We are concerned that the action items proposed in the Draft Plan are insufficient to support Goal 5. In particular, lacking from the action items is any clear plan for ensuring habitat connectivity within the region.

Instead, it appears that the County has not prioritized this issue. For instance, the County General Plan EIR anticipated a significant adverse effect on wildlife movement.⁴ The California Department of Fish and Wildlife (“CDFW”) urged the County to develop mitigation opportunities for wildlife connectivity, since such “opportunities for wildlife corridors and nursery sites are best established during large scale planning efforts such as this General Plan.” CDFW noted that “Wildlife corridor areas can be delineated and set aside in the General Plan for current and future conservation efforts. An assessment could be placed on development within the Project area to secure the acquisition of these critical linkages and sites, therefore reducing impacts to wildlife corridors and nursery sites and ensuring biological diversity.”⁵ The County did not implement CDFW’s recommendations.

The Plan should include a goal to develop a wildlife connectivity ordinance. Moreover, while the proposed “actions” to support Goal 5 are all helpful measures, more is needed. The Plan should incorporate policies that support an “urban growth boundary.” Urban growth boundaries have been used in other jurisdictions as a tool to encourage development in or near existing communities while leaving natural areas undeveloped. Without a clearly defined urban growth boundary, developers will continue to propose—and the Board will continue to approve—development in wild and fire-prone areas, which will further inhibit wildlife connectivity while increasing traffic and air pollution.

G. The Center Supports Goals 7 and 8 and Encourages Stronger Policies To Reduce VMT.

We support Goals 7 and Goal 8—a fossil fuel-free LA County with convenient, safe and affordable transportation that reduces car dependency. However, the targets and associated actions do not include sufficiently ambitious goals to reduce vehicle miles travelled (“VMT”). The Draft Plan’s aims for “[a]t least 15% of all trips will be by foot, bike, micromobility, or public transit.” (Draft Plan at 108.) This means that even if this target is met, in six years 85 percent of trips in the County will still be by car. The Draft Plan should call for much stronger measures to reduce single occupancy vehicle trips and VMT. The best way to do this is to limit development in areas far from existing cities that generate high VMT and limit new freeway development, which induces additional VMT.

The December 2018 Technical Advisory issued by the Governor’s Office of Planning and Research (the “VMT Report”)⁶ contains helpful guidance and analysis that could be

⁵ County of Los Angeles, *Los Angeles County General Plan Update Final Environmental Impact Report* (March 2015), available at http://planning.lacounty.gov/assets/upl/project/gp_2035_lac-gpu-final-eir-final.pdf.

⁶ The VMT Report is available at http://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf.

incorporated into the Draft Plan. For instance, the VMT Report states that land use decisions to reduce GHG emissions associated with the transportation sector are crucial in order to meet the GHG reductions set forth in SB 375. (VMT Report at 3.) The VMT Report further notes that California cannot meet its climate goals without curbing single-occupancy vehicle activity; land use patterns and transportation options will need to change to support reductions in VMT. (*Id.* at 10.) The VMT Report also proposes a “per capita” or “per employee” threshold of 15 percent below existing development as a reasonable threshold. (*Id.* at 10.) The VMT Report reiterates the conclusion of the California Air Resources Board that “there is a gap between what SB 375 can provide and what is needed to meet the State’s 2030 and 2050 goals.” (*Id.*)

The VMT Report confirms that VMT-intensive development impacts human health and the environment: “Human health is impacted as increases in vehicle travel lead to more vehicle crashes, poorer air quality, increases in chronic diseases associated with reduced physical activity, and worse mental health. Increases in vehicle travel also negatively affect other road users, including pedestrians, cyclists, other motorists, and many transit users. The natural environment is impacted as higher VMT leads to more collisions with wildlife and fragments habitat. Additionally, development that leads to more vehicle travel also tends to consume more energy, water, and open space (including farmland and sensitive habitat). This increase in impermeable surfaces raises the flood risk and pollutant transport into waterways.” (VMT Report at 3.) As such, if the County took strong steps to reduce VMT, it would have co-benefits of better air quality, decreased chronic disease, decreased wildlife-vehicle collisions, and less habitat fragmentation.

The VMT Report further states that roadway expansion projects can induce substantial VMT such that the environmental reviews should incorporate quantitative estimates of induced VMT. (VMT Report at 23.) The VMT Report explains that “[b]uilding new roadways, adding roadway capacity in congested areas, or adding roadway capacity to areas where congestion is expected in the future, typically induces additional vehicle travel.” (*Id.* at 24.) The Plan should thus contain policies to discourage unnecessary highway development and instead focus infrastructure resources on alternative transportation projects.

H. Conclusion

Thank you for the opportunity to submit comments on the Draft Plan. Again, the Center strongly supports the goals of the Draft Plan. But if the goals in the plan are not supported by clear and enforceable policies, then the final Plan will be ineffective in achieving these goals.

Los Angeles County’s traffic jams, air pollution, fragmented wildlife habitat, and diminishing wildlands are a legacy of poor planning decisions made by local officials, often made under pressure from profit-driven developers. Unfortunately Los Angeles County and its Board have continued to approve costly, dangerous, and environmentally-damaging development despite (1) strong public opposition and (2) science confirming that such development is inappropriate in light of the climate crisis, extinction crisis, and the risks of building in fire-prone landscapes.

The Center urges the Chief Sustainability Office and Board to use this Plan as a means to establish a new vision for Los Angeles County that supports healthy communities and healthy wildlands. For such a vision to become reality, it must be supported by clear, binding, and legally enforceable policies. As long as such policies are vague or absent, developers will continue proposing—and officials will likely keep approving—projects that take the county in the wrong direction.

Please do not hesitate to contact the Center at the number or email listed below.

Sincerely,

J.P. Rose

SUPERIOR COURT OF CALIFORNIA
COUNTY OF SONOMA

JUL 20 2017

BY M. [Signature]
Deputy Clerk

8 SUPERIOR COURT FOR THE STATE OF CALIFORNIA
9 COUNTY OF SONOMA

11 CALIFORNIA RIVERWATCH,
12 Petitioner,
13 v.
14 COUNTY OF SONOMA, ET AL.
15 Defendants.
16

Case No.: SCV-259242

ORDER GRANTING PETITION
FOR WRIT OF MANDATE

18 This matter was tried to the court on March 23, 2017, the Honorable Nancy Case
19 Shaffer presiding. The Law Office of Jack Silver and Jerry Bernhaut and Jack Silver
20 appeared on behalf of Petitioner; the Office of Sonoma County Counsel and Bruce Goldstein
21 and Verne Ball appeared on behalf of Respondent Sonoma County Regional Climate
22 Protection Authority. At the conclusion of the hearing, the court ordered further briefing.
23 The matter was deemed submitted on April 21, 2017, when all briefs were submitted.

24 I. SUMMARY OF RULING

25 The court finds that the Sonoma County Regional Climate Protection Authority's Final
26 Programmatic EIR ("the PEIR") for Climate Action 2020 and Beyond, its Climate Action
27 plan ("CAP") and the County of Sonoma's approval of the CAP violate CEQA, in that the
28 inventory of greenhouse gas emissions is based on insufficient information; the PEIR fails to

1 include effectively enforceable, clearly defined performance standards for the mitigation
2 measures regarding Green House Gas ("GHG") emissions, identified as "GHG Reduction
3 Measures;" and fails to develop and fully analyze a reasonable range of alternatives.

4 Accordingly, the approval of the PEIR was a prejudicial abuse of discretion by
5 Respondent. Given the lack of information and other material defects, as a matter of law the
6 PEIR cannot fulfill its basic CEQA purpose as an information document.

7 The court finds that there is insufficient information in the administrative record to
8 support the factual conclusion that the CAP will achieve its fundamental purpose of reducing
9 Respondent's countywide GHG emissions to the stated target of 25% below 1990 levels by
10 2020.

11 **I. FACTS**

12 Petitioner seeks a writ of mandate overturning Respondent's certification and of a
13 Final Programmatic EIR (the PEIR) for its Climate Action Aplan (CAP) and the approval of
14 the CAP on the grounds that the approvals violate CEQA.

15 **A. The Project**

16 The CAP Project is a planning-level document to guide analysis of the greenhouse gas
17 (GHG) impacts of future projects in the county.

18 In 2006, the California legislature passed AB 32, the Global Warming Solutions Act
19 (the Act) which, among other things, establishes a statewide goal of achieving 1990-level
20 GHG impacts by 2020.

21 CEQA Guideline 15183.5 allows agencies to adopt an overall long-range plan such as
22 a general plan or similar plan governing GHG analysis of subsequent projects. Respondent
23 adopted the CAP in accord with Guideline 15183.5 as a method of providing an overall *tiered*
24 *analysis* of GHG impacts in subsequent projects as a method of complying with the Act's
25 mandate. (1 AR 4, 10.)
26
27
28

1 **B. The Petition for Writ of Mandamus**

2 Petitioner argues that the EIR fails to provide an accurate description of the existing
3 conditions or a means for calculating GHG emissions; that the PEIR contains inadequate
4 mitigation measures, alternatives analysis, or response to public comments.

5 Respondent opposes the petition, contending that Petitioner relies on non-existent
6 requirements in 15183.5; that Petitioner fails to discuss the substantial evidence in the record,
7 that the EIR sufficiently discusses existing conditions; that the PEIR properly discloses
8 methodology; that the CAP is not a mitigation measure and does not need to contain
9 mitigation measures; that substantial evidence supports the CAP emissions reduction
10 estimates; that the alternatives analysis complies with CEQA; that Petitioner failed to exhaust
11 administrative remedies on the responses to comments; and that Petitioner has demonstrated
12 no prejudicial error.

13 **II. ANALYSIS**

14 **A. Request for Judicial Notice**

15 The court grants, in full, Respondents' request to take judicial notice of certain
16 government and regulatory documents, including a statement from the Natural Resources
17 Agency on amendments to the Guidelines regarding GHG emissions; the California Air
18 Resources Board ("CARB") Climate Change Scoping Plan; the CARB draft 2030 Target
19 Scoping Plan Update; the County of Napa CAP; Guideline 15183.5, AB32, and SB 97; and
20 the lodgment of the record in this case.

21 **B. CEQA**

22 An EIR is required for a project which substantial evidence indicates may have a
23 significant effect on the environment. (Guidelines for the Implementation of CEQA
24 (Guidelines), 14 CCR section 15063(b)¹; PRC sections 21100, 21151.) EIRs are, in the words
25

26
27
28 ¹These are at 14 Cal Code Regs §§ 15000, *et seq.* Courts should at a minimum afford great weight to the Guidelines except when a section is clearly unauthorized or erroneous under CEQA. *Laurel Heights Improvement Ass'n v. Regents of Univ. of Cal. (Laurel Heights I)* (1988) 47 Cal.3d 376, 391, fn 2; *Sierra Club v. County of Sonoma* (1992) 6 Cal.App.4th 1307, 1315.

1 of the California Supreme Court, “the heart of CEQA.” *Laurel Heights Improvement Assn. v.*
 2 *Regents of the University of California* (1988) 47 Cal.3d 376, 392 (*Laurel Heights I*).

3 The ultimate mandate of CEQA is “to provide public agencies and the public in
 4 general with *detailed information* about the effect [of] a proposed project” and to minimize
 5 those effects and choose possible alternatives. (emphasis added) (PRC 21061.) The public
 6 and public participation hold a “privileged position” in the CEQA process based on
 7 fundamental “notions of democratic decision-making.” (*Concerned Citizens of Costa Mesa,*
 8 *Inc. v. 32nd District Agricultural Association* (1986) 42 Cal.3d 929, 936.)

9 As a fundamental benchmark that generally applies to all issues in CEQA the court, is
 10 that the court, in considering an issue, should look to see if “the public could discern... the
 11 ‘analytic route the... agency traveled from evidence to action.’” (See *Al Larson Boat Shop*
 12 *Inc. v. Bd. of Harbor Commissioners* (1993) 18 Cal.App.4th 729, 749; see also *Topanga Assn.*
 13 *for a Scenic Community v. County of Los Angeles* (1974) 11 Cal.3d 506, 513-514, 522.)

14 The burden of investigation rests with the government and not the public. (*Lighthouse*
 15 *Field Beach Rescue v. City of Santa Cruz* (2005) 131 Cal.App.4th 1170, 1202.)

16 **C. Standard of review**

17 **1. Preliminary Basis for Standard of Review**

18 The standard of review is in dispute here. This dispute arises out of the divergent
 19 characterizations of the issues by the parties.

20 Public Resources Code section 21168 provides that when a court reviews a
 21 determination, finding, or decision of a public agency, "as a result of a proceeding in which
 22 by law a hearing is required to be given, evidence is required to be taken and discretion in the
 23 determination of facts is vested in a public agency ... the court shall not exercise its
 24 independent judgment on the evidence but shall only determine whether the act or decision is
 25 supported by substantial evidence in the light of the whole record." However, review is *de*
 26 *novo* when the court must determine whether the agency has prejudicially abused its
 27 discretion either by failing to proceed in the manner required by law or by reaching a decision
 28 that is not supported by substantial evidence. (*Laurel Heights I, supra* 47 Cal.3d 392, fn.5.)

1 “[A] reviewing court must adjust its scrutiny to the nature of the alleged defect, depending on
 2 whether the claim is predominantly one of improper procedure or a dispute over the facts.”
 3 *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40
 4 Cal.4th 412, 435 (“*Vineyard*”).

5 As the court explained in *Vineyard*:

6 [A]n agency may abuse its discretion under CEQA either by failing to proceed in the
 7 manner CEQA provides or by reaching factual conclusions unsupported by substantial
 8 evidence. (§21168.5.) Judicial review of these two types of error differs significantly:
 9 while we determine de novo whether the agency has employed the correct procedures,
 10 “scrupulously enforc[ing] all legislatively mandated CEQA requirements” (*Citizens of*
 11 *Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564...), we accord greater
 12 deference to the agency's substantive factual conclusions. In reviewing for substantial
 13 evidence, the reviewing court “may not set aside an agency's approval of an EIR on
 14 the ground that an opposite conclusion would have been equally or more reasonable,”
 15 for, on factual questions, our task “is not to weigh conflicting evidence and determine
 16 who has the better argument.”(*Laurel Heights I, supra*, 47 Cal.3d at p. 393....)²

17 While courts must give deference as to substantive factual decisions, courts demand
 18 strict compliance with “legislatively mandated CEQA requirements.” (*Citizens of Goleta*
 19 *Valley v. Bd. of Supervisors* (1990) 52 Cal.3d 553, 564 (*Goleta II*.) A Respondent is entitled
 20 to no deference where the law has been misapplied, or where the decision was based on “an
 21 erroneous legal standard.” (*East Peninsula Educ. Council, Inc. v. East Peninsula Unif. Sch.*
 22 *Dist.* (1989) 210 Cal.App.3d 155, 165.)

23 Courts must ‘determine de novo whether the agency has employed the correct
 24 procedures, “scrupulously enforc[ing] all legislatively mandated CEQA requirements”....’
 25 (*Vineyard Area Citizens for Responsible Growth, supra*, 40 Cal.4th 435, citing *Goleta II*, 52
 26 Cal.3d at 564.) *Failure to include required information is a failure to proceed in the manner*
 27

28

² *Laurel Heights I* is *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 400 (*Laurel Heights I*)

1 required by law and demands strict scrutiny. (*Sierra Club v. State Bd. of Forestry* (1994) 7
 2 Cal.4th 1215, 1236; *Vineyard, supra*, 40 Cal.4th at 435.) The court reviews the PEIR here de
 3 novo.

4 Nevertheless, agency actions are presumed to comply with applicable law unless the
 5 petitioner presents proof to the contrary. (Evid. Code § 664; *Foster v. Civil Service*
 6 *Commission of Los Angeles County* (1983) 142 Cal.App.3d 444, 453.) The petitioner in a
 7 CEQA action thus has the burden of proving that an EIR is insufficient. (*Al Larson Boat*
 8 *Shop, Inc. v. Board of Harbor Commissioners* (1993) 18 Cal.App.4th 729, 740.)

9 **2. Standard of Review: Substantial-Evidence Test**

10 The substantial-evidence test applies to substantive issues in a decision certifying an
 11 EIR. The court must uphold the decision if it is supported by substantial evidence in the
 12 record as a whole. (*Bowman v. City of Petaluma* (1986) 185 Cal.App.3d 1065, 1075; see
 13 *River Valley Preservation Project v. Metropolitan Transit Dev. Bd.* (1995) 37 Cal.App.4th
 14 154, 166; see *Santa Teresa Citizen Action Group v. City of San Jose* (2003) 114 Cal.App.4th
 15 689, 703. The “substantial evidence” test requires the court to determine “whether the act or
 16 decision is supported by substantial evidence in the light of the whole record.” (*Chaparral*
 17 *Greens v. City of Chula Vista* (1996) 50 Cal.App.4th 1134, 1143; *River Valley Preservation*
 18 *Project v. Metropolitan Transit Develop. Bd.* (1995) 37 Cal.App.4th 154, 168.)

19 When applying the substantial-evidence standard, the court must focus not upon the
 20 “correctness” of a report’s environmental conclusions, but only upon its “sufficiency as an
 21 informative document.”(*Laurel Heights I* 47 Cal.3d at 393.) The findings of an administrative
 22 agency are presumed to be supported by substantial evidence. (*Taylor Bus. Service, Inc. v.*
 23 *San Diego Bd. of Education* (1987) 195 Cal.App.3d 1331.) The court must resolve reasonable
 24 doubts in favor of the findings and decision. (*Id.*)

25 A claim that the EIR lacks *sufficient* information regarding an issue will be treated as
 26 an argument that the EIR is not supported by substantial evidence. (*Barthelemy v. Chino*
 27 *Basin Munic. Water Dist.* (1995) 38 Cal.App.4th 1609, 1620.) The petitioners in *Barthelemy*
 28

1 asserted that it was a failure to proceed in the manner required by law where an EIR did not
 2 include key information. The court rejected that argument.

3 **a) The Definition of “Substantial Evidence”**

4 Substantial evidence is “enough relevant information and reasonable inferences” to
 5 allow a “fair argument” supporting a conclusion, in light of the whole record before the lead
 6 agency. (14 CCR § 15384(a); PRC §21082.2; *City of Pasadena v. State of California* (2nd
 7 Dist.1993) 14 Cal.App.4th 810, 821-822.) Other decisions define “substantial evidence” as
 8 that with “ponderable legal significance,” reasonable in nature, credible, and of solid value.
 9 (*Stanislaus Audubon Society, Inc., v. County of Stanislaus* (1995) 33 Cal.App.4th 144.)

10 Substantial evidence includes facts, reasonable assumptions predicated upon facts,
 11 and expert opinion supported by facts. (PRC §21082.2(c); see also Guidelines 15064(g)(5),
 12 15384.) It does not include argument, speculation, unsubstantiated opinion or narrative,
 13 clearly incorrect evidence, or social or economic impacts not related to an environmental
 14 impact. (Guideline 15384.)

15 **3. Prejudicial Abuse of Discretion**

16 A court may only issue a writ in a CEQA case for an abuse of discretion, including
 17 making a finding without substantial evidence, if the error was *prejudicial*. (*Chaparral*
 18 *Greens v. City of Chula Vista* (1996) 50 Cal.App.4th 1134, 1143.) The court must defer to the
 19 agency’s substantive conclusions and uphold the determination unless. ((Id); see PRC §
 20 21168, 21168.5, *Laurel Heights I, supra*, 47 Cal.3d at 392, fn.5; Remy, et al., Guide to the
 21 California Environmental Quality Act (10th Ed.1999) Chapter XI (D), p.590.)

22 **4. Tiered EIRs**

23 As discussed further below, the PEIR here is a tiered EIR prepared in accordance with
 24 Guideline 15183.5, which specifically allows for preparation of an overall, first-tier EIR and
 25 planning document to govern analysis of GHG emissions and control GHG emissions in order
 26 to comply with the statewide mandates to reduce GHG emissions.

27 A tiered EIR scheme allows an agency to produce a general EIR focusing on an
 28 overall plan or policy and later conduct more limited, narrow subsequent EIR review for

1 individual projects within the broad plan or scope of the original, general EIR. (PRC 21068.5,
 2 21093(a); Guideline 15152; *Koster v. County of San Joaquin* (1996) 47 Cal.App.4th 29, 36.)

3 “Tiering” is defined in PRC 21068.5 as:

4 coverage of general matters and environmental effects in an [EIR] prepared for a
 5 policy, plan, program or ordinance followed by narrower or site-specific [EIRs] which
 6 incorporate by reference the discussion in any prior [EIR] and which concentrate on
 7 the... effects which (a) are capable of being mitigated, or (b) were not analyzed... in
 8 the prior [EIR].

9 In other words, it is ‘a process by which agencies can adopt programs, plans, policies, or
 10 ordinances with EIRs focusing on “the big picture” and can use streamlined CEQA review for
 11 individual projects that are consistent with such... [first tier plans]....’ (*Koster v. County of*
 12 *San Joaquin* (3d Dist. 1996) 47 Cal.App. 4th 29, 36.) The later EIRs need not repeat the
 13 analysis or revisit the issues from the original EIR. (Guideline 15385.)

14 Guideline 15152 is the overall provision governing first-tier documents in general and
 15 in its detailed discussion demonstrates clearly what such documents must do, what they must
 16 include, and how they may be used.¹ Environmental impact reports “shall be tiered whenever
 17 feasible, as determined by the lead agency.” (PRC 21093(b).) This “is needed in order to
 18 provide increased efficiency in the CEQA Process. It allows agencies to deal with broad
 19 environmental issues in EIRs at planning stage and then to provide more detailed examination
 20 of specific effects....These later EIRs are excused by the tiering concept from repeating the
 21 analysis of the broad environmental issues examined in the [first tier] EIRs.” (Discussion
 22 following Guideline 15385.)

23 PRC 21094(c) states that “[f]or purposes of compliance with this section, an initial
 24 study shall be prepared to assist the lead agency in making the determinations required by this
 25 section.”

26
 27 **C. GREENHOUSE GAS EMISSIONS**

28 The Global Warming Solutions Act (“the Act”) ‘implements deep reductions in
 greenhouse gas emissions, recognizing that “[g]lobal warming poses a serious threat to the

1 economic well-being, public health, natural resources, and the environment of California...”
 2 (Health & Saf.Code, § 38501, subd. (a).) Through this enactment, the Legislature has
 3 expressly acknowledged that greenhouse gases have a significant environmental effect.’
 4 (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 91
 5 (*CEB*)). Guideline 15183.5 governs tiering and streamlining the analysis of GHG
 6 emissions.ⁱⁱ Subdivision (b) sets forth the specific things such a plan should do.

7 **1. The Role of the CAP in Subsequent GHG Analysis**

8 A key issue is the ultimate role this CAP will play in subsequent GHG analysis of
 9 future projects. Here neither party clearly addresses the intended role and effect of the CAP
 10 in the review of subsequent projects.

11 The CAP at 1013-1016 generally indicates that the CAP is intended to eliminate any
 12 need to conduct any GHG analysis in future discretionary projects that comply with the CAP.
 13 Specifically, the introduction to the checklist of standards and measures, states that:

14 Discretionary projects that utilize the checklist, as modified by the individual agency,
 15 and can demonstrate consistency with all applicable mandatory local or regional
 16 measures in the CAP, can conclude that their impacts related to [GHG] emissions
 17 would be less than significant under CEQA because the project would be consistent
 18 with a qualified GHG reduction plan under... Guidelines Section 15183.5.

19 The introduction then quotes 15183.5(b) and (b)(2) in part as follows:

20 (b) Pursuant to sections 15064(h)(3) and 15130(d), a lead agency may determine that a
 21 project's incremental contribution to a cumulative effect is not cumulatively
 22 considerable if the project complies with the requirements in a previously adopted
 23 plan or mitigation program under specified circumstances.

24 ...

25 (b)(2) A plan for the reduction of greenhouse gas emissions, once adopted following
 26 certification of an EIR or adoption of an environmental document, may be used in the
 27 cumulative impacts analysis of later projects. An environmental document that relies
 28 on a greenhouse gas reduction plan for a cumulative impacts analysis must identify

1 those requirements specified in the plan that apply to the project, and, if those
 2 requirements are not otherwise binding and enforceable, incorporate those
 3 requirements as mitigation measures applicable to the project.

4 It reiterates that the ‘significance threshold for projects using the checklist for streamlining is
 5 “consistency with an applicable plan for the reduction of [GHG] emissions meeting the
 6 requirements of...15183.5” ’ All of this indicates an intent that a future project complying
 7 with this CAP and its standards and measures need include no independent GHG analysis.

8 **2. Respondent’s Contention That Petitioner Imposes Non-Existent Requirements**

9 Respondent argues, that Petitioner is improperly trying to impose requirements on the
 10 CAP that do not exist in Guideline 15183.5. This argument is expressly stated at the start of
 11 its brief and is repeated throughout its papers. This argument is itself groundless; it is
 12 contrary to the fundamental purpose of CEQA requirements.

13 First, Respondent contends that the Guideline merely gives a list of what such a plan
 14 “should” do; not what it “must” do. Although the Guideline does only state what such a plan
 15 “should” include, (see end note ii, Guideline 15183.5), it expressly states that it is a tiering
 16 mechanism and that it must comply with the standards for first-tier programs or plan EIRs. It
 17 is titled “Tiering and Streamlining the Analysis of Greenhouse Gas Emissions.” (Emphasis
 18 added.) It begins by explaining that agencies may develop a GHG plan or standards in a plan
 19 using a tiering method, governed by the standards for tiering. It states that agencies *may*
 20 handle GHG analysis:

21 at a *programmatic* [i.e., first-tier] level, such as in a general plan, a long range
 22 development plan, or a separate plan to reduce greenhouse gas emissions. *Later*
 23 project-specific environmental documents *may tier from* and/or incorporate by
 24 reference that existing programmatic review. Project-specific environmental
 25 documents *may* rely on an EIR containing a programmatic analysis of greenhouse gas
 26 emissions as provided in *section 15152 (tiering), 15167 (staged EIRs) 15168*
 27 *(program EIRs), 15175-15179.5 (Master EIRs), 15182 (EIRs Prepared for Specific*
 28 *Plans), and 15183 (EIRs Prepared for General Plans, Community Plans, or Zoning).*

1 (emphasis added.)

2 As noted above, the CAP also makes it clear that, as a first-tier document, it is to be
 3 used in such a manner that, if complied with, will excuse the analysis of a future project from
 4 revisiting GHG emissions. Therefore, the CAP, and any such plan prepared under 15183.5,
 5 must meet the requirements for all first-tier documents and thus must impose effectively
 6 enforceable requirements and measures with defied performance standards.

7 Second, although Respondent is correct that the requirements on which Petitioner
 8 relies are not necessarily in the Guideline itself, they are applicable to *all* CEQA review and,
 9 specifically, to first-tier documents, as explained above. Petitioner's further arguments, such
 10 as that the CAP must provide a clear, complete, and accurate GHG "inventory," i.e., the
 11 existing GHG emissions associated with activities in the county, are consistent with a
 12 standard CEQA mandate, which is that an environmental document must present clear,
 13 meaningful information sufficient to allow the agency and public to make an intelligent,
 14 informed decision, or, stated another way, sufficient to make clear the analytic route of the
 15 agency. (*Concerned Citizens of Costa Mesa, Inc. v. 32nd District Agricultural Association*
 16 (1986) 42 Cal.3d 929, 936; *Al Larson Boat Shop Inc. v. Bd. of Harbor Commissioners,*
 17 *supra*, 18 Cal.App.4th at 749; *Topanga Assn. for a Scenic Community v. County of Los*
 18 *Angeles* (1974) 11 Cal.3d 506, 513-514, 522. Therefore, it must be based on substantial
 19 evidence. (See section C.2., above.)
 20

21 **3. Existing Conditions**

22 Petitioner first argues that the PEIR fails to describe existing conditions accurately
 23 because it limits the range of emissions from vehicles miles traveled (VMT) associated with
 24 land-use activities in the county and to and from 18 nearby regional locations. Petitioner
 25 contends that the baseline or current GHG emissions level associated with the county should
 26 include all VMT for trips associated with activities in the county, not only within the county
 27 and to and from the 18 nearby regional locations used in the PEIR and that Respondent thus
 28 understates the current GHG emissions. Respondent focuses on two general categories of
 VMT omitted from the PEIR: VMTs generated by goods exported from the county to

1 locations beyond (produce, medical equipment, beer, and wine) , and tourist travel to Sonoma
2 County.

3 **a) CEQA Baselines and Quantifying Current GHG Levels**

4 Ordinarily, an EIR must clearly and consistently describe the baseline, which is
5 *normally* the *existing* environmental setting or conditions. The existing conditions, at the time
6 the notice of preparation ("NOP") is published, “normally constitute the baseline physical
7 conditions by which the lead agency determines whether an impact is significant.” (Guideline
8 15125(a).) Guideline 15126.2(a) states that the agency “should normally limit its examination
9 to changes in the existing physical conditions in the affected area as they exist at the
10 time...environmental analysis is commenced.”

11 Guideline 15183.5(b)(1)(A) sets forth special requirements for GHG first-tier plans
12 such as the CAP. Such plans are required to “[q]uantify greenhouse gas emissions, both
13 existing and projected over a specified time period, resulting from activities within a defined
14 geographic area.”

15 Respondent notes that the ordinary requirements governing determination of the
16 “baseline” apply where there is a project that may alter this in of itself in order to determine
17 the extent of any impact which a project will have. (See Guideline 15126.2(a).)

18 **b) VMT Data**

19 The CAP explanation of how it determined the GHG inventory is found at AR 1050,
20 et seq. It used 2010 data because that year includes largely complete or complete activity data
21 for all sectors as needed to calculate GHG levels; this is not challenged by Petitioner. (See
22 AR 1052; Memorandum of Points and Authorities in Support of Petition for Writ of Mandate,
23 9:1-3.) The response to comment at AR 1084 explains that the VMTs were determined by
24 considering the travel in the county plus travel between the county and 18 external “traffic
25 analysis zones” (“TAZ”).

26 Respondent relies on Guideline 15130(b) which provides that studies of cumulative
27 impacts are guided by “standards of practicality and reasonableness.” According to Guideline
28 15364, “Feasible” means capable of being accomplished in a successful manner within a

1 reasonable period of time, taking into account economic, environmental, legal, social, and
 2 technological factors.’ Thus, “[a]n evaluation of the environmental effects of a proposed
 3 project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of
 4 what is reasonably feasible The courts have looked not for perfection but for adequacy,
 5 completeness, and a good faith effort at full disclosure.” (Guideline 15151; see also *Citizens*
 6 *to Preserve the Ojai v. County of Ventura, supra*, 176 Cal.App.3d at 429.) Petitioner argues
 7 that an agency is “not required to engage in sheer speculation as to future environmental
 8 consequences [Citations], [but an] EIR [is] required to set forth and explain the basis for any
 9 conclusion that analysis of the cumulative impact of offshore emissions [is] wholly infeasible
 10 and speculative.” (*Citizens to Preserve the Ojai, supra*, 176 Cal.App.3d at 430.)

11 Respondent correctly argues that ultimately GHG emissions must be considered in
 12 light of their cumulative worldwide impact because of their nature. The Supreme Court in
 13 *Center for Biological Diversity v. California Dept. of Fish and Wildlife* (2015) 62 Cal.4th 204,
 14 at 219-220, considered a challenge to an agency’s GHG analysis. The Court explained:

15 [W]e address two related aspects of the greenhouse gas problem that inform our
 16 discussion of CEQA significance.

17 First, because of the global scale of climate change, *any one project's contribution is*
 18 *unlikely to be significant by itself. The challenge for CEQA purposes is to determine*
 19 *whether the impact of the project's emissions of greenhouse gases is cumulatively*
 20 *considerable*, in the sense that “the incremental effects of [the] individual project are
 21 considerable when viewed in connection with the effects of past projects, the effects of
 22 other current projects, and the effects of probable future projects.” (§ 21083, subd.
 23 (b)(2); see Guidelines, § 15064, subd. (h)(1).) “With respect to climate change, an
 24 individual project's emissions will most likely not have any appreciable impact on the
 25 global problem by themselves, but they will contribute to the significant cumulative
 26 impact caused by greenhouse gas emissions from other sources around the globe. *The*
 27 *question therefore becomes whether the project's incremental addition of greenhouse*
 28 *gases is ‘cumulatively considerable’ in light of the global problem, and thus*

1 significant.” (Crockett, Addressing the Significance of Greenhouse Gas Emissions
 2 Under CEQA: California's Search for Regulatory Certainty in an Uncertain World
 3 (July 2011) 4 Golden Gate U. Env'tl. L.J. 203, 207–208 (hereafter Addressing the
 4 Significance of Greenhouse Gas Emissions).)

5 Second, the global scope of climate change and the fact that carbon dioxide and other
 6 greenhouse gases, once released into the atmosphere, are not contained in the local
 7 area of their emission means that *the impacts to be evaluated are also global rather*
 8 *than local. For many air pollutants, the significance of their environmental impact*
 9 *may depend greatly on where they are emitted; for greenhouse gases, it does not.* For
 10 projects, like the present residential and commercial development, which are designed
 11 to accommodate long term growth in California's population and economic activity,
 12 this fact gives rise to an argument that a certain amount of greenhouse gas emissions is
 13 as inevitable as population growth. Under this view, a significance criterion framed in
 14 terms of efficiency is superior to a simple numerical threshold because CEQA is not
 15 intended as a population control measure.

16 (emphasis added.)

17 Consistent with the Supreme Court’s discussion in that case, the EIR here expressly
 18 discusses the global nature of GHG emissions, explaining that “unlike other resource areas
 19 that are primarily concerned with localized project impacts... the global nature of climate
 20 change requires a broader analytic approach. Although this section focuses on GHG
 21 emissions generated as a result of the CAP, the analysis considered them in the context of
 22 potential state, national, and global GHG impacts.” (AR 314.) It also noted global GHG
 23 concentrations. (AR 81, 106, 316.)

24 The PEIR analysis considered VMT for the county and the 18 TAZs in the region, and
 25 only for automobile traffic and “emissions that local governments have primary influence or
 26 control over.” (AR 85.) It did not consider travel by other means such as by airplane or
 27 emissions over which the local entities have no direct control. (AR 85.) The PEIR explained
 28

1 at AR 82 and 85 that it was relying on the International Council for Local Environmental
2 Initiatives (ICLEI) Protocol and that:

3 the ICLEI Community Protocol does not require air travel emissions to be included in
4 the basic emissions necessary for protocol-compliance GHG inventories because it
5 recognizes that local governments have less control over such sources as air travel and
6 that information is often not available to precisely describe an airport's emissions to a
7 specific community.

8 Similarly, it noted that methodologies exist to estimate emissions further afield but associated
9 with local activities but rejected these methodologies because the information might be
10 difficult to obtain or are not "common" approaches. (AR 85-86.) For example, the response
11 to the comment at AR 85-86 stated:

12 [w]hile there are methodologies to estimate upstream emissions..., these
13 methodologies are commonly used to prepare what is known as a "consumption-
14 based" inventory, which estimate the life cycle "carbon footprint" of everything
15 households (and...other consumers) consume. There are also methodologies to
16 estimate "downstream" emissions associated with the transportation, end use, and
17 disposal of goods produced in a jurisdiction, but such methodologies require highly
18 detailed information about the entire downstream supply chain, including the ultimate
19 geographical destination of goods that can be difficult to come by, especially if such
20 data is privately held. While one could estimate emissions using a consumption-based
21 approach of a "downstream" emissions method, these are not the common approach
22 used for community emissions, or national emissions at present, and if used, would
23 make it impossible to compare regional inventories.

24 As a result, the response contends, "nearly every" national, state, and local agency preparing a
25 CAP has used the "activity-based" approach to calculate and define the GHG inventories.
26 (AR 86.) Respondent asserts that by avoiding the methodologies which include upstream or
27 downstream data, and instead using the ICLEI Protocol, the CAP inventory "can be compared
28 to those other communities, using a common standard...." (Ibid.)

1 The question before the court is whether there is information in the record showing
 2 that Respondent might or might not feasibly have included the additional data as Petitioner
 3 contends, or whether Respondent did not need to include it.

4 Respondent's primary argument that it did not need to include additional emissions
 5 estimates is based on its assertion that CEQA only requires an agency to do what is feasible,
 6 and further that it need not, and should not, engage in speculation over data that is
 7 unknowable. The basic that a public agency is only required to do what is feasible, discussed
 8 above, is correct, but Respondent has not persuasively shown that it defeats Petitioner's
 9 arguments regarding the need for more information about MVT. The response to comments
 10 at AR 84-86 expressly admits that there are methodologies to quantify the additional sources
 11 of GHG emissions Petitioner identifies, but did not use them because they are not
 12 "commonly" used or the information "can be difficult to come by." This argument does not
 13 establish that Respondent had substantial evidence to support its approval.

14 The record, including the admissions in the PEIR shows that Respondent had a
 15 feasible ability to include the additional GHG data. Respondent compares the data used in
 16 this CAP to that used by other agencies. (AR 86; generally AR 84-86.) This is a logical
 17 explanation for employing the ICLEI Protocol used, but it does not demonstrate that it was
 18 "infeasible" to obtain the additional MVT data, especially given that Respondent
 19 acknowledges that the methodologies exist.

20 Had the EIR explained that it was unable to obtain the necessary information, or that
 21 there were no methodologies that it could have used to obtain/include it, Respondent's would
 22 have been justified in failing to obtain this data. However, here, Petitioner complains that
 23 Respondent appears merely to have avoided including greater, more complete, information
 24 based on the assumption that it would be "too much work."

25 The court grants the petition on this point.

26 **D. MITIGATION MEASURES**

27 Petitioner also argues that Respondent failed to adopt "definite, clearly defined and
 28 enforceable" mitigation measures. It contends that at least some of the mitigation measures

1 and standards it sets forth are unclear, vague, and not fully enforceable. Petitioner points out
 2 that the EIR concludes that the CAP would be “beneficial” and would thus support applicable
 3 regulatory plans for reducing GHG emissions, so, it contends, no mitigation for GHG
 4 emissions is necessary. (AR 204.)

5 Respondent argues that the CAP is not intended as a mitigation measure. No
 6 mitigation is needed because it is a plan to reduce GHG emissions in subsequent projects.

7 What Petitioner contends is not that the CAP and EIR need to adopt mitigation
 8 measures for the CAP itself, but instead that the CAP, in setting forth purported mitigation
 9 measures for future analysis and handling of GHG emissions, fails to present sufficient clearly
 10 defined and enforceable mitigation measures and standards.

11 Respondent points out this is not a “project” in the sense of an activity that will do
 12 anything that might create GHG emissions but instead is a plan for handling analysis and
 13 mitigation of GHG emissions in future projects. Therefore, there is clearly nothing about this
 14 Project to mitigate. Petitioner's contention that the PEIR should imposing sufficiently defined
 15 and enforceable mitigations measures, is a different issue.

16 Guideline 15183.5(b)(1)(D) and (E) are instructive. Subdivision (D) states that the
 17 plan should “[s]pecify measures or a group of measures, including performance standards,
 18 that substantial evidence demonstrates, if implemented on a project-by-project basis, would
 19 collectively achieve the specified emissions level. Subdivision (E) states that the plan should
 20 “[e]stablish a mechanism to monitor the plan's progress toward achieving the level and to
 21 require amendment if the plan is not achieving specified levels.” (Emphasis added.)
 22

23 **1. Role and Purpose of Mitigation Measures in CEQA**

24 Mitigation measures are needed, even required, where a project may have a significant
 25 impact and the purpose of the measures is to reduce any impact to less than significant. (PRC
 26 21003.1(b); Guideline 15002(a)(3).)

27 **2. Deferral of Mitigation**

28 In general, it is improper for an agency to rely on *deferred* mitigation. (*Sundstrom v.*
County of Mendocino (1988) 202 Cal.App.3d 296, 306; *Defend the Bay v. City of Irvine*

1 (2004) 119 Cal.App.4th 1261, 1275-1276.) An agency cannot find a significant impact to be
 2 mitigated to a less-than-significant level based on a deferred mitigation measure. (*Sundstrom*
 3 *v. County of Mendocino, supra*, 202 Cal.App.3d at 306. It is a violation of CEQA when an
 4 agency “simply requires a project applicant to obtain a biological report and then comply with
 5 any recommendations that may be made in the report. [Citation.]” (*Defend the Bay v. City of*
 6 *Irvine* (2004) 119 Cal.App.4th 1261, 1275; see also *Endangered Habitats League, Inc. v.*
 7 *County of Orange* (2005) 131 Cal.App.4th 777, 793.)

8 “Deferral of the specifics of mitigation is permissible where the local entity commits
 9 itself to mitigation and lists the alternatives to be considered, analyzed and possibly
 10 incorporated in the mitigation plan.” (*Defend the Bay v. City of Irvine* (2004) 119 Cal.App.4th
 11 1261, 1275-1276; see also *Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d
 12 1011, 1028-1030.) This applies where “mitigation is known to be feasible, but where the
 13 practical considerations prohibit devising such measures early,” so that “[w]here future action
 14 to carry a project forward is contingent on devising means to satisfy such criteria, the agency
 15 should be able to rely on its commitment as evidence that significant impacts will in fact be
 16 mitigated.” (*Sacramento Old City Assn., supra*, 229 Cal.App.3d at 1028-1029.)

17 Because of the nature of first-tier tier EIRs, in particular, deferral of the specifics of
 18 mitigation measures, as long as they contain clear performance standards, is particularly
 19 appropriate and logical. (See, e.g., *Rio Vista Farm Bureau Center v. County of Solano* (1st
 20 Dist.1992) 5 Cal.App.4th 351 (“*Rio Vista Farm Bureau*”); *Al Larson Boat Shop Inc. v. Bd. of*
 21 *Harbor Commissioners, supra*, 18 Cal.App.4th 729.) In *Rio Vista Farm Bureau*, a first-tier
 22 “program EIR” serving as “primary planning document for hazardous waste management in
 23 the county” was found to contain sufficient mitigation measures adopted as policies to guide
 24 subsequent projects. The court rejected a challenge based on the assertion that the mitigation
 25 measures were “vague, inconclusive, and even inconsistent,” finding the measures sufficient
 26 “given the broad, nebulous scope of the project under evaluation.” (*Rio Vista Farm Bureau,*
 27 *supra*, 5 Cal.App.4th at 376.) The court found that the specificity of mitigation measures
 28

1 should be proportionate to the specificity of the underlying project, which in that case was a
2 broad planning document to guide later site-specific projects.

3 The court in *Coastal Hills Rural Preservation v. County of Sonoma* (2016) 2
4 Cal.App.5th 1234, 1258, upholding the trial court’s order denying a CEQA petition for writ of
5 mandate, explained that although “CEQA usually requires mitigation measures to be defined
6 in advance” and not deferred, “deferral [of mitigation measures] is permitted if, in addition to
7 demonstrating some need for deferral, the agency (1) commits itself to mitigation; and (2)
8 spells out, in its environmental impact report, the possible mitigation options that would meet
9 “specific performance criteria” contained in the report.”

10 In *Sundstrom, supra*, the county required future hydrological studies as conditions of a
11 use permit and required that any mitigation measures that the study suggested would become
12 mandatory. This was held to be improper because the impacts and mitigation measures were
13 not determined.

14 The court in *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359 found an Negative
15 Declaration defective because it improperly relied on deferred formulation of specific
16 mitigation measures. There, the city required the applicant to comply with any existing
17 ordinance protecting the Stephens’ kangaroo rat and allowed the city to require a biological
18 report on the rat and compliance with any recommendations in the report. The court found
19 this to be insufficient because it, like the approval in *Sundstrom*, was based on compliance
20 with a report that had not yet even been performed.

21 By contrast, the court in *Schaeffer Land Trust v. San Jose City Council* (1989) 215
22 Cal.App.3d 612, upheld an Negative Declaration for a general plan amendment for a parcel of
23 land which, regarding traffic issues, required any future development to comply with
24 applicable “level of service” standards. Unlike the other cases mentioned above, here the
25 mitigation measures were delayed because the development and impacts were not concrete,
26 but the mitigation was fixed to set standards which, by definition, ensured that there would be
27 no significant impact. Mitigation with deferred specifics was found to satisfy CEQA where
28 the lead agency had committed to mitigation meeting a specified range of criteria and project

1 approval required the developer to obtain permits and adopt seven itemized measures in
 2 coordination and consultation with relevant agencies. *Defend the Bay, supra*, 1276.

3 In *Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th
 4 777, 794, the court found a mitigation measure that required replacement habitat preservation
 5 to satisfy CEQA even though the specifics were not fully determined but where the approval
 6 set forth *specific possibilities and parameters that the mitigation needed to meet*.

7 **3. The Role of the CAP in Subsequent GHG Analysis**

8 The key issue here in determining the sufficiency of mitigation measures is the role
 9 this CAP is intended to play in s GHG analysis of future projects. As noted above, one aspect
 10 of first-tier plans and EIRs is that they may obviate the need for later projects falling within
 11 their ambit to conduct new CEQA review on certain issues where the future projects comply
 12 with the first-tier plan. Any later discretionary project that complies with its criteria, such as
 13 the standards and requirements it imposes, would not need to do further study of GAG
 14 emissions. Accordingly, the standards and requirements the CAP imposes for reducing or
 15 minimizing GHG emissions must be considered mitigation measures for purposes of CEQA
 16 and must comply with the CEQA requirements. This means that they must set forth clearly
 17 defined and enforceable performance standards to be met. Because of the intended
 18 streamlining, Petitioner correctly contends that the performance standards and measures set
 19 forth the PEIR must be clear, definite, and enforceable.
 20

21 Here also, Respondent contends that Petitioner is imposing requirements and standards
 22 that do not exist in Guideline 15183.5. Respondent ignores the fundamental CEQA
 23 requirements which underlie Petitioner's claims. Respondent contends that Guideline 15183.5
 24 does not require mitigation measures for the CAP or within the CAP imposed on future
 25 projects. This position not only conflicts with 15183.5 itself, it is fundamentally contrary to
 26 the principles of CEQA review.

27 It is axiomatic in CEQA that any measures or requirements imposed be sufficiently
 28 defined to be enforceable and that, in the context of tiering, any subsequent project may avoid
 analysis of an issue only if it complies with a first-tier document that satisfies CEQA

1 requirements. As noted above, PRC 21094(a) states that where a prior first-tier EIR has been
 2 certified and applies to a subsequent project, the agency “*need not examine those effects*
 3 *which ... were either (1) mitigated or avoided... as a result of the prior [EIR] or (2) examined*
 4 *at a sufficient level of detail in the prior [EIR] to enable those effects to be mitigated or*
 5 *avoided by site specific revisions, the imposition of conditions, or by other means....”*

6 Accordingly, to obviate the need to address an issue or impact as part of a later project’s
 7 CEQA review, a first-tier plan or program document and EIR must sufficiently analyze that
 8 issue or impact to determine that compliance with the document and its mitigations will
 9 mitigate or avoid the impact. The mitigation requirements in a first-tier document for
 10 avoiding or mitigating the impact *must* include performance standards that are mandatory and
 11 include specific, and effectively enforceable performance standards. (*Coastal Hills Rural*
 12 *Preservation v. County of Sonoma* (2016) 2 Cal.App.5th 1234, 1258.)

13 The prior discussion of Guideline 15183.5 addresses the impact of tiering
 14 mechanisms. Again, the CAP, and any such plan prepared under 15183.5, must meet the
 15 requirements for all first-tier documents and thus must impose effectively enforceable
 16 requirements and measures with defied performance standards.

17 Further, Guideline 15183.5 *does require the CAP to impose mitigation measures on*
 18 *future projects.* As both Respondent and the CAP itself acknowledge, and as noted above,
 19 subdivision (b) expressly states that “a lead agency may determine that a project's incremental
 20 contribution to a cumulative effect is not cumulatively considerable *if* the project complies
 21 with *the requirements* in a previously *adopted plan or mitigation program* under specified
 22 circumstances.” This plan or mitigation program, i.e., the CAP, according to (b)(2), “*may be*
 23 *used in the cumulative impacts analysis of later projects”* which clearly means that it need not.
 24 However, (b)(2) continues to state that *if it is* so used for a later project, that project must
 25 comply with the requirements and mitigation measures from the CAP. Once again, in the
 26 Guideline’s words, a later project that in fact “relies on [the CAP] for a cumulative impacts
 27 analysis *must identify those requirements specified in the plan* that apply to the project, and, *if*
 28

1 *those requirements are not otherwise binding and enforceable, incorporate those*
 2 *requirements as mitigation measures....”*

3 In countering Petitioner's complaint that some of the so-called measures or standards
 4 are too vague or loose or ill-defined to be properly enforceable, Respondent asserts that this
 5 will be “cured” because Guideline 15183.5(b)(2) states that any requirements that are not
 6 “binding and enforceable” will be incorporated as mitigation measures in the project’s CEQA
 7 document. This “interpretation” does not withstand scrutiny. As explained above, a first-tier
 8 document, in order to be used to avoid revisiting analysis of an issue in a later project, must
 9 have sufficiently analyzed the issue and found any significant impact to be mitigated or
 10 avoided by complying with the document. That means that any requirement, such as
 11 mitigation, must have sufficiently defined, clear, and mandatory performance standards to be
 12 effectively enforceable and to have predictable results. If the requirements or measures are so
 13 ill-defined as to be unenforceable as a practical matter, and effectively meaningless, merely
 14 “incorporating” them into the later project’s CEQA document will obviously not fix that
 15 problem. What the state in the Guideline must mean, therefore, is not that an ineffective
 16 measure may simply be incorporated into a later project’s document, as Respondent asserts,
 17 but that a measure or requirement must be incorporated in the document *if it is not enforced*
 18 *independently, or through some other mechanism.*

19 **4. The Measures in the CAP**

20 The CAP sets forth requirements and standards or mitigation measures at AR 1015-
 21 1048.

22 Respondent primarily argues that under Guideline 15183.5(b)(2), any measure which
 23 the CAP imposes and which is “not otherwise binding and enforceable” must be incorporated
 24 into future projects. As addressed above, this argument is not meritorious. Guideline
 25 15183.5(b)(2) expressly requires that:

26 *“An environmental document that relies on a greenhouse gas reduction plan for a*
 27 *cumulative impacts analysis must identify those requirements specified in the plan that*
 28 *apply to the project, and, if those requirements are not otherwise binding and*

1 *enforceable, incorporate those requirements as mitigation measures* applicable to the
 2 project. *If there is substantial evidence that the effects of a particular project may be*
 3 *cumulatively considerable notwithstanding the project's compliance with the specified*
 4 *requirements in the plan for the reduction of greenhouse gas emissions, an EIR must*
 5 *be prepared for the project.*

6 (emphasis added.)

7 Petitioner singles out three of the specific measures or requirements in the CAP for
 8 discussion as demonstrating a lack of meaningful enforceability and clear standards.

9 **a) 5-R4 (AR 1026)**

10 The first is 5-R4 (AR 1026.) This “trip-reduction ordinance” requires employers with
 11 50+ employees to offer one of several options to employees in order to reduce GHG
 12 emissions: “pre-tax transit expenses, transit or vanpool subsidy, free or low cost shuttle, *or an*
 13 *alternative benefit.*” (Emphasis added.) It is the latter to which Petitioner objects, arguing
 14 that it is vague and undefined either in what it must be like or what it must achieve, so that
 15 there is no way to enforce this. As a result, Petitioner contends, a project could offer as
 16 “alternative benefit” which no-one can at this point predict, and argue that it need not do GHG
 17 analysis because it has “complied” with this measure. Respondent contends that an
 18 alternative of purchasing GHG offsets is considered and this is correct but this is not the
 19 definition of “an alternative benefit,” which is left open and could be anything. Petitioner is
 20 correct on this point.

21 Respondent contended that Petitioner failed to exhaust administrative remedies on this
 22 specific issue.

23 According to PRC section 21177, “[a] person shall not maintain an action or
 24 proceeding unless that person objected to the approval of the project orally or in writing
 25 during the public comment period provided by this division or prior to the close of the public
 26 hearing on the project before the filing of the notice of determination.” This does not,
 27 however, bar an association or organization formed after approval from raising a challenge
 28 which one of its constituent members had raised, directly or by agreeing with or supporting

1 another's comments. (PRC section 21177(c).) Moreover, someone may file a legal challenge
 2 based on an issue as long as "any person" raised that issue during the review process. PRC
 3 section 21177(a); see *Friends of Mammoth v. Board of Supervisors* (1972) 8 Cal.3d 247, 267-
 4 268. It also does not apply to any grounds of which the agency did not give required notice
 5 and for which there was no hearing or opportunity to be heard. PRC section 21177(e).

6 A party challenging decision under CEQA cannot, to exhaust administrative remedies,
 7 rely merely on "general objections" or "unelaborated comments." *Sierra Club v. City of*
 8 *Orange* (2008) 163 Cal.App.4th 523, 535; *Coalition for Student Action v. City of Fullerton*
 9 (1984) 153 Cal.App.3d 1194, 1197. However, "[l]ess specificity is required to preserve an
 10 issue for appeal in an administrative proceeding than in a judicial proceeding..." *Citizens*
 11 *Association for Sensible Development of Bishop Area v. County of Inyo* (1985) 172
 12 Cal.App.3d 151, 163.

13 Petitioner responds that only the substance of the issue must be raised at the
 14 administrative level, relying on *Save Our Residential Environment v. City of West Hollywood*
 15 (1992) (Cal.App.4th 1745, 1750.) And further that less specificity is required to exhaust an
 16 issue in an administrative proceeding than in a judicial one, relying on *Woodward park*
 17 *Homeowners Assn. v. City of Fresno* (2007) 150 Cal.app.4th 683, 712 and *Brothers Real*
 18 *Estate Group v. City of Los Angeles* (2008) 153 Cal.App.4th 1385, 1395. The court finds that
 19 Petitioner did articulate this as a basic contention in the underlying administrative
 20 proceedings. (AR 66 and AR 67.)

21 **b) 4-L-1 (AR 1024)**

22 Petitioner's attack 4-L-1, at AR 1024, which requires consistency with applicable
 23 "adopted policies" on mixed-use and transit-oriented development, such as zoning codes,
 24 general plans, etc., and states that agencies must "support mixed use [sic] development in
 25 city-centers and transit-oriented development locations through their General Plans, etc." is
 26 not persuasive. Petitioner contends that this is too vague because "mixed-use" has been
 27 interpreted to allow hotels and tourist destinations built downtown or near rail stations.
 28 Petitioner focuses on one portion of this requirement that is open-ended. Nothing indicates

1 that the type of use that could be allowed in a mixed-use development, whether store,
 2 museum, eatery, office, or hotel, has any bearing on GHG emissions. Petitioner cites no
 3 evidence or explanation in support of this claim and does not explain how this is material.
 4 What matters is that there are clear, adopted standards mandating such development and
 5 Petitioner does not challenge that portion of the measure at all.

6 It is possible that the measure could be found too vague and Petitioner may be
 7 challenging it on that basis as well. Petitioner refers to it when mentioning how an
 8 “undefined alternative... lacks the required specificity” and Petitioner again mentions it on the
 9 following page with reference to “tentative plans” for future mitigation in ill-defined
 10 subsequent regulation to be adopted. This, merely requires each jurisdiction to “identify such
 11 appropriate areas and include unspecified policies and incentives to encourage development
 12 near high-quality transit service.” It requires the jurisdiction to define requirements and
 13 identify potential incentives, giving a list of the types that these “may include,” the last being
 14 “other related items.” Again, this does not give any clear performance standards regarding
 15 how to achieve this or what the parameters are. As Petitioner argues, for the third measure,
 16 the court in *Communities for a Better Environment v. City of Richmond*, 184 Cal.App.4th 70,
 17 92, found a measure insufficiently specific where it required reduction of mobile emission
 18 sources though “transportation smart” development because “reliance on tentative plans for
 19 future mitigation... significantly undermines CEQA’s goals of full disclosure and informed
 20 decision making.” Under this analysis, this measure is also defective.

21
 22 **c) 2-L-1 (AR 1021)**

23 Lastly, Petitioner argues that 2-L-1, at AR 1021, is defective. This measure mandates
 24 that the project “comply with local requirement(s) for rooftop solar PV on new residential
 25 development. It states that each jurisdiction “will define which new development must
 26 provide rooftop solar [PV] by defining qualifying criteria... and the amount of solar
 27 required....” As Petitioner argues, this sets no standards at all, just like 4-L-1, but instead
 28 merely general principles and future possibilities. This violates CEQA.

1 Petitioner further argues that the measures in general do not guarantee any likelihood
2 of implementation. This is clear from the ones discussed above. Petitioner cites 1-R2 as
3 another example. It states that two named agencies “will work with the participating
4 communities to implement energy efficient retrofits. Actions may include: Implementing a...
5 weatherization program, expanding energy efficiency outreach/education campaigns...,
6 promoting the smart grid,” etc. Again, none of this goes beyond stating wishful thinking,
7 good intentions, and an intent to “work” with others. Measures that fall into this category
8 violate CEQA as well.

