavoidable. The magnitude of long-term impacts may increase over time to the extent that more projects would be facilitated by CAP measures and actions to meet the 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets. The Board, therefore, finds that even with implementation of the identified mitigation measures, the Project would contribute to a significant cumulative impact to air quality associated with localized air pollutant and TAC emissions. Therefore, the Board finds Impact 3.4-7 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.4-1: Construction Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-2: Operational Fugitive Dust Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-3: Architectural Coating VOC Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-4: Enhanced Energy Conservation. See Impact 3.4-2 for a description of this mitigation measure.

Mitigation Measure 3.4-5: Low-VOC/Green Cleaning Product Educational Program. See Impact 3.4-2 for a description of this mitigation measure.

Mitigation Measure 3.4-6: Stationary Sources. See Impact 3.4-3a for a description of this mitigation measure.

Mitigation Measure 3.4-7: Health Risk Assessment. See Impact 3.4-3a for a description of this mitigation measure.

Mitigation Measure 3.4-8: Valley Fever. See Impact 3.4-3b for a description of this mitigation measure.

iv) Biological Resources

Impact 3.5-2: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would have a substantial adverse indirect impact (i.e., through habitat modifications) on one or more species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by California Department of Fish and Wildlife (CDFW) or United States Fish and Wildlife Service (USFWS).

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Although direct impacts on special-status species would be mitigated, significant indirect impacts on special-status species would occur due to the loss of common, non-sensitive habitat. Special-status species are dependent on both sensitive and common habitats and with the development facilitated by 2045 CAP measures and actions, habitat and resources to support special-status species could be reduced. The Board, therefore, finds that even with implementation of the identified mitigation measures, the Project would have a substantial adverse indirect impact on one or more species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS. Therefore, the Board finds Impact 3.5-2 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.5-1 (Recirculated Draft PEIR, p. 3.5-19)

The County shall require biological resources to be analyzed on a project-specific level by a qualified biological consultant. Prior to or during the preparation of project-level environmental documents, and prior to the start of construction activities, a biological resources assessment shall be conducted to characterize the project site. Suitable buffer areas surrounding the project site shall be included where native habitat is contiguous with off-site habitat areas. The assessment and analysis shall emphasize identifying endangered, threatened, rare, and other special-status species; regionally and locally unique species; and sensitive natural communities, jurisdictional waters, and oak woodlands. Focused surveys shall be conducted as necessary to determine the presence of special-status species (e.g., focused sensitive plant or wildlife surveys). Focused surveys shall be conducted according to established CDFW or USFWS protocols, if available for the object species. Natural communities shall be mapped and identified according to floristic alliance- and/or association-based mapping protocols consistent with CDFW natural communities. A jurisdictional delineation may be required if there are signs of potentially regulated wetlands and non-wetland waters. A biological resources assessment report shall be prepared to characterize the biological resources on-site, analyze direct and indirect impacts on biological resources, and propose mitigation measures to offset those impacts. The report shall include site location, literature sources, methodology, timing of surveys, vegetation map, site photographs, and descriptions of biological resources on-site (e.g., observed and detected species as well as those species with potential to occur on-site).

Mitigation Measure 3.5-2 (Recirculated Draft PEIR, p. 3.5-19et seq.)

If there is potential for direct impacts to special-status species with implementation of construction activities, the project-specific biological resources assessment report (as described in Mitigation Measure 3.5-1) shall include a mitigation measure requiring pre-construction surveys for special-status species and/or construction monitoring to ensure avoidance, relocation, or safe escape of special-status species from the construction activities, as appropriate. The mitigation measures shall also include consultation with and obtaining permits from USFWS or CDFW prior to construction, if required by FESA or CESA for listed endangered and threatened species. If special-status species are found to be nesting, brooding, denning, etc. on-site during the pre-construction survey or monitoring, construction activity shall be halted until offspring are weaned, fledged, etc. and are able to escape the site or be safely relocated to appropriate offsite habitat areas. Relocation of such species into areas of appropriate restored habitat would have the best chance of replacing/incrementing populations that are lost due to habitat converted to development. Relocation to restored habitat areas shall be the preferred goal of this measure. A qualified biologist shall be on site to conduct surveys, to perform or oversee implementation of protective measures, and to determine when construction activity may resume.

Impact 3.5-3: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would have a substantial adverse impact on sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Although direct impacts on sensitive natural communities would be mitigated, no mitigation is provided for indirect impacts on sensitive natural communities through the loss of common, non-sensitive habitat. Sensitive natural communities are dependent on both sensitive and common habitats, and with the potential increase in development to implement the 2045 CAP, measures and actions could reduce common habitat and resources to support sensitive natural communities. The Board, therefore, finds that even with implementation of the identified mitigation measures, the Project would have a substantial adverse impact on sensitive natural communities identified in local or regional plans, policies, regulations or by CDFW or USFWS. Therefore, the Board finds Impact 3.5-3 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.5-1. See Impact 3.5-2 for a description of this mitigation measure.

Mitigation Measure 3.5-5 (Recirculated Draft PEIR, p. 3.5-26)

Proponents of projects resulting in the loss of oak woodlands shall mitigate with in-kind replacement habitat at a minimum of 1:1 mitigation ratio documented through a County-approved habitat mitigation plan. The plan shall include the number of replacement trees (or acreage and average density of woodland), location of replacement woodland, understory habitat components, sequencing for any phased tree removal, and performance standards for mitigation. The plan shall include monitoring for a minimum of five years, with annual reports submitted to the County.

For oak woodlands impacts, project mitigation shall be consistent with recommendations in the County's Oak Woodland Conservation Management Plan and its 2014 Guide. If a project cannot be redesigned to avoid impacts to oak woodlands, an appropriate mitigation strategy would be developed by selecting from the Guide's list of recommended mitigation measures prioritizing the acquisition of oak woodland habitat comparable to the habitat that was affected over the restoration of degraded off-site and in-lieu fees. A Mitigation Monitoring Plan consistent with the Guide's recommendations would be prepared and implemented.

Impact 3.5-5: The Project, as a result of projects facilitated by the 2045 CAP measures and actions, would interfere substantially with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Projects facilitated by 2045 CAP measures and actions could adversely affect wildlife corridors, habitat linkages, and native wildlife nursery sites when expanding bicycle and pedestrian networks within recreational areas, procuring zero-carbon electricity, electrifying all new development, increasing renewable energy production on new development, and expanding energy resilience. These measures may facilitate new development such as large utility-scale energy projects (e.g., solar, battery storage, substation, transmission infrastructure) in the Antelope Valley or other rural areas and would affect wildlife corridors, habitat linkages, and native wildlife nursery sites if they narrow existing corridors or remove them completely. Impacts associated with narrowing or removing existing wildlife corridors, habitat

linkages, and/or native wildlife nursery sites would remain. The Board, therefore, finds that even with implementation of the identified mitigation measures, the Project would interfere substantially with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. Therefore, the Board finds Impact 3.5-5 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

[Mitigation Measure 3.5-1](#). See Impact 3.5-2 for a description of this mitigation measure.

[Mitigation Measure 3.5-4 \(Recirculated Draft PEIR, p. 3.5-25\)](#)

Proponents for individual projects facilitated by the 2045 CAP provisions shall analyze impacts on wildlife movement and corridors that may introduce new or additional barriers to wildlife dispersal or constrain existing wildlife corridors to future movement, or indirect impacts constraining future wildlife movement. Where projects may interfere with wildlife movement, alternative designs shall be included in the analysis to reduce wildlife movement impacts. Corridors, linkages, and pinch points shall not be entirely closed by any development, and partial mitigation shall be mandatory for project-specific impacts on wildlife corridors and wildlife nursery sites. This shall include provision of a minimum of half the corridor width. (The width shall be at least what is needed to remain connective for the top predators using the corridor.) Mitigation can include preservation by deed in perpetuity of other parts of the wildlife corridor connecting through the development area; it can include native landscaping to provide cover on the corridor. For nursery site impacts, mitigation shall include preservation by deed in perpetuity for another comparable nursery site of the same species.

Impact 3.5-7: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would result in a cumulatively considerable contribution to a significant cumulative impact through habitat modifications on one or more species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: For indirect impacts resulting in part from the loss of common habitats and diminished resource availability, the implementation of Mitigation Measures 3.5-1 and 3.5-2 would not be sufficient to reduce the level of the Project-specific impact (as a result of projects facilitated by the 2045 CAP) to a less-than-significant level. The Board, therefore, finds that even with implementation of the identified mitigation measures, the Project would result in a cumulatively considerable contribution to a significant cumulative impact through habitat modifications on one or more species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS. Therefore, the Board finds Impact 3.5-7 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

[Mitigation Measure 3.5-1](#). See Impact 3.5-2 for a description of this mitigation measure.

Mitigation Measure 3.5-2. See Impact 3.5-2 for a description of this mitigation measure.

Impact 3.5-8: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would result in a cumulatively considerable contribution to a significant cumulative impact on sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: The 2045 CAP would contribute a significant and unavoidable incremental contribution to this significant cumulative impact. No further mitigation is available to reduce the significance of this incremental contribution because riparian habitat and sensitive natural communities are limited in distribution; therefore, the ability to replace or mitigate the loss of these areas are equally limited in opportunity and new habitats, especially riparian, cannot readily be created. Accordingly, the Project-specific, incremental contribution, combined with the cumulative projects' impacts on sensitive natural communities over the span of the 2045 CAP, would remain. The Board, therefore, finds that even with implementation of the identified mitigation measures, the Project would result in a cumulatively considerable contribution to a significant cumulative impact on sensitive natural communities identified in local or regional plans, policies, regulations or by CDFW or USFWS. Therefore, the Board finds Impact 3.5-8 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.5-1. See Impact 3.5-2 for a description of this mitigation measure.

Mitigation Measure 3.5-5. See Impact 3.5-3 for a description of this mitigation measure.

Impact 3.5-10: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would contribute to a significant cumulative impact relating to substantial interference with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impediment of the use of native wildlife nursery sites.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Projects facilitated by the 2045 CAP would contribute a significant unavoidable incremental contribution to this significant cumulative impact. Even with the implementation of Mitigation Measures 3.5-1 and 3.5-4, the Project-specific, incremental contribution, combined with the cumulative projects' impacts on special-status species over the span of the 2045 CAP, would be cumulatively considerable. Additional mitigation opportunities for wildlife movement are limited or unavailable. A significant cumulative impact from interference with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impediment of the use of native wildlife nursery sites would result. The Board, therefore, finds that even with implementation of the identified mitigation measures, Impact 3.5-10 would be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

[Mitigation Measure 3.5-1](#). See Impact 3.5-2 for a description of this mitigation measure.

[Mitigation Measure 3.5-4](#). See Impact 3.5-5 for a description of this mitigation measure.

Impact 3.5-11: The Project, as a result of projects facilitated by 2045 CAP measures and actions, would contribute to the cumulative conversion of oak woodlands or other unique native woodlands.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Projects facilitated by 2045 CAP measures and actions would result in a cumulatively considerable contribution to significant cumulative impacts when combined with the incremental impacts of other projects over the span of the 2045 CAP and with the impacts of other natural factors beyond the County's control that contribute to the conversion of oak woodlands and other unique woodlands (e.g., wildfires, climate change, introduced plant diseases, insect pests). The implementation of Mitigation Measures 3.5-1 and 3.5-5 would not reduce the significance of the Project's contribution to a less than cumulatively considerable level. The Board, therefore, finds that even with implementation of the identified mitigation measures, a significant cumulative impact related to a cumulative conversion of oak woodlands or other unique native woodlands would remain. Therefore, the Board finds Impact 3.5-11 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

[Mitigation Measure 3.5-1](#). See Impact 3.5-2 for a description of this mitigation measure.

[Mitigation Measure 3.5-5](#). See Impact 3.5-3 for a description of this mitigation measure.

v) Noise and Vibration

Impact 3.13-1: Projects facilitated by the 2045 CAP could generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Mitigation Measure 3.13-1 would reduce impacts associated with construction activities. However, because of the potential for construction activities to occur near sensitive uses, and because of the potential intensity of construction activities, it may not be feasible to reduce the impact to a less-than-significant level. Accordingly, the impact would remain significant and unavoidable. Mitigation Measure 3.13-2 would reduce impacts associated with stationary-source noise, but because exterior noise levels may still exceed the County's noise land use compatibility criteria despite exterior noise attenuation (e.g., noise controls, sound walls, and/or berms), the impact would remain significant and unavoidable. No additional feasible mitigation measures have been identified to further reduce Project-specific incremental contributions to significant noise impacts. Residential land uses comprise the majority of existing sensitive uses in Los Angeles County that would be affected by the increase in noise generated

by projects facilitated by the 2045 CAP. Construction of sound barriers would be inappropriate to reduce traffic noise impacts for residential land uses that face the roadway because such a measure would create aesthetic and access concerns. Furthermore, for individual development projects, the cost to mitigate off-site noise impacts on existing uses (for example, by implementing noise controls such as sound walls, berms, or the replacement of existing single-paned windows) often is out of proportion with the level of impact. The Board, therefore, finds that even with implementation of the identified mitigation measures, the Project could generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. Therefore, the Board finds Impact 3.13-1 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.13-1: Construction Noise (Recirculated Draft PEIR, p. 3.13-20)

Construction activities associated with new projects facilitated by the 2045 CAP that occur within 500 feet of noise-sensitive receptors (i.e., residences, parks, schools, historic sites, cemeteries, and recreation areas) shall be evaluated by the project applicant for noise impacts that would result in a 5 dBA increase over existing ambient noise levels at any sensitive receptor. Mitigation measures such as installing temporary sound barriers for construction activities that occur adjacent to occupied noise-sensitive structures; equipping construction equipment with more effective mufflers, sound-insulating hoods or enclosures, vibration dampers, and other Best Available Control Technology (BACT); and reducing non-essential idling of construction equipment to no more than five minutes shall be incorporated into construction activities to reduce construction-related noise.

Mitigation Measure 3.13-2: Stationary-Noise Source (Recirculated Draft PEIR, p. 3.13-20)

For any project that involves a noise-sensitive use within the 65 dBA CNEL contour (i.e., areas in or above 65 dBA CNEL) exposed to project stationary-source noise levels in excess of applicable standards in the Los Angeles County Noise Ordinance, the project applicant shall submit an acoustic analysis prior to project approval. The acoustic analysis shall identify site design features (e.g., setbacks, berms, parapets, equipment enclosures, equipment mufflers, sound walls, or other similar noise control device or noise barrier) and/or required building acoustical improvements (e.g., sound transmission class rated windows, doors, and attic baffling) to ensure compliance with the County's Noise Compatibility Criteria, the California Building Code, and the California Noise Insulation Standards (Title 24 of the California Code of Regulations).

Impact 3.13-2: Projects facilitated by the 2045 CAP could generate excessive groundborne vibration or groundborne noise levels.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: The implementation of Mitigation Measure 3.13-3 would reduce vibration impacts associated with construction activities. However, because of the potential for construction activities to occur near sensitive uses, and because of the potential intensity of construction activities, it may not be feasible to reduce the impact to a less-than-significant level.

The Board, therefore, finds that even with implementation of Mitigation Measure 3.13-3, the Project could generate excessive groundborne vibration. Therefore, the Board finds Impact 3.13-2 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.13-3: Construction Vibration (Recirculated Draft PEIR, p. 3.13-23)

Individual projects that use vibration-intensive construction equipment, such as pile drivers, jackhammers, and vibratory rollers near vibration-sensitive receptors shall be evaluated by the applicant for potential vibration impacts. If construction-related vibration is determined to be perceptible at vibration-sensitive uses (i.e., exceed the County's standard of 0.01 inches per second (in/sec) vibration velocity [within the range of 1 to 100 Hz frequency]), additional requirements shall be implemented during construction, such as the use of less-vibration-intensive equipment or vibration-reduction construction techniques or strategies (e.g., drilled piles to eliminate the use of a vibration-intensive pile driver, increased setback distances).

Impact 3.13-3: Projects facilitated by the 2045 CAP could make a cumulatively considerable contribution to a significant cumulative impact related to the generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: While the implementation of Mitigation Measure 3.13-1 and Mitigation Measure 3.13-2 would reduce the significance of the Project-specific incremental contribution, it may not be feasible to reduce the Project-specific contribution to the significant cumulative impact to a less than cumulatively considerable / less-than-significant level. Thus, post-mitigation cumulative noise impacts would remain significant and unavoidable. No additional feasible mitigation measures have been identified to further reduce Project-specific incremental contributions to significant cumulative noise impacts. For residential land uses, which comprise the majority of existing sensitive uses in Los Angeles County that would be affected by the increase in noise generated by projects facilitated by the 2045 CAP, the construction of sound barriers would be inappropriate to reduce traffic noise impacts because such barriers would create aesthetic and access concerns. For other individual development project types, the cost to mitigate off-site noise impacts on existing uses often is out of proportion with the level of impact. The Board, therefore, finds that even with implementation of the identified mitigation measures, the Project could make a cumulatively considerable contribution to a significant cumulative impact related to the generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. Therefore, the Board finds Impact 3.13-3 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.13-1. Construction Noise. See Impact 3.13-1 for a description of this mitigation measure.

Mitigation Measure 3.13-2. Stationary-Noise Source. See Impact 3.13-1 for a description of this mitigation measure.

Impact 3.13-4: Projects facilitated by the 2045 CAP could make a cumulatively considerable contribution to a significant cumulative impact relating to the generation of excessive groundborne vibration or groundborne noise levels from construction activities.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Although the implementation of Mitigation Measure 3.13-3 and Mitigation Measure 3.13-4 would reduce the Project-specific incremental contribution to significant cumulative vibration impacts, it may not be feasible to reduce the cumulative impact to a less-than-significant level. The Board, therefore, finds that even with implementation of the identified mitigation measures, a cumulatively considerable contribution to a significant cumulative impact relating to the generation of excessive groundborne vibration or groundborne noise levels from construction activities would remain. Therefore, the Board finds Impact 3.13-4, as a result of projects facilitated by the Draft 2045 CAP, to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.13-3. Measure 3.13-3. See Impact 3.13-2 for a description of this mitigation measure.

Mitigation Measure 3.13-4: New Development Near Railroad Tracks (Recirculated Draft PEIR, p. 3.13-25)

New development that occurs within 200 feet of a railroad track (according to the FTA's vibration screening distances) shall be evaluated for potential vibration impacts. The project property owner/developers shall retain an acoustical engineer to conduct an acoustic analysis and identify, where appropriate, site design features and/or required building construction improvements to ensure that vibration impacts would remain below acceptable levels of 0.08 in/sec RMS for residential uses.

vi) Utilities and Service Systems

Impact 3.17-1: Projects facilitated by the 2045 CAP would require or result in the relocation or construction of new or expanded water, wastewater treatment, stormwater drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Construction of some utility projects, in particular utility-scale energy projects, could result in significant impacts on environmental resources including air quality, biological resources, cultural resources, water quality, transportation, and noise. Mitigation measures outlined in the PEIR would reduce these impacts. (See Section 3.4, Air Quality; Section 3.5, Biological Resources; Section 3.6, Cultural Resources; Section 3.10, Hazards and

Hazardous Materials; Section 3.13, Noise; and Section 3.15, Transportation.) Nonetheless, as described in these sections of the EIR, construction of new water, wastewater, stormwater drainage, electric power, natural gas power, or telecommunications utilities would result in significant and unavoidable impacts. The Board, therefore, finds that even with implementation of the identified mitigation measures, the Project could cause significant environmental effects due to the relocation or construction of new or expanded water, wastewater treatment, stormwater drainage, electric power, natural gas, or telecommunication facilities. Therefore, the Board finds Impact 3.17-1 to be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.4-1. Construction Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-2. Operational Fugitive Dust Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-3. Architectural Coating VOC Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-4. Enhanced Energy Conservation. See Impact 3.4-2 for a description of this mitigation measure.

Mitigation Measure 3.5-1. See Impact 3.5-2 for a description of this mitigation measure.

Mitigation Measure 3.5-2. See Impact 3.5-2 for a description of this mitigation measure.

Mitigation Measure 3.5-3. See Impact 3.5-4 for a description of this mitigation measure.

Mitigation Measure 3.5-4. See Impact 3.5-9 for a description of this mitigation measure.

Mitigation Measure 3.5-5. See Impact 3.5-6 for a description of this mitigation measure.

Mitigation Measure 3.6-1: Historic Resources Assessment. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-2. Archaeological Resources Assessment. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-3. Construction Worker Cultural Resources Sensitivity Training. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-4. Archaeological Resources Discoveries. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-5. Treatment of Archaeological Resources. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-6. Curation and Disposition of Cultural Materials. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-7. Paleontological Resources Assessment and Monitoring. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-8. Paleontological Resources Sensitivity Training. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-9. Paleontological Discoveries. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-10. Human Remains Discoveries. See Impact 3.6-4 for a description of this mitigation measure.

Mitigation Measure 3.13-1. Construction Noise. See Impact 3.13-1 for a description of this mitigation measure.

Mitigation Measure 3.13-2. Stationary-Noise Source. See Impact 3.13-1 for a description of this mitigation measure.

Mitigation Measure 3.13-3. Measure 3.13-3. See Impact 3.13-2 for a description of this mitigation measure.

Mitigation Measure 3.13-4. New Development Near Railroad Tracks. See Impact 3.13-4 for a description of this mitigation measure.

Mitigation Measure 3.15-1. Traffic Control Plan. See Impact 3.10.6 for a description of this mitigation measure.

Impact 3.17-3: Projects facilitated by the 2045 CAP would result in a determination by the wastewater treatment provider which serves or may serve the Project that it has inadequate capacity to serve the Project's projected demand in addition to the provider's existing commitments.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Measures and actions facilitated by the 2045 CAP would lead to increased use of recycled and gray water systems, requiring the development of new water recycling and direct potable reuse facilities. The development of these new facilities would allow for wastewater treatment providers to adequately serve their existing and projected commitments; however, this would lead to significant and unavoidable impacts. Mitigation measures outlined in the PEIR that would reduce these impacts have been developed. (See Section 3.4, Air Quality; Section 3.5, Biological Resources; Section 3.6, Cultural Resources; Section 3.10, Hazards and Hazardous Materials; Section 3.13, Noise; and Section 3.15, Transportation.) Nonetheless, as described in these sections of the EIR, construction of new water recycling and direct potable reuse facilities would result in a determination by the wastewater treatment provider that serves or may serve the Project that it has inadequate capacity to serve the Project's projected demand in addition to the provider's existing commitments. The Board, therefore, finds that even with implementation of the identified mitigation measures, Impact 3.17-3 would be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.4-1. Construction Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-2. Operational Fugitive Dust Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-3. Architectural Coating VOC Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-4. Enhanced Energy Conservation. See Impact 3.4-2 for a description of this mitigation measure.

Mitigation Measure 3.5-1. See Impact 3.5-2 for a description of this mitigation measure.

Mitigation Measure 3.5-2. See Impact 3.5-2 for a description of this mitigation measure.

Mitigation Measure 3.5-3. See Impact 3.5-4 for a description of this mitigation measure.

Mitigation Measure 3.5-4. See Impact 3.5-9 for a description of this mitigation measure.

Mitigation Measure 3.5-5. See Impact 3.5-6 for a description of this mitigation measure.

Mitigation Measure 3.6-1: Historic Resources Assessment. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-2. Archaeological Resources Assessment. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-3. Construction Worker Cultural Resources Sensitivity Training. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-4. Archaeological Resources Discoveries. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-5. Treatment of Archaeological Resources. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-6. Curation and Disposition of Cultural Materials. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-7. Paleontological Resources Assessment and Monitoring. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-8. Paleontological Resources Sensitivity Training. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-9. Paleontological Discoveries. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-10. Human Remains Discoveries. See Impact 3.6-4 for a description of this mitigation measure.

Mitigation Measure 3.10-2. See Impact 3.10-2 for a description of this mitigation measure.

Mitigation Measure 3.13-1. Construction Noise. See Impact 3.13-1 for a description of this mitigation measure.

Mitigation Measure 3.13-2. Stationary-Noise Source. See Impact 3.13-1 for a description of this mitigation measure.

Mitigation Measure 3.13-3. Measure 3.13-3. See Impact 3.13-2 for a description of this mitigation measure.

Mitigation Measure 3.13-4. New Development Near Railroad Tracks. See Impact 3.13-4 for a description of this mitigation measure.

Mitigation Measure 3.15-1. Traffic Control Plan. See Impact 3.10.6 for a description of this mitigation measure.

Impact 3.17-5: Projects facilitated by the 2045 CAP would result in a cumulatively considerable contribution to a significant cumulative impact relating to the relocation or construction of new or expanded water, wastewater treatment, stormwater drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Construction of new water, wastewater, stormwater drainage, electric power, natural gas power, or telecommunications utilities would result in significant and unavoidable impacts and the incremental impacts contributed by projects facilitated by the 2045 CAP would be cumulatively considerable. In an attempt to reduce these impacts, the Project would necessitate the implementation of Mitigation Measure 3.4-1 through Mitigation Measure 3.4-4 from *Air Quality*, Mitigation Measure 3.5-1 through Mitigation Measure 3.5-5 from *Biological Resources*, Mitigation Measure 3.6-1 through Mitigation Measure 3.6-10 from *Cultural Resources*, Mitigation Measure 3.10-2 from *Hazards and Hazardous Materials*, Mitigation Measure 3.13-1 through Mitigation Measure 3.13-4 from *Noise*, and Mitigation Measure 3.15-1 from *Transportation*. Although these mitigation measures would reduce the incremental impacts of the Project, the Project's contribution to cumulative impacts in many instances would remain cumulatively considerable. The Board, therefore, finds that even with implementation of the identified mitigation measures, Impact 3.17-5 would be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.4-1. Construction Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-2. Operational Fugitive Dust Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-3. Architectural Coating VOC Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-4. Enhanced Energy Conservation. See Impact 3.4-2 for a description of this mitigation measure.

Mitigation Measure 3.5-1. See Impact 3.5-2 for a description of this mitigation measure.

Mitigation Measure 3.5-2. See Impact 3.5-2 for a description of this mitigation measure.

Mitigation Measure 3.5-3. See Impact 3.5-4 for a description of this mitigation measure.

Mitigation Measure 3.5-4. See Impact 3.5-9 for a description of this mitigation measure.

Mitigation Measure 3.5-5. See Impact 3.5-6 for a description of this mitigation measure.

Mitigation Measure 3.6-1: Historic Resources Assessment. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-2. Archaeological Resources Assessment. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-3. Construction Worker Cultural Resources Sensitivity Training. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-4. Archaeological Resources Discoveries. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-5. Treatment of Archaeological Resources. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-6. Curation and Disposition of Cultural Materials. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-7. Paleontological Resources Assessment and Monitoring. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-8. Paleontological Resources Sensitivity Training. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-9. Paleontological Discoveries. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-10. Human Remains Discoveries. See Impact 3.6-4 for a description of this mitigation measure.

Mitigation Measure 3.10-2. See Impact 3.10-2 for a description of this mitigation measure.

Mitigation Measure 3.13-1. Construction Noise. See Impact 3.13-1 for a description of this mitigation measure.

Mitigation Measure 3.13-2. Stationary-Noise Source. See Impact 3.13-1 for a description of this mitigation measure.

Mitigation Measure 3.13-3. Measure 3.13-3. See Impact 3.13-2 for a description of this mitigation measure.

Mitigation Measure 3.13-4. New Development Near Railroad Tracks. See Impact 3.13-4 for a description of this mitigation measure.

Mitigation Measure 3.15-1. Traffic Control Plan. See Impact 3.10.6 for a description of this mitigation measure.

Impact 3.17-7: Projects facilitated by the 2045 CAP would cause or contribute a cumulatively considerable contribution to a significant cumulative impact relating to inadequate wastewater treatment capacity.

Finding 3: There are no feasible and reasonable mitigation measures which would reduce this impact to a less-than-significant level. The Board hereby makes Finding 3 and determines that this impact would be significant and unavoidable.

Facts in Support of Finding: Construction of new water recycling and direct potable reuse facilities would result in significant and unavoidable impacts and the incremental impacts contributed by projects facilitated by the 2045 CAP would be cumulatively considerable. To reduce these impacts, implementation of the following mitigation measures is recommended at the Program level: Mitigation Measure 3.4-1 through Mitigation Measure 3.4-4 from *Air Quality*, Mitigation Measure 3.5-1 through Mitigation Measure 3.5-5 from *Biological Resources*, Mitigation Measure 3.6-1 through Mitigation Measure 3.6-10 from *Cultural Resources*, Mitigation Measure 3.10-2 from *Hazards and Hazardous Materials*, Mitigation Measure 3.13-1 through Mitigation Measure 3.13-4 from *Noise*, and Mitigation Measure 3.15-1 from *Transportation*. Although these mitigation measures would reduce the incremental impacts of the Project, the Project's contribution to cumulative impacts in many instances would remain cumulatively considerable. The Board, therefore, finds that even with implementation of the identified mitigation measures, Impact 3.17-7 would be significant and unavoidable. No additional feasible mitigation is available.

Mitigation Measures:

Mitigation Measure 3.4-1. Construction Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-2. Operational Fugitive Dust Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-3. Architectural Coating VOC Emissions. See Impact 3.4-1 for a description of this mitigation measure.

Mitigation Measure 3.4-4. Enhanced Energy Conservation. See Impact 3.4-2 for a description of this mitigation measure.

Mitigation Measure 3.5-1. See Impact 3.5-2 for a description of this mitigation measure.

Mitigation Measure 3.5-2. See Impact 3.5-2 for a description of this mitigation measure.

Mitigation Measure 3.5-3. See Impact 3.5-4 for a description of this mitigation measure.

Mitigation Measure 3.5-4. See Impact 3.5-9 for a description of this mitigation measure.

Mitigation Measure 3.5-5. See Impact 3.5-6 for a description of this mitigation measure.

Mitigation Measure 3.6-1: Historic Resources Assessment. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-2. Archaeological Resources Assessment. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-3. Construction Worker Cultural Resources Sensitivity Training. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-4. Archaeological Resources Discoveries. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-5. Treatment of Archaeological Resources. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-6. Curation and Disposition of Cultural Materials. See Impact 3.6-1 for a description of this mitigation measure.

Mitigation Measure 3.6-7. Paleontological Resources Assessment and Monitoring. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-8. Paleontological Resources Sensitivity Training. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-9. Paleontological Discoveries. See Impact 3.6-3 for a description of this mitigation measure.

Mitigation Measure 3.6-10. Human Remains Discoveries. See Impact 3.6-4 for a description of this mitigation measure.

Mitigation Measure 3.10-2. See Impact 3.10-2 for a description of this mitigation measure.

Mitigation Measure 3.13-1. Construction Noise. See Impact 3.13-1 for a description of this mitigation measure.

Mitigation Measure 3.13-2. Stationary-Noise Source. See Impact 3.13-1 for a description of this mitigation measure.

Mitigation Measure 3.13-3. Measure 3.13-3. See Impact 3.13-2 for a description of this mitigation measure.

Mitigation Measure 3.13-4. New Development Near Railroad Tracks. See Impact 3.13-4 for a description of this mitigation measure.

Mitigation Measure 3.15-1. Traffic Control Plan. See Impact 3.10.6 for a description of this mitigation measure.

VII. FINDINGS REGARDING ALTERNATIVES

An EIR must contain a discussion of “a range of reasonable alternatives to a project, or the location of a project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project and evaluate the comparative merits of the alternatives.” (CEQA Guidelines, § 15126.6(a).) CEQA further states that “the range of alternatives in an EIR is governed by the ‘rule of reason’ that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice.” (CEQA Guidelines, § 15126.6(f).) Thus, the following discussion focuses on project alternatives that are capable of eliminating significant environmental impacts or substantially reducing them as compared to the Project, even if the alternative would impede the attainment of some project objectives or would be more costly. Among the factors that may be taken into account when

addressing the feasibility of alternatives are: (1) site suitability; (2) economic viability; (3) availability of infrastructure; (4) general plan consistency; (5) other plans or regulatory limitations; (6) jurisdictional boundaries; and (7) whether the proponent can reasonably acquire, control or otherwise have access to the alternative site. (CEQA Guidelines, § 15126.6(f)(1).)

The objectives of the Project listed in the Recirculated Draft PEIR (Project Objectives) include: (1) Identify detailed programs, actions, and performance goals to achieve the climate action policies of the General Plan. (2) Identify GHG emissions reduction targets tailored to the unincorporated County that closely align with state and County climate goals. (3) Provide a road map for reducing GHG emissions to achieve the County's GHG emissions reduction targets. (4) Encourage sustainable housing production at all levels of affordability, including increasing housing densities near transit to the extent allowed in the General Plan. (5) Demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects (serve as a "qualified CAP") via a Draft 2045 CAP CEQA Streamlining Checklist.

As required by CEQA, in developing the alternatives to be addressed in this section, consideration was given to an alternative's ability to meet most of the basic objectives of the project. (CEQA Guidelines, § 15126.6(a).) Alternatives may be eliminated from detailed consideration in an EIR if they fail to meet most of the project objectives, are infeasible, or do not avoid or substantially reduce any significant environmental effects. (CEQA Guidelines, § 15126.6(c).) The concept of "feasibility" encompasses the question of whether a particular alternative or mitigation measure promotes the underlying goals and objectives of a project. (*City of Del Mar v. City of San Diego* (1982) 133 Cal.App.3d 410, 417 (*City of Del Mar*); *Sierra Club v. County of Napa* (2004) 121 Cal.App.4th 1490, 1506-1509 [court upholds CEQA findings rejecting alternatives in reliance on applicant's project objectives]; see also *California Native Plant Society v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, 1001 (CNPS) ["an alternative 'may be found infeasible on the ground it is inconsistent with the project objectives as long as the finding is supported by substantial evidence in the record'"] (quoting *Kostka & Zischke, Practice Under the Cal. Environmental Quality Act* [Cont.Ed.Bar 2d ed. 2009] (*Kostka*), § 17.39, p. 825); *In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings* (2008) 43 Cal.4th 1143, 1165, 1166 ["[i]n the CALFED program, feasibility is strongly linked to achievement of each of the primary project objectives"; "a lead agency may structure its EIR alternative analysis around a reasonable definition of underlying purpose and need not study alternatives that cannot achieve that basic goal"].) Moreover, "'feasibility' under CEQA encompasses 'desirability' to the extent that desirability is based on a reasonable balancing of the relevant economic, environmental, social, legal, and technological factors." (*City of Del Mar, supra*, 133 Cal.App.3d at p. 417; see also *CNPS, supra*, 177 Cal.App.4th at p. 1001 ["an alternative that 'is impractical or undesirable from a policy standpoint' may be rejected as infeasible"] [quoting *Kostka, supra*, § 17.29, p. 824]; *San Diego Citizenry Group v. County of San Diego* (2013) 219 Cal.App.4th 1, 17.) Alternatives that are remote or speculative, or the effects of which cannot be reasonably predicted, also do not need to be considered. (CEQA Guidelines, § 15126(f)(2).)

a. Findings Regarding Alternatives Considered But Rejected

During public review of the Recirculated Draft PEIR, some commenters suggested that the PEIR analyze an alternative to the Project for the development of small-scale renewable resource generation. (See Recirculated Draft PEIR Comment O2-8.) The Board rejects a Project alternative for the development of small-scale renewable resource generation on the basis that such an alternative is infeasible, the suggestion pertains to a component of the Project rather than the Project as a whole, and such an alternative would not substantially reduce the Project's significant environmental impacts for the reasons

set forth in General Response 1 and Response to Comment O2-8. Other comments suggested a Project alternative for battery storage resources to be distributed throughout urban load pockets to supply local energy needs and for expanding and streamlining battery storage. (See Recirculated Draft PEIR Comments O2-8, O2-11, O2-24, O2-25, O2-26, and O2-28.) The Board rejects as infeasible a Project alternative for distributed battery storage resources throughout urban load pockets and for expanding and streamlining battery storage on the basis that such an alternative is infeasible, the suggestion pertains to a component of the Project rather than the Project as a whole, and this suggested alternative would not substantially reduce the Project's significant environmental impacts for the reasons set forth in General Response 1 and Response to Comments O2-8, O2-11, O2-24, O2-25, O2-26, and O2-28. One comment suggested an alternative to replace roadways with cool or green surfaces. (See Recirculated Draft PEIR Comment O2-42.) The Board rejects as infeasible a Project alternative for replacing roadways with cool or green surfaces on the basis that such an alternative is infeasible, the suggestion pertains to a component of the Project rather than the Project as a whole, and such an alternative would not substantially reduce the Project's significant environmental impacts for the reasons set forth in General Response 1 and Response to Comment O2-42. One comment suggested the PEIR analyze an alternative to the Project for distributed energy resources. (See Recirculated Draft PEIR Comment O7-50.) The Board rejects as infeasible a Project alternative for distributed energy resources on the basis that such an alternative is infeasible, the suggestion pertains to a component of the Project rather than the Project as a whole, and the suggested alternative would not substantially reduce the Project's significant environmental impacts for the reasons set forth in General Response 1 and Response to Comment O7-50.

The alternatives listed below were originally considered but eliminated from further consideration in the PEIR because they failed to feasibly attain most of the basic objectives of the Project, were infeasible, or failed to avoid or substantially reduce any significant environmental effects. They are as follows:

- Carbon Neutrality Target by 2045 Alternative
 - What would be required to achieve a target of carbon neutrality by 2045 would be beyond what the County alone could implement, and it would be speculative to assume that technological advancements to achieve carbon neutrality would become available within the next 25 years. Accordingly, a Carbon Neutrality Target by 2045 Alternative was not carried forward for more detailed evaluation because it is speculative and potentially infeasible: There is no present basis to assume that it could be accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.
- More Aggressive Timeline to Carbon Neutrality Alternative
 - As discussed above as to why the Carbon Neutrality Target by 2045 Alternative was not carried forward, as there is no present basis to assume that it could be accomplished in a successful manner within a reasonable period of time. An even more aggressive timeline to achieving carbon neutrality than 2045 also was not carried forward for more detailed review because it would be even more speculative to assume that the technological advancements needed to achieve carbon neutrality, in addition to those identified above, would become available in time.
- Minimize Loss of Carbon Sequestration Caused by Development Alternative
 - This potential alternative was not carried forward because it would not meet most of the basic Project Objectives. More specifically, a Minimize Loss of Carbon Sequestration Caused by Development Alternative would not implement the climate action policies of the General Plan (Objective 1); would not encourage sustainable housing production (Objective 4); and would not demonstrate a level of GHG emissions below which the

County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects (“qualified CAP”) (Objective 5). The Minimize Loss of Carbon Sequestration Caused by Development Alternative has also been rejected from more detailed consideration because it is legally infeasible: it would not permit the County to fully meet its Regional Housing Needs Allocation (as mandated by state housing law) within the unincorporated areas.

- Substantially Reduced Vehicle Miles Traveled Alternative
 - The Substantially Reduced Vehicle Miles Traveled Alternative was not carried forward for more detailed review because its implementation would be remote or speculative. Total VMT in California and in the County is the product of myriad individual decisions made daily by households and businesses. Achieving a substantial reduction in VMT would require a major shift in decision-making by households and businesses alike, beyond the ability of the County to implement. Significantly improved transit and alternative transportation infrastructure, widespread and inexpensive access to single-occupancy vehicle alternatives, and substantial financial incentives to use these transportation alternatives or (alternatively) providing considerable disincentives to drive could all be part of the solution. However, there is no basis to assume that this alternative could be accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors. The time and expense required to implement this alternative, such as substantially upgrading transportation infrastructure, would compete with the County’s pursuit of other community priorities, such as health, bridging the digital divide, child welfare, affordable housing, justice reform, and support for immigrant residents and their families.
- Aquatic Impact Avoidance Alternative
 - The Aquatic Impact Avoidance Alternative has not been carried forward for more detailed review because it would not meet most of the basic Project Objectives. Such an alternative would not implement the climate action policies of the General Plan (Objective 1); would not identify appropriate GHG emissions reduction targets that closely align with state and local climate goals (Objective 2); would not provide a road map to achieve GHG reductions to meet the GHG emissions reduction targets (Objective 3); and would not encourage sustainable housing production at all levels of affordability, including increasing housing densities near transit to the extent allowed in the General Plan (Objective 4).
 - This alternative also was not carried forward for more detailed review because its implementation is remote or speculative. Opportunities to successfully address those challenges have not been developed; therefore, the impacts of implementing the alternative cannot be reasonably ascertained.
 - Further, this alternative would not avoid or substantially lessen a significant impact of the Project. As analyzed in the context of Impact 3.11-3 in Section 3.11, Hydrology and Water Quality, approval of the 2045 CAP would not substantially alter the existing drainage pattern of the site or area, alter the course of a stream or river, or add impervious surfaces in a manner that would result in a significant impact. As analyzed in the context of criterion c) in Section 3.5, Biological Resources, approval of the 2045 CAP could incentivize future projects—such as those supporting the electrification of new development—that could cause a significant adverse impact on state or federally protected wetlands (e.g., marshes, vernal pools, or coastal wetlands) through direct removal, filling, hydrological interruption, or other means.
- Complete Phase-Out of Oil and Gas Operations by 2030 Alternative

- The Complete Phase-Out of Oil and Gas Operations by 2030 Alternative was not carried forward for more detailed review for several reasons. First, this alternative would not clearly avoid or substantially lessen any of the potential significant impacts of the Project. It is possible that this alternative could worsen or increase the Project's potential short-term significant impacts, such as localized construction-related air quality and health risk impacts from decommissioning of oil and gas wells and remediation activities at contaminated sites, though there would be future benefits.
- Second, the implementation of this alternative would be remote or speculative, given that without the amortization study, it is not possible to know whether the alternative is feasible. Without more information from this detailed study, it is speculative to assume that implementing this alternative is possible. There is no basis to assume that this alternative could be accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.
- Third, this alternative addresses only one of the CAP's many measures, Measure ES 1 (Sunset Strategy for All Oil and Gas Operations). An EIR is required to consider alternatives to the project as whole, and is not required to consider alternatives to each project component.
- Limited-Scope CAP Alternative
 - This alternative would not implement the climate action policies of the General Plan (Objective 1) because, for example:
 - Its lower performance goal for Measure ES2 would conflict with Policy AQ 3.9 to "Ensure the availability of zero-carbon electricity to serve unincorporated Los Angeles County."
 - Its lower performance goal for Measure T6 would conflict with Policy AQ 2.7 to "Encourage and support the development and implementation of Zero-Emission technology and infrastructure."
 - Its lower performance goal for Measure E1 would conflict with Policy AQ 3.5 to "Require the full electrification of new development."
 - This alternative would not provide a feasible and realistic road map for reducing GHG emissions to achieve the GHG emissions reduction targets (Objective 3) because it would call for a CAP that does the bare minimum to achieve the County's targets, with no margin of safety. Such a CAP would provide no emissions "buffer" if certain measures and actions are not as effective in reducing GHG emissions in the future as they were modeled during the planning stage.
 - This alternative also would not demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and thus be a "qualified CAP" (Objective 5). This alternative would put the County in danger of missing its GHG emissions reduction targets, and thus would not be a reliable pathway to achieving a level of GHG emissions below which GHG emissions in the County would have less than cumulatively considerable GHG impacts.

Thus, the Recirculated Draft PEIR presents a reasonable range of feasible alternatives to the Project that would reduce and/or avoid some of the Project's significant environmental effects while achieving most of the Project Objectives. The following findings and brief explanation of the rationale for the findings

regarding Project alternatives identified in the PEIR are set forth to comply with the requirements of CEQA Guidelines section 15091(a)(3).

Four alternatives to the Project were defined and analyzed:

b. Findings Regarding Alternatives Analyzed in the PEIR

The Recirculated Draft PEIR analyzed three alternatives in addition to the No Project Alternative in Chapter 4, *Alternatives*, which sets forth the objectives of the Project, summarizes the Project's significant environmental impacts, discusses the alternatives considered but eliminated from further analysis, describes the alternatives evaluated in detail, and compares the impacts of the alternatives evaluated to the impacts of the Project. The Final EIR's Table 4-6, *Summary of Impacts of the Project and Alternatives*, summarizes the significant environmental impacts of the Project alternatives, and provides a fact-based comparison of the alternatives' impacts to the Project's impacts. The Project alternatives are summarized below along with the findings relevant to each alternative.

1. No Project Alternative.

Facts in Support of Finding: An EIR's discussion of alternatives to the proposed project must include a "no project alternative" to allow a comparison of the environmental impacts of approving the proposed project with the effects of not approving it. (CEQA Guidelines, § 15126.6(e)(1).) The No Project Alternative examines a scenario in which the County would not approve the 2045 CAP for implementation in the unincorporated areas and none of the GHG emissions reduction strategies, measures, or actions outlined in the 2045 CAP would be implemented. The No Project Alternative is captured in the 2045 CAP's Adjusted business-as-usual (BAU) forecast, which accounts for future growth under BAU conditions but adjusts for federal, state, and County legislation and regulations that were implemented before development of the 2045 CAP.