9 Petitioner also generally attacks the measures as lacking meaningful enforceability.
10 Petitioner also contends that of all of them, only 1-S1 and 1-S2 are actually enforceable
11 because they govern building energy and lighting efficiency, both controlled by state
12 regulation. The court finds a few others in addition to 1-S1 and 1-S2 to be similarly
13 enforceable. These include 1-L1, based on Windsor’s building code, 1-L2, requiring LED
14 lights in new development.

15 Aside from those few, Petitioner is correct that most are not enforceable, either
16 because they are too vague and lacking in meaningful mandatory requirements such as those
17 already discussed, which only “require” some “alternative” that is not specified or governed
18 by set parameters. Others, such as 1-L3 through 2-L2, state mitigation measures but then state
19 that these are “voluntary,” or “encouraged,” or only necessary where “applicable” based on
20 circumstances or criteria that are not defined. Others again rely on other jurisdictions such as
21 the cities creating applicable requirements that in some unspecified manner promote the
22 stated, vague, open-ended policies that lack any parameters or requirements. These are too
23 numerous to list them all here but this general characteristic dominates almost all of the
24 measures from what I have read.

25 Accordingly, the court grants the petition with respect to mitigation. Because the
26 record does not provide adequate information about extraterritorial emissions the agency and
27 the public could not and the court cannot determine whether the CAP would achieve its stated
28 goal to reduce GAG impacts to pre-1990 levels by 2020.

1 **E. ALTERNATIVES**

2 Petitioner asserts that Respondent violated CEQA by adopting as the “environmentally
3 superior alternative” the Zero Net Energy Buildings Alternative because it fails to address
4 GHG emissions from transportation while Respondent declined to evaluate an alternative with
5 a moratorium on, or significant reduction of, new or expanded vineyards, wineries and tourist
6 destinations. (AR 94; 426-427.)

7 Respondent contends that the analysis is sufficient because Petitioner believes that
8 reducing or stopping growth, and in particular growth that involves travel of people and goods
9 to and from the county, is necessary, and Petitioner cannot impose such mandates on R;
10 Respondent considered a range of alternatives; and choosing the moratorium alternative
11 would require the court to “dramatically substitute” its judgment for Respondent's.

12 CEQA requires all EIRs to consider alternatives to the project. (*Friends of the Old*
13 *Trees v. Dept. of Forestry & Fire Protection* (1st Dist.1997) 52 Cal.App.4th 1383, 1393-1395
14 (*Friends of Old Trees*.)

15 **1. Importance and Central Role of Alternatives Analysis**

16 PRC section 21002 states that “it is the policy of the state that public agencies should
17 not approve projects as proposed if there are feasible alternatives or feasible mitigation
18 measures available which would substantially lessen the significant environmental effects....”
19 An agency may not approve a project that will result in significant impacts *unless it first finds*
20 *that mitigation measures or alternatives are infeasible*. (PRC section 21081; Guidelines
21 15091, 15093.)

22 The Supreme Court decided that considering alternatives is one of the most important
23 functions of an EIR. (*Wildlife Alive v. Chickering* (1976) 18 Cal.3d 190, 197.) In fact, “[t]he
24 core of the EIR is the mitigation and alternatives sections.” (*Citizens of Goleta Valley v. Bd.*
25 *of Supervisors* (1990) 52 Cal.3d 553, 564, 566 (*Goleta II*.)

26 Without evidence regarding why the alternatives are insufficient to meet the project or
27 CEQA goals, meaningful analysis is impossible. An EIR must “explain in meaningful detail
28 the reasons and facts supporting [the] conclusion.” (*Marin Municipal Water Dist. v. KG Land*

1 *Corp. California* (1991) 235 Cal.App.3d 1652, 1664.) Failure to provide sufficient analysis
 2 or alternatives makes it impossible for the court to “intelligently examine the validity of the...
 3 action.” (*Topanga Assn. for a Scenic Community v. County of Los Angeles* (1974) 11 Cal.3d
 4 506, 513-514, 522.)

5 The alternatives must be discussed in the EIR itself, provided for public review, and
 6 subject to analysis, and the agency cannot cure defects by providing analysis in its official
 7 response. (See *Friends of the Old Trees, supra*, 52 Cal.App.4th at 1403-1405.)

8 **2. Authority on Analyzing Alternatives and Feasibility**

9 The discussion should evaluate the relative merits of each alternative 14 CCR
 10 §15126.6(a). Respondents need not analyze or adopt alternatives that are not feasible. 14
 11 CCR ' 15126.6(c), (f); *Citizens of Goleta Valley v. Bd. of Supervisors* (1990) 52 Cal.3d 553,
 12 564, 566 (*Goleta II*). However, the document *must* consider alternatives that *are* feasible.
 13 *EPIC v. Johnson* (1985) 170 Cal.App.3d 604, 610; *Friends of the Old Trees, supra*, 52
 14 Cal.App.4th 1404.

15 Ultimately, determining if alternatives are suitable involves a three-part test governed
 16 by the “rule of reason” as set forth in Guideline 15126.6. (See *Citizens of Goleta Valley v.*
 17 *Bd. of Supervisors* (1990) 52 Cal.3d 553, 564, 566 (*Goleta II*); *Save San Francisco Bay*
 18 *Association v. San Francisco Bay Conservation and Development Commission* (1992) 10
 19 Cal.App.4th 908, 919.) The analysis must consider alternatives that 1) may “attain most of the
 20 basic objectives of the project,” 2) reduce or avoid the project’s impacts, and 3) are
 21 “potentially feasible.” (Guideline 15126.6(a), (f).)

22 The analysis of alternatives is required to set forth facts and “*meaningful analysis*” of
 23 these alternatives rather than “just the agency’s bare conclusions or opinions.” (*Laurel*
 24 *Heights I, supra*, 47 Cal.3d 376, 404-405; *Goleta II, supra*, 52 Cal.3d 569; *Preservation*
 25 *Action Council v. City of San Jose* (2006) 141 Cal.App.4th 1336, 1353.) All analysis must
 26 include “detail sufficient to enable those who did not participate... to understand and to
 27 consider meaningfully” the alternatives. (*Laurel Heights I, supra*, 404-405.)
 28

1 As notes above, “feasible” means able to be “accomplished in a successful manner
 2 within a reasonable period... taking into account economic, environmental, social, and
 3 technological factors.” (PRC section 21061.1.)

4 When the agency determines that alternatives are infeasible, it “shall describe the
 5 specific reasons for rejecting identified...project alternatives.” (Guideline 15091(a), (c).) The
 6 analysis of alternatives is required to set forth facts and “*meaningful* analysis” of these
 7 alternatives rather than “just the agency’s bare conclusions or opinions.” (*Laurel Heights I*,
 8 *supra*, 47 Cal.3d 376, 404-405; *Goleta II, supra*, 52 Cal.3d 569; *Preservation Action Council*
 9 *v. City of San Jose* (2006) 141 Cal.App.4th 1336, 1353.) All analysis must include “detail
 10 sufficient to enable those who did not participate... to understand and to consider
 11 meaningfully” the alternatives. (*Laurel Heights I, supra*, 404-405.)

12 The agency must make findings identifying specific considerations making an
 13 alternative infeasible and the specific benefits of the Project that outweigh the relative harm.
 14 (PRC § 21002.1(b), 21081, Guideline 15092(b); *Preservation Action Council, supra*, 1353.)

15 On the other hand, as usual, the requirement is one of reasonableness and a “crystal
 16 ball” inquiry is not necessary. (*Residents Ad Hoc Stadium Committee v. Bd. of Trustees* (3d
 17 Dist.1979) 89 Cal.App.3d 272, 286.) The key, as with most aspects of an EIR is that the
 18 agency must provide enough information about the analytical path taken to allow the court to
 19 “intelligently examine the validity of the administrative action.” (*Topanga Assn. for a Scenic*
 20 *Community v. County of Los Angeles* (1974) 11 Cal.3d 506, 513-514, 522.) However, no
 21 “ironclad rule” other than the “rule of reason” governs the decision. (Guideline 15126.6(a).)

22 An agency cannot find an alternative infeasible simply because the developer does not
 23 want to do it. (*Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 601.)
 24 In fact, the analysis must include alternatives that are reasonable “even if they substantially
 25 impede the project or are more costly.” (*San Bernardino Valley Audubon Society v. County of*
 26 *San Bernardino* (1984) 155 Cal.App.3d 738, 750; see also *Preservation Action Council v.*
 27 *City of San Jose* (2006) 141 Cal.App.4th 1336.)
 28

1 An EIR or decision thereon also cannot merely state that an alternative is infeasible
 2 simply because it is too expensive or will not lead to sufficient return without providing
 3 supporting analysis. (*Preservation Action Council v. City of San Jose* (2006) 141 Cal.App.4th
 4 1336.) “The fact that an alternative may be more expensive or less profitable is not sufficient
 5 to show that the alternative is financially infeasible. What is required is evidence that the
 6 *additional costs or lost profitability* are sufficiently *severe as to render it impractical to*
 7 *proceed with the project.*” (*Citizens of Goleta Valley v. Board of Supervisors* (1988) 197
 8 Cal.App.3d 1167, 1181; *Uphold Our Heritage, supra*, 599; (emphasis added).)

9 An alternative should be capable of “substantially lessening” adverse impacts but it
 10 need only have fewer impacts and it need not be impact free. PRC 21002; Guideline
 11 15126.6(a); *Citizens of Goleta Valley v. Board of Supervisors (Goleta II)* (1990) 52 Cal.3d
 12 553, 566.

13 **3. Reasonable Range**

14 An EIR must describe a reasonable range of alternatives to the proposed project or its
 15 location that would feasibly achieve most of the project’s objectives, while reducing or
 16 avoiding any of its significant effects. (Guideline 15126.6(a), (d).)

17 The EIR “shall focus on alternatives... which are capable of avoiding or substantially
 18 lessening any significant effects of the project, even if these alternatives would impede to
 19 some degree the attainment of the project objective, or would be more costly.” (Guideline
 20 15126.6(b).)

21 The EIR must set forth the alternatives necessary to permit a reasoned choice and in a
 22 manner that will allow “meaningful evaluation.” (Guideline 15126.6(a), (d), (f); *Goleta II*;
 23 see also *Laurel Heights I, supra*; see also *San Bernardino Valley Audubon Soc., Inc. v. County*
 24 *of San Bernardino* (1984) 155 Cal.App.3d 738, 750-751 (the detail must allow a reasonable
 25 choice “so far as environmental aspects are concerned.”).)

26 If an EIR excludes certain alternatives, it should identify the alternatives and set forth
 27 the reasons. (*Goleta II, supra*, 569; Guideline 15126.6(b).) The court in determining if the
 28

1 EIR included a reasonable range of alternatives may consider the entire record to determine if
 2 alternatives were properly excluded from consideration. (*Goleta II, supra*, 569.)

3 Alternatives that would eliminate or reduce significant environmental impacts *must* be
 4 considered even if they would cost more or “to some degree” impede attainment of the
 5 project’s objectives. (Guideline 15126.6(b).)

6 **4. Detail of Relevant Decisions on the Adequacy of Alternatives**

7 In *Friends of the Old Trees, supra*, 52 Cal.App.4th 1383, an extreme case, there was
 8 no discussion of alternatives in the versions submitted for public review. The agency argued
 9 that the fact it considered mitigation should suffice, while the real party marked a box
 10 selecting a certain method of cutting. The court also noted that the *public* brought forth “the
 11 only true alternatives,” and that these were discussed only after the document was approved.
 12 (*Friends of the Old Trees, supra*, 52 Cal.App.4th 1405.) The court found the discussion
 13 inadequate. (*Id.*, 1403-1405.)

14 In *Citizens of Goleta Valley v. Board of Supervisors (Goleta I)*, (1988) 197
 15 Cal.App.3d 1167, the EIR considered a smaller hotel to be an economically infeasible
 16 alternative to the proposed hotel at issue. Because the EIR lacked *evidence* that the smaller
 17 hotel was economically infeasible, the court considered it error to deny the writ of mandate.
 18 The court found that although the EIR contained estimated figures of costs, the record did not
 19 reveal any *evidence* which *analyzed* the alternative in terms of comparative costs, comparative
 20 profits or losses, or comparative economic benefit to the project proponent, residents, or the
 21 community at large. (*Id.*, 1180.)

22 The court in *Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587,
 23 at 599, addressed a project to demolish an historic mansion in order to construct a new,
 24 smaller single-family residence. The court found that evidence that alternatives of historic
 25 rehabilitation or rehabilitation with a new addition, would cost between \$4.9 million and \$10
 26 million was not substantial evidence that alternatives were not economically feasible since
 27 there was no evidence of the likely cost of a proposed replacement home or average cost of
 28

1 building the proposed 6,000 square foot home in the city. It also found that whether the
 2 developer wanted to do the alternative was irrelevant to determining if it is not feasible.

3 *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus (Arambel and*
 4 *Rose Development, Inc.)* (1994) 27 Cal.App.4th 713, also dealt with alternatives analysis.
 5 The court found, in the context of a proposed housing development, that the discussion of
 6 housing density alternatives was inadequate. The DEIR stated that a lower density would
 7 “lessen the impacts,” but failed to identify which impacts it meant or to what degree. The
 8 court ruled that “[s]uch a bare conclusion without an explanation of its factual and analytical
 9 basis is insufficient.” *Id.*, at 736. The court went on to state:

10 That lower density might not be “economically feasible,” is not sufficient
 11 justification for the failure to give basic information as to density alternatives
 12 which were considered and rejected. Contrary to [respondent’s] argument,
 13 [petitioners] are not required to show there are reasonable alternatives. *It is the*
 14 *project proponent's responsibility to provide an adequate discussion of*
 15 *alternatives....* If the project proponent concludes there are no feasible
 16 alternatives, it must explain in *meaningful detail* in the EIR the basis for that
 17 conclusion. Thus, even if alternatives are rejected, an EIR *must explain why*
 18 each suggested alternative either does not satisfy the goals of the proposed
 19 project, does not offer substantial environmental advantages or cannot be
 20 accomplished.

21 *Id.*, at 737 (emphasis added).

22
 23 **5. Whether Feasibility Finding Is Necessary**

24 As noted above, PRC sections 21002, 21081, and Guidelines 15091, 15093 together
 25 forbid approval of a project that *will result in significant impacts without first finding that*
 26 *any environmentally superior alternatives are infeasible.* Petitioner argues that Respondent
 27 failed to consider an alternative that is environmentally superior.

6. The Alternatives Analysis for the CAP

The alternatives analysis is at AR 425-438. The PEIR explains that it developed and analyzed only *one* other alternative, the Carbon Offset Alternative, in addition to the chosen Zero Net Energy Buildings plan and the mandatory no-project alternative. It expressly rejected a growth moratorium, reduced density, greater density, increased Sonoma Clean Power, expanded transit service, 1990 Levels by 2020 (AB32), and 80% Below 1990 Levels by 2020.

The real issue here is whether the Respondent, in rejecting formulating other alternatives, has considered a reasonable range, as required, and whether Respondent has provided sufficient explanation of infeasibility or other reasoning to support not considering other proposed alternatives.

Respondent's analysis is insufficient. Respondent considered almost no range at all, and only one other alternative that essentially is one that does nothing other than to authorize Respondent to buy GHG offsets for all GHG impacts from projects. Although Respondent argues to the contrary, this alternative seems both infeasible and at the same time would not actually do anything to control or limit actual GHG production. As an alternative, this appears to be one of form, but not of substance.

By contrast, the moratorium or reduced-development alternative which Petitioner proposes, and which was presented to Respondent in public comments (see, e.g., AR 93-94, response to comment) along with others noted but rejected without being developed, include real solutions that differ significantly from the chosen CAP. At least some, like the moratorium or growth limit, also address issues of GHG production from travel. While it is logical that some may be infeasible or incompatible with goals of growth, this is not alone, without explanation or support, a basis for not even considering those alternatives, or modified versions. For example, Respondent noted a moratorium on growth of wineries or housing “until the jobs-housing balance in the County is more equitable,” but this does not even address the issues of Petitioner's proposed moratorium, it is arbitrarily limited, and it does not even seem to make much sense. There is no evidence or explanation for what it

1 would be or why Respondent could not consider a similar, but different one, such as Petitioner
 2 proposed. That is the purpose of actually developing and considering alternatives. Given
 3 that there are available alternatives that differ drastically from what Respondent has
 4 considered and given that Respondent has, in effect, considered only one other option that is
 5 perhaps only nominally an alternative, this analysis fails to consider a reasonable range of
 6 alternatives, or even any range at all.

7 The court Grants the petition on this issue.

8 **F. RESPONSE TO PUBLIC COMMENTS**

9 Petitioner next argues that Respondent's response to public comments was insufficient
 10 in violation of Guideline 15088(c).

11 The “evaluation and response to public comments is an essential part of the CEQA
 12 process.” (Discussion following CEQA Guideline 15088.) The final EIR must include
 13 evaluation and responses to all comments received in the public-comment period. PRC
 14 section 21091(d)(2)(A). Guideline 15088 governs responses to comments and subdivision (c)
 15 governs the substance of such responses. It requires responses to address issues “in detail”
 16 and demonstrate “why specific comments and suggestions were not accepted.” Most
 17 importantly, perhaps, the responses must explain the reasons for rejecting suggestions with a
 18 “good faith, reasoned analysis” and must not rely on “[c]onclusory statements unsupported by
 19 factual information.” Guideline 15088(c).

20 **1. Exhaustion of Administrative Remedies**

21 Respondent first contends that Petitioner failed to exhaust administrative remedies on
 22 this issue. The court has found, above, that Petitioner exhausted its administrative remedies.

23 Petitioner's argument here is collateral and not persuasive. Although Petitioner points
 24 out that a few responses may not sufficiently resolve issues, that is of little importance in of
 25 itself. What matters are the fundamental defects that have not been cured as discussed above:
 26 failure to properly determine GHG inventory, or demonstrate that Respondent could not
 27 practically have done more or did not need to do more; ill-defined mitigation measures
 28 lacking enforceable criteria or parameters; and lack of reasonable range of alternatives.

The court denies the Petition with respect to the comments..

G. WHETHER RESPONDENTS' ERROR WAS PREJUDICIAL

Respondent contends that even if Petitioner demonstrated error, it was not prejudicial. As noted at the outset, in order for the court to issue a writ of mandate, it must find not only error, i.e., a violation of CEQA, but that error was prejudicial. (*Chaparral Greens v. City of Chula Vista* (1996) 50 Cal.App.4th 1134, 1143; see PRC 21168, 21168.5, *Laurel Heights I, supra* 47 Cal.3d 392, fn.5; Remy, et al., Guide to the California Environmental Quality Act (10th Ed.1999) Chapter XI(D), p.590.)

Respondent's failure to impose meaningful, effectively enforceable mitigation measures, when presenting compliance with the CAP as a way for future projects to avoid any other GHG analysis, is fundamentally and on its face, prejudicial. The failure to present a reasonable range of alternatives or to properly inventory GHG emissions as required are also on, their face, prejudicial because they prevent informed decision making or public review, the very bases of CEQA. (*Sierra Club v. State Bd. of Forestry* (1994) 7 Cal.4th 1215, 1228-1230, 1235-1237 (failure to put critical information in an environmental document was in of itself a prejudicial abuse of discretion partly because it “frustrated the purpose of the public comment provisions”); *Save Cuyama Valley v. County of Santa Barbara* (2013) 213 Cal.App.4th 1059, at 1073 (“[a]n error is prejudicial when an agency fails to comply with a mandatory CEQA procedure or when a report omits information and thereby precludes informed decision making); *Lighthouse Field Beach Rescue v. City of Santa Cruz* (2005) 131 Cal.App.4th 1170, 1182.; *Schoen v. Dept. of Forestry & Fire Protection* (1997) 58 Cal.App.4th 556, 565 (“We cannot overlook a prejudicial error by surmising that the project would have gone forward anyway.”).)

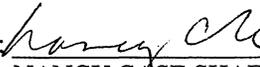

Based on the foregoing,

1 NOW, THEREFORE,

2 ORDER

3 1. The Petition for Mandamus is granted as stated above.

4 Dated: 7/20/17

5 By: 
6 NANCY CASE SHAFFER
7 Judge of the Superior Court

8 END NOTES

9 (a) "Tiering" refers to using the analysis of general matters contained in a broader EIR (such
10 as one prepared for a general plan or policy statement) with later EIRs and negative
11 declarations on narrower projects; incorporating by reference the general discussions from the
12 broader EIR; and concentrating the later EIR or negative declaration solely on the issues
13 specific to the later project.

14 (b) Agencies are encouraged to tier the environmental analyses which they prepare for
15 separate but related projects including general plans, zoning changes, and development
16 projects. This approach can eliminate repetitive discussions of the same issues and focus the
17 later EIR or negative declaration on the actual issues ripe for decision at each level of
18 environmental review. Tiering is appropriate when the sequence of analysis is from an EIR
19 prepared for a general plan, policy, or program to an EIR or negative declaration for another
20 plan, policy, or program of lesser scope, or to a site-specific EIR or negative declaration.
21 Tiering does not excuse the lead agency from adequately analyzing reasonably foreseeable
22 significant environmental effects of the project and does not justify deferring such analysis to
23 a later tier EIR or negative declaration. However, the level of detail contained in a first tier
24 EIR need not be greater than that of the program, plan, policy, or ordinance being analyzed.

25 (c) Where a lead agency is using the tiering process in connection with an EIR for a large-
26 scale planning approval, such as a general plan or component thereof (e.g., an area plan or
27 community plan), the development of detailed, site-specific information may not be feasible
28 but can be deferred, in many instances, until such time as the lead agency prepares a future
environmental document in connection with a project of a more limited geographical scale, as
long as deferral does not prevent adequate identification of significant effects of the planning
approval at hand.

(d) Where an EIR has been prepared and certified for a program, plan, policy, or ordinance
consistent with the requirements of this section, any lead agency for a later project pursuant to
or consistent with the program, plan, policy, or ordinance should limit the EIR or negative
declaration on the later project to effects which:

- (1) Were not examined as significant effects on the environment in the prior EIR; or
- (2) Are susceptible to substantial reduction or avoidance by the choice of specific revisions in
the project, by the imposition of conditions, or other means.

(e) Tiering under this section shall be limited to situations where the project is consistent with
the general plan and zoning of the city or county in which the project is located, except that a
project requiring a rezone to achieve or maintain conformity with a general plan may be
subject to tiering.

- 1 (f) A later EIR shall be required when the initial study or other analysis finds that the later
 2 project may cause significant effects on the environment that were not adequately addressed
 3 in the prior EIR. A negative declaration shall be required when the provisions of Section
 4 15070 are met.
- 5 (1) Where a lead agency determines that a cumulative effect has been adequately addressed in
 6 the prior EIR, that effect is not treated as significant for purposes of the later EIR or negative
 7 declaration, and need not be discussed in detail.
- 8 (2) When assessing whether there is a new significant cumulative effect, the lead agency shall
 9 consider whether the incremental effects of the project would be considerable when viewed in
 10 the context of past, present, and probable future projects. At this point, the question is not
 11 whether there is a significant cumulative impact, but whether the effects of the project are
 12 cumulatively considerable. For a discussion on how to assess whether project impacts are
 13 cumulatively considerable, see Section 15064(i).
- 14 (3) Significant environmental effects have been “adequately addressed” if the lead agency
 15 determines that:
- 16 (A) they have been mitigated or avoided as a result of the prior environmental impact report
 17 and findings adopted in connection with that prior environmental report; or
- 18 (B) they have been examined at a sufficient level of detail in the prior environmental impact
 19 report to enable those effects to be mitigated or avoided by site specific revisions, the
 20 imposition of conditions, or by other means in connection with the approval of the later
 21 project.
- 22 (g) When tiering is used, the later EIRs or negative declarations shall refer to the prior EIR
 23 and state where a copy of the prior EIR may be examined. The later EIR or negative
 24 declaration should state that the lead agency is using the tiering concept and that it is being
 25 tiered with the earlier EIR.
- 26 (h) There are various types of EIRs that may be used in a tiering situation. These include, but
 27 are not limited to, the following:
- 28 (1) General plan EIR (Section 15166).
 (2) Staged EIR (Section 15167).
 (3) Program EIR (Section 15168).
 (4) Master EIR (Section 15175).
 (5) Multiple-family residential development/residential and commercial or retail mixed-use
 development (Section 15179.5).
 (6) Redevelopment project (Section 15180).
 (7) Projects consistent with community plan, general plan, or zoning (Section 15183).
- One specific example of a first-tier EIR is a “program” EIR as set forth in Guideline
 15168. This details the nature and requirements and uses of such a first-tier EIR, in a manner
 similar to that set forth in 15152, and gives another good picture of how they are to be used
 and what they must do to be so used in compliance with CEQA. It states, in full,
- (a) General. A program EIR is an EIR which may be prepared on a series of actions
 that can be characterized as one large project and are related either:
- (1) Geographically,
 (2) As logical parts in the chain of contemplated actions,
 (3) In connection with issuance of rules, regulations, plans, or other general criteria to
 govern the conduct of a continuing program, or

1
2 (4) As individual activities carried out under the same authorizing statutory or
3 regulatory authority and having generally similar environmental effects which can be
4 mitigated in similar ways.

(b) Advantages. Use of a program EIR can provide the following advantages. The
5 program EIR can:

(1) Provide an occasion for a more exhaustive consideration of effects and alternatives
6 than would be practical in an EIR on an individual action,

(2) Ensure consideration of cumulative impacts that might be slighted in a case-by-
7 case analysis,

(3) Avoid duplicative reconsideration of basic policy considerations,

(4) Allow the lead agency to consider broad policy alternatives and program wide
8 mitigation measures at an early time when the agency has greater flexibility to deal with basic
9 problems or cumulative impacts,

(5) Allow reduction in paperwork.

(c) Use With Later Activities. Subsequent activities in the program must be examined
10 in the light of the program EIR to determine whether an additional environmental document
11 must be prepared.

(1) If a later activity would have effects that were not examined in the program EIR, a
12 new initial study would need to be prepared leading to either an EIR or a negative declaration.

(2) If the agency finds that pursuant to Section 15162, no new effects could occur or
13 no new mitigation measures would be required, the agency can approve the activity as being
14 within the scope of the project covered by the program EIR, and no new environmental
15 document would be required.

(3) An agency shall incorporate feasible mitigation measures and alternatives
16 developed in the program EIR into subsequent actions in the program.

(4) Where the subsequent activities involve site specific operations, the agency should
17 use a written checklist or similar device to document the evaluation of the site and the activity
18 to determine whether the environmental effects of the operation were covered in the program
19 EIR.

(5) A program EIR will be most helpful in dealing with subsequent activities if it deals
20 with the effects of the program as specifically and comprehensively as possible. With a good
21 and detailed analysis of the program, many subsequent activities could be found to be within
22 the scope of the project described in the program EIR, and no further environmental
23 documents would be required.

(d) Use With Subsequent EIRS and Negative Declarations. A program EIR can be
24 used to simplify the task of preparing environmental documents on later parts of the program.
25 The program EIR can:

(1) Provide the basis in an initial study for determining whether the later activity may
26 have any significant effects.

(2) Be incorporated by reference to deal with regional influences, secondary effects,
27 cumulative impacts, broad alternatives, and other factors that apply to the program as a whole.

(3) Focus an EIR on a subsequent project to permit discussion solely of new effects
28 which had not been considered before.

(e) Notice With Later Activities. When a law other than CEQA requires public notice
when the agency later proposes to carry out or approve an activity within the program and to

1
2 rely on the program EIR for CEQA compliance, the notice for the activity shall include a statement that:

- 3 (1) This activity is within the scope of the program approved earlier, and
4 (2) The program EIR adequately describes the activity for the purposes of CEQA.

5 ii (a) Lead agencies may analyze and mitigate the significant effects of greenhouse gas
6 emissions at a programmatic level, such as in a general plan, a long range development plan,
7 or a separate plan to reduce greenhouse gas emissions. Later project-specific environmental
8 documents may tier from and/or incorporate by reference that existing programmatic review.
9 Project-specific environmental documents may rely on an EIR containing a programmatic
10 analysis of greenhouse gas emissions as provided in section 15152 (tiering), 15167 (staged
11 EIRs) 15168 (program EIRs), 15175-15179.5 (Master EIRs), 15182 (EIRs Prepared for
12 Specific Plans), and 15183 (EIRs Prepared for General Plans, Community Plans, or Zoning).
13 (b) Plans for the Reduction of Greenhouse Gas Emissions. Public agencies may *choose to*
14 *analyze and mitigate significant greenhouse gas emissions in a plan for the reduction of*
15 *greenhouse gas emissions or similar document.* A plan to reduce greenhouse gas emissions
16 may be used in a cumulative impacts analysis as set forth below. Pursuant to sections
17 15064(h)(3) and 15130(d), a lead agency may determine that a project's incremental
18 contribution to a cumulative effect is not cumulatively considerable if the project complies
19 with the requirements in a previously adopted plan or mitigation program under specified
20 circumstances.

21 (1) *Plan Elements. A plan for the reduction of greenhouse gas emissions should:*

22 (A) Quantify greenhouse gas emissions, both existing and projected over a specified
23 time period, resulting from activities within a defined geographic area;

24 (B) Establish a level, based on substantial evidence, below which the contribution to
25 greenhouse gas emissions from activities covered by the plan would not be cumulatively
26 considerable;

27 (C) Identify and analyze the greenhouse gas emissions resulting from specific actions
28 or categories of actions anticipated within the geographic area;

(D) Specify measures or a group of measures, including performance standards, that
substantial evidence demonstrates, if implemented on a project-by-project basis, would
collectively achieve the specified emissions level;

(E) Establish a mechanism to monitor the plan's progress toward achieving the level
and to require amendment if the plan is not achieving specified levels;

(F) Be adopted in a public process following environmental review.

(2) Use with Later Activities. A plan for the reduction of greenhouse gas emissions,
once adopted following certification of an EIR or adoption of an environmental document,
may be used in the cumulative impacts analysis of later projects. An environmental document
that relies on a greenhouse gas reduction plan for a cumulative impacts analysis must identify
those requirements specified in the plan that apply to the project, and, if those requirements
are not otherwise binding and enforceable, incorporate those requirements as mitigation
measures applicable to the project. If there is substantial evidence that the effects of a
particular project may be cumulatively considerable notwithstanding the project's compliance
with the specified requirements in the plan for the reduction of greenhouse gas emissions, an
EIR must be prepared for the project.

(c) Special Situations. As provided in Public Resources Code sections 21155.2 and 21159.28, environmental documents for certain residential and mixed use projects, and transit priority projects, as defined in section 21155, that are consistent with the general use designation, density, building intensity, and applicable policies specified for the project area in an applicable sustainable communities strategy or alternative planning strategy need not analyze global warming impacts resulting from cars and light duty trucks.

A lead agency should consider whether such projects may result in greenhouse gas emissions resulting from other sources, however, consistent with these Guidelines.

2.3.2.7 Letter O7: Center for Biological Diversity

This letter provides comments on the Revised Draft 2045 CAP as well as CEQA comments on the Recirculated Draft PEIR. Comments specific to the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, the County has received and reviewed comments on the Revised Draft 2045 CAP and common topics are discussed in Section 1.4, *Comments on the Revised Draft 2045 CAP*, in Chapter 1, *Introduction*. PEIR-focused comments are addressed below.

- O7-1 The County has received and considered the comments provided. Responses to specific comments are provided below.
- O7-2 CEQA Guidelines section 15088.5(f)(1) provides that “[w]hen an EIR is substantially revised and the entire document is recirculated, the lead agency may require reviewers to submit new comments and, in such cases, need not respond to those comments received during the earlier circulation period.” As explained in Recirculated Draft PEIR Section ES.1 (p. ES-1) and Section 1.4.3 (p. 1-7), the “[r]ecirculated Draft PEIR wholly replaces the May 2022 Draft PEIR” And “[c]omments on the May 2022 Draft PEIR, though part of the administrative record, will not be responded to in the Final PEIR; new comments must be submitted on the Recirculated Draft PEIR.” The County has also informed reviewers that new comments on the Recirculated Draft PEIR must be submitted and that the County would not respond to comments received during the original Draft PEIR public review period. In circumstances such as this, letters that predate the issuance of the Recirculated Draft PEIR do not address adequacy or accuracy of the analysis included in the Recirculated Draft PEIR, which post-dates the comments. To the extent the commenter believes its prior comments have continuing relevance, the burden is on the commenter to explain how with sufficient specificity to enable the County to provide a detailed response. The County does not have the duty to decipher what comments on the May 2022 DEIR the public believes to still be applicable or inapplicable from their previous comment letters, which is why the public has been given the opportunity to draft new comment letters on the Recirculated Draft PEIR.
- O7-3 to O7-8 These comments on the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on these issues pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses comments received on the Revised Draft 2045 CAP.
- O7-9 to O7-10 The County acknowledges the Center for Biological Diversity’s concern that the Revised Draft 2045 CAP does not include any measure for reducing emissions from power and peaker plants within the County that are powered by fossil fuels, particularly since many are located in disadvantaged communities. The County does not have the authority to phase out power plants, whether in disadvantaged communities or elsewhere; the power generation sector is regulated by the CPUC,

CEC, CARB, and USEPA. The purpose of the Revised Draft 2045 CAP is to reduce GHG emissions resulting from activities occurring within unincorporated LA County. Specifically, the project objectives are to achieve the climate action policies of the General Plan and provide a road map for reducing GHG emissions to achieve the County's GHG emissions reduction targets (Recirculated Draft PEIR p. 2-9). The Revised Draft 2045 CAP is not an air pollution or health risk reduction plan, and it is therefore not the appropriate venue for the County to reduce air pollution burdens in environmental justice communities.

Despite the Revised Draft 2045 CAP being first and foremost a plan for reducing GHG emissions, the Revised Draft 2045 CAP is intended to be inclusive, accessible, and meaningful and prioritizes frontline communities, which are Black, Indigenous, and People of Color (BIPOC) and low-income households that have historically experienced a disproportionately high share of environmental impacts (Revised Draft 2045 CAP p. 1-14). In unincorporated Los Angeles County, frontline communities are in areas with the worst air and soil pollution and traffic congestion, with the least open space and smallest number of trees, and they are exposed to particulate matter from living near major freeways, ports, and industry. Because frontline communities also have fewer resources to prevent, adapt, or recover from climate disasters, the County prioritizes strategies that both invest in and support these communities.

The Revised Draft 2045 CAP includes indirect emissions associated with electricity consumed within unincorporated County areas and emission reduction measures and actions to reduce these emissions to zero through the use of 100 percent carbon-free electricity produced through sources such as solar, wind, and hydro (see Measure ES2). The Revised Draft 2045 CAP does not include emissions from large stationary sources (like power plants) that are covered by CARB's CAP & Trade regulations and regulated by other entities because these sources are 1) outside of the jurisdictional control of the County and 2) including these emissions would double-count electricity consumption emissions in the Revised Draft 2045 CAP. The Revised Draft 2045 CAP focuses reduction measures on where the County has jurisdictional influence or control (Revised Draft 2045 CAP p. 1-4 footnote 1). Measure ES2 calls for 100 percent zero-carbon electricity for all County accounts by 2025, and 96 percent zero-carbon electricity for the entire community by 2030 (4 percent opt-out rate assumption). In addition, Measure ES3 calls for substantial increases in local solar power installations (DER infrastructure) throughout the County for both new and existing buildings (municipal, residential, and commercial).

O7-11 to O7-13 The County acknowledges the Center for Biological Diversity's concern that there are gaps in the state and air district's regulation of the energy sector, such as the state's 100 percent zero carbon target (as mandated by SB 100) being focused on retail sales only, potentially allowing power generators to meet this target while still combusting fossil fuels for end uses outside of retail sales (e.g., to meet transmission and distribution losses from the grid). As explained in response to comments O7-9

and O7-10, the County does not have the authority to regulate power plants, which are covered by CARB's CAP & Trade regulations and regulated by other entities.

O7-14 In response to the comment's concern that the Revised Draft 2045 CAP does not include any measure addressing emissions from the power plant sector that may occur due to end uses beyond retail sales (such as meeting transmission and distribution needs), the County does not have the authority to regulate power plants, which are covered by CARB's CAP & Trade regulations and regulated by other entities, as explained in response to comments O7-9 and O7-10.

O7-15 to O7-20 These comments on the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on these issues pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses comments received on the Revised Draft 2045 CAP.

O7-21 to O7-22 In response to the comment's point about the benefits of distributed energy resources and its lesser environmental impacts, the Recirculated Draft PEIR analyzes the significant environmental impacts of the Revised Draft 2045 CAP as a whole within each environmental resource area of the Recirculated Draft PEIR, which includes aesthetic impacts. For a specific discussion regarding an alternative related to distributed energy generation, please see General Response 1. As explained in General Response 1, distributed generation and storage are not without adverse environmental impacts, which are introduced in Recirculated Draft PEIR Section 3.1.3.6 and are quantitatively analyzed throughout Chapter 3, *Environmental Setting, Impacts, and Mitigation Measures* (p. 3.1-1 et seq.).

O7-23 Regarding the comment's concern regarding utility costs to ratepayers and its suggestion that distributed energy resources could offset a portion of those costs, the Recirculated Draft PEIR analyzes the physical environmental impacts of distributed energy resource-related development facilitated by the Revised Draft 2045 CAP measures and actions on a resource-by-resource basis. Utility costs are beyond the scope of this Recirculated Draft PEIR, which, consistent with CEQA, analyzes the impacts of the Revised Draft 2045 CAP on the physical environment. (See CEQA Guidelines, § 15131.) Public Resources Code section 21060.5 defines "environment" as "the *physical conditions* which exist within the area which will be affected by a proposed project." (Emphasis added.) Thus, by statute, an impact must be related to a change in the physical environment before it is subject to analysis under CEQA. Economic impacts alone are not changes in physical conditions and so are beyond the scope of CEQA review. See CEQA Guidelines section 15064 ("Economic and social changes resulting from a project shall not be treated as significant effects on the environment."); see also, and CEQA Guidelines section 15382 ("An economic or social change by itself shall not be considered a significant effect on the environment.").

- O7-24 See Response O7-23, which explains that CEQA does not require consideration of economic effects. These comments on the Revised Draft 2045 CAP do not result in physical changes to the environment. (See CEQA Guidelines, § 15131.)
- O7-25 See Response O7-23, which explains that ratepayer costs (including the potential for distributed energy resources to offset them) are beyond the scope of this CEQA review. CEQA does not require consideration of economic effects that do not result in physical changes to the environment. (See CEQA Guidelines, § 15131.)
- O7-26 See Response O7-23, which explains that ratepayer costs are beyond the scope of this CEQA review, as CEQA does not require consideration of economic effects that do not result in physical changes to the environment. (See CEQA Guidelines, § 15131.) The County has reviewed the CPUC’s May 2021 whitepaper entitled “Utility Costs and Affordability of the Grid of the Future: An Evaluation of Electric Costs, rates, and Equity Issues Pursuant to Public Utilities Code Section 913.1” (cited in footnote 15 of the comment letter) and has determined that the information provided does not affect the County’s conclusion that ratepayer costs are beyond the scope of this CEQA review. CEQA does not require consideration of economic effects that do not result in physical changes to the environment. (See CEQA Guidelines, § 15131.)

Nonetheless, the cost of program-level mitigation measures to reduce potential impacts of projects facilitated by the Revised Draft 2045 CAP would be borne by project applicants and could be passed through to SCE ratepayers only if SCE was the project applicant. The wildfire-related impacts associated with the Project are described in Section 3.18, *Wildfire* (p. 3.18-1 et seq.). As described in detail in Section 3.18.2.3, *Project Impacts*, individual projects facilitated by Draft 2045 CAP measures and actions could require fuel breaks, emergency water sources, power lines, or other associated infrastructure that could exacerbate fire hazard risk or result in temporary or ongoing impacts on the environment. (Recirculated Draft PEIR, p. 3.18-22.) To reduce this impact, the County would implement Mitigation Measure 3.18-3, which would require project applicants for projects under the County’s permitting authority to prepare a fire protection plan to ensure that wildland fire-related hazards would not be exacerbated by installation or maintenance of infrastructure associated with future projects facilitated by the Revised Draft 2045 CAP measures and actions that may exacerbate fire risk or may result in temporary or ongoing impacts on the environment. (See Recirculated Draft PEIR, Section 3.18.2.3, pp. 3.18-23, 3.18-24, 3.18-26). The County would also impose Mitigation Measure 3.15-1, which would require the implementation of a traffic control plan (Section 3.18.2.3, p. 3.18-18).

The County has reviewed the statement made about ratepayer savings cited in footnote 16 of the comment letter and finds that it does not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a).

O7-27 This comment on the Revised Draft 2045 CAP does not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on these issues pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses comments received on the Revised Draft 2045 CAP.

O7-28 See Response O7-23, which explains that ratepayer costs are beyond the scope of this CEQA review, as CEQA does not require consideration of economic effects that do not result in physical changes to the environment. (See CEQA Guidelines, § 15131.) The County has reviewed the July 2021 report by Vibrant Clean Energy (cited in footnote 17 of the comment letter) and finds that the information contained does not raise environmental issues related to the Recirculated Draft PEIR and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). To the contrary, the County agrees with the suggestion that distributed generation has a role in supporting the County's efforts to meet its targets and advance toward its goal of carbon neutrality.

O7-29 See Response O7-23 which explain that ratepayer costs, including those that may be increased to address the cost to investor-owned utilities of implementing measures to address wildfire risk, are beyond the scope of this CEQA review, as CEQA does not require consideration of economic effects that do not result in physical changes to the environment. (See CEQA Guidelines, § 15131.) Also see Response O7-26, which explains how individual projects facilitated by Revised Draft 2045 CAP measures and actions would be required to implement Mitigation Measure 3.18-3 to reduce wildfire risk.

The County has reviewed Order Instituting Rulemaking to Revisit Net Energy Metering Tariffs Pursuant to Decision 16-01-044, and to Address Other Issues Related to Net Energy Metering (CPUC R.20-08-020, cited in footnote 18 of the comment letter). See, e.g., page 32 (“Much of the proposed \$4 billion wildfire mitigation expenditures could be avoided by having all customers in the Tier 3 [High Fire-Threat District] HFTD add solar and battery storage, and authorizing the IOUs to conduct power shutoffs at their discretion.”). The County finds that the information contained does not raise environmental issues related to the Recirculated Draft PEIR and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a).

O7-30 to O7-33 These comments on the Revised Draft 2045 CAP does not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses comments received on the Revised Draft 2045 CAP.

O7-34 The performance goal for Measure ES2 that all unincorporated County accounts must participate in 100 percent renewable electricity service was revised to include other available 100 percent zero-carbon electricity service in addition to CPA's Green Power option and SCE's Green Rate option (Revised Draft 2045 CAP, pp. 3-20, B-

14). The County has already implemented this measure: since October 2022, all customers in unincorporated Los Angeles County are automatically enrolled in CPA’s 100 percent renewable energy option and all residents and businesses in unincorporated Los Angeles County have been receiving 100 percent renewable energy—wind, solar, geothermal—from CPA (Revised Draft 2045 CAP, p. 3-17). The comment does not address the adequacy or accuracy of the Recirculated Draft PEIR or any environmental effects of the proposed Project such that no further response is required pursuant to CEQA Guidelines section 15088(a).

O7-35 As discussed on Revised Draft 2045 CAP p. 3-17, since October 2022, all customers in unincorporated Los Angeles County are automatically enrolled in CPA’s 100 percent renewable energy option. CPA has capacity for all County customers. Thus, this measure is specific, enforceable, and feasible, contrary to the commenter’s claims. Also see General Response 5, which explains the relationship between GHG emissions reduction measures in the Revised Draft 2045 CAP and CEQA mitigation measures and addresses how the quantitative analysis within the Revised Draft 2045 CAP is substantiated. Comment concerns are addressed in the following subsection: Qualified Revised Draft 2045 CAP Reduction Measures Compared to CEQA Mitigation Measures (2.2.5.1).

O7-36 Draft 2045 CAP Measure ES3, *Increase Renewable Energy Production*, calls for a substantial increase in the amount of rooftop solar installed throughout the County. Rooftop solar is a form of distributed energy resources (DER). For example, the performance goals for Measure ES3 include installing rooftop solar on 20 percent of all existing single-family residential homes and multifamily residential buildings and 80 percent of all new single-family residential homes and multifamily residential buildings by 2030, a huge undertaking. Measure ES3 also includes aggressive solar installation performance goals for later years, including 2035 and 2045, and for commercial buildings. This will enable a shift away from CPA’s 100 percent renewable energy option. Because installing rooftop solar is resource intensive and time consuming to implement at scale, and because reducing GHG emissions as quickly as possible is a priority of the Revised Draft 2045 CAP, the County has already implemented Measure ES2 by enrolling all customers in CPA’s 100 percent renewable energy option. Over time, the County’s renewable energy supply will shift from CPA to DER with implementation of Measure ES3 and other similar measures.

O7-37 The commenter does not include suggested performance goals for Measure ES3 or provide evidence to support the claim that Measure ES2 is vague. Please see responses to comments O7-35 and O7-36 above. The comment does not address the adequacy or accuracy of the Recirculated Draft PEIR or any environmental effects of the proposed Project such that no further response is required pursuant to CEQA Guidelines section 15088(a).

O7-38 to O7-40 These comments on the Revised Draft 2045 CAP does not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response

is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses generally comments received on the Revised Draft 2045 CAP.

- O7-41 Responding to the comment’s concern regarding deferring DER implementation, the Revised Draft 2045 CAP sets a goal under ES4 of increasing DER to achieve community electricity storage and generation equal to the community-wide 24-hour average usage by 2035/2045. Action ES4.3 calls for developing a publicly accessible community energy map that identifies opportunities for deploying distributed energy resources and microgrids to improve energy resiliency. In response to this comment, the County has changed the implementation timeline for the community energy map required by Action ES4.3 to the short term (2024–2030) timeline. DER takes time and careful planning to implement into the community and the County has set realistic targets for measure realization.
- O7-42 Regarding the comment’s concern regards utility-scale solutions, consistent with the challenges reported in the 2022 California Renewables Portfolio Standard Annual Report, “no single solution... will resolve the myriad of challenges impacting [California Renewables Portfolio Standard (RPS)] project development.”²¹ As described in the Recirculated Draft PEIR Section 3.7.1.3, *Regulatory Setting*, in Section 3.7, *Energy* (p. 3.7-6) SB 100 (de León, 2018) sets an RPS requirement to achieve 60 percent by 2030 and establishes a goal that renewable and zero-carbon resources supply 100 percent of electric retail sales to California end-use customers by 2045. SB 100 directed the California Energy Commission, CPUC, and the California Air Resources Board to collaborate on a joint agency report to evaluate challenges and opportunities for SB 100’s implementation. The first SB 100 Joint Agency Report,²² issued in March 2021, includes an initial evaluation of the additional energy resources and the resource building rates necessary to realize 100 percent clean electricity. It recognizes that microgrids have a role in supporting energy resilience as an important alternative to fossil fuel backup generators, but cautions that “clean energy microgrids have limitations, particularly in how long they can keep the power on and the associated relatively high cost.” Ultimately, both utility-scale and distributed renewable energy generation will need to be deployed at increasing levels to achieve target set forth at the state level and in the Revised Draft 2045 CAP. Regarding the concern about environmental impacts from utility-scale solutions, the Recirculated Draft PEIR Section 3.1.3.6, *Future Projects Facilitated by the Draft 2045 CAP* (p. 3.1-13), expressly acknowledges that future projects facilitated by Draft 2045 CAP measures and actions, including utility-scale development may cause adverse environmental impacts. The Recirculated Draft PEIR provides two full pages (p. 3.1-

²¹ California Public Utilities Commission (CPUC), 2022. 2022 California Renewables Portfolio Standard Annual Report. November 2022. <https://www.cpuc.ca.gov/-/media/cpuc-website/industries-and-topics/documents/energy/rps/2022-rps-annual-report-to-the-legislature.pdf>. Accessed June 7, 2023.

²² Gill, Liz, Gutierrez, Aleccia, and Weeks, Terra. 2021. 2021 SB 100 Joint Agency Report, Achieving 100 Percent Clean Electricity in California: An Initial Assessment. Updated September 3, 2021. <https://www.energy.ca.gov/publications/2021/2021-sb-100-joint-agency-report-achieving-100-percent-clean-electricity>. Accessed June 7, 2023.

13 et seq.) discussing new utility-scale solar projects and why the County believes that renewable energy demand could be met in a variety of ways other than through new utility-scale solar projects, such as further development of rooftop solar.

O7-43 and O7-44 See Section 2.2.1, *General Response 1: CEQA Alternatives*, regarding the Recirculated Draft PEIR's analysis of utility-scale and other renewable energy projects, including battery storage, that would be facilitated by implementation of the Revised Draft 2045 CAP. Comments O7-43 and O7-44 do not identify any additional environmental impacts that were not considered or analyzed in the Recirculated Draft PEIR.

Comment O7-44 states that the Recirculated Draft PEIR should evaluate potential environmental impacts from utility-scale biofuel operations. However, no such projects are included as measures or implementing actions in the Revised Draft 2045 CAP, except for Action W2.3 which calls for working with waste and wastewater service providers to "utilize unused anaerobic digestion capacity of existing wastewater treatment plants and solid waste facilities to generate vehicle fuel." (Revised Draft 2045 CAP, p. 3-60). The use of these existing facilities for such purposes would not require additional CEQA review. Action T6.7 identifies the use of biomethane and biogas created from organic waste as a "bridge fuel to achieve 100 percent green hydrogen and electric vehicles (Revised Draft 2045 CAP, p. 3-39). Measure E1 identifies biomethane as a potential alternative to fossil natural gas for use in existing buildings for water heating, space heating, and cooking, but also states that existing opportunities for the widespread use of biomethane are currently limited (Revised Draft 2045 CAP, p. 3-48). Action E3.1 calls for working with utilities to incorporate increasing levels of biomethane into the natural gas mix (Revised Draft 2045 CAP, p. 3-53). Any utility-scale biomethane production facility would require project-level CEQA review before approval.

O7-45 The comment correctly states that poorly sited large-scale solar development can result in adverse impacts to the physical environment; however, no renewable energy projects of any scale are specifically proposed in the Revised Draft 2045 CAP. Recirculated Draft PEIR Section 3.1.3.6 (p. 3.1-13), expressly acknowledges that future projects facilitated by Draft 2045 CAP measures and actions may cause environmental impacts. Examples of such projects could include distributed generation via solar roofs, community solar, or microgrids; battery storage and electric vehicle charging stations; utility-scale solar photovoltaic (PV) development; and/or energy transmission and subtransmission facilities. Such impacts are analyzed on a resource-by-resource basis in Recirculated Draft PEIR Chapter 3, *Environmental Setting, Impacts, and Mitigation Measures*. See Section 2.2.1, *General Response 1: CEQA Alternatives*, which provides specific cross-references to such analyses.

O7-46 The comment correctly states that terrestrial wind projects may result in adverse impacts to avian species and other aspects of the physical environment. However, it does not question the adequacy or accuracy of the Recirculated Draft PEIR. The

Recirculated Draft PEIR analyzes the impacts of projects that would be facilitated by implementation of the Revised Draft 2045 CAP at a program level of detail. See Section 2.2.1, *General Response 1: CEQA Alternatives*, for examples of where the Recirculated Draft PEIR analyzes the impacts of renewable energy development. The County has reviewed the documents cited in footnotes 24 and 25 of the comment letter and has determined that the information provided does not bear on the adequacy or accuracy of the Recirculated Draft PEIR or the conclusions reached in the Recirculated Draft PEIR. Nonetheless, the information has been included in the administrative record where it will be considered as part of the decision-making process.

- O7-47 While the comment correctly states that geothermal energy projects may result in adverse impacts the physical environment, it does not provide specific concerns regarding the adequacy or accuracy of the Recirculated Draft PEIR. The Recirculated Draft PEIR analyzes the impacts of projects that would be facilitated by implementation of the Revised Draft 2045 CAP at a program level of detail. See Section 2.2.1, *General Response 1: CEQA Alternatives*, for examples of where the Recirculated Draft PEIR analyzes the impacts of renewable energy development. The County has reviewed the document cited in footnote 26 of the comment letter and has determined that the information provided is generic, offers no opinion about impacts associated with the Revised Draft 2045 CAP, and does not bear on the adequacy or accuracy of the Recirculated Draft PEIR or the conclusions reached in the Recirculated Draft PEIR.
- O7-48 While the comment correctly suggests that distributed energy generation projects such as rooftop solar projects can reduce impacts to the physical environment relative to ground-mounted, utility-scale projects, it does not provide specific concerns regarding the adequacy or accuracy of the Recirculated Draft PEIR. The Recirculated Draft PEIR analyzes the impacts of projects that would be facilitated by implementation of the Revised Draft 2045 CAP at a program level of detail; please refer to Section 2.2.1, *General Response 1: CEQA Alternatives*, for examples of where the Recirculated Draft PEIR analyzes the impacts of renewable energy development. The impacts of distributed energy generation projects are analyzed in the Recirculated Draft PEIR. See Response O7-45 for details. See also, for example, Section 3.2, *Aesthetics* (p. 3.2-9), Section 3.7, *Energy* (pp. 3.7-12, 3.12-13), Section 3.10, *Hazards and Hazardous Materials* (pp. 3.10-19, 3.10-22, 3.10-24), and Section 3.12, *Land Use and Planning* (p. 3.12-17). The County has reviewed the documents cited and determined that the information provided is generic, offers no opinion about impacts associated with the Revised Draft 2045 CAP, and does not bear on the adequacy or accuracy of the Recirculated Draft PEIR or the conclusions reached in the Recirculated Draft PEIR.
- O7-49 The decision to implement small-scale solar development rather than utility-scale solar development relate to County policy decisions, which are not addressed or resolved in the Revised Draft 2045 CAP. The Revised Draft 2045 CAP instead considers the potential for a mix of new renewable energy sources to be developed as

facilitated by the Revised Draft 2045 CAP. The County has reviewed the document cited in footnote 27 of the comment letter and has determined that the information provided is generic, offers no opinion about impacts associated with the Revised Draft 2045 CAP, and does not bear on the adequacy or accuracy of the Recirculated Draft PEIR or the conclusions reached in the Recirculated Draft PEIR. Regarding impacts, please refer to *General Response 1: CEQA Alternatives*, for examples of where it will be considered as part of the decision-making process. The Recirculated Draft PEIR analyzes the impacts of renewable energy development.

O7-50 Regarding the comment’s acknowledgment that the Recirculated Draft PEIR details impacts of the types of energy development that could occur, the comment provides insufficient information about the commenter’s concern regarding the “degree” of impacts to allow the County to address this point in greater detail. Please refer to *General Response 1: CEQA Alternatives*, for examples of where the Recirculated Draft PEIR analyzes the impacts of renewable energy development and explains that CEQA does not require an EIR to consider alternatives to a component of a project, but rather recommends that alternatives focus on alternatives to the project as whole. (*California Native Plant Society v. City of Santa Cruz* (2009) 177 Cal.App.4th 957 [an EIR is required to describe alternatives to the proposed project as a whole, not to the various facets thereof].) Measure ES3, *Increase Renewable Energy Production* (Recirculated Draft PEIR Section 2.6.2.1, p. 2-22 et seq.), which includes Action ES3.6, and Measure ES4, *Increase Energy Resilience* (p. 2-23), are components of the Project rather than the entirety of the Project. Accordingly, the Recirculated Draft PEIR need not evaluate alternatives to specific measures and implementing actions for the Revised Draft 2045 CAP’s renewable energy policies and to achieve its renewable energy targets. Also see generally Section 3.1.3.3, *Significance Conclusions* (Recirculated Draft PEIR, p. 3.1-11), which explains the distinctions among significance conclusions reached in the Recirculated Draft PEIR. Regarding the comment’s statement related to the environmentally superior alternative, see Recirculated Draft PEIR, Section 4.6, p. 4-20 et seq. and General Response 1 regarding DER-focused alternatives.

O7-51 The Comment correctly notes that the Recirculated Draft PEIR does not detail the potential local impacts of biofuel and biomass processing facilities, specifically biomethane production and combustion. The Revised Draft 2045 includes anaerobic digestion and biomass conversion conceptually in the description of Strategy 8: Minimize Waste and Recover Energy and Materials from the Waste Stream (Revised Draft 2045 CAP, 3-57). However, there is just one action related to biomass conversion – Measure 2 (Increase Organic Diversion), Action W2.3 – which calls for working with waste and wastewater service providers to “utilize unused anaerobic digestion capacity of existing wastewater treatment plants and solid waste facilities to generate vehicle fuel.” (Revised Draft 2045 CAP, p. 3-60). The use of these existing facilities for such purposes would not require additional CEQA review.

As discussed in response to comment O7-44 above, there are several measures and actions that identify biomethane as a potential renewable fuel source. This includes Action T6.7 (biomethane and biogas created from organic waste can be used as a "bridge fuel" to achieve 100 percent green hydrogen and electric vehicles), Measure E1 (biomethane as a potential alternative to fossil natural gas for use in existing buildings), and Action E3.1 (work with utilities to incorporate increasing levels of biomethane into the natural gas mix) (Revised Draft 2045 CAP, pp. 3-39, 3-48, and 3-53). Any utility-scale biomethane production facility would require project-level CEQA review before approval.

Further, as explained in Recirculated Draft PEIR Section 1.3, *Program-level Analysis and Tiering* (pp. 1-2 and 1-3), a program EIR is a type of EIR prepared pursuant to CEQA that is used to evaluate a plan or program that has multiple components or actions that are related either: geographically; as logical parts in the chain of contemplated actions; in connection with application of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program; or as individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar environmental impacts which can be mitigated in similar ways. (Public Resources Code, §§ 21068.5 and 21093; CEQA Guidelines, § 15168(a).) Consistent with CEQA, the Recirculated Draft PEIR evaluates general impacts of the plan or program (i.e., the Revised Draft 2045 CAP), but does not examine the potential site-specific impacts of the many individual projects implementing Revised Draft 2045 CAP measures and actions that may be proposed in the future.

Environmental justice and its special focus on disadvantaged communities is beyond the scope of CEQA. See Public Resources Code section 21060.5, which defines "environment" as "the physical conditions that exist within the area which will be affected by a proposed project, including land, air, water, minerals, flora, fauna, noise, or objects of historic or aesthetic significance." See also the Environmental Checklist provided in CEQA Guidelines Appendix G. Nonetheless, the Recirculated Draft PEIR does consider potential impacts of the Revised Draft 2045 CAP on the environmental resource areas that typically are considered in an environmental justice analysis. See, e.g., Section 3.4, *Air Quality* (p. 3.4-1 et seq.), Section 3.10, *Hazards and Hazardous Materials* (p. 3.10-1 et seq.), and Section 3.11, *Hydrology and Water Quality* (p. 3.11-1 et seq.).

Regarding the comment's statement that biomethane represents a "false climate solution," SB 100 does indeed consider biomethane a zero-carbon resource.²³ The 2022 Scoping Plan also identifies biomethane as a low-carbon fuel and a strategy for achieving the state's GHG reduction targets.²⁴ The Revised Draft 2045 CAP intends

²³ California Energy Commission, 2017. *Renewables Portfolio Standard Eligibility*. January 2017. Available at file:///C:/Users/bschuster/Downloads/TN217317_20170427T142045_RPS_Eligibility_Guidebook_Ninth_Edition_Revised.pdf. Accessed September 2023.

²⁴ California Air Resources Board. 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. November 16, 2022. Pages 78, 88, 146, 190, 206-218. Available at <https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2022-scoping-plan-documents>. Accessed August 2023

to align with state climate goals; this is Project Objective #2 (*Identify GHG emissions reduction targets tailored to the unincorporated County that closely align with state and County climate goals*). Because CARB and CEC accept biomethane as a zero-carbon resource, so does the Revised Draft 2045 CAP. The comment's note that proper accounting for the GHG emissions and climate impacts associated with biomethane production and combustion are acknowledged and agrees with the statement that experts who study the climate impacts biofuel feedstocks identify wide ranges of uncertainty. The County recognizes these concerns, and does not rely on the use of biofuels or biomethane to achieve the Revised Draft 2045 CAP's targets for 2030, 2035, or 2045.

Potential socio-economic impacts also are beyond the scope of CEQA analysis. As explained in the CEQA Guidelines, an EIR must analyze the "physical changes in the environment which may be caused by the project" and "[e]conomic or social effects of a project shall not be treated as significant effects on the environment." (CEQA Guidelines, §§ 15064(d), 15131.) The Recirculated Draft PEIR analyzed the Project's physical changes to the environment and impacts related to public health and the community. Here, no site-specific biofuel plants are proposed in the Revised Draft 2045 CAP. As explained in Recirculated Draft PEIR Section 3.1.3.6 (p. 3.1-13), "The Draft 2045 CAP is a policy document that does not propose any specific development or any other specific physical change to the environment" and "[f]uture developments will be subject to project-level environmental review where they are not exempt from CEQA." In this context, it would be speculative to assume that any biomass power plant facilitated by the implementation of Revised Draft 2045 CAP measures and actions would cause repeated air quality violations.

The County has reviewed the documents cited in footnotes 30 and 31 of the comment letter and has determined that the information provided is generic, offers no opinion about impacts associated with the Revised Draft 2045 CAP, and does not bear on the adequacy or accuracy of the Recirculated Draft PEIR or the conclusions reached in the Recirculated Draft PEIR. Nonetheless, the information has been included in the administrative record where it will be considered as part of the decision-making process.

- O7-52 In response to this comment's concern regarding potential uncertainty attendant to properly accounting for the climate impacts of biomass and biomethane, this concern is beyond the scope of the Recirculated Draft PEIR because the Revised Draft 2045 CAP does not include such projects listed in the comment. The Revised Draft 2045 CAP does rely on related emissions reductions from biomass and biomethane controls to achieve 2045 CAP goals.
- O7-53 Specific responses to this comment's concern regarding phase out of oil and gas operations are provided below in Responses to Comments O7-54 through O7-56.

- O7-54 Measure ES1 (Develop a Sunset Strategy for All Oil and Gas Operations) identifies a performance objective to reduce oil and gas operations: 40 percent by 2030, 60 percent by 2035, and 80 percent by 2045. This represents the quantified GHG emission reductions contribution from this measure toward the total Revised Draft 2045 CAP GHG emission reduction targets. This does not restrict the County from exceeding the performance objective to achieve environmental justice goals.
- O7-55 The Oil Well Ordinance adopted on January 24, 2023 applies to 473 of the 1,547 total oil wells in the unincorporated County. The remaining 1,074 oil wells are within the Baldwin Hills Community Standards District (855 oil wells), in an area designated as a specific plan (57 oil wells), or are operating under a valid discretionary permit (162 oil wells). These remaining oil wells will be addressed in pending and future County efforts. The performance objectives represent guideposts for successful implementation of measures and do not represent maximum achievements. Measures are able to exceed the performance objectives. See O7-56 for additional discussion.
- O7-56 The performance objective associated with Measure ES1 reflects the quantified GHG emission reduction contribution from this measure toward the total Draft 2045 CAP GHG emission reduction targets. The introductory statement on page E-3 of the Revised Draft 2045 CAP Appendix E (Implementation Details) explains the purpose and intent of performance objectives. The performance objectives represent guideposts for the successful implementation of each measure and the Revised Draft 2045 CAP as a whole. However, they are not specific mandates. Successful implementation of the Revised Draft 2045 CAP ultimately translates to the County meeting its GHG reduction targets for 2030, 2035 and 2045. The Revised Draft 2045 CAP demonstrates how these targets can be met through a combination of measures, including an 80 percent reduction in emissions from oil and gas operations by 2045. The County recognizes that as the Revised Draft 2045 CAP is implemented and monitored, future amendments to CAP measures may be needed to address future federal and state regulations and as such, performance objectives may change in the future.

An amortization study is underway to determine the fastest possible phase-out timeline for all existing oil wells and production facilities. This study will consider the legal, environmental, political, and cost considerations of the phase out. The performance objective does not dictate the amortization rate; however, the amortization study may influence future adjustments to the performance objectives should the results determine that the performance objective is infeasible or should be accelerated. As such, the performance objective has been modified to include a note to adjust the performance objective to reflect the results from the amortization study. The note will read, “**The performance objective provided here serves as a general metric and may be refined upon completion of the Oil Well Amortization Study.**”

- O7-57 and O7-58 The County acknowledges that results from the Oil Well Amortization Study will help inform the amortization speed and process and guide the strategy to phase

out oil and gas extractions and facilities. As such, Section 4.3.6 of the Recirculated Draft PEIR will be edited to strike out the following statement pending outcome of the amortization study:

~~*Achieving a complete phase-out by 2045 would be a daunting challenge.*~~
(Recirculated Draft PEIR, Section 4.3.6, p. 4-9.)

- O7-59 Section 4.3.6 of the Recirculated Draft PEIR discusses three primary reasons for not carrying forward the alternative for complete phase-out of oil and gas operations by 2030. The first is that the alternative would not clearly avoid or substantially lessen the potential impacts of the Project. It will be clarified however that the reference to an increase in localized construction-related air quality impacts from decommissioning oil and gas wells are for short-term construction impacts. As such, Section 4.3.6 will be revised as follows:

It is possible that this alternative could worsen or increase the Project's potential significant impacts, such as short-term localized construction-related air quality and health risk impacts from decommissioning of oil and gas wells and remediation activities at contaminated sites. (Recirculated Draft PEIR, Section 4.3.6, p. 4-9.)

These revisions do not result in changes to environmental impact analyses or conclusions presented in the Recirculated Draft PEIR, and therefore do not constitute significant new information that would trigger recirculation under CEQA Guidelines section 15088.5.

Secondly, without a completed amortization study, the timeline for phase-out of oil and gas facilities is speculative for the 1,074 oil wells not covered by the Oil Well Ordinance and are within the Baldwin Hills Community Standards District, in an area designated as a specific plan, or are operating under a valid discretionary permit. Oil wells authorized through discretionary permits and with expiration dates beyond 2030 will need to be addressed in the amortization study.

Thirdly, the alternative addresses only one of the Revised Draft 2045 CAP measures, a Project component, rather than the Project as a whole. (See *California Oak Foundation v. Regents of University of California* (2010) 188 Cal.App.4th 227, 276-277.) See General Response 1 for more discussion.

- O7-60 See Response O7-51, which addresses the comment associated with the examples provided in this footnote.
- O7-61 The County acknowledges the County Code citation that references the process for review of requests for extension for nonconforming uses (County Code, Section 22.172.060). This comment does not raise significant environmental issues relating to the Recirculated Draft PEIR such that no response is required pursuant to CEQA Guidelines section 15088(a).

- O7-62 Regarding the comment’s concern regarding conservation of natural lands and wildfire risk, see Responses to Comments O7-63 through O7-65.
- O7-63 The Revised Draft 2045 CAP emphasizes actions around the transportation and building energy sectors because they collectively contribute to 85% of County GHG emissions. Conservation of natural lands for carbon sequestration, biodiversity, and habitat resiliency is an important contribution to the aspirational goal of carbon neutrality; however, actions need to be initiated more immediately that can reduce more quickly tackle the GHG emission sources. The County will continue to seek opportunities to conserve habitats through concurrent efforts such as the Significant Ecological Areas Program which requires preservation of natural open space to offset impacts to biotic resources and the Santa Monica Mountains Local Coastal Program’s Resource Conservation Program which consists of an expenditure of funds used for acquisition and permanent preservation of habitat.
- O7-64 SB 379 (2015) mandated the County to update the Safety Element to incorporate climate adaptation and resiliency strategies. The updated Safety Element was adopted in July 2022 and includes clear linkages between land development and climate-induced hazards, particularly wildfire. All elements of the General Plan work in tandem with each other and as a cohesive framework to address the natural and built environment. Addressing the linkage between land development and climate-induced hazards is best suited for the Safety Element as directed by SB 379.
- O7-65 SB 379 (2015) mandated the County to update the Safety Element to incorporate climate adaptation and resiliency strategies. The Safety Element was updated with an extended number of policies to address fire hazards that consider climate change as well as traditional, but also adapted, approaches for the forecasted wildfire changes. Such policies within the Safety Element include:

Policy S 4.3: Ensure that biological and natural resources are protected during rebuilding after a wildfire event.

Policy S 4.10: Encourage the planting of native oaks in strategic locations and near existing oak woodlands, including those to be mapped in the Oak Woodlands Conservation Management Plan, to protect developments from wildfires, as well as to lessen fire risk associated with developments.

Policy S 4.13: Encourage the siting of major landscape features, including but not limited to large water bodies, productive orchards, and community open space at the periphery of new subdivisions to provide strategic firefighting advantage and function as lasting firebreaks and buffers against wildfires, and the maintenance of such features by respective property owners. (General Plan, Safety Element, p. S-18 – S-19)

Addressing the linkage between land development and climate-induced hazards is best suited for the Safety Element, as directed by SB 379.

- O7-66 Responding to the comment’s request for more clarity on the Checklist, please see General Response 3 for discussion regarding implementation of the Revised Draft 2045 CAP’s measures and actions and the processes applicable to various project applicants.
- O7-67 As noted by the commenter, the Checklist does include all project-level requirements for CEQA streamlining purposes. Please see General Response 3, which addresses project-level requirements for CEQA streamlining as identified in the Checklist, for additional discussion.

Responding regarding the adequacy of the Revised Draft 2045 CAP’s measures, see enforceable General Response 5, which addresses the relationship between Revised Draft 2045 CAP measures and CEQA mitigation measures. The Revised Draft 2045 CAP and Recirculated Draft PEIR demonstrate with substantial evidence that the Revised Draft 2045 CAP meets the requirements of CEQA Guidelines section 15183.5(b), thereby allowing future projects to streamline their GHG impacts evaluation pursuant to CEQA Guidelines sections 15064.4 and 15183.5. (Revised Draft 2045 CAP pp. 1-4 to 1-5; Recirculated Draft PEIR pp. 2-9 to 2-12 and pp. 2-17 to 2-18.) Specifically, to meet the requirements of CEQA Guidelines section 15183.5(b), a CAP must only analyze GHG reductions “resulting from specific actions *or categories of actions anticipated* within the geographic area” (emphasis added). In addition, a CAP must “[s]pecify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level.” (CEQA Guidelines, § 15183.5(b)(1)(D).) The Revised Draft 2045 CAP complies with this requirement by including specific performance standards for new development in the Checklist and explaining how these standards achieve the Revised Draft 2045 CAP’s emission reduction targets. (Revised Draft 2045 CAP p. 1-4; Recirculated Draft PEIR p. 2-11.)

Regarding the specificity and enforceability of CAP measures, as discussed in the Recirculated Draft PEIR, the Revised Draft 2045 CAP includes a preponderance of mandatory (versus voluntary) measures and actions, measures that address the largest GHG emissions sources (such as building energy use and transportation), a focus on core measures that are likely to reduce large amounts of emissions, transparency in methods of quantification (see Appendix B of the Revised Draft 2045 CAP), and no reliance on voluntary carbon offsets (Recirculated Draft PEIR p. 2-11). Further, the previous comments dated April 30, 2020, pertain to a previous draft of the Revised Draft 2045 CAP and are not relevant to the Recirculated Draft PEIR, which wholly replaces the May 2022 Draft PEIR. (See CEQA Guidelines, § 15088.5(f)(1).)

Please also see General Response 3, which addresses the Revised Draft 2045 CAP’s reliance on future ordinances or plans that have not yet been developed to achieve its GHG reduction targets.

O7-68 As explained in General Response 3, the Checklist is clear about what is required of projects that choose to streamline their CEQA GHG impact analysis (see Appendix F, p. F-5 et seq.). Regarding requirements for projects prior to adoption of future ordinances implementing Revised Draft 2045 CAP measures and actions, the Checklist is also clear on this front. The Checklist states that the project must either do X (such as include electric options for promoting active transportation) or comply with a future ordinance (such as a future EVCS ordinance) and readiness. If the ordinance is not in place when the Checklist is being completed, then the project need not comply with such future ordinance.

To the commenter's example regarding the County's future potential zero net energy (ZNE) ordinance, voluntary Tier 2 Checklist item #16 requires, for projects under construction after 2030, the project to be zero-net-energy and/or comply with the County's ZNE ordinance, unless the project meets specific exemptions identified in the ordinance.

To document the proposed change in use of the Checklist and provide further clarity regarding streaming requirements prior to adoption of future ordinances, the County has revised the Revised Draft 2045 CAP in the following way:

For projects under construction after 2030, the project must be zero-net-energy and fully electric with no natural gas infrastructure or appliances achieve zero GHG emissions for on-site energy use, as specified in and/or comply with the County's ZNE ordinance, unless the project meets specific exemptions identified in the ordinance. (Revised Draft 2045 CAP, Appendix F, p. F-25.)

O7-69 Please see General Response 3, which addresses the Revised Draft 2045 CAP's validity as a CEQA streamlining tool, and General Response 5, which addresses the Revised Draft 2045 CAP's reliance on future ordinances or plans that have not yet been developed to achieve its GHG reduction targets. Also see response to comment O7-68 above.

O7-70 In response to the comment's statement regarding incorporating by reference all previous comments submitted by the commenter, CEQA Guidelines section 15088.5(f)(1) provides that "[w]hen an EIR is substantially revised and the entire document is recirculated, the lead agency may require reviewers to submit new comments and, in such cases, need not respond to those comments received during the earlier circulation period." As explained in Recirculated Draft PEIR Executive Summary Section ES.1 (p. ES-2), "[c]omments on the May 2022 Draft PEIR, though part of the administrative record, will not be responded to in the Final PEIR; new comments must be submitted on the Recirculated Draft PEIR." The County has also informed reviewers that new comments on the Recirculated Draft PEIR must be submitted and that the County would not respond to comments received during the original Draft PEIR public review period. The commenter's previous submittals predate the issuance of this Recirculated Draft PEIR, are inapplicable and are

presumed not to bear on the adequacy or accuracy of the Recirculated Draft PEIR. The Recirculated Draft PEIR wholly replaces the May 2022 Draft PEIR. To the extent the commenter believes its prior comments have continuing relevance, the burden is on the commenter to explain how with sufficient specificity to enable the County to provide a detailed response. The County does not have the duty to decipher what comments on the May 2022 Draft PEIR the public believes to still be applicable or inapplicable from their previous comment letters, which is why the public has been given the opportunity to draft new comment letters on the Recirculated Draft PEIR.

- O7-71 CEQA Guidelines section 15088.5(f)(1) provides that “[w]hen an EIR is substantially revised and the entire document is recirculated, the lead agency may require reviewers to submit new comments and, in such cases, need not respond to those comments received during the earlier circulation period.” As explained in Recirculated Draft PEIR Executive Summary Section ES.1 (p. ES-1), Section 1.2 (p. 1-2), Section 1.4.3 (p. 1-7), and Section 1.4.4 (p. 1-9) the “Recirculated Draft PEIR wholly replaces the May 2022 Draft PEIR.” The Recirculated Draft PEIR specifically states, “Comments on the May 2022 Draft PEIR, though part of the administrative record, will not be responded to in the Final PEIR; new comments must be submitted on the Recirculated Draft PEIR.” This also was noted in the Notice of Availability for the Recirculated Draft PEIR posted on the project website at <https://planning.lacounty.gov/long-range-planning/climate-action-plan/documents/>. It was also noted in the April 19, 2023, email sent to interested parties registered on the project email listserv.

The commenter’s previous submittals predate the issuance of the Recirculated Draft PEIR, are inapplicable, and do not address adequacy or accuracy of the analysis included in the Recirculated Draft PEIR that post-dates the commenter’s July 18, 2022, and February 1, 2022, comments on the Draft PEIR. The comment’s general statement incorporating prior submittals by reference without some indication of their applicability or relevance does not provide the County with enough information to provide a detailed response in this Final PEIR or in the context of any further revisions to the Revised Draft 2045 CAP. To the extent the commenter believes their prior comments have continuing relevance, the burden was on the commenter to explain with sufficient specificity how they are relevant to the Recirculated Draft PEIR to enable the County to provide a detailed response. The County does not have the duty to decipher what comments on the May 2022 Draft PEIR the commenter believes to still be applicable from its previous comment letters, which is why the public has been given the opportunity to draft new comment letters on the Recirculated Draft PEIR.

May 16, 2023

Attn: Thuy Hua,
Los Angeles County Regional Planning
320 W. Temple Street, 13th Floor Los Angeles, CA 90012

Sent via electronic mail

To the Los Angeles County Department of Regional Planning,

RE: Comments on the Draft 2045 Los Angeles County Action Plan

On behalf of Communities for a Better Environment (CBE) we are submitting this comment letter to share feedback on the Draft 2045 Los Angeles County Climate Action Plan (CAP). We commend the Los Angeles County Department of Regional Planning (DRP) for updating the CAP. While the CAP is an opportunity to reduce greenhouse gas emissions, CBE urges the County to continue engaging with frontline communities and meaningfully inventory the disproportionate climate impacts that hit Environmental Justice (EJ) communities hardest.

O8-1

Energy Supply

In addition to the goals for phaseout of Oil & Gas extraction, the Oil Refinery phase down process will begin, as a measure in the State Scoping Plan. We urge the County to support the state Scoping Plan process to phase down Oil Refinery production of gasoline, diesel, and other products in line with reduction in demand for these fuels. It is important to plan the decommissioning and clean-up of refinery infrastructure, and a Just Transition for refinery workers as California uses less gasoline, diesel, and other refinery products. Refineries will not automatically disappear but continue to pollute local communities for short term profits as they export a greater and greater volume of climate warming fossil fuels abroad.

O8-2

Oil & Gas

DRP recognizes that eliminating oil and gas drilling are core to the County's decarbonized future, but also that benefits of energy decarbonization do not always reach frontline communities. DRP should continue to accelerate its drilling phaseout timeline to close and remediate drill sites as soon as legally possible. While the County's plan to phase down oil and gas operations 80 percent by 2045 will benefit community health, the CAP can be, and should be more ambitious, targeting 100% phase out by the soonest possible date based on the County's amortization study.

O8-3

- ES 1.1: CBE supports a sunset strategy which prioritizes disproportionately impacted communities for well abandonment and site remediation. In this process the county must place an emphasis on community involvement so that impacted residents can guide the phase down and trust in effective clean up and remediation practices. Addressing

O8-4

<p>breaches in community trust is one of many remedies a drilling phase out must include alongside stringent health protections and “polluter pays” measures.¹</p>	<p>O8-4 (cont.)</p>
<ul style="list-style-type: none"> ES 1.2: DRP’s recognition of the fugitive emissions threat is an important component of drilling phase out. As abandonment of oil wells proceeds, DRP must establish a long-term well monitoring plan to ensure LA County’s legacy of oil drilling does not morph into a legacy of brownfields and fugitive methane pollution. Fugitive methane emissions have proven notoriously difficult to monitor.² Drill site remediation should include a management plan to ensure plugging has been effective both in the short and long term. 	<p>O8-5</p>
<ul style="list-style-type: none"> ES 1.3: DRP should be extraordinarily cautious in its plans for Carbon Capture and Storage (CCS) in the County. While safety rules and community protection measures should be continued wherever oil and gas infrastructure are present as those sites operate and wind down, CCS is not such a community health measure. Rather, CCS can extend the life of polluting operations in the County, take up large swaths of urban land, and is very energy intensive to operate. CCS can also introduce new hazards into communities already burdened by harmful oil and gas infrastructure.³ 	<p>O8-6</p>
<p><u>Solar & Energy Resilience</u></p> <ul style="list-style-type: none"> ES 3.1, ES 3.2, and ES 3.5: CBE supports the installation of solar on buildings to increase access to renewable energy. It is imperative that the County set baseline protections that prevent landlords from simultaneously claiming County funds and passing costs on to tenants. Instead, DRP’s solar incentives should incent affordable housing with upfront financial support for retrofits. 	<p>O8-7</p>
<ul style="list-style-type: none"> ES 4.1: Community Resilience Hubs have the potential to provide a safe and comfortable space for community to gather during extreme climate events. A successful resilience hub must be co-designed and developed with community and directly address community concerns. CBE has been working with community members to support the development of two sites in Wilmington to serve as resilience hubs.⁴ We encourage the County to directly partner with community-based organizations (CBOs) to ensure meaningful engagement with community members. Community leadership should identify trusted sites, the energy load, resources, services, and materials necessary at the resilience hub to address community needs. 	<p>O8-8</p>

Transportation

Transportation is the largest contributor to County greenhouse gas emissions,⁵ made up of mostly single-occupancy vehicles. DRP recognizes that lowering total vehicle miles traveled (VMT) and expanding access to zero-emission vehicles (ZEVs) is critical to reducing the County’s total GHG emissions. For environmental and low-income communities, public transportation is a vital part of peoples’ mobility and increased investment has the opportunity to improve the economic livelihood of communities.⁶ Environmental justice communities need a transit system that is free, reliable, clean, adapted to climate conditions, equipped to support riders during extreme climate or industrial risks, and safe. Our lens of safety is embedded in community care and not over-policing. Additionally, investments into local transit systems should prioritize electric and zero-emission technologies. We expand our concerns, recommendations, and support below:

O8-9

- T 4.6: CBE supports free transit to encourage the use of public transit as a viable alternative to single occupancy vehicles.

- T 4.8: CBE supports the establishment of temporary car-free areas. However, such areas must be identified in partnership with the local and surrounding community’s leadership. Following community leadership will ensure that the car-free zones don’t further gridlock, increase traffic, and are available during times when community is able to utilize the space.

O8-10

- T 4.1: CBE has concerns regarding autonomous vehicles. One concern is that it could potentially displace workers from similar delivery jobs, harming low-income workers.⁷ Additionally, there is concern regarding the potential personal data breach and over policing of communities. Such autonomous vehicles have been found to record their surroundings using a mounted camera, we are concerned that such recordings could be sold to private companies or local police.⁸ This could be systematically dangerous to low-income, people of color who have historically been overpoliced. We also suggest the County directly partner with disability justice leaders and organizations to identify how to best support those living with different abilities who may benefit or be harmed by autonomous mobility.

O8-11

CBE urge the County to reprioritize investment in mass electric public transit instead of autonomous mobility due to safety concerns and unintended impacts to low-income workers.

O8-12

O8-13

⁵ Revised Draft 2045 Climate Action Plan, available at: https://planning.lacounty.gov/wp-content/uploads/2023/03/LA_County_2045-CAP_Rev_Public_Draft_March_2023_Chapters.pdf

⁷ Issuu., Driverless Jobs: Autonomous Vehicles & A Just Transition for Black Drivers, (pg 4), 1 Sept 2021. <https://issuu.com/congressionalblackcaucusfoundation/docs/0821-cpar-driverless-jobs-02>

⁸ SFist, Report: SFPD Already Using Surveillance Video from Self-Driving Cars, 12 May 2022

<ul style="list-style-type: none"> • T 4.10 and T 6.7: Public transportation should be zero emission. “Low emission”, “Biomethane” and “Biogas” are not ambitious enough technologies to reach the CAP’s target goals. Reather these technologies further exacerbate health impacts in environmental justice communities and air quality and delay the transition to an electric bus fleet. Though low emission could qualify green hydrogen fuel cell transit, many communities have solely and adamantly advocated for electric buses. CBE urges the County to prioritize and commit to an electric transportation fleet at every opportunity. Electrification is cleaner, more efficient, and more technologically advanced than hydrogen transit, and further supports existing electric vehicle infrastructure. 	O8-14
<ul style="list-style-type: none"> • T 9.2: All commercial equipment listed (i.e. forklifts, loaders, welders, saws, pumps, etc.) can be electrified. The Port of Long Beach has already been utilizing such equipment and the County should build on this success, reserving green hydrogen for sectors that cannot be electrified. 	O8-15
<ul style="list-style-type: none"> • T 8.2 and T 8.4: We encourage the county to prioritize electrification over alternative fuels. Low emission fueling sources, including hydrogen, biomethane, biogas, and natural gas could further delay electrification and potentially create health and environmental impacts for environmental justice communities. Additionally, the streamlining of fueling infrastructure without proper and lengthy community engagement, health studies, and full CEQA analysis could lead to oversight of quality checks, assurances, safety requirements, and lack of proper training for contractors. 	O8-16
	O8-17
<p><u>Building Decarbonization</u></p>	
<p>The decarbonization of residential buildings is an opportunity to both decrease GHG emissions and reinvest in people’s resilience. Low-income families and communities of color face a disproportionate energy burden by paying more than 30% of their income on energy bills.⁹ Further electrification and energy efficiency in people’s homes could alleviate financial and environmental burdens. However, it can also deeply impact peoples’ livelihoods if the transition is not done equitably. Here, we encourage the County to set a baseline platform that prohibits the displacement of tenants, cost of retrofits to be passed on to tenants, exacerbate energy burden, and harassment against tenants. We urge the County to prioritize upfront financial support to affordable housing in retrofits, support tenants with comfortable, local, and free housing during retrofits, mandate sufficient notice to tenants, and incorporate Indigenous land management and greening. The expansion of native landscapes can provide holistic GHG emissions reductions, energy efficiency and overall comfort to tenants. Additionally, CBE does not support the use of hydrogen in residential buildings.¹⁰ Direct electrification of homes and businesses is more efficient and safer than burning highly volatile, polluting hydrogen in enclosed buildings. We</p>	O8-18

⁹ Climate Emergency Mobilization Office: Report on Equitable Building Decarbonization, 15 Sept 2022. <https://www.climate4la.org/wp-content/uploads/2022/09/Report-on-Equitable-Building-Decarbonization-FINAL-September-15-2022.pdf>

¹⁰ Appendix C, Environmental justice and environmental principles regarding the buildout of hydrogen in California, p. 6, 23 March 2023.

<p>urge the County to focus on the electrification of buildings to meet CAP goals rather than delay by exploring or considering the use of “other zero-emission fuel sources” for buildings.</p>	<p>O8-20 (cont.)</p>
<ul style="list-style-type: none"> • E 1.5: We support a comprehensive fund to support the decarbonization of new and existing affordable housing. This fund should provide energy efficiency improvements without increasing energy burdens on environmental and low-income communities who are systematically impacted by socio-economic factors. Additionally, this should be designed to leverage funding from state programs or local County funding opportunities. 	<p>O8-21</p>
<ul style="list-style-type: none"> • E 2.1: Technical and financial assistance can provide the support necessary for affordable housing entities to meet an ordinance requirement that all new buildings are electric. We encourage the County to directly partner with mission-based affordable housing developers in order to create a program that addresses their concerns and needs. 	<p>O8-22</p>
<ul style="list-style-type: none"> • E 4.3: The expansion of tree planting and green spaces directly supports local communities, curbs the urban heat island effect, and can lead to energy efficiency. As the County develops frameworks for decarbonization, there is a need to couple it with the expansion of green spaces and increased tree canopy. Ultimately, this is also an opportunity to address environmental racism by prioritizing Indigenous land management practices and reinvesting in communities of color. 	<p>O8-23</p>
<p><u>Green Spaces</u></p> <p>Land management and expansion of green spaces supports GHG emissions reductions and overall health and environmental benefits. We strongly encourage the County to commit and prioritize Native greening efforts, rather than solely focus on technical and energy production methods. Natural landscapes can combat the urban heat island effect which could result in lowered energy consumption and encourage the use of public transportation. This combination could curb emissions from the top two higher GHG emitting sectors, transportation, and stationary sources. As such, we encourage the County to promote Strategy 9 as a core strategy. As the County progresses on building electrification, and expands green spaces, there is significant potential in GHG emissions reductions and support for environmental justice communities.</p>	<p>O8-24</p>
<ul style="list-style-type: none"> • A3: CBE supports the commitment to expand the County’s tree canopy and green spaces. We encourage the County prioritize Native trees, plants, and flowers that heal the soil, build connections to Indigenous communities, and support overall biodiversity and community health. As such, any trees removed must be replaced with Native trees. 	<p>O8-25</p>
<p><u>CEQA Exemption</u></p> <p>CBE is also concerned that the CAP would expediate future CEQA discretionary projects as long as the project can demonstrate consistency with the CAP. In fact, projects consistent with the</p>	<p>O8-26</p>

CAP would not be required additional greenhouse gas emission analysis or mitigation under CEQA, provided that a project's EIR identifies the CAP requirements that are applicable to the project and adopt those requirements as mitigation measures. (p. 4-10) As such, we ask that the County revise the CAP to provide additional information on the types of discretionary projects that could potentially demonstrate consistency with the CAP.

O8-26
(cont.)

We believe that CEQA provides the public, and especially environmental justice communities, the opportunity to monitor and provide input on projects proposed in their communities. In fact, CBE strongly opposed the use of CEQA exemptions in the County's Green Zones Ordinance because such exemptions could potentially contravene the Ordinance's purpose of protecting already-overburdened communities from harmful projects.

Given the high rates of government reinvestment into environmental justice communities and the historic placement of energy production and storage facilities and refineries, we believe that a complete analysis of greenhouse gas emissions is necessary for all proposed projects in environmental justice communities. While in isolation a project may seem to minimally increase greenhouse gas emissions, a series of projects that could be consistent with the CAP could potentially create hotspots of higher greenhouse gas emissions.

O8-27

Conclusion

CBE appreciates the opportunity to provide feedback and comments on the 2045 Draft Climate Action Plan. Overall, we urge the County to prioritize electrification, expand access to solar and storage, increase electric public transit, recommit to Indigenous land management, and explore holistic community-led strategies that address climate impacts. We look forward to working with the County to ensure that strategies are reaching climate goals and supporting low-income communities of color.

O8-28

Thank you,

Darryl Molina-Sarmiento

Re: CARB Draft Scoping Plan: AB32 Source Emissions Initial Modeling Results

To CARB and E3 Representatives:

Communities for a Better Environment (“CBE”) submits the following comments on the CARB Draft Scoping Plan: AB32 Source Emissions Initial Modeling Results (“Initial Modeling Results”) presented by E3 at the California Air Resources Board (“CARB”) Public Workshop on the 2022 Scoping Plan Update – Initial Modeling Results Workshop on March 15, 2022. The comments focus on the Petroleum Refining and associated Hydrogen Production sector.¹ (Note that we are separately commenting about the electricity sector.) We request the publication of the detailed input assumptions used in the modeling soon as possible, even if only available in draft form.

CBE is a statewide environmental justice (“EJ”) organization with a strong focus on addressing the fossil fuel energy sources that heavily pollute the California communities of Wilmington, Southeast Los Angeles, East Oakland, Richmond, and surrounding areas where we organize, live, and work. Climate change, smog, and toxic emissions severely and disproportionately impact our communities, including oil refineries, oil wells and drilling, power plants, transportation and other sources.

Despite our appreciation for the modeling work and presentation from E3, we are disturbed by the glaring omission of detailed written information explaining critical underlying input assumptions of the PATHWAYS modeling results. During the Q&A portion of the March 15 workshop, CARB indicated it does not intend to correct this serious flaw in the public process and plans to release that information alongside the draft Scoping Plan. At best, failing to disclose such critical assumptions creates fertile ground for extremely unrealistic concepts that skews public discourse and creates a bias for poor decision-making. Without this information, the public is left to speculate. Furthermore, it is essential that CARB disclose and ultimately revise its assumptions for the refinery sector. A recent OEHHA analysis indicated that communities living around refineries and hydrogen plants have seen an increase in GHG and PM2.5 toxic emissions during the period of the Cap and Trade program.² Four of the top five entities

¹ SP22-MODEL-RESULTS-E3-PPT.PDF, available at: <https://ww2.arb.ca.gov/resources/documents/2022-scoping-plan-update-initial-modeling-results-workshop>.

² Office of Environmental Health Hazard Assessment (OEHHA), Impacts of Greenhouse Gas Limits Within Disadvantaged Communities: Progress Toward Reducing Inequities, Feb. 2022, Table 2. Direction of Emission Changes at Facilities Near High-Scoring CES Communities Varies by Pollutant and Sector (2018 Compared to 2012 Emissions), p. 38

that use the most offsets own petroleum refineries.³ The 2022 Scoping Plan must use the best available evidence to provide a clear path forward for the refining sector and refinery communities.

In the case of the Petroleum Refinery sector, the lack of real-world technical evidence to support the assumptions risks premature, or worse, predetermined policy decision-making. The comments below ask questions regarding the reasoning and inputs behind several key results and figures. **These include:**

- the assumed carbon capture rates on individual pieces of equipment and across a whole refinery,
- the lack of evidence of operational and comparable carbon capture and sequestration (“CCS”) systems at existing refineries,
- hypothetical CCS-driven emission reduction timelines which inexplicably start immediately,
- non-CCS versus CCS starting points,
- assessment of major physical constraints for siting CCS equipment at California refineries,
- and accompanying safety implications, for starters.

I. Present capture rate assumptions and emissions reductions results for petroleum refining GHGs indicate alarming need for disclosure of additional assumptions and rigorous review of corresponding evidence base.

A. REQUEST FOR RESPONSE: Please clarify the “90% CCS capture” percentage assumption in the context of a whole refinery’s emissions.

1. Please detail the total percentage of the overall refinery that is assumed to be covered by CCS,
2. Please detail which parts of the refinery are assumed covered by CCS, including oil refinery hydrogen plants.
3. Please also refer to Table 2-1 of the South Coast 1109.1 report, later excerpted, which lists hundreds of different major refinery combustion equipment (heaters, boilers, incinerators, turbines, FCCUs, calciners, flares, etc.). Did the modeling consider the feasibility of applying CCS to such a complex set of equipment at California refineries, when determining the percentage of emissions covered by CCS? Please detail which specific types of the listed equipment are assumed covered.
4. Please explain whether or how much capture may occur over combustion sources, and whether the percentage is only for carbon dioxide or additionally methane fugitive emissions and other pollutants. Please provide the detailed accompanying spreadsheets used for the relevant portions of the GHG inventory.

³ Id. at 8

5. Please provide citations on the basis of the assumption that 90% of emissions are captured, where CCS is applied within a refinery, and also identify all existing and operational refinery CCS systems in place in the U.S. and in California that can help assess the validity of the modeling assumptions.

During an Environmental Justice Advisory Committee (EJAC) Fossil Fuel Transportation Working Group, CARB staff indicated the Quest carbon capture and storage project in Alberta provided CARB with a basis for understanding CCS on refineries. We highly discourage CARB from relying on the existence of this project to validate the idea of investing in CCS on refineries generally. The project cost \$1.35B (of which \$865 Million came from the Canadian government⁴) and only captured a third of the upgrader's emissions. And despite initially claiming that its project Polaris would capture more than 90% of emissions,⁵ Shell now states that it is only expected to capture up to 40% from the refinery as a whole and up to 30% from the chemicals plant.⁶ We request an explanation for the capture assumption that addresses which part of the Quest project data CARB has considered, if at all.

B. REQUEST FOR RESPONSE: Please explain the reasoning behind the starting time and levels of emission reductions results in scenarios with CCS.

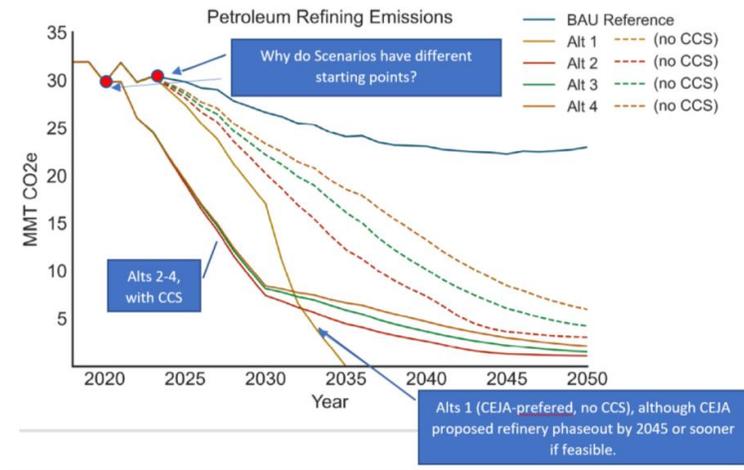

To assist comments on the oil refining sector, below is an annotated version of the graph on refining emissions as presented on Slide 10 at the workshop on March 15, 2022. This graph includes projected emissions in the four Alternatives (“Alt”) scenarios 1-4, plus BAU (“Business As Usual”).

We interpret this graph to mean, as recommended by the Environmental Justice Advisory Committee (“EJAC”), Alt 1 for refineries does not include CCS. As a result, there is only one Alt 1 line shown, whereas Alts 2-4 are shown both with and without CCS. The three closely grouped solid lines which fall quickly prior to 2030 are Alts 2-4 *with* CCS. The dotted lines are Alts 2-4 *without* CCS.

⁴ <https://sequestration.mit.edu/tools/projects/quest.html>

⁵ See: <https://www.cnbc.com/2022/01/24/shell-ccs-facility-in-canada-emits-more-than-it-captures-study-says.html> “The hydrogen projects we’re planning – like Polaris – will use a new technology that captures more than 90% of emissions.”

⁶ See: https://www.shell.ca/en_ca/media/news-and-media-releases/news-releases-2021/shell-proposes-large-scale-ccs-facility-in-alberta.html

Given that **no CCS units currently exist at California oil refineries**, and for reasons further detailed below, this sharp decline indicates magical thinking around the current state of California refineries and refinery carbon capture technology.

6. Please provide any underlying evidence base for the assumption that results in all three scenarios with CCS (Alternatives 2-4, shown as three tightly-grouped solid lines above) rapidly declining through 2030, *starting immediately*.
7. Please explain why non-CCS scenarios and CCS scenarios use different starting points of emissions. Why do CCS scenarios begin earlier at a lower level of refinery emissions (which might reflect low refinery production and emissions during the pandemic), yet all the non-CCS scenarios start at the higher level, apparently after refinery production and emissions increased again. Or is there another reason for the spike in emissions after 2021?

II. Carbon capture of high percentages of refinery carbon emissions is unlikely at refineries due to their complexity, and the infeasibility of adding controls to hundreds of massive combustion units and thousands of fugitive sources.

Setting any assumptions for a new technology for refineries must be, at least in part, informed by the immensely complex and large physical scale of oil refinery emissions sources and controls. Just last fall 2021, the South Coast Air Quality Management District (SCAQMD) adopted Regulation 1109.1 to address high emissions of Nitrogen Oxides (NOx) at oil refineries after years of rule development, and also after decades of failure of the NOx pollution trading program in the South Coast called RECLAIM.

This is relevant to the Scoping Plan analysis and modeling, because NOx is another combustion pollutant emitted with CO2 when hydrocarbon fuels are burned or otherwise used at oil refineries.⁷ As a result, the data collected on these combustion sources, and the engineering difficulties in siting emissions controls, is also at issue in the Scoping Plan process related to evaluations of Carbon Capture equipment.

The South Coast District performed an updated assessment of the numbers and types of individual combustion units at South Coast refineries. As the largest oil refining region in California, it serves as a ready example of statewide issues and source of critical insights. The next largest region is the Bay Area, with additional substantial refining activities in Bakersfield and Santa Maria.

The South Coast 1109.1 regulation staff report included the following graphics, charts, and tables identifying the large number of major refinery and refinery hydrogen plant sources at play in the South Coast alone. Figure 5 for instance identifies 9 petroleum refineries, 3 small refineries, and 4 related Hydrogen Plants and Sulfuric Acid Plants that are substantial emissions sources (p. 2-1):

Figure 5. PR 1109.1 Affected Facilities

The SCAQMD report identified hundreds of major combustion sources within these facilities. Each one is massive - one refinery heater can combust as much fuel in an hour as four homes using natural gas burn in a year.⁸ For a visual, the google map below shows two massive coker heaters at the Marathon (Tesoro) Wilmington refinery, out of the hundreds of combustion units at South Coast refineries and related operations. They dwarf the warehouses and container units seen across the channel and hide multiple burners inside. The NOx, CO2, and other pollutants emitted through the tall stacks are invisible.

⁷ For example, SCAQMD Rule 1109.1 staff report, p. A-1 describes combustion reactions resulting on both NOx and CO2 emissions, such as Fuel NOx Formation ($R-N + O_2 \rightarrow NO, NO_2, CO_2, H_2O, \text{trace species}$), or Prompt NOx Formation ($R + O_2 + N_2 \rightarrow NO, NO_2, CO_2, H_2O, \text{trace species}$).

⁸ A million BTUs (British Thermal Units) of heat content is present in approximately 1000 cubic feet of natural gas (which varies a little in energy content). “In 2012, the average U.S. home consumed 61,200 cubic feet of natural gas (or 62.7 million Btu).” ([American Gas Association Playbook](#), 2015, p. 78) So a refinery heater rated at 250 million BTUs per hour can burn the same amount of fuel hourly as about 4 homes burn in an entire year. ($250/62.7 \approx 4$)

[Google map of Marathon LA Refinery](#)

For an idea of the complexity of refineries in the Wilmington / Carson / W. Long Beach area, here are a few refinery views from google maps:

Panning further out shows the extreme density of the area, with 5 oil refineries (two Marathon, two Phillips 66, and one Valero), numerous warehouses and other industrial facilities, thousands of homes, and numerous schools and sensitive receptors:

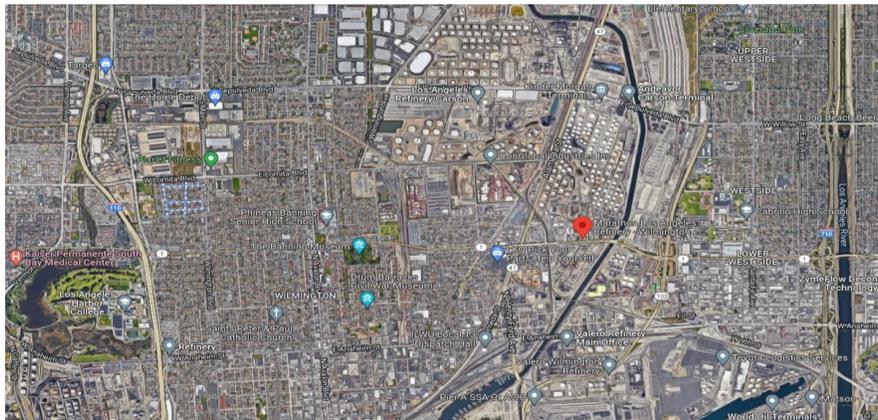

Table 2.1 from the South Coast staff report below identifies 228 Process and SMR⁹ heaters and boilers in the South Coast, plus 56 other combustion units. (p. 2-3)

When faced with regulating the many combustion sources, oil refiners complained of the need for long timelines. The final rule includes implementation through 2035, fourteen years after adoption, in addition to a 3-year rulemaking process.

These issues illustrate the complexity of the detailed rulemaking process, engineering and design, and construction of complex oil refinery emissions controls. **These realities underline the absurdity of setting modeling assumptions (even if space could be found), that assume non-existent CCS technologies can be quickly constructed and implemented across broad parts of California oil refineries.** This is to say nothing of the high costs.

III. Carbon capture at scale is unrealistic at California refineries due to major limitations in physical space at oil refineries.

During many regulatory proceedings, oil refineries have successfully argued against adding pollution controls, based on physical space limitations. For example, SCAQMD relaxed the originally

⁹ Steam Methane Reforming

proposed NOx standard under Regulation 1109.1 from the demonstrated achievable level of 2 ppm, up to 5ppm and higher. Refiners claimed it would require additional stages of Selective Catalytic Reduction (SCR) equipment to meet the 2ppm standard, without sufficient physical space available. The same combustion sources at refineries which emit NOx are also major emitters of GHGs – including hundreds of Boilers & Heaters identified in South Coast rulemaking.

The space issue was not a small or rare complaint. The Staff Report for SCAQMD Rule 1109.1 (Heaters and Boilers and Other Refinery Combustion Sources) identified widespread industry and Air District concerns about space constraints in extremely old facilities.¹⁰ As reported in the Staff Report, the Fossil Energy Research Corporation Assessment (FERCo) conducted site visits to the five major refineries, Chevron, Marathon (Tesoro Refinery), Phillips 66, Torrance, and Valero, to evaluate and discuss facility constraints and challenges of implementing SCR on specific refinery systems. The main concern refinery stakeholders frequently raised to staff was the issue of space and the ability to install post-combustion control.¹¹ Based on the site visits, FERCo concluded that *all the facilities exhibited space limitations to varying degrees*. Not all open space that surrounds a unit is available for an SCR system, as *open space may be necessary for maintenance work and thus, safety*.¹² As a result, advanced technology, engineering, and design for additional pollution controls are required specifically to address space constraints.¹³ The cost for two facilities operating around 8 ppmv NOx to upgrade and meet 8 ppmv NOx was approximately \$1 million to \$3 million, but to completely replace the SCR or add new technology to meet 2 ppmv *while addressing space constraints* ranged from \$75 million to \$220 million.¹⁴

Another important example includes the South Coast Rule 1410 rulemaking process, which would have banned the use of deadly Hydrogen Fluoride or Modified Hydrogen Fluoride at two South Coast refineries. This regulation was killed by industry complaints, despite the County of LA’s Health Dept. stating that the use of this chemical caused the risk of severe injury or death to a million people in the region. Despite the dire need for regulation, one reason given by the industry opposing the regulation was space constraints at the Valero Wilmington refinery: “Of particular note, available plot space adjacent to the existing HF alkylation unit was identified as a key criteria for success; *as the District is well aware, such plot space does not exist at the Wilmington Refinery*.”¹⁵

¹⁰ “The affected refineries were built 50 to over 100 years ago and while equipment has changed over the years, most of the equipment affected by the rule is old and **the spacing configuration of the sites are dense**. Thus, to install pollution control requires creative engineering and design to accommodate the space necessary and perform properly. Some projects currently taking place involve building vertically requiring deep earth pylons to support the structure housing the control technology or constructing complex ducting to house the SCR catalyst beds that stretch long distances horizontally away from the basic equipment”, p. 2-19; “Replacing conventional burners with LNB or ULNB often requires special attention because of the flame dimensions and limited space within a refinery process heater,” p. A-6; Refinery stakeholders immediately raised the concern that staff did not consider space availability and constraints for this type of design. Refineries cannot accommodate a second SCR reactor which makes the alternative pathway not technically feasible, p. B-20.

¹¹ p. 2-47.

¹² “Despite the space limitations, some facilities have devised several workarounds such as vertical SCR orientation, running ductwork over existing roadways, and replacement of air heaters with SCR reactors. In addition, FERCo also identified that the locations or sites for SCR installations may hold many unknowns such as electrical capacity for the SCR and uncertainties that can complicate foundation work such as underground pipes,” p. 2-47.

¹³ p. 2-36.

¹⁴ p. 2-36.

¹⁵ Valero letter to AQMD, Sept. 18, 2017 to Susan Nakamura, South Coast Air Quality Management District, in response to August 23 PR1410 Working Group Meeting, p. 2, available at: <https://www.aqmd.gov/docs/default->

Especially after the adoption and planning of broad application of SCR (Selective Catalytic Reduction) controls for NOx, oil refinery real estate will be even more constrained. The record in these proceedings illustrates the foolishness of assuming that additional end of pipe emissions controls are a feasible choice even with regard to a well-established technology, unlike CCS, which does not exist at California refineries.

IV. Oil and chemical plant risk assessment literature states that increasing oil refinery density also increases dangers during fires and explosions.

Oil and chemical industry risk management literature also identifies the need to maintain adequate space for safety at oil refineries (which already regularly have major explosions and fires). For example, an analysis called *Oil and Chemical Plant Layout and Spacing* found:

Loss experience clearly shows that fires or explosions in congested areas of oil and chemical plants can result in extensive losses. Wherever explosion or fire hazards exist, proper plant layout and adequate spacing between hazards are essential to loss prevention and control. Layout relates to the relative position of equipment or units within a given site. Spacing pertains to minimum distances between units or equipment.¹⁶

While this analysis identified many specific hazards, it recommended performing detailed site by site risk analysis, and identified general comments about access between process units. We have excerpted some recommendations to illustrate the complexity of the safety issues, but also request that CARB and modelers consider the entire document and its implications for realistic assessment of added CCS at oil refineries. Importantly, the final recommendation on this list, which was highlighted in bold by the authors, stated: **“Do not consider the clear area between units as a future area for process expansion.”**

Provide access roadways between blocks to allow each section of the plant to be accessible from at least two directions.

- Avoid dead end roads. • Size road widths and clearances to handle large moving equipment and emergency vehicles or to a minimum of 28 ft (8.5 m), whichever is greater.
- Maintain sufficient overhead and lateral clearances for trucks and cranes to avoid hitting piping racks, pipe ways, tanks or hydrants.
- Do not expose roads to fire from drainage ditches and pipeways.

source/rule-book/Proposed-Rules/1410/1410-comment-letters/valero-2017-09-18-working-group-meeting-5.pdf?sfvrsn=6

¹⁶ Property Risk Consulting Guidelines, A Publication of AXA XL Risk Consulting, PRC.2.5.2, Copyright © 2020, AXA XL Risk Consulting, available at: https://axaxl.com/prc-guidelines/-/media/axaxl/files/pdfs/prc-guidelines/prc-2/prc252oilandchemicalplantlayoutandspacingv1.pdf?sc_lang=en&hash=996EA28071174510C4DA5D35102A9222

- Slightly elevate roads in areas subject to local flooding. • Locate hydrants and monitors along roads to allow easy hook-up of firefighting trucks.
- Provide at least two entrances to the plant for emergency vehicles to prevent the possibility of vehicles being blocked during an incident, e.g., open bridge, railway.
- Plan and implement a “Roadway Closure” permit system authorized and controlled by site Emergency Response personnel as part of the site impairment handling system.

Provide spacing between units based upon the greater of either Table 1 or a hazard assessment. The space between battery limits of adjoining units should be kept clear and open.

Do not consider the clear area between units as a future area for process expansion.

Thus, increases in hazards at oil refineries through broad application of CCS at the hundreds of combustion units at oil refineries represents a *new* safety hazard, increasing the risk for workers and neighbors.

V. CARB Should Request New Modeling to Reflect a 2045 Phasedown Target Without CCS to Support a Commitment to a Statewide Plan to Manage Refinery Phasedown.

Ultimately, we urge CARB to begin crafting new modeling assumptions for the refining sector. We support the EJAC recommendation to model a 2045 phaseout date *without* the use of CCS. Currently, the initial modeling results are rife with cognitive dissonance between phasing out fossil fuel transportation while allowing oil refineries to continue operating in disproportionately pollution burdened communities of color.

California must lead by choosing modeling inputs that reflect the values of environmental justice *and* which will succeed in truly addressing impending climate disaster. Fossil fuel corporations repeatedly and regularly state to investors their intentions to *expand exports* of transportation fuels produced at California oil refineries (including gasoline, diesel, etc.), to add emissions during a climate crisis. Exporting outside of California over the Pacific Rim, prolonging the life of otherwise stranded assets which carry multi-billion dollar clean up liabilities, leaves California environmental justice communities holding the bag of continued harmful toxic emissions and eventual remediation liabilities or workers’ pension losses at the point of bankruptcy. For a just and equitable transition, CARB must sound the alarm on the need for a fossil fuel worker and community safety net and commit to develop a plan by 2024 to manage the decline and coordinate the phasedown of California oil refineries by 2045. As the EJAC recommendations discussed and the comments above reflect, the oil refineries are enormously complex and require thoughtful and rigorous planning now.

We appreciate the hard work involved in this modeling, including the many valid assumptions and results that do appear. However, the public, both community-based organizations and corporations alike, need transparent access to the assumptions used and to understand which parts are unchangeable technical matters and which are a matter of policy choice.

We look forward to the background documentation so we can more fully comment in the future.

Sincerely;

Julia May, Senior Scientist, CBE

COMMUNITIES
FOR A BETTER
ENVIRONMENT
established 1978

Resilience Hubs

The CARE Program sees the climate crisis through an environmental justice lens. We support community-led organizing to develop community resilience and climate solutions such as resilience hubs. Resilience hubs provide year-round support and resources during climate events, emergency response, and create space for frontline residents to gather and practice self-determination. Through community surveying in Wilmington, we identified a few priorities necessary to create resilience hubs, described below:

Solar panels absorb sunlight and create electricity. Connecting these panels to a solar battery charges the battery. During a power outage, the charged battery can power outlets for phone charging, lights, air filtration, refrigerators, and much more.

Air conditioning and air filtration helps save lives during extreme heat, wildfire season, or during poor air quality days.

Preference was expressed for expanded hours (8 am - 9 pm). Creating an overnight plan would allow the use of the center during an emergency.

Culturally conscious, multi-lingual, holistic health trained staff are vital to Resilience Hubs to provide support and materials like food, water, and emergency kits- which are necessary for daily life and emergency preparedness

A community garden can provide green space, increase access to local nutritional foods and build relationships.

The impacts from environmental injustice and climate change have disproportionately impacted communities living next to heavy industry. As we build healthy and resilient communities, we must uplift environmental justice and community-led solutions to deliver transformative solutions to respond to the climate crisis.

During our surveying, we asked Wilmington community members what they were most concerned about (see "Top 10 Concerns"). The following resources were requested by frontline residents to combat the worsening climate crisis:

Top 10 Concerns:

- Earthquakes
- Refinery Flaring
- Air Pollution
- Extreme Heat
- Wildfires
- Water + Food Insecurity
- Oil Drilling
- Drought
- Tsunami
- Power Outage

Re: Environmental justice and environmental principles regarding the buildout of hydrogen in California

Dear Governor Newsom, Pro Tem Atkins, and Speaker Rendon,

On behalf of the undersigned organizations, we respectfully raise vital concerns, considerations, and principles on the buildout of hydrogen in California and its use as part of the state's pathway to decarbonization. Without proper guardrails, hydrogen production threatens to increase climate pollution and make it harder to reach California's ambitious climate goals. Hydrogen could have potential benefits in the fight against climate change, but it is critical to understand its limitations. Before California moves to rely heavily on hydrogen to meet its climate goals, it is essential to understand how and where hydrogen is produced, stored, delivered, and used. Even green hydrogen can itself have short-term climate warming impacts and cause harm to local communities if implemented poorly and without stringent safeguards.