The No Project Alternative would not implement the Project's GHG emissions reduction strategies, measures, or actions, which would facilitate fewer projects compared with implementation of the 2045 CAP. Because the No Project Alternative would facilitate fewer projects, the No Project Alternative would result in fewer adverse physical environmental impacts on the project area and its surrounding environment in comparison to the impacts associated with implementation of the 2045 CAP strategies, measures, and actions. (See Table 4-6 in Chapter 4, *Alternatives*, which provides a comparative summary of environmental impacts.)

However, in the long-term, the No Project Alternative would result in fewer environmental benefits to the County overall because air pollutant and GHG emissions would be much higher than emissions levels associated with all other alternatives and the Project. The No Project Alternative would result in greater human health risks associated with exposure to toxic air contaminants than all other alternatives and the Project, because all other alternatives and the Project would substantially reduce toxic air contaminant (TAC) emissions in the County. The No Project Alternative would neither realize the long-term GHG emission reduction benefits associated with implementation of the 2045 CAP (and all the co-benefits that would also occur, such as reduced criteria pollutant and TAC emissions), nor provide a clear pathway for the County to meet and exceed the statewide 2030 GHG reduction goal identified in SB 32 or meet and exceed the 2045 direct emission reduction target and carbon neutrality goal established by AB 1279.

The No Project Alternative would not further many County goals and policies. Specifically, the No Project Alternative would not achieve or support the County Board of Supervisors' motions pertaining to supporting the Paris Agreement, equitable energy grid resiliency, zero-emissions medium- and heavy-duty vehicles, climate resilient communities, and equitable decarbonization of buildings.

Importantly, the No Project Alternative would not achieve any of the Project's basic objectives; specifically, the No Project Alternative would not implement the climate action policies of the General Plan (Objective 1); would not identify GHG emissions reduction targets tailored to the unincorporated County that closely align with state and County climate goals (Objective 2); would not provide a road map to achieve GHG reductions to meet the GHG emissions reduction targets (Objective 3); would not encourage sustainable housing production (Objective 4); and would not demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects ("qualified CAP") (Objective 5).

Finding: The EIR, including Chapter 4 of the Recirculated Draft PEIR, contains facts and analysis supporting the Finding, some of which are set forth here. Under the No Project Alternative, none of the GHG emissions reduction strategies, measures, or actions outlined in the 2045 CAP would be implemented in the unincorporated areas, resulting in fewer adverse environmental impacts than the Project because it would avoid all adverse impacts caused by projects facilitated by the 2045 CAP. (See Table 4-6 in Chapter 4, *Alternatives*, which provides a comparative summary of environmental impacts.) However, in the long-term, the No Project Alternative would result in less environmental benefits to the County overall, as air pollutant and GHG emissions would be higher than emissions levels associated with all other alternatives and the Project, resulting in greater human health risks. The No Project Alternative would neither realize the long-term GHG emission reduction benefits associated with implementation of the 2045 CAP nor provide a clear pathway for the County to meet and exceed the statewide 2030 GHG reduction goal identified in SB 32 or meet the 2045 carbon neutrality goal established by AB 1279. Lastly, the No Project Alternative would not achieve any of the Project's Objectives, which makes this alternative undesirable from a policy standpoint and therefore, the Board rejects the No Project Alternative as infeasible.

2. Alternative 1: Carbon Offset Alternative

Facts in Support of Finding:

Under Alternative 1, in addition to implementing the measures and actions called for by the 2045 CAP, the County would reduce GHG emissions by purchasing carbon offsets. Carbon offset projects could increase or protect carbon sequestration, invest in solar or wind projects, improve water or energy efficiency, capture methane at animal farms or landfills, replace high-global warming-potential gas use with a gas that has a lower global warming potential, or implement other measures. To achieve the greatest environmental co-benefits to the County, priority would be given, from highest to lowest, to offsets purchased from local projects (within Los Angeles County), regional projects (from within Southern California), projects within California, projects outside of California but within the Pacific Southwest (within Arizona, Hawaii, Utah, or Nevada), and projects elsewhere in the United States.

Implementation of Alternative 1 would generally result in the same environmental impacts as the Project but would result in greater environmental impacts associated with hazards and hazardous materials as well as utilities and service systems. Implementation of Alternative 1 would facilitate projects that include

wind projects with wind turbines that could result in a safety hazard for people residing or working in the project area due to collision risk, interference with radar or other air navigation tools, and other hazards related to air navigation. Additionally, implementation of this alternative would facilitate projects that would not encourage the reduction of solid waste like those facilitated by the Project, and instead would focus on the purchase of carbon offsets. As such, some of the adverse impacts caused by projects facilitated by Alternative 1, as compared to impacts under the 2045 CAP, would occur outside the County and so would not be subject to the same local thresholds that apply to the Project, such as thresholds established in the County General Plan or by the South Coast Air Quality Management District. Alternative 1 would result in fewer environmental benefits to the County overall because the reductions in air pollutant and GHG emissions could be realized elsewhere in Southern California, the State, or the Pacific Southwest, and because greater environmental impacts could result from wind projects facilitated by the purchase of carbon offsets.

Importantly, Alternative 1 would not provide a clear pathway for the County to meet and exceed the statewide 2030 GHG reduction goal identified in SB 32 or meet the 2045 direct emission reduction target established by AB 1279. This is because CARB's statewide targets are to reduce direct emissions occurring within state boundaries, and do not allow for carbon offsets occurring outside of the state to contribute to these targets (for example, AB 1279 states that it is "the policy of the state... to ensure that by 2045, statewide anthropogenic greenhouse gas emissions are reduced to at least 85% below the 1990 levels"). Only the state's 2045 net zero GHG emissions target appears to allow offsets. Similarly, Alternative 1 would not provide a clear pathway for the County to meet the County's local GHG reduction targets identified in the 2045 CAP. Specifically, the 2045 CAP's GHG reduction targets for 2030, 2035, and 2045 are to reduce direct, in-boundary county emissions to specific levels below 2015 emissions. Carbon offsets would likely not produce emission reductions within unincorporated county boundaries because there likely aren't enough offsets within the County to achieve these GHG targets. As such, Alternative 1 may not achieve Project Objective 2.

Alternative 1 would also likely not achieve Project Objective 5 to allow CEQA streamlining for future development projects because CEQA Guidelines section 15183.5(b)(1)(B) states that GHG reduction plans must "[e]stablish a level, based on substantial evidence, below which the contribution to greenhouse gas emissions *from activities covered by the plan* would not be cumulatively considerable" (emphasis added). Because the 2045 CAP's GHG emission reduction targets apply to GHG emissions associated with activities occurring within unincorporated county boundaries, and the targets would be achieved by reducing GHG emissions "from activities covered by the plan," reducing emissions outside of county boundaries for activities not covered by the plan through the use of carbon offsets would not contribute toward meeting the represent 2045 CAP's GHG emission reduction targets. In addition, CEQA Guidelines section 15183.5(b)(1)(C) states that GHG reduction plans must "[i]dentify and analyze the greenhouse gas emissions resulting from specific actions or categories of actions *anticipated within the geographic area*" (emphasis added) and CEQA Guidelines section 15183.5(b)(1)(D) states that GHG reduction plans must "[s]pecify measures... that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively *achieve the specified emissions level*" (emphasis added). Because carbon offsets would produce GHG emission reductions that occur outside the geographic area of the 2045 CAP (i.e., unincorporated county boundaries), and because the 2045 CAP's GHG emission reduction targets apply to GHG emissions associated with activities occurring within unincorporated county boundaries, carbon offsets would likely not achieve 2045 CAP's GHG emission reduction targets. As such, Alternative 1 is undesirable from a policy standpoint and would also likely conflict with several project objectives.

Alternative 1 is infeasible from a policy standpoint, given the uncertainties with its implementation. The volatile cap and trade market makes it difficult to anticipate the cost of regulatory carbon allowances. The County would have to purchase and retire carbon offsets from the voluntary market, which is not regulated. Prices in the voluntary carbon market vary widely depending on the type, size, and location of the project generating the offset, as well as the protocol or standard under which it was developed. A review of over-the-counter reputable offset retailers, conducted in April 2022, reveals current prices for voluntary offsets ranging from approximately \$15 to \$25 per metric ton of carbon dioxide equivalent (MTCO_{2e}). Based on these prices, the 2022 purchase of 1.25 million MTCO_{2e} could range from \$17 million to \$36 million per year. Funding sources would have to be identified, but theoretically could be sourced from the County General Fund, existing or new development fees, or other sources. However, it is unlikely that other funding sources, such as those from CARB or the U.S. EPA, could be used to finance the purchase of out-of-county and out-of-state carbon offsets, since these funding programs are generally designed to reduce direct, in-boundary emissions within the influence or control of the agency or jurisdiction applying for the funds.

To implement Alternative 1, the County would have to purchase and retire carbon offsets from the unregulated voluntary carbon market on an annual basis to meet the County's annual GHG emission reduction targets, and the prices of voluntary GHG offset credits vary widely such that it is difficult to anticipate the cost of offset purchases. Implementation of Alternative 1 could be more expensive than implementation of the Project because costs would be greater if the cost per MTCO_{2e} for voluntary offsets were greater than the cost per MTCO_{2e} reduced by local CAP measures. Additionally, the County would have to purchase voluntary GHG offset credits perpetually each year to achieve the 2045 CAP's annual GHG emission reduction targets, while most of the 2045 CAP's measures and actions, once implemented, would result in GHG reductions every year in perpetuity. For example, decarbonizing a single building in 2025 would produce annual GHG emission reductions over the entire life of the building (30+ years), but if these reductions were instead achieved through offsets, the County would have to purchase an individual carbon offset credit for each year of that building's operation to achieve the same cumulative annual GHG reductions as that building's decarbonization. The uncertainty of the prices in the unregulated voluntary carbon market contributes to the uncertainty of implementation, making Alternative 1 undesirable from a policy standpoint.

Finding: The EIR, including Chapter 4 of the Recirculated Draft PEIR, contains facts and analysis supporting the Finding, some of which are set forth here. Alternative 1 would have similar but incrementally fewer adverse environmental impacts than the Project because some of the adverse impacts caused by projects facilitated by Alternative 1, as compared to impacts under the 2045 CAP, would occur outside the County and so would not be subject to the same local thresholds that apply to the Project, such as thresholds established in the County General Plan or by the South Coast Air Quality Management District. However, in the long-term, Alternative 1 would result in fewer environmental benefits to the County overall, because the reductions in air pollutant and GHG emissions could be realized elsewhere in Southern California, the State, or the Pacific Southwest and because greater environmental impacts associated with hazards and hazardous materials as well as utilities and service systems could result from wind projects facilitated by the purchase of carbon offsets; this makes Alternative 1 undesirable from a policy standpoint. Alternative 1 is also rejected because the uncertainty of the prices in the unregulated voluntary carbon market makes Alternative 1 undesirable from a policy standpoint, and makes the financial feasibility of Alternative 1 uncertain in the long-term (especially through 2045). Lastly, Alternative 1 is rejected by the Board as undesirable from a policy standpoint on the basis of inconsistency with County goals and policies to meet and exceed the statewide 2030 GHG

reduction goal identified in SB 32 or meet the 2045 carbon neutrality goal established by AB 1279 in the unincorporated areas of the County, Alternative 1 is further rejected as undesirable from a policy standpoint because Alternative 1 would result in greater impacts to hazards and hazardous materials and utilities and service systems than the Project. For the above stated reasons, the Board rejects Alternative 1 as infeasible.

3. Alternative 2: Zero Net Energy Buildings Alternative

Facts in Support of Finding: Zero net energy (ZNE) buildings produce enough renewable energy to meet their own annual energy consumption requirements, thereby reducing the use of nonrenewable energy in the building sector. These buildings achieve ZNE first through high levels of energy efficiency to minimize energy use, then through the addition of on-site renewable power generation and renewable energy storage systems (e.g., batteries). Under Alternative 2, the County would supplement its implementation of the Draft 2045 CAP measures and actions by requiring all new residential and commercial construction in the unincorporated areas to be ZNE by 2025, 50 percent of residential and commercial buildings in the unincorporated areas to be retrofitted to ZNE by 2030, 50 percent of new major renovations of County buildings to be ZNE by 2025, and the energy usage footprint of local government buildings to be 50 percent below 2015 levels by 2030. Further, Alternative 2 would reward projects in the unincorporated areas that voluntarily exceed state and local minimum energy codes by expedited permitting and favorable fee structures.

Energy efficiency measures include building design elements that reduce energy demand such as high-performance building envelopes, air barrier systems, daylighting, sun control and shading design, window selection and glazing, passive solar heating, natural ventilation, and water conservation. Energy use could be managed with efficient equipment and systems, such as energy-efficient lighting; electric lighting controls; high-performing heating, ventilation, and air conditioning; and energy-conversion devices. Once efficiency measures have been incorporated, the remaining energy needs of the building can be met with on-site renewable energy generation and storage. Common on-site electricity generation strategies include photovoltaic solar panels on rooftops or over surface parking, and solar water heating.

This alternative would worsen or increase the Project's significant and unavoidable air quality impacts related to operational criteria pollutant emissions and localized construction-related health risks from toxic air contaminants because the alternative would facilitate additional new construction of ZNE buildings that would cause short-term construction emissions that could exceed the SCAQMD's project-level thresholds and expose additional sensitive receptors to pollutant concentrations from localized emissions near those construction sites. Alternative 2 would also result in worse significant and unavoidable localized noise impacts than the Project. Construction of ZNE buildings facilitated by Alternative 2 would result in short-term construction noise and create new stationary noise sources that could exceed noise levels in excess of standards. Additionally, such construction of ZNE buildings would result in significant and unavoidable groundborne vibration impacts that exceed standards. As such, implementation of Alternative 2 would result in significant and unavoidable noise and vibration impacts (as well as result in cumulatively considerable noise and vibration impacts) at a greater level than the Project. Implementation of Alternative 2 would also result in greater transportation impacts compared with the Project, as construction of ZNE buildings would increase the amount of heavy-duty construction vehicles on roadways, which could substantially increase hazards due to incompatible uses with normal vehicles on roadways. Alternative 2 would create safety and mobility concerns for motorists, transit operators, bicyclists, and/or pedestrians during construction activities and result in a greater impact than the Project. This alternative would also contribute to a greater impact on utilities and service systems because

projects facilitated by Alternative 2 would not encourage the reduction of solid waste like those facilitated by the Project, and instead would focus on water and energy efficiencies.

Finding: The EIR, including Chapter 4 of the Recirculated Draft PEIR, contains facts and analysis supporting the Finding, some of which are set forth here. Alternative 2 would cause similar but incrementally greater adverse environmental impacts than the Project because the additional construction of new and retrofitted ZNE buildings would increase impacts for air quality, noise and vibration, transportation, and utilities and service systems. Alternative 2 is rejected by the Board as undesirable from a policy standpoint and infeasible on the basis of environmental considerations described above, as Alternative 2 would result in greater adverse environmental impacts than the Project on air quality, noise and vibration, transportation, and utilities and service systems. For the above stated reasons, the Board rejected Alternative 2 as infeasible.

4. Alternative 3: Lower Targets Alternative

Facts in Support of Finding: Under Alternative 3, the GHG emissions reduction targets of the 2045 CAP would be lower than those contained in the 2045 CAP. These targets would represent the minimum targets needed to “align” with California’s codified statewide targets for 2030 and 2045. Specifically, the targets under Alternative 3 would be:

- By 2030, reduce emissions to 31 percent below 2015 levels (equivalent to a 40 percent reduction below 1990 levels).
- By 2035, maintain the same level of GHG reductions achieved in 2030.
- By 2045, reduce emissions to 83 percent below 2015 levels (equivalent to an 85 percent reduction below 1990 levels).

Because Alternative 3 has lower GHG emissions reduction targets for years 2030 and 2035 compared to the Project, implementation of Alternative 3 would facilitate fewer projects through 2030 and 2035 to achieve the lower targets. Additionally, performance objectives for the measures and actions would be reduced compared to the Project. This is because the County would implement fewer 2045 CAP strategies, measures, and actions to reduce GHG emissions to achieve the less aggressive reduction targets. For example, Measure T6, Increase ZEV Market Share, has a 2030 performance goal of a 30 percent ZEV fleetwide percentage for light-duty vehicles in the County; under Alternative 3, this performance objective would likely be reduced to a 10 percent ZEV market share (or lower). Because Alternative 3 would facilitate fewer new projects through 2030 and 2035, it would result in less construction of new projects having physical environmental impacts compared with that anticipated under the Project. Thus, implementation of Alternative 3 would result in less adverse physical environmental impacts on the project area and its surrounding environment compared to the impacts associated with implementation of the 2045 CAP strategies, measures, and actions needed to meet the Project’s higher GHG emissions reduction targets.

While Alternative 3’s reduced performance objectives would facilitate fewer projects in the short-term for years 2030 through 2035 compared to the Project, it would likely facilitate the same number of projects through 2045, resulting in the same environmental impacts through 2045 compared to the Project. However, implementation of Alternative 3 would more likely facilitate a greater number of projects in the 2035 to 2045 period than the Project. Consequently, Alternative 3 would delay the realization of its environmental impacts but would not lessen or eliminate these adverse environmental impacts entirely and would likely worsen environmental impacts during the 2035 to 2045 timeframe compared to the Project.

Regarding specific environmental impacts, Alternative 3 would result in similar but lesser impacts than the Project on the following resource areas: aesthetics, agriculture and forestry resources, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, transportation, and wildfire. However, Alternative 3 would result in greater impacts than the Project for energy, GHG emissions, and air quality. Alternative 3 would also likely result in greater impacts for utilities and service systems.

Alternative 3 would result in greater energy impacts than the Project because Alternative 3 would facilitate fewer projects that would reduce Countywide energy use compared to the Project, resulting in greater energy consumption than the Project. Because Alternative 3 would facilitate fewer projects that would increase renewable energy use compared to the Project, implementation of Alternative 3 would result in much less renewable energy use and much greater non-renewable and fossil energy use as compared to the Project.

Alternative 3 would result in greater GHG emissions impacts because Alternative 3 would not reduce Countywide GHG emissions as much as the Project through 2030 and 2035, producing much greater GHG emissions than the Project. This much higher level of GHG emissions associated with Alternative 3 would likely cause the alternative to conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, including the CARB 2022 Scoping Plan, SB 32, AB 1279, the Southern California Association of Governments 2020–2045 RTP/SCS, the OurCounty Sustainability Plan, the CALGreen Code, and the Los Angeles County Green Building Ordinance.

Implementation of Alternative 3 would result in greater air quality impacts than the Project for operational impacts because Alternative 3 would facilitate fewer projects through 2030 and 2035, resulting in much greater emissions of criteria pollutants and TACs throughout the county for these years as compared to the Project, which would result in greater human health risks than the Project. This greater level of criteria pollutant and TAC emissions associated with implementation of Alternative 3 could result in an increase in the frequency or severity of existing air quality violations, cause or contribute to new violations, or delay timely attainment of the ambient air quality standards or emissions reductions in the SCAQMD 2016 AQMP or the AVAQMD 2017 Ozone Attainment Plan. Alternative 3 would result in a greater impact associated with exposure of sensitive receptors to operational TAC emissions because Alternative 3 would result in much greater operational TAC emissions than the Project.

Finally, Alternative 3 could result in greater utilities and service systems impacts because projects facilitated by Alternative 3 would lead to increased use of recycled and gray water systems compared to the Project, increasing the amount of wastewater requiring treatment by wastewater treatment providers, requiring the development of new water recycling and direct potable reuse facilities. Alternative 3 would also not encourage the reduction of solid waste to the same extent as those facilitated by the Project, resulting in greater solid waste generation and greater need for solid waste processing and disposal.

Importantly, Alternative 3 would not meet Project Objectives 1, 2, and 5. Alternative 3 would not meet Project Objective 1 (identify detailed programs, actions, and performance goals to achieve the climate policies of the General Plan) because implementation would result in an inconsistency with the County's General Plan Policy AQ 3.9 ("Ensure the availability of zero-carbon electricity to serve unincorporated Los Angeles County."). As stated above, Alternative 3 has lower GHG emissions reduction targets for years 2030 and 2035 compared to the Project such that Alternative 3's performance objectives for CAP strategies, measures, and actions would be lower than the Project's performance objectives. For example, Alternative 3 would reduce the performance objectives for 2045 CAP Measure ES2, *Procure*

Zero Carbon Electricity, which is to supply the County's power demand with zero-carbon electricity and is critical to achieving significant GHG emissions reductions. If the performance goals of Measure ES2 were reduced, then Alternative 3 would conflict General Plan Policy AQ 3.9 because Measure ES2 would not require zero-carbon electricity to serve the County. Measure ES2 is one of the five core measures necessary to meet the Project's targets for 2030 and 2035. Reducing Measure ES2's performance objectives would inhibit the County's ability to exceed the 2030 target by more than 160,000 MTCO_{2e} and the 2035 target by more than 230,000 MTCO_{2e}, which would occur under implementation of the Project.

Alternative 3 would not meet Project Objective 2 (identify GHG emissions reduction targets tailored to the unincorporated County that closely align with state and County climate goals) because implementation of Alternative 3 does not align with County or state goals. The 2030 target of 40 percent below 1990 levels is far off the emissions reduction trajectory needed to achieve emissions of 83 percent below 2015 levels by 2045, which means that Alternative 3 does not align with either County or state goals (Recirculated Draft PEIR, pp. 4.18 to 4.19). Specifically, CARB projects that a 48 percent reduction in 1990 emissions levels by 2030 is needed: "The Scoping Plan Scenario achieves the AB 1279 target of 85 percent below 1990 levels by 2045 and identifies a need to accelerate the 2030 target to 48 percent below 1990 levels" (CARB 2022b). This is far beyond the 40 percent reduction required by SB 32. The Project's 2030 target of 40 percent below 2005 levels is equivalent to 48 percent below 1990 levels, which aligns the Project with state goals and the 2022 Scoping Plan, which Alternative 3 would not do. Additionally, Alternative 3 does not align with the statewide targets codified in AB 1279, which establishes the state policy to achieve net zero GHG emissions as soon as possible but no later than 2045 and to achieve and maintain net negative GHG emissions thereafter. AB 1279 also mandates that by 2045, statewide anthropogenic GHG emissions are to be reduced at least 85 percent below 1990 levels.