We are diverse groups that agree on bedrock principles for the limited role of hydrogen in meeting California's climate and air quality goals; even this letter cannot capture each group's complete perspective on hydrogen policy. As California considers the role of hydrogen in our decarbonized future, we urge you to enact measures that will:

1. Ensure that any hydrogen used or produced in California is produced via electrolysis through clean and renewable sources and prohibit hydrogen produced with fossil fuels or other polluting feedstocks and processes;
2. Ensure robust monitoring, prevention, and enforcement against leaks in hydrogen infrastructure;
3. Discourage the use of hydrogen for end uses better served by electrification, such as light duty transportation and providing space and water heating in homes and businesses;
4. Avoid blending hydrogen into existing pipelines and minimize other forms of hydrogen transportation;
5. Ensure community engagement from design to completion of any hydrogen project.

1) Hydrogen produced with fossil fuels or other polluting feedstocks and processes is not a climate solution and cannot be used for hydrogen production in California.

Currently, California's supply of hydrogen comes almost entirely from fossil fuels and is produced through a process that emits health-harming pollution in the communities on the fencelines of the state's oil refineries. Hydrogen production by any means other than clean, renewable-powered electrolysis only entrenches the continued use of fossil fuels, plastics, and biogas, even when paired with carbon capture and sequestration (CCS) technology. Methane leakage from producing hydrogen using natural gas and CCS technologies is of significant concern; the climate effects of methane leakage are often underestimated in hydrogen assessments,¹ and methane is a powerful greenhouse gas with high global warming potential. The level of climate harm only increases if there is embedded carbon in the lifecycle analysis of

¹ Ilissa B. Ocko and Steven P. Hamburg, Climate consequences of hydrogen emissions, Atmospheric Chemistry and Physics (July 2022). <https://acp.copernicus.org/articles/22/9349/2022/acp-22-9349-2022.pdf>

hydrogen. Biogas feedstocks, including dairy biogas, must be excluded from all hydrogen production.

The exclusion of hydrogen produced through polluting industrial processes is also a public health imperative. Carbon dioxide is not the only important pollutant produced through the hydrogen generation process, especially when not produced with renewable energy. Currently, petrochemical companies rely on the steam reformation of fossil gas to produce nearly all of California's hydrogen supply. Steam methane reformation emits health-harming pollution such as nitrogen oxides, fine particulate matter, and carbon monoxide and these facilities are primarily located in disadvantaged communities on the fencelines of California's oil refineries. Policymakers must guard against a build-out of steam methane reformation infrastructure or other hydrogen production equipment that would exacerbate California's air quality crisis.

2) Any hydrogen project must consider the environmental impact of hydrogen including the climate warming impact of leaks and water resource demands.

Hydrogen is not inherently a net benefit for the climate – even when it is produced through electrolysis. Hydrogen itself is an indirect greenhouse gas.² While it doesn't trap heat, hydrogen, through a series of chemical reactions, increases the concentration of other greenhouse gases like methane that accelerate the rate of warming. This means that hydrogen itself has a short-lived but powerful impact on the climate, even when produced with renewable energy-powered electrolysis.

Hydrogen is also a very small and slippery molecule and leaks easily into the atmosphere.³ Any rapid expansion of hydrogen infrastructure (pipelines, storage tanks, etc.) would increase the opportunity for hydrogen to leak.

Because of the inherent climate risk posed by hydrogen use, California's approach must include robust leak detection and monitoring to prevent or swiftly repair leaks of any size. There is emerging consensus among the scientific community on hydrogen's warming impact as a powerful short-lived indirect greenhouse gas; it is a highly potent gas given its indirect impacts as previously discussed. Its potency also changes over different time horizons; it is more powerful over a 20-year period than a 100-year period, but the short-term effects are not typically measured in assessments. When monitoring leakage, hydrogen's impact should be measured both in the short and long term. Minimizing or eliminating hydrogen leakage is absolutely critical to the success of hydrogen as part of the solution to climate change.

² D. Ehhalt and M. Prather, et al, Atmospheric Chemistry and Greenhouse Gases: Intergovernmental Panel on Climate Change (2018). <https://www.ipcc.ch/site/assets/uploads/2018/03/TAR-04.pdf>

³ Shanti Menon, Everyone's excited about this new climate solution, but it could create a new climate problem, Environmental Defense Fund (July 2022). <https://www.edf.org/article/we-need-talk-about-hydrogen>

Furthermore, hydrogen projects must account for the full climate impact of upstream emissions as well as of the hydrogen itself as an indirect, short-lived greenhouse gas. To that end, hydrogen use must include a full lifecycle analysis of emissions associated with its production, transportation, storage, and use.

Production of hydrogen through electrolysis also requires water, though it is not as water-intensive as the steam methane reformation process that industry uses to produce hydrogen today.⁴ As California grows its renewable hydrogen sector, consideration of water resource demands must be taken into consideration.

3) Hydrogen should only be used in limited, hard-to-electrify sectors; not sectors that could decarbonize more efficiently through electrification.

Given the risks of a rapid, large-scale buildout of hydrogen production, including its climate warming potential, California should only encourage the use of hydrogen, if at all, for hard-to-decarbonize sectors such as steel, plate glass, cement manufacturing, or as an alternative fuel for maritime shipping, aviation, and long-haul heavy-duty trucking.

Given its relative energy intensity, even green hydrogen risks squandering renewable energy if it is used in end uses that could more efficiently be directly electrified, like the vast majority of road-transportation, cargo-handling equipment, and residential and commercial space heating needs, as well as a large share of industrial heating needs. Moreover, it would be inappropriate to burn hydrogen in residential and commercial buildings or in industrial heating applications that have electric alternatives because hydrogen combustion emits lung-damaging pollution.⁵ California should avoid promoting hydrogen use of any kind in these end uses.

Hydrogen is not efficient or well-suited to all sectors, and should not be used as a catch-all decarbonization solution or to delay electrification. Analysis from the Environmental Defense Fund shows that using green hydrogen in passenger vehicles would require much greater quantities of renewable energy – perhaps as much as 2 to 5 times as much renewable energy – than direct electrification of light duty transportation.⁶ An even more significant “energy penalty” emerges in the use of hydrogen for home heating; it is far more efficient to use renewable energy to electrify passenger vehicles and heat homes than to use renewable energy to produce hydrogen.

⁴ Andi Mehmeti et al, Life Cycle Assessment and Water Footprint of Hydrogen Production Methods: From Conventional to Emerging Technologies, *Environments* (February 2018). <https://www.mdpi.com/2076-3298/5/2/24>

⁵ Sara Baldwin, et al, Assessing the Viability of Hydrogen Proposals: Considerations for State Utility Regulators and Policymakers, *Energy Innovation* (March 2022) pg 9, <https://energyinnovation.org/wp-content/uploads/2022/03/Assessing-the-Viability-of-Hydrogen-Proposals.pdf>.

⁶ Eriko Shrestha and Tianyi Sun, Rule #1 of deploying hydrogen: electrify first, *Environmental Defense Fund* (January 2023). <https://blogs.edf.org/energyexchange/2023/01/30/rule-1-of-deploying-hydrogen-electrify-first/>

A widespread transition to electrification is also necessary to address California's air quality crisis, whereas using equipment that burns hydrogen could worsen air quality. In some hard-to-decarbonize sectors such as steel manufacturing or maritime shipping, renewables-based hydrogen could play a valuable role in decarbonization. But in many other sectors, direct electrification is a much safer and more energy efficient route. Therefore, hydrogen should be considered a last resort, not a silver bullet. Furthermore, as is discussed in more detail in following sections, transportation of hydrogen and proposed blending of hydrogen in existing pipelines pose significant leakage risks, further limiting hydrogen's potential use for sectors beyond those mentioned here.

4) California should only use hydrogen produced via electrolysis through renewable sources.

Within the specific sectors that are best suited for hydrogen use, it is crucial that the only hydrogen used is produced via renewable-powered electrolysis. Strict standards for hydrogen production are essential because emissions-intensive hydrogen production technologies could worsen the climate crisis and harm public health in California's most vulnerable communities. Hydrogen is not an inherently 'climate-neutral' source of energy; its effects on the climate, positive or negative, depend on where and how it is produced.

Renewable electrolytic hydrogen production must meet certain standards to ensure it actually delivers climate and public health benefits. First, any renewable hydrogen developed must simultaneously build out renewable sources in tandem to support them. This is necessary to prevent the problem of "resource shuffling," in which the increased demand on renewable energy resources results in pushing demand back to fossil fuel resources.⁷ By building out renewable energy sources in tandem with renewable hydrogen projects, California can ensure that its renewable energy generation capacity is expanded and that the renewable hydrogen industry is supported with a stable and renewable power supply.

The threat of increased pollution is particularly acute when hydrogen producers use electricity from the grid. A hydrogen producer that relies on grid electricity cannot meaningfully claim to use renewable power unless it meets the following conditions: (1) it must support additional renewable electricity on the grid (i.e., renewable electricity that would not have existed on the grid but for the electrolyzer's demand), (2) the renewable electricity must be deliverable to the same balancing authority where the electrolyzer is located, (3) the producer must use the renewable electricity in the same hour that it's delivered onto the grid, and (4) it retires all renewable energy credits (RECs) associated with this electricity. Without all of these guardrails, fossil-fuel power generators will likely ramp up and spew more health-harming pollution into neighboring communities to serve hydrogen producers. About half of the state's gas-fired power plants are located in CalEnviroScreen defined disadvantaged communities. Furthermore,

⁷ Sasan Saadat and Sara Gersen, Reclaiming Hydrogen for a Renewable Future: Distinguishing Oil & Gas Industry Spin from Zero-Emissions Solutions, Earthjustice (August 2021). https://earthjustice.org/wp-content/uploads/hydrogen_earthjustice_2021.pdf

hydrogen produced from average grid electricity is even more carbon intensive than both incumbent gray hydrogen and fossil fuels like diesel.⁸

5) Hydrogen should not be blended in existing natural gas pipelines and co-location of production and end use should be prioritized.

Because hydrogen leaks easily, one key strategy to avoid any amount of leakage is to move it around as little as possible. Transporting hydrogen increases leakage risk whether by rail, truck, or pipeline. To the extent possible, hydrogen should be produced near the few appropriate end uses to minimize leakage.

Blending hydrogen into existing natural gas pipelines presents significant safety concerns and requires a massive investment in infrastructure to ensure compatibility and integrity. Studies have shown that hydrogen blends up to 20% offer only marginal climate benefits, even without considering the risk of leakage, and could potentially compromise the safety of pipelines made of steel or polymeric materials.⁹ The Hydrogen Blending Impacts Study that the University of California, Riverside performed for the California Public Utilities Commission did not identify a level of hydrogen blending that would not jeopardize safety and reliability.¹⁰ The compatibility of end-use appliances, such as cooktop burners and heating furnaces, is also a concern. Building infrastructure to support hydrogen blending would require a significant investment in retrofitting existing natural gas pipelines and ensuring their safety, making it a challenging and expensive proposition. Policymakers must focus on ending reliance on the gas distribution system through rapid and widespread electrification because rapid electrification will advance both climate and air quality goals, whereas injecting hydrogen into the gas distribution system threatens to increase health-harming air pollution.

6) Community engagement is imperative from the start of project development through to project completion.

⁸ According to data CARB has compiled for the Low Carbon Fuel Standard program, hydrogen produced through the electrolysis of California's grid-average electricity has a carbon intensity of 164.46 gCO₂e/MJ, far higher than diesel's carbon intensity of 100.45 gCO₂e/MJ. CARB, Table 7-1. Lookup Table for Gasoline and Diesel and Fuels that Substitute for Gasoline and Diesel, https://ww2.arb.ca.gov/sites/default/files/classic/fuels/lcfs/ca-greet/lut.pdf?_ga=2.69927632.1369297514.1670526688-1354554675.1652381457.

Community engagement and consent are critical components of any process to build out clean energy, and any hydrogen buildout must prioritize early and robust local engagement with communities. We should not repeat the top-down model of decision making that has created environmental injustice, which unfortunately we are experiencing on the ground today with proposed hydrogen projects. Local needs and concerns such as the community selection for projects and the localized impacts of pipelines cannot be overlooked by companies working in this space.

Furthermore, California must ensure that the production of hydrogen does not replicate the extractive cycles of the fossil fuel industry by continuing to pollute Environmental Justice (EJ) communities. It is critical to acknowledge the disproportionate impacts of pollution and environmental harm on EJ communities, and any investment in the renewable hydrogen industry must ensure that these communities are not further burdened with pollution or negative health outcomes. California must prioritize equity and justice in its approach to the renewable hydrogen industry and ensure that it does not perpetuate environmental harm in already overburdened communities.

As the renewable hydrogen industry is in its infancy, California has an opportunity to ensure that the accelerating investment in hydrogen projects yields the climate benefits being sought in the near term, and thereby avoid needing to make major retrofits down the road or even abandon large capital investments that do not turn out to be climate solutions. Hydrogen must only be produced using renewable energy, and should only be applied for hard-to-decarbonize end uses while prioritizing the co-location of production and end use to minimize transportation.

Thank you for your consideration of these issues. We are happy to discuss these concerns further.

2.3.2.8 Letter O8: Communities for a Better Environment

This letter provides input on the Revised Draft 2045 CAP as well as CEQA comments on the Recirculated Draft PEIR. Comments specific to the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, the County has received and reviewed comments on the Revised Draft 2045 CAP and common topics are discussed in Section 1.4, *Comments on the Revised Draft 2045 CAP*, in Chapter 1, *Introduction*. PEIR-focused comments are addressed below.

- O8-1 The County intends to continue engaging with frontline communities to ensure equitable implementation and correction of environmental injustices. An equity approach is outlined in Figure 1-3 which starts with frontline communities. (Revised Draft 2045 CAP, p. 1-16.) An equitable implementation process is further expanded upon in Chapter 4 of the Revised Draft 2045 CAP. (Revised Draft 2045 CAP, p. 4-2.) To address implementation of the Revised Draft 2045 CAP strategies, measures, and actions in an equitable manner, the County identified applicable guiding principles from the Los Angeles County Draft Racial Equity Strategic Plan to assist with the equitable distribution of benefits and resources across all segments of a community. (Revised Draft 2045 CAP, Appendix H, p. H-17.)
- O8-2 The County’s Office of Oil and Gas will continue to partner with the state on local oil well phase out. The Just Transition Task Force issued a report in December 2022 containing 19 specific strategies that create a pathway for workers in oil drilling to find new employment as the County and City of Los Angeles phase out oil extraction in Los Angeles.
- O8-3 An amortization study is underway to determine the fastest possible phase-out timeline for all existing oil wells and production facilities. This study will consider the legal, environmental, political, and cost considerations of the phase out. The performance objective does not dictate the amortization rate; however, the amortization study may influence future adjustments to the performance objectives, such as whether the performance objective should be accelerated, as suggested by the comment. As such, the performance objective has been modified to include a note to adjust the performance objective to reflect the results from the amortization study. The note reads, “**The performance objective provided here serves as a general metric and may be refined upon completion of the Oil Well Amortization Study.*” (Revised Draft 2045 CAP, p. 3-19.)
- O8-4 The Oil Well Ordinance outlines specific decommissioning steps and timeframes for those actions. A schedule for compliance will be required and allows for enforcement action to be taken should compliance not be met. The amortization study will further inform the phase out process.
- O8-5 All oil wells will need to be plugged, abandoned, and the site restored consistent with the California Geologic Energy Management Division requirements.

- O8-6 Carbon capture and sequestration are discussed in the Revised Draft 2045 CAP as a potential strategy to offset all remaining residual emissions that would exist in 2045 to meet the aspirational goal of carbon neutrality if the residual emissions cannot be eliminated through new regulations or technologies. SB 905 requires CARB to create the Carbon Capture, Removal, Utilization, and Storage Program to evaluate, demonstrate, and regulate carbon capture, utilization, or storage, and CO₂ removal projects and technology. Results from SB 905 will inform any future County efforts, which could support the County's aspirations to achieve carbon neutrality. The Revised Draft 2045 CAP Action ES1.3 dictates the County would develop a carbon removal strategy, including direct air capture and carbon capture and sequestration. (Revised Draft 2045 CAP, p. 3-19.) Any future projects related to Action ES1.3 would be subject to CEQA review, including impact analysis and mitigation measures to reduce any significant impacts.
- O8-7 Regarding the comment's concern about the potential for costs associated with energy retrofits completed by landlords to be passed onto tenants, Chapter 1 of the Revised Draft 2045 CAP discusses the equity approach to confront the barriers that frontline communities encounter in terms of traditional public investment and support pathways toward equitable and transformative implementation of climate strategies. (Revised Draft 2045 CAP, p. 4-2.) The Revised Draft 2045 CAP discusses the challenges frontline communities face accessing incentives for energy retrofit initiatives and the County's priority to provide a grant program in place of the traditional rebate programs for frontline communities. (Revised Draft 2045 CAP, p. 1-19.) A grant program to fund energy retrofits will allow frontline communities to take advantage of the benefits from the beginning of the process. The grant program can also include services, labor, and supplies provided by the County. The goal is to support bringing the benefits of decarbonization to frontline communities without burdening vulnerable people with upfront costs. Further, the County is working to strengthen rent stabilization ordinances to limit the annual rent increases for covered units and address gaps in tenant protections for non-rent-stabilized units, enforcement of anti-harassment provisions, relocation assistance, and other emerging issues. Housing affordability remains in the forefront of the transition to a decarbonized built environment and as such the County will assess anti-displacement measures such as the rent stabilization ordinance where public funds are utilized for decarbonization retrofits.
- O8-8 Partnerships with community-based organizations have been effective in engaging many communities and the County will continue to pursue these partnerships to address community needs.
- O8-9 to O8-13 These comments on the Revised Draft 2045 CAP does not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses comments received on the Revised Draft 2045 CAP.

O8-14 The County endeavors to transition all forms of public transportation to zero-emission technologies and will be working with LA Metro and other transportation providers to achieve this goal. Revised Draft 2045 CAP Action T4.10 includes collaborating with Metro to ensure that all new forms of public transportation (e.g., new bus lines, new light rail service) are low- or zero-emission, as the commenter states.

LA Metro already has plans to electrify its entire bus fleet by 2030.²⁵ In addition, CARB’s Innovative Clean Transit program requires that all public transit agencies must gradually transition to a 100 percent zero-emission bus fleet by 2040. By 2026, 50 percent of large and 25 percent of small transit agencies’ new bus purchases must be zero-emission buses. By 2029, 100 percent of large and small transit agencies’ new bus purchases must be zero-emission buses.²⁶ All of this will contribute to the zero-emission public transit future that the commenter strives for.

Regarding the use of alternative fuels such as green hydrogen, biomethane, and biogas, Measure T6.7 aims to increase the use of green hydrogen vehicles and use biomethane and biogas created from organic waste as a “bridge fuel” to achieve 100 percent green hydrogen and electric vehicles. This is an interim step to reduce GHG emissions as much as possible before the entire public transit fleet can fully electrify. Electrification is the Revised Draft 2045 CAP’s ultimate goal, but the County acknowledges the technological, practical, and financial limitations of an immediate shift to all-electric heavy-duty vehicles.

Measure T7, Electrify County Fleet Vehicles, aims to electrify the County bus and shuttle vehicle fleets by 2035 and increase the fleetwide percentage of light-duty vehicles in the County-owned fleet that are ZEVs to 35 percent by 2030, 60 percent by 2035, and 100 percent by 2045. The County agrees with the commenter and has already started implementation of converting the County’s fleet including bus and shuttles to electric vehicles.

Regarding the comment’s claim that the use of low-emission, biomethane, and biogas technologies are not ambitious enough technologies to reach the Revised Draft 2045 CAP’s target goals, as explained in Revised Draft 2045 CAP Chapter 3, the Revised Draft 2045 CAP’s GHG emission reduction targets for 2030, 2035, and 2045 are indeed achieved through the quantified measures, including those in the transportation sector such as Measure T4 (Broaden Options for Transit, Active Transportation, and Alternative Modes of Transportation), T6 (Increase ZEV Market Share and Reduce Gasoline and Diesel Fuel Sales), and T7 (Electrify County Fleet Vehicles), contrary to the commenter’s claims (Revised Draft 2045 CAP p. 3-4).

²⁵ LA Metro, 2023. Moving Beyond Sustainability. November 2022. <https://www.metro.net/about/plans/moving-beyond-sustainability/>. Accessed July 2023.

²⁶ California Air Resources Board, 2022. Innovative Clean Transit – About. <https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/about>. Accessed July 2023.

The comment also claims that the use of low-emission, biomethane, and biogas technologies would exacerbate health impacts in environmental justice communities and delay the transition to an electric bus fleet, but provides no evidence to support this claim. Biomethane and biogas have a similar emissions profile to compressed natural gas (CNG), which has far fewer tailpipe emissions of criteria air pollutants and toxic air contaminants than gasoline and diesel fuel vehicles.^{27, 28} In addition, the potential air quality health risk impacts associated with projects facilitated by Revised Draft 2045 CAP measures and actions are comprehensively evaluated in the Recirculated Draft PEIR (see Recirculated Draft PEIR Chapter 3.4, *Air Quality*).

O8-15 Revised Draft 2045 CAP Action T9.2 would identify types of ZEV equipment and green hydrogen equipment that are commercially available (e.g., forklifts, loaders, welders, saws, pumps, fixed cranes, air compressors, sweepers, aerial lifts, pressure washers) and require the use of these types of equipment on all new projects through an ordinance or conditions of approval. The commenter is correct that all or most of this equipment is commercially available as electric equipment. The County appreciates the commenter’s reference to the Port of Long Beach, which has already been using such electric equipment. The County endeavors to follow a similar approach and prioritize electrification over the use of green hydrogen and other alternative fuels, reserving green hydrogen for sectors that cannot be electrified, following the commenter’s recommendation. The County will be developing an ordinance to require the use of electric equipment like those listed in Action T9.2 for all new discretionary projects seeking County approval.

O8-16 The County appreciates the commenter’s recommendation to prioritize electrification over alternative fuels and agrees that fueling sources such as including hydrogen, biomethane, biogas, and natural gas could delay electrification, and as such has prioritized electrification and included the use of such fuels only as a “bridge” to electrification (for example, see Revised Draft 2045 CAP Action T6.7 and response to comment O8-14 above). Actions T8.2 and T8.4 are intended to support the transition to zero-emission goods movement medium- and heavy-duty vehicles by encouraging such alternative fuels as bridge fuels.

The commenter also states that the use of such alternative fuels could potentially create health and environmental impacts for environmental justice communities but does not provide evidence to support this claim. As mentioned above in response to comment O8-15, biomethane and biogas have a similar emissions profile to CNG, which has far fewer tailpipe emissions of criteria air pollutants and toxic air contaminants than gasoline and diesel fuel vehicles. In addition, the potential air quality health risk impacts associated with future projects facilitated by Revised Draft

²⁷ U.S. Department of Energy, 2023. Natural Gas Vehicle Emissions. https://afdc.energy.gov/vehicles/natural_gas_emissions.html/. Accessed July 2023.

²⁸ California Air Resources Board, 2023. Alternative Fuels: Compressed Natural Gas (CNG). <https://ww2.arb.ca.gov/our-work/programs/alternative-fuels/alternative-fuels-compressed-natural-gas-cng>. Accessed July 2023.

2045 CAP measures and actions are comprehensively evaluated in the Recirculated Draft PEIR (see Recirculated Draft PEIR Chapter 3.4, *Air Quality*).

- O8-17 In implementing Actions T8.2 and T8.4, as for other similar actions in the Revised Draft 2045 CAP, the County will perform all required due diligence, feasibility studies, public outreach, and CEQA review as required by County policy and state law. The County will take all the commenter's concerns about quality assurance, safety, training, and health impacts considerations into account before developing any permit streamlining options or ordinances.
- O8-18 to O8-19 See Response O8-7 regarding the comment's concern about the potential for costs associated with energy retrofits completed by landlords to be passed onto tenants. Where landscaping is required as a part of a development project, native plants are required to be used. The forthcoming Urban Forest Management Plan identified in Measure A3 will focus on native plants as an opportunity to reduce GHG emissions along with reducing extreme heat conditions.
- O8-20 Responding to the comment's opposition to the use of hydrogen in residential buildings, the Revised Draft 2045 CAP does not include any measure or action supporting the use of hydrogen in residential buildings. As stated by the comment, electrification of homes and buildings is the County's preferred approach. The County will be developing building decarbonization ordinances pursuant to Revised Draft 2045 CAP Measure E1 (Decarbonize Existing Buildings) and E2 (Decarbonize New Development).

To clarify this goal of the Revised Draft 2045 CAP and the intent of Measure E1, the County has revised sections of the Revised Draft 2045 CAP as follows:

Transition Decarbonize Existing Buildings to All-Electric: *As the carbon intensity of grid-supplied energy decreases, decarbonization of the electrical grid must be combined with building ~~electrification~~ decarbonization, shifting the energy load from fossil ~~natural gas~~ fuels to cleaner carbon-free sources while taking into consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face. This measure aims to ~~electrify~~ decarbonize applicable existing buildings. A primary alternative to fossil natural gas is renewable electricity supplied by CPA. Biomethane is another preferred alternative to fossil natural gas; however, existing opportunities for widespread use of biomethane are currently limited. The use of other zero-emission fuel sources for buildings ~~should~~ will also be considered (Revised Draft 2045 CAP, Chapter 3, p. 3-47)*

These revisions do not result in changes to environmental impact analyses or conclusions presented in the Recirculated Draft PEIR, and therefore do not constitute significant new information that would trigger recirculation under CEQA Guidelines section 15088.5.

In response to the comment’s claim that burning hydrogen in buildings would be “polluting,” hydrogen is a clean-burning fuel with no criteria pollutant or toxic air contaminant emissions associated with combustion.^{29, 30} The commenter does not provide support for the claim that burning hydrogen would cause air quality or health risk problems.

- O8-21 The County will consider the comment’s comprehensive fund recommendation should the County administer a program with County funding.
- O8-22 The County will consider the comment’s recommendation for technical and financial assistance to affordable housing entities should the County administer a program with County funding.
- O8-23 Measure A3 addresses the commenter’s concern. Measure A3 will focus tree planting on frontline communities with insufficient tree cover and green spaces, which would directly support such local communities, curb the urban heat island effect, and lead to energy efficiency. The Urban Forest Management Plan is currently under development and implements Action 3.1 to create and implement an equitable Urban Forest Management Plan that prioritizes: 1) tree- and parks-poor communities; 2) climate- and watershed-appropriate and drought/pest-resistant vegetation; 3) appropriate watering, maintenance, and disposal practices; 4) provision of shade; and 5) biodiversity. The Urban Forest Management Plan will help inform tree planting locations and prioritize tree- and parks-poor communities.
- O8-24 The identification of core measures was based upon quantification of measures that addressed the highest GHG emitting sectors. This resulted in measures that target transportation, stationary energy, and waste. The County agrees with the comment that conserving and restoring forests, chaparral shrublands, and wetlands would have beneficial environmental effects, but does not choose to promote Strategy 9 as a core strategy. However, Strategy 9 is an important strategy to ensure the County remains on a path toward the 2045 aspirational goal of carbon neutrality.
- O8-25 The County prioritizes native plants in new developments and will ensure the priority is carried into the Urban Forest Management Plan.
- O8-26 Regarding the comment’s opposition to the use of CEQA exemptions in the County’s Green Zones Ordinance, the Revised Draft 2045 CAP meets the requirements of CEQA Guidelines section 15183.5(b), thereby allowing future projects to streamline their GHG impacts evaluation pursuant to CEQA Guidelines sections 15064.4 and 15183.5(b). This does not wholesale exempt discretionary projects from performing their own CEQA analysis but rather incentivizes projects to implement climate actions that have been analyzed to contribute to the County’s GHG emission reductions,

²⁹ U.S. Department of Energy, 2022. Energy Efficiency and Renewable Energy, Alternative Fuels Data Center. Hydrogen Basics. <https://www.energy.gov/eere/fuelcells/hydrogen-fuel-basics>. Accessed July 2023.

³⁰ U.S. Environmental Protection Agency, 2023. A Glimpse into Hydrogen & Transportation. Last Updated February. <https://www.epa.gov/greenvehicles/glimpse-hydrogen-transportation>. Accessed July 2023.

thereby reducing the time and expense needed for individual environmental clearances for a project's GHG analysis. Please see General Response 3, which addresses the Revised Draft 2045 CAP processes applicable to various project applicants.

- O8-27 See General Response 3, which addresses project-level requirements for CEQA streamlining as identified in the Checklist. See General Response 5, which addresses the obligation of the Revised Draft 2045 CAP to quantify GHG emission reductions for strategies, measures, and actions.

The County's Green Zone Program seeks to enhance public health and land use compatibility in communities that bear a disproportionate pollution burden. An environmental justice screening method tool was developed to identify stationary sources of pollution and analyze cumulative environmental impacts based on expert recommendations and information gathered from ground truthing activities. This tool is a foundation and resource to support analysis of cumulative effects from new uses that may include energy production and storage facilities and refineries.

- O8-28 The County acknowledges the recommended prioritization of specified actions and believes the Revised Draft 2045 CAP generally aligns with these recommendations.

RE: Revised Draft 2045 Climate Action Plan (CAP)

Dear Ms. Hua:

Endangered Habitats League (EHL) appreciates the opportunity to comment on selected portion of the Revised Draft 2045 CAP.

Transportation strategies (p. 3-26)

A major component is Strategy 3: Reduce Single-Occupancy Vehicle Trips. However, isn't total VMT a better metric for carbon emissions? While some measures would be the same for both options, single-occupancy trips does not address trip length, long commutes, and sprawling land use patterns. One the other hand, total VMT does so.

O9-1

Reducing driving distances by reducing remote new development – in addition to increasing housing opportunities near transit – should be added as a measure. This is important as our local transit system is declining in use, and locating housing nearby will not overcome the many barriers. To help implement this measure, project GHG emissions from automotive sources should require full mitigation.

O9-2

In view of the declining use of traditional bus and rail transit, T4.1 is particularly important, and should be stressed for early implementation.

O9-3

T4.1—Expand and improve the frequency of service of unincorporated Los Angeles County shuttles and explore new mobility services, such as micro transit, autonomous delivery vehicles, micro mobility, and on-demand autonomous shuttles.

Strategy 9: Conserve and Connect Wildlands and Working Lands

- **Measure A1: Conserve Forests, Woodlands, Shrublands, Grasslands, Desert, and Other Carbon-Sequestering Wildlands and Working Lands**

O9-4

We appreciate the revised draft’s greater targets for conservation of natural lands, which has many co-benefits to society. But unless these conserved lands are *newly* protected from development, they do not accomplish much beyond baseline. Suggest the following:

O9-4
(cont.)

New ~~a~~ Acres of wildland managed for wildfire risk reduction and carbon stock savings:

- 10,000 acres by 2030
- 20,000 acres by 2035
- 50,000 acres by 2045

We continue to recommend further reductions in conversion of natural lands, whose protection now facilitated by the County’s fire safety policies.

O9-5

Reduce the amount of natural land converted for urbanized uses:

- ~~25~~ 50% percent by 2030
- ~~50~~ 75% percent by 2035
- ~~75~~ 90% percent by 2045

MEASURE ES5: Establish GHG Requirements for New Development

O9-6

Using the 2045 Climate Action Plan for CEQA Streamlining

Consistency Review Checklist (Appendix F)

EHL has *not* technically reviewed the adequacy of the Consistency Review Checklist (Appendix F) for General Plan-consistent projects to reduce GHG emissions in accord with 2045 targets. We do, however, object to use of 110 ADT as a threshold for screening out projects, as it does not account for trip length. Although recommended by CARB, particularly in unincorporated areas, more remote development will have significant emissions even if technically under 110 ADT.

Due to the well-documented problems, we again *concur* with the Checklist provision that, “Carbon offset credits are not permitted to be used as alternative project emissions reduction measures.”

We also agree that an Offsite GHG Reduction Program (Offsite Program, ES5.4) that involves *local* emissions reductions would be appropriate if, as described in the Checklist, it meets various strict criteria (enforceability, additionality, etc.). However, there is a lack of clarity that a precondition for use of the Offsite Program is that *on-site* Checklist measures or *on-site* alternative/additional measures (Alternative Project Emissions Reduction Measures and Additional GHG Reductions) are *both* infeasible. The language in the draft – “in tandem” – is imprecise on these relationships (“This program

O9-7

would be used in tandem with the 2045 CAP Consistency Checklist for projects that propose GHG emissions reduction measures as alternatives to those identified in Table F-1 of the 2045 CAP Consistency Checklist, or that propose to include additional GHG emissions reduction measures beyond those described in Table F-1.”). Clarification of the sequencing involved would be helpful, so that Checklist and Alternative and Additional measures are exhausted prior to turning to the Offsite Program.

O9-7
(cont.)

There is also a proposed Carbon Offsets/Credits Feasibility Study, to prepare for the contingency of not meeting 2045 targets. While this is a reasonable precaution, remote carbon offsets are problematic for many reasons. There should be early identification of incipient target failure through monitoring. If called for, the *first steps* should be adjustment of, and additions to, the 2045 CAP measures.

O9-8

We have questions and concerns over how General Plan amendments (GPAs) relate to the Checklist and over ES5.3—*Evaluate a program for reducing GHG emissions for new developments that require General Plan amendments*. Theoretically, GPA proposals could be beneficial for GHG emissions, or, like leapfrog sprawl development, could be very harmful. But in order to enact the best *overall* planning, the General Plan should be amended *comprehensively*, as part of a County-wide or Community Plan update process. *Piecemeal GPAs should be discouraged*.

O9-9

The CEQA streamlining offered by Checklist compliance should remain as an incentive to build out the existing General Plan. While there is always a right to propose a GPA, the applicant cannot not rely on Checklist compliance for its GHG analysis. According to Appendix F, GPAs are by definition outside the scope of the Checklist:

The growth projections outlined in the General Plan’s Land Use Element were used in the 2045 CAP to estimate unincorporated Los Angeles County’s future emissions. Therefore, projects can use the 2045 CAP Checklist if they are consistent with the Land Use Element.

Proposed GPAs must undertake *de novo* GHG impact analyses in Environmental Impact Reports.

O9-10

There is, however, ambiguity in the document as to the use of the Checklist. Besides for General Plan-consistent projects, there is a second use, that is, “for projects required or electing to prepare project-specific CEQA GHG analyses, to demonstrate that all feasible applicable checklist measures or alternative project emissions reduction measures have nevertheless been implemented, either as project features or as GHG mitigation measures.” Does this second use of the Checklist apply *solely* to General Plan-consistent projects which, for one reason or another, are doing project-specific CEQA review, or is it *also* for use by GPAs in project-specific CEQA GHG analyses? If the latter, what is the purpose of ES5.3?

Thank you for your commitment to climate action and for considering our comments.

Yours truly,

Dan Silver
Executive Director

RE: Revised Draft 2045 Climate Action Plan (CAP) - Corrected

Dear Ms. Hua:

Endangered Habitats League (EHL) appreciates the opportunity to comment on selected portion of the Revised Draft 2045 CAP. *In the record for this project, please replace our original comment letter of April 11, 2023 with this corrected version.*

Transportation strategies (p. 3-26)

A major component is Strategy 3: Reduce Single-Occupancy Vehicle Trips. However, isn't total VMT a better metric for carbon emissions? While some measures would be the same for both options, single-occupancy trips does not address trip length, long commutes, and sprawling land use patterns. One the other hand, total VMT does so.

Reducing driving distances by reducing remote new development – in addition to increasing housing opportunities near transit – should be added as a measure. This is important as our local transit system is declining in use, and locating housing nearby will not overcome the many barriers. To help implement this measure, project GHG emissions from automotive sources should require full mitigation.

In view of the declining use of traditional bus and rail transit, T4.1 is particularly important, and should be stressed for early implementation.

T4.1—Expand and improve the frequency of service of unincorporated Los Angeles County shuttles and explore new mobility services, such as micro transit, autonomous delivery vehicles, micro mobility, and on-demand autonomous shuttles.

Strategy 9: Conserve and Connect Wildlands and Working Lands

• Measure A1: Conserve Forests, Woodlands, Shrublands, Grasslands, Desert, and Other Carbon-Sequestering Wildlands and Working Lands

O9-11

We appreciate the revised draft’s greater targets for conservation of natural lands, which has many co-benefits to society. But unless these conserved lands are *newly* protected from development, they do not accomplish much beyond baseline. Suggest the following:

New Acres of wildland managed for wildfire risk reduction and carbon stock savings:

- 10,000 acres by 2030
- 20,000 acres by 2035
- 50,000 acres by 2045

We continue to recommend further reductions in conversion of natural lands, whose protection now facilitated by the County’s fire safety policies.

Reduce the amount of natural land converted for urbanized uses:

- ~~25~~ 50% percent by 2030
- ~~50~~ 75% percent by 2035
- ~~75~~ 90% percent by 2045

O9-11
(cont.)

MEASURE ES5: Establish GHG Requirements for New Development

Using the 2045 Climate Action Plan for CEQA Streamlining

Consistency Review Checklist (Appendix F)

EHL has *not* technically reviewed the adequacy of the Consistency Review Checklist (Appendix F) for General Plan-consistent projects to reduce GHG emissions in accord with 2045 targets. We do, however, object to use of 110 ADT as a threshold for screening out projects, as it does not account for trip length. Although recommended by CARB, particularly in unincorporated areas, more remote development will have significant emissions even if technically under 110 ADT.

Due to the well-documented problems, we again *concur* with the Checklist provision that, “Carbon offset credits are not permitted to be used as alternative project emissions reduction measures.”

We also agree that an Offsite GHG Reduction Program (Offsite Program, ES5.4) that involves *local* emissions reductions would be appropriate if, as described in the Checklist, it meets various strict criteria (enforceability, additionality, etc.). However, there is a lack of clarity that a precondition for use of the Offsite Program is that *on-site* Checklist measures or *on-site* alternative/additional measures (Alternative Project Emissions Reduction Measures and Additional GHG Reductions) are *both* infeasible. The language in the draft – “in tandem” – is imprecise on these relationships (“This program would be used in tandem with the 2045 CAP Consistency Checklist for projects that propose GHG emissions reduction measures as alternatives to those identified in Table F-1 of the 2045 CAP Consistency Checklist, or that

propose to include additional GHG emissions reduction measures beyond those described in Table F-1.”). Clarification of the sequencing involved would be helpful, so that Checklist and Alternative and Additional measures are exhausted prior to turning to the Offsite Program.

There is also a proposed Carbon Offsets/Credits Feasibility Study, to prepare for the contingency of not meeting 2045 targets. While this is a reasonable precaution, remote carbon offsets are problematic for many reasons. There should be early identification of incipient target failure through monitoring. If called for, the *first steps* should be adjustment of, and additions to, the 2045 CAP measures.

We have questions and concerns over how General Plan amendments (GPAs) relate to the Checklist and over ES5.3—*Evaluate a program for reducing GHG emissions for new developments that require General Plan amendments*. Theoretically, GPA proposals could be beneficial for GHG emissions, or, like leapfrog sprawl development, could be very harmful. But in order to enact the best *overall* planning, the General Plan should be amended *comprehensively*, as part of a County-wide or Community Plan update process. *Piecemeal GPAs should be discouraged*.

The CEQA streamlining offered by Checklist compliance should remain as an incentive to build out the existing General Plan. While there is always a right to propose a GPA, the applicant cannot not rely on Checklist compliance for its GHG analysis. According to Appendix F, GPAs are by definition outside the scope of the Checklist:

O9-11
(cont.)

The growth projections outlined in the General Plan’s Land Use Element were used in the 2045 CAP to estimate unincorporated Los Angeles County’s future emissions. Therefore, projects can use the 2045 CAP Checklist if they are consistent with the Land Use Element.

Proposed GPAs must undertake *de novo* GHG impact analyses in Environmental Impact Reports.

There is, however, ambiguity in the document as to the use of the Checklist. Besides for General Plan-consistent projects, there is a second use, that is, “for projects required or electing to prepare project-specific CEQA GHG analyses, to demonstrate that all feasible applicable checklist measures or alternative project emissions reduction measures have nevertheless been implemented, either as project features or as GHG mitigation measures.” Does this second use of the Checklist apply *solely* to General Plan-consistent projects which, for one reason or another, are doing project-specific CEQA review, or is it *also* for use by GPAs in project-specific CEQA GHG analyses? If the latter, what is the purpose of ES5.3?

In regard to the above, please note that as a signatory to the “Tejon Ranch Conservation and Land Use Agreement,” EHL does not oppose development of Tejon Ranch’s Centennial Community project in Los Angeles County or its approvals. Additionally, in light of its site-specific measures, EHL is not advocating that the Climate Action Plan requires any changes to the Centennial project as currently approved by the relevant agencies.

Thank you for your commitment to climate action and for considering our comments.

Yours truly,

Dan Silver
Executive Director

O9-11

2.3.2.9 Letter O9: Endangered Habitats League

This letter provides input on the Revised Draft 2045 CAP as well as CEQA comments on the Recirculated Draft PEIR. Comments specific to the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, the County has received and reviewed comments on the Revised Draft 2045 CAP and common topics are discussed in Section 1.4, *Comments on the Revised Draft 2045 CAP*, in Chapter 1, *Introduction*. PEIR-focused comments are addressed below.

O9-1 through O9-5 These comments on the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on these issues pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses comments received on the Revised Draft 2045 CAP.

O9-6 Regarding the comment’s opposition to utilizing the transportation screening threshold of 110 average daily trips (ADT), as listed in the Checklist because the criteria does not address trip lengths (Revised Draft 2045 CAP, Appendix F, p. F-9 and F-19), the 110 ADT threshold is from the Governor’s Office of Planning and Research (OPR) Technical Advisory on Evaluating Transportation Impacts in CEQA.³¹ According to OPR, “projects that generate or attract fewer than 110 trips per day generally may be assumed to cause a less-than-significant transportation impact.”

CEQA provides a categorical exemption for existing facilities, including additions to existing structures of up to 10,000 square feet, so long as the project is in an area where public infrastructure is available to allow for maximum planned development and the project is not in an environmentally sensitive area. (CEQA Guidelines, § 15301, subI(e)(2).) Typical project types for which trip generation increases relatively linearly with building footprint (i.e., general office building, single tenant office building, office park, and business park) generate or attract an additional 110-124 trips per 10,000 square feet. Therefore, absent substantial evidence otherwise, it is reasonable to conclude that the addition of 110 or fewer trips could be considered not to lead to a significant impact.

The basis for OPR’s VMT thresholds, including the 110 ADT threshold, is compliance with California’s GHG emission reduction targets. These include SB 32, which requires California to reduce GHG emissions 40 percent below 1990 levels by 2030, and Executive Order B- 16-12, which provides a target of 80 percent below 1990 emissions levels for the transportation sector by 2050. OPR’s Technical Advisory states, “OPR recommends using quantitative VMT thresholds linked to

³¹ Governor’s Office of Planning and Research, 2018. Technical Advisory on Evaluating Transportation Impacts in CEQA. December 2018. https://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf. Accessed July 2023.

GHG reduction targets when methods exist to do so.”³² Consequently, the 110 ADT criteria is a valid screening criteria for GHG emissions and potential GHG impacts.

The County appreciates the comment’s support of the exclusion of carbon offset credits for use in the Checklist; please see General Response 4, which addresses the use of voluntary GHG offset credits in the Revised Draft 2045 CAP and as an alternative GHG reduction measure in the Checklist.

- O9-7 Regarding the comment’s concern of a lack of clarity in the Checklist surrounding the use of alternative GHG reduction measures and the offsite GHG reduction program, please refer to General Response 3, which addresses the alternative GHG reduction measure pathway in the Checklist, and General Response 6, which addresses concerns regarding the proposed Offsite GHG Emissions Reduction Program. To clarify the County’s preference for on-site versus off-site GHG emission reductions for streamlining purposes via the Checklist, the County has revised sections of the Revised Draft 2045 CAP in the following ways, as shown in the example below:

Action ES5.4 of the 2045 CAP would establish an Offsite GHG Emissions Reduction Program (Offsite Program) for new development to use as a GHG reduction or mitigation pathway for 2045 CAP compliance and to fund programs for reducing GHG emissions in the built environment. This program would allow new development to fund decarbonization programs for existing development to accelerate 2045 CAP measures and actions or go beyond 2045 CAP measures and actions. An Offsite GHG Emissions Reduction Program (Offsite Program) will be developed. Future projects that cannot achieve net-zero GHG emissions or are unable to comply with all required 2045 CAP Checklist items CEQA streamlining requirements would have the option to participate in the Offsite Program. The Offsite GHG Reduction Program could be used for projects that propose alternative GHG emissions reduction measures to those identified in Table F-1, or that propose to include additional GHG emissions reduction measures beyond those described in Table F-1 (Revised Draft 2045 CAP, Appendix F, p. F-34).

These revisions do not result in changes to environmental impact analyses or conclusions presented in the Recirculated Draft PEIR, and therefore do not constitute significant new information that would trigger recirculation under CEQA Guidelines section 15088.5.

- O9-8 The comment raises concerns regarding the use of “remote carbon offsets” for meeting the County’s 2045 GHG reduction target; the County agrees that actual GHG reductions occurring within the unincorporated County are the highest priority in determining progress toward its GHG reduction targets, and that the Revised Draft 2045 CAP monitoring program should identify any course corrections that may be needed for the County to remain on track for meeting those targets, as described in

³² Ibid.

Section 4.2 of the Revised Draft 2045 CAP. As stated on page 4-5 of the Revised Draft 2045 CAP, the County will be reporting on the implementation progress of the Revised Draft 2045 CAP as part of the General Plan Annual Progress Report, and within the first two years of implementation will identify where further efforts and additional resources may be needed to stay on track toward targets. Further, the Revised Draft 2045 CAP is a dynamic document that will be monitored and evaluated for its effectiveness on an ongoing basis to allow the County to make timely adjustments to implementing actions as technologies, federal and state programs, and circumstances change. Flexibility in implementation is necessary to allow the County to evolve its strategies and achieve its targets, including for 2045. The County will update the GHG emissions inventory and the Revised Draft 2045 CAP every five years.

The Revised Draft 2045 CAP's current measures and actions are sufficient; based on current assumptions, performance objectives, and modeling tools; for achieving the County's 2045 GHG emission reduction *target* of 83 percent below 2015 levels (Revised Draft 2045 CAP pp. 3-2 and 3-3). The Revised Draft 2045 CAP also includes an *aspirational goal* of achieving carbon neutrality by 2045; it is important to note that this is not a *target* of the Revised Draft 2045 CAP as stated in the comment. However, achieving carbon neutrality is an entirely different challenge, and the Revised Draft 2045 CAP does not show a quantitative pathway to carbon neutrality. Section 3.2 of the Revised Draft 2045 CAP discusses what is needed to achieve carbon neutrality and acknowledges the need for new and evolving technologies:

If the residual emissions, shown in Figure 3-1, cannot be eliminated through new regulations or technologies, the County will consider future implementation of carbon removal strategies (such as carbon capture and sequestration and direct air capture), along with future implementation of a carbon offsets/credits program, following completion of a feasibility study, to achieve carbon neutrality by 2045. Evolving state regulations, programs, and financial incentives will provide new opportunities for unincorporated Los Angeles County to counteract any residual emissions. (Revised Draft 2045 CAP p. 3-12).

As stated in the comment, the Revised Draft 2045 CAP includes a carbon offsets/credits feasibility study. The purpose of using carbon offsets would be to enable the County to achieve its long-term aspirational goal of carbon neutrality by 2045 (Revised Draft 2045 CAP p. 4-12). This would be a "last resort" if in-County measures, actions, and projects are not sufficient to achieve carbon neutrality. It is worth noting that in the 2022 Scoping Plan, the state's roadmap for achieving carbon neutrality statewide by 2045 pursuant to AB 1279, there are over 100 million metric tons of CO₂ equivalent emissions after full implementation of the scoping plan scenario in 2045. This means that carbon removal is an essential component of the State's strategy:

Even if anthropogenic emissions are reduced to at least 85 percent below 1990 levels by 2045 as called for by AB 1279, there will still be residual emissions in the AB 32 GHG Inventory sectors in 2045 that must be addressed in order to achieve the California’s carbon neutrality target... To achieve carbon neutrality, mechanical CDR [carbon dioxide removal] will therefore need to be deployed. Because NWL [natural and working lands] management is not estimated to be a significant carbon removal path in the near term, additional CDR options will be needed.³³

The comment also states that “remote carbon offsets are problematic for many reasons” but does not provide such reasons or evidence supporting this claim such that a specific response cannot be provided. This comment does not raise significant environmental issues relating to the Recirculated Draft PEIR warranting a response pursuant to CEQA Guidelines section 15088(a).

- O9-9 As discussed in General Response 4, all future projects that would require a General Plan Amendment cannot use the Revised Draft 2045 CAP to streamline its GHG impact analysis under CEQA. Such projects would have to undergo their own project-level CEQA analyses of GHG impacts. The Revised Draft 2045 CAP has been revised to remove Measure ES5.3 (Evaluate a program for reducing GHG emissions for new developments that require General Plan Amendments). (Revised Draft 2045 CAP, p. 3-25.) All new development projects requiring a General Plan Amendment must prepare their own GHG impact analysis under CEQA. Project-specific amendments must be consistent with the General Plan’s overall intent, goals and policies. These revisions do not result in changes to environmental impact analyses or conclusions presented in the Recirculated Draft PEIR, and therefore do not constitute significant new information that would trigger recirculation under CEQA Guidelines section 15088.5.

See General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan. Also see General Response 3, which addresses how the Revised Draft 2045 CAP and 2045 Checklist applies to development projects.

- O9-10 As discussed in General Response 4, all future projects that would require a General Plan Amendment cannot use the Revised Draft 2045 CAP to streamline its GHG impact analysis under CEQA. Such projects would have to undergo their own project-level CEQA analyses of GHG impacts. As discussed in response to comment O9-9, the Revised Draft 2045 CAP has been revised to remove Measure ES5.3 (Evaluate a program for reducing GHG emissions for new developments that require General Plan Amendments). Regarding the comment’s concern regarding the use of the Checklist, as discussed in General Response 3, the County has revised the Checklist to clarify that the Checklist will be used only for projects that wish to streamline their CEQA GHG impact analysis pursuant to CEQA Guidelines sections 15064(h)(3),

³³ California Air Resources Board. 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. November 16, 2022. Pages 91-92. Available at <https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2022-scoping-plan-documents>. Accessed August 2023.

15064(h)(3), 15064.4 and 15183.5(b). Demonstrating consistency with the Checklist is no longer mandatory for new development projects but is rather a voluntary option that project applicants can use to streamline their project's GHG impact analysis.

See General Response 3, which provides further information regarding how the Revised Draft 2045 CAP and 2045 Checklist applies to development projects. Also see General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan.

- O9-11 The County acknowledges the comment's statement that EHL does not oppose the Tejon Ranch Centennial Community project, and that the Revised Draft 2045 CAP need not be revised to require changes to that project. This comment does not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a).

 Email: climate@planning.lacounty.gov

Re: Comments on the Revised Draft 2045 Climate Action Plan

Dear Ms. Hua:

The Newhall Land and Farming Company thanks you for the opportunity to provide comments on the Revised Draft Los Angeles County 2045 Climate Action Plan (“CAP”). As the proponent of California’s first large-scale net-zero greenhouse gas (“GHG”) mixed-use community, we appreciate the County’s efforts to reduce GHG emissions while encouraging critical housing.

Innovative Net-Zero GHG Housing Project – In coordination with the County and State in 2017, Newhall developed a net-zero GHG program that implements a broad suite of innovative GHG reduction strategies to maximize onsite and local GHG reductions, such as installing thousands of EV charging stations throughout LA County and implementing a Building Retrofit Program in disadvantaged communities within the County.

- The California Air Resources Board evaluated Newhall’s net-zero GHG program and determined that it “will not result in any net additional greenhouse gas emissions.”¹
- The California Department of Fish and Wildlife similarly concluded that “the Project represents an *innovative* demonstration of a mixed-use development project *providing needed housing* and commercial development in a manner consistent with California’s GHG reduction goals... the Project will be one of the largest, if not the *largest developments in California ever to achieve net zero GHG emissions*.”²

When the County Board of Supervisors reapproved Mission Village and Landmark Village, the Board found that Newhall’s net-zero GHG program would feasibly achieve net-zero GHG emissions based on substantial evidence in the record:

- “The Board further finds that, based on substantial evidence in the record, potentially significant GHG impacts of the Mission Village Project are reduced to

O10-1

¹ California Air Resources Board, Letter from Richard Corey, Executive Officer, to Chuck Bonham, Director, California Department of Fish and Wildlife, June 7, 2017.

² California Department of Fish and Wildlife, Final Actions and Supplemental Findings for Newhall Ranch RMDP/SCP, p. 40, June 14, 2017 (emphasis added).

less-than-significant levels with implementation of the following measures and that the Project will *feasibly and reliably achieve net zero GHG emissions.*³

- “In addition, because the Project would result in *no net increase of GHG emissions*, it would not conflict with any plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.”⁴

The Board concluded: “The Project represents *an innovative* demonstration of a mixed-use development *Project providing needed housing* and commercial development in a *manner consistent with California’s GHG reduction goals.*”⁵

Following the County’s approval, Newhall utilized this program to settle with groups that had long opposed the project. The LA Times called this settlement a “historic truce.”⁶ The approvals and settlement facilitated the start of construction after multiple decades of litigation and delays, although two local groups continued to challenge the County’s approvals and attempt to block these projects that will deliver badly needed housing to the region. Now, homeowners are moving into Mission Village, adding to the County’s diversity of housing stock.

Newhall Satisfies CEQA GHG Compliance Pathway – The 2022 Scoping Plan expressly identifies multiple compliance pathways for evaluating a project’s GHG impacts under the California Environmental Quality Act (“CEQA”), including for projects demonstrated to achieve “net-zero GHG emissions.”⁷ Indeed, the 2022 Scoping Plan specifically recognizes Newhall as an example net-zero GHG project that satisfies this CEQA compliance pathway.⁸

The Draft CAP incorporates California GHG reduction goals as its own: “Consistency with the 2022 Scoping Plan, SB 32, and AB 1279 is an appropriate metric by which to determine the significance of the 2045 CAP’s GHG emissions through 2045...”⁹ Newhall already exceeds the Draft CAP’s 2030 and 2035 reduction targets and satisfies the Draft CAP’s aspirational target of carbon neutrality by 2045, twenty years early. Therefore, Newhall satisfies the Draft CAP’s GHG reduction goals and the Scoping Plan’s CEQA compliance pathway.

CARB-Approved Program Must Be Grandfathered Under the CAP to Avoid Impairing Innovative and Sustainable Housing and Jobs – As recognized by the Board, Newhall is an “an innovative...Project providing needed housing...consistent with California’s GHG reduction goals.” Newhall’s net-zero GHG program is unique because it was previously approved by CARB *and* withstood extensive litigation challenges up to the California Supreme Court. Homes and commercial uses developed under Newhall’s net-zero GHG program will disproportionately help the County achieve its climate goals with development that satisfies the CAP’s aspirational target of carbon neutrality 20 years early. To avoid unintended consequences for this endeavor that aligns with the Scoping Plan’s CEQA compliance strategy, it is imperative

that all development covered by Newhall's net-zero GHG program be grandfathered from the CAP's compliance requirements.¹⁰ As such, we respectfully request that the County expressly grandfather development covered by net-zero GHG programs that were approved by CARB before the adoption of the CAP from the CAP's compliance elements (e.g., checklist in Draft CAP, Appendix F). Of course, we remain fully supportive of the County's overall climate goals and will continue to deliver climate neutral housing and jobs to advance such policies.

O10-3

We look forward to continuing to work with the County on these important sustainability initiatives.

Sincerely,

Matt Carpenter
Vice President, Environmental Resources
On behalf of The Newhall Land and Farming Company

¹⁰ FivePoint has committed to implement the CARB-approved net-zero GHG program across all nine of its villages in Valencia, including the five Newhall Ranch Specific Plan villages (Mission Village, Landmark Village, Homestead North, Homestead South and Potrero Valley) and Entrada South, Entrada North, Valencia Commerce Center, and Legacy Village.

2.3.2.10 Letter O10: FivePoint Newhall Land and Farming Company

This letter provides input on the Revised Draft 2045 CAP as well as CEQA comments on the Recirculated Draft PEIR. Comments specific to the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, the County has received and reviewed comments on the Revised Draft 2045 CAP and common topics are discussed in Section 1.4, *Comments on the Revised Draft 2045 CAP*, in Chapter 1, *Introduction*. PEIR-focused comments are addressed below.

O10-1 to O10-3 The County acknowledges FivePoint’s comment that the recently approved Newhall Ranch mixed-use project achieved CEQA compliance by demonstrating how the project would achieve net zero GHG emissions through a mix of local GHG reductions, the purchase of GHG offsets, and consistency with CARB’s 2022 Scoping Plan, SB 32 and AB 1279. Responding to the comment’s request that that all development covered by Newhall’s net-zero programs be exempt from the Revised Draft 2045 CAP’s requirements including its CEQA Streamlining Checklist, Newhall is a project that has already undergone CEQA review and thus, does not need to demonstrate consistency with the Revised Draft 2045 CAP through use of the Checklist or any other means. Further, future development projects, including future approvals of previously planned projects, are still permitted to undergo their own project-level CEQA analysis of GHG impacts independent of the Checklist; such projects may use voluntary GHG offset credits to mitigate GHG impacts if warranted. For a more detailed response concerning the use of the Checklist, please see *General Response 3: 2045 CAP CEQA Streamlining Checklist*. For a discussion regarding the technical basis for why the Checklist does not permit the use of voluntary GHG offset credits to demonstrate a less-than-significant GHG impact under CEQA, see *General Response 4: GHG Offsets*, which addresses the use of voluntary GHG offset credits in the Revised Draft 2045 CAP and as an alternative GHG reduction measure in the Checklist.

2.3.2.11 Letter O11:

This letter is intentionally omitted.

Ms. Thuy Hua, Supervising Regional Planner
 Los Angeles County Department of Regional Planning
 320 West Temple Street, 13th Floor
 Los Angeles, CA 90012

Sent via email to climate@planning.lacounty.gov

Dear Ms. Hua,

Comments on Revised Draft 2045 Climate Action Plan dated March 2023

<p>The League of Women Voters (LWV) of Los Angeles County strongly supports Los Angeles County’s Climate Action Plan (CAP) and encourages the County to adopt the plan and implement it. <i>It is imperative that the County implement measures to reduce greenhouse gas (GHG) emissions as quickly as possible.</i> The CAP outlines numerous measures to move electricity generation from fossil fuels to renewables, to electrify buildings and transportation, to encourage use of mass transit, to reduce energy use, and to reduce generation of GHG in the development of building materials and the decomposition of organic waste. The CAP is thorough and broad-ranging in its coverage.</p>	O12-1
<p>The League’s policies and values on Climate Change, Land Use, Housing and Homelessness, Transportation, and Meeting Basic Needs are in excellent alignment with those of the County. However, we differ in urgency to act, particularly regarding land use and transportation.</p>	O12-2
<p>Transportation remains the largest emissions category in our county and postponing work to reduce car dependence will run through our carbon budget faster. The low supply of available electric vehicles (EV), their cost, and slow adoption by drivers who must travel the farthest to their jobs mean that a key leg of the CAP’s decarbonization strategy will not meet the schedule.</p>	O12-3
<p>Our County does not control the supply of EVs, but we do control the number of lane miles of bike lanes on major roads. Priority bus lanes and bike lanes are statutorily exempt from CEQA so there is no need for delay to complete lengthy and expensive studies. Our county’s money and staff time are better spent working on implementation.</p>	O12-4
<p>The League “recognizes land as a resource as well as a commodity”. For instance, the League opposes locking land near multi-billion dollar transit investments, major job centers, and colleges and universities with zoning for low-density uses.</p>	O12-6
<p>There is no need to wait for a future rail line or EV, when people can simply walk or bike to work or school today if zoning and safe streets allow it. People who live walking or cycling distance to work or school do not suffer the stress of delayed or canceled buses and trains.</p>	O12-7

The League of Women Voters of Los Angeles County, a nonpartisan political organization, encourages informed and active participation in government, works to increase understanding of major public policy issues, and influences public policy through education and advocacy.

<p>Implementation of many CAP actions is dependent upon development and adoption of many detailed plans, policies, regulations and ordinances. The work is divided among many agencies and departments with full-time day-to-day responsibilities. The League is concerned that implementation be accomplished urgently and that it not slip into a bureaucratic quagmire. Appendix E lays out the details of implementation and monitoring and gives time frames. The early time frames extend out to 2030 and the later ones to 2045. There are no very near timeframes set out in the CAP for development and adoption of the plans, policies, regulations and ordinances. If these directives are not put in place promptly, the League is concerned that the implementation of the actual actions will lag. This must not happen.</p>	O12-8
<p>Further, the League understands that measures in the CAP are restricted by other elements of the County's General Plan. The League recommends that future updates of General Plan elements be integrated with CAP needs.</p>	O12-9
<p>For instance densifying high quality transit areas (HQTAs) is expected to lower GHG emissions and improve equity because residents can take transit to access jobs and services instead of driving. However, transit is <u>only one</u> low-carbon mobility option. Walking is the cheapest and lowest emitting option.</p>	O12-10
<p>Unincorporated LA County land across the street from 8,000 jobs at or adjacent to Los Angeles Air Force Base is zoned for R-1. Similarly, students in community colleges are sleeping in their cars and county land across the street from El Camino College (22,000 students) is zoned R-1.</p>	O12-11
<p>The League urges the Board of Supervisors and the management of the Los Angeles County government to prioritize climate action and to set, budget and monitor firm expectations for each upcoming year.</p>	O12-12
<p>The League urges the County to be fully transparent with the public about successes and difficulties with carrying out the CAP. We appreciate the transparency of the Measure W: Safe Clean Water Program Portal. We hope to see something similar for the CAP with links to the General Plan, Public Works, Transportation and other departments as appropriate.</p>	O12-13

Sincerely,

Margo Reeg,

President
 Los Angeles County League of Women Voters

2.3.2.12 Letter O12: League of Women Voters

This letter provides input on the Revised Draft 2045 CAP as well as CEQA comments on the Recirculated Draft PEIR. Comments specific to the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, the County has received and reviewed comments on the Revised Draft 2045 CAP and common topics are discussed in Section 1.4, *Comments on the Revised Draft 2045 CAP*, in Chapter 1, *Introduction*. PEIR-focused comments are addressed below.

O12-1 The County acknowledges the support to adopt and implement the Revised Draft 2045 CAP.

O12-2 to O12-4 These comments on the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on these issues pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses comments received on the Revised Draft 2045 CAP.

O12-5 Regarding the comment's statement regarding priority bus and bike lane exemptions under CEQA, the Recirculated Draft PEIR is a programmatic level document and is intended to inform agency decision-makers and the public about environmental impacts of the Project at a program level. The document does not recommend approval or denial of specific projects under the Program. However, the Revised Draft 2045 CAP does include Strategies, Measures, and Actions aimed at reducing single-occupancy vehicle use including Measure T3, Measure T4, and Measure T5, which could be implemented on a project-level.

O12-6 to O12-8 These comments on the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on these issues pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses comments received on the Revised Draft 2045 CAP.

O12-9 Regarding the comment's request that future updates of General Plan elements be integrated with Revised Draft 2045 CAP needs, the Revised Draft 2045 CAP is an implementation program for the Air Quality Element of the General Plan. General Plans, including updates to General Plans, are required to be internally consistent such that all elements and parts comprise an integrated, internally consistent and compatible statement of policies for the County.

O12-10 to O12-11 These comments on the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on these issues pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses comments received on the Revised Draft 2045 CAP.

- O12-12 The County prioritizes climate action and is committed to adapting its programs and services to reduce Countywide GHG emissions. In response to the comment's recommendation to budget and monitor expectations, Chapter 4 of the Revised Draft 2045 CAP discusses the monitoring and reporting the County will implement. In addition to annual reporting through the General Plan Annual Progress Report, the County intends to develop a dashboard as a part of the reporting to provide information through data and spatial displays. Adopting the Revised Draft 2045 CAP positions the County to pursue climate related grants and to start budgeting for the identified actions.
- O12-13 The County intends to be transparent with the public about implementation of the Revised Draft 2045 CAP. Chapter 4 of the Revised Draft 2045 CAP discusses the monitoring and reporting the County will implement. In addition to annual reporting through the General Plan Annual Progress Report, the County intends to develop a dashboard as a part of the reporting to provide information through data and spatial displays.

CAUTION: External Email. Proceed Responsibly.

Due to many events these last two months we have not had time to focus on the revised and re-circulated CAP EIR. We request an additional two weeks to review these documents.

O13-1

Some of our members did watch the posted link to your presentation. Our biggest concern is that you are using the 2015 year as a baseline. This seems inappropriate when the situation demands a return to 1990 levels as requested by the IPCC and other government agencies. It is as though you are only going back to 2015 so that your figures will look good instead of really trying to comply with the changes that need to be made. We believe that this baseline will not comply with State and County climate goals. Changing the baseline to make it look as though the County is making headway will not address the underlying problem of the urgent need to reduce CO2 and Methane releases through reducing or eliminating their sources.

Subject: Revised Draft 2045 Climate Action Plan

Good morning,

Thank you for your prior participation in the update to the County's climate action plan. We released the Revised Draft 2045 Climate Action Plan and Recirculated Draft Environmental Impact Report for public review. Comments on both documents are requested by 5:00 pm on May 15th. Both documents can be accessed on the project website: <https://planning.lacounty.gov/long-range-planning/climate-action-plan/documents/>

We will be convening an online meeting to discuss and answer questions from the environmental community on April 20, 2023 at 3:00 pm. A meeting invite will be

sent out shortly with the link to the Zoom meeting.

If you are unable to join this meeting, we invite you to sign up for an appointment to ask us your questions during lunchtime hours. [Click here to sign up for an appointment.](#)

Thank you,

Iris

2.3.2.13 Letter O13: Santa Clarita Organization for Planning and the Environment

This letter provides input on the Revised Draft 2045 CAP as well as CEQA comments on the Recirculated Draft PEIR. Comments specific to the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, the County has received and reviewed comments on the Revised Draft 2045 CAP and common topics are discussed in Section 1.4, *Comments on the Revised Draft 2045 CAP*, in Chapter 1, *Introduction*. PEIR-focused comments are addressed below.

- O13-1 Regarding the comment’s request for an additional two weeks of public review, CEQA presumes the adequacy of a 45-day review period for a Draft PEIR (Pub. Resources Code, § 21091(a); CEQA Guidelines, § 15105) and explains that the public review period should not be longer than 60 days except in “unusual circumstances.” There are no extenuating circumstances here and as such, the standard 45-day review period is sufficient. Additionally, during those 45 days, the County hosted seven open meeting hours advertised as lunchtime office hours, posted on the project website and distributed via email an informational video on the Project, and held meetings with responsive stakeholder groups to facilitate review and discussion. In order to provide stakeholders additional time to review and understand the Revised Draft 2045 CAP and Recirculated Draft PEIR, and since changes to the Recirculated Draft PEIR were predicated on changes to the Revised Draft 2045 CAP, the Revised Draft 2045 CAP was released prior to the Recirculated Draft PEIR to offer additional review time to read the changes driving the analysis in the Recirculated Draft PEIR. For these reasons, the County believes that the 60-day public review period provided for the Revised Draft 2045 CAP and the 45-day public review period provided for the Recirculated Draft PEIR were sufficient to allow informed public comment.
- O13-2 In response to the comment regarding the appropriate baseline for climate action planning, the 2015 baseline is appropriate when considering the reduction goals of 40 percent below 2015 levels by 2030, 50 percent below 2015 levels by 2035, and 83 percent below 2015 levels by 2045. These targets are consistent with the state goals of 40 percent below 1990 levels by 2030, and 85 percent below 1990 levels by 2045. As stated in Chapter 2 of the Revised Draft 2045 CAP, total unincorporated Los Angeles County emissions in 1990 are estimated to be 6.4 million MTCO_{2e}. Because the 2015 emissions of 5.5 million MTCO_{2e} are 15 percent lower than the 1990 emissions, the 2030 target of a 40 percent reduction below 2015 levels is equivalent to a 48 percent reduction below 1990 levels. This exceeds the state target of 40 percent below 1990 levels by 2030. As such, the Revised Draft 2045 CAP’s 2030 target is in line with (and more stringent than) the SB 32 target for the state. The 2045 target of 83 percent below 2015 levels (equivalent to 85 percent below 1990 levels) aligns with the State of California’s 2045 target as codified in AB 1279 and evaluated in the Final 2022 Scoping Plan. In addition, the 2035 target of 50 percent below 2015 levels (equivalent to 57 percent below 1990 levels) puts unincorporated Los Angeles County

on the trajectory to achieve 85 percent below 1990 levels by 2045, consistent with state targets. Therefore, the Revised Draft 2045 CAP not only aligns with the State's GHG reduction targets, but it also exceeds them.

**RE: Southwest Mountain States Regional Council of Carpenters’
Comments in Support of the County of Los Angeles’ Draft 2045
Climate Action Plan.**

Dear Thuy Hua:

On behalf of the Southwest Mountain States Regional Council of Carpenters (“**SWMSRCC**”), my Office is submitting these comments regarding the County of Los Angeles’ (“**County**”) Revised Draft Environmental Impact Report (“**RDEIR**”) for the Draft 2045 Climate Action Plan (“**Draft 2045 CAP**” or “**Plan**”).

SWMSRCC is a labor union representing over 63,000 union carpenters in 10 states, including California, and has a strong interest in well-ordered land use planning and in addressing the environmental impacts of development projects. Individual members of SWMSRCC live, work, and recreate in the unincorporated areas of the County and would be directly affected by the environmental and social impacts of future projects subject to the Plan.

SWMSRCC expressly reserves the right to supplement these comments at or prior to future hearings or proceedings related to the Plan. Gov. Code, § 65009, subd. (b); Pub. Res. Code, § 21177, subd. (a); see *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal.App.4th 1184, 1199-1203; accord *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal.App.4th 1109, 1121.

SWMSRCC incorporates by reference all comments raising issues regarding the Plan and its environmental review, including associated documents and reports. See

O14-1

O14-2

California Clean Energy Com. v. City of Woodland (2014) 225 Cal.App.4th 173, 191 (citing *Citizens for Open Government v. City of Lodi* (2006) 144 Cal.App.4th 865, 875) (any party who has objected to a project’s environmental documentation may assert any issue timely raised by other parties); see also *Santa Teresa Citizen Action Group v. City of San Jose* (2003) 114 Cal.App.4th 689, 701 (citing Pub. Res. Code, § 21177, subds. (a), (b)) (in order to attack a decision that is subject to the California Environmental Quality Act (CEQA), the alleged grounds for noncompliance must have been presented to the public agency, and the party attacking the decision must have raised some objection during the administrative proceedings).

O14-2
(cont.)

Moreover, SWMSRCC requests that the County provide notice for any and all actions referring or relating to the Project issued under CEQA (Pub. Res. Code, § 21000 et seq.), and the California Planning and Zoning Law (Gov. Code, §§ 65000–65010). California Public Resources Code, sections 21092.2 and 21167, subsection (f) and California Government Code, section 65092 require agencies to mail such notices to any party who has filed a written request for them with the clerk of the agency’s governing body.

O14-3

I. THE COUNTY SHOULD REQUIRE THE USE OF A LOCAL SKILLED AND TRAINED WORKFORCE TO BENEFIT ITS ECONOMIC DEVELOPMENT AND THE ENVIRONMENT.

The County has committed itself to meet the goals of the 2016 Paris Climate Agreement and achieving carbon neutrality for its unincorporated areas by adapting programs and services to essentially reduce GHG emissions. See Draft 2045 CAP, p. ES-1. The Plan “identifies strategies, measures, and actions to mitigate GHG emissions from community activities, which may include some municipal operations[.]” *Ibid.* Considering that transportation by on-road vehicles comprises 52% of the 5.2 million metric tons of carbon dioxide equivalent (MTCO₂e) that unincorporated L.A. County emitted in 2018 (the most recent inventory completed), and that “the largest decline in emissions will result from changes to the transportation” sector, it is vital that the Plan implement strategies, measures, and actions that effectively curb the amount of time individuals spend on the road. Draft 2045 CAP, p. ES-7.

O14-4

Besides increasing densities and diversity of land uses near transit, reducing single-occupancy vehicle trips, and institutionalizing low-carbon transportation, the Plan should mandate additional measures and strategies. Draft 2045 CAP, p. ES-5.

O14-5

To this aim, the County should require that all developers of future projects subject to the Plan utilize local workers who are registered apprentices in, have graduated from, or have at least as many hours of on-the-job experience in the applicable craft which would be required to graduate from, a Joint Labor-Management Apprenticeship Program approved by the State of California.

O14-6

Community benefits such as local hire can also be helpful to reduce environmental impacts and improve the positive economic impacts of future projects subject to the Plan. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of future project sites can reduce the length of vendor trips, reduce greenhouse gas (GHG) emissions, and provide localized economic benefits. As environmental consultants Matt Hagemann and Paul E. Rosenfeld note:

[A]ny local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

O14-7

March 8, 2021, SWAPE Letter to Mitchell M. Tsai re Local Hire Requirements and Considerations for Greenhouse Gas Modeling.

Workforce requirements promote the development of skilled trades that yield sustainable economic development. As the California Workforce Development Board and the University of California, Berkeley Center for Labor Research and Education concluded:

O14-8

[L]abor should be considered an investment rather than a cost—and investments in growing, diversifying, and upskilling California’s workforce can positively affect returns on climate mitigation efforts. In other words, well-trained workers are key to delivering emissions reductions and moving California closer to its climate targets.¹

Furthermore, workforce policies have significant environmental benefits given that they improve an area’s jobs-housing balance, decreasing the amount and length of job

O14-9

¹ California Workforce Development Board (2020) Putting California on the High Road: A Jobs and Climate Action Plan for 2030 at p. ii, *available at* <https://laborcenter.berkeley.edu/wp-content/uploads/2020/09/Putting-California-on-the-High-Road.pdf>.

commutes and the associated GHG emissions. In fact, on May 7, 2021, the South Coast Air Quality Management District (South Coast AQMD) found that the use of a local state-certified apprenticeship program can result in air pollutant reductions.²

O14-9
(cont.)

The extent and significance on the environment of locating jobs closer to residential areas cannot be overstated. As the California Planning Roundtable has noted:

People who live and work in the same jurisdiction would be more likely to take transit, walk, or bicycle to work than residents of less balanced communities and their vehicle trips would be shorter. Benefits would include potential reductions in both vehicle miles traveled and vehicle hours traveled.³

Moreover, local hire mandates and skill-training are critical facets of a strategy to reduce vehicle miles traveled (VMT). As planning experts Robert Cervero and Michael Duncan have noted, simply placing jobs near housing stock is insufficient to achieve VMT reductions given that the skill requirements of available local jobs must match those held by local residents.⁴ Some municipalities have actually tied local hire and other workforce policies to local development permits to address transportation issues. Cervero and Duncan note that:

O14-10

In nearly built-out Berkeley, CA, the approach to balancing jobs and housing is to create local jobs rather than to develop new housing. The city’s First Source program encourages businesses to hire local residents, especially for entry- and intermediate-level jobs, and sponsors vocational training to ensure residents are employment-ready. While the program is voluntary, some 300 businesses have used it to date, placing more than

² South Coast Air Quality Management District (May 7, 2021) Certify Final Environmental Assessment and Adopt Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program, and Proposed Rule 316 – Fees for Rule 2305, Submit Rule 2305 for Inclusion Into the SIP, and Approve Supporting Budget Actions, *available at* <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2021/2021-May7-027.pdf?sfvrsn=10>.

³ California Planning Roundtable (2008) Deconstructing Jobs-Housing Balance at p. 6, *available at* <https://cprroundtable.org/static/media/uploads/publications/cpr-jobs-housing.pdf>.

⁴ Cervero, Robert and Duncan, Michael (2006) Which Reduces Vehicle Travel More: Jobs-Housing Balance or Retail-Housing Mixing? *Journal of the American Planning Association* 72 (4), 475-490, 482, *available at* <http://reconnectingamerica.org/assets/Uploads/UTCT-825.pdf>.

<p>3,000 city residents in local jobs since it was launched in 1986. When needed, these carrots are matched by sticks, since the city is not shy about negotiating corporate participation in First Source as a condition of approval for development permits.</p>	<p>O14-10 (cont.)</p>
<p>Recently, the State of California verified its commitment to developing its workforce through the Affordable Housing and High Road Jobs Act of 2022, otherwise known as Assembly Bill No. 2011 (AB2011). AB2011 amended the California Planning and Zoning Law to allow ministerial, by-right approval for projects being built alongside commercial corridors that meet certain affordability and labor requirements.</p>	<p>O14-11</p>
<p>The Plan focuses heavily on ensuring that the path to carbon neutrality is inclusive, accessible, equitable, and fair. Draft 2045 CAP, p. 1-13. It intends to effectuate its goals in a way that prioritizes frontline communities and low-income households that have historically experienced a disproportionately high share of environmental impacts. Many of these communities and households are comprised of or include laborers and carpenters. To ensure that this sector of the workforce is included in the Plan’s definitive strategies and policies through a local hire mandate would not only further the County’s goal of utilizing the Plan as a “policy document,” but also further the Plan’s commitment to create opportunities to “integrate equity in ways that help reverse the trends of discrimination and disinvestment.” Draft 2045 CAP, p. 1-14.</p>	<p>O14-12</p>
<p>While the Plan’s Climate Equity Guiding Principles may be adequate for prioritizing equity, more should be mandated.</p>	<p>O14-13</p>
<p>Implementing a local workforce requirement in all future applicable projects aligns with prioritizing frontline communities, promoting collaborative work, and achieving direct results.</p>	<p>O14-14</p>
<p>The County should therefore consider mandating that all future projects in unincorporated L.A. County utilize local workforce policies and requirements to benefit the local area economically and to mitigate GHG emissions, improve air quality, and reduce transportation impacts.</p>	<p>O14-15</p>
<p>II. ALL FUTURE PROJECTS SHOULD BE CONSISTENT WITH THE 2045 CLIMATE ACTION PLAN APPROACH TO THE CALIFORNIA ENVIRONMENTAL QUALITY ACT.</p> <p>CEQA is a California statute designed to inform decision-makers and the public about the potential significant environmental effects of a project. CEQA Guidelines,</p>	<p>O14-16</p>

§ 15002, subd. (a)(1).⁵ At its core, its purpose is to “inform the public and its responsible officials of the environmental consequences of their decisions *before* they are made.” *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564.

CEQA directs public agencies to avoid or reduce environmental damage, when possible, by requiring alternatives or mitigation measures. CEQA Guidelines, § 15002, subds. (a)(2)-(3); see also *Berkeley Keep Jets Over the Bay Com. v. Board of Port Comrs. of the City of Oakland* (2001) 91 Cal.App.4th 1344, 1354; *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 400. The Environmental Impact Report (EIR) serves to provide public agencies and the public in general with information about the effect that a proposed project is likely to have on the environment and to “identify ways that environmental damage can be avoided or significantly reduced.” CEQA Guidelines, § 15002, subd. (a)(2). If the project has a significant effect on the environment, the agency may approve the project only upon finding that it has “eliminated or substantially lessened all significant effects on the environment where feasible” and that any unavoidable significant effects on the environment are “acceptable due to overriding concerns” specified in Public Resources Code section 21081. See CEQA Guidelines, §§ 15092, subds. (b)(2)(A)-(B).

While the courts review an EIR using an ‘abuse of discretion’ standard, the reviewing court is not to *uncritically* rely on every study or analysis presented by a project proponent in support of its position. *Berkeley Keep Jets, supra*, 91 Cal.App.4th at p. 1355 (quoting *Laurel Heights, supra*, 47 Cal.3d at pp. 391, 409 fn. 12) (internal quotations omitted). A clearly inadequate or unsupported study is entitled to no judicial deference. *Id.* Drawing this line and determining whether the EIR complies with CEQA’s information disclosure requirements presents a question of law subject to independent review by the courts. *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 515; *Madera Oversight Coalition, Inc. v. County of Madera* (2011) 199 Cal.App.4th 48, 102, 131. As the First District Court of Appeal has previously stated, prejudicial abuse of discretion occurs if the failure to include relevant information precludes informed decision-making and informed public participation, thereby thwarting the statutory

⁵ The CEQA Guidelines, codified in Title 14 of the California Code of Regulations, section 15000 et seq., are regulatory guidelines promulgated by the state Natural Resources Agency for the implementation of CEQA. Pub. Res. Code, § 21083. The CEQA Guidelines are given “great weight in interpreting CEQA except when . . . clearly unauthorized or erroneous.” *Center for Biological Diversity v. Dept. of Fish & Wildlife* (2015) 62 Cal.4th 204, 217.

goals of the EIR process. *Berkeley Keep Jets, supra*, 91 Cal.App.4th at p. 1355 (internal quotations omitted).

The preparation and circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. *Communities for a Better Environment v. Richmond* (2010) 184 Cal.App.4th 70, 80 (quoting *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 449-450). The EIR’s function is to ensure that government officials who decide to build or approve a project do so with a full understanding of the environmental consequences and, equally important, that the public is assured those consequences have been considered. *Id.* For the EIR to serve these goals it must present information so that the foreseeable impacts of pursuing the project can be understood and weighed, and the public must be given an adequate opportunity to comment on that presentation before the decision to go forward is made. *Id.*

O14-16
 (cont.)

A strong presumption in favor of requiring preparation of an EIR is built into CEQA. This presumption is reflected in what is known as the “fair argument” standard under which an EIR must be prepared whenever substantial evidence in the record supports a fair argument that a project may have a significant effect on the environment. *Quail Botanical Gardens Found., Inc. v. City of Encinitas* (1994) 29 Cal.App.4th 1597, 1602; *Friends of “B” St. v. City of Hayward* (1980) 106 Cal.3d 988, 1002.

The fair argument test stems from the statutory mandate that an EIR be prepared for any project that “may have a significant effect on the environment.” Pub. Res. Code, § 21151; see *No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal.App.3d 68, 75 (hereafter, “*No Oil*”); accord *Jensen v. City of Santa Rosa* (2018) 23 Cal.App.5th 877, 884 (hereafter, “*Jensen*”). Under this test, if a proposed project is not exempt and may cause a significant effect on the environment, the lead agency must prepare an EIR. Pub. Res. Code, §§ 21100, subd. (a), 21151; CEQA Guidelines, §§ 15064, subds. (a)(1), (f)(1). An EIR may be dispensed with only if the lead agency finds no substantial evidence in the initial study or elsewhere in the record that the project may have a significant effect on the environment. *Parke Shattuck Neighbors v. Berkeley City Council* (2013) 222 Cal.App.4th 768, 785. In such a situation, the lead agency *must* adopt a negative declaration. Pub. Res. Code, § 21080, subd. (c)(1); CEQA Guidelines, §§ 15063, subd. (b)(2), 15064, subd. (f)(3).

“Significant effect upon the environment” is defined as “a substantial or potentially substantial adverse change in the environment.” Pub. Res. Code, § 21068; CEQA

Guidelines, § 15382. A project may have a significant effect on the environment if there is a reasonable probability that it will result in a significant impact. *No Oil, supra*, 13 Cal.App.3d at p. 83 fn. 16; see *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 309 (hereafter, “*Sundstrom*”). If any aspect of the project may result in a significant impact on the environment, an EIR must be prepared even if the overall effect of the project is beneficial. CEQA Guidelines, § 15063, subd. (b)(1); see *County Sanitation Dist. No. 2 v. County of Kern* (2005) 127 Cal.App.4th 1544, 1580.

O14-16
(cont.)

This standard sets a “low threshold” for preparation of an EIR. *Consolidated Irrigation Dist. v. City of Selma* (2012) 204 Cal.App.4th 187, 207; *Nelson v. County of Kern* (2010) 190 Cal.App.4th 252; *Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903, 928; *Bowman v. City of Berkeley* (2004) 122 Cal.App.4th 572, 580; *Citizen Action to Serve All Students v. Thornley* (1990) 222 Cal.App.3d 748, 754; *Sundstrom, supra*, 202 Cal.App.3d at p. 310. If substantial evidence in the record supports a fair argument that the project may have a significant environmental effect, the lead agency must prepare an EIR even if other substantial evidence before it indicates the project will have no significant effect. See *Jensen, supra*, 23 Cal.App.5th at p. 886; *Clews Land & Livestock v. City of San Diego* (2017) 19 Cal.App.5th 161, 183; *Stanislaus Audubon Society, Inc. v. County of Stanislaus* (1995) 33 Cal.App.4th 144, 150; *Brentwood Assn. for No Drilling, Inc. v. City of Los Angeles* (1982) 134 Cal.App.3d 491; *Friends of “B” St.*, 106 Cal.App.3d 988; CEQA Guidelines, § 15064, subd. (f)(1).

SWMSRCC supports the Plan’s element to develop a new review consistency checklist to allow future projects to streamline GHG analyses pursuant to CEQA by allowing that General Plan-consistent projects that incorporate applicable 2045 CAP actions be excused from a separate quantitative GHG analysis. See Draft 2045 CAP, pp. ES-2, 1-4, 1-5. The CEQA Guidelines specify that CEQA review of a project’s GHG emissions can be streamlined should the CAP do the following:

O14-17

- Quantifies GHG emissions, both existing and projected, from activities within a defined geographic area over a specified time period.
- Establishes a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable.
- Identifies and analyzes the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area.

O14-18

- Specifies measures or a group of measures, including performance standards, that would collectively achieve the specified emissions level if implemented on a project-by-project basis, as demonstrated by substantial evidence.
- Establishes a mechanism for monitoring the plan’s progress toward achieving the target, and requires an amendment if the plan is not achieving specified levels.
- Is adopted in a public process following environmental review.

O14-18
(cont.)

See Draft 2045 CAP, p. 1-4; CEQA Guidelines, § 15183.5.

Additionally, the Plan meets the requirements of CEQA Guidelines, section 15183.5 by:

- Quantifying all primary sectors of GHG emissions associated with all activities occurring within unincorporated Los Angeles County over which the County has some level of jurisdictional control or influence¹ for 2015 through 2045;
- Establishing GHG emissions reduction targets for 2030, 2035, and 2045, below which GHG emissions would not be cumulatively considerable based on the substantial evidence that the 2045 CAP is consistent with the 2022 Scoping Plan, Senate Bill (SB) 32, and AB 1279,² as well as an aspirational goal for 2045;
- Analyzing community emissions for unincorporated Los Angeles County as a whole and including predicted growth expected by 2045;
- Including specific mandatory and voluntary measures that quantitatively achieve the overall reduction targets for 2030, 2035, and 2045, and make progress toward the aspirational goal for 2045;
- Including an implementation and monitoring program that contains performance indicators and targets, details regarding funding and financing strategies, a list of available and expected funding sources, and a table for monitoring and reporting progress on the measures and their implementing actions; and,
- Being adopted through a public process in compliance with CEQA.

Id.

¹Considering the magnitude of the emissions generated by on-road transportation in unincorporated L.A. County, coupled with the wide-reaching benefits of a reduction in VMT resulting from local hire requirements, SWMSRCC requests that the County

O14-19

County of Los Angeles – Draft 2045 CAP
May 12, 2023
Page 10 of 10

include an additional provision into the Plan’s CEQA streamlining procedures by mandating that a local hire measure be included in the checklist addressing all feasible applicable measures or alternative project emissions reduction measures as project features or as GHG mitigation measures for projects that are required or electing to prepare a project-specific GHG analysis. See Draft 2045 CAP, p. 1-5.

O14-19
(cont.)

III. CONCLUSION

SWMSRCC respectfully requests that the County take into consideration the aforementioned concerns and incorporate the measures suggested into its implementation of the Plan. Doing so would address several of the Plan’s strategy areas and further its overarching purpose, namely, to reduce the County’s impact on climate change, to aid in its “obligation under CEQA . . . and various California Executive Orders to do its part to reduce GHG emissions within the state[,]” and to do so in ways that “support pathways toward equitable and transformative implementation of climate strategies.” Draft 2045 CAP, p. 1-15. Should the County have any questions or concerns, it should feel free to contact my Office.

Subject: Local Hire Requirements and Considerations for Greenhouse Gas Modeling

Dear Mr. Tsai,

Soil Water Air Protection Enterprise (“SWAPE”) is pleased to provide the following draft technical report explaining the significance of worker trips required for construction of land use development projects with respect to the estimation of greenhouse gas (“GHG”) emissions. The report will also discuss the potential for local hire requirements to reduce the length of worker trips, and consequently, reduced or mitigate the potential GHG impacts.

Worker Trips and Greenhouse Gas Calculations

The California Emissions Estimator Model (“CalEEMod”) is a “statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects.”¹ CalEEMod quantifies construction-related emissions associated with land use projects resulting from off-road construction equipment; on-road mobile equipment associated with workers, vendors, and hauling; fugitive dust associated with grading, demolition, truck loading, and on-road vehicles traveling along paved and unpaved roads; and architectural coating activities; and paving.²

The number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.³

¹ “California Emissions Estimator Model.” CAPCOA, 2017, available at: <http://www.aqmd.gov/caleemod/home>.

² “California Emissions Estimator Model.” CAPCOA, 2017, available at: <http://www.aqmd.gov/caleemod/home>.

³ “CalEEMod User’s Guide.” CAPCOA, November 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

Specifically, the number and length of vehicle trips is utilized to estimate the vehicle miles travelled (“VMT”) associated with construction. Then, utilizing vehicle-class specific EMFAC 2014 emission factors, CalEEMod calculates the vehicle exhaust, evaporative, and dust emissions resulting from construction-related VMT, including personal vehicles for worker commuting.⁴

Specifically, in order to calculate VMT, CalEEMod multiplies the average daily trip rate by the average overall trip length (see excerpt below):

$$\text{“VMT}_d = \Sigma(\text{Average Daily Trip Rate}_i * \text{Average Overall Trip Length}_i)_n$$

Where:

$$n = \text{Number of land uses being modeled.”}^5$$

Furthermore, to calculate the on-road emissions associated with worker trips, CalEEMod utilizes the following equation (see excerpt below):

$$\text{“Emissions}_{\text{pollutant}} = \text{VMT} * \text{EF}_{\text{running,pollutant}}$$

Where:

$$\text{Emissions}_{\text{pollutant}} = \text{emissions from vehicle running for each pollutant}$$

$$\text{VMT} = \text{vehicle miles traveled}$$

$$\text{EF}_{\text{running,pollutant}} = \text{emission factor for running emissions.”}^6$$

Thus, there is a direct relationship between trip length and VMT, as well as a direct relationship between VMT and vehicle running emissions. In other words, when the trip length is increased, the VMT and vehicle running emissions increase as a result. Thus, vehicle running emissions can be reduced by decreasing the average overall trip length, by way of a local hire requirement or otherwise.

Default Worker Trip Parameters and Potential Local Hire Requirements

As previously discussed, the number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.⁷ In order to understand how local hire requirements and associated worker trip length reductions impact GHG emissions calculations, it is important to consider the CalEEMod default worker trip parameters. CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act (“CEQA”) requires that such changes be justified by substantial evidence.⁸ The default number of construction-related worker trips is calculated by multiplying the

⁵ “Appendix A Calculation Details for CalEEMod.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 23.

⁶ “Appendix A Calculation Details for CalEEMod.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 15.

⁷ “CalEEMod User’s Guide.” CAPCOA, November 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

⁸ CalEEMod User Guide, available at: <http://www.caleemod.com/>, p. 1, 9.

number of pieces of equipment for all phases by 1.25, with the exception of worker trips required for the building construction and architectural coating phases.⁹ Furthermore, the worker trip vehicle class is a 50/25/25 percent mix of light duty autos, light duty truck class 1 and light duty truck class 2, respectively.¹⁰ Finally, the default worker trip length is consistent with the length of the operational home-to-work vehicle trips.¹¹ The operational home-to-work vehicle trip lengths are:

“[B]ased on the *location* and *urbanization* selected on the project characteristic screen. These values were *supplied by the air districts or use a default average for the state*. Each district (or county) also assigns trip lengths for urban and rural settings” (emphasis added).¹²

Thus, the default worker trip length is based on the location and urbanization level selected by the User when modeling emissions. The below table shows the CalEEMod default rural and urban worker trip lengths by air basin (see excerpt below and Attachment A).¹³

Worker Trip Length by Air Basin		
Air Basin	Rural (miles)	Urban (miles)
Great Basin Valleys	16.8	10.8
Lake County	16.8	10.8
Lake Tahoe	16.8	10.8
Mojave Desert	16.8	10.8
Mountain Counties	16.8	10.8
North Central Coast	17.1	12.3
North Coast	16.8	10.8
Northeast Plateau	16.8	10.8
Sacramento Valley	16.8	10.8
Salton Sea	14.6	11
San Diego	16.8	10.8
San Francisco Bay Area	10.8	10.8
San Joaquin Valley	16.8	10.8
South Central Coast	16.8	10.8
South Coast	19.8	14.7
Average	16.47	11.17
Minimum	10.80	10.80
Maximum	19.80	14.70
Range	9.00	3.90

⁹ “CalEEMod User’s Guide.” CAPCOA, November 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

¹⁰ “Appendix A Calculation Details for CalEEMod.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 15.

¹¹ “Appendix A Calculation Details for CalEEMod.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14.

¹² “Appendix A Calculation Details for CalEEMod.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 21.

¹³ “Appendix D Default Data Tables.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-84 – D-86.

As demonstrated above, default rural worker trip lengths for air basins in California vary from 10.8- to 19.8- miles, with an average of 16.47 miles. Furthermore, default urban worker trip lengths vary from 10.8- to 14.7- miles, with an average of 11.17 miles. Thus, while default worker trip lengths vary by location, default urban worker trip lengths tend to be shorter in length. Based on these trends evident in the CalEEMod default worker trip lengths, we can reasonably assume that the efficacy of a local hire requirement is especially dependent upon the urbanization of the project site, as well as the project location.

Practical Application of a Local Hire Requirement and Associated Impact

To provide an example of the potential impact of a local hire provision on construction-related GHG emissions, we estimated the significance of a local hire provision for the Village South Specific Plan (“Project”) located in the City of Claremont (“City”). The Project proposed to construct 1,000 residential units, 100,000-SF of retail space, 45,000-SF of office space, as well as a 50-room hotel, on the 24-acre site. The Project location is classified as Urban and lies within the Los Angeles-South Coast County. As a result, the Project has a default worker trip length of 14.7 miles.¹⁴ In an effort to evaluate the potential for a local hire provision to reduce the Project’s construction-related GHG emissions, we prepared an updated model, reducing all worker trip lengths to 10 miles (see Attachment B). Our analysis estimates that if a local hire provision with a 10-mile radius were to be implemented, the GHG emissions associated with Project construction would decrease by approximately 17% (see table below and Attachment C).

Local Hire Provision Net Change	
Without Local Hire Provision	
Total Construction GHG Emissions (MT CO ₂ e)	3,623
Amortized Construction GHG Emissions (MT CO ₂ e/year)	120.77
With Local Hire Provision	
Total Construction GHG Emissions (MT CO ₂ e)	3,024
Amortized Construction GHG Emissions (MT CO ₂ e/year)	100.80
% Decrease in Construction-related GHG Emissions	17%

As demonstrated above, by implementing a local hire provision requiring 10 mile worker trip lengths, the Project could reduce potential GHG emissions associated with construction worker trips. More broadly, any local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

This serves as an example of the potential impacts of local hire requirements on estimated project-level GHG emissions, though it does not indicate that local hire requirements would result in reduced construction-related GHG emission for all projects. As previously described, the significance of a local hire requirement depends on the worker trip length enforced and the default worker trip length for the project’s urbanization level and location.

¹⁴ “Appendix D Default Data Tables.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-85.

Los Angeles-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	45.00	1000sqft	1.03	45,000.00	0
High Turnover (Sit Down Restaurant)	36.00	1000sqft	0.83	36,000.00	0
Hotel	50.00	Room	1.67	72,600.00	0
Quality Restaurant	8.00	1000sqft	0.18	8,000.00	0
Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	CH4 Intensity (lb/MWhr)	0.029	N2O Intensity (lb/MWhr)	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Annual

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	CH4 Intensity (lb/MWhr)	0.029	N2O Intensity (lb/MWhr)	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	45.00	1000sqft	1.03	45,000.00	0
High Turnover (Sit Down Restaurant)	36.00	1000sqft	0.83	36,000.00	0
Hotel	50.00	Room	1.67	72,600.00	0
Quality Restaurant	8.00	1000sqft	0.18	8,000.00	0
Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	CH4 Intensity (lb/MWhr)	0.029	N2O Intensity (lb/MWhr)	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Annual

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	CH4 Intensity (lb/MWhr)	0.029	N2O Intensity (lb/MWhr)	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	45.00	1000sqft	1.03	45,000.00	0
High Turnover (Sit Down Restaurant)	36.00	1000sqft	0.83	36,000.00	0
Hotel	50.00	Room	1.67	72,600.00	0
Quality Restaurant	8.00	1000sqft	0.18	8,000.00	0
Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	CH4 Intensity (lb/MWhr)	0.029	N2O Intensity (lb/MWhr)	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1	Demolition	Demolition	9/1/2021	10/12/2021	5	30	
2	Site Preparation	Site Preparation	10/13/2021	11/9/2021	5	20	
3	Grading	Grading	11/10/2021	1/11/2022	5	45	
4	Building Construction	Building Construction	1/12/2022	12/12/2023	5	500	
5	Paving	Paving	12/13/2023	1/30/2024	5	35	
6	Architectural Coating	Architectural Coating	1/31/2024	3/19/2024	5	35	

Acres of Grading (Site Preparation Phase): 0

Acres of Grading (Grading Phase): 112.5

Acres of Paving: 0

Residential Indoor: 2,025,000; Residential Outdoor: 675,000; Non-Residential Indoor: 326,400; Non-Residential Outdoor: 108,800; Striped Parking Area: 0 (Architectural Coating – sqft)

OffRoad Equipment

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Phase Name	Offroad Equipment Type	Amount	Usage Hours	Horse Power	Load Factor
Demolition	Concrete/Industrial Saws	1	8.00	81	0.73
Demolition	Excavators	3	8.00	158	0.38
Demolition	Rubber Tired Dozers	2	8.00	247	0.40
Site Preparation	Rubber Tired Dozers	3	8.00	247	0.40
Site Preparation	Tractors/Loaders/Backhoes	4	8.00	97	0.37
Grading	Excavators	2	8.00	158	0.38
Grading	Graders	1	8.00	187	0.41
Grading	Rubber Tired Dozers	1	8.00	247	0.40
Grading	Scrapers	2	8.00	367	0.48
Grading	Tractors/Loaders/Backhoes	2	8.00	97	0.37
Building Construction	Cranes	1	7.00	231	0.29
Building Construction	Forklifts	3	8.00	89	0.20
Building Construction	Generator Sets	1	8.00	84	0.74
Building Construction	Tractors/Loaders/Backhoes	3	7.00	97	0.37
Building Construction	Welders	1	8.00	46	0.45
Paving	Pavers	2	8.00	130	0.42
Paving	Paving Equipment	2	8.00	132	0.36
Paving	Rollers	2	8.00	80	0.38
Architectural Coating	Air Compressors	1	6.00	78	0.48

Trips and VMT

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Paul Rosenfeld, Ph.D.

Principal Environmental Chemist

Chemical Fate and Transport & Air Dispersion Modeling

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
 UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
 UCLA School of Public Health; 2003 to 2006; Adjunct Professor
 UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
 UCLA Institute of the Environment, 2001-2002; Research Associate
 Komex H₂O Science, 2001 to 2003; Senior Remediation Scientist
 National Groundwater Association, 2002-2004; Lecturer
 San Diego State University, 1999-2001; Adjunct Professor
 Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
 Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
 Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
 King County, Seattle, 1996 – 1999; Scientist
 James River Corp., Washington, 1995-96; Scientist
 Big Creek Lumber, Davenport, California, 1995; Scientist
 Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
 Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Rosenfeld, P.E., C.L. Henry. (1998). Characterization, Quantification, and Control of Odor Emissions from Biosolids Application To Forest Soil. *Biofest*. Lecture conducted from Lake Chelan, Washington.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., C.L. Henry, R. B. Harrison, and R. Dills. (1997). Comparison of Odor Emissions From Three Different Biosolids Applied to Forest Soil. *Soil Science Society of America*. Lecture conducted from Anaheim California.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. \$41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: \$10,000 grant awarded to San Diego State University. Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. \$100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. \$20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: \$10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: \$15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. \$500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

- In the United States District Court For The District of New Jersey
Duarte et al, *Plaintiffs*, vs. United States Metals Refining Company et. al. *Defendant*.
Case No.: 2:17-cv-01624-ES-SCM
Rosenfeld Deposition. 6-7-2019
- In the United States District Court of Southern District of Texas Galveston Division
M/T Carla Maersk, *Plaintiffs*, vs. Conti 168., Schiffahrts-GMBH & Co. Bulker KG MS “Conti Perdido”
Defendant.
Case No.: 3:15-CV-00106 consolidated with 3:15-CV-00237
Rosenfeld Deposition. 5-9-2019
- In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
Carole-Taddeo-Bates et al., vs. Ifran Khan et al., Defendants
Case No.: No. BC615636
Rosenfeld Deposition, 1-26-2019
- In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
The San Gabriel Valley Council of Governments et al. vs El Adobe Apts. Inc. et al., Defendants
Case No.: No. BC646857
Rosenfeld Deposition, 10-6-2018; Trial 3-7-19
- In United States District Court For The District of Colorado
Bells et al. Plaintiff vs. The 3M Company et al., Defendants
Case: No 1:16-cv-02531-RBJ
Rosenfeld Deposition, 3-15-2018 and 4-3-2018
- In The District Court Of Regan County, Texas, 112th Judicial District
Phillip Bales et al., Plaintiff vs. Dow Agrosiences, LLC, et al., Defendants
Cause No 1923
Rosenfeld Deposition, 11-17-2017
- In The Superior Court of the State of California In And For The County Of Contra Costa
Simons et al., Plaintiffs vs. Chevron Corporation, et al., Defendants
Cause No C12-01481
Rosenfeld Deposition, 11-20-2017
- In The Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 8-23-2017
- In The Superior Court of the State of California, For The County of Los Angeles
Warrn Gilbert and Penny Gilber, Plaintiff vs. BMW of North America LLC
Case No.: LC102019 (c/w BC582154)
Rosenfeld Deposition, 8-16-2017, Trail 8-28-2018
- In the Northern District Court of Mississippi, Greenville Division
Brenda J. Cooper, et al., *Plaintiffs*, vs. Meritor Inc., et al., *Defendants*
Case Number: 4:16-cv-52-DMB-JVM
Rosenfeld Deposition: July 2017

- In The Superior Court of the State of Washington, County of Snohomish
Michael Davis and Julie Davis et al., Plaintiff vs. Cedar Grove Composting Inc., Defendants
Case No.: No. 13-2-03987-5
Rosenfeld Deposition, February 2017
Trial, March 2017
- In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants
Case No.: RG14711115
Rosenfeld Deposition, September 2015
- In The Iowa District Court In And For Poweshiek County
Russell D. Winburn, et al., Plaintiffs vs. Doug Hoksbergen, et al., Defendants
Case No.: LALA002187
Rosenfeld Deposition, August 2015
- In The Iowa District Court For Wapello County
Jerry Dovico, et al., Plaintiffs vs. Valley View Sine LLC, et al., Defendants
Law No.: LALA105144 - Division A
Rosenfeld Deposition, August 2015
- In The Iowa District Court For Wapello County
Doug Pauls, et al., et al., Plaintiffs vs. Richard Warren, et al., Defendants
Law No.: LALA105144 - Division A
Rosenfeld Deposition, August 2015
- In The Circuit Court of Ohio County, West Virginia
Robert Andrews, et al. v. Antero, et al.
Civil Action NO. 14-C-30000
Rosenfeld Deposition, June 2015
- In The Third Judicial District County of Dona Ana, New Mexico
Betty Gonzalez, et al. Plaintiffs vs. Del Oro Dairy, Del Oro Real Estate LLC, Jerry Settles and Deward
DeRuyter, Defendants
Rosenfeld Deposition: July 2015
- In The Iowa District Court For Muscatine County
Laurie Freeman et. al. Plaintiffs vs. Grain Processing Corporation, Defendant
Case No 4980
Rosenfeld Deposition: May 2015
- In the Circuit Court of the 17th Judicial Circuit, in and For Broward County, Florida
Walter Hinton, et. al. Plaintiff, vs. City of Fort Lauderdale, Florida, a Municipality, Defendant.
Case Number CACE07030358 (26)
Rosenfeld Deposition: December 2014
- In the United States District Court Western District of Oklahoma
Tommy McCarty, et al., Plaintiffs, v. Oklahoma City Landfill, LLC d/b/a Southeast Oklahoma City
Landfill, et al. Defendants.
Case No. 5:12-cv-01152-C
Rosenfeld Deposition: July 2014

In the County Court of Dallas County Texas

Lisa Parr et al, *Plaintiff*, vs. Aruba et al, *Defendant*.

Case Number cc-11-01650-E

Rosenfeld Deposition: March and September 2013

Rosenfeld Trial: April 2014

In the Court of Common Pleas of Tuscarawas County Ohio

John Michael Abicht, et al., *Plaintiffs*, vs. Republic Services, Inc., et al., *Defendants*

Case Number: 2008 CT 10 0741 (Cons. w/ 2009 CV 10 0987)

Rosenfeld Deposition: October 2012

In the United States District Court of Southern District of Texas Galveston Division

Kyle Cannon, Eugene Donovan, Genaro Ramirez, Carol Sassler, and Harvey Walton, each Individually and on behalf of those similarly situated, *Plaintiffs*, vs. BP Products North America, Inc., *Defendant*.

Case 3:10-cv-00622

Rosenfeld Deposition: February 2012

Rosenfeld Trial: April 2013

In the Circuit Court of Baltimore County Maryland

Philip E. Cvach, II et al., *Plaintiffs* vs. Two Farms, Inc. d/b/a Royal Farms, Defendants

Case Number: 03-C-12-012487 OT

Rosenfeld Deposition: September 2013

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

**Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review**

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nationwide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, *Oxygenates in Water: Critical Information and Research Needs*.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Hagemann, M.F., 2005. Use of Electronic Databases in Environmental Regulation, Policy Making and Public Participation. Brownfields 2005, Denver, Colorado.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Nevada and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Las Vegas, NV (served on conference organizing committee).

Hagemann, M.F., 2004. Invited testimony to a California Senate committee hearing on air toxins at schools in Southern California, Los Angeles.

Brown, A., Farrow, J., Gray, A. and **Hagemann, M.**, 2004. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to the Ground Water and Environmental Law Conference, National Groundwater Association.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Arizona and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Phoenix, AZ (served on conference organizing committee).

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in the Southwestern U.S. Invited presentation to a special committee meeting of the National Academy of Sciences, Irvine, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a tribal EPA meeting, Pechanga, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a meeting of tribal representatives, Parker, AZ.

Hagemann, M.F., 2003. Impact of Perchlorate on the Colorado River and Associated Drinking Water Supplies. Invited presentation to the Inter-Tribal Meeting, Torres Martinez Tribe.

Hagemann, M.F., 2003. The Emergence of Perchlorate as a Widespread Drinking Water Contaminant. Invited presentation to the U.S. EPA Region 9.

Hagemann, M.F., 2003. A Deductive Approach to the Assessment of Perchlorate Contamination. Invited presentation to the California Assembly Natural Resources Committee.

Hagemann, M.F., 2003. Perchlorate: A Cold War Legacy in Drinking Water. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. From Tank to Tap: A Chronology of MTBE in Groundwater. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. A Chronology of MTBE in Groundwater and an Estimate of Costs to Address Impacts to Groundwater. Presentation to the annual meeting of the Society of Environmental Journalists.

Hagemann, M.F., 2002. An Estimate of the Cost to Address MTBE Contamination in Groundwater (and Who Will Pay). Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to a meeting of the U.S. EPA and State Underground Storage Tank Program managers.

Hagemann, M.F., 2001. From Tank to Tap: A Chronology of MTBE in Groundwater. Unpublished report.

Hagemann, M.F., 2001. Estimated Cleanup Cost for MTBE in Groundwater Used as Drinking Water. Unpublished report.

Hagemann, M.F., 2001. Estimated Costs to Address MTBE Releases from Leaking Underground Storage Tanks. Unpublished report.

Hagemann, M.F., 1992. Dense Nonaqueous Phase Liquid Contamination of Groundwater: An Ounce of Prevention... Proceedings, Association of Engineering Geologists Annual Meeting, v. 35.

Other Experience:

Selected as subject matter expert for the California Professional Geologist licensing examination, 2009-2011.

2.3.2.14 Letter O14: Southwest Mountain States Regional Council of Carpenters

This letter provides input on the Revised Draft 2045 CAP as well as CEQA comments on the Recirculated Draft PEIR. Comments specific to the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, the County has received and reviewed comments on the Revised Draft 2045 CAP and common topics are discussed in Section 1.4, Comments on the Revised Draft 2045 CAP, in Chapter 1, *Introduction*. PEIR-focused comments are addressed below.

- O14-1 This comment does not raise significant environmental issues related to the Recirculated Draft PEIR warranting a response pursuant to CEQA Guidelines section 15088(a). However, all comments timely provided and fairly presented by SWMSRCC during the public comment period and before the close of the Project’s public hearing shall be included within the administrative record and presented to the County Board of Supervisors for consideration prior to Project approval.
- O14-2 In response to the comment’s incorporation by reference of comments raising issues regarding the Revised Draft 2045 CAP and its environmental review, this comment does not identify any specific alleged deficiencies in the Recirculated Draft PEIR such that a specific response cannot be provided and does not raise significant environmental issues relating to the Recirculated Draft PEIR warranting a response pursuant to CEQA Guidelines section 15088(a). However, all public comments timely provided and fairly presented to the County shall be included within the administrative record and presented to the County Board of Supervisors for consideration prior to Project approval.
- O14-3 The County will provide notice to the commenter of actions relating to the Revised Draft 2045 CAP as required under CEQA and Planning and Zoning Law. For the notices regarding the Revised Draft 2045 CAP project, interested parties can register for the project listserv to receive email notifications:
<https://planning.lacounty.gov/get-involved/>.
- O14-4 to O14-5 The comment requests the consideration of measures and strategies in addition to increasing densities and diversity of land uses near transit, reducing single-occupancy vehicle trips, and institutionalizing low-carbon transportation. See O14-6 to O14-10 for a response to the specific additional requested measures and strategies.
- O14-6 to O14-10 In regards to the comment’s statement that local hire is helpful to reduce environmental impacts by reducing the length of vendor trips and GHG emissions, ensuring that local workers have employment opportunities on projects situated within their communities has long been a core element of economic development programs at the municipal level. To this end, the County adopted a Local and Targeted Worker Hire Policy that took effect for contracts approved by the Board of Supervisors after October 31, 2016. This policy imposes a 30 percent Local Hire goal and a 10 percent

Targeted Worker hire goal on most major construction projects approved by the Board. A Targeted Worker is defined as a County resident of the County who has indices of career-limiting circumstances such as documented annual income at or below 100 percent of the Federal Poverty Level (FPL). A Local Worker is defined as an individual living within Tier 1 or Tier 2 qualifying Zip Codes. Before employing workers from Tier 2 Zip Codes, the available pool of local residents whose primary place of residence is within Tier 1 Zip Codes must first be exhausted. Tier 1 means a qualifying Zip Code within five miles of the proposed project site and Tier 2 means a qualifying Zip Code beyond five miles of the proposed project site.

The Local and Targeted Worker Hire Policy achieves the following: 1) retain and create jobs in communities that need them most; 2) provide opportunities and life-long skills that can become real careers; 3) provide second chance and hope to those facing barriers of employment; 4) stimulate local economy; and 5) promote small business. Simultaneously, it contributes to the reduction of GHG emissions from this segment of the workforce.

The remainder of this comment regarding local hire effects on economic development does not raise significant environmental issues relating to the Recirculated Draft PEIR warranting a further response pursuant to CEQA Guidelines section 15088(a).

- O14-11 Assembly Bill 2011 focuses on affordable housing on commercially zoned lands and has a list of other specified criteria. The County's Local and Targeted Worker Hire Policy complements Assembly Bill 2011 since it has a broader range of projects than solely affordable housing projects on commercially zoned lands. This comment does not raise significant environmental issues relating to the Recirculated Draft PEIR warranting a further response pursuant to CEQA Guidelines section 15088(a).
- O14-12 to O14-15 See Response O14-6 through O14-10. The County already implements a Local and Targeted Worker Hire Policy that contributes to the environmental benefits stated in the comment, including the reduction of GHG emissions from this segment of the workforce.
- O14-16 This comment provides a recitation of certain general legal standards regarding CEQA compliance, and no response is required for such comments, as it does not raise significant environmental issues relating to the Recirculated Draft PEIR warranting a response pursuant to CEQA Guidelines section 15088(a). The Recirculated Draft PEIR has been prepared in compliance with CEQA. Regarding the comment's discussion regarding preparation of an EIR, as described in Chapter 1, *Introduction*, of the Recirculated Draft PEIR, the Recirculated Draft PEIR is an informational document intended to disclose to the public and decision-makers the environmental impacts of the Revised Draft 2045 CAP. Consistent with CEQA Guidelines section 15081, the County has prepared the Recirculated Draft PEIR to document its analysis of the environmental impacts of the Revised Draft 2045 CAP. All environmental resource areas in the CEQA Guidelines Appendix G Environmental Checklist have

been studied, as shown in Appendix A.1, *Notice of Preparation and Initial Study*, of the Recirculated Draft PEIR. Some environmental resource areas were screened out of detailed review based on substantial evidence that the Revised Draft 2045 CAP would have no impact or a less-than-significant impact on the environment. The Recirculated Draft PEIR provided a more detailed analysis as to whether the Revised Draft 2045 CAP would result in significant environmental impacts to the remaining resources that were not screened out.