Further, Alternative 3 would not align with the state's GHG emissions reduction goals because it would exclude several recommended priority local GHG emissions reduction strategies that the 2022 Scoping Plan recommends be incorporated "to the extent appropriate to ensure alignment with State climate goals." Such recommended strategies that Alternative 3 would not incorporate includes, for example: creating a jurisdiction-specific ZEV ecosystem to support deployment of ZEVs statewide (Measures T6, T7, T8, and T9); increasing access to public transit by increasing density of development near transit (Measure T1); improving transit service by increasing service frequency, creating bus priority lanes, reducing or eliminating fares, and incorporating microtransit (Measure T4); adopting all-electric new construction reach codes for residential and commercial uses (Measure E2); facilitating deployment of renewable energy production and distribution and energy storage (Measures ES2, ES3, and ES4); and deploying renewable energy production and energy storage directly in new public projects and on existing public facilities (Measure ES3). Alternative 3 would not need these strategies to achieve its reduced targets for 2030 and 2035, thereby conflicting with Project Objective 2.

Alternative 3 would not meet Project Objective 5 (demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects via the Checklist) because Alternative 3's lower targets would not meet CEQA standards for a level of GHG emissions that would not be cumulatively considerable for future environmental review of projects. CEQA requires that thresholds of significance are based on substantial evidence. (CEQA Guidelines, § 15064.7.) Further, CEQA permits lead agencies to develop thresholds of significance for GHG emissions which "consider a project's consistency with the State's long-term climate goals or strategies." (CEQA Guidelines, § 15064.4(b)(3).) The Project's GHG reduction targets are more stringent than or align with statewide targets (Recirculated

Draft PEIR, p. 2-12). However, as discussed above, Alternative 3 would not meet Project Objective 2 because implementation of Alternative 3 does not align with state goals. Consequently, Alternative 3's targets do not demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects, thereby conflicting with Project Objective 5.

Finding: The EIR, including Chapter 4 of the Recirculated Draft PEIR, contains facts and analysis supporting the Finding, some of which are set forth here. Under Alternative 3, the County would establish lower targets than included in the Project, i.e., targets representing the minimum needed to “align” with California’s codified statewide targets for 2030 and 2045. The Board rejects Alternative 3 as undesirable from a policy standpoint and infeasible on the basis of environmental considerations, because Alternative 3 would result in greater adverse environmental impacts associated with energy, GHG, air quality, and utilities and service systems. Alternative 3 would not meet Project Objectives 1, 2, and 5, and the Board finds that Alternative 3’s failure to meet these Project Objectives makes this alternative undesirable from a policy standpoint and rejects Alternative 3 as infeasible. Specifically, Alternative 3 would not align with County and state GHG emissions reduction goals, including the County’s General Plan Policy AQ 3.9, AB 1279, or CARB’s 2022 Scoping Plan. This failure substantially impairs the ability of Alternative 3 to achieve the basic Project Objectives, including Objectives 1, 2, and 5. For the above stated reasons, the Board rejected Alternative 3 as infeasible.

5. Environmentally Superior Alternative

Facts in Support of Finding: CEQA requires an EIR to identify the “environmentally superior alternative” if the no project alternative is environmentally superior. (CEQA Guidelines, § 15126.6 (e)(2).)

The Recirculated Draft PEIR determined that the No Project Alternative is the environmentally superior alternative. The No Project Alternative would not implement the GHG emissions reduction strategies, measures, or actions identified by the Project, which would result in fewer facilitated projects compared with the 2045 CAP and thus, result in fewer adverse environmental impacts in comparison to the impacts associated with implementation of the 2045 CAP. Because the No Project Alternative would avoid impacts potentially associated with facilitated projects in comparison to the impacts associated with implementation of the 2045 CAP, the No Project Alternative is considered the environmentally superior alternative. However, in the long-term, the No Project Alternative would result in substantially fewer environmental benefits to the County overall for several reasons. First, air pollutant (criteria pollutants and toxic air contaminants) and GHG emissions would be much higher under the No Project Alternative than air pollutant and GHG emissions under all other alternatives and the Project such that impacts to human health would be higher. This is because the Project would substantially reduce countywide GHG emissions, and many of these emission reductions would produce parallel reductions in criteria pollutants and toxic air contaminants primarily by reducing fuel combustion. The No Project Alternative would result in greater human health risks associated with exposure to toxic air contaminants than all other alternatives and the Project, because all other alternatives and the Project would substantially reduce TAC emissions in the County. The No Project Alternative would neither realize the long-term GHG emission reduction benefits associated with implementation of the 2045 CAP (and all the co-benefits that would also occur, such as reduced criteria pollutant and TAC emissions), nor provide a clear pathway for the County to meet and exceed the statewide 2030 GHG reduction goal identified in SB 32 or meet and exceed the 2045 direct emission reduction target and carbon neutrality goal established by AB 1279. Significantly, the No Project Alternative would not meet any of the Project Objectives and the County is

not obligated to select the environmentally superior alternative for implementation if it would not accomplish the basic Project Objectives. (CEQA Guidelines, § 15126.6.)

CEQA Guidelines section 15126.6(e)(2) states “[i]f the environmentally superior alternative is the ‘no project’ alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.” Of Alternatives 1-3, Alternative 3 would reduce adverse environmental impacts compared to the Project to the greatest extent because it would facilitate fewer new projects compared with that anticipated under the 2045 CAP.

Because Alternative 3 has lower GHG emissions reduction targets for years 2030 and 2035 compared to the Project, implementation of Alternative 3 would facilitate fewer new projects through 2030 and 2035 to achieve the lower targets and performance objectives for the measures and actions compared to the Project. Thus, the County would implement fewer 2045 CAP strategies, measures, and actions to reduce GHG emissions to achieve the less aggressive reduction targets such that Alternative 3 would result in less short-term adverse physical environmental impacts compared to the impacts associated with implementation of the 2045 CAP strategies, measures, and actions needed to meet the Project’s higher GHG emissions reduction targets.

However, Alternative 3 would likely only delay these impacts as compared to the Project rather than lessen or eliminate these impacts entirely because Alternative 3 has lower GHG emissions reduction targets for years 2030 and 2035 compared to the Project (it has the same targets for the year 2045). Alternative 3 would likely facilitate the same number of projects through 2045, resulting in the same environmental impacts through 2045 compared to the Project. However, Alternative 3 would more likely facilitate a greater number of projects in the 2035 to 2045 period than the Project, worsening environmental impacts during the 2035 to 2045 timeframe as compared to the Project. Consequently, Alternative 3 would delay the realization of its environmental impacts but would not lessen or eliminate these adverse environmental impacts entirely and could increase or create certain environmental impacts as compared to the Project.

Alternative 3 would result in similar but lesser impacts on the following resource areas: aesthetics, agriculture and forestry resources, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, transportation, and wildfire. However, Alternative 3 would also result in greater impacts than the Project in resource areas including energy, GHG emissions, air quality, and utilities and service systems. Alternative 3 would result in greater energy impacts than the Project because Alternative 3 would facilitate fewer projects that would reduce Countywide energy use compared to the Project, resulting in greater energy consumption than the Project. Alternative 3 would result in greater GHG emissions impacts than the Project because Alternative 3 would not reduce Countywide GHG emissions as compared to the Project through 2030 and 2035, producing much greater GHG emissions than the Project. Additionally, implementation of Alternative 3 would result in greater air quality impacts than the Project for operational impacts because Alternative 3 would facilitate fewer projects through 2030 and 2035, resulting in much greater emissions of criteria pollutants and TACs throughout the county for these years, resulting in greater human health risks as compared to the Project. Finally, Alternative 3 would result in greater utilities and service systems because projects facilitated by Alternative 3 would lead to increased use of recycled and gray water systems compared to the Project, increasing the amount of wastewater requiring treatment by wastewater treatment providers, and thus, would require the development of new water recycling and direct potable reuse facilities.

Importantly, as discussed above, Alternative 3 is unable to meet Project Objectives 1, 2, and 5. Alternative 3 would not meet Project Objective 1 (identify detailed programs, actions, and performance goals to achieve the climate policies of the General Plan) because implementation would result in an inconsistency with the County's General Plan Policy AQ 3.9 ("Ensure the availability of zero-carbon electricity to serve unincorporated Los Angeles County."). Alternative 3 would not meet Project Objective 2 (identify GHG emissions reduction targets tailored to the unincorporated County that closely align with state and County climate goals) because implementation of Alternative 3 does not align with County or state goals, including AB 1279, which establishes the state policy to achieve net zero GHG emissions as soon as possible but no later than 2045 and to achieve and maintain net negative GHG emissions thereafter. AB 1279 also mandates that by 2045, statewide anthropogenic GHG emissions are to be reduced at least 85 percent below 1990 levels. Alternative 3 would also not meet Project Objective 5 (demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects via the Checklist) because Alternative 3's lower targets would not meet CEQA standards for a level of GHG emissions that would not be cumulatively considerable for future environmental review of projects, given that Alternative 3's targets do not align with state goals and consistency with state goals is the criteria for whether the targets represent a level of GHG emissions that would have a less than cumulatively considerable GHG impact for future environmental review projects.

Alternative 3 would likely exclude several recommended priority local GHG emissions reduction strategies that the 2022 Scoping Plan recommends be incorporated "to the extent appropriate to ensure alignment with State climate goals." Alternative 3 would likely not align with the state's GHG emissions reduction goals if it excluded 2022 Scoping Plan priority local GHG emissions reduction strategies, making Alternative 3 inconsistent with Project Objectives 1, 2, and 5.

Finding: Based on the analysis for each alternative above, Alternative 3 is considered the environmentally superior alternative to the Project in relation to some short-term environmental impacts because Alternative 3's reduced performance objectives would facilitate fewer projects for years 2030 through 2035. However, Alternative 3 would likely facilitate the same number of projects through 2045, resulting in the same environmental impacts through 2045 compared to the Project, and would more likely facilitate a greater number of projects in the 2035 to 2045 period than the Project. Consequently, Alternative 3 would delay the realization of its environmental impacts but would not lessen or eliminate these adverse environmental impacts and would likely worsen environmental impacts during the 2035 to 2045 timeframe compared to the Project. The Board rejects Alternative 3, the Environmentally Superior Alternative, as undesirable from a policy standpoint and infeasible on the basis of environmental considerations, as Alternative 3 would result in greater adverse environmental impacts associated with energy, GHG emissions, air quality, and utilities and service systems. Alternative 3 would not meet Project Objectives 1, 2, and 5 and the Board finds that Alternative 3's failure to meet these Project Objectives makes this alternative undesirable from a policy standpoint and rejects Alternative 3 as infeasible. Specifically, Alternative 3 would not align with County and state GHG emissions reduction goals, including the County's General Plan Policy AQ 3.9, AB 1279, or CARB's 2022 Scoping Plan. This failure substantially impairs the ability of Alternative 3 to achieve the basic Project Objectives, including Objectives 1, 2, and 5.

VIII. FINDINGS CONCERNING CERTAIN RECOMMENDED MITIGATION MEASURES NOT INCLUDED IN MMRP

During the PEIR's public review process, commenters recommended certain mitigation measures. With respect to those specific mitigation measures suggested in public comments, which were not incorporated into the Final PEIR and are not included in the Mitigation Monitoring and Reporting Plan (MMRP), the Board finds as follows:

Programmatic mitigation measures for utility-scale solar projects to address dust control, water supply, wildlife impacts, heat islands, and aesthetic impacts. To reduce project impacts, one commenter generally recommended implementation of unspecified programmatic mitigation measures to address potential impacts from utility-scale solar projects (Recirculated Draft PEIR Comment O2-17 and O2-18). The PEIR identified reasonable, feasible programmatic mitigation measures to avoid or reduce significant environmental impacts, including cumulative environmental impacts, of future projects implementing 2045 CAP measures and actions, including utility-scale solar projects. The Board hereby rejects the proposed mitigation on the basis that other mitigation has been identified in the PEIR and included in the MMRP to reduce impacts to less than significant levels, because the proposed, unspecified measure would not be effective in mitigating a significant Project impact or provide substantial additional mitigation beyond the measures identified in the PEIR and included in the MMRP, and for the reasons set forth in Response to Comment O2-17 and O2-18.

Programmatic mitigation measures for utility-scale energy storage projects to address potential impacts. To reduce project impacts, one commenter generally recommended implementation of unspecified programmatic mitigation measures to address potential impacts from utility-scale energy storage projects (Recirculated Draft PEIR Comment O2-24 and O2-25). The PEIR identified reasonable, feasible programmatic mitigation measures to avoid or reduce significant environmental impacts, including cumulative environmental impacts, of future projects implementing 2045 CAP measures and actions, including utility-scale battery projects. The Board hereby rejects the proposed, unspecified mitigation on the basis that other mitigation has been identified in the PEIR and included in the MMRP to reduce impacts to less than significant levels, because the proposed, unspecified measure would not be effective in mitigating a significant Project impact or provide substantial additional mitigation beyond the measures identified in the PEIR and included in the MMRP, and for the reasons set forth in Response to Comment O2-24 and O2-25.

Limiting application of Action ES3.6 (streamlining and prioritizing permitting for solar and battery storage projects) to only distributed battery storage projects. To reduce Project impacts on unidentified "risks", one commenter suggested a mitigation measure limiting application of 2045 CAP Action ES3.6 to only distributed battery storage projects "because utility scale storage projects pose substantial risks...." (See Recirculated Draft PEIR Comment O2-26.) The PEIR identified mitigation measures to reduce hazards and hazardous materials impacts to a less than significant level. The Board hereby rejects the proposed mitigation on the basis that other mitigation has been identified in the PEIR and included in the MMRP to reduce this impact to a less than significant level, because the proposed measure would not be effective in mitigating a significant Project impact or provide substantial additional mitigation beyond the measures identified in the PEIR and included in the MMRP, and for the reasons set forth in Response to Comment O2-26.

Locating utility scale storage projects outside of Very High Fire Hazard Severity Zones and remote areas where there are no residents. To reduce Project impacts, one commenter recommended mitigation for

wildfire risk posed by utility scale storage facilities that might be caused by the projects facilitating 2045 CAP strategies, measures, and actions. (See Recirculated Draft PEIR Comment O2-27.) The EIR identified mitigation measures to reduce impacts on wildfire to a less than significant level. The Board hereby rejects the proposed mitigation on the basis that other mitigation has been identified in the PEIR and included in the MMRP to reduce this impact to a less than significant level, because the proposed measure would not be effective in mitigating a significant Project impact or provide substantial additional mitigation beyond the measures identified in the PEIR and included in the MMRP, and for the reasons set forth in Response to Comment O2-27.

IX. ADDITIONAL ENVIRONMENTAL FINDINGS

a. Findings Regarding EIR Recirculation

i. Legal Requirements Regarding Recirculation

A lead agency is required to recirculate a Draft EIR for additional public review when “significant” new information is added to the EIR after the initial public review, according to CEQA Guidelines section 15088.5(a). New information added to an EIR is not “significant” unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment on a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such effect, including a feasible project alternative that the project proponents have declined to implement. “Significant new information” requiring recirculation includes, for example, a disclosure showing that:

- A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
- A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
- A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project but the project’s proponents decline to adopt it.
- The Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

Recirculation is not required where the new information added to the EIR merely clarifies, amplifies, or makes insignificant modifications to an adequate EIR, according to CEQA Guidelines section 15088.5(b).

ii. Recirculated Draft PEIR Comments, Responses, and Revisions Do Not Trigger Draft PEIR Recirculation

No significant new information has been added to the EIR in Recirculated Draft PEIR comments, responses to Recirculated Draft PEIR comments, and Recirculated Draft PEIR revisions made in the Final PEIR that would trigger recirculation of the Recirculated Draft PEIR under CEQA Guidelines section 15088.5(a) because:

- They did not disclose a new significant environmental impact that would result from the Project or from a new mitigation measure proposed to be implemented.
- They did not disclose a substantial increase in the severity of an environmental impact that would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
- They did not disclose a feasible Project alternative or mitigation measure considerably different from others previously analyzed that would clearly lessen the adverse environmental impacts of the Project.

- They did not otherwise result in major revisions to the Recirculated Draft PEIR that precluded meaningful public review and comment on a substantial, adverse project impact environment, a feasible mitigation measure, or an alternative not proposed or implemented.

Instead, only minor changes were made to the Recirculated Draft PEIR in response to public comments and to amplify, clarify, and update certain information. The changes and new information provided in the Final PEIR include:

- Clarifications to the Recirculated Draft PEIR analysis in response to comments received;
- Minor revisions to mitigation measures in response to comments received; and
- Corrections of typographical and editorial errors.

This new information does not include identification of new or substantially increased significant impacts associated with the Project, alternatives, or mitigation measures that are considerably different from those previously analyzed that would clearly lessen the Project's significant impacts.

The Board finds that none of the revisions to the Recirculated Draft PEIR made by, or discussion included in, the Final PEIR involves "significant new information" triggering recirculation because the changes do not result in any new significant environmental effects, substantial increase in the severity of previously identified significant effects, or feasible project alternatives that would clearly lessen the environmental effects of the project. The Board further finds that incorporating the information and corrections does not deprive the public of a meaningful opportunity to comment on the Project or its effects, and that no information has been added to the EIR that would warrant recirculation pursuant to Public Resources Code section 21092.1 or CEQA Guidelines section 15088.5. This finding is based upon all the information presented in the Final PEIR and the Record of Proceedings.

b. Findings Regarding Disagreement Among Experts

It is possible that during the public review process experts may disagree with assumptions, analysis, conclusions, and other materials presented in the Recirculated Draft PEIR. The Final PEIR has summarized the conflicting opinions, where such information is known in advance, including response to comment O14-21. All such information will be considered by the decision-makers during the public review process. However, to be adequate under CEQA, the Recirculated Draft PEIR need not resolve all such disagreements.

In rendering a decision on a project where there is a disagreement among experts, the decision makers may give more weight to the views of one expert than to those of another, and need not resolve a dispute among experts. Disagreement among experts does not make an EIR inadequate. (CEQA Guidelines, § 15151).

The Board has considered the comments and objections received, but need not follow said comments or objections. The Board makes its decisions based on the evidence that is contained within the administrative record provided by the Final PEIR, its supporting information and analysis, and the associated public review process. The Board finds that the Final PEIR accurately reflects the 2045 CAP's impacts on environmental resources and is supported by the County's experts.

c. Section 21082.1(c)(3) Findings

Pursuant to Public Resources Code section 21082.1(c)(3), the Board hereby finds that the Final PEIR reflects that independent judgment of the lead agency.

X. MITIGATION MONITORING AND REPORTING PLAN

The Board hereby finds that a Mitigation Monitoring and Reporting Program has been prepared for the EIR and has been adopted concurrently with these Findings. (Pub. Resources Code, § 21081.6(a)(1).) The County will use the MMRP to track implementation of EIR mitigation measures adopted in these Findings. The County will also monitor the County's implementation of 2045 CAP policies relied upon to reduce environmental impacts.

STATEMENT OF OVERRIDING CONSIDERATIONS
CEQA Guidelines Section 15093
For:
LOS ANGELES COUNTY 2045 CLIMATE ACTION PLAN
Final Program Environmental Impact Report SCH No. 2021120568

Lead Agency:
County of Los Angeles Department of Regional Planning

Pursuant to Public Resources Code section 21081(b) and the California Environmental Quality Act (CEQA) Guidelines section 15093(a) and (b), the County is required to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the project. For a project that has significant impacts that cannot feasibly be avoided or substantially lessened, a public agency, after adopting proper findings, may nevertheless approve the project if the agency first adopts a Statement of Overriding Considerations setting forth the specific reasons why the agency found that the project's "benefits" rendered "acceptable" its "unavoidable adverse environmental effects." (CEQA Guidelines, §§ 15093, 15043(b); Pub. Resources Code, § 21081(b).)

The Los Angeles County 2045 Climate Action Plan (2045 CAP, or Project) will result in environmental effects, which, although mitigated to the extent feasible by the implementation of mitigation measures required for the Project, will remain significant and unavoidable, as discussed in the Final Program Environmental Impact Report (PEIR) and CEQA Findings of Fact. These impacts are summarized below and constitute those impacts for which this Statement of Overriding Considerations is made. The significant and unavoidable impacts of the Project are as follows:

- Aesthetics (Impacts 3.2-1, 3.2-2, 3.2-3, 3.2-4, 3.2-6, 3.2-7, 3.2-8, 3.2-9)
- Agriculture and Forestry (Impacts 3.3-1, 3.3-2, 3.3-5, 3.3-7, 3.3-8, 3.3-11)
- Air Quality (Impacts 3.4-1, 3.4-2, 3.4-3a, 3.4-5, 3.4-6, 3.4-7 [local Air Pollutant and TAC emissions])
- Biological Resources (Impacts 3.5-2, 3.5-3, 3.5-5, 3.5-7, 3.5-8, 3.5-10, 3.5-11)
- Noise and Vibration (All impacts)
- Utilities and Service Systems (Impact 3.17-1, 3.17-3, 3.17-5, 3.17-7)

Finding:

The County of Los Angeles Board of Supervisors (Board) finds and determines in approving the Project that the Final PEIR has considered the identified means of lessening or avoiding the Project's significant effects and that to the extent any significant direct or indirect environmental effects, including cumulative project impacts, remain unavoidable or not mitigated to below a level of significance after mitigation, such impacts are at an acceptable level in light of the social, legal, economic, environmental, technological and other project benefits discussed below, and such benefits override, outweigh, and make "acceptable" any such remaining environmental impacts of the project. (CEQA Guidelines, § 15092(b).)

The following benefits and considerations, taken together or individually, outweigh such significant and unavoidable adverse environmental impacts. All of these benefits and considerations are based on the facts set forth in the Findings, the Final PEIR (including, without limitation, the response to comments and appendices and attachments thereto), and the record of proceedings for the Project. The Board determines that the evidence in the record constitutes substantial evidence to support the determinations made in this Statement of Overriding Considerations, that the facts stated in this document and in the Findings are supported by substantial evidence in the record, including testimony received at the public hearing, the staff presentations, staff reports and all materials in the project files. The Board also determines that to the extent other evidence was presented that is contrary to the determinations made herein or in the Findings, such evidence was nevertheless considered, weighed and determined to be either lacking in credibility or insufficient in weight to detract from the determinations made herein or in the Findings such that the Board reached these determinations after due consideration of all evidence presented to it. Each of these benefits and considerations is a separate and independent basis that justifies approval of the Project, so that if a court were to set aside the determination that any particular benefit or consideration will occur and justifies project approval, this Board determines that it would stand by its determination that the remaining benefit(s) or consideration(s) is or are sufficient to warrant project approval.