- O14-17 The County acknowledges the commenter’s support for the Checklist as a mechanism for general plan-consistent projects to streamline their CEQA GHG impact analysis pursuant to CEQA Guidelines sections 15064(h)(3), 15064.4 and 15183.5(b). See General Response 3, which addresses how the Revised Draft 2045 CAP and 2045 Checklist applies to development projects, for additional discussion.
- O14-18 The County acknowledges the commenter’s summary of CEQA Guidelines section 15183.5(b) regarding the requirements of a qualified CAP, and concurrence that the Revised Draft 2045 CAP meets these requirements. See General Response 3, which addresses how the Revised Draft 2045 CAP and 2045 Checklist applies to development projects, for additional discussion.
- O14-19 In response to the comment’s request for the Checklist to include a local hire requirement, although a local hire measure has the potential to reduce Countywide VMT and associated mobile source GHG emissions, the Revised Draft 2045 CAP does not include a local hire measure or as a requirement in the Checklist. At this time, the County respectfully declines to include a local hire measure or as a Checklist requirement. However, such a measure could potentially be used as an alternative GHG emission reduction measure pursuant to Checklist Step 4, provided that a project applicant demonstrate how such a measure would reduce GHG emissions equivalent or greater level than to the Checklist requirement that it replaces. (Revised Draft 2045 Appendix F, pp. F-4, F-12 to F-15). See General Response 3, which addresses how the Revised Draft 2045 CAP and 2045 Checklist applies to development projects, for additional discussion. As a matter of policy, the County does employ a Local and Targeted Worker Hire Policy on most major construction projects approved by the Board of Supervisors.
- O14-20 See Response O14-10.
- O14-21 The County notes the information contained in Attachment A of the comment letter, consisting of a draft technical report regarding worker trips with respect to the estimation of GHG emissions in support of the substance of the main comment letter. The Recirculated Draft PEIR has adequately analyzed impacts associated with transportation resources and VMT specifically (see Recirculated Draft PEIR p. 3.15-18) and the Revised Draft 2045 CAP includes measures that reduce VMT (see, for example, Measures T1, T4, and T5). The County has reviewed SWAPE’s draft report and determined that the information provided is generic, offers no opinion about

impacts associated with the Revised Draft 2045 CAP, and does not bear on the adequacy or accuracy of the Recirculated Draft PEIR or the conclusions reached in the Recirculated Draft PEIR. The commenter's draft opinions about worker trips and GHG emissions are acknowledged, but in light of substantial evidence cited and relied upon in the Recirculated Draft PEIR, the County disagrees with any suggestion that the opinions expressed should result in revision to or clarification of the Recirculated Draft PEIR. This comment presenting data to support a suggested policy directive does not raise significant environmental issues specifically relating to the adequacy of the Recirculated Draft PEIR such that no response is required pursuant to CEQA Guidelines section 15088(a).

- O14-22 This comment consists of the resumes of Paul Rosenfeld CV and Matt Hagemann CV of SWAPE, which prepared the technical report referenced in Comment O14-21; however, this comment does not raise significant environmental issues relating to the adequacy of the Recirculated Draft PEIR such that no response is required pursuant to CEQA Guidelines section 15088(a).

Los Angeles, CA 90012

VIA EMAIL: climate@planning.lacounty.gov

SUBJECT: Draft 2045 Climate Action Plan (CAP) Comment Period

Dear Ms. Hua:

Tejon Ranch Co., on behalf of itself and its subsidiary/affiliated entities Tejon Ranchcorp and Centennial Founders, LLC (collectively, the “Tejon Ranch”) offers these written comments on the proposed Draft 2045 Climate Action Plan (“CAP”) and the Recirculated Draft Program Environmental Impact Report (“PEIR”), State Clearinghouse #2021120568.

Tejon Ranch applauds Los Angeles County’s pledge to fight global climate change. We believe that State and local climate measures can be feasibly implemented in furtherance of other critical California priorities such as the continued growth of the California economy, the increased equity and upward mobility for our working families and employers, the funding and timely completion of urgently needed transportation, water and other infrastructure, and the implementation of the housing elements approved by our cities and counties to solve our regional housing crisis. Tejon Ranch is committed to being at the forefront of conservation and sustainable development to help lead the charge on protecting California’s resources while creating communities that provide jobs and housing that align with the State’s and County’s goals.

O15-1

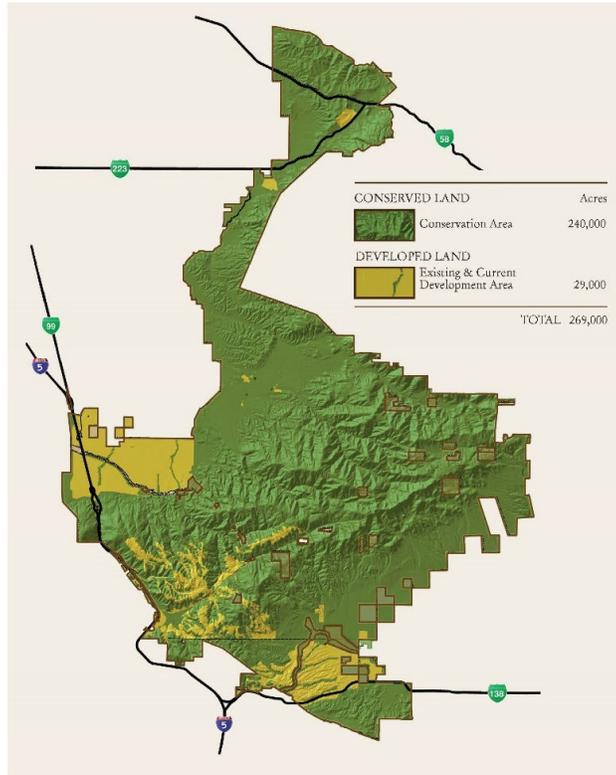

Tejon Ranch – Leading the Way

In 2008, Tejon Ranch entered into the Tejon Ranch Conservation and Land Use Agreement (Ranchwide Agreement), a historic conservation agreement with the state's leading environmental advocacy groups (Natural Resources Defense Council, Sierra Club, Audubon Society, Planning and Conservation League, and Endangered Habitats League) to conserve approximately 240,000 acres (roughly 90 percent) of the Ranch lands, and allow development of four significant new master planned communities on sites scientifically selected as having lower natural resource values, which are located proximate to existing transportation and utility infrastructure on the remaining, approximately 30,000 acres (roughly 10 percent). As a voluntary and proactive conservation agreement by Tejon Ranch, the Ranchwide Agreement is the largest private land conservation commitment in California history and was finalized following many years of detailed project-level scientific analysis and data collection on Tejon Ranch. At 240,000 acres, the open space preservation at Tejon Ranch is larger than any other private conservation commitment in

P.O. Box 1000 | 4436 Lebec Road

www.tejonranch.com

under the Ranchwide Agreement contain multitudes of trees and plants which serve as carbon sinks that will fight climate change in perpetuity. These lands capture approximately 3.3 million tons of carbon, which is equivalent to the carbon produced by 2.5 million passenger vehicles (5% of California’s fleet) in a year.

Tejon Ranch is an iconic California property in remarkable condition – but not from being untouched. It is working land that is cared for with intention and principles of good stewardship that inspired the creation of huge conservation areas that conserve hundreds of plant and animal species. Tejon Ranch’s extensive water assets meet our current needs as well as our projected future needs through the full buildout of our master planned communities. The Ranch has led in the adoption of environmentally sensitive practices throughout our enterprise, including water conservation in our ranching, farming, and real estate operations, including water resource recovery facilities (WRRF) incorporated into each of our master plans including Centennial, Tejon Mountain Village, Grapevine, and the Tejon Ranch Commerce Center. Environmental sensitivity and sustainability are

cornerstones of the thoughtful planning, intentional design, and careful development of our master planned communities which will serve to solve California’s housing crisis in an intelligent way. All communities at Tejon Ranch will be built with resiliency features such as permanently maintained defensible space, community water systems incorporating state-of-the-art water conservation measures, reclaimed water for irrigation, stormwater capture, drought-tolerant landscaping, photovoltaic solar, multi-modal transportation, and prolific EV charging stations.

Tejon Ranch has executed upon thoughtful, forward-thinking development at our Tejon Ranch Commerce Center (TRCC), which has created thousands of jobs for the surrounding communities. One such example was the completion of second largest single-roof commercial solar energy system in the State of California in 2011¹ which was the equivalent of “eliminating the emissions of 389 cars or powering 241 homes yearly.” The water used for irrigating the drought tolerant landscaping at TRCC is recycled at Tejon Castac Water District’s water

¹ <https://www.businesswire.com/news/home/20110511005387/en/IKEA-Powers-Up-2nd-Largest-Single-Roof-Commercial-Solar-Energy-System-in-State-at-Distribution-Center-in-Tejon-California>

O15-1

reclamation and recycling facilities. The Commerce Center is also a focal stopping point along the Interstate 5 corridor for electric vehicles. To date, there are over one hundred charging stations built on-site and we are working to deliver many more.

O15-1
(cont.)

Tejon Ranch’s masterplan, Centennial, a future net-zero GHG community² located in Los Angeles County, includes 19,333 homes, of which nearly 3,500 are affordable housing units, and provides a jobs-housing balance through 10.1 million square feet of commercial, industrial and institutional uses. During the many years of planning of Centennial, Tejon meticulously identified achievable GHG reductions and project level mitigation measures that dramatically reduced the GHG impacts of the project. Many of these GHG reduction measures are included within the certified Environmental Impact Report ("EIR") for the Centennial project and the remainder are included in the legally-binding and publicly transparent Climate Resolve Settlement Agreement which has been previously provided to the County. As a result of our commitment to these unrivaled GHG reduction measures, the project has been formally recognized by the state’s leading climate regulatory agency, the California Air Resources Board, as a model for large residential development projects in achieving net-zero GHG emissions³. A few of these measures are listed below and are consistent with the Draft 2045 CAP or exceed what Los Angeles County has envisioned to date.

O15-2

- 50% of the project’s total electric energy demand (i.e. household, business, civic/institutional, recreational, and public facilities) shall be met by onsite renewable energy.
- 100% of project single-family detached homes shall be “solar-ready” or equivalent, based on the latest technology.
- Provide a ride-share program, on demand pick up, shuttle service or similar methods to employment, commercial and residential areas of Centennial.
- Provide “complete streets” throughout the community to provide alternative modes of transport (walking, biking, low-speed vehicles (LSVs) such as neighborhood electric scooters, bikes, and other Neighborhood Electric Vehicles (NEVs).
- Implement a NEV Network – for NEVs (a “low speed vehicle” up to 35 MPH that are electric powered and ideal for short trips up to 30 miles in length). A NEV network includes roadways, parking, charging stations, striping, signs, and educational tools and can double as bicycle routes. NEVs are an alternative to traditional vehicle trips and therefore would reduce vehicle trips.
- Net Zero GHG Emissions: The community commits to net zero GHG emissions by reducing to zero all emissions through significant on-site and off-site commitments. A large component prioritizes disadvantaged communities, followed by other projects within Los Angeles County, and other parts of southern and central California.
- Electric Vehicle Advancement: Advance the EV future through commitments to install almost 30,000 chargers within and outside the community. Provide incentives to support the purchase of 10,500 electric vehicles.

² [Environmental group and Tejon Ranch agree on plan to build 19,300 zero-emission homes](#), Los Angeles Times, December 1, 2021

³ [California Air Resources Board Final 2022 Scoping Plan Update](#), Appendix D, pages 25-26.

- 95 miles of bike/pedestrian trails to encourage walkability and non-motorized transportation for residents to work, live and play within Centennial.
- Wildfire Prevention: Funding for on-site and off-site fire protection and prevention measures, including up to 4 fire stations, comprehensive fire protection plan and emergency response plan, fire-resilient community design, planning, and vegetation management (including fuel modification zones) with benefits to neighboring communities and new buildings that will employ the latest building codes.

O15-2
(cont.)

These are just some of the forward-thinking commitments that Tejon Ranch has made on a project level to minimize and then fully offset remaining GHG emissions as to its Centennial project. These project features are important because they demonstrate feasible, clear, implementable project level mitigations. Tejon Ranch is proud of Centennial and the progressive measures it will implement while providing attainable housing and affordable housing for Los Angeles County residents. Tejon Ranch will continue to support climate crisis goals and is partnering with Los Angeles County to bring cutting edge concepts to address climate change on a project level.

Draft 2045 CAP Should Not be a Component of the General Plan

The Draft 2045 CAP is crafted for an enormous County with vastly different pockets of populations and densities and is trying to address numerous issues in a one-size-fits-all section of the County General Plan. Erroneously, as currently written, the Draft 2045 CAP is contemplated to be adopted as part of the Los Angeles County General Plan. Irreparably, once included in the General Plan, compliance with the Draft 2045 CAP is mandatory: neither elected officials nor staff can authorize deviations from the Draft 2045 CAP without amending the General Plan. Third parties seeking to block funding or approvals of infrastructure, job-creation, and housing projects can also sue the County, alleging failure to fully comply with the Draft 2045 CAP in accepting or disbursing funds, or approving, infrastructure, jobs or housing projects. Both the County and applicants receiving County approvals for such projects will become targets in such opposition lawsuits.

O15-3

Inclusion of the Draft 2045 CAP in the General Plan also creates new County obligations, and expands litigation risks, under the California Environmental Quality Act ("CEQA").¹ As the Draft 2045 CAP itself explains, any project that fails to comply with all applicable requirements (inclusive of the 25 Draft 2045 CAP measures, more than 90 implementation actions, and scores of PEIR mitigation measures, collectively "CAP Measures") would conflict with an environmental component of the General Plan, a significant and unavoidable Land Use impact, and would have a significant GHG impact.² These conflicts would trigger the necessity for an Environmental Impact Report (EIR) and preclude the County or applicants from making use of less costly, less time-consuming, and less litigious CEQA compliance pathways.³ The Draft 2045 CAP specifies that for each non-compliant Draft 2045 CAP Measure, the "infeasibility" of such a measure must be demonstrated with substantial evidence. Each one of these "infeasibility" findings, as well as the sufficiency of any alternative Draft 2045 CAP measure, is also subject to challenge in CEQA and General Plan compliance lawsuits.

O15-4

O15-5

O15-6

O15-7

<p>California Governor Newsom has stressed that California needs 2.5 million new homes by 2030⁴, and officials at the California Department of Housing and Community Development are implementing state law to achieve this goal. To meet the demand of the housing crisis, including achieving the goal of 1 million new units of affordable housing, Los Angeles County must dramatically ramp up housing construction. The Southern California Association of Governments (SCAG) 6th Cycle Regional Housing Needs Allocation (RHNA) plan driving the 2021-2029 housing element for Los Angeles County targets the delivery of over 812,000 homes, 90,000 of which are to be delivered in unincorporated Los Angeles County by 2029. These targets include over 330,000 low income and very-low-income homes, over 39,000 of which are allocated to Unincorporated Los Angeles County. If adopted as part of the General Plan, the Draft 2045 CAP will be used to stop development and will be weaponized against achieving</p>	<p>O15-8</p>
<p>State goals and thwarting the delivery of desperately needed homes. The Draft 2045 CAP should be revised to include only feasible, clear, implementable Draft 2045 CAP Measures that are aligned with and allow for full implementation and achievement of other critical County infrastructure, economic development, housing, and other needs.</p>	<p>O15-9</p>
<p>If adopted as part of the General Plan, the Draft 2045 CAP hinders County elected and appointed officials' ability to implement long-term housing law compliance obligations. Once adopted, the</p>	<p>O15-10</p>
<p>Draft 2045 CAP cannot be amended without undergoing further CEQA review inclusive of adoption of "all feasible mitigation" to achieve either the same or a modified GHG reduction</p>	<p>O15-11</p>
<p>goal. Evidence of this happening can be found when San Diego County adopted what its Board of Supervisors believed to be an aspirational CAP into its General Plan in 2018. Anti-housing litigants weaponized the CAP, and courts concluded that the County had adopted the CAP as a fully enforceable General Plan and CEQA mandate. Housing opponents have had an unbroken run of successful lawsuits in blocking multiple new housing projects in that county. San Diego attempted unsuccessfully to amend its CAP and allow for example the use of CARB-approved and other GHG offsets to mitigate GHG emissions, only to lose in court – again, and again. Another example is Solano County, in Northern California, which suffered the same fate when its General Plan aspirational CAP also failed to pass muster in a no-growth advocacy CEQA lawsuit challenge. Looking at this woeful record of local agency losses when CAPs were included in General Plans, even the most pro-climate jurisdictions in California, such as San Francisco, have elected not to include their CAPs in their General Plan – while others have very carefully drafted CAPs to assure that they are clear, feasible, implementable, and operate in alignment with and support other approved General Plan elements, as well as other policy priorities, plans and obligations.</p>	<p>O15-12</p>
<p>Tejon Ranch supports the currently adopted County CAP, because it is feasible and includes measures that are within the County's jurisdiction and control to feasibly implement. As the County knows, the Centennial project was determined in both our EIR and by the trial court to be fully consistent with the County's current CAP. The Draft 2045 CAP, in contrast, is a massive</p>	<p>O15-13</p>
<p>and sprawling set of mandates – some of which are not even defined, and none of which are tailored to quantitatively assign feasible GHG reduction obligations to new projects, proposed retrofits, and existing structures. CAP 2045 also does not include an economic feasibility</p>	<p>O15-14</p>
<p>assessment for the vast range of structures and activities that it seeks to regulate, from advanced manufacturing to entertainment and tourism, from every category of infrastructure project, and</p>	<p>O15-15</p>

from isolated single-family homes to multi-family, mixed-use, and master planned communities.

O15-15
(cont.)

Overview and Examples of Concerning Draft 2045 CAP Measures

Building homes or commercial and retail is a calculated risk in Los Angeles County and comes with a certain level uncertainty because of CEQA and how CEQA allows opponents to litigate all aspects of each project. However, even the tortuous CEQA process lays out the road map for project applicants to follow to demonstrate compliance, including how to analyze and mitigate impacts through a series of measures and performance standards. CEQA Guidelines are analyzed, debated, studied and compared to previously completed projects, and yet litigants are consistently successful in overruling approvals throughout the State. The reason for the success of overturning approvals during the court process is because project level mitigation and impact analysis can be subjective and left to a judge’s interpretation of CEQA. The Draft 2045 CAP and PEIR add more than 50 new General Plan consistency and compliance obligations, and dozens more implementation and other measures, often without any detail and almost always without any GHG quantification metric, which will only add more uncertainty for project applicants.

O15-16

The Draft 2045 CAP and PEIR collectively provide project opponents a vast bucket list of items to weaponize through CEQA challenges arguing that projects did not sufficiently mitigate impacts against poorly defined, unclear measures and performance standards. The following are just some examples of infeasible measures and mitigations that would create uncertainty for future development in Los Angeles County.

O15-17

1. **Land Use to Address Jobs/Housing Balance:** *By 2030 achieve a jobs density of 300 jobs per acre:*

O15-18

The Draft 2045 CAP 300 employee per acre mandate would not have any immediate effect on existing employers; however, employers and applicants proposing new or expanded commercial, manufacturing, infrastructure, tourism, entertainment, and even church and educational uses, that do not have 300 employees per acre, would be inconsistent with the Draft 2045 CAP.

O15-19

These projects would thus have a significant and unavoidable GHG impact triggering the need for an EIR instead of more streamlined CEQA addendum and categorical exemptions for projects that are consistent with the General Plan.

O15-20

These projects would then be subject to a costly CEQA compliance process, the outcome of which would provide opponents with scores of new CEQA deficiency litigation claims about the sufficiency of substantial evidence to support infeasibility determinations as well as whether the substitute measure will indeed achieve the GHG reduction performance target that corresponds to this 300 employee per acre employment target.

O15-21

Since no such GHG calculations are disclosed in the Draft 2045 CAP, prospective employers would not even know how to begin to show compliance with this Draft 2045 CAP mandate, which is proposed to be independently and fully enforceable as part of the General Plan.

O15-22

Imposing this narrowly defined County-wide employment density metric to such a broad array of future projects, thus exposing them all to CEQA litigation while being out of compliance with the General Plan, is not consistent with the State and County goals to create economic growth and bring jobs to the County's many and diverse communities.

The Draft 2045 CAP and associated Program EIR do not, however, analyze or mitigate the consequences of this measure on the economic development plan components of the County's General Plans, Area Plans, and Community Plans. This is both a fatal flaw in the Program EIR, and a violation of General Plan laws requiring internal harmony and consistency within the County's complex General Plan, which also includes multiple Area Plans and Community Plans.

O15-23

O15-24

The County should encourage job creation that will bring employment opportunities to the residents of Los Angeles County, especially higher wage jobs in expanding and innovating industry and business sectors. It is unrealistic to mandate a job creation of 300 jobs per acre that would be hard to meet for even high-density downtown areas. This measure will discourage any small businesses, hospital expansions, medical offices, manufacturers, retail services, church, entertainment, schools and others from building as none of them could meet the employment density standard established by the Draft 2045 CAP and would be considered inconsistent with the General Plan and have an unavoidable CEQA GHG impact. This is particularly unachievable given the expansion of hybrid workforce, where only a portion of employees are present daily, especially in the goods movement sector, entertainment or religious venues, schools or recreational sports facilities, or on college and university campuses, this mandate would not be achievable. Table 1 below includes the average employment densities of common categories of commercial use, none of which come close to the 300 employee per acre Draft 2045 CAP requirement.

O15-25

O15-26

O15-27

Table 1: Employment Density per Acre by Sector

O15-28

Sector (NAICS codes)	Mean	Median	IQR	Sample size
Manufacturing (31, 32, 33)	18.8	11.0	15.7	217
Transportation and Warehousing (48, 49)	11.2	8.0	10.8	34
Construction (23)	19.4	9.9	18.4	122
Wholesale Trade (42)	12.8	8.0	11.1	132
Retail Trade (44, 45)	13	7.1	11.6	65
Real Estate and Rental and Leasing (53)	5.7	2.2	5.8	24
Administrative Support and Waste Management and Remediation Services (56)	22.5	20.3	22.0	25

2. Ban on Net Zero Projects Using CARB-Approved Methodologies for Feasibly Achieving Net Zero GHG Projects:

The Draft 2045 CAP correctly relies on other laws and agencies previously completed work product to help Los Angeles County meet their goals. The Draft 2045 CAP heavily touts the California Air Resources Board (CARB), widely considered the state's expert climate agency, adopted the 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan), "which lays out a path for achieving the statewide goals". The goals and priorities of the Draft 2045 CAP can mirror the 2022 Scoping Plan without being adopted

O15-29

in the General Plan. Instead, the County should consider the Draft 2045 CAP as aspirations for the County to achieve and review each individual project to thoughtfully craft and adopt measures that can be implemented to help off-set emissions.

O15-29
(cont.)

In fact, the County has already done this with their approval of the only two major mixed use master planned communities recognized by CARB to have achieved Net Zero GHG: Centennial and Newhall. Centennial is a model for achieving Net Zero GHG as acknowledged by CARB in their 2022 Scoping Plan “Tejon Ranch Company, the developer for the Centennial Specific Plan located in northern Los Angeles County, also committed its development to result in no net increase of GHG emissions... Mitigation measures employed by these developers include the prohibition of natural gas in residential and commercial properties; the requirement of on-site solar photovoltaic energy systems on residential and commercial properties; the installation of almost 30,000 EV chargers within and outside the plan area; funding incentives for the purchase of 10,500 passenger EVs and electric school buses and trucks; and procuring and retiring carbon offset credits from the voluntary market... they do demonstrate the feasibility of a net-zero approach for other large and complex residential development projects.”

O15-30

The County likewise recognized this achievement and commitment from Centennial with their trial court filing on February 2, 2022, stating, “that Real Parties (*Tejon Ranch Co. et al.*) have reached an accord with Climate Resolve to **achieve a “net zero GHG project” with massive investments in green infrastructure.**”⁵

Centennial's net zero GHG program also complies with the CARB-endorsed geographic hierarchy of GHG mitigation to successfully mitigate GHG emissions: “The State recommends prioritizing GHG mitigation actions according to a geographic hierarchy as follows: on-site opportunities; local, off-site GHG mitigation; and GHG offsets that meet CEQA’s requirements.” “The recent settlement agreement applicable to the Centennial Specific Plan in Los Angeles County also applied a geographic hierarchy for GHG mitigation, specifying that at least 51 percent of mitigated emissions should take place within the project, 69.5 percent within California, 82.25 percent within the United States, and no more than 17.75 percent from international projects. The geographic hierarchy of GHG mitigation is feasible, as demonstrated by these examples.”⁶

O15-31

Despite supporting these Centennial project approvals and supporting CARB’s 2022 Scoping Plan, the Draft 2045 CAP specifically forbids projects from partnering with CARB to achieve carbon neutral goals, rejecting use of the CARB-approved Net Zero GHG compliance pathway employed by the only recognized large residential Net Zero GHG projects in California, by expressly disallowing GHG reductions to be achieved by CARB-approved GHG offsets that are quantified, validated, and meet other criteria including additionality.⁷ Instead, the Draft 2045 CAP allows, but does not provide detail on, a future County-only GHG reduction offset credit program that may potentially be

O15-32

O15-33

⁵ Objections to Petitioners’ [Proposed] Judgment Granting Peremptory Writ of Mandate at p. 6, Center for Biological Diversity et al. v. County of Los Angeles, et al., Case No. 19STCP02100 (Los Angeles County Superior Court, filed Feb. 22, 2022).

⁶ https://ww2.arb.ca.gov/sites/default/files/2022-05/2022-draft-sp-appendix-d-local-actions_0.pdf Draft 2022 Scoping Plan May 2022

defined, evaluated, adopted, and ultimately implemented at some later date. In fact, there is no information provided about the cost, feasibility, schedule, or scale of any such future offset program. The Draft 2045 CAP states:

“An offsets/credits program is not a 2045 CAP strategy, measure, or action currently proposed for implementation... Further, offset credits are not currently permitted to be used as alternative project emissions reduction measures for new development pursuant to the 2045 CAP Consistency Checklist. The offsets/credits program would be considered for potential implementation later, and only after completion of the feasibility study. The potential offsets/credit program would be designed to be consistent with applicable CEQA case law requirements, including requirements that offsets be enforceable, real, permanent, quantifiable, verifiable, and additional. The potential offsets/credits program would provide clear, objective, and measurable performance standards for all allowable GHG offsets. For any potential future GHG offsets/credits program evaluated by the County, the County would prioritize implementation of offsets generated within or close to Los Angeles County.”

O15-33
(cont.)

¶The Draft 2045 CAP asserts that it will fulfill CARB’s goals and policies, but then expressly forbids the essential GHG offset component that were critical components of the net zero GHG programs in the County's own CARB-recognized master planned communities.

O15-34

¶If the County’s ultimate goal is indeed to achieve carbon neutrality by 2045, while simultaneously fighting climate change, the County should embrace any method that helps reduce GHG for both the County, State and the Globe.

O15-35

¶As mentioned above, the Draft 2045 CAP allows but does not include a County-only GHG reduction offset credit program, but includes zero information about the cost, feasibility, schedule or scale of any such future program. ¶The Draft 2045 CAP does not create any feasible new Net Zero GHG compliance pathway for any new project, undermining the Board’s Resolution endorsing net zero GHG project outcomes similar to those already achieved by Centennial and Newhall. ¶The Draft 2045 CAP currently creates only a net zero GHG compliance pathway for like-kind replacement projects on the same site that emit less GHG. Replacing an old office building or home with a new "like-kind" office building or home easily achieves this net zero GHG outcome given new lower GHG technologies and legal mandates, but the Draft 2045 CAP creates no compliance pathway for projects that would increase land use densities and intensities which are called for under the Housing Element as well as economic development components of the General Plan, or that include new uses beyond those that already exist on the same site. ¶The Draft 2045 CAP makes housing, commercial, and mixed-use master planned community projects – as well as infrastructure and public facility projects - that are in full compliance with the General Plan, Housing Element and every existing GHG reduction mandate, a violation of the County’s General Plan.

O15-36

O15-37

O15-38

O15-39

3. Severe and Unlawful New Prohibitions Regarding the Use of Existing Water Supplies:

Like much of California, the development of Los Angeles County was and remains dependent on a diverse and resilient water supply that includes imported water. The Draft 2045 CAP demands that 90% of all water consumed within the unincorporated County boundaries, and 80% of agricultural irrigation water, be supplied exclusively by local water sources consisting of reclaimed water, grey water, and potable recycled water by 2045 with no pathway to achieve this. Under this Draft 2045 CAP Measure, no

O15-40

imported water source – including water delivered directly to the County, and water purchased and stored for use in the County, and no de-salinization technology or other technology falling outside the three designated technologies, can supply more than 10% of the County’s total water demand. It is unrealistic and infeasible to demand new projects study and comply with this measure when the technology does not currently exist to do so, regulations do not currently authorize potable use of treated water, and existing development within the County will not be held to the same standards. This will create certain litigation for any project moving forward as a red flag of General Plan inconsistency, and yet the Draft 2045 CAP provides no pathway for new projects to be compliant. Consider the following five concerns if the Draft 2045 CAP moves forward with this measure.

O15-41

O15-42

i. Legally infeasible. The County is party to numerous water infrastructure, supply, and management contracts that govern imported water, which is by far the largest source of water to the County and cities within the County.

O15-43

ii. Technically and scientifically infeasible. While all three of the exclusively sanctioned water treatment technologies (grey water, reclaimed water, and toilet-to-tap water) have already been invented and implemented on a small scale in limited areas (almost none of which supply water to unincorporated Los Angeles County), all of these treatment technologies effectively concentrate nitrate and other residual chemicals in the treated water supply, and for technical, scientific, and regulatory compliance reasons, these treated waters must be blended with fresh water to be usable (for either non-potable or potable uses) over time through multiple treatment cycles. It is not technically feasible, based on both the realities of chemistry and geographic distribution, to supply 90% of the County’s water supply from grey water, recycled water, and potable reclaimed water.

O15-44

O15-45

iii. Conflict with other County General Plan, plan, policy, and state law legal mandates. The County is required by its own General Plan as well as state law to implement its approved Housing Element, calling for delivery of 90,000 new homes in Unincorporated Los Angeles County by 2029, and plan for and approve plan-compliant housing for these many thousands of new homes. New homes cannot be built without adequate water supplies;

O15-46

<p>however, the Draft 2045 CAP would cause the County to violate housing laws by disapproving new housing dependent on existing and new water supplies that are not supplied by a minimum of 90% recycled, grey water, and potable recycled water – none of which are currently available or legally sanctioned to meet the potable drinking water needs of multi-family and community-scale housing seeking County approvals today.</p>	O15-47
<p>The County also cannot achieve its economic diversification goals, including for example attracting additional advanced manufacturing, battery and climate-tech, aerospace, research, medical, and technology employers, without providing an adequate, secure, and high-quality water supply.</p>	O15-48
<p>iv. The Draft 2045 CAP, if adopted into the General Plan as proposed, applies most directly and immediately to the County’s own projects, and to the County’s approval of project applications. This means that the legal risks and compliance costs of the legally and technically infeasible water mandate in the Draft 2045 CAP will fall most immediately on challenges to County-funded projects (e.g., infrastructure, arts, parks), as well as County-approved and applicant-proposed housing and job-creation projects that meet other urgent County needs and legal obligations.</p>	O15-49
<p>A new water recycling project that relies on blending treated water with imported water would, for example, fail if it used even 15% of imported water as a blending source for recycled water.</p>	O15-50
<p>v. The One-Size Fits All Technology Mandates in the Draft 2045 CAP (for Water Supplies and Other prescriptions) Are Anti-Innovation and Impede Global GHG Reductions. The Draft 2045 CAP accepts only three water technologies to provide 90% of the County’s total water supply, all of which are technologies that exist today.</p>	O15-51
<p>The Draft 2045 CAP is hostile to innovative technologies, notwithstanding decades of progress in achieving environmental goals through technology innovation. CARB has confirmed that the entire California economy contributes less than 1% to global GHG emissions, and the County’s most significant climate change leadership opportunities are supporting innovation including development and production of new technologies and practices that are desirable and cost-effective, and thus likely to be used by other states and countries. The County’s leadership in technology innovation, capital and company formation, advanced manufacturing, and marketing, are the necessary and appropriate engines of global climate change solutions.</p>	O15-52
<p>The 2045 Draft CAP’s 10% cap on imported water frustrates, rather than furthers, these climate change leadership opportunities and is more likely to shuffle people and jobs to other states and local jurisdictions than result in meaningful global GHG reductions.</p>	O15-53

Additional Challenges with the Draft 2045 CAP

<p>As documented throughout this letter, the Draft 2045 CAP does not quantify the amount of GHG reductions the various measures would bring to the County if implemented, and yet each project applicant will be left trying to calculate reduction numbers to try and comply with the measures.</p>	<p>O15-54</p>
<p>The Draft 2045 CAP indicates that to show consistency through an alternative measure, a project must show how it can quantitatively achieve the same reductions as the listed measure (Page F-5 of Appendix F). However, for many of these measures the Draft 2045 CAP does not quantify the emissions associated with the measure (e.g., ES4, ES5, T5, E3, W2, A2, and emission reductions within sub-measures listed in Appendix E for each measure are not broken out individually</p>	<p>O15-55</p>
<p>either) and thus, there is 1) no basis in the Draft 2045 CAP how these measures are achieving GHG reductions, and 2) no basis for a Project to demonstrate consistency with the Draft 2045</p>	<p>O15-56</p>
<p>CAP or for alternatives to these measures.</p>	<p>O15-57</p>
<p>The Draft 2045 CAP Checklist also includes aspirational requirements (i.e., EV trucks [Measure T8] and construction electric equipment [Measure T9]) which no project can currently be consistent with given the lack of technology to meet these requirements. However, when</p>	<p>O15-58</p>
<p>included in the General Plan as proposed for the Draft 2045 CAP, the County has ensured that projects will be inconsistent with the General Plan by not being able to comply with technology that doesn't exist.</p>	<p>O15-59</p>
<p>In addition, the Draft 2045 CAP includes many plans (e.g., Zero Emission Vehicle Master Plan, Building Performance Standards, Carbon Intensity Limits, ZNE Ordinance, All-Electric New Buildings Ordinance, and Net Zero Water Ordinance) that are cited in Appendix E and F, but have not even been developed yet. Without knowing the content of these undeveloped plans, neither housing and job-creating applicants, nor supporters of public facilities or infrastructure improvement projects proposed by other County departments or public agencies, can confidently assess project consistency with the Draft 2045 CAP, nor could a project demonstrate that it meets the requirements of the Draft 2045 CAP checklist. This is another example of why the Draft 2045 CAP should not be substantially revised, as well as excluded from the General Plan.</p>	<p>O15-60</p>
<p>Furthermore, the performance criteria listed in Appendix E are mostly established on a county-wide basis, yet they are connected to the checklist items in Appendix F for specific projects (e.g. Measure T6 lists County-wide goals for EV sales and number of EVCS installed but does not indicate project-specific goals for this measure). In this way, the Draft 2045 CAP does not</p>	<p>O15-61</p>
<p>present a viable basis for a project to demonstrate consistency with the Draft 2045 CAP. As</p>	<p>O15-62</p>
<p>discussed at length, the County should consider projects on an individual basis, fully consider foreseeable GHG project-level impacts based on core state law GHG reduction mandates that comprise the vast majority of the quantified GHG reductions as documented in the Draft 2045 CAP, and then identify feasible additional GHG reductions and mitigation measures based on</p>	<p>O15-63</p>
<p>specific project information as well as ever-evolving technologies and practices. Only this modified Draft 2045 CAP General Plan approach can be implemented consistent with, and in furtherance of, the many other housing, jobs, conservation, infrastructure, and other priorities</p>	<p>O15-64</p>
<p>included in existing, approved General Plan, Area Plans, and Community Plans. The many infeasible, one-size-fits-all measures in the Draft 2045 CAP should be removed from the General</p>	<p>O15-65</p>

Plan, but can potentially be maintained as a list, outside the General Plan, of potentially feasible GHG reduction measures for consideration on project-by-project basis, and in the context of evaluating potential future ordinances as state law and feasible technologies and practices continue to evolve.

O15-65
(cont.)

Considerations

In closing, Tejon Ranch Company thanks the County for providing the opportunity for us to share our deep and broad concerns regarding the Draft 2045 Climate Action Plan. The Company takes seriously its responsibility to lead in addressing the critical climate and housing crises facing our County. We have consistently demonstrated through our substantial and voluntary land conservation efforts, the employment of best practices in environmentally sensitive and sustainable community planning and design and our entering the legally-binding, publicly transparent Climate Resolve Agreement, the Company's unrivaled commitment to achieving Net Zero GHG emissions for our Centennial project and enabling the County to successfully address the dire housing crisis in a safe, resilient, and sustainable way. We respectfully submit that the County should recognize Centennial as a model for achieving net zero GHG emissions, just as CARB has, and not impede or otherwise take action to add costs, uncertainties, or new or inconsistent GHG reduction obligations for the project. We further ask that the County give serious and thoughtful consideration to addressing the following problematic core elements of the Draft 2045 CAP, and that the County stay on track to provide for the housing and economic growth that is consistent with the approved General Plan, as carefully determined by the Board of Supervisors to best serve all Angelinos.

O15-66

O15-67

O15-68

O15-69

- The Draft 2045 CAP should be substantially revised into an aspirational document that focuses solely on feasible GHG reduction measures which are within the jurisdiction of the County to implement, operate in full alignment and support of the County's economic development, housing, and infrastructure goals, and do not increase the cost, time, or litigation risks for the County or applicants.
- The Draft 2045 CAP should separately quantify GHG reductions from the successful implementation of statewide laws and mandates, and calculate what additional measures, if any, should be undertaken by the County, while allowing projects to reduce their GHG emissions through CARB-approved offsets and other mitigation approaches.
- The Draft 2045 CAP inventory and GHG reduction methodology should pivot into recognition that retaining County residents and jobs, and providing the necessary expansions of housing, economic development and infrastructure needed to restore economic opportunity and upward mobility to County residents, is a more effective GHG strategy than exporting jobs to states and countries with lower standards and practices for reducing GHG impacts.

Thank you for your consideration of these important items.

Sincerely,

Marc W. Hardy
Senior Vice President and General Counsel

2.3.2.15 Letter O15: Tejon Ranch Company

This letter provides input on the Revised Draft 2045 CAP as well as CEQA comments on the Recirculated Draft PEIR. Comments specific to the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, the County has received and reviewed comments on the Revised Draft 2045 CAP and common topics are discussed in Section 1.4, *Comments on the Revised Draft 2045 CAP*, in Chapter 1, *Introduction*. Recirculated Draft PEIR-focused comments are addressed below.

- O15-1 The comment discusses the Tejon Ranch development but does not raise any significant environmental issues or inadequacies associated with the Recirculated Draft PEIR; no response is required pursuant to CEQA Guidelines section 15088(a).
- O15-2 The comment discusses the Tejon Ranch development and its project-level mitigation measures but does not raise any significant environmental issues or inadequacies associated with the Recirculated Draft PEIR; no response is required pursuant to CEQA Guidelines section 15088(a).
- O15-3 In response to the comment’s statement regarding the General Plan, please refer to General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan. The County has chosen to prepare and utilize the Revised Draft 2045 CAP as an implementation program for the Air Quality Element of the General Plan and would adopt the Revised Draft 2045 CAP by General Plan amendment together with proposed revisions to the Air quality Element. In California, local governments regulate many activities that contribute to GHG emissions and air pollutants, including land use and transportation planning, zoning and urban growth decisions, implementation of building codes and other standards, and control of municipal operations. Local governments have typically addressed climate change either in policies in the general plan itself, or through adoption of a CAP.

As an implementation program for the Air Quality Element, the Revised Draft 2045 CAP is not a regulatory document but is rather a plan-level framework for the County to implement; General Plan consistency would be determined by comparing a future project to the Air Quality Element goals and policies rather than with the detailed implementation programs identified in order to achieve Countywide strategies, goals, and actions to reach emissions reductions targets of the Revised Draft 2045 CAP. A subcomponent of the Revised Draft 2045 CAP implementation program is the Checklist, Appendix F, which the County will only utilize to determine the consistency of future project applicants who wish to streamline the GHG impact analysis of their project with the Revised Draft 2045 CAP pursuant to CEQA Guidelines sections 15064(h)(3), 15064.4 and 15183.5(b). If a project is consistent with the General Plan and can demonstrate consistency with the Revised Draft 2045 CAP by completing the Checklist, the project would be considered consistent with the Revised Draft 2045 CAP and eligible for CEQA streamlining of its project-level GHG analysis. (Recirculated Draft PEIR, p. 2-40.)

However, demonstrating consistency with the Checklist is no longer mandatory for new development projects, but is rather a voluntary option that project applicants can utilize to streamline their project's GHG impact analysis. The Checklist provides a list of Tier 1 measures, which are required for all discretionary private development projects to demonstrate consistency with the Revised Draft 2045 CAP unless alternative measures are proposed. Nothing beyond the Tier 1 measures is required for project applicants to streamline their CEQA GHG impacts analysis. Projects that do not intend to streamline their GHG impact analysis do not need to demonstrate consistency with the Checklist. Such projects would be required to prepare a project-specific impact analysis under CEQA, separate and apart from use of the Checklist. Please refer to General Response 3 for further discussion regarding the Revised Draft 2045 CAP processes applicable to various project applicants.

Responding to the comment's point about amendments to the General Plan, the Revised Draft 2045 CAP is a plan-level framework for the County to implement to achieve Countywide GHG reduction targets for 2030, 2035, and 2045 that are consistent with the state's GHG reduction targets and related legislative actions. (Recirculated Draft PEIR, p. 2-8.) The Revised Draft 2045 CAP recognizes that future amendments to CAP measures may be needed to address future federal and state regulations. (Revised Draft 2045 CAP, p. 1-7.) Amendments to the Revised Draft 2045 CAP would represent a change to the County's General Plan implementation program and would be a discretionary action subject to CEQA compliance.

In response to the comment's concern regarding potential litigants, while potential litigation challenging future projects is always a possibility, it is speculative at this time to presume that there would be imminent lawsuits challenging future projects. Any project approval is subject to legal challenge and there is no evidence presented by the commenters suggesting that it is more likely that future projects implementing the Revised Draft 2045 CAP would be challenged. The comment raising potential legal challenges does not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a).

- O15-4 It is true the Revised Draft 2045 CAP would create new County obligations – which include specific County policies, programs, or tools to support long-range planning – necessary to achieve the emissions reduction targets consistent with AB 1279 and the 2022 Scoping Plan. The Revised Draft 2045 CAP is an implementation program for the Air Quality Element of the General Plan and would be adopted by General Plan Amendment together with proposed revisions to the Air Quality Element. Please refer to General Response 2 for further discussion on the relationship between the Revised Draft 2045 CAP and the County's General Plan.

Regarding the comment's allegation that the Revised Draft 2045 CAP would expand litigation risks under CEQA, while potential litigation challenging future projects is always a possibility, it is speculative at this time to presume that there would be

imminent lawsuits challenging future projects. Any project approval is subject to legal challenge and there is no evidence presented by the commenters suggesting that it is more likely that future projects implementing the Revised Draft 2045 CAP would be challenged. The comment raising potential legal challenges does not raise significant environmental issues related to the Recirculated Draft PEIR and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a).

- O15-5 The comment incorrectly asserts that any project that fails to comply with all CAP measures and actions would conflict with an environmental component of the General Plan, a significant and unavoidable land use impact, and would have a significant GHG impact. As stated above, since the Revised Draft 2045 CAP is an implementation program for the Air Quality Element of the General Plan and would be adopted by General Plan Amendment together with proposed revisions to the Air Quality Element, General Plan consistency would be determined by comparing a future project to the Air Quality Element goals and policies rather than with the detailed implementation programs identified in the Revised Draft 2045 CAP.

Demonstrating consistency with the Checklist is no longer mandatory for new development projects, but is rather a voluntary option that project applicants can utilize to streamline their project's GHG impact analysis with the Revised Draft 2045 CAP pursuant to CEQA Guidelines sections 15064(h)(3), 15064.4 and 15183.5(b). Projects that do not intend to streamline their GHG impact analysis do not need to demonstrate consistency with the Checklist. Such projects would be required to prepare a project-specific impact analysis under CEQA, separate and apart from use of the Checklist.

Please refer to General Response 3 for further discussion regarding the Revised Draft 2045 CAP processes applicable to various project applicants.

- O15-6 Regarding the comment's point about alternative CEQA compliance pathways, please see Response to Comment O15-3, explaining the processes applicable to project applicants. To reiterate, projects that do not intend to streamline their GHG impact analysis no longer need to demonstrate consistency with the Checklist. Such projects would be required to prepare a project-specific impact analysis under CEQA, separate and apart from use of the Checklist. Such project applicants may utilize an appropriate CEQA compliance pathway tailored to their projects. Please refer to General Response 2 regarding General Plan conflict issues, and General Response 3 for more discussion regarding implementation of the Revised Draft 2045 CAP's measures and actions and the processes applicable to various project applicants.

- O15-7 The Revised Draft 2045 CAP has been revised such that project applicants do not need to demonstrate compliance with the Revised Draft 2045 CAP measures and complete "infeasibility" findings if they do not intend to streamline their CEQA GHG impacts analysis. Projects that do not intend to streamline their GHG impact analysis do not need to demonstrate consistency with the Checklist. Such projects would be

required to prepare a project-specific impact analysis under CEQA, separate and apart from use of the Checklist.

Only project applicants that wish to streamline their GHG impact analysis with the Revised Draft 2045 CAP pursuant to CEQA Guidelines sections 15064(h)(3), 15064.4 and 15183.5(b) must complete the Checklist to demonstrate consistency with the Revised Draft 2045 CAP. The Checklist is clear about what is required of projects that choose to streamline their CEQA GHG impact analysis. (See Appendix F, p. F-5 et seq.) The Checklist provides a list of Tier 1 measures, which are required for all discretionary private development projects unless alternative measures are proposed to demonstrate consistency with the Revised Draft 2045 CAP. Nothing beyond the Tier 1 measures is required for project applicants to streamline their CEQA GHG impacts analysis. Please refer to General Response 3 for further discussion as to the required elements of the Revised Draft 2045 CAP for certain projects.

Regarding the comment's concern about future CEQA and General Plan compliance lawsuits, while potential litigation challenging future projects is always a possibility, it is speculative at this time to presume that there would be imminent lawsuits challenging future projects. Any project approval is subject to legal challenge and there is no evidence presented by the commenters suggesting that it is more likely that future projects implementing the Revised Draft 2045 CAP would be challenged. The comment raising potential legal challenges does not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a).

- O15-8 The Housing Element serves as a policy guide to address the comprehensive housing needs of the County. Its focus is to ensure decent, safe, sanitary, and affordable housing for current and future residents. It also focuses on equitable development to counter historical residential segregation and environmental injustice. The Housing Element sets forth implementing actions that encourage the private sector to build and improve housing. To that end, a climate action plan was identified as a program of the Housing Element. The Revised Draft 2045 CAP includes a streamlined procedure for environmental clearance for certain projects, which could include individual housing projects, thereby reducing the time and expense needed for individual environmental clearances. Qualifying projects will be able to rely on the Revised Draft 2045 CAP for their GHG emissions analysis under CEQA. Housing projects have been able to successfully integrate climate action as identified in the CARB's 2022 Scoping Plan. In response to the comment's concern about the Revised Draft 2045 CAP's relationship in the General Plan and alleged use of the Revised Draft 2045 CAP to stop housing development, please refer to General Response 2.
- O15-9 The Revised Draft 2045 CAP includes feasible, clear, and implementable measures that allow for implementation of County goals related to infrastructure, economic development, and housing. The Revised Draft 2045 CAP's measures and actions support the County's goals related to economic development, housing, and

infrastructure: general goals and policies relevant to the Revised Draft 2045 CAP include those related to infill development (Goal LU 4), vibrant, livable and healthy communities that contain a mix of community-serving uses (Goal LU 5), and land use patterns and community infrastructure that promote health and wellness for all neighborhoods (Goal LU 10). For further discussion regarding the Revised Draft 2045 CAP measures and how they would achieve Countywide GHG reduction targets consistent with the state's GHG reduction targets and related legislative actions, including AB 1279 and the 2022 Scoping Plan, please refer to General Response 5.

See General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan. Also see General Response 3, which addresses how the Revised Draft 2045 CAP and 2045 Checklist applies to development projects.

O15-10 Implementation of the Revised Draft 2045 CAP into the General Plan would not hinder the ability to implement long-term housing law compliance obligations. The Revised Draft 2045 CAP is a policy document that would support development allowed under the General Plan. No changes to General Plan land use designations, zoning, or land use-specific projects are proposed as part of the Revised Draft 2045 CAP.

In fact, the Revised Draft 2045 CAP focuses on the importance of housing availability and seeks to balance encouragement for increased housing supply with GHG reductions. The County prioritizes strategies that both invest in and support frontline communities, which include providing specific incentives and subsidies for affordable housing developments and implementing other initiatives that integrate equity in ways that help reverse the trends of discrimination and disinvestment. For example, Action ES5.1 requires identification of new requirements for new development to reduce GHG emissions from energy use, transportation, and other sources that includes affordable housing considerations in these requirements and supporting measures to maintain housing affordability. Measure T1 seeks to increase housing opportunities that are affordable and near high-quality transit areas to reduce VMT. Action T1.2 directs the County to develop land use tools that will increase the production of a diversity of housing types, such as missing middle housing. As such, the Revised Draft 2045 CAP implements measures and actions that would help fulfill the County's housing law compliance obligations.

O15-11 The Revised Draft 2045 CAP, once finalized and approved, would require an amendment to the Los Angeles County General Plan 2035 to replace the existing implementation strategy of the Air Quality Element, known as the Unincorporated Los Angeles County Community Climate Action Plan 2020 (2020 CCAP). The Revised Draft 2045 CAP builds on previous climate action work from the 2020 CCAP, adopted in October 2015 as a subcomponent of the Air Quality Element of the Los Angeles County General Plan 2035 and includes new emissions reduction targets consistent with AB 1279 and the 2022 Scoping Plan.

In addition to the proposed Revised Draft 2045 CAP, the proposed project evaluated in the Recirculated Draft PEIR includes proposed revisions to the General Plan's Air Quality Element. The revisions to the General Plan's Air Quality Element are set forth in Table 2-1, *Proposed Updates to the Los Angeles County General Plan 2035 Air Quality Element*, and Table 2-2, *Proposed Updates to the Los Angeles County General Plan 2035 Implementation Program*, in Chapter 2, Project Description. The Revised Draft 2045 CAP is consistent with these revisions and helps implement them.

Future amendments to the Revised Draft 2045 CAP would represent a change to the County's General Plan implementation program and would be a discretionary action subject to CEQA compliance. For further discussion regarding the relationship between the Revised Draft 2045 CAP and the County's General Plan, please refer to General Response 2.

- O15-12 The County notes the comment's examples of other jurisdictions' actions in adopting their own climate action plans. For a specific response regarding the County of San Diego's Climate Action Plan and how it differs from the County's 2045 CAP, please refer to Response to Comment O5b-36. The Revised Draft 2045 CAP is an implementation program of the Air Quality Element of the County's General Plan and will be adopted by General Plan Amendment together with proposed revisions to the Air Quality Element. In California, local governments regulate many activities that contribute to GHG emissions and air pollutants, including land use and transportation planning, zoning and urban growth decisions, implementation of building codes and other standards, and control of municipal operations. Local governments have typically addressed climate change either in policies in the general plan itself, or through adoption of a CAP. Please refer to General Response 2 for further discussion of the relationship between the Revised Draft 2045 CAP and the County's General Plan.

Regarding the comment's concerns regarding future litigation, while potential litigation challenging future projects is always a possibility, it is speculative at this time to presume that there would be imminent lawsuits challenging future projects. Any project approval is subject to legal challenge and there is no evidence presented by the commenters suggesting that it is more likely that future projects implementing the Revised Draft 2045 CAP would be challenged. The comment raising potential legal challenges does not raise significant environmental issues related to the Recirculated Draft PEIR and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a).

- O15-13 This comment does not raise significant environmental issues regarding the Recirculated DEIR and no further response is required pursuant to CEQA Guidelines section 15088(a). Also, please note that the "currently adopted CAP" is no longer in effect.

O15-14 Regarding the comment’s claim that the Revised Draft 2045 CAP would impose mandates on development and new projects, the comment fails to recognize the difference between Revised Draft 2045 CAP performance goals (as identified in the Revised Draft 2045 CAP strategies, measures, and actions) and the Checklist’s requirements for new projects. First, the performance goals in the Revised Draft 2045 CAP are *Countywide goals*, not requirements or mandates for individual projects. All project-level requirements for CEQA streamlining are identified in the Checklist itself. There are no additional streamlining requirements for new projects that are not included in the Checklist. Please see General Response 3 for additional discussion. Second, as explained in the Checklist instructions (Appendix F, p. F-5 to F-15), the Checklist is clear about what is required of projects that choose to streamline their CEQA GHG impact analysis. (See Appendix F, p. F-10 to F-12.) The Checklist provides a list of “Tier 1” measures, which are required for all discretionary projects in order to use CEQA streamlining for GHG impacts, and “Tier 2” measures, which are not mandatory, but encouraged for all discretionary projects to implement.

Implementation of the Revised Draft 2045 CAP into the General Plan would not hinder the ability to implement long-term housing law compliance obligations. The Revised Draft 2045 CAP is a policy document that would support development allowed under the General Plan. No changes to General Plan land use designations, zoning, or land use-specific projects are proposed as part of the Revised Draft 2045 CAP.

In fact, the Revised Draft 2045 CAP focuses on the importance of housing availability and seeks to balance encouragement for increased housing supply with GHG reductions. The County prioritizes strategies that both invest in and support frontline communities, which include providing specific incentives and subsidies for affordable housing developments and implementing other initiatives that integrate equity in ways that help reverse the trends of discrimination and disinvestment. For example, Action ES5.1 requires identification of new requirements for new development to reduce GHG emissions from energy use, transportation, and other sources that includes affordable housing considerations in these requirements and supporting measures to maintain housing affordability. Measure T1 seeks to increase housing opportunities that are affordable and near high-quality transit areas to reduce VMT. Action T1.2 directs the County to develop land use tools that will increase the production of a diversity of housing types, such as missing middle housing. As such, the Revised Draft 2045 CAP implements measures and actions that would help fulfill the County’s housing law compliance obligations.

O15-15 Regarding the comment’s concern about the alleged mandates of the Revised Draft 2045 CAP and their quantification, please refer to General Response 2 for discussion regarding the Revised Draft 2045 CAP’s relation to the General Plan and General Response 3 for a discussion regarding the application of the Checklist to project applicants. Quantification of the Revised Draft 2045 CAP strategies, measures and actions are discussed in detail in General Response 5.

- O15-16 Please refer to General Response 3 for a discussion regarding the application of the Checklist to project applicants. See General Response 5, which addresses the obligation of the Revised Draft 2045 CAP to quantify GHG emission reductions for strategies, measures, and actions. The comment’s concern regarding potential litigation challenging future projects is speculative at this time and there is no evidence presented by the comment suggesting that it is more likely that future projects implementing the Revised Draft 2045 CAP would be challenged.
- O15-17 The Revised Draft 2045 CAP does not present poorly defined, unclear measures and performance standards; please refer to General Response 3 regarding the application of the Checklist to project applicants and which addresses the Revised Draft 2045 CAP’s GHG reduction measures. Regarding the comment’s concerns regarding future litigation, while potential litigation challenging future projects is always a possibility, it is speculative at this time to presume that there would be imminent lawsuits challenging future projects. Any project approval is subject to legal challenge and there is no evidence presented by the commenters suggesting that it is more likely that future projects implementing the Revised Draft 2045 CAP would be challenged. The comment raising potential legal challenges does not raise significant environmental issues related to the Recirculated Draft PEIR and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a).
- O15-18 Regarding the commenter’s claim that all future projects must meet a job density of 300 jobs per acre and that projects that do not achieve this standard would be inconsistent with the Revised Draft 2045 CAP, this is not a mandate for individual projects. A job density of 300 jobs per acre is not a requirement of the Checklist or the Revised Draft 2045 CAP for new projects. As discussed in General Response 3, Draft 2045 CAP measure T2 (Develop Land Use Plans Addressing Jobs-Housing Balance and Increase Mixed Use) includes a *Countywide* performance goal of 300 jobs per acre by 2030; this is a goal for the entire County to meet by 2030 and represents an average value for Countywide job density. For projects that wish to streamline their GHG impacts evaluation under CEQA, the Checklist requires nothing in the way of job density for new projects and Measure T2 is also not a requirement for demonstrating consistency with the Revised Draft 2045 CAP. See General Response 3 for additional discussion.
- O15-19 The comment incorrectly asserts that a project’s failure to meet a job density of 300 jobs per acre would be deemed to conflict with an Recirculated Draft PEIR sufficiently analyzes and mitigates the environmental component of the General Plan, and that such projects would have significant and unavoidable GHG impacts that would trigger the need for an EIR. As discussed in response to comment O15-18 above and in General Response 3, the Checklist does not mandate that all new projects achieve 300 jobs per acre. Checklist item #12, *TIER 2: Achieve a High Jobs/Housing Balance*, is a voluntary Tier 2 item that encourages projects with nonresidential development to “*support the County’s goal to achieve a job density of 300 jobs per acre*” (emphasis

added). A project that could not meet this metric could still use the Checklist to streamline its GHG impact analysis under CEQA.