Facts in Support of Statement of Overriding Considerations:

In determining whether to approve the 2045 CAP, the County has weighed the economic, legal, social, technological, environmental, and other benefits of the Project against its unavoidable significant environmental impacts. The County finds that the adoption and implementation of the 2045 CAP would have substantial overriding benefits, supported by substantial evidence in the PEIR and elsewhere in the administrative record, warranting approval of the Project and the Board of Supervisors determines that the adverse environmental impacts of the Project are “acceptable” if any one of these benefits will be realized. The Project will provide benefits to Los Angeles County and the region as follows:

1. Improves Regional Air Quality

Degraded air quality can aggravate a wide range of health problems, including asthma and other debilitating and costly respiratory and cardiovascular diseases. The Project would improve air quality in the region, which in turn reduces these health impacts related to air quality. The Project also offers many co-benefits to public health, including reducing chronic disease, lowering obesity levels, reducing respiratory diseases, and improving mental health.

2. Increases Community Resiliency

The Project facilitates community resiliency by reducing the impacts of climate change such as extreme heat, drought, wildfire, pollution, extreme storms and wind, invasive species, and vector-borne illnesses.

3. Promotes Green Jobs

The Project facilitates the development of a wide range of green jobs and provides meaningful employment opportunities across job sectors.

4. Lowers Energy Costs

The Project promotes lower energy and transportation costs by encouraging the use of cost-efficient renewable resources.

5. Fights Drought

The Project promotes water conservation which lessens the dependence on imported water sources, which is especially beneficial economically during drought years.

6. Improves Active Transportation

With an emphasis on active transportation and reducing vehicle emissions, the Project promotes safer walking and cycling throughout the region.

7. Improves CEQA Streamlining

Per section 15183.5 of the CEQA Guidelines, this Project provides CEQA streamlining benefits for future development projects. This simplifies the GHG emissions analyses necessary to comply with CEQA in the future.

8. Achieves Statewide Climate Goals

The Project helps the County meet and/or exceed Statewide climate goals.

9. Encourages Green Investment

The Project positions the economy for growth by encouraging green investment and infrastructure spending. Additionally, the Project improves the opportunity for access to statewide climate grants and other funding sources.

10. Promotes Environmental and Social Justice

The Project promotes environmental and social justice by focusing efforts and improvements within disadvantaged communities through infrastructure investment, creation of greenspaces, active and accessible transportation, and building decarbonization.

Conclusion

CEQA requires a public agency to balance the benefits of a proposed project against its significant and unavoidable adverse impacts in determining whether to approve the project. As discussed more fully above, the proposed Project would result in significant and unavoidable project-level and/or cumulative impacts to on aesthetics, agricultural and forestry resources, air quality, biological resources, noise and vibration, and utilities and service systems, which, although mitigated to the extent feasible by the implementation of mitigation measures required for the Project, will remain unavoidable significant adverse impacts. This Board of Supervisors finds that such impacts are at an acceptable level in light of each of the Project benefits described above, which make “acceptable” any significant environmental impacts of the Project.

MITIGATION MONITORING AND REPORTING PROGRAM

The California Environmental Quality Act (CEQA) requires a Mitigation Monitoring and Reporting Program (MMRP) for projects where mitigation measures are a condition of project approval and development. (Pub. Resources Code, § 21081.6.) The County of Los Angeles (County) has prepared the Recirculated Draft Programmatic Environmental Impact Report (Recirculated Draft PEIR) to address the environmental impacts of the Revised Draft 2045 Climate Action Plan (2045 CAP or Project) and where appropriate, the Recirculated Draft PEIR recommends mitigation measures that would avoid or substantially lessen the significant environmental impacts associated with the Project.

This MMRP has been developed for the Project in compliance with Public Resources Code section 21081.6 and CEQA Guidelines section 15097. The mitigation measures in Table 1 are coded by alphanumeric identification consistent with the Recirculated Draft PEIR. The following items are identified for each mitigation measure:

- **Mitigation Method.** This section of the MMRP lists how the mitigation measure would be implemented. The numbering in this column corresponds to the project stage numbers listed in the Timing of Implementation column.
- **Timing of Implementation.** This section of the MMRP lists the stage of the project during which the mitigation measure would be implemented and during the stage that the monitoring and reporting would be conducted.
- **Implementation Responsibility.** This section of the MMRP indicates who is responsible for implementing the mitigation measure (i.e., the “implementing party”).
- **Monitoring and Reporting Agency.** This section lists the agency that is responsible for ensuring that the mitigation measure is implemented and which agency will receive reports on mitigation implementation.
- **Verification of Compliance.** This section of the MMRP provides a location for the implementing party and/or monitoring and reporting agency to make notes and to record their initials and the compliance date for each mitigation measure.

The County must adopt this MMRP, or an equally effective program, if it approves the Project with the mitigation measures that were adopted or made conditions of Project approval

**TABLE 1
2045 CAP MITIGATION MONITORING AND REPORTING PROGRAM**

Mitigation Measure	Mitigation Method	Timing of Implementation	Implementation Responsibility	Monitoring and Reporting Agency	Verification of Compliance		
					Initials	Date	Remarks
Aesthetics							
<p>Mitigation Measure 3.2-1: Alternative Design. Projects facilitated by the 2045 CAP that would obstruct views from publicly-accessible vantage points as defined in this analysis (such as from a vista point or a regional riding, hiking, or multiuse trail) shall identify and protect public views and significant landscape features or landforms visible from such views, and shall implement project-specific mitigation as applicable. If it is determined that a project would obstruct scenic views, the County shall consider alternative designs that seek to avoid and/or minimize these impacts. Project-specific design measures may include reduction in height of improvements or width of improvements to reduce obstruction of views or other adverse visual effects, or relocation of improvements to reduce obstruction of views. The County shall consider taking the following (or equivalent) actions: i) Require that the scale and massing of new development provide appropriate transitions in structure height and bulk that are sensitive to the physical and visual character of the affected area; ii) ensure structure heights are stepped back to maintain appropriate transitions in scale and to protect scenic views; and iii) avoid siting electric towers, solar power facilities, wind power facilities, communication transmission facilities and/or above ground lines where they could obstruct views from public vantage points, such as a regional riding, hiking, or multiuse trail, along scenic roadways and routes, or scenic vista points.</p>	<p>1-2) Review of project plans and specifications to ensure project includes specific design measures to protect public views.</p>	<p>1) During project-specific environmental review. 2) Prior to approval of future projects construction. 3) Monitoring and reporting conducted during project review and at time of permit approval.</p>	<p>Applicant/County of Los Angeles</p>	<p>County of Los Angeles</p>			
<p>Mitigation Measure 3.2-2: Visual Screening and Other View Protection Measures. To partially screen views of projects facilitated by 2045 CAP measures and actions in locations where they would be visible from publicly accessible vantage points (e.g., scenic vistas, trails, scenic roadways and routes) and affect visual character or quality, if feasible and effective, the County shall (and other implementing state or local agencies can and should) require the construction of a berm, vegetative screening, or other form of visual barrier of sufficient height to provide a visual transition from ground level to surrounding hills or ridgelines. The color of proposed building facades and roofs shall be designed to visually blend in and minimize the potential for visual contrast between the project elements and their natural landscape surroundings. Bright or very light colors (including white) shall be avoided. Re-contouring and revegetation of temporarily disturbed, graded areas shall be completed to provide a natural appearing landform upon completion of construction.</p>	<p>1-2) Review of project plans and specifications to ensure project design includes a visual barrier, building materials and color schemes that match the surrounding landscape. 3) Field verification to ensure revegetation and recontouring is implemented.</p>	<p>1) During project specific environmental review. 2) Prior to approval of future projects construction. 3) During future project construction. 4) Monitoring and reporting conducted during project review and construction.</p>	<p>County of Los Angeles</p>	<p>County of Los Angeles</p>			
<p>Mitigation Measure 3.2-3: Reduce Light and Glare Impacts. To reduce significant light and glare impacts of projects facilitated by the 2045 CAP, the County shall require the following measures to be incorporated: a) All lighting shall be focused toward the site and outdoor lighting shall be directed downward; b) The design of exterior light fixtures shall incorporate shielding to prevent glare and offsite light spillage; c) Outdoor lighting shall include non-glare fixtures; and d) Structure design shall include exterior finishes and materials that would be minimally reflective or sited or oriented in such a way as to direct glare away from sensitive receptors.</p>	<p>1) Ensure project design plan includes lighting plan consistent with mitigation measure 3.2.3 requirements. 2) Ensure that lighting requirements are included in construction contract documents.</p>	<p>1) During project specific environmental review. 2) Prior to approval of future projects construction. 3) Monitoring and reporting conducted during project review.</p>	<p>County of Los Angeles</p>	<p>County of Los Angeles</p>			
Agriculture and Forestry							
<p>Mitigation Measure 3.3-1: Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar and Energy Storage Development. To reduce the impacts of converting Farmland in physical use for agriculture to nonagricultural uses when a utility-scale solar development is proposed on actively farmed land, the County shall require renewable energy project applicants to demonstrate their consideration of alternate sites consisting of formerly developed and/or contaminated lands such as landfills and mine sites located within one mile of the proposed project site when such development is consistent with General Plan and zoning requirements.</p>	<p>1-2) Demonstrate consideration of alternate sites of formerly developed and/or contaminated lands within one mile of the proposed project site.</p>	<p>1) During project specific environmental review. 2) Prior to approval of future projects construction. 3) Monitoring and reporting conducted during project review.</p>	<p>County of Los Angeles</p>	<p>County of Los Angeles</p>

					Initials	Date	Remarks
Air Quality							
<p>Mitigation Measure 3.4-1: Construction Emissions. If, during subsequent project-level environmental review, construction-related criteria air pollutants are determined to have the potential to exceed the applicable air quality management district (AQMD) adopted thresholds of significance, the lead agency shall require applicants for new projects facilitated by the 2045 CAP measures and actions to incorporate mitigation measures to avoid or reduce air pollutant emissions during construction activities. Mitigation measures that may be identified during the environmental review include, but are not limited to:</p> <ul style="list-style-type: none"> • When wind gusts exceed 25 miles per hour, cease all active construction activities or follow the applicable guidelines outlined in Table 3 of SCAQMD Rule 403 or Sections (C)(10) through (C)(14) of AVAQMD Rule 403. • Use construction equipment rated by the U.S. Environmental Protection Agency (USEPA) as having Tier 3 (model year 2006 or newer) or Tier 4 (model year 2008 or newer) emission limits, applicable for engines between 50 and 750 horsepower, as commercially available. • Ensure that construction equipment is properly serviced and maintained to the manufacturer's standards. • Limit nonessential idling of construction equipment to no more than five consecutive minutes. • Where acceptable to the fire department, control weed growth by mowing instead of disking, thereby leaving the ground undisturbed and with a mulch covering. • Water all active construction areas at least three times daily or four times daily if needed to control dust emissions. Watering should be sufficient to prevent airborne visible dust from leaving the site. Where local water supplies are not available in sufficient quantities within unincorporated areas of the County, use nontoxic chemical soil stabilizers or dust suppressants to control dust emissions in sufficient amounts to prevent airborne visible dust from leaving the site. • Increase watering frequency and/or application frequency of nontoxic chemical soil stabilizers or dust suppressants whenever wind speeds exceed 25 miles per hour. Reclaimed water shall be used whenever possible. • Cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least two feet of freeboard (i.e., the minimum required space between the top of the load and the top of the trailer). • Pave, apply water three times daily or as often as necessary to control dust, or where local water supplies are not available in sufficient quantities within unincorporated areas of the County, apply (nontoxic) soil stabilizers or dust suppressants on all unpaved access roads, parking areas, and staging areas at construction sites. • Sweep daily (with water sweepers using reclaimed water if possible), or as often as needed, all paved access roads, parking areas, and staging areas at the construction site to control dust. • Sweep public streets daily (with water sweepers using reclaimed water if possible) in the vicinity of the Project site, or as often as needed, to keep streets free of visible soil material. • Where local water supplies are not available in sufficient quantities within unincorporated areas of Los Angeles County, hydroseed or apply nontoxic chemical soil stabilizers or dust suppressants to inactive construction areas. • Enclose, cover, water three times daily, or apply nontoxic chemical soil stabilizers or dust suppressants to exposed stockpiles (dirt, sand, etc.). • In areas with existing vegetation, install the facility components with minimal disturbance. Take all necessary precautions to not use vehicles or machinery for grading or alter the existing grade in these areas. 	<p>1-2) Review of project plans and specifications to ensure that all measures included.</p> <p>3) Construction contractor/manager shall submit signed letter verifying compliance. Field verification to ensure measures are implemented.</p>	<p>1) During project specific environmental review.</p> <p>2) Prior to approval of future projects construction.</p> <p>3) During future project construction.</p> <hr/> <p>4) Monitoring and reporting conducted during project review and construction.</p>	<p>Applicant</p> <p>County of Los Angeles</p>	<p>County of Los Angeles</p>			

Mitigation Measure	Mitigation Method	Timing of Implementation	Implementation Responsibility	Monitoring and Reporting Agency	Verification of Compliance		
					Initials	Date	Remarks
<ul style="list-style-type: none"> • Design project facilities to limit ground disturbance or grading to only the access roads, substations and related underground transmission lines, tanks, basins, inverter pads, or other areas required by the County. Ensure that the facilities comply with all applicable grading standards. • Site utility-scale renewable energy projects in a way that minimizes site disturbance, such as grading, brush clearance, and other forms of earthwork. • In areas with existing vegetation, install facility components with minimal disturbance. Take all necessary precautions to avoid using vehicles or machinery for grading or altering the existing grade in these areas. • Establish and maintain a landscaped buffer: <ul style="list-style-type: none"> ○ Maintain a landscaped area at least 10 feet deep along any facility perimeter fencing and between such fencing and any public right-of-way or adjacent property with an existing residential or agricultural use. ○ Establish the landscaped area in such manner that adequate corner sight distance is maintained from all access roads to the public right-of-way to the satisfaction of the County of Los Angeles Department of Public Works. ○ Maintain the landscaped area throughout the life of the facility 							
<p>Mitigation Measure 3.4-2: Operational Fugitive Dust Emissions. If, during subsequent project-level environmental review, operational fugitive dust emissions are determined to have the potential to be significant, the lead agency shall require applicants for new projects facilitated by the 2045 CAP measures and actions to incorporate mitigation measures to avoid or reduce air pollutant emissions during operational activities. Mitigation measures that may be identified during the environmental review include, but are not limited to, the following:</p> <ul style="list-style-type: none"> • Unpaved main access roads for operational vehicle trips shall be paved or effectively stabilized using soil stabilizers that can be determined to be as efficient as or more efficient for fugitive dust control than California Air Resources Board–approved soil stabilizers, and that shall not increase any other environmental impacts, including loss of vegetation. • All other unpaved roads shall be stabilized using water or soil stabilizers so that vehicle travel on these roads does not cause visible dust plumes. • Gravel pads, grizzly strips, or other material track-out control methods approved for use by the local AQMD shall be installed where vehicles enter or exit unpaved roads onto paved roadways. • Traffic speeds on unpaved roads shall be limited to no more than 10 miles per hour, except that vehicles may travel up to 25 miles per hour on stabilized unpaved roads as long as such speeds do not create visible dust emissions. Traffic speed signs shall be displayed prominently at all site entrances and at egress point(s) from the central maintenance complex. • Where acceptable to the local and County fire departments, all unpaved, non-road surfaces that may potentially be disturbed shall be covered with a minimum of 3 inches of mulch. Where acceptable to the local and County fire departments, vegetation shall be maintained at 6 inches height. • All trucks hauling dirt, sand, soil, or other loose materials shall be covered or shall maintain at least 6 inches of freeboard (minimum vertical distance between top of the load and top of the trailer) in accordance with California Vehicle Code Section 23114. • A fugitive dust control plan that includes a dust plume response plan shall be prepared for review and approval by applicable agencies before any earthwork activities. • Where acceptable to the local and County fire departments, weed control shall be accomplished by mowing instead of disking, thereby leaving the ground undisturbed and with a mulch covering. 	<p>1-2) Review of project plans and specifications to ensure that all measures are included.</p> <p>3) Construction contractor/manager shall submit a signed letter verifying compliance. Field verification to ensure measures are implemented.</p>	<p>1) During future project-level environmental review.</p> <p>2) Prior to approval of future projects construction.</p> <p>3) During future project construction.</p> <hr/> <p>4) Monitoring and reporting conducted during project review and construction.</p>	County of Los Angeles	County of Los Angeles			

Mitigation Measure	Mitigation Method	Timing of Implementation	Implementation Responsibility	Monitoring and Reporting Agency	Verification of Compliance		
					Initials	Date	Remarks
<ul style="list-style-type: none"> Existing vegetation may be mowed, but removal of existing vegetation root systems shall be prohibited, except where necessary for construction of access roads, substations and related underground transmission lines, tanks, basins, inverter pads, or other areas required by the County. Continuous particulate monitors shall be installed at the discretion of the lead agency. 							
<p>Mitigation Measure 3.4-3: Architectural Coating VOC Emissions. If, during subsequent project-level environmental review, it is determined that VOC emissions impacts may be significant, the lead agency shall require Super-Compliant VOC-content architectural coatings (0 grams per liter to less than 10 grams per liter VOC) to be used during construction and operational application of paints and other architectural coatings to reduce ozone precursors. If paints and coatings with VOC content of 0 grams/liter to less than 10 grams/liter cannot be utilized, the developer shall avoid application of architectural coatings during days when the USEPA, CARB, or SCAQMD has forecasted the Air Quality Index for ozone to be greater than 100 for the project location.</p>	<p>1-2) Review of project plans and specifications to ensure that project design includes Super-Compliant VOC-content architectural coatings, and timeframe limits.</p> <p>3) Construction contractor/manager shall submit letter verifying compliance. Field verification to ensure measures are implemented.</p>	<p>1) During future project-level environmental review.</p> <p>2) Prior to approval of future projects construction.</p> <p>3) During future project construction.</p> <p>4) Monitoring and reporting conducted during project review and construction.</p>	County of Los Angeles	County of Los Angeles			
<p>Mitigation Measure 3.4-4: Enhanced Energy Conservation. If, during subsequent project-level environmental review, it is determined that operational emissions impacts are significant, the lead agency shall require the project to incorporate enhanced energy conservation measures beyond those required by federal or state law, County ordinance, and the 2045 CAP measures and actions to reduce energy-related emissions. Enhanced energy conservation measures shall include one or more of the following as applicable:</p> <ul style="list-style-type: none"> Install Energy Star rated heating, cooling, lighting, and appliances. Use of heating, ventilation, and air conditioning equipment with a Seasonal Energy Efficiency Ratio of 12 or higher. Installation of water heaters with an energy factor of 0.92 or higher. Install solar water heaters or tankless water heaters. Use passive solar cooling/heating. Reduce building natural gas infrastructure, use renewable natural gas in place of fossil fuel-derived natural gas, or eliminate building natural gas infrastructure and fully electrify buildings. 	<p>1-3) Review of project plans and specifications to ensure that project design includes enhanced energy conservation measures.</p> <p>4) Field verification to ensure measures are implemented.</p>	<p>1) During project-level environmental review.</p> <p>2) Prior to approval of future projects construction.</p> <p>3) Prior to issuance of future project building permits.</p> <p>4) During future project construction.</p> <p>5) Monitoring and reporting conducted during project review and construction</p>	County of Los Angeles	County of Los Angeles			
<p>Mitigation Measure 3.4-5: Low-VOC/Green Cleaning Product Educational Program. If, during subsequent project-level environmental review, it is determined that operational emissions impacts may be significant, the lead agency shall require the project applicant or developer to provide tenants and residents with information about low-VOC/green cleaning products and paints, including materials educating how to identify low-VOC cleaners and products.</p>	<p>1-3) Review of project plans and specifications to ensure that project applicant includes relevant information.</p>	<p>1) During future project-level environmental review.</p> <p>2) Prior to approval of future projects.</p> <p>3) Prior to issuance of future project building permits.</p> <p>4) Monitoring and reporting conducted during project review.</p>	County of Los Angeles	County of Los Angeles			
<p>Mitigation Measure 3.4-6: Stationary Sources. Applicants for new or modified stationary sources facilitated by the 2045 CAP measures and actions that: (1) have the potential to generate 40 or more diesel trucks per day and (2) are located within 1,000 feet of a sensitive land use (e.g., residential, schools, hospitals, nursing homes), as measured from the property line of the project to the property line of the nearest sensitive use, shall submit a health risk assessment (HRA) to the County Department of Regional Planning prior to future discretionary project approval. The HRA shall be prepared in accordance with</p>	<p>1) Applicant shall submit HRA to the County.</p> <p>2) Review of plans and specifications to ensure that project design includes T-BACTs.</p>	<p>1) Prior to approval of future projects.</p> <p>2) Prior to approval of future projects construction.</p> <p>3) Monitoring and reporting conducted during project review</p>	Applicant	County of Los Angeles			