Further, the Checklist would *not* be used as a tool for evaluating a project's consistency with the County's General Plan. General Plan consistency will be determined by comparing a future project to the Air Quality Element goals and policies rather than with the detailed implementation programs identified in the Revised Draft 2045 CAP. Demonstrating consistency with the Checklist is no longer mandatory for new development projects, but is rather a voluntary option that project applicants can utilize to streamline their project's GHG impact analysis. Projects that do not intend to streamline their GHG impact analysis no longer need to demonstrate consistency with the Checklist. These projects can demonstrate CEQA compliance in the most appropriate way tailored to the project, which may not necessitate a full EIR. Please see General Response 3 for further discussion regarding the process for project applicants.

- O15-20 Regarding the commenter's claim that all future projects must meet a job density of 300 jobs per acre and that projects that do not achieve this standard would be inconsistent with the Revised Draft 2045 CAP, a job density of 300 jobs per acre is not a requirement of the Checklist or the Revised Draft 2045 CAP for new projects. Please refer to responses to comments O15-18 and O15-19 above, which explain that projects that do not intend to streamline their GHG impact analysis need not demonstrate consistency with the Checklist. Such projects can demonstrate CEQA compliance in the most appropriate way tailored to the project, which may not necessitate what the comment calls "a costly CEQA compliance process." Also see General Response 3, which addresses how the Revised Draft 2045 CAP and 2045 Checklist applies to development projects.

With regard to the commenter's concerns regarding CEQA litigation, while potential litigation challenging future projects is always a possibility, it is speculative at this time to presume that there would be imminent lawsuits challenging future projects. measures and actions. Also see General Response 2, which addresses concerns regarding third parties initiating lawsuits against the County and future project applicants. This comment raising potential litigation concerns does not raise environmental issues and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a).

- O15-21 Regarding the comment's concern regarding GHG calculations, see General Response 5, which addresses quantification, estimated costs, and sources of funding for the Revised Draft 2045 CAP measures. Regarding the commenter's claim that all future projects must meet a job density of 300 jobs per acre and that projects that do not achieve this standard would be inconsistent with the Revised Draft 2045 CAP, a job density of 300 jobs per acre is not a requirement of the Checklist or the Revised Draft 2045 CAP for new projects. Please refer to responses to comments O15-18 and O15-19 above, along with General Response 3, which addresses how the Revised Draft

2045 CAP and 2045 Checklist applies to development projects. See also General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan. Also, the County has added a new subsection in Revised Draft 2045 CAP Appendix F in Section F.2 under Step 4 titled, “Guidance for Quantifying GHG Reductions from Alternative Measures” to help project applicants choose this pathway. This new section provides guidance for how applicants can quantify the GHG reduction benefits of a Checklist streamlining requirement for an individual project to determine the amount of GHG emissions reduction that an alternative project emissions reduction measure must achieve. See Revised Draft 2045 CAP Appendix F, pages F-13 to F-15 for more detail.

O15-22 Regarding the commenter’s claim that all future projects must meet a job density of 300 jobs per acre and that projects that do not achieve this standard would be inconsistent with the Revised Draft 2045 CAP, a job density of 300 jobs per acre is not a requirement of the Checklist or the Revised Draft 2045 CAP for new projects. Please refer to responses to comments O15-18 and O15-19 above, along with General Response 3, which addresses how the Revised Draft 2045 CAP and 2045 Checklist applies to development projects. Refer to General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan. Also see General Response 2, which addresses concerns regarding potential lawsuits against the County and future project applicants. The comment regarding economic growth and jobs does not raise significant environmental issues related to the Recirculated Draft PEIR and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a).

O15-23 The Recirculated Draft PEIR sufficiently analyzes and mitigates the environmental consequences of the Revised Draft 2045 CAP measures and actions. In response to the comment’s concern related to consequences of the Revised Draft 2045 CAP associated with the County’s General Plan, community plans, area plans, and specific plans, the comment does not allege any specific conflicts. Section 3.12, *Land Use and Planning*, of the Recirculated Draft PEIR evaluates land use and planning issues to determine whether the Revised Draft 2045 CAP would result in a significant impact related to a physical division of an established community or conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental impact. As described in Section 3.12.2.3, the Revised Draft 2045 CAP is a policy document intended to reduce community-wide GHG emissions and would support development allowed under the General Plan. No changes to General Plan land use designations, zoning, or land use-specific projects are proposed as part of the Revised Draft 2045 CAP. The Recirculated Draft PEIR concluded that projects facilitated by the Revised Draft 2045 CAP would have less-than-significant impacts related to a conflicting with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental impact. See General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan.

- O15-24 See Response O15-23 and General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan.
- O15-25 Regarding the commenter’s claim that all future projects must meet a job density of 300 jobs per acre and that projects that do not achieve this standard would be inconsistent with the Revised Draft 2045 CAP, a job density of 300 jobs per acre is not a requirement of the Checklist or the Revised Draft 2045 CAP for new projects. Please refer to responses to comments O15-18 and O15-19 above, along with General Response 3, which addresses how the Revised Draft 2045 CAP and 2045 Checklist applies to development projects.
- O15-26 As explained in General Response 3, project applicants that do not intend to streamline their GHG impact analysis need no longer demonstrate consistency with the Checklist, which would *not* be used as a tool for evaluating a project’s consistency with the County’s General Plan. Such projects would be required to prepare a project-specific impact analysis under CEQA, separate and apart from use of the Checklist.
- The comment incorrectly asserts that a project’s failure to meet a job density of 300 jobs per acre would be deemed to conflict with the General Plan, and that such projects would have significant and unavoidable GHG impacts. As discussed, the Checklist does not mandate that all new projects achieve 300 jobs per acre. Please refer to responses to comments O15-18 and O15-19 above, along with General Response 3, which addresses how the Revised Draft 2045 CAP and 2045 Checklist applies to development projects. Also see General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan.
- O15-27 Please refer to responses to comments O15-18 and O15-19 above, along with General Response 3, which addresses how the Revised Draft 2045 CAP and 2045 Checklist applies to development projects. Also see General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan.
- O15-28 Please refer to responses to comments O15-18 and O15-19 above, along with General Response 3, which addresses how the Revised Draft 2045 CAP and 2045 Checklist applies to development projects. Also see General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan. See response to comment O15-26 above.
- O15-29 In response to the comment’s point about the aspirational nature of the Revised Draft 2045 CAP and relation to the General Plan, the Revised Draft 2045 CAP is an implementation program of the Air Quality Element of the County’s General Plan. In California, local governments regulate many activities that contribute to GHG emissions and air pollutants, including land use and transportation planning, zoning and urban growth decisions, implementation of building codes and other standards, and control of municipal operations. Local governments have typically addressed climate change either in policies in the general plan itself, or through adoption of a CAP.

Project applicants that do not intend to streamline their GHG impact analysis need no longer demonstrate consistency with the Checklist, which would *not* be used as a tool for evaluating a project's consistency with the County's General Plan. Such projects would be required to prepare a project-specific impact analysis under CEQA, separate and apart from use of the Checklist. Project applicants that do not wish to streamline their project would be required to thoughtfully craft and adopt measures that must be implemented to mitigate project-specific GHG emissions impacts.

Please refer to General Response 2 for further discussion of the relationship between the Revised Draft 2045 CAP and the County's General Plan and to General Response 3 for further discussion regarding the Revised Draft 2045 CAP processes applicable to various project applicants. Please also refer to General Response 4 for further discussion about the voluntary GHG offset credits (GHG offsets) as a strategy for achieving the County's GHG reduction targets.

- O15-30 In response to the comment's point about project-level measures to mitigate GHG emissions impacts, the County has developed the Checklist, Appendix F, as a subcomponent of the implementation program. Per Revised Draft 2045 CAP revisions, the Checklist would *not* be used as a tool for evaluating a project's consistency with the County's General Plan. Demonstrating consistency with the Checklist is no longer mandatory for new development projects, but is rather a voluntary option that project applicants can utilize to streamline their project's GHG impact analysis. Projects that do not intend to streamline their GHG impact analysis no longer need to demonstrate consistency with the Checklist. Such projects would be required to prepare a project-specific impact analysis under CEQA, separate and apart from use of the Checklist. This tailored, project-specific CEQA analysis would be required to include feasible mitigation measures to lessen the project's significant GHG impacts.

Please refer to General Response 3 for further discussion regarding the Revised Draft 2045 CAP processes applicable to various project applicants.

- O15-31 Please refer to General Response 3 for further discussion regarding the Revised Draft 2045 CAP processes applicable to various project applicants. This comment does not raise significant environmental issues regarding the Revised Draft 2045 CAP Recirculated DEIR and no further response is required pursuant to CEQA Guidelines section 15088(a).
- O15-32 The Revised Draft 2045 CAP does not preclude a project from using GHG offsets to demonstrate net zero emissions (or carbon neutrality) or to attain any other CEQA significance threshold. In other words, a project can undergo its own CEQA review of GHG impacts and determine such impacts would be less than significant based on substantial evidence and valid CEQA mitigation, which (as previous projects have demonstrated) may include the use of voluntary GHG offset credits. The Revised Draft 2045 CAP does not prohibit this approach. See Revised Draft 2045 CAP

Appendix F, page F-13 for more discussion. However, for projects intending to use the Revised Draft 2045 CAP CEQA Streamlining Checklist to streamline CEQA review of their GHG impacts, the use of GHG offsets is not an option. For further discussion, see General Response 4, which addresses concerns regarding the use of voluntary GHG offset credits in the Revised Draft 2045 CAP and as an alternative GHG reduction measure in the Checklist for streamlining CEQA review of a project's GHG impacts.

O15-33 See General Response 6, which addresses concerns regarding the proposed Offsite GHG Emissions Reduction Program.

O15-34 and O15-35 As discussed above in Response to Comment O15-32, the Revised Draft 2045 CAP does not preclude a project from using GHG offsets to demonstrate net zero emissions (or carbon neutrality) or to attain any other CEQA significance threshold. See General Response 4, which addresses concerns regarding the use of voluntary GHG offset credits in the Revised Draft 2045 CAP and as an alternative GHG reduction measure Checklist for streamlining CEQA review of a project's GHG impacts.

O15-36 See General Response 5, which addresses quantification, estimated costs, and sources of funding for the Revised Draft 2045 CAP measures. Also see General Response 6, which addresses concerns regarding the proposed Offsite GHG Emissions Reduction Program. As stated, the Revised Draft 2045 CAP presents a *framework* for the Offsite GHG Reduction Program and does not represent the program itself. As stated on page F-35, the actual program will be developed after the Revised Draft 2045 CAP is adopted. Given that the program itself has not been developed, it would be speculative to estimate the implementation costs of such a program at this point. Further, the Offsite GHG Reduction Program itself is not a Revised Draft 2045 CAP measure that is quantified for GHG reductions and it is not relied upon to achieve the Revised Draft 2045 CAP's GHG emission reduction targets. Use of the Offsite GHG Reduction Program is not mandatory for project applicants wishing to streamline environmental review of their project's GHG impacts using the Revised Draft 2045 CAP's Recirculated Draft PEIR pursuant to CEQA Guidelines section 15183.5(b).

O15-37 The Revised Draft 2045 CAP does not undermine the County Board of Supervisors' resolution endorsing net zero project outcomes. See General Response 4, which addresses concerns regarding the use of voluntary GHG offset credits in the Revised Draft 2045 CAP and as an alternative GHG reduction measure in the Checklist for streamlining CEQA review of a project's GHG impacts.

O15-38 In response to this comment, the County has revised the Checklist to change the "net-zero" GHG requirement with a "zero GHG" requirement as follows.

2045 CAP Checklist Screening Criteria: Projects may skip the Demonstrate Compliance with the CEQA Streamlining 2045 CAP Measure and Action

Consistency Requirements section of Table F-1 below if they meet the following criteria:

- *If the project would achieve **net-zero GHG emissions** compared to existing on-site development at the project site, provided that existing on-site development is similar to the proposed project and that GHG emissions from existing on-site development are not substantially larger than emissions from the proposed project, the project is considered consistent with the 2045 CAP and the analysis is complete.*

Net-zero GHG emissions means that the project's GHG emissions from construction and operational activities occurring at full buildout would result in zero total GHG emissions on an annual basis. In other words, all GHGs emitted to the atmosphere during construction and operation by a project are balanced completely by GHG sequestration and removal over each calendar year period. Construction GHG emissions should be amortized for the project (typically 30 or 40 years) and added to the annual full buildout operational emissions to determine total annual emissions. Net zero GHG emissions for a project does not consider the difference in GHG emissions from between existing conditions or existing uses at the project site and the emissions from construction and operation of the proposed project is zero. For example, if a project emits 1,500 MTCO₂e per year for both construction and operation, but includes the planting of enough new trees to sequester 1,500 MTCO₂e per year, the project would achieve net zero GHG emissions. existing on-site uses at the project site are 3,000 metric tons of carbon dioxide equivalent (MTCO₂e) per year, and if the project emits fewer than 3,000 MTCO₂e per year through both construction and operations, it would achieve net zero GHG emissions. Existing conditions constitute the project's CEQA baseline for GHG impacts.

The net zero criterion can only be applied if existing on-site development is similar to the proposed project. This means that the existing land use type and the project's land use type(s) are reasonably similar, subject to the County's discretion. For example, a mixed-use project replacing an office land use would be considered similar. However, a mixed-use project replacing an industrial facility or a distribution center would not be considered similar.

Additionally, this criterion can only be applied if emissions from existing on-site development are not substantially larger than emissions from the proposed project, subject to the County's discretion. For example, a retail project with low emissions replacing a large office building with high emissions could not use the net zero criterion, producing as many emissions as the large office building; such a project would have to produce lower emissions than the large office building to be consistent with the 2045 CAP. Although the 2045 CAP intends to replace high-emitting land use types (such as oil and gas facilities) with low-emissions land use types (such as mixed-use transit-oriented development) to

~~reduce emissions overall, it does not intend to make such replacements without reducing emissions compared to existing uses, which a net-zero emissions criterion would not necessarily facilitate.~~

~~To demonstrate that the project achieves net-zero GHG emissions compared to existing on-site development at the project site, that the existing land use type and the project's land use type(s) are reasonably similar, and that emissions from existing on-site development are not substantially larger than emissions from the proposed project, the applicant must submit a comprehensive quantitative project-specific analysis of all GHG emissions, sinks, and removals from construction and full buildout operations, consistent with all CEQA guidelines and standard practice for modeling GHG emissions for projects. If the project meets this criterion these criteria, the project does not need to complete Table F-1 below and the analysis is complete. (Revised Draft 2045 CAP Appendix F, p. F-8).~~

The commenter's claim that the Checklist does not create a compliance pathway for projects which increase land use densities as called for in the 2021-2029 Housing Element is incorrect. To the contrary, a proposed mixed-use project which achieves zero GHG emissions for operations would indeed qualify for the zero GHG screening criterion. The existing use is not part of this zero GHG screening criterion. The reason for this is that the current use may choose to relocate to another place in the County and continue to emit GHGs; the new mixed-use project would therefore not actually "remove" the GHG emissions produced by the existing building from the County entirely. This approach is consistent with the CARB 2022 Scoping Plan, which states, "Lead agencies should consider whether there is substantial evidence that the GHG emissions generated by existing uses of the project site will cease to exist as a direct result of the proposed project and will not merely occur at a different location after the proposed project is developed."³⁴

See General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan. See General Response 4, which addresses concerns regarding the use of voluntary GHG offset credits in the Revised Draft 2045 CAP and as an alternative GHG reduction measure in the Checklist for streamlining CEQA review of a project's GHG impacts. This comment does not raise significant environmental issues regarding the Recirculated Draft PEIR and no further response is required pursuant to CEQA Guidelines section 15088(a).

- O15-39 See General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan. The Revised Draft 2045 CAP is not a regulatory document but is rather a plan-level framework for the County to implement to achieve Countywide GHG reduction targets for 2030, 2035, and 2045 that are consistent with

³⁴ California Air Resources Board. 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. Appendix D, "Local Actions." November 16, 2022. Pages 24. Available: <https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-appendix-d-local-actions.pdf>. Accessed July 2023.

the state's GHG reduction targets and related legislative actions. (Recirculated Draft PEIR, p. 2-8.) Demonstrating consistency with the Checklist is no longer mandatory for new development projects, but is rather a voluntary option that project applicants can utilize to streamline their project's GHG impact analysis.

Also see General Response 3, which addresses how the Revised Draft 2045 CAP and 2045 Checklist applies to development projects, as well as the feasibility of Revised Draft 2045 CAP measures and actions. The comment does not provide specific evidence as to why the Revised Draft 2045 CAP would make master planned community projects and infrastructure/public projects inconsistent with the County's General Plan, such that a specific response cannot be provided.

- O15-40 The performance goals of Measure E5 are to increase the use of alternative water sources such that 25 percent of Unincorporated Los Angeles County demand is met by recycled water, graywater, or potable reuse by 2030, 50 percent by 2035, and 90 percent by 2045. The commenter is incorrect that the Revised Draft 2045 CAP does not provide a pathway to achieve these goals. Actions E5.1 through E5.5 are identified to achieve these goals. For example, Action E5.1 requires dual waste piping to be installed in new residential developments to allow for future graywater irrigation systems. Action E5.3 requires the use of recycled water and graywater for industrial purposes where recycled water is available. Action E5.5 requires partnering with the County water districts and retail suppliers to explore the potential for widespread utilization of direct potable reuse through pilot projects.

The comment does not provide specific evidence as to why this measure is infeasible, such that a specific response cannot be provided.

- O15-41 As discussed in General Response 3, the Checklist does not mandate that all new projects ensure that 90 percent of their water demand is met by alternative water sources or that 80 percent of agricultural irrigation uses be supplied exclusively by local water sources. Draft 2045 CAP Measure E5 includes a *Countywide* performance goal that 90 percent of total Countywide water demand is met by recycled water graywater, or potable reuse by the year 2045 (25 percent by 2030 and 50 percent by 2035) (Revised Draft 2045 CAP Chapter 3, p. 3-54). This is not a project-level mandate. Checklist item #21, *TIER 2: Use Recycled Water and Graywater for Non-potable Uses and Include Rainfall Capture*, is a voluntary Tier 2 item that encourages projects to implement water reuse strategies on-site through certain design elements such as using reclaimed water for outdoor uses and installing residential graywater systems. A project that could not meet this metric could still use the Checklist to streamline its GHG impact evaluation under CEQA.

Further, as discussed in General Response 3, in response to comments received, the County has revised the Checklist to clarify that the Checklist will be used only for projects that voluntarily wish to streamline their CEQA GHG impact analysis pursuant to CEQA Guidelines sections 15064(h)(3), 15064.4 and 15183.5(b).

Demonstrating consistency with the Checklist is no longer mandatory for new development projects but is rather a voluntary option that project applicants can use to streamline their project's GHG impact analysis under CEQA. Please refer to General Response 3, which addresses how the Revised Draft 2045 CAP and Checklist applies to development projects.

The comment does not provide specific evidence as to why this measure is unrealistic or technically infeasible and the examples given do not support the claim that these goals are legally or technically infeasible such that a specific response cannot be provided.

- O15-42 As discussed in General Response 3 and responses to comments O15-40 and O15-41 above, Revised Draft 2045 CAP Measure E5 includes a performance goal that 90 percent of total Countywide water demand is met by recycled water graywater, or potable reuse by the year 2045 (25 percent by 2030 and 50 percent by 2035) (Revised Draft 2045 CAP Chapter 3, p. 3-54). This is not a project-level mandate. For projects that wish to streamline their GHG impacts evaluation under CEQA, the Checklist requires nothing regarding water source types. While potential litigation challenging future projects is always a possibility, it is speculative at this time to presume that there would be imminent lawsuits challenging future projects. The comment raising potential legal challenges does not raise environmental issues related to the Recirculated Draft PEIR and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a).
- O15-43 The 2045 goal of Measure E5 is progressive and forward looking. This goal originally came from *OurCounty: Los Angeles Countywide Sustainability Plan* Goal 2, which has a target of sourcing 80 percent of Countywide water use locally (inclusive of all 88 cities). Measure E5 is legally feasible for the County to implement and the comment does not provide specific explanation or evidence as to why this measure is legally infeasible such that a specific response cannot be provided.
- O15-44 As discussed above, Measure E5 is technically and scientifically feasible for the County to implement. The comment does not provide specific evidence as to why this measure is technically or scientifically infeasible and the examples given do not support the claim that these goals are technically or scientifically infeasible. The comment does not specify what technical, scientific and regulatory compliance reasons or evidence that the technologies needed to achieve the goals of Measure E5 would concentrate nitrate and other residual chemicals in the treated water supply, such that a specific response cannot be provided. However, see Response O2-5, explaining that all dual waste piping to be installed in new residential developments to allow for future graywater irrigation systems would meet regulatory standards for nitrate concentrations in septic system effluent.
- O15-45 As discussed above, Measure E5 is feasible for the County to implement. The comment does not provide specific evidence as to why this measure is technically or

scientifically infeasible and the examples given do not support the claim that the goals of Measure E5 are technically infeasible, such that a specific response cannot be provided.

- O15-46 As discussed in General Response 3 and responses to comments O15-40 and O15-41 above, Revised Draft 2045 CAP Measure E5 includes a performance goal that 90 percent of total Countywide water demand is met by recycled water graywater, or potable reuse by the year 2045 (25 percent by 2030 and 50 percent by 2035) (Revised Draft 2045 CAP Chapter 3, p. 3-54). This is not a project-level mandate. For projects that wish to streamline their GHG impacts evaluation under CEQA, the Checklist requires nothing regarding water source types. Further, the County has revised the Checklist to clarify that the Checklist will be used only for projects that voluntarily wish to streamline their CEQA GHG impact analysis pursuant to CEQA Guidelines sections 15064(h)(3), 15064.4 and 15183.5(b). Demonstrating consistency with the Checklist is no longer mandatory for new development projects but is rather a voluntary option that project applicants can use to streamline their project's GHG impact analysis under CEQA. As such, there is nothing in Measure E5 that would conflict with the County's Housing Element. Also see General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan.
- O15-47 As discussed in General Response 3 and responses to comments O15-40 and O15-41 above, Revised Draft 2045 CAP Measure E5 includes a *Countywide* performance goal that 90 percent of total Countywide water demand is met by recycled water graywater, or potable reuse by the year 2045 (25 percent by 2030 and 50 percent by 2035) (Revised Draft 2045 CAP Chapter 3, p. 3-54). This is not a project-level mandate. Checklist item #21, *TIER 2: Use Recycled Water and Graywater for Non-potable Uses and Include Rainfall Capture*, is a voluntary Tier 2 item that encourages projects to implement water reuse strategies on-site through certain design elements such as using reclaimed water for outdoor uses and installing residential graywater systems. A project that could not meet this metric could still use the Checklist to streamline its GHG impact evaluation under CEQA. Contrary to the comment's claim, the County would not disapprove new housing that doesn't meet a 90 percent alternative water source target, and no housing laws would be violated. Please refer to General Response 3, which addresses how the Revised Draft 2045 CAP and Checklist applies to development projects.
- O15-48 As discussed in General Response 3 and responses to comments O15-40 and O15-41 above, Revised Draft 2045 CAP Measure E5 includes no project-level mandates. Checklist item #21, *TIER 2: Use Recycled Water and Graywater for Non-potable Uses and Include Rainfall Capture*, is a voluntary Tier 2 item that encourages projects to implement water reuse strategies on-site through certain design elements such as using reclaimed water for outdoor uses and installing residential graywater systems. Further, the County has revised the Checklist to clarify that the Checklist will be used only for projects that voluntarily wish to streamline their CEQA GHG impact analysis pursuant to CEQA Guidelines sections 15064(h)(3), 15064.4 and 15183.5(b). Demonstrating consistency with the Checklist is no longer mandatory for new

development projects but is rather a voluntary option that project applicants can use to streamline their project's GHG impact analysis under CEQA.

As discussed above, Measure E5 is legally feasible for the County to implement and the comment does not provide specific evidence as to why this measure would preclude the County from achieving its economic diversification goals, such that a specific response cannot be provided.

O15-49 See General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan. As discussed above, Measure E5 is legally feasible for the County to implement and the comment does not provide specific evidence as to why this measure is legally and technically infeasible and the examples given do not support the claim that these goals are legally infeasible, such that a specific response cannot be provided.

O15-50 As discussed in General Response 3 and responses to comments O15-40 and O15-41 above, Revised Draft 2045 CAP Measure E5 includes a performance goal that 90 percent of total Countywide water demand is met by recycled water graywater, or potable reuse by the year 2045 (25 percent by 2030 and 50 percent by 2035) (Revised Draft 2045 CAP Chapter 3, p. 3-54). This is not a project-level mandate. For projects that wish to streamline their GHG impacts evaluation under CEQA, the Checklist requires nothing regarding water source types. This would include a new water recycling project that would blend imported water with recycled water.

Further, the County has revised the Checklist to clarify that the Checklist will be used only for projects that voluntarily wish to streamline their CEQA GHG impact analysis pursuant to CEQA Guidelines sections 15064(h)(3), 15064.4 and 15183.5(b). Demonstrating consistency with the Checklist is no longer mandatory for new projects but is rather a voluntary option that project applicants can use to streamline their project's GHG impact analysis under CEQA. As such, there is nothing in Measure E5 that would preclude a water recycling project from proceeding.

O15-51 As discussed in General Response 3 and responses to comments O15-40 and O15-41 above, Revised Draft 2045 CAP Measure E5 includes a performance goal that 90 percent of total Countywide water demand is met by recycled water graywater, or potable reuse by the year 2045 (25 percent by 2030 and 50 percent by 2035) (Revised Draft 2045 CAP Chapter 3, p. 3-54). The comment is incorrect that Measure E5 only accepts three alternative water source technologies. The three technologies cited in the comment; recycled water, graywater, and indirect potable reuse; are examples of technologies that could be used to achieve the performance goals of Measure E5. There is no requirement in the Revised Draft 2045 CAP to use only these three strategies, and no prohibition on other strategies. For reference, the full text of measure E5 is provided below:

Increase Use of Recycled Water and Graywater Systems: Increasing the use of alternative water sources (e.g., recycled water, graywater, indirect potable reuse)

reduces the demand for water sources with higher energy and carbon intensities (e.g., imported water, groundwater). (Emphasis added.) (Revised Draft 2045 CAP p. 3-57.)

- O15-52 The comment is correct that innovative new technologies will be required to achieve California’s long-term goal of carbon neutrality by 2045, as identified by CARB in the 2022 Scoping Plan.³⁵ However, the comment is incorrect that the Revised Draft 2045 CAP is hostile to new technologies. To the contrary, the Revised Draft 2045 CAP encourages new technologies, such as by incorporating new technologies that become more commercially available over the next 20–25 years to further reduce the County’s residual emissions, like zero-emission engine technologies for off-road equipment and heavy-duty on-road trucks (Revised Draft 2045 CAP pp. 3-11 to 3-12). Within the context of Measure E5’s performance goals for alternative water supply, the three technologies listed in Measure E5 (recycled water, graywater, and indirect potable reuse) are example technologies that could be used to achieve the performance goals of Measure E5. There is no requirement in the Revised Draft 2045 CAP to use only these three strategies, and no prohibition on other strategies or new technologies.

The County agrees with the comment that the County must take a leadership role in technology innovation, capital and company formation, advanced manufacturing, and marketing, to achieve its GHG reduction targets and its long-term GHG reduction goal of carbon neutrality by 2045. The Revised Draft 2045 CAP serves as a key leadership roadmap to achieve these targets, and supports the development and use of innovative new technologies to reduce GHG emissions.

- O15-53 As discussed above, Measure E5 is feasible for the County to implement. The comment does not provide specific evidence as to why this measure would frustrate the County’s climate change leadership opportunities or why the measure would cause people and jobs to move to other states and local jurisdictions..

- O15-54 to O15-57 See General Response 3, which addresses concerns regarding quantification of GHG emission reductions for each CAP measure and action included in the Checklist, or for each CEQA streamlining requirement in the Checklist (General Response 3, Section 2.2.3.2), and an adequate basis or guidance for demonstrating GHG reduction equivalency for Alternative Project Emissions Reduction Measures (General Response 3, Section 2.2.3.4). Regarding Alternative Project Emissions Reduction Measures, the County has added a new subsection in Revised Draft 2045 CAP Appendix F in Section F.2 under Step 4 titled, “Guidance for Quantifying GHG Reductions from Alternative Measures” to help project applicants choose this pathway. This new section provides guidance for how applicants can quantify the GHG reduction benefits of a Checklist streamlining requirement for an individual project to determine the amount of GHG emissions reduction that an alternative

³⁵ California Air Resources Board. 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. November 16, 2022. Pages 5 and 9. Available at <https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2022-scoping-plan-documents>. Accessed July 2023.

project emissions reduction measure must achieve. See Revised Draft 2045 CAP Appendix F, pages F-13 to F-15 for more detail. Also see General Response 5, which addresses the obligation of the Revised Draft 2045 CAP to quantify GHG emission reductions for strategies, measures, and actions.

- O15-58 The commenter is incorrect by claiming that no project could be consistent with Checklist streamlining requirements #9, *Decarbonize Trucks*, or #10, *Incorporate Zero-Emission Technologies for Off-Road Vehicles & Equipment*, because the technology needed to comply with these requirements does not exist. The commenter provides no evidence to support the claims that there is a lack of technology prohibiting projects from meeting these requirements.

Checklist streamlining requirement #9 requires that projects: comply with any CALGreen Code requirement, County ordinance, Building Code, or condition of approval that requires a certain amount of EV charging infrastructure and readiness for goods movement facilities and trucks; provide EVCSs at all new warehouse loading docks; and implement freight decarbonization technologies along highway corridors, among other things. EV charging infrastructure for trucks is readily available and commercially scalable.³⁶

According to CARB, as of July 2022, there are currently 148 models of zero emission vehicle (ZEV) trucks in North America available for order or pre-order and 135 models are actively being produced and delivered to customers.³⁷ According to the Global Drive to Zero Zero-Emission Technology Inventory (ZETI) tool, a database for ZEVs, there are 20 manufacturers with over 50 models of medium-duty trucks currently available and 17 manufacturers with over 30 models of heavy-duty trucks currently available in the U.S. and Canada as of July 2023.³⁸ CARB's adopted Advanced Clean Trucks (ACT) regulation requires manufacturers who certify Class 2b-8 chassis or complete vehicles with combustion engines sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035.³⁹ By 2035, zero-emission truck/chassis sales would need to be 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales. The ACT rule also requires large employers including retailers, manufacturers, brokers and others are to report information about shipments and shuttle services to help identify future strategies to ensure that fleets purchase

Available at <https://www.cpuc.ca.gov/news-and-updates/all-news/cpuc-adopts-transportation-electrification-program-to-help-accelerate-electric-vehicle-adoption>. Accessed July 2023.

³⁷ California Air Resources Board, 2023. Advanced Clean Fleets Regulation Summary: Accelerating Zero-Emission Truck Markets. Updated May 17, 2023. Available at <https://ww2.arb.ca.gov/resources/fact-sheets/advanced-clean-fleets-regulation-summary>. Accessed July 2023.

³⁸ Global Drive to Zero, 2023. ZETI (Zero-Emission Technology Inventory). Available at <https://globaldrivetozero.org/tools/zeti/>. Accessed July 2023.

³⁹ California Air Resources Board, 2021. Advanced Clean Trucks Fact Sheet: Accelerating Zero-Emission Truck Markets. August 20. Available at https://ww2.arb.ca.gov/sites/default/files/2021-08/200625factsheet_ADA.pdf. Accessed July 2023.

available zero-emission trucks and place them in service where suitable to meet their needs.

CARB's new proposed Advanced Clean Fleets regulation would require several things including: 1) manufacturers sell only zero-emission medium- and heavy-duty vehicles starting in 2036; 2) beginning January 1, 2024, only zero-emission drayage trucks may register in the CARB Online System and all drayage trucks entering seaports and intermodal railyards would be required to be zero-emission by 2035; 3) high-priority fleets must purchase only ZEVs beginning 2024 and, starting January 1, 2025, must remove internal combustion engine vehicles at the end of their useful life as specified in the regulation; and 4) state and local government fleets, including city, county, special district, and State agency fleets, are required to ensure 50 percent of vehicle purchases are zero-emission beginning in 2024 and 100 percent of vehicle purchases are zero-emission by 2027.⁴⁰

According to the South Coast Air Quality Management District, the zero emission truck market is beginning to grow rapidly with many models entering the commercial market today and many major manufacturers announcing plans for future commercialization of battery-electric and hydrogen fuel cell electric trucks.⁴¹ Some notable manufacturer announcements include: Daimler Class 8 eCascadia, Navistar battery-electric Class 8, Volvo battery-electric VNR Class 8, Tesla's long range battery-electric tractor, BYD's battery-electric Class 6 and 8, Nikola's and Kenworth (in conjunction with Toyota) hydrogen fuel cell tractors, Sea Electric Class 4-8 battery-electric trucks, Lion Electric's Class 6-8 battery-electric trucks, Amazon's order of 100,000 Rivian's battery electric trucks, etc. NZE engines are currently available in two sizes: 11.9 liter and 8.9 liter. Major truck manufacturers offer these engines in different truck classes, including for class 8 regional haul and/or drayage truck operations.

Also see General Response 5, which addresses the obligation of the Revised Draft 2045 CAP to quantify GHG emission reductions for strategies, measures, and actions.

Regarding streamlining requirement #10, there are numerous pieces of electric and zero-emission construction equipment currently commercially available, including for

⁴⁰ California Air Resources Board, 2023. Advanced Clean Fleets Regulation Summary: Accelerating Zero-Emission Truck Markets. Updated May 17, 2023. Available at <https://ww2.arb.ca.gov/resources/fact-sheets/advanced-clean-fleets-regulation-summary>. Accessed July 2023.

⁴¹ South Coast Air Quality Management District, 2021. generators, pumps, welders, forklifts, skid steer loaders, dumpers, cranes, air compressors, saws, excavators, rollers, front loaders, and others.⁴²⁻⁴³

Consequently, the technology is currently available for projects to comply with streamlining requirement #9 and #10, and available technologies will expand in response to CARB's rules and regulations in addition to market demand.

O15-59 See General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan. The Revised Draft 2045 CAP will be revisited every five years after adoption to adjust policies and programs, where needed, to account for changes in technology and evolving federal and state regulations.

O15-60 The commenter is correct that the Revised Draft 2045 CAP includes several Checklist streamlining requirements that point to future regulations and ordinances that would implement the Revised Draft 2045 CAP measures and actions, such as the Zero Emission Vehicle Master Plan and future decarbonization ordinances. Before such regulations and ordinances are developed and adopted by the County, there is nothing with which projects intending to streamline their CEQA GHG impact analysis must comply. Therefore, in these instances, projects using the Checklist must only comply with currently adopted ordinances and requirements at the time of project approval. See General Response 3 for additional discussion.

In response to the comment's statement regarding demonstrating consistency with the Revised Draft 2045 CAP and Checklist, the Checklist would *not* be used as a tool for evaluating a project's consistency with the County's General Plan.

Demonstrating consistency with the Checklist is no longer mandatory for new development projects, but is rather a voluntary option that project applicants can utilize to streamline their project's GHG impact analysis. Projects that do not intend to streamline their GHG impact analysis no longer need to demonstrate consistency with the Checklist. Such projects would be required to prepare a project-specific impact analysis under CEQA, separate and apart from use of the Checklist. Please see General Response 3 for further discussion regarding the process for project applicants and General Response 2 for discussion regarding the Revised Draft 2045 CAP's relation to the General Plan.

O15-61 The Revised Draft 2045 CAP's measures and actions do, as the commenter accurately observes, include Countywide performance goals. For example, Measure T6 has a Countywide goal of installing 37,000 new public and shared private EV chargers by 2030 to support a fleetwide light-duty ZEV market share of 30 percent. However, contrary to the comment's claim, the Checklist does identify those specific project

⁴² California Air Resources Board, 2023. \$125M in Incentives for Off-Road Zero-Emission Equipment Available through California's CORE Project. Available at <https://ww2.arb.ca.gov/news/125m-incentives-road-zero-emission-equipment-available-through-californias-core-project> Accessed July 2023.

⁴³ California Clean Off-Road Equipment Voucher Incentive Project, 2023. California CORE - Equipment. Available at <https://californiacore.org/equipment-category/construction/>. Accessed July 2023.

requirements needed to demonstrate consistency with each applicable measure and action for new projects opting to streamline their GHG impacts analysis under CEQA, as required by CEQA Guidelines section 15183.5(b)(1)(D) (“Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level”). Using the comment’s same example, the project-specific requirements to support implementation of Measure T6 in Checklist include several things such as complying with any CALGreen Code requirement, County ordinance, building code, or condition of approval that requires a certain amount of EV charging infrastructure and readiness (such as minimum requirements for EV charging stations, EV-capable parking spaces, and EV-ready parking spaces) and include electric options for promoting active transportation, such as electric scooters and e-bikes. This is the same for all Tier 1 streamlining requirements. Consequently, the commenter’s claim that the Checklist does not indicate project-specific goals for measure T6 is incorrect.

O15-62 See General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan. See General Response 3, the Checklist is a valid basis for determining consistency with the Revised Draft 2045 CAP as which addresses project-level requirements for CEQA streamlining mechanism for GHG impacts as identified in the Checklist.

O15-63 As discussed in General Response 3, demonstrating consistency with the Checklist is no longer mandatory for new development projects, but is rather a voluntary option that project applicants can utilize to streamline their project’s GHG impact analysis. Projects that do not intend to streamline their GHG impact analysis no longer need to demonstrate consistency with the Checklist.

Such projects would be required to prepare a project-specific impact analysis under CEQA, separate and apart from use of the Checklist. Such an analysis would be tailored to the specific project and could include state law GHG reduction mandates and feasible additional GHG reductions and mitigation measures based on specific project information and new technologies and practices, as the comment requests. Please see General Response 3 for further discussion regarding the process for project applicants.

O15-64 In response to the comment’s statement that consideration of projects on an individual basis is the only way the Revised Draft 2045 CAP can be consistent with and in furtherance of other County plans, see General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan, and General Response 3, which addresses project-level requirements for CEQA streamlining as identified in the Checklist.

Please see General Response 3 for further discussion regarding the process for project applicants and General Response 2 for discussion regarding the Revised Draft 2045 CAP's relation to the General Plan.

- O15-65 See General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan. See General Response 3, which addresses project-level requirements for CEQA streamlining as identified in the Checklist.
- O15-66 The County acknowledges the legally binding agreement of the commenter; however, this comment does not raise significant environmental issues or raise inadequacies associated with the Recirculated Draft PEIR such that no response is required pursuant to CEQA Guidelines sections 15064(h)(3), 15064.4 and 15183.5(b). Please also refer to response to comment O15-61 above.
- O15-67 This comment on the Revised Draft 2045 CAP does not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses generally comments received on the Revised Draft 2045 CAP.
- O15-68 The comment raises general concerns about the Revised Draft 2045 CAP core elements, which are individually addressed in the responses below. See General Response 2, which addresses the relationship between the Revised Draft 2045 CAP and the General Plan. See General Response 3, which addresses project-level requirements for CEQA streamlining as identified in the Checklist.
- O15-69 The County intends to stay on track with the implementation of the Housing Element. The Housing Element sets forth implementing actions that encourage the private sector to build and improve housing. To that end, a climate action plan was identified as a program of the Housing Element. The Revised Draft 2045 CAP includes a streamlined voluntary procedure for environmental clearance for individual housing projects, thereby reducing the time and expense needed for individual environmental clearances. Such an analysis would be tailored to the specific project and could include state law GHG reduction mandates and feasible additional GHG reductions and mitigation measures based on specific project information and new technologies and practices, as the comment requests. Please see General Response 3 for further discussion regarding the process for project applicants.
- O15-70 Regarding this comment's suggestion that the Revised Draft 2045 CAP be revised into an aspirational document, please refer to General Response 2, which addresses this suggestion by clarifying the relationship between the Revised Draft 2045 CAP and the County's General Plan.
- O15-71 In response to the comment's suggestion that the Revised Draft 2045 CAP should quantify GHG reductions from statewide laws and mandates, and from measures that will be undertaken by the County and should allow projects to reduce emissions

through offsets and other approaches, the Revised Draft 2045 CAP does account for reductions from statewide laws and mandates, such as California’s Advanced Clean Car Standards, starting on page 2-7, and from forthcoming County measures in Chapter 3. See General Response 4, which addresses concerns regarding the use of voluntary GHG offset credits in the Revised Draft 2045 CAP and as an alternative GHG reduction measure in the Checklist for streamlining CEQA review of a project’s GHG impacts. See also General Response 3, which addresses concerns regarding the CEQA Streamlining Checklist and the use of alternative project emissions reduction measures, as well as General Response 5, which addresses the quantification of GHG emission reductions for the Revised Draft 2045 CAP strategies, measures, and actions.

O15-72 These comments on the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on these issues pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses generally comments received on the Revised Draft 2045 CAP.

May 15, 2023

Los Angeles County Department of Regional Planning
Attn: Thuy Hua
320 W. Temple Street, 13th Floor
Los Angeles, CA 90012

RE: Comments on the Revised Draft 2045 Climate Action Plan

Dear Ms.Hua,

Thank you for the opportunity to help shape the County's [Revised Draft 2045 Climate Action Plan \(CAP\)](#).¹ The Greenlining Institute is a policy advocacy organization that works toward a future where communities of color can build wealth, live in healthy places filled with economic opportunity, and are ready to meet the challenges posed by climate change. Our organization has worked extensively to research and advocate for key strategies to make equity real in climate adaptation and resilience in California. In Los Angeles County, we work directly with communities of the San Gabriel and Pomona Valleys who are at the frontlines and have been identified by the LA County Climate Vulnerability Assessment as having a higher likelihood of increased exposure to climate hazards.² Our partners have also identified the following key priorities for local climate action in the region: mobility and transportation justice, food justice and urban agriculture, and extreme heat. However, the communities we serve face significant barriers such as the necessary capacity building and resources needed to address climate impacts. To overcome these challenges, our shared vision for the region is to:

- Connect leaders to build collective people power, and develop a common language to pursue climate opportunities;
- Center organizations and bring together stakeholders who have not been traditionally part of the climate conversation;
- Increase community ownership over climate solutions, including language justice to effectively engage in participatory planning and policy making at the local and state level;
- Support community stakeholders with the capacity, resources and partnerships needed to realize community visions for climate resilience and equity.

¹ *Revised Draft 2045 Climate Action Plan*, Los Angeles County Department of Regional Planning, Mar. 2023. https://planning.lacounty.gov/wp-content/uploads/2023/03/LA_County_2045-CAP_Rev_Public_Draft_March_2023_Chapters.pdf. Accessed 17 Apr. 2023.

² *LA County Climate Vulnerability Assessment*, Oct 2021. <https://ceo.lacounty.gov/wp-content/uploads/2021/10/LA-County-Climate-Vulnerability-Assessment-1.pdf>. Accessed 17 Apr. 2023.

We look forward to shaping the development of the CAP by applying our experience in climate resilience, capacity building and learnings from our local partners. There are numerous aspects of the the current draft that we appreciate:

- First, we support the newly added section on *Climate Equity* in Chapter 1 from the first iteration of the CAP, which includes a list of climate equity guiding principles and a proposed equity approach for implementation (pages 51-57).
- We also agree that investments should be prioritized in frontline communities of unincorporated regions of LA County, and alignment with existing resources and tools such as the County's Climate Vulnerability Assessment, Healthy Places Index and CalEnvironScreen 4.0 to identify frontline communities (page 54).
- Lastly, we appreciate that capacity building in frontline communities and partnerships with community-based organizations (CBOs) is prioritized to ensure meaningful engagement throughout the CAP implementation and evaluation process (page 55).

We appreciate the opportunity to provide feedback on the current draft and offer the following CAP recommendations to ensure equitable outcomes and meaningful benefits in frontline communities across unincorporated areas of Los Angeles County.

Recommendations

Communities of color, indigenous communities, and low-income neighborhoods have been shaped by deliberate and exclusionary public policies. As a result, under-resourced communities have borne the brunt of generational disparities in socioeconomic and health outcomes, and suffer first and worst from escalating climate impacts. Moreover, these communities have long been excluded from the decision-making processes that impact their lives and neighborhoods, despite the deep expertise and solutions that they hold.

To achieve full potential, we must dismantle the systemic barriers for communities to have full access and opportunity to participate in local climate action. In our experience, under-resourced communities face the following key structural challenges to addressing climate impacts:

- *Ecosystem Gaps*: Decades of disinvestment have resulted in gaps across local ecosystems. Local organizations often require additional support for specific issue-area, content, or technical expertise. Another challenge is staffing and overall administrative capacity to meaningfully engage in the development, implementation and evaluation of local climate plans. In LA County, unincorporated regions face additional challenges to fully and actively participate in local climate action without local city governments in place.

- *Need for More Robust Multi-Sector Partnerships:* Even where neighborhoods may have strong community-based or institutional anchors, those actors may not be working constructively together to achieve greater collective impact. Communities may be siloed by issue areas, sectors, or a lack of trust, and require more meaningful opportunities to work together towards a shared climate vision grounded in equity.
- *Funding:* Under-resourced communities have been systematically starved of funding and investments, both public and private. Communities lack the resources needed to meaningfully engage residents, build collective visions, share their expertise, and work with local governments to implement projects and policies set forth by climate action plans.
- *Access to Structural Power:* Under-resourced communities lack the access or influence needed to advance community priorities. Implementing projects and changing policies to meet the needs of residents often requires access to structural power as embodied by local and regional governments.

In order to address these structural challenges, DRP must support under-resourced communities to fully take ownership over the decisions and proposed actions from the CAP that will shape their neighborhoods for years to come.

1. Support Capacity Building from the Bottom Up

To support equitable opportunity and access to tools for community-driven climate action, DRP should actively support capacity building activities in under-resourced communities from the bottom up. This involves centering community engagement, leadership, and governance, and supporting the ecosystem of change. Our organization defines capacity building as the process of strengthening local leadership, skills, expertise, and resources to enable communities to meet their needs and achieve self-determination:

a. Center Community Engagement, Leadership, and Governance

Centering community engagement and leadership in local climate action is foundational. No one knows better than community members themselves what is needed in their neighborhoods, yet rarely are community voices centered in the decision-making processes that impact their daily lives. An example of a process that centered meaningful engagement is the community engagement model used in the development of the LA County Sustainability Plan (OurCounty).³ The development of OurCounty employed a number of best practices including multi-stakeholder workshops, language-accessible outreach materials, and anchor community-based organizations to facilitate workshops and uplift equity strategies. Through local multi-stakeholder partnerships with philanthropy, the county was also able to provide anchor community-based organizations with grants and participation stipends for stakeholder engagement.

³ *OurCounty Stakeholder Engagement Summary*, LA County Chief Sustainability Office. https://ourcountyla.lacounty.gov/wp-content/uploads/2019/07/OurCounty-Stakeholder-Engagement-Summary_For-Web.pdf. Accessed 17 Apr. 2023.

The Transformative Climate Communities (TCC) program, administered by the Strategic Growth Council, also provides a strong design model for both community engagement and collaborative governance that can be applied in the implementation of local climate action plans.⁴ TCC requires the development of Community Engagement Plans, supports community-led decision-making that builds towards collective impact and requires collaborative governance between a diverse range of organizations. This creates a platform where community organizations and residents not only have a seat at the table, but also have meaningful decision-making power in developing strategies and actions for climate resilience in their communities.

b. Support the Ecosystem of Change

Across local ecosystems, we have found that successful collective impact depends on the resourcing of several key stakeholder types (a strong community anchor, supportive local government, and community-facing technical assistance or a third-party entity) so they can effectively collaborate to conduct community engagement efforts.

- i. Community anchors are community-based organizations or coalitions which organize or engage directly with residents and have a history of strong relationships, trust, and cultural competency with impacted communities. Community anchors ground the effort in community-identified priorities and leadership, but may lack the technical or administrative capacity. Through using an intersectional approach, community anchors can also bring together stakeholders who have not traditionally been part of the climate conversation but whose communities are at the frontlines of climate impacts such as immigrant rights, worker centers and tenant rights organizations.
- ii. Government partners may include local governments, regional governments, and other public agencies that can offer significant administrative and fiscal capacity. However, for local governments to be strong community-aligned partners, it is crucial that key political decision-makers and implementing staff support the community-led effort.

⁴ *Transformative Climate Communities Program Final Round 5 Guidelines*, California Strategic Growth Council, 15 Feb. 2023. https://sgc.ca.gov/programs/tcc/docs/20230308-TCC_R5_Guidelines.pdf. Accessed 17 Apr. 2023.

- iii. Technical assistance providers can be a vital component in advancing community-led visions for climate resilience. TA providers should tailor their services to fill capacity gaps of community partners including partnership-building support, funding, community engagement, project pre-development, building community capacity, and more. Furthermore, many community-based organizations have developed community-driven climate resilience plans and potential projects ideas. Therefore, the DRP should prioritize aligning the CAP with existing community visions for climate resilience, and provide TA support to build their capacity. Doing so will ensure communities' visions of climate resilience and adaptation become an integral component of the CAP.

2. Operationalize Equity from Project Goals through Evaluation

Including a commitment to equity is not enough to ensure that equity will occur. Operationalizing equity requires embedding equity into all stages of a climate action plan. We strongly encourage DRP to embed equity into the proposed strategies, measures and actions of the CAP and in the creation of any new local grant programs to support frontline communities. The Greenlining Institute's "Making Equity Real in Climate Adaptation and Community Resilience Guidebook" provides a framework for how to embed equity in policies, projects or programs using the following four steps.⁵

- a. *Embed Equity in the Mission, Vision, & Values*

Equitable outcomes and a strong equity evaluation flow directly from the goals and targets established at the outset. The CAP should explicitly state a commitment to equity, clearly define equity, establish specific measurable equity targets, and identify the frontline communities they seek to benefit upfront. An example of equity-centered goals is the LA County's Sustainability Plan where equity is embedded in the twelve sustainability goals of the plan. Existing county resources such as the Climate Vulnerability Assessment can also be used for targeted benefits in communities most vulnerable to the impacts of climate change.⁶ Such efforts will allow the county to tackle the climate impacts faced by frontline communities. The effort must also aim to create comprehensive climate strategies for communities that go beyond building the resilience of physical environments to address other health and economic injustices that climate impacts exacerbate.

- b. *Build Equity into the Process*

⁵ Mohnot, Sona, et al. The Greenlining Institute, 2019, *Making Equity Real in Climate Adaptation and Community Resilience Policies and Programs*, <https://greenlining.org/wp-content/uploads/2019/08/Making-Equity-Real-in-Climate-Adaption-and-Community-Resilience-Policies-and-Programs-A-Guidebook-1.pdf>. Accessed 17 Apr. 2023.

⁶ *LA County Climate Vulnerability Assessment*, Oct 2021. <https://ceo.lacounty.gov/wp-content/uploads/2021/10/LA-County-Climate-Vulnerability-Assessment-1.pdf>. Accessed 17 Apr. 2023.

DRP should deeply engage community members to learn about and respond to their priorities, needs, and challenges in adapting to climate impacts in order to inform the development and implementation of the CAP. This includes building partnerships with diverse organizations such as immigrant rights organizations and worker centers that are increasingly advocating for measures to address extreme heat.

In addition, DRP Equity Guiding Principles can be improved upon. Figure 4-1: Equity Guiding Principles notes the engagement process as Step 6. Rather, engagement should be woven throughout. Communities should be actively part of the decision-making process in implementation (Step 5), when conducting evaluation (Step 8), and so on (pgs. 39-43). DRP should include securing funding sources for CBO grants and stipends to support participants throughout the engagement process as well. Through this, DRP will be able to better identify how proposed actions may generate burdens (e.g. time/capacity, displacement, and increased costs), either directly or indirectly to frontline communities and an accompanying plan to address and mitigate those burdens.

c. Ensure Equity Outcomes

The CAP must lead to equity outcomes that respond to community needs, reduce climate vulnerabilities, and increase community resilience. Outcomes can include improved public health and safety, workforce and economic development, and more in ways that reduce historical and current disparities. As one example, the Santa Cruz Climate Action Plan developed an Equity Screening Tool to screen all proposed actions to ensure equitable and just transition outcomes for communities. Some of the equity criteria used in the tool included community health and safety, affordability, and green job facilitation and creation.⁷

d. Measure & Analyze for Equity

The CAP should apply clear equity metrics in Chapter 4: Implementation and Monitoring (pages 139-143) and in tracking metrics proposed in Table 4-1 (page 144) to evaluate its successes and challenges in prioritizing frontline communities. DRP can partner with CBOs to establish reporting criteria and metrics to achieve this. Additionally, DRP should establish accountability checkpoints to measure the outcomes of actions to ensure equitable benefits to frontline communities and avoid disproportionate harm. Course correction checkpoints, and a transparent process for communicating progress to community stakeholders should also be put in place.

3. Assess Grant Administration and Potential Funding Opportunities

⁷*Climate Action Plan Appendices*, City of Santa Cruz, Jun. 2023.
<https://www.cityofsantacruz.com/home/showpublisheddocument/90694/637983259399030000>. Accessed 17 April. 2023.

DRP must assess and improve its internal practices to simplify program administration, reduce barriers in the development of new grant programs and prioritize potential funding opportunities that invest in frontline communities.

a. Administrative Assessments

Communities working through local grants and other government processes often encounter a labyrinth of complicated rules and regulations. To reduce barriers for entry in the development of new grant programs for individuals for energy retrofits (page 57) and grants for local CBOs to conduct community engagement (page 142), we encourage DRP to conduct internal evaluations of their own grant management processes and requirements. Such an evaluation would help DRP assess how their internal administrative processes could be streamlined to improve public access. For example, such an assessment could distinguish which administrative requirements are statutorily required, and which requirements are in fact just custom or accepted practice. This would help to reduce the number of administrative specifications and increase overall accessibility of grants especially for under-resourced communities of LA County.

b. Remove Needless Funding Barriers

As DRP carries out its own internal assessments, funding barriers immediately stand out for limiting the ability of communities to participate in local climate action plans. As DRP acknowledges, many incentive programs present barriers to fully engage in local climate action (pg 57). The reimbursement model creates significant cash flow challenges for individuals as they may not have available extra resources to cover upfront costs. In the creation of any new programs targeted at frontline communities, DRP should offer advance pay to allow full equitable participation in climate resilience. Small and/or under-resourced community-based organizations seeking to partner with local governments to engage in climate action plans also have similar barriers when accessing local grants. When partnering with community-based organizations to support community engagement activities DRP should offer advance payment to reduce financial barriers.

c. Prioritize Funding Sources that Invest in Frontline Communities

Many of the funding sources identified in Table 3-3 (page 76) do not prioritize investments in frontline communities. DRP should identify a list of potential funding sources that invest in and outline clear benefits to frontline communities. When partnering with community-based organizations to seek state and federal grant opportunities, DRP should prioritize grant opportunities that also have the least administrative barriers and provide advance pay for partner organizations. For instance, the California Air Resources Board Sustainable

Transportation Equity Program (STEP)⁸ uses an advance pay regulation to grant the majority of funds up front for planning and implementation grants⁹. Doing so will ensure DRP's commitment to “*prioritize funding and action in frontline communities*” and support diverse multi-stakeholder partnerships to implement actions from the CAP (pg 140).

Conclusion

Thank you for the opportunity to offer comments for the proposed LA County 2045 Climate Action Plan. We urge the LA County Department of Regional Planning to incorporate the recommendations outlined above into the final CAP and continue engaging frontline communities so the CAP is reflective of their visions for climate resilience.

Sincerely,

Katherine Cabrera
Program Manager of Capacity Building, *The Greenlining Institute*

⁹ *Proposed Additional Requirement for Advance Payment of Certain Funds Regulation*. California Air Resources Board, 3 Sept. 2019, <https://ww2.arb.ca.gov/rulemaking/2019/advancedpayment2019>. Accessed 17 Apr. 2023.

2.3.2.16 Letter O16: The Greenlining Institute

This letter provides input on the Revised Draft 2045 CAP only. Comments specific to the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, the County has received and reviewed comments on the Revised Draft 2045 CAP and common topics are discussed in Section 1.4, *Comments on the Revised Draft 2045 CAP*, in Chapter 1, *Introduction*.

2.3.3 Responses to Comments from Individuals

Comment Letter I1

CAUTION: External Email. Proceed Responsibly.

Hello,

I live in Pasadena, CA in LA County. I've focused my review on the transportation segments of the document as they are the greatest contributors to climate change by the numbers. There should be more of a focus on dense development and transit infrastructure and the intersection of land use and VMT than I currently see in this document. Is there a way to be alerted to revisions of this document, or meetings reviewing this document?