Mitigation Measure	Mitigation Method	Timing of Implementation	Implementation Responsibility	Monitoring and Reporting Agency	Verification of Compliance		
					Initials	Date	Remarks
<p>policies and procedures of the state Office of Environmental Health Hazard Assessment and the applicable air quality management district. If the HRA shows that the incremental cancer risk exceeds ten in one million (10E-06), particulate matter concentrations would exceed 2.5 µg/m3, or the appropriate noncancer hazard index exceeds 1.0, the applicant will be required to identify and demonstrate that best available control technologies for toxics (T-BACTs) are capable of reducing potential cancer and noncancer risks to an acceptable level, including appropriate enforcement mechanisms. T-BACTs may include, but are not limited to, restricting idling onsite or electrifying warehousing docks to reduce diesel particulate matter, or requiring use of newer equipment and/or vehicles. T-BACTs identified in the HRA shall be identified as mitigation measures in the environmental document and/or incorporated into the site development plan as a component of the project.</p>							
<p>Mitigation Measure 3.4-7: Health Risk Assessment.</p> <p>Applicants shall submit a health risk assessment (HRA) to the County prior to future discretionary project approval for sensitive land uses facilitated by the 2045 CAP measures and actions within the following distances as measured from the property line of the project to the property line of the source/edge of the nearest travel lane, from these facilities or similar types of facilities that produce TAC emissions:</p> <ul style="list-style-type: none"> • Industrial facilities within 1,000 feet • Distribution centers (40 or more trucks per day) within 1,000 feet • Major transportation projects (50,000 or more vehicles per day) within 1,000 feet • Gasoline dispensing facilities within 300 feet <p>Applicants proposing projects facilitated by the 2045 CAP measures and actions which produce TAC emissions may be required to submit an HRA based on local rules and regulations, and/or at the discretion of the lead agency.</p> <p>The HRA shall be prepared in accordance with policies and procedures of the applicable Air Quality Management District. If the HRA shows that the incremental cancer risk exceeds ten in one million (10E-06) or the appropriate noncancer hazard index exceeds 1.0, the applicant will be required to identify and demonstrate that mitigation measures are capable of reducing potential cancer and non-cancer risks to an acceptable level (i.e., below ten in one million or a hazard index of 1.0), including appropriate enforcement mechanisms. Measures to reduce risk may include but are not limited to:</p> <ul style="list-style-type: none"> • Air intakes located away from high-volume roadways and/or truck loading zones, unless it can be demonstrated to County Department of Regional Planning that there are operational limitations. • Heating, ventilation, and air conditioning systems of the buildings provided with appropriately sized maximum efficiency rating value (MERV) filters. <p>Mitigation measures identified in the HRA shall be identified as mitigation measures in the environmental document and/or incorporated into the site development plan as a component of the Project. The air intake design and MERV filter requirements shall be noted and/or reflected on all building plans submitted to the County and shall be verified by County Department of Regional Planning.</p>	<p>1) Applicant shall submit HRA to the County.</p> <p>2) Review of plans and specifications to ensure that project design includes mitigation measures identified in the HRA.</p> <p>3) Ensure mitigation measures identified in the HRA are identified as mitigation measures in the environmental document and/or incorporated into the site development plan.</p>	<p>1) Prior to approval of future projects.</p> <p>2) Prior to approval of future projects construction.</p> <p>3) During future project-level environmental review.</p> <p>4) Monitoring and reporting conducted during project review.</p>	Applicant	County of Los Angeles			
<p>Mitigation Measure 3.4-8: Valley Fever.</p> <ul style="list-style-type: none"> • Require crews to use respirators during project clearing, grading, and excavation operations in accordance with California Division of Occupational Safety and Health regulations. • Require that the cabs of grading and construction equipment be air-conditioned or enclosed with sufficient ventilation and particulate matter filtration systems. • Require crews to work upwind from excavation sites where possible. • Where acceptable to the fire department, control weed growth by mowing instead of disking, thereby leaving the ground undisturbed and with a mulch covering. • During rough grading and construction, ensure that the access way into the project site from adjoining paved roadways is paved or treated with environmentally safe dust control agents. 	<p>1-2) Review of plans and specifications to ensure that project design includes measures.</p> <p>3) Construction contractor/manager shall submit a letter verifying compliance. Field verification to ensure measures are implemented.</p>	<p>1) During future project-level environmental review.</p> <p>2) Prior to approval of future projects construction.</p> <p>3) During future project construction activities that would involve ground disturbance.</p> <p>4) Monitoring and reporting conducted during project review and construction.</p>	Applicant	County of Los Angeles			

Mitigation Measure	Mitigation Method	Timing of Implementation	Implementation Responsibility	Monitoring and Reporting Agency	Verification of Compliance		
					Initials	Date	Remarks
Biological Resources							
<p>BIO-1 Biological resources shall be analyzed on a project-specific level by a qualified biological consultant. A general survey shall be conducted to characterize the project site, and focused surveys should be conducted as necessary to determine the presence/absence of special-status species (e.g., focused sensitive plant or wildlife surveys). A biological resources assessment report shall be prepared to characterize the biological resources on-site, analyze project-specific impacts to biological resources, and propose appropriate mitigation measures to offset those impacts. The report shall include site location, literature sources, methodology, timing of surveys, vegetation map, site photographs, and descriptions of biological resources on-site (e.g., observed and detected species as well as an analysis of those species with potential to occur onsite).^a</p> <p>^a - This mitigation measures was previously adopted in 2015 as part of the Los Angeles County General Plan Update.</p>	<p>1) Survey conducted by a qualified biologist.</p> <p>2) Submit biological resources assessment report (including general site survey and focused surveys, as necessary).</p>	<p>1) During future project-level environmental review.</p> <p>2) Prior to approval of future projects.</p> <p>3) Monitoring and reporting conducted during project review.</p>	Applicant	County of Los Angeles			
<p>BIO-2 If there is potential for direct impacts to special-status species with implementation of construction activities, the project-specific biological resources assessment report (as mentioned in Mitigation Measure BIO-1) shall include mitigation measures requiring preconstruction surveys for special-status species and/or construction monitoring to ensure avoidance, relocation, or safe escape of special-status species from the construction activities, as appropriate. If special-status species are found to be nesting, brooding, denning, etc. on-site during the pre-construction survey or monitoring, construction activity shall be halted until offspring are weaned, fledged, etc. and are able to escape the site or be safely relocated to appropriate offsite habitat areas. Relocations into areas of appropriate restored habitat would have the best chance of replacing/incrementing populations that are lost due to habitat converted to development. Relocation to restored habitat areas should be the preferred goal of this measure. A qualified biologist shall be on site to conduct surveys, to perform or oversee implementation of protective measures, and to determine when construction activity may resume.^a</p> <p>^a - This mitigation measures was previously adopted in 2015 as part of the Los Angeles County General Plan Update.</p>	<p>1-2) Submit pre-construction survey</p> <p>3) Obtain permit(s) as necessary.</p> <p>4) Construction monitoring by qualified biologist.</p> <p>5) Submit construction monitoring documentation.</p>	<p>1) During future project-level environmental review</p> <p>2) Prior to approval of future projects construction.</p> <p>3) Prior to issuance of grading permits</p> <p>4) During future project construction activities that would involve ground disturbance</p> <p>5) Monitoring and reporting conducted during project review and construction</p>	Applicant	County of Los Angeles			
<p>Mitigation Measure 3.5-1: The County shall require biological resources to be analyzed on a project-specific level by a qualified biological consultant. Prior to or during the preparation of project-level environmental documents, and prior to the start of construction activities, a biological resources assessment shall be conducted to characterize the project site. Suitable buffer areas surrounding the project site shall be included where native habitat is contiguous with off-site habitat areas. The assessment and analysis shall emphasize identifying endangered, threatened, rare, and other special-status species; regionally and locally unique species; and sensitive natural communities, jurisdictional waters, and oak woodlands. Focused surveys shall be conducted as necessary to determine the presence of special-status species (e.g., focused sensitive plant or wildlife surveys). Focused surveys shall be conducted according to established CDFW or USFWS protocols, if available for the object species. Natural communities shall be mapped and identified according to floristic alliance-and/or association-based mapping protocols consistent with CDFW natural communities. A jurisdictional delineation may be required if there are signs of potentially regulated wetlands and non-wetland waters. A biological resources assessment report shall be prepared to characterize the biological resources on-site, analyze direct and indirect impacts on biological resources, and propose mitigation measures to offset those impacts. The report shall include site location, literature sources, methodology, timing of surveys, vegetation map, site photographs, and descriptions of biological resources on-site (e.g., observed and detected species as well as those species with potential to occur on-site).</p>	<p>1) A qualified biologist shall prepare a biological resources assessment report.</p> <p>2) Review of the biological resources assessment report.</p>	<p>1) Prior to or during the preparation of project-level environmental documents.</p> <p>2) Prior to the start of construction activities.</p> <p>3) Monitoring and reporting conducted during project review.</p>	County of Los Angeles/Applicant	County of Los Angeles			
<p>Mitigation Measure 3.5-2: If there is potential for direct impacts to special-status species with implementation of construction activities, the project-specific biological resources assessment report (as described in Mitigation Measure 3.5-1) shall include a mitigation measure requiring pre-construction surveys for special-status species and/or construction monitoring to ensure avoidance, relocation, or safe escape of special-status species from the construction activities, as appropriate. The mitigation measures shall also include consultation with and obtaining permits from USFWS or CDFW prior to construction, if required by FESA or CESA for listed endangered and threatened species. If special-status species are found to be nesting, brooding, denning, etc. on-site during the pre-construction survey or monitoring, construction activity shall be halted until offspring are weaned, fledged, etc. and are able to escape the site or be safely relocated to appropriate offsite habitat areas. Relocation of such species into areas of appropriate restored habitat would have the best chance of replacing/incrementing</p>	<p>1) General Contractor to consult with qualified biologist to verify compliance with requirements.</p> <p>2) Qualified biologist shall be on-site to conduct surveys and oversee implementation of measures.</p> <p>3) Qualified biologist to submit report documenting compliance with requirements.</p>	<p>1) Prior to construction of future projects.</p> <p>2) During future project construction activities.</p> <p>3) After construction of future projects.</p>	Applicant	County of Los Angeles			

Mitigation Measure	Mitigation Method	Timing of Implementation	Implementation Responsibility	Monitoring and Reporting Agency	Verification of Compliance		
					Initials	Date	Remarks
populations that are lost due to habitat converted to development. Relocation to restored habitat areas shall be the preferred goal of this measure. A qualified biologist shall be on site to conduct surveys, to perform or oversee implementation of protective measures, and to determine when construction activity may resume.		<hr/> 4) Monitoring and reporting conducted before and during project construction.					
Mitigation Measure 3.5-3: Prior to issuance of any grading permit for permanent impacts in the areas designated as jurisdictional features, the project applicant shall obtain a Clean Water Act Section 404 permit from U.S. Army Corps of Engineers, a Clean Water Act Section 401 certification from the Regional Water Quality Control Board, and a Streambed Alteration Agreement/ (LSAA) permit under Section 1602 of the California Fish and Game Code from California Department of Fish and Wildlife, where the project warrants..	1) Applicant to obtain listed permits, where required. 2) Review and verification of listed permits, where required.	1-2) Prior to issuance of any grading permit for permanent impacts in the areas designated as jurisdictional features. 3) Monitoring and reporting conducted before project construction.	Applicant	County of Los Angeles			

Mitigation Measure	Mitigation Method	Timing of Implementation	Implementation Responsibility	Monitoring and Reporting Agency	Verification of Compliance		
					Initials	Date	Remarks
<p>Mitigation Measure 3.5-4: Proponents for individual projects facilitated by the 2045 CAP provisions shall analyze impacts on wildlife movement and corridors that may introduce new or additional barriers to wildlife dispersal or constrain existing wildlife corridors to future movement, or indirect impacts constraining future wildlife movement. Where projects may interfere with wildlife movement, alternative designs shall be included in the analysis to reduce wildlife movement impacts. Corridors, linkages, and pinch points shall not be entirely closed by any development, and partial mitigation shall be mandatory for project-specific impacts on wildlife corridors and wildlife nursery sites. This shall include provision of a minimum of half the corridor width. (The width shall be at least what is needed to remain connective for the top predators using the corridor.) Mitigation can include preservation by deed in perpetuity of other parts of the wildlife corridor connecting through the development area; it can include native landscaping to provide cover on the corridor. For nursery site impacts, mitigation shall include preservation by deed in perpetuity for another comparable nursery site of the same species</p>	<p>1) Ensure alternative designs and mitigation is included in the analysis where wildlife movement and corridors are impacted.</p> <p>2) Review of plans and specifications to ensure that project design includes alternative measures.</p>	<p>1) During project-specific environmental review.</p> <p>2) Prior to approval of future development projects.</p> <p>3) Monitoring and reporting conducted during project review.</p>	Applicant	County of Los Angeles			
<p>Mitigation Measure 3.5-5: Proponents of projects resulting in the loss of oak woodlands shall mitigate with in-kind replacement habitat at a minimum of 1:1 mitigation ratio documented through a County-approved habitat mitigation plan. The plan shall include the number of replacement trees (or acreage and average density of woodland), location of replacement woodland, understory habitat components, sequencing for any phased tree removal, and performance standards for mitigation. The plan shall include monitoring for a minimum of five years, with annual reports submitted to the County.</p> <p>For oak woodlands impacts, project mitigation shall be consistent with recommendations in the County's Oak Woodland Conservation Management Plan and its 2014 Guide. If a project cannot be redesigned to avoid impacts to oak woodlands, an appropriate mitigation strategy would be developed by selecting from the Guide's list of recommended mitigation measures, prioritizing the acquisition of oak woodland habitat comparable to the habitat that as affected over the restoration of degraded off-site and in-lieu fees. A Mitigation Monitoring Plan consistent with the Guide's recommendations would be prepared and implemented.</p>	<p>1) Applicant shall retain an arborist to develop and submit the Mitigation Monitoring Plan to the County Department of Regional Planning.</p> <p>2) Review of plans and specifications to ensure that project design includes Mitigation Monitoring Plan.</p> <p>3) Field verification to ensure measures are implemented.</p>	<p>1) During project-specific environmental review.</p> <p>2) Prior to construction of future projects.</p> <p>3) During future project construction activities.</p> <p>4) Monitoring and reporting conducted during project review and construction</p>	Applicant	County of Los Angeles			
Cultural Resources							
<p>Mitigation Measure 3.6-1: Historic Resources Assessment. Prior to demolition or alteration of buildings and/or structures or the construction of aboveground infrastructure with potentially significant impacts on historic architectural resources, the project proponent shall retain an architectural historian meeting the minimum professional qualifications standards (PQS) set forth by the Secretary of the Interior (codified in 36 CFR Part 61; 48 FR 44738-44739) (Qualified Architectural Historian) to conduct a historic resources assessment of affected properties. The assessment shall include a records search at the South Central Coastal Information Center or review of a prior record search conducted within the previous one year; a review of other pertinent archives and sources; a pedestrian field survey; recordation of all identified historic architectural resources on California Department of Parks and Recreation (DPR) 523 forms; evaluation of resources which may be eligible for listing in the California Register (i.e., meets the definition for historical resource in CEQA Guidelines Section 15064.5[a]), and for local listing; and preparation of a technical report documenting the methods and results of the assessment for each future project facilitated by 2045 CAP measures and actions. If a historic architectural resource is found eligible by the Qualified Architectural Historian, then the Qualified Architectural Historian shall coordinate with the project proponent and the County to ensure the project is constructed in conformance with the Secretary of the Interior's Standards. All reports resulting from implementation of this measure shall be filed with the South Central Coastal Information Center (including but not limited to historic resources assessments and Secretary of the Interior's Standards plan reviews).</p>	<p>1) Qualified architectural historian to submit historic resources assessment report of affected properties to the County Department of Regional Planning.</p> <p>2) Review plan and specifications to ensure project is constructed in conformance with the Secretary of the Interior's Standards.</p> <p>3) File report with the South Central Coastal Information Center.</p>	<p>1) During project-specific environmental review.</p> <p>2) Prior to demolition or alteration of buildings and/or structures or the construction of aboveground infrastructure with potentially significant impacts on historic architectural resources.</p> <p>3) After construction of future projects with potentially significant impacts on historic architectural resources.</p> <p>4) Monitoring and reporting conducted during project review and construction.</p>	Applicant	County of Los Angeles			
<p>Mitigation Measure 3.6-2: Archaeological Resources Assessment. Prior to conducting construction activities that would involve ground disturbance, the project proponent shall retain an archaeologist meeting the minimum PQS set forth by the Secretary of the Interior (codified in 36 CFR Part 61; 48 FR 44738-44739) (Qualified Archaeologist) to conduct an archaeological resources assessment. The assessment shall include a records search at the South Central Coastal Information Center or review of a prior record search conducted within the previous one year; a Sacred Lands File search at the California Native American Heritage Commission (NAHC); geoaerchaeological review including a focused assessment of land use history and any available geotechnical data to assess the potential for</p>	<p>1) Applicant shall retain a Qualified archaeologist to prepare an archaeological resources assessment report and submit to the County Department of Regional Planning.</p> <p>2) Qualified archaeologist shall develop and submit a work plan to the County.</p>	<p>1) During project-specific environmental review.</p> <p>2) Prior to conducting construction activities that would involve ground disturbance.</p>	Applicant/County of Los Angeles	County of Los Angeles			

Mitigation Measure	Mitigation Method	Timing of Implementation	Implementation Responsibility	Monitoring and Reporting Agency	Verification of Compliance		
					Initials	Date	Remarks
subsurface archaeological resources; a pedestrian field survey in instances where ground surface is exposed; recordation of all identified archaeological resources on DPR 523 forms; evaluation of resources affected by the project for eligibility for listing in the California	3) The County shall consult with local Native American tribes.	3) Prior to the initiation of field work for any Extended Phase I or Phase II investigation.					
Register (i.e., meets the definition for historical resource in CEQA Guidelines Section 15064.5[a]), and for local listing; and preparation of a technical report documenting the methods and results of the assessment. Resources that do not qualify as historical resources shall be considered by the Qualified Archaeologist for qualification as unique archaeological resources as defined in Public Resources Code Section 21083.2(g). The technical report also shall provide recommendations as to whether additional studies are warranted to further identify or evaluate archaeological resources (i.e., Extended Phase I boundary delineation, Phase II testing and evaluation) and if archaeological monitoring and Native American monitoring of ground disturbing activities is warranted (e.g., in areas where there is a higher potential to encounter buried resources). Prior to the initiation of field work for any Extended Phase I or Phase II investigation, the Qualified Archaeologist shall prepare a work plan outlining the investigation's objectives, goals, and methodology. When developing a work plan for Native American resources, the County shall consult with local Native American tribes. If archaeological/Native American monitoring is warranted, the Qualified Archaeologist shall determine the locations and duration of monitoring and reporting requirements. All reports resulting from implementation of this measure shall be filed with the South Central Coastal Information Center (including but not limited to archaeological resources assessments, Extended Phase I and Phase II reports, and monitoring reports).	4) File report(s) with the South Central Coastal Information Center.	4) After construction of future projects with potentially significant impacts on archaeological resources. 5) Monitoring and reporting conducted during project review and construction.					
Mitigation Measure 3.6-3: Construction Worker Cultural Resources Sensitivity Training. For projects with ground-disturbing activities that may encounter potentially significant archaeological resources, the Qualified Archaeologist shall implement a cultural resources sensitivity training program. The Qualified Archaeologist, or its designee, shall instruct all construction personnel of the types of archaeological resources that may be encountered, the proper procedures to be enacted in the event of an inadvertent discovery of archaeological resources or human remains, applicable laws protecting archaeological resources, and confidentiality of discoveries. Native American monitor(s) shall be invited to participate in presenting tribal perspectives as part of the training curriculum. In the event that construction crews are phased, additional trainings shall be conducted for new construction personnel. The project proponent or its contractors shall ensure construction personnel are made available for and attend the training. The project proponent shall retain documentation demonstrating attendance and provide it to the County.	1) Qualified archaeologist shall prepare and conduct a cultural resources sensitivity training program. 2) Construction contractor/manager ensure construction personnel attend training. 3) Applicant shall retain documentation demonstrating attendance and provide it to the County.	1-3) Prior to conducting construction activities that would involve ground-disturbance. 4) Monitoring and reporting conducted before project construction.	Applicant	County of Los Angeles			
Mitigation Measure 3.6-4: Archaeological Resources Discoveries. In the event archaeological resources are encountered during construction of a project, the project proponent shall cease all activity within 50 feet of the find shall cease. The discovery shall be evaluated for significance by the Qualified Archaeologist. When assessing significance and developing treatment for resources that are Native American in origin, the County shall consult with local Native American tribes. If the Qualified Archaeologist determines that the resource is significant (i.e., meets the definition for historical resource in CEQA Guidelines Section 15064.5[a] or for unique archaeological resource in Public Resources Code Section 21083.2[g]), the Qualified Archaeologist shall provide a method for avoidance and preservation in place, which shall be the preferred manner of mitigating impacts. If avoidance is infeasible, the Qualified Archaeologist shall develop a Phase III Archaeological Resources Data Recovery and Treatment Plan consistent with Mitigation Measure 3.6-5. The Qualified Archaeologist also shall determine, based on the initial assessment of the discovery, whether the 50-foot buffer may be reduced. All reports resulting from implementation of this measure shall be filed with the South Central Coastal Information Center (including but not limited to Extended Phase I, Phase II, and Phase III reports).	1) Qualified archaeologist shall evaluate archeological discovery's significance. 2) Qualified archaeologist shall provide a method for avoidance and preservation in place or develop a Phase III Archaeological Resources Data Recovery and Treatment Plan consistent with Mitigation Measure 3.6-5. 3) File report(s) with the South Central Coastal Information Center.	1-2) If archaeological resources are encountered during construction of a project. 3) After construction of future projects with archaeological resource discoveries. 4) Monitoring and reporting conducted during project construction.	Applicant/County of Los Angeles	County of Los Angeles			
Mitigation Measure 3.6-5: Treatment of Archaeological Resources. If the assessment conducted under Mitigation Measure 3.6-2 or Mitigation Measure 3.6-4 identifies significant archaeological resources (i.e., meets the definition for historical resource in CEQA Guidelines Section 15064.5[a] or for unique archaeological resource in Public Resources Code Section 21083.2[g]), then avoidance and preservation in place shall be the preferred manner of mitigating impacts. Preservation in place may be accomplished by, but is not	1) Review plans and specification to ensure measures for avoidance and preservation in place, or those from the Phase III Archaeological Resources Data Recovery and Treatment Plan are included.	1) During project-specific environmental review.	Applicant/County of Los Angeles	County of Los Angeles			

Mitigation Measure	Mitigation Method	Timing of Implementation	Implementation Responsibility	Monitoring and Reporting Agency	Verification of Compliance		
					Initials	Date	Remarks
limited to, avoidance, incorporating the resource into open space, capping, or deeding the site into a permanent conservation easement. If avoidance and preservation in place of significant archaeological resources is determined by the County to be infeasible, then the Qualified Archaeologist shall prepare a Phase III Archaeological Resources Data Recovery	2) The County Department of Regional Planning shall consult with local Native American tribes.	2) Prior to conducting construction activities that would involve ground disturbance.					
and Treatment Plan. The plan shall include: a detailed research design; justification for data recovery or other treatment methods depending on the nature of the resource's eligibility; excavation methodology; and, reporting and curation requirements. When developing treatment for resources that are Native American in origin, the County shall consult with local Native American tribes. All Phase III reports resulting from implementation of this measure shall be filed with the South Central Coastal Information Center.	3) File report(s) with the South Central Coastal Information Center.	3) After construction of future projects with potentially significant impacts on archaeological resources. 4) Monitoring and reporting conducted during project review and construction.					
<p>Mitigation Measure 3.6-6: Curation and Disposition of Cultural Materials. The project proponent shall arrange curation for all Native American archaeological materials, with the exception of funerary objects or grave goods (i.e., artifacts associated with Native American human remains). For significant Native American archaeological materials, the project proponent shall first consider repositories that are accredited by the American Association of Museums and that meet the standards outlined in 36 CFR 79.9. If a suitable accredited repository is not identified, then the project proponent shall consider nonaccredited repositories as long as they meet the minimum standards set forth by 36 CFR 79.9. If a suitable nonaccredited repository is not identified, then the project proponent shall donate the collection to a local California Native American tribe(s). Nonsignificant archeological materials shall be donated to a local California Native American tribe(s). If neither an accredited or nonaccredited repository or tribe accepts the collection, then the project proponent may offer the collection to a public, nonprofit institution with a research interest in the materials, or to a local school or historical society in the area for educational purposes. Disposition of Native American human remains and associated funerary objects or grave goods shall be determined by the landowner in consultation with the County and the MLD.</p> <p>The project proponent shall curate all significant historic-period archaeological material, or portions thereof at the discretion of the Qualified Archaeologist, at a repository accredited by the American Association of Museums that meets the standards outlined in 36 CFR 79.9. If no accredited repository accepts the collection, then the project proponent may curate it at a nonaccredited repository as long as it meets the minimum standards set forth in 36 CFR 79.9. If neither an accredited nor a nonaccredited repository accepts the collection, then the project proponent may offer the collection to a public, nonprofit institution with a research interest in the materials, or to a local school or historical society in the area for educational purposes.</p>	<p>1) Applicant shall arrange curation for all Native American archaeological materials, with the exception of funerary objects or grave goods.</p> <p>2) Landowner to consult with County Department of Regional Planning and the Native American Most Likely Descendant (MLD) regarding disposition of Native American human remains and associated funerary objects or grave goods.</p> <p>3) Applicant to consult with Qualified Archaeologist to curate all significant historic-period archaeological material, or portions thereof.</p>	<p>1-3) If archaeological resources are encountered during construction of a project.</p> <p>4) Monitoring and reporting conducted during project construction.</p>	Applicant	County of Los Angeles			
<p>Mitigation Measure 3.6-7: Paleontological Resources Assessment and Monitoring. For projects facilitated by 2045 CAP measures and actions that involve ground disturbance, the project proponent shall retain a paleontologist who meets the Society of Vertebrate Paleontology's (SVP 2010) definition for qualified professional paleontologist (Qualified Paleontologist) to prepare a paleontological resources assessment report prior to the start of construction activities. The report shall include methods and results of the paleontological resources assessment, monitoring requirements (including depths, frequency, and reporting), and maps that outline where monitoring is required. Monitoring shall follow SVP Guidelines: no monitoring of ground-disturbing activities within units of <i>Low Sensitivity or No Potential</i>; monitoring of all ground-disturbing activities (with depths specified) in units of <i>Low to High Significance</i>; and at all depths within units of <i>High Significance</i> unless the Qualified Paleontologist's report identifies previous disturbances or the use of construction methods which do not warrant monitoring; and monitoring at the initiation of excavation in units of <i>Undetermined Significance</i>. The report also shall stipulate whether screen washing is necessary to recover small specimens following SVP Guidelines and determine whether unique geologic features are present onsite. If monitoring is conducted, then the Qualified Paleontologist shall prepare a final report summarizing monitoring results and submit it to the project proponent and the County.</p>	<p>1) Applicant shall retain a Qualified Paleontologist to prepare a paleontological resources assessment report and submit to the County.</p> <p>2) If monitoring is warranted, then the Qualified Paleontologist shall prepare a final report summarizing monitoring results and submit to the Applicant and County.</p>	<p>1) Prior to conducting construction activities that would involve ground disturbance.</p> <p>2) After construction of future projects with potentially significant impacts on paleontological resources.</p> <p>3) Monitoring and reporting conducted during project construction.</p>	Applicant	County of Los Angeles			
<p>Mitigation Measure 3.6-8: Paleontological Resources Sensitivity Training. Prior to the start of ground-disturbing activities for projects facilitated by 2045 CAP measures and actions with potentially significant impacts on paleontological resources, the Qualified Paleontologist or its designee shall conduct construction worker paleontological resources sensitivity training (or may be provided via digital recording) for all construction workers. Construction workers shall be informed on how to identify the types of paleontological resources that may be encountered, the proper procedures to be enacted in the event of an</p>	<p>1) Qualified Paleontologist or its designee shall prepare and conduct construction worker paleontological resources sensitivity training (or may be provided via digital recording) for all construction workers.</p>	<p>1-3) Prior to conducting construction activities that would involve ground-disturbance.</p>	Applicant	County of Los Angeles			

Mitigation Measure	Mitigation Method	Timing of Implementation	Implementation Responsibility	Monitoring and Reporting Agency	Verification of Compliance		
					Initials	Date	Remarks
inadvertent discovery of paleontological resources, and safety precautions to be taken when working with paleontological monitors. The project proponent shall ensure that construction workers are made available for and attend the training. The project proponent shall retain documentation demonstrating attendance and provide it to the County.	2) Construction contractor/manager ensure construction personnel attend training.						
	3) Applicant shall retain documentation demonstrating attendance and provide it to the County.	4) Monitoring and reporting conducted before project construction.					
<p>Mitigation Measure 3.6-9: Paleontological Discoveries. If a potential fossil is found, the paleontological monitor shall be allowed to temporarily divert or redirect grading and excavation activities in the area of the exposed fossil to facilitate evaluation of the discovery. An appropriate buffer area determined by the paleontological monitor shall be established around the find where construction activities shall not be allowed to continue. Work shall be allowed to continue outside of the buffer area. At the monitor's discretion, and to reduce any construction delay, the grading/excavation contractor shall assist, where feasible, in removing rock/sediment samples for initial processing and evaluation. If a fossil is determined to be significant, the Qualified Paleontologist shall implement a paleontological salvage program to remove the resources from their location, following the guidelines of the SVP (2010). Any fossils encountered and recovered shall be prepared to the point of identification, catalogued, and curated at a public, nonprofit institution with a research interest in the material and with retrievable storage, such as the Natural History Museum of Los Angeles County, if such an institution agrees to accept the fossils. Accompanying notes, maps, and photographs shall also be filed at the repository. If no institution accepts the fossil collection, it may be donated to a local school or other interested organization in the area for educational purposes.</p> <p>If construction workers discover any potential fossils during construction while the paleontological monitor is not present, regardless of the depth of work or location, work at the discovery location shall cease in a 50-foot radius of the discovery until the Qualified Paleontologist has assessed the discovery and recommended and implemented appropriate treatment as described earlier in this measure.</p> <p>Any salvage reports resulting from implementation of this measure shall be filed with the Natural History Museum of Los Angeles County.</p>	<p>1) Paleontological monitor shall provide direction to Construction contractor/manager to temporarily divert or redirect grading and excavation activities in the area of the exposed fossil. Paleontological monitor shall establish an appropriate buffer area around the find where construction activities shall not be allowed to continue.</p> <p>2) Qualified Paleontologist shall implement a paleontological salvage program.</p> <p>3) Construction contractor/manager shall cease work at discovery location in a 50-foot radius until the Qualified Paleontologist has assessed the discovery and recommended and implemented appropriate treatment.</p> <p>4) File report with the Natural History Museum of Los Angeles County.</p>	<p>1) If a potential fossil is encountered during construction of a project.</p> <p>2) If a fossil is determined to be significant.</p> <p>3) If construction workers discover any potential fossils during construction while the paleontological monitor is not present.</p> <p>4) After construction of future projects with potentially significant impacts on paleontological resources.</p> <p>5) Monitoring and reporting conducted during and after project construction.</p>	Applicant	County of Los Angeles			
<p>Mitigation Measure 3.6-10: Human Remains Discoveries. If human remains are encountered, then the project proponent or its contractor shall immediately halt work within 50 feet of the discovery and contact the County Coroner in accordance with Public Resources Code Section 5097.98 and Health and Safety Code Section 7050.5, which require that no further disturbance shall occur until the County Coroner has made the necessary findings as to the remains' origin and disposition. If the County Coroner determines that the remains are Native American, then the County Coroner will notify the NAHC within 24 hours in accordance with Health and Safety Code Section 7050.5(c), and Public Resources Code Section 5097.98. The NAHC shall then identify the person(s) thought to be the MLD. The MLD may, with the permission of the land owner, or their authorized representative, inspect the site of the discovery of the Native American remains and may recommend to the owner or the person responsible for the excavation work means for treating or disposing, with appropriate dignity, the human remains and any associated grave goods. The MLD shall complete their inspection and make their recommendation within 48 hours of being granted access by the landowner to inspect the discovery. The recommendation may include the scientific removal and nondestructive analysis of human remains and items associated with Native American burials. The project proponent, County, and the landowner shall discuss and confer with the MLD on all reasonable options regarding the MLD's preferences for treatment.</p> <p>Until the project proponent, the County, and the landowner have conferred with the MLD, the contractor shall ensure that the immediate vicinity where the discovery occurred is not disturbed by further activity and is adequately protected according to generally accepted cultural or archaeological standards or practices (e.g., the NAHC's <i>A Professional Guide for the Preservation and Protection of Native American Human Remains and Associated Grave Goods</i> [NAHC 2022], which reiterates statutory requirements), and that further activities take into account the possibility of multiple burials.</p> <p>If the NAHC is unable to identify an MLD, or the MLD identified fails to make a recommendation, or the landowner rejects the recommendation of the MLD and the</p>	<p>1) Project proponent or its Construction contractor/manager shall immediately halt work within 50 feet of the discovery and contact the County Coroner.</p> <p>2) Project proponent, County, and the landowner shall discuss and confer with the MLD on all reasonable options regarding the MLD's preferences for treatment.</p> <p>3) Construction contractor/ manager shall ensure that the immediate vicinity where the discovery occurred is not disturbed by further activity and is adequately protected.</p> <p>4) In the absence of an MLD, the landowner or his or her authorized representative shall inter the human remains and items associated with Native American human remains with appropriate dignity on the property in a location not subject to further and future subsurface disturbance.</p>	<p>1-4) If human remains are encountered during construction of a project.</p> <p>5) Monitoring and reporting conducted during project construction.</p>	Applicant	County of Los Angeles			

Mitigation Measure	Mitigation Method	Timing of Implementation	Implementation Responsibility	Monitoring and Reporting Agency	Verification of Compliance		
					Initials	Date	Remarks
mediation provided for in Public Resources Code Section 5097.94(k), if invoked, fails to provide measures acceptable to the landowner, the landowner or his or her authorized representative shall enter the human remains and items associated with Native American human remains with appropriate dignity on the property in a location not subject to further and future subsurface disturbance.							
Hazards and Hazardous Materials							
<p>Mitigation Measure 3.10-2: The County shall require applicants of solar PV installation projects that include the use of CdTe modules to dispose of panels or recycle panels in accordance with current local, state, and federal regulations. Broken and end-of-project-life PV modules, materials, and components shall be:</p> <ul style="list-style-type: none"> • Stored on-site in a manner that complies with federal and state laws until recycling or disposal actions can be taken. • Stored on-site no longer than allowed by federal and state laws. • Recycled in accordance with federal and state laws applicable at that time. 	<p>1) Review plans and specifications to ensure disposal of panels or recycle of panels in accordance with current local, state, and federal regulations is included.</p> <p>2) Field verification to ensure measures are implemented.</p>	<p>1) Prior to construction of future projects.</p> <p>2) During project construction activities.</p> <p>3) Monitoring and reporting conducted during project review and construction.</p>	County of Los Angeles/Applicant	County of Los Angeles			
Noise							
<p>Mitigation Measure 3.13-1: Construction Noise. Construction activities associated with new projects facilitated by the 2045 CAP that occur within 500 feet of noise-sensitive receptors (i.e., residences, parks, schools, historic sites, cemeteries, and recreation areas) shall be evaluated by the project applicant for noise impacts that would result in a 5 dBA increase over existing ambient noise levels at any sensitive receptor. Mitigation measures such as installing temporary sound barriers for construction activities that occur adjacent to occupied noise-sensitive structures; equipping construction equipment with more effective mufflers, sound-insulating hoods or enclosures, vibration dampers, and other Best Available Control Technology (BACT); and reducing non-essential idling of construction equipment to no more than five minutes shall be incorporated into construction activities to reduce construction-related noise.</p>	<p>1-2) Review plans and specifications to ensure that measures to reduce noise are included.</p> <p>3) Construction contractor/manager shall submit a letter to the County verifying full compliance with all requirements.</p> <p>4) Field Verification to ensure measures are implemented.</p>	<p>1) Prior to future development project approval.</p> <p>2) Prior to construction of future projects.</p> <p>3) During future project construction.</p> <p>4) Monitoring and reporting conducted during project review and construction.</p>	Applicant	County of Los Angeles			
<p>Mitigation Measure 3.13-2: Stationary-Source Noise. For any project that involves a noise-sensitive use within the 65 dBA CNEL contour (i.e., areas in or above 65 dBA CNEL) exposed to project stationary-source noise levels in excess of applicable standards in the Los Angeles County Noise Ordinance, the project applicant shall submit an acoustic analysis prior to project approval. The acoustic analysis shall identify site design features (e.g., setbacks, berms, parapets, equipment enclosures, equipment mufflers, sound walls, or other similar noise control device or noise barrier) and/or required building acoustical improvements (e.g., sound transmission class rated windows, doors, and attic baffling) to ensure compliance with the County's Noise Compatibility Criteria, the California Building Code, and the California Noise Insulation Standards (Title 24 of the California Code of Regulations).</p>	<p>1) Applicant shall submit an acoustic analysis to the County.</p> <p>2) Review plans and specifications to ensure that project design includes features to reduce noise.</p> <p>3) Field Verification to ensure measures are implemented.</p>	<p>1) Prior to future development project approval.</p> <p>2) Prior to construction of future projects.</p> <p>3) During future project construction.</p> <p>4) Monitoring and reporting conducted during project review and construction.</p>	Applicant	County of Los Angeles			
<p>Mitigation Measure 3.13-3: Construction Vibration. Individual projects that use vibration-intensive construction equipment, such as pile drivers, jackhammers, and vibratory rollers near vibration-sensitive receptors shall be evaluated by the applicant for potential vibration impacts. If construction-related vibration is determined to be perceptible at vibration-sensitive uses (i.e., exceed the County's standard of 0.01 inches per second (in/sec) vibration velocity [within the range of 1 to 100 Hz frequency]), additional requirements shall be implemented during construction, such as the use of less-vibration-intensive equipment or vibration-reduction construction techniques or strategies (e.g., drilled piles to eliminate the use of a vibration-intensive pile driver, increased setback distances).</p>	<p>1) Applicant shall complete an analysis for potential vibration impacts and submit to the County.</p> <p>2) Review plans and specifications to ensure project construction includes measures to reduce vibration impacts.</p> <p>3) Field Verification to ensure measures are implemented.</p>	<p>1) Prior to future development project approval for future projects that include vibration-intensive construction equipment.</p> <p>2) Prior to construction of future projects.</p> <p>3) During future project construction.</p> <p>4) Monitoring and reporting conducted during project review and construction.</p>	Applicant/County of Los Angeles	County of Los Angeles			
<p>Mitigation Measure 3.13-4: New Development Near Railroad Tracks. New development that occurs within 200 feet of a railroad track (according to the FTA's vibration screening distances) shall be evaluated for potential vibration impacts. The project property owner/developers shall retain an acoustical engineer to conduct an acoustic analysis and identify, where appropriate, site design features and/or required building construction</p>	<p>1) Applicant shall retain an acoustical engineer to conduct an acoustic analysis and submit to the County.</p> <p>2) Review plans and specifications to ensure project design includes features to</p>	<p>1) Prior to future development project approval for projects that occur within 200 feet of a railroad track.</p> <p>2) Prior to construction of future projects.</p>	Applicant	County of Los Angeles			

Mitigation Measure	Mitigation Method	Timing of Implementation	Implementation Responsibility	Monitoring and Reporting Agency	Verification of Compliance		
					Initials	Date	Remarks
improvements to ensure that vibration impacts would remain below acceptable levels of 0.08 in/sec RMS for residential uses.	keep vibration impacts below acceptable levels.	3) Monitoring and reporting conducted during project review.					
Transportation							
<p>Mitigation Measure 3.15-1, Traffic Control Plan: The County shall require project applicants and construction contractors to coordinate with relevant County departments, transit providers, and emergency service providers to develop a traffic control plan to reduce the impacts of construction traffic on transit service, roadway operations, emergency responders, pedestrian and bicycle facilities, and public safety in the surrounding area. (A traffic control plan may not be required for minor construction activities.) The project applicant shall be responsible for monitoring to ensure that the plan is effectively implemented by the construction contractor(s). Measures that may be employed throughout the course of the construction period include, but are not limited, to the following.</p> <ul style="list-style-type: none"> • Provide advance notice of lane and sidewalk closures, durations, and alternative routes to emergency service providers, motorists, bicyclists, and pedestrians. • Provide clearly marked pedestrian detours if any sidewalk or pedestrian walkway closures are necessary. • Provide clearly marked bicycle detours if heavily used bicycle routes must be closed, or if bicyclist safety may otherwise be comprised. • Provide crossing-guards and/or flag persons as needed to avoid traffic conflicts and ensure pedestrian and bicyclist safety. • Locate all stationary equipment as far as possible from areas used heavily by vehicles, bicyclists, and pedestrians. • Use nonskid traffic plates over open trenches to reduce hazards. • Implement traffic control measures to reduce vehicle travel delays through construction zones. • Maintain acceptable response times and performance objectives for emergency response services. • Avoid routing construction traffic through residential areas to the extent feasible. • Prohibit mobilization and demobilization of heavy construction equipment during AM and PM peak traffic hours. • Maintain access for driveways and private roads outside the immediate construction zone by using steel plates or temporary backfill, as necessary. • Provide designated areas for construction worker parking wherever feasible to reduce use of parking on streets or in city center areas. 	<p>1) Applicant and/or its Construction contractor/manager shall develop a construction traffic control plan.</p> <p>2) Review plans and specifications to ensure that project includes traffic control plan.</p> <p>3) Applicant monitor to ensure measures are implemented by Construction contractor/manager.</p>	<p>1) Prior to future development project approval.</p> <p>2) Prior to construction of future projects.</p> <p>3) During future project construction.</p> <p>4) Monitoring and reporting conducted during project review and construction.</p>	County of Los Angeles/Applicant	County of Los Angeles			
Tribal Cultural Resources							
<p>Mitigation Measure 3.16-1: AB 52 Consultation. Consistent with AB 52, before the release of a negative declaration, mitigated negative declaration, or EIR, the County shall initiate consultation within 14 days of a decision to undertake a project facilitated by 2045 CAP measures or actions. The County shall provide formal notification to the designated contact of, or a tribal representative of, each traditionally and culturally affiliated California Native American tribe that has requested notice. The County shall begin the consultation process within 30 days after receiving a California Native American tribe's request for consultation. The purpose of the consultation shall be to identify sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that meet the definition of tribal cultural resources provided in CEQA Section 21074(a)(1) or Section 21074(a)(2). In addition, the California Native American tribe may request consultation regarding the type of environmental review necessary, the significance of tribal cultural resources, the significance of the project's impacts on the tribal cultural resources, and, if necessary, project alternatives or the appropriate measures for preservation or mitigation.</p> <p>If tribal cultural resources are identified, the County shall implement mitigation measures that could avoid or substantially lessen significant impacts on such resources, including but not limited to the measures recommended in Public Resources Code Section 21084.3, or shall implement alternatives that would avoid significant impacts on the tribal cultural</p>	<p>1) County shall initiate AB 52 Consultation.</p> <p>2) County shall begin the consultation process.</p> <p>3) County shall implement measures or alternatives that could avoid or substantially lessen significant impacts on tribal cultural resources, in consultation with the California Native American tribe.</p>	<p>1) Within 14 days of decision to undertake a future project.</p> <p>2) Within 30 days after receiving a California Native American tribe's request for consultation.</p> <p>3) If tribal cultural resources are identified.</p> <p>4) Monitoring and reporting conducted during project review.</p>	County of Los Angeles	County of Los Angeles

					Initials	Date	Remarks
resources. Such measures shall be implemented in consultation with the California Native American tribe.							
Wildfire							
<p>Mitigation Measure 3.18-3: Fire Safety During Construction and Operation. Future applicants and/or their contractors shall prepare and implement project-specific fire protection plans for projects located in the VHFHSZ to ensure that wildfire-related hazards are not exacerbated by projects facilitated by the 2045 CAP measures or goals. The applicant shall prepare and submit a fire protection plan to the County for review and approval at least 60 days before the start of construction activities. The fire protection plan shall include or require, but not be limited to, the following measures along with Fire Code compliance, as applicable to address construction and operation:</p> <ul style="list-style-type: none"> • A training module within the pre-construction worker training (e.g., Worker Environmental Awareness training, safety training, fire equipment and procedures) on the specifics of the approved plan for all construction crew members before the start of construction. • List project site roles and responsibilities and identify appropriate emergency notification procedures and site-specific emergency response and evacuation measures and routes that would be followed during emergency situations. All construction vehicles shall have fire suppression equipment. • Instruct construction personnel to park vehicles within roads, road shoulders, graveled areas, and/or cleared areas (i.e., away from dry vegetation) wherever such surfaces are present at the construction site. • Protocol for the project contractor and/or the applicant to perform visual inspections to ensure that all ignition risks are reduced or eliminated before leaving the worksite. Identify fire safety and prevention measures for project-specific infrastructure that can ignite fires, such as power lines, battery storage facilities, and composting facilities. 	<p>1) Applicant and/or its Construction contractor/manager shall prepare and submit a fire protection plan to the County.</p> <p>2) Review plans and specifications to ensure project includes fire protection measures.</p>	<p>1) At least 60 days before the start of construction activities.</p> <p>2) Prior to future development project approval for projects located in the VHFHSZ, and prior to construction of future projects</p> <hr/> <p>3) Monitoring and reporting conducted during project review.</p>	Applicant	County of Los Angeles			

**SUMMARY OF PROCEEDINGS
REGIONAL PLANNING COMMISSION
LOS ANGELES COUNTY 2045 CLIMATE ACTION PLAN
PROJECT NO. 2019-002015-(1-5)
ADVANCE PLANNING NO. RPPL2019003630
ENVIRONMENTAL ASSESSMENT NO. RPPL2019003635**

November 15, 2023 Regional Planning Commission Hearing

Staff presented the Los Angeles County 2045 Climate Action Plan (2045 CAP) at the November 15, 2023 public hearing. Staff provided an overview of the 2045 CAP and accompanying voluntary CEQA Streamlining Checklist, General Plan consistency, and summarized outreach and engagement efforts made throughout the development of the project.

Discussion

Nine individuals testified at the hearing (two in-person, seven online) and one person who signed up was unable to provide a testimony due to audio issues.

Commissioners Hastings and O'Connor disclosed that they received phone calls from labor and building industry groups prior to the hearing and that the statements made during the calls were consistent with the public comment letters submitted by the groups.

Representatives from the Las Virgenes Homeowners Federation, Endangered Habitats League, Santa Clarita Organization for Planning and the Environment, and an individual testified in support of the approval of the 2045 CAP. A representative of the Acton Town Council expressed concerns about Measure T5 and how it will impact a local intersection and requested an action be added to ban new gas stations. Representatives from the Building Industry Association, BizFed, Rebuild SoCal Partnership, and an individual requested a one year pause to the project and for the County to conduct an economic impact analysis of the 2045 CAP. Testimonies from these representatives also included concerns with the performance objective of 300 jobs per acre.

The Commission had questions on decarbonization and grid capacity. Staff responded that based on discussions with utility providers, energy providers are already planning for expansion of electrical grid infrastructure. Staff also responded that with the decarbonization of the freight vehicles, the County already require decarbonization of vehicles used in industrial warehouses through conditions of approval for discretionary permits and the State of California passed the Advanced Clean Fleets Regulation that will require the sale of zero emissions medium- and heavy-duty vehicles by 2036. Staff explained that the 2045 CAP will demonstrate that the County is planning for

infrastructure upgrades and give the County an advantage when applying for competitive funding opportunities.

The Commission asked about the performance objective of 300 jobs per acre in the 2045 CAP. Staff clarified to the Commission that the performance objective of achieving a job density of 300 jobs per acre by 2030 is a goal to be achieved by the County in suitable locations such as transit-oriented districts where high density housing is planned to reduce commuter distances. Development projects are not required to comply with this performance goal when utilizing the 2045 CAP CEQA Streamlining Checklist. The goal of the performance objective is to ensure that housing and jobs are located close together and the County's community and area plan planning processes will consider the right balance to help to achieve this performance objective. Staff also responded that an economic impact analysis will not be conducted since the 2045 CAP is consistent with the General Plan Economic Development Element. Staff also reiterated that the 2045 CAP is consistent with the County's Housing Element and fulfills Program Number 3 in the Housing Element, which explicitly directs the update of the CAP.

Vote

The Commission unanimously voted to recommend to the Board of Supervisors the certification of the Final PEIR, along with the adoption of the required Findings of Fact, Statement of Overriding Considerations, and Mitigation Monitoring and Reporting Program; and the approval of the Project.

2045 Climate Action Plan	OurCounty Sustainability Plan
<p><u>Measure ES1</u> Develop a Sunset Strategy for All Oil and Gas Operations: Develop a sunset strategy for all oil and gas operations that prioritizes disproportionately affected communities and develop a strategy for carbon removal.</p>	<p><u>Action 3</u> Conduct an inventory to identify all abandoned/idled oil and gas infrastructure in LA County, and work with DOGGR to develop and implement a closure plan, prioritized by condition and proximity to sensitive populations, that includes identification of potential funding sources.</p> <p><u>Action 84</u> Collaborate with the City of Los Angeles and other cities to develop a sunset strategy for all oil and gas operations that prioritizes disproportionately affected communities.</p>
<p><u>Measure ES4</u> Increase Energy Resilience: Expand energy storage and microgrids throughout the community and for County operations.</p>	<p><u>Action 26</u> Develop minimum requirements and best practices for amenities, programming, and accessibility of cooling centers.</p> <p><u>Action 86</u> Develop a publicly-accessible community energy map that identifies opportunities for deploying distributed energy resources and microgrids in order to improve energy resiliency in disadvantaged communities.</p>
<p><u>Measure T1</u> Increase Density Near High-Quality Transit Areas: Increase housing opportunities that are affordable and near transit, to reduce VMT.</p>	<p><u>Action 49</u> Expand the number and extent of transit oriented communities while ensuring that vital public amenities such as parks and active transportation infrastructure are included.</p>
<p><u>Measure T3</u> Expand Bicycle and Pedestrian Network to Serve Residential, Employment, and Recreational Trips: Travel options that serve a variety of land uses and trip purposes can help shift some trips away from single-occupancy vehicles.</p>	<p><u>Action 30</u> Build shade structures at major transit stops, such as those identified in Metro's Active Transportation Strategic Plan, prioritizing communities with high heat vulnerability.</p>
<p><u>Measure T4</u> Broaden Options for Transit, Active Transportation, and Alternative Modes of Transportation: Transit service, micro mobility services (such as bike-share, scooter-share, and</p>	<p><u>Action 98</u> Install bus-only lanes and signal prioritization along major thoroughfares, and work with transit agencies and neighboring jurisdictions to plan and install full bus rapid transit infrastructure along priority corridors, as appropriate.</p>

<p>drone deliveries), and access to these transportation options can help reduce VMT</p>	<p><u>Action 100</u> Offer free transit passes for students, youth, seniors, disabled, and low-income populations.</p> <p><u>Action 103</u> Evaluate and implement demand-based priced parking at County facilities and on County streets where appropriate.</p>
<p><u>Measure T5</u> Limit and Remove Parking Minimums: Parking strategies such as parking maximums, unbundling parking, or market-price parking can help reduce VMT.</p>	<p><u>Action 99</u> Develop and implement a comprehensive parking reform strategy, which should include, but not be limited to: elimination of minimum parking requirements for all new residential units, establishment of parking maximums within half a mile of high-quality transit stops, creation and expansion of parking benefit districts, and incentives for developers to provide less than maximum allowable parking.</p>
<p><u>Measure T6</u> Increase ZEV Market Share and Reduce Gasoline and Diesel Fuel Sales: Increase unincorporated Los Angeles County’s ZEV market share and vehicle penetration to the maximum extent feasible to replace internal combustion engine vehicles. Set targets for reducing total gasoline and diesel vehicle fuel sales.</p>	<p><u>Action 91</u> Streamline permitting and construction of zero-emission vehicle infrastructure.</p> <p><u>Action 92</u> Install electric vehicle (EV) chargers at County facilities and properties for public, employee, and fleet use, prioritizing locations in disadvantaged communities.</p>
<p><u>Measure T7</u> Electrify County Fleet Vehicles: Electrify the County bus, shuttle, and light-duty vehicle fleets.</p>	<p><u>Action 93</u> Revise and regularly update the County's fleet policy to require zero-emission vehicles or better whenever available and operationally feasible.</p> <p><u>Action 94</u> Convert Sheriff's Department (LASD) fleet to zero emission by partnering with vehicle manufacturers to develop a zero-emission pursuit vehicle and transport bus.</p>
<p><u>Measure T8</u> Accelerate Freight Decarbonization: Incentivize and implement freight decarbonization</p>	<p><u>Action 10</u> Partner with local and regional agencies along key freight corridors, as well as with private freight movers, to implement “green goods</p>

<p>technologies, specifically focusing on charging infrastructure.</p>	<p>movement” technologies, such as medium- and heavy-duty zero emission vehicle infrastructure, through initiatives like Metro's I-710 Corridor Project or use of County properties for refueling.</p> <p><u>Action 95</u> Partner with Los Angeles Fire Department (LAFD) and equipment manufacturers to pilot a zero-emission fire engine.</p>
<p><u>Measure E1</u> Decarbonize Existing Buildings: As the carbon intensity of grid-supplied electricity decreases, decarbonization of the electrical grid must be combined with building decarbonization, shifting the energy load from fossil fuels to carbon-free energy sources while taking into consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face. This measure aims to decarbonize applicable existing buildings. A primary alternative to fossil natural gas is renewable electricity supplied by CPA. Biomethane is another alternative to fossil natural gas; however, existing opportunities for widespread use of biomethane are currently limited. The use of other zero-GHG-emission fuel sources for buildings will also be considered.</p>	<p><u>Action 85</u> Collaborate with the City of Los Angeles, Santa Monica, and other members of the Building Decarbonization Coalition to develop building energy and emissions performance standards that put the County on a path towards building decarbonization.</p>
<p><u>Measure E2</u> Decarbonize New Development: This measure aims to decarbonize all applicable new buildings, while taking into consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face.</p>	<p><u>Action 31</u> Adopt CALGreen Tier 1 green building standards and identify which Tier 2 standards could be adopted as code amendments.</p>
<p><u>Measure E4</u> Improve Energy Efficiency of Existing Buildings: Retrofit existing building stock to reduce overall unincorporated Los Angeles County energy use.</p>	<p><u>Action 117</u> Adopt an energy and water efficiency ordinance for existing buildings, requiring all privately owned buildings over 20,000 square feet to benchmark and report their energy and water use, and demonstrate their pathway to energy and water efficiency.</p> <p><u>Action 118</u> Expand and enhance the energy efficiency programs offered by the Southern California Regional Energy Network (SoCalREN).</p>

<p><u>Measure E5</u> Increase Use of Recycled Water and Graywater Systems: Increasing the use of alternative water sources (e.g., recycled water, graywater, indirect potable reuse) reduces the demand for water sources with higher energy and carbon intensities (e.g., imported water, groundwater).</p>	<p><u>Action 37</u> Support efforts to maximize sustainable yield from local groundwater basins.</p> <p><u>Action 40</u> Reduce barriers and increase accessibility to alternative water sources (rainwater, greywater, stormwater, and recycled water), including incentives for residential and commercial/small business greywater systems and streamlining permitting pathways.</p> <p><u>Action 114</u> Develop a Net Zero Water Ordinance for new development.</p>
<p><u>Measure E6</u> Reduce Indoor and Outdoor Water Consumption: Reducing indoor and outdoor water consumption is essential as the State experiences longer and more severe droughts. Not only will water conservation improve regional resiliency, but it will also reduce GHG emissions through the reduction of energy consumption associated with the processing, treatment, and conveyance of water and wastewater.</p>	<p><u>Action 18</u> Complete an assessment of the region's drinking water systems to identify resiliency to drought and shocks, as well as risk of water quality issues due to aging infrastructure, deferred maintenance, etc.</p> <p><u>Action 115</u> Adopt building code changes that improve water efficiency and reduce indoor and outdoor water use above current CALGreen standards.</p> <p><u>Action 116</u> Establish pilot programs for smart metering or sub-metering indoor and outdoor water use at County facilities.</p>
<p><u>Measure W1</u> Institutionalize Sustainable Waste Systems and Practices: Undertake actions that result in sustainable waste systems. Responsible and sustainable waste practices are learned behaviors that the County can facilitate through outreach, education, and mandates. Increase diversion of recyclable materials and organics from landfills through ordinances, service improvements, education and outreach, and promotion of product stewardship and markets for material reuse. An increased diversion rate indirectly</p>	<p><u>Action 107</u> In collaboration with the City of Los Angeles, develop and implement an equitable strategy to phase out single use plastics, including in County contracts and facilities.</p> <p><u>Action 108</u> Adopt and advocate for producer and manufacturer responsibility requirements.</p> <p><u>Action 123</u></p>

<p>reduces the demand for virgin materials, which reduces the life-cycle carbon intensity of any resulting products. Through action taken at the County level, waste-conscious habits and thoughtful consumption can become the default.</p>	<p>Increase the diversion requirements in the County’s Construction and Demolition Debris Recycling and Reuse Ordinance, encourage the use of recycled-content materials in construction projects, and incentivize use of recycled materials in public art projects funded or commissioned by the County.</p>
<p><u>Measure W2</u> Increase Organic Waste Diversion: Provide services for diverting yard waste, food scraps, and compostable paper from landfills to beneficial uses, including compost, food rescue, and energy production.</p>	<p><u>Action 120</u> Establish guidelines for large-quantity food waste or green waste generators to perform on-site composting, mulching, or anaerobic digestion, and develop a marketing plan for the product.</p> <p><u>Action 121</u> Promote and communicate source separation, organic waste collection requirements, food waste reduction and donation, local organic waste recycling programs, and conduct targeted, sector-based educational campaigns.</p> <p><u>Action 128</u> Enhance and expand the County's existing Food DROP food donation and redistribution program to divert edible food from landfills and make available to food insecure communities.</p>
<p><u>Measure A1</u> Conserve Forests, Woodlands, Shrublands, Grasslands, Desert, and other Carbon-Sequestering Wildlands and Working Lands: Preserve, conserve, and restore agricultural lands, working lands, rangelands, forest lands, wetlands, and other wildlands in unincorporated Los Angeles County.</p>	<p><u>Action 47</u> Support the preservation of agricultural and working lands, including rangelands, by limiting the conversion of these lands to residential or other uses through tools such as the creation of agricultural easements, particularly within high climate-hazard areas and SEAs.</p> <p><u>Action 67</u> Develop a wildlife connectivity ordinance.</p>
<p><u>Measure A3</u> Expand Unincorporated Los Angeles County’s Tree Canopy and Green Spaces: Create an Urban Forest Management Plan to plant trees, increase unincorporated Los Angeles County’s tree canopy cover, add green space, and convert impervious surfaces. Focus tree planting on frontline communities with insufficient tree cover and green spaces.</p>	<p><u>Action 43</u> Create and implement a community-informed Urban Forest Management Plan that incorporates equitable urban forest practices, identifies County funding sources, and prioritizes:</p> <ul style="list-style-type: none"> • Tree- and park-poor communities; • Climate and watershed-appropriate and drought/pest-resistant vegetation;

	<ul style="list-style-type: none">• Appropriate watering, maintenance, and disposal practices;• Shading; and• Biodiversity. <p><u>Action 71</u> Increase the number of native plants, trees, and pollinator/bird-friendly landscapes on public properties for education and habitat connectivity.</p>

Celia Zavala, Executive Officer-
Clerk of the Board of Supervisors
383 Kenneth Hahn Hall of Administration
Los Angeles, California 90012

NOTICE OF PUBLIC HEARING CONCERNING
LOS ANGELES COUNTY 2045 CLIMATE ACTION PLAN

PROJECT NO. 2019-002015-(1-5)
ADVANCE PLANNING NO. RPPL2019003630
ENVIRONMENTAL ASSESSMENT NO. RPPL2019003635
STATE CLEARINGHOUSE NO. 2021120568

Notice is hereby given that the Board of Supervisors will conduct a public hearing on the matter referenced above on **Tuesday, March 12, 2024 at 9:30 a.m.**, in Room 381B of the Kenneth Hahn Hall of Administration, 500 West Temple Street, Los Angeles, California 90012. Interested persons will be given an opportunity to testify. **Please note that due to the COVID-19 pandemic, a virtual public hearing may be held.** Please visit <http://bos.lacounty.gov/Board-Meeting/Board-Agendas> for details on how to listen to the virtual meeting and/or address the Board. Written comments may be submitted to the address above, attention: Public Hearing Section or e-mailed to PublicHearing@bos.lacounty.gov with the Project No. in the "Subject". Project status can be obtained online at: <http://bos.lacounty.gov/Board-Meeting/Public-Hearings> or you may also call (213) 974-1426. If the final decision on this proposal is challenged in court, challenges may be limited to issues raised before or at the public hearing.

Location: Unincorporated areas of Los Angeles County

General Description of Proposal:

The proposed Los Angeles County 2045 Climate Action Plan (2045 CAP) is the County's plan toward meeting greenhouse gas (GHG) emissions reduction targets for unincorporated Los Angeles County by the years of 2030, 2035, and 2045. The 2045 CAP is an implementing component of the Air Quality Element. It was developed with the goal of implementing the GHG emissions reduction policies of the General Plan Air Quality Element and aligning with statewide GHG emissions reduction targets. The project will amend the County's General Plan Air Quality Element goals, policies, and implementation programs and replace the Community Climate Action Plan with the 2045 CAP. The Board will also consider the certification of the Program Environmental Impact Report (PEIR), which includes the Final PEIR and Recirculated Draft PEIR; and adoption of the CEQA Findings of Fact, Statement of Overriding Considerations, and County Mitigation Monitoring and Reporting Program.

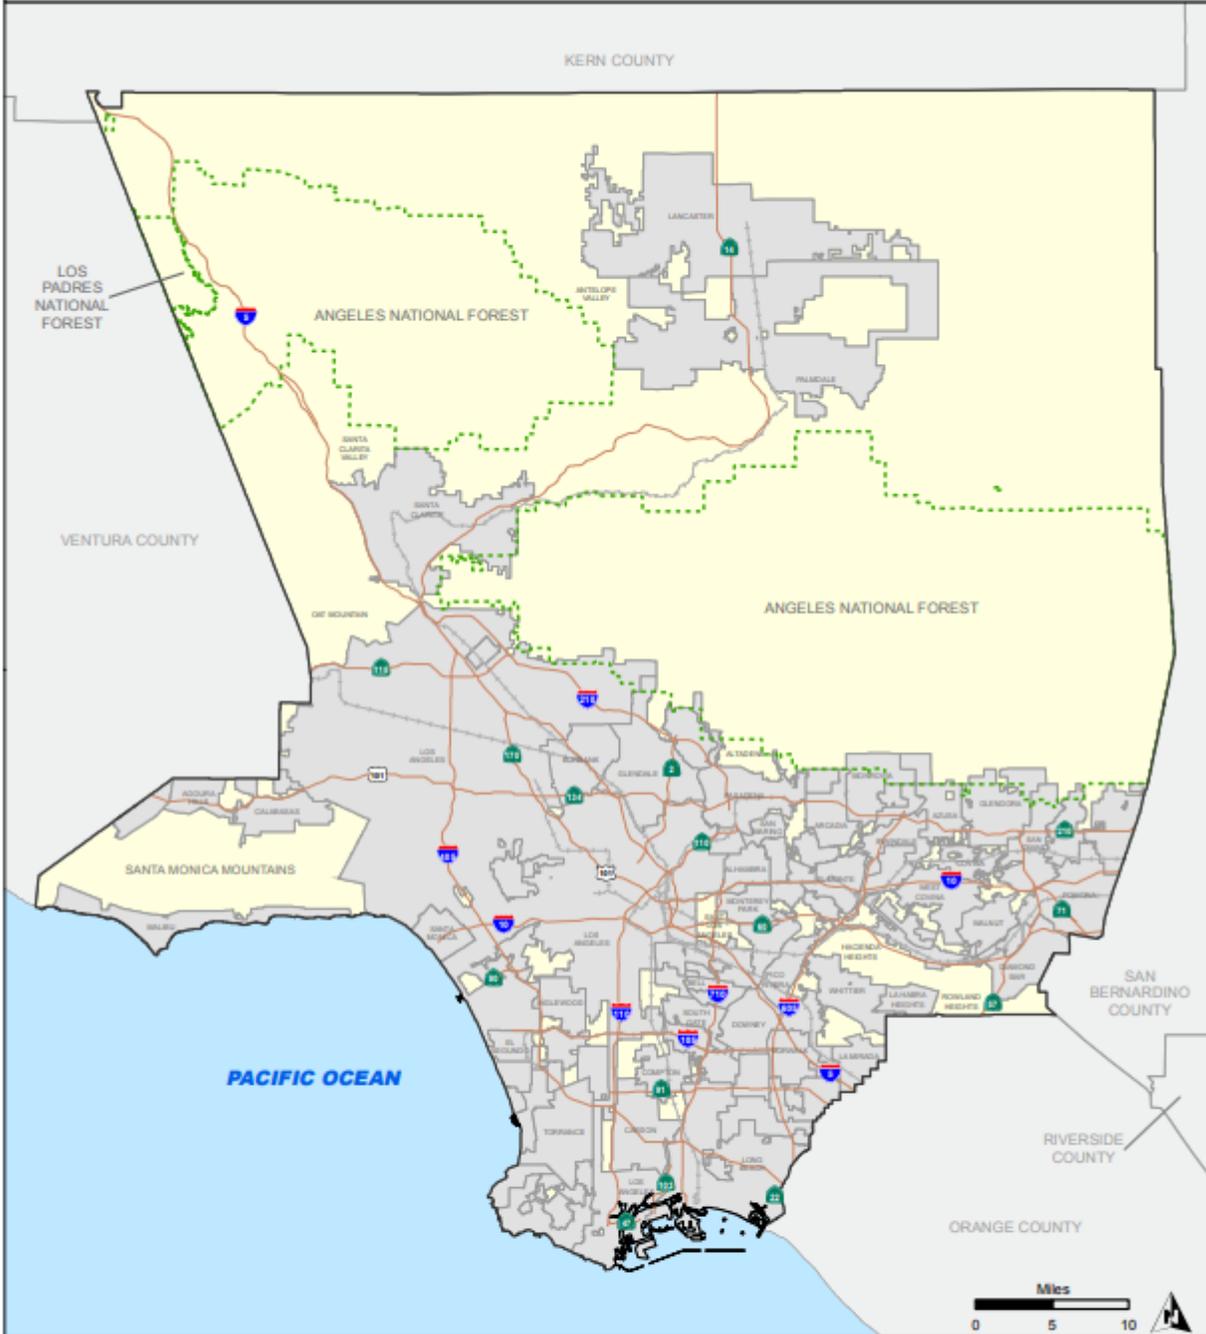

Contact the Department of Regional Planning, **Thuy Hua at (213) 974-6461** between 7:30 a.m. and 5:30 p.m., Monday through Thursday (office is closed Fridays) or thua@planning.lacounty.gov directly for questions or additional information. Selected materials are available at <https://planning.lacounty.gov/long-range-planning/climate-action-plan/documents/>. **Si necesita más información en Español, por favor llame al (213) 974-6427.**

If you need reasonable accommodations, such as assistive listening devices, agenda in Braille, interpreters, disability-related accommodations or other auxiliary aids, please contact the Executive Office of the Board at (213) 974-1411 or (213) 974-1707 (TTY), Monday through Friday from 8:00 a.m. to 5:00 p.m., at least three business days prior to the Board meeting. Later requests will be accommodated to the extent feasible. Máquinas de traducción están disponibles o si necesita intérprete para las juntas del Condado de Los Angeles, por favor llame al (213) 974-1426, de lunes a viernes de 8:00 a.m. a 5:00 p.m., con tres días de anticipación.