I1-1

- Measure T1, p. 99: Please remove the maximum DU cap (quoted below). There should be no limitation to how many dwelling units are built surrounding transit. Increased transit access helps decrease single occupant trips and decrease vehicle miles traveled.
 - "Achieve a minimum of 20 dwelling units (DU) per acre (~~maximum of 30-150 DU per acre~~) for HQTAs. :

I1-2

- Measure T1: I appreciated the focus on access to public amenities like parks!

- Measure T2, p. 100: This seems to not account for remote work and work from home lives. We're already seeing other downtowns struggle to fill office spaces. It would make more sense to emphasize housing combined with jobs. This also reduces VMT.

I1-3

- Measure T3: What percentage of bike lanes will be physically protected? Paint is not protection. These need to be safe enough for children to ride to truly increase biking safety.

I1-4

- Measure T4 - that's an awesome goal to increase transit hours! Short headways make transit way easier to take!
- Measure T4.6 - I love this measure! Increasing affordability of transit helps people use it!
- Measure T4.8 - can't wait to see it here!

- Measure T4.10 - don't let this one become a blocker to making transportation abundant and reliable. Something is better than nothing, even if it's not perfect.

I1-5

- Measure T5 - love this, let's get rid of parking minimums! Especially near transit!

- I think there's an overfocus on EV's as a solution to climate change.

I1-6

- Is the grid system ready and changing to support that load in parallel?

I1-7

- How will that grid support EV during extreme temperatures?

I1-8

- Studies are starting to show that vehicle tires produce quite a bit of pollution too: <https://www.theguardian.com/environment/2022/jun/03/car-tyres-produce-more-particle-pollution-than-exhausts-tests-show>

2.3.3.1 Letter I1: Chelsea Katan

This letter provides input on the Revised Draft 2045 CAP as well as CEQA comments on the Recirculated Draft PEIR. Comments specific to the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, the County has received and reviewed comments on the Revised Draft 2045 CAP and common topics are discussed in Section 1.4, *Comments on the Revised Draft 2045 CAP*, in Chapter 1, *Introduction*. PEIR-focused comments are addressed below.

I1-1 For the notices regarding the Revised Draft 2045 CAP Measure T1, Measure T2, Measure T3, Measure T4, Measure T5, and other areas of the Revised Draft 2045 CAP are acknowledged and have been included in the record and they will be considered by decision-makers. Regarding housing density and land use decisions the project, interested parties can register for the project listserv to receive email notifications: <https://planning.lacounty.gov/get-involved/>.

The Revised Draft 2045 CAP is a policy document that is intended to reduce community-wide GHG emissions and would support development allowed under the General Plan. No changes to General Plan land use designations, zoning, or specific projects are proposed as part of the Revised Draft 2045 CAP. However, the Housing Element developed the Rezoning Program as one of the first steps to facilitate sustainable housing production. The rezoning is being implemented through the Area Plan and is named as Programs 7 (East San Gabriel Valley Area Plan), 8 (Metro Area Plan), 18 (South Bay Area Plan), 19 (West San Gabriel Valley Area Plan), and 20 (Westside Area Plan) in the Housing Element. The Rezoning Program will increase housing densities in areas with existing infrastructure.

The Revised Draft 2045 CAP includes Measure T1, which seeks to increase housing opportunities that are affordable and near high-quality transit areas to reduce VMT. Implementation of the Revised Draft 2045 CAP's measures and actions would reduce overall Countywide vehicle trips and VMT. The Revised Draft 2045 CAP would encourage mixed-use development (Measure T2) and place residential density near transit (Measure T1), which would reduce VMT within the County.

I1-2 to I1-5 These comments on the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on these issues pursuant to CEQA Guidelines section 15088(a). Nonetheless, see Chapter 1, which addresses generally comments received on the Revised Draft 2045 CAP.

I1-6 Responding to the comment's opinion that the Revised Draft 2045 CAP includes too much focus on EVs as a solution to climate change, transportation represents over 50 percent of the County's total GHG inventory and it is notoriously difficult to reduce GHG emissions in the transportation sector. Increasing the Countywide market share of zero emission vehicles is a cornerstone of the Revised Draft 2045 CAP's

program to achieve the County’s 2030, 2035, and 2045 GHG emission reduction targets. This aligns with CARB’s 2022 Scoping Plan, which also heavily relies on ZEVs to achieve California’s statutory GHG emission reduction targets.

The County has limited control over individual behaviors when it comes to transportation. The Revised Draft 2045 CAP includes Strategy 2, *Increase Densities and Diversity of Land Uses Near Transit*, which focuses on coordinating land use development that leads to outcomes associated with reduced VMT, such as increased densities near transit, jobs-housing balance, and strategically located land uses that can reduce travel distances for many trip purposes. Strategy 3, *Reduce Single-Occupancy Vehicle Trips*, focuses on development of transportation networks that increase the accessibility, comfort, and convenience of active travel modes to help reduce trips made in single-occupancy vehicles. The measures and actions listed under these two strategies aim to reduce the amount of time and miles traveled in vehicles throughout the County.

- I1-7 In response to the commenter’s concern that the electric grid is not ready to support the new electricity demand resulting from the new EVs in the vehicle fleet as called for by Draft 2045 CAP Measure T6, please refer to Draft PEIR Chapter 3.7, *Energy*, for a discussion of the capacity of the grid to support implementation of the Revised Draft 2045 CAP’s electrification measures and actions. (Recirculated Draft PEIR, Chapter 3.7, pp. 3.7-13 to 3.7-14.)
- I1-8 Please refer to Draft PEIR Chapter 3.7, *Energy*, for a discussion of the capacity of the grid to support implementation of the Revised Draft 2045 CAP’s electrification measures and actions. (Recirculated Draft PEIR, Chapter 3.7, pp. 3.7-13 to 3.7-14.)
- I1-9 The County has reviewed the Guardian article on car tires and air pollution (URL provided by the commenter). Tire wear is a known source of particulate matter and this is acknowledged in Recirculated Draft PEIR Chapter 3.4, *Air Quality*. (Recirculated Draft PEIR, Chapter 3.4, pp. 3.4-33.) Reducing particulate matter is a co-benefit of reducing VMT. However, the County has determined that the information provided in this article does not raise environmental issues related to the Recirculated Draft PEIR and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, the information has been included in the administrative record where it will be considered as part of the decision-making process.

Comment Letter I2

From: [Emmanuel Alcantar](#)
To: [DRP EPS Climate](#)
Subject: Climate Action Plan
Date: Thursday, May 11, 2023 1:17:07 PM

CAUTION: External Email. Proceed Responsibly.

Hello,

My name is Emmanuel Alcantar and I wanted to provide feedback on the County's climate action plan.

Right now, LA County's current plan is to cap housing density near high quality transit at as low as 30 homes/acre. CARB's own scoping plan says that we need 25% reduction in per capita VMT in order for the state to reach its own climate goals and building densely — especially in our transit corridors — is one of the most significant ways we can make progress on that. I do not believe we should be putting any limits on density, height, or floor area near public transit.

I2-1

I also think we need to re-zone areas near our community colleges (many of which are high quality transit areas) and ensure that they are being used for dense housing, especially since we have so many students who are either severely rent burdened or are unhoused.

I2-2

Lastly, in a similar vein, I believe the County should reform its parking requirements to allow for easier implementation of SB 9.

I2-3

Thank you so much for your time.

Best regards,
Emmanuel Alcantar

2.3.3.2 Letter I2: Emmanuel Alcantar

This letter provides input on the Revised Draft 2045 CAP as well as CEQA comments on the Recirculated Draft PEIR. Comments specific to the Revised Draft 2045 CAP do not raise significant environmental issues related to the Recirculated Draft PEIR, and no further response is required on this issue pursuant to CEQA Guidelines section 15088(a). Nonetheless, the County has received and reviewed comments on the Revised Draft 2045 CAP and common topics are discussed in Section 1.4, *Comments on the Revised Draft 2045 CAP*, in Chapter 1, *Introduction*. PEIR-focused comments are addressed below.

- I2-1 The commenter is correct that the 2022 Scoping Plan has a statewide goal of reducing per-capita VMT 25 percent below 2019 levels by 2030. As discussed in Revised Draft 2045 CAP Appendix H, *2022 Scoping Plan Recommendations Consistency*, the Revised Draft 2045 CAP does not achieve the same levels of per-capita VMT reduction as the Scoping Plan Scenario for 2045. Compared to estimated 2019 levels, the Revised Draft 2045 CAP achieves a 10 percent reduction in per-capita VMT by 2030, a 12 percent reduction by 2035, and a 16 percent reduction by 2045, which is extremely aggressive for the land use profile of unincorporated Los Angeles County. Note that CARB's 30 percent reduction goal is a statewide target and not a mandate for individual jurisdictions, including cities and counties. Therefore, the Revised Draft 2045 CAP is consistent with the 2022 Scoping Plan. For additional discussion, see Revised Draft 2045 CAP Appendix H.
- I2-2 Regarding the comment's recommendations related to increasing housing density near transit corridors and community colleges, as discussed in General Response 2, the Revised Draft 2045 CAP is a policy document that would support development allowed under the General Plan. No changes to General Plan land use designations, zoning, or land use-specific projects are proposed as part of the Revised Draft 2045 CAP. Specifically, the 30 dwelling units per acre minimum within HQTAs is directly from the County's 2021-2029 Housing Element, and is not a new component of the Revised Draft 2045 CAP.
- I2-3 Assembly Bill 2097 removed parking minimums for projects located within one half mile of public transit. The County is currently working toward codifying AB 2097 regulations into the County Code.

CHAPTER 3

Revisions to the Recirculated Draft PEIR

3.1 Introduction

The following changes have been made to the previously published text of the Recirculated Draft Program Environmental Impact Report (PEIR). Changes to the Recirculated Draft PEIR include minor corrections: improving writing clarity, grammar, and consistency; making clarifications, additions, or deletions resulting from specific responses to comments; and showing changes to update information in the Recirculated Draft PEIR. These text revisions are organized by the chapter and page number (provided on the left-hand side of the page, below) that appear in the Recirculated Draft PEIR. An explanation of the change, including identification of where it would be made, is presented in italics. The specific additions and deletions use the following conventions:

- Text deleted from the EIR is shown in ~~strike out text~~.
- Text added to the EIR is shown in underline text.

These revisions are provided to clarify, refine, and provide supplemental information to the Recirculated Draft PEIR and are incorporated as part of this Final PEIR. These changes do not constitute substantial new information that requires recirculation of the Recirculated Draft PEIR pursuant to CEQA Guidelines section 15088.5. Recirculation is not required when new information is added that “merely clarifies or amplifies or makes insignificant modifications in an adequate EIR.” (CEQA Guidelines, § 15088.5(b).) The new information added to the EIR through these modifications clarifies or amplifies information already provided or makes insignificant modifications to the already adequate Recirculated Draft PEIR. While these additions to the Recirculated Draft PEIR provide valuable information by which to evaluate the environmental impacts of the Project, and include clarification and insignificant modifications to the Recirculated Draft PEIR, they do not trigger recirculation under the standard articulated in the Guidelines. The information added to the EIR does not reveal any potentially new significant impacts which had not been previously analyzed. Recirculation is not required here.

3.2 Text Changes to the Recirculated Draft PEIR

3.2.1 Executive Summary

Page ES-4 Table ES-1: Action ES1.1 has been revised as follows:

Action ES1.1 – Collaborate with other local jurisdictions and utilities to develop a sunset strategy for all oil and gas operations that prioritizes disproportionately affected communities. ~~Develop an ordinance.~~

Page ES-4 Table ES-1: Action ES1.2 has been revised as follows:

Action ES1.2 – Develop a policy that requires the examination of ~~all active, idle, and abandoned~~ oil wells for fugitive emissions of GHGs to develop and implement a closure plan. Coordinate with federal and state agencies ~~conducting~~ collecting fugitive emissions data.

Page ES-4 Table ES-1: Action ES 5.3 has been revised as follows:

~~Action ES5.3 – Evaluate a program for reducing GHG emissions for new development that require General Plan amendments.~~

Page ES-4 Table ES-1: Action ES 5.4 has been modified and revised as follows:

Action ES5.4~~3~~ - Establish an Offsite GHG Reduction Program for new development to use as a GHG reduction or mitigation pathway for 2045 CAP compliance and to fund programs for reducing GHG emissions in the built environment.

Page ES-5 Table ES-1: Action ES 5.2 has been modified and revised as follows:

Action ES5.2 - Implement the 2045 CAP ~~consistency review~~ CEQA streamlining checklist for new development to demonstrate consistency with the 2045 CAP's strategies, measures, and actions for purposes of streamlining environmental review of GHG impacts using the 2045 CAP's PEIR pursuant to CEQA Guidelines Section 15183.5(b).

Page ES-5 Table ES-1: Action ES 5.3 has been revised as follows:

~~Action ES5.3 – Evaluate a program for reducing GHG emissions for new development that require General Plan amendments.~~

Page ES-5 Table ES-1: Action ES 5.4 has been modified and revised as follows:

Action ES5.4~~3~~ - Establish an Offsite GHG Reduction Program for new development to use as a GHG reduction or mitigation pathway for 2045 CAP

compliance and to fund programs for reducing GHG emissions in the built environment.

Page ES-10 Table ES-1: Measure E1 has been modified and revised as follows:

Measure E1: ~~Transition~~ Decarbonize Existing Buildings to All Electric

Page ES-10 Table ES-1: Action E 1.1 has been modified and revised as follows:

Action E1.1 - Adopt Building Performance Standards for existing buildings and reach code requirements for major retrofits and renovations that require zero-GHG emission appliances, electric water and space heating. ~~Require buildings to retrofit natural gas water and space heating to electric water and space heating at the point of sale.~~

Page ES-10 Table ES-1: Action E 1.2 has been modified as follows:

Action E1.2 - Increase alternatives to fossil natural gas uses, such as for cooking, in existing buildings. Establish carbon and GHG intensity limits for existing nonresidential and residential buildings over a certain size.

Page ES-11 Table ES-1: Action E 1.1 has been modified and revised as follows:

Action E1.1 - Adopt Building Performance Standards for existing buildings and reach code requirements for major retrofits and renovations that require zero-GHG emission appliances, electric water and space heating. ~~Require buildings to retrofit natural gas water and space heating to electric water and space heating at the point of sale.~~

Page ES-11 Table ES-1: Measure E2 has been modified and revised as follows:

Measure E2: ~~Standardize~~ Decarbonize All Electric-New Development

Page ES-11 Table ES-1: Action E2.1 has been modified and revised as follows:

Action E2.1 - Adopt an ordinance requiring all applicable new buildings to be zero-GHG emission fully electric with no natural gas hookups. Include affordable housing considerations in these requirements, and develop supporting measures (financial support, technical assistance, or other incentives) to defray potential additional first costs in order to maintain housing affordability. Require all new development to be electric-ready.

Page ES-12 Table ES-1: Action E4.1 has been modified and revised as follows:

Action E4.1 – Adopt Building Performance Standards for energy efficiency in existing buildings. Require buildings to perform energy efficiency retrofits at the point of sale. Expand and enhance the energy efficiency programs offered by the

Southern California Regional Energy Network (SoCalREN). Include affordable housing considerations in these requirements, and develop additional renter protections and supporting measures (financial support, technical assistance, or other incentives) to limit the amount of first costs being passed on to low-income renters.

Page ES-14 Table ES-1: Action W 1.2 has been modified and revised as follows:

Action W1.2 - Implement, enforce, and expand to the maximum extent feasible the single-use plastics ~~ordinance~~ and expanded polystyrene ban ordinance.

Page ES-14 Table ES-1: Action W 2.3 has been modified as follows:

Action W2.3 - Collaborate with the Los Angeles County Sanitation Districts and other waste and wastewater service providers to utilize unused anaerobic digestion capacity of existing wastewater treatment plants and solid waste facilities to generate vehicle fuel and other beneficial uses (electricity and/or biomethane) from newly diverted organic waste. Develop a strategy for using bioenergy created from recycled organic waste.

Page ES-16 Section ES 2.1 Project Overview has been modified and revised as follows:

- A new development review CEQA streamlining consistency checklist to allow projects to streamline CEQA compliance by using the Draft 2045 CAP, per CEQA Guidelines Section 15183.5.

Page ES-17 Section ES 2.2 Project Objectives has been modified and revised as follows:

(5) Demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects (serve as a “qualified CAP”) via a Draft 2045 Climate Action Plan CEQA Streamlining CAP Consistency Checklist.

Page ES-54 Section 4.2.1 has been modified and revised as follows:

In this case, the No Project Alternative examines a scenario in which the County would not approve the Draft 2045 CAP for implementation in the unincorporated areas, and none of the GHG emissions reduction strategies, measures, or actions outlined in the 2045 CAP would be implemented ~~and none of the benefits and co-benefits identified in the 2045 CAP would be realized.~~

Page ES-58 Section 4.2.4 has been revised and modified as follows:

For example, Measure T6, Increase ZEV Market Share, has a 2030 performance goal of a 30 percent ZEV fleetwide percentage for light-duty vehicles in the

County; under Alternative 3, this performance objective ~~could~~ would likely be reduced to a 10 percent ZEV market share (or lower).

Pages ES-59 to ES-60 Section 4.4 has been revised and modified as follows:

~~The CEQA Guidelines define the *environmentally superior alternative* as that alternative with the least adverse impacts on the project area and its surrounding environment. For this Project, the No Project Alternative is considered the environmentally superior alternative for CEQA purposes because it would avoid all impacts of the Project even though air quality and GHG emissions would be the worst among all alternatives under the No Project Alternative. However, the No Project Alternative would fail to meet the basic objectives of the Project. Additionally, selection of the No Project Alternative would result in realization of none of the benefits identified in the Draft 2045 CAP. Because the environmentally superior alternative is the No Project Alternative, the EIR also must identify an environmentally superior alternative from among the other alternatives. (CEQA Guidelines Section 15126.6(e)(2).)~~

An EIR’s discussion of alternatives to the proposed project must include a “no project alternative” to allow a comparison of the environmental impacts of approving the proposed project with the effects of not approving it. (CEQA Guidelines, § 15126.6(e)(1).). CEQA requires an EIR to identify the “environmentally superior alternative” if the no project alternative is environmentally superior. (CEQA Guidelines, § 15126.6 (e)(2).).

The EIR No Project Alternative evaluates the scenario where the County would not approve the Revised Draft 2045 CAP for implementation such that no GHG emissions reduction strategies, measures, or actions identified by the Revised Draft 2045 CAP would be implemented. This would avoid adverse impacts caused by projects facilitated by the Revised Draft 2045 CAP, as compared to impacts under the Revised Draft 2045 CAP. Because the No Project Alternative would not facilitate projects, there would be no project-related impacts when compared to implementation of the Revised Draft 2045 CAP (see Table 4-6, which provides a comparative summary), and thus, the No Project Alternative is identified as the environmentally superior alternative.

However, in the long-term, the No Project Alternative would result in substantially fewer environmental benefits to the County overall for several reasons. First, air pollutant (criteria pollutants and toxic air contaminants) and GHG emissions would be much higher under the No Project Alternative than air pollutant and GHG emissions under with all other alternatives and the Project such that impacts to human health would be higher. This is because the Project would substantially reduce countywide GHG emissions, and many of these emission reductions would produce parallel reductions in criteria pollutants and toxic air contaminants primarily by reducing fuel combustion. The No Project

Alternative would result in greater human health risks associated with exposure to toxic air contaminants than all other alternatives and the Project, because all other alternatives and the Project would substantially reduce TAC emissions in the County. The No Project Alternative would neither realize the long-term GHG emission reduction benefits associated with implementation of the Revised Draft 2045 CAP (and all the co-benefits that would also occur, such as reduced criteria pollutant and TAC emissions), nor provide a clear pathway for the County to meet and exceed the statewide 2030 GHG reduction goal identified in SB 32 or meet and exceed the 2045 direct emission reduction target and carbon neutrality goal established by AB 1279. Significantly, the No Project Alternative would not meet any of the Project objectives and the County is not obligated to select the environmentally superior alternative for implementation if it would not accomplish the basic project objectives. (CEQA Guidelines, § 15126.6(a), (c), (f).)

CEQA Guidelines Section 15126.6(e)(2) states, “[i]f the environmentally superior alternative is the “no project” alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.”

For purposes of this EIR, Of Alternatives 1-3, Alternative 3 would reduce adverse environmental impacts compared to the Project to the greatest extent because it would result in fewer facilitated projects compared with the Revised Draft 2045 CAP. Alternative 3 is considered the environmentally superior alternative for CEQA purposes because it would result in similar but lesser impacts than 11 resource areas relative to the Project in the following resource areas: (i.e., aesthetics, agriculture and forestry resources, air quality, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, utilities and service systems, and wildfire.) and However, Alternative 3 would result in greater impacts than the Project in two resource areas (i.e., for energy, and GHG emissions, air quality, and utilities and service systems). Alternative 3 would facilitate fewer projects that would reduce Countywide energy use compared to the Project, resulting in greater energy consumption than the Project. Alternative 3 would result in greater GHG emissions impacts than the Project because Alternative 3 would not reduce Countywide GHG emissions as much as the Project through 2030 and 2035, producing much greater GHG emissions than the Project. Additionally, implementation of Alternative 3 would result in greater air quality impacts than the Project for operational impacts because Alternative 3 would facilitate fewer projects through 2030 and 2035, resulting in much greater emissions of criteria pollutants and TACs throughout the county for these years, resulting in greater human health risks as compared to the Project. Finally, Alternative 3 would result in greater utilities and service systems because projects facilitated by Alternative 3 would lead to increased use of recycled and gray water systems compared to the Project, increasing the amount of wastewater requiring treatment by wastewater treatment providers, and thus, would require the development of new water recycling and direct potable reuse facilities.

Alternative 3 would have same impacts as the Project with respect to the remaining resources. See Table 4-6 for details.

However, ~~it should be noted that~~ Alternative 3 would likely only delay these impacts as compared to the Project ~~versus rather than lessening these impacts or eliminate ing these m impacts entirely.~~ This is because Alternative 3 has lower GHG emissions reduction targets only for the years 2030 and 2035 compared to the Project; (it has the same targets for the year 2045). This means that Alternative 3 would likely facilitate fewer projects through 2030 and 2035 to achieve the lower lesser targets, resulting in reduced adverse environmental impacts for these years. ~~But However,~~ Alternative 3 would likely facilitate the same number of projects through 2045, resulting in the same environmental impacts through 2045 compared to the Project. However, Alternative 3 would more likely facilitate a greater number of projects in the 2035 to 2045 period than the Project, worsening environmental impacts during the 2035 to 2045 timeframe compared to the Project. Consequently, Alternative 3 would delay the realization of its environmental potential impacts but would not completely lessen or eliminate or permanently lessen these adverse environmental impacts entirely, and could increase or create certain environmental impacts compared to the Project.

~~Additionally, it should be noted that~~ Alternative 3 ~~has does have~~ some drawbacks compared to the Project. As discussed previously in the description of Alternative 3 (Section 4.4.4), its ability to it would not meet Project Objectives 1, 2, and 5 ~~would be limited compared to the Project.~~ Alternative 3 would not meet Project Objective 1 (identify detailed programs, actions, and performance goals to achieve the climate policies of the General Plan) because implementation would result in an inconsistency with the County’s General Plan Policy AQ 3.9 (“Ensure the availability of zero-carbon electricity to serve unincorporated Los Angeles County.”). Additionally, the 2030 target of 40 percent below 1990 levels is ~~quite~~ far off the emissions reduction trajectory needed to achieve emissions of 83 percent below 2015 levels by 2045, which ~~may~~ likely means that Alternative 3 does not align with either County or state emissions reduction goals.

Alternative 3 does not align with County or state goals, including AB 1279, which establishes the state policy to achieve net zero GHG emissions as soon as possible but no later than 2045 and to achieve and maintain net negative GHG emissions thereafter. AB 1279 also mandates that by 2045, statewide anthropogenic GHG emissions are to be reduced at least 85 percent below 1990 levels. Implementation of Alternative 3 may would likely exclude several recommended priority local GHG emissions reduction strategies recommended by the 2022 Scoping Plan to ensure alignment with State climate goals.

Alternative 3 would also not meet Project Objective 5 (demonstrate a level of GHG emissions below which the County would have less than cumulatively

considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects via the Checklist) because Alternative 3’s lower targets would not meet CEQA standards for a level of GHG emissions that would not be cumulatively considerable for future environmental review of projects, given that Alternative 3’s targets do not align with state goals and consistency with state goals is the criteria for whether the targets represent a level of GHG emissions that would have a less than cumulatively considerable GHG impact for future environmental review projects. Nevertheless, in balancing both Alternative 3’s reduction in adverse environmental impacts and long-term beneficial effects compared to the Project, the County has determined that Alternative 3 is the environmentally superior alternative.

3.2.2 Chapter 1, Introduction

Pag 1-1 Section 1.1 has been revised as follows:

- A new CEQA streamlining development review consistency checklist to allow future projects to streamline GHG emissions analyses pursuant to the California Environmental Quality Act (CEQA)¹ as anticipated by CEQA Guidelines Section 15183.5 by using the Draft 2045 CAP.

3.2.3 Chapter 2, Project Description

Page 2-4 Table 2-1: Policy AQ 3.5 has been revised and modified as follows:

Policy AQ 3.5: Encourage energy conservation in new development and municipal operations. Require the full electrification decarbonization of new development. Encourage the retrofit of existing development to achieve full electrification decarbonization.

Pages 2-5 to 2-6 Table 2-2 has been revised and modified as follows:

Program No.	Program Description	General Plan Goals and Policies	Lead and Partner Agencies	Time Frame
AQ-1	PACE Financing Program Pursuant to AB 811, establish a countywide property assessed clean energy (PACE) financing program to provide municipal financing for energy and water efficiency and renewable energy projects on private property.	Air Quality Element: Policies AQ 3.2, AQ 3.3 Public Services and Facilities Element: Policy 6.5 Economic Development Element: Policy ED 1.2	Lead: ISD	Years 1-2
AQ-2	Climate Change Adaptation Program <ul style="list-style-type: none"> • Develop strategies to address the impacts of climate change related but not limited to agriculture, public health, ecosystems and natural resources, energy, infrastructure, and emergency management. 	Air Quality Element: Policy AQ 3.8	Lead: CEO	Years 1-2

¹ This analysis is being prepared in accordance with CEQA (Public Resources Code Section 21000 et seq.) and its implementing regulations, the CEQA Guidelines (California Code of Regulations Title 14, Section 15000 et seq.).

	<ul style="list-style-type: none"> Climate change adaptation strategies may be conducted sequentially, starting with the evaluation of threats, vulnerability and risk assessments, identification of mitigation actions, and implementation. Investigate short and long term funding mechanisms. Amend the General Plan accordingly to incorporate proposed climate change adaptation actions. 			
<u>AQ-1</u>	<p>Climate Action Plan Implementation</p> <ul style="list-style-type: none"> Implement the actions identified in the Los Angeles County Climate Action Plan to reduce greenhouse gas emissions. 	Air Quality Element: Goal AQ 2, AQ 3	Lead: Chief Executive Office, Department of Public Health, Department of Parks and Recreation, Department of Regional Planning, Fire, Internal Services Department, Public Works	Ongoing
<u>AQ-2</u>	<p>Alternative Renewable Energy Program</p> <ul style="list-style-type: none"> Coordinate with the LADWP to identify potential alternative energy projects or facility types for the unincorporated areas. 	Air Quality Element: Goals AQ2, AQ3	Lead: CSO, DPH, DPR, DRP, Fire, ISD, PW	Ongoing
<u>AQ-3</u>	<p>Travel Demand Management</p> <ul style="list-style-type: none"> Encourage ride sharing programs and a permanent transportation management association membership Implement marketing strategies to reduce commute trips. Encourage market based bike sharing programs that support bicycle use around and between transit stations/hubs. 	Air Quality Element: Policy AQ 2.6	Lead: CSO	Ongoing
<u>AQ-4</u>	<p>Car Sharing Program</p> <ul style="list-style-type: none"> Conduct a feasibility study to identify priority residential and nonresidential areas for implementation. Explore incentives to encourage employer based and private car sharing programs. 	Air Quality Element: Policies AQ 2.6, 2.7	Lead: CSO	Ongoing
<u>AQ-5</u> <u>AQ-1</u>	<p>Efficient Goods Movement</p> <ul style="list-style-type: none"> Coordinate with SCAG to facilitate implementation of a region-wide goods movement strategy. Support SCAG and LA Metro on the evaluation of truck routes throughout the County to identify and target areas for improvement. 	Air Quality Element: Goal AQ 2	Lead: PW Partner: DRP	Ongoing
<u>AQ-6</u>	<p>Electrify Construction and Landscaping Equipment</p> <ul style="list-style-type: none"> Develop an outreach and education program. Identify incentives for equipment electrification. Collaborate with regulatory agencies such as South Coast Air Quality Management District (SCAQMD) to identify potential customers. Coordinate with SCAQMD to implement an incentive program and/or lawnmower exchange program. Develop an outreach and education program. 	Air Quality Element: Goal AQ4	Lead: PW Partner: DRP, DPR, BH	Ongoing

<u>AQ 7</u>	<p><u>Water Supply Improvement Program</u></p> <ul style="list-style-type: none"> • Coordinate with water agencies to identify opportunities to expand groundwater management and begin development of groundwater management plans. • Expand the Low Impact Development (LID) stormwater catchment to more facilities, if feasible. • Identify partnership opportunities with regional entities or opportunities to expand regional programs. 	<p><u>Air Quality Element:</u> <u>Goal AQ3</u></p> <p><u>Safety Element:</u> <u>Goal S6</u></p>	<p><u>Lead: PW</u></p> <p><u>Partner: DPR, DRP, ISD</u></p>	<u>Ongoing</u>
<u>AQ 8</u>	<p><u>Create New Vegetated Open Space</u></p> <ul style="list-style-type: none"> • Identify restoration projects. • Consider funding and program options. • Promote community based restoration programs. 	<p><u>Air Quality Element:</u> <u>Policy AQ 2.3</u></p>	<p><u>Lead: Fire</u></p> <p><u>Partner: DRP, DPR, PW</u></p>	<u>Ongoing</u>

NOTES:

1. The PACE Financing Program (existing program number AQ-1) is being deleted because the County of Los Angeles's contracts with Renovate America and Renew Financial expired on April 3, 2020. The County stopped approving new assessment contracts through PACE Funding Group on May 13, 2020. The County continues to work with its PACE administrators to manage existing assessment contracts and provide appropriate consumer protection.
2. The Climate Change Adaptation Program (existing program number AQ-2) is being deleted because the Safety Element Update developed adaptation strategies to address climate change impacts and because the OurCounty Sustainability Plan strategically addressed this directive.
3. ~~The Climate Action Plan Implementation Program proposed as a part of the Air Quality Element amendment is being deleted to eliminate redundancies within the General Plan given that the Climate Action Plan is an implementing subcomponent of the General Plan that has been drafted and no further direction is needed to guide its development.~~
4. ~~The Alternative Renewable Energy Program, Travel Demand Management, Car-Sharing Program, Electrify Construction and Landscaping Equipment, Water Supply Improvement Program, and Create New Vegetated Open Space proposed as a part of the Air Quality Element are being deleted to eliminate redundancies since they are incorporated, in its current or modified form, into the 2045 CAP.~~

Page 2-9 Section 2.3.2 has been revised as follows:

5. Demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide California Environmental Quality Act (CEQA) streamlining for development projects (serve as a “qualified CAP”) via the 2045 Climate Action Plan ~~Consistency Review~~ CEQA Streamlining Checklist (2045 CAP Checklist).

Page 2-12 Section 2.3.3 has been revised as follows:

The Draft 2045 CAP is consistent with the requirements for a qualified GHG emissions reduction plan pursuant to CEQA as identified in Table 2-4 for the years 2030, ~~and 2035, and 2045.~~

Page 2-13 Section 2.3.3 has been revised as follows:

Appendix F—2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist: This appendix includes the ~~consistency review~~ CEQA streamlining checklist for new development that elect to streamline environmental review of GHG impacts using the 2045 CAP’s PEIR pursuant to CEQA Guidelines Section 15183.5(b).

Page 2-23 Section 2.6.2.1 Measure ES5 has been revised as follows:

The performance objective for Measure ES5 is to require that all new development choosing to streamline their GHG impacts analysis under CEQA is consistent with the Draft 2045 CAP's goals and GHG emissions reduction targets and to develop reach codes, ordinances, and conditions of approval as needed to achieve this objective. ~~All new development not requiring General Plan amendments shall be consistent with the Draft 2045 CAP.~~

Page 2-26 Section 2.6.2.5 Measure E1 has been revised as follows:

Measure E1: ~~Transition~~ Decarbonize Existing Buildings to all Electric.

The primary performance objectives for Measure E1 are to: (1) ~~electrify~~ decarbonize 25 percent of the existing residential buildings by 2030, 40 percent by 2035, and 80 percent by 2045; (2) ~~electrify~~ decarbonize 15 percent of the existing nonresidential buildings by 2030, 25 percent by 2035, and 60 percent by 2045; and (3) require zero net energy (ZNE)² for 50 percent of all major renovations by 2030, 75 percent by 2035, and 100 percent by 2045.

Page 2-26 Section 2.6.2.5 Measure E2 has been revised as follows:

Measure E2: Decarbonize ~~Standardize All Electric~~ New Development.

The performance objectives for Measure E2 are to: (1) require that all applicable new buildings to be zero GHG emissions ~~are all electric~~ (taking into consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face), such that 90 percent of new residential and nonresidential buildings are zero-GHG emission buildings ~~all electric~~ by 2030, 95 percent by 2035, and 100 percent by 2045; and (2) require that all applicable new residential and nonresidential buildings are ZNE, such that 90 percent of new residential and nonresidential are ZNE by in 2030.

Page 2-30 Section 2.6.3 has been revised as follows:

As shown in the table, in 2030, nearly half (46 percent) of the anticipated reductions would be attributed to energy-related measures, including zero-carbon electricity, the sunset strategy for oil and gas operations, ~~electrification~~ decarbonization of the existing building stock, local renewable energy generation, decarbonization of new development, and energy efficiency.

Page 2-30 Table 2-10: Measure E1 has been revised and modified as follows:

E1 ~~Transition~~ Decarbonize Existing Buildings to All Electric

Page 2-30 Table 2-10: Measure E2 has been revised and modified as follows:

² Zero net energy is defined by the U.S. Department of Energy as follows: "An energy-efficient building where, on a source energy basis, the actual annual delivered energy is less than or equal to the on-site renewable exported energy" (U.S. Department of Energy 2015).

E2 Decarbonize ~~Standardize All-Electric~~ New Development

Page 2-31 to 2-31 Section 2.7 has been revised and modified as follows:

- **Phase 1: Short-Term Actions (2024–2030)**—Short-term actions that are high-priority with large emissions reductions that would lay the foundation for longer term actions. The short-term target of the Draft 2045 CAP is to reduce GHG emissions in the County by 40 percent below 2015 levels by 2030.
- **Phase 2: Medium-Term Actions (2030+–2035)**—Actions needed to achieve the 2030 or 2035 GHG emissions reduction targets that may need additional time, funding, or new technology to implement. The medium-term target of the Draft 2045 CAP is to reduce GHG emissions in the County by 50 percent below 2015 levels by 2035.
- **Phase 3: Long-Term Actions (2035+–2045)**—Actions needed to achieve the 2045 GHG emissions reduction target that may need substantial time, funding, or new technology to implement. The long-term target of the Draft 2045 CAP is to reduce GHG emissions in the County by 83 percent below 2015 levels by 2045. The long-term aspirational goal of the Draft 2045 CAP is to achieve carbon neutrality in the County by 2045.

Page 2-32 to 2-33 Table 2-11: Strategy 1—Measure ES4.3 and ES5 have been revised and modified as follows:

Strategy 1: Decarbonize the Energy Supply (cont.)			
ES4.3 Develop a publicly accessible community energy map that identifies opportunities for deploying distributed energy resources and microgrids to improve energy resiliency.	X	X	X
ES5 Establish GHG Requirements for New Development: Develop and implement requirements <u>for new projects choosing to streamline their GHG impacts analysis under CEQA</u> to ensure that <u>such</u> new development is consistent with the 2045 CAP goals as well as its milestone targets for 2030, 2035, and 2045. These requirements include applicant completion of a <u>2045 CAP CEQA streamlining project review consistency</u> checklist for non-CEQA exempt new development requiring discretionary approvals to demonstrate consistency with the 2045 CAP <u>and thereby streamline environmental review of their GHG impacts using the 2045 CAP’s PEIR pursuant to CEQA Guidelines Section 15183.5(b).</u> To demonstrate <u>consistency compliance</u> with the 2045 CAP <u>CEQA streamlining</u> requirements, all projects that do not screen out of the 2045 CAP consistency review process must implement either: 1) all feasible applicable checklist measures, or 2) for infeasible checklist measures, alternative project emission reduction measures. The project review checklist will be used <u>in one two ways: 1) for projects consistent with the 2045 CAP, to demonstrate CAP consistency that allows for streamlined project-specific CEQA GHG analysis, or 2) for projects required or electing to prepare project-specific CEQA GHG analyses, to demonstrate that all feasible applicable checklist measures or alternative project emission reduction measures have nevertheless have been implemented, either as project features or GHG mitigation measures. Projects that do not implement all feasible applicable checklist measures or alternative project emission reduction measures may have</u>	X	X	X

significant GHG impacts because they could conflict with an applicable GHG reduction plan per Guidelines Appendix G Section VII. They may also be inconsistent with the General Plan because the Cap is a component of the Air Quality Element. In addition, the County will assess the feasibility of developing a GHG offsets/credit program to create a pathway toward achieving the aspirational 2045 goal of carbon neutrality.			
ES5.2 Implement the 2045 CAP CEQA streamlining consistency review checklist for new development to demonstrate consistency with the 2045 CAP’s strategies, measures, and actions for purposes of streamlining environmental review of GHG impacts using the 2045 CAP’s PEIR pursuant to CEQA Guidelines Section 15183.5(b).	X		
ES5.3 Evaluate a program for reducing GHG emissions for new development that require General Plan amendments	X		
ES5.4 3 Establish an Offsite GHG Reduction Program for new development to use as a GHG reduction or mitigation pathway for 2045 CAP compliance and to fund programs for reducing GHG emissions in the built environment.	X		

Page 2-36 Table 2-11: Strategy 5—Measure E1 & E2 has been revised and modified as follows:

Strategy 5: Decarbonize Buildings			
E1 (Core) Transition Decarbonize Existing Buildings to all electric: As the carbon intensity of grid-supplied energy <u>electricity</u> decreases, decarbonization must be combined with building <u>decarbonization electrification</u> , shifting <u>the energy more</u> load from fossil fuels to carbon-free energy sources while taking into consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face. This measure aims to <u>decarbonize electrify</u> applicable existing buildings. <u>A primary alternative to fossil natural fuel is renewable electricity supplied by CPA.</u> Biomethane is another preferred alternative to fossil natural gas; however, the existing opportunities for widespread use of biomethane are limited. Consider the use of other zero-GHG-emission fuel sources for buildings <u>will also be considered.</u>	X	X	X
E1.1 Adopt Building Performance Standards for existing buildings and reach code requirements for major retrofits and renovations that require <u>zero-GHG emission appliances electric water and space heating.</u> Require buildings to retrofit natural gas water and space heating to electric water and space heating at the point of sale.	X	X	
E1.2 Increase alternatives to <u>fossil</u> natural gas uses, such as for cooking, in existing buildings. Establish carbon <u>and GHG</u> intensity limits for existing nonresidential and residential buildings over a certain size.	X	X	
E2 Standardize All Electric Decarbonize New Development: This measure aims to <u>electrify decarbonize</u> all applicable new buildings, while taking into consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face.	X		

E2.1 Adopt an ordinance requiring all applicable new buildings to be <u>zero-GHG emission fully electric with no natural gas hookups</u> . Include affordable housing considerations in these requirements, and develop supporting measures (financial support, technical assistance, or other incentives) to defray potential additional first costs in order to maintain housing affordability. <u>Require all new development to be electric-ready.</u>	X		
--	---	--	--

Page 2-37 Table 2-11: Strategy 6 – Action 4.1 has been revised and modified as follows:

Action E4.1 – Adopt Building Performance Standards for energy efficiency in existing buildings. Require buildings to perform energy efficiency retrofits at the point of sale. Expand and enhance the energy efficiency programs offered by the Southern California Regional Energy Network (SoCalREN). Include affordable housing considerations in these requirements, and develop additional renter protections and supporting measures (financial support, technical assistance, or other incentives) to limit the amount of first costs being passed on to low-income renters.

Page 2-38 Table 2-11: Strategy 8—Measure W1.2 and W2.3 has been revised and modified as follows:

W1.2 Implement, enforce, and expand to the maximum extent feasible the single-use plastics ordinance and <u>expanded polystyrene ordinance ban</u> .			
W2.2 Develop organic waste collection, management, and diversion programs for constituents in unincorporated communities and all County operations; establish a contamination monitoring plan for organic waste programs.	X	⊗	
W2.3 Collaborate with the Los Angeles County Sanitation Districts and other waste and wastewater service providers to utilize unused anaerobic digestion capacity of existing wastewater treatment plants and solid waste facilities to generate vehicle fuel <u>and other beneficial uses</u> (electricity and/or biomethane) from newly diverted organic waste. Develop a strategy for using bioenergy created from recycled organic waste.	<u>X</u>	X	⊗

Page 2-40 Section 2.7.1 has been revised and modified as follows:

2.7.1 2045 Climate Action Plan CEQA Streamlining Consistency-Checklist

As discussed in Section 2.3.3, *Qualified Greenhouse Gas Emissions Reduction Plan*, projects in the County can demonstrate consistency with the Draft 2045 CAP (as a qualified GHG emissions reduction plan) if they are consistent with the 2045 CAP’s future growth projections and with the CEQA streamlining requirements identified in the 2045 CAP Checklist its GHG emission reduction measures.

The County has developed the 2045 CAP Checklist to assist with determining the consistency of projects with the Draft 2045 CAP for purposes of CEQA streamlining. The 2045 CAP Checklist provides individual projects the opportunity to demonstrate that they are reducing GHG emissions; it also ensures that future projects would achieve their proportion of emissions reductions consistent with the assumptions of the Draft 2045 CAP. A project would demonstrate consistency with the Draft 2045 CAP by complying with the CEQA streamlining requirements incorporating the GHG emission reduction measures included in the ~~Draft 2045 CAP Checklist that apply to new projects~~.

- If a project would be consistent with the General Plan growth projections and Housing Element and complies with all CEQA streamlining requirements ~~could demonstrate consistency with the Draft 2045 CAP~~ by completing the 2045 CAP Checklist, then the project would be considered consistent with the Draft 2045 CAP and would be eligible for CEQA streamlining of its project-level GHG analysis.

Page 2-41

Section 2.7.1 has been revised and modified as follows:

- If a project would be inconsistent with the General Plan growth projections Housing Element and require a General Plan amendment, then it would not be able to use this the 2045 CAP Checklist for CEQA streamlining. Such a project would have to undergo its own project-level analysis of GHG impacts pursuant to CEQA.
- If a project could not comply with all CEQA streamlining requirements demonstrate consistency with the Draft 2045 CAP by completing the 2045 CAP Checklist, by implementing equivalent replacement strategies, or by implementing a qualified off-site GHG emission reduction project, as provided for in the 2045 CAP Checklist, then a project-specific GHG analysis would be required. In this case, it is encouraged that the project incorporate all the CEQA streamlining requirements in the 2045 CAP Checklist, though this is not required ~~implementation of applicable CAP Checklist items that are feasible would still be required.~~

Consistency with General Plan Growth Projections Land Use Assumptions.

Projects consistent with the demographic forecasts and land use projection assumptions used in the Draft 2045 CAP can use the 2045 CAP Checklist to demonstrate compliance with the CEQA streamlining requirements consistency with the 2045 CAP. If consistent, these projects could rely on the programmatic environmental review contained in the certified PEIR for the 2045 CAP.

If a project would not be consistent with the General Plan's growth projections land use designations, then it would not be eligible for CEQA streamlining by using the 2045 CAP Checklist. Projects inconsistent with the General Plan's growth projections land use designations would prepare a project-specific analysis of GHG emissions. Such an analysis would quantify existing and projected GHG emissions for the project and is encouraged to incorporate applicable items from the 2045 CAP Checklist to the maximum extent feasible (though this is not required), along with any identified project-specific mitigation measures.

Offsite GHG Emission Reduction Projects. As part of the 2045 CAP Checklist, the County will develop an offsite GHG emissions reduction program. Future development projects that cannot achieve net-zero GHG emissions or are unable to comply with all CEQA streamlining requirements in the required 2045 CAP Checklist items, would have the option to participate in the offsite GHG emissions reduction program.

3.2.4 Chapter 3, Environmental Analysis

3.2.4.1 Section 3.1 Introduction to Environmental Analysis

No text changes have been made to Section 3.1, *Introduction to Environmental Analysis*.

3.2.4.2 Section 3.2 Aesthetics

Page 3.2-8 Section 3.2.2.3 has been revised as follows:

These and other relevant measures and actions include Action T3.3 (which would facilitate the use of shading [shadow] and shade structures); measures and actions associated with Strategy 1, Decarbonize the Energy Supply; Measure ES2, Procure Zero-Carbon Electricity; Measure ES3, Increase Renewable Energy Production; Measures T6, T7, T8, and T9, each regarding the ~~electrification~~ decarbonization of vehicles; and Strategy 5, regarding the ~~electrification~~ decarbonization of buildings. These measures and actions could facilitate renewable energy generation and infrastructure projects, the development of which could affect aesthetics.

Page 3.2-9 Section 3.2.2.3 has been revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program.

Page 3.2-12 Impact 3.2-2 has been revised as follows:

Draft 2045 CAP strategies such as Strategy 5, Strategy 6, and Strategy 7 would include measures that would require retrofits to existing buildings to electrify appliances, increase energy efficiency, and reduce water consumption. For example, Measure E1 would ~~Transition~~ Decarbonize Existing Buildings to all ~~electric~~ and Measure E4 would improve the energy efficiency of existing buildings.

3.2.4.3 Section 3.3 Agricultural and Forestry Resources

Page 3.3-12 Section 3.3.2.3 has been revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review

Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will be developing an offsite GHG emissions reduction program.

3.2.4.4 Section 3.4 Air Quality

Page 3.4-35 Section 3.4.2.3 has been revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will be developing an offsite GHG emissions reduction program.

Page 3.4-36 Impact 3.4-1 has been revised as follows:

The Draft 2045 CAP would be implemented through future projects facilitated by the proposed Draft 2045 CAP measures and actions, as well as through the application of the Draft 2045 CAP CEQA Streamlining Consistency Checklist (Appendix F) to allow for streamlining of GHG impacts under CEQA. Additional analysis would be needed to determine the impacts of implementation of these measures at specific locations, and future projects would be analyzed at the project level and would be subject to CEQA.

For future projects seeking to use the Draft 2045 CAP CEQA Streamlining Consistency Checklist for CEQA GHG streamlining, the County would determine whether the future project would be consistent with the Draft 2045 CAP. As described above, projects implementing Draft 2045 CAP measures and actions that are deemed consistent with local land use plans would also be consistent with the AQMP, and this applies to each horizon year.

Page 3.4-43 Impact 3.4-1 has been revised as follows:

The Draft 2045 CAP would be implemented through future projects facilitated by the proposed Draft 2045 CAP measures and actions, as well as through the application of the Draft 2045 CAP CEQA Streamlining Consistency Checklist (Appendix F) to allow for streamlining of GHG impacts under CEQA.

Page 3.4-44 Impact 3.4-1 has been revised as follows:

For future projects seeking to use the Draft 2045 CAP CEQA Streamlining Consistency Checklist for CEQA GHG streamlining, the County would determine whether the future project would be consistent with the Draft 2045 CAP.

Page 3.4-56 Impact 3.4-2 has been revised as follows:

However, Draft 2045 CAP measures and actions may facilitate new facilities and projects such as decarbonize existing buildings and new development electrification (Measures E1 and E2), new renewable energy facilities (Measure ES3), energy storage facilities (Measure ES4), building retrofits for energy efficiency (Measure E4), new or expanded recycled water facilities (Measure

E5), new electric vehicle charging station infrastructure (Measure T6), new or expanded waste processing facilities (Measures W1 and W2), and demolition of impervious surfaces and planting trees (Measure A3).

Page 3.4-58 Impact 3.4-2 has been revised as follows:

Operational emissions from projects facilitated by the Draft 2045 CAP measures and actions in the unincorporated areas of the County would be further reduced as electric vehicles (Measures T6, T7, and T8), renewable energy use (Measures ES2 and ES3), decarbonize existing buildings and new development electrification (Measures E1 and E2), and other decarbonization actions (Measure E3) become more widespread.

Page 3.4-65 Impact 3.4-3a has been revised as follows:

Operational emissions from projects facilitated by the Draft 2045 CAP measures and actions in the unincorporated areas of the County would be further reduced as renewable energy use (Measures ES2 and ES3), decarbonize existing buildings and new development electrification (Measures E1 and E2), and other decarbonization actions (Measure E3) are implemented.

Page 3.4-67 Impact 3.4-3a has been revised as follows:

However, implementation of the Draft 2045 the CAP would substantially reduce fossil fuel use and associated TAC emissions from operational activities as a result of renewable energy use (Measures ES2 and ES3), decarbonize existing buildings and new development electrification (Measures E1 and E2), and other decarbonization actions (Measure E3) are implemented, with greater reduction in fossil fuel use across horizon years 2030, 2035, and 2045.

Page 3.4-77 Impact 3.4-7 has been revised as follows:

Implementation of the Draft 2045 CAP would substantially reduce fossil fuel use and regional emissions from operational activities as a result of decarbonize existing buildings and new development electrification (Measures E1 and E2) and other decarbonization actions (Measure E3) are implemented.

3.2.4.5 Section 3.5 Biological Resources

Page 3.5-16 to 3.5-17 Section 3.5.2.3 has been revised as follows:

Renewable energy and related infrastructure projects facilitated by Draft 2045 CAP measures and actions toward decarbonization of the energy supply (e.g., Measure ES2: Procure Zero-Carbon Electricity, Measure ES3: Increase Renewable Energy Production, and Measure ES4: Increase Energy Resilience), the electrification of vehicles (e.g., Measure T6: Increase ZEV Market Share and Reduce Gasoline and Diesel Fuel Sales, Measure T7: Electrify County Fleet Vehicles, Measure T8: Accelerate Freight Decarbonization, and Measure T9: Expand Use of Zero-Emission Technologies for Off-Road Vehicles and Equipment) and ~~the electrification of~~ decarbonize existing buildings (Strategy 5, Decarbonize Buildings) are particularly relevant to the analysis of impacts to

biological resources because related development could affect special-status species and habitats, sensitive natural communities, state or federally protected wetlands, interference with species movement or impediment of the use of native wildlife nursery sites, or the conversion of oak woodlands or other unique native woodlands.

Page 3.5-17 Section 3.5.2.3 has been revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will be developing an offsite GHG emissions reduction program.

Page 3.5-29 Section 3.5.2.4 has been revised as follows:

The Draft 2045 CAP would contribute a significant incremental contribution to this significant cumulative impact that could be mitigated to a level that would be less than cumulatively considerable (i.e., less than significant) by the implementation of Mitigation Measures 3.5-1 and 3.5-3 3.5-4.

3.2.4.6 Section 3.6 Cultural Resources

Page 3.6-22 Section 3.6.2.3 has been revised as follows:

These and other relevant measures and actions include the renewable energy and related infrastructure projects that would be facilitated by Draft 2045 CAP measures and actions toward the following categories of strategies: (1) Decarbonization of the energy supply (e.g., Measure ES2, Procure Zero-Carbon Electricity; Measure ES3, Increase Renewable Energy Production; and Measure ES4, Increase Energy Resilience); (2) The electrification of vehicles (e.g., Measure T6, Increase Zero-Emission Vehicle Market Share; Measure T7, Electrify County Fleet Vehicles; Measure T8, Accelerate Freight Decarbonization; and Measure T9, Expand Use of Zero-Emission Technologies for Off-Road Vehicles and Equipment); and (3) The electrification of decarbonize existing buildings (Strategy 5, Decarbonize Buildings).

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program.

3.2.4.7 Section 3.7 Energy

Page 3.7-10 Section 3.7.2.3 has been revised as follows:

- (8) Measure E1 and associated Actions E1.1, E1.2, E1.3, E1.4 (which would result in the electrification decarbonization of applicable existing buildings and achieve zero net energy for certain buildings, while taking into

consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face);

- (9) Measure E2 and associated Actions E2.1 and E2.2 (which would require ~~all electric and~~ zero net GHG emissions energy for all applicable new buildings, while taking into consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face);

Page 3.7-11 Section 3.7.2.3 has been revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program.

Page 3.7-12 to 3.7-13 Impact 3.7-1 has been revised as follows:

Further the Draft 2045 CAP would promote adoption of renewable energy production in both new and existing residential and commercial development (Measure ES3), which would decrease grid energy demand and advance the County toward its ~~electrification~~ decarbonization and zero net energy targets (Measures ES2, E1, and E2), all of which would support the state’s energy efficiency and renewable energy goals.

Implementation of CAP Measure E1 and associated Actions E1.1, E1.2, E1.3, and E1.4 would result in the ~~electrification~~ decarbonization of applicable existing buildings and achieve zero net energy for certain new buildings. This aligns with building ~~electrification~~ decarbonization as a major focal point of state agencies and electric utilities in reaching the state’s renewable energy and GHG reduction goals. According to SCE, approximately one-third of space and water heating in all buildings within SCE’s service territory must be electric by 2030 and three-quarters must be electric by 2045 to meet state goals (SCE 2019). Pursuant to SB 1477, the combined CPUC–approved and proposed funding for building ~~electrification~~ decarbonization projects and developments is approximately \$435 million through 2024 (CPUC 2020). One of the CPA’s three major program measure categories to build and strengthen future local programs is ~~electrification~~ decarbonization, which includes public charging of electric vehicles, building ~~electrification~~ decarbonization code incentives, all-electric post-fire rebuilding, and natural gas appliance replacement (CPA 2020). Therefore, the Draft 2045 CAP would facilitate building ~~electrification~~ decarbonization to support these state goals.

~~electrification~~ Decarbonization may put additional strain on the electricity grid as the demand for electricity increases, including in rural communities and other parts of the County that are already facing grid capacity problems such as blackouts and brownouts. Although the maintenance and improvement of the electricity grid is outside of the jurisdiction of the County, state agencies and electric utilities are working to strengthen and enhance the electricity grid to

increase the supply of renewable electricity along with grid reliability and resilience.

To achieve growth and reliability in the electricity grid, SCE is planning grid investments of up to \$75 billion. These investments will be used for multiple purposes: (1) integrate bulk renewable generation and storage and serve the load growth associated with transportation and building ~~electrification~~ decarbonization; (2) provide transmission upgrades for generation interconnections within the state; (3) increase utility-scale storage to balance load and resources and to minimize transmission and distribution upgrades; (4) provide grid upgrades to meet increased demand and peak loads; and (5) modernize the grid to harness the full potential of Distributed Energy Resources (DERs) (SCE 2019). The CPA plans for \$200 million in local investment in customer programs and community priorities centered around resiliency and grid management, building and transportation ~~electrification~~ decarbonization, and local renewable energy procurement (CPA 2020).

Page 3.7-14 Impact 3.7-1 has been revised as follows:

In summary, the Draft 2045 CAP's measures and actions regarding building and vehicle ~~electrification~~ decarbonization were developed with the understanding that state agencies and utilities have implementation strategies in place to increase the capacity of the grid and improve its reliability as electricity demand throughout the County increases. Therefore, the Draft 2045 CAP would not result in the inefficient consumption of energy resources related to ~~electrification~~ decarbonization and grid capacity.

The Draft 2045 CAP would also include strategies, with corresponding implementation measures and actions, that would reduce vehicle miles traveled, emissions, and transportation fuel consumption. The CAP includes transportation strategies, measures and actions that would reduce fuel consumption such as: locating development within High Quality Transit Areas; emphasizing non-motorized travel through the County's Pedestrian Action Plan, Bicycle Master Plan, Active Transportation Plans, and Vision Zero Action Plan; expanding the electric vehicle charging infrastructure; and partnering with transit agencies to electrify the County bus and shuttle fleets. For example, the Draft 2045 CAP aims to electrify 100 percent of the County bus fleet by 2035 (Measure T7), in line with Metro's goal of electrification for its fleet.

3.2.4.8 Section 3.8 Geology and Soils

Page 3.8-15 Section 3.8.2.3 has been revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program.

3.2.4.9 Section 3.9 Greenhouse Gas Emissions

Page 3.9-36 Section 3.9.2.3 is revised as follows:

Measure E1: ~~Transition~~ Decarbonize Existing Buildings to all Electric.

This measure aims to ~~electrify~~ decarbonize applicable existing buildings, while taking into consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face.

Measure E2: Decarbonize Standardize All Electric New Development. This measure aims to ~~electrify~~ decarbonize all applicable new buildings, while taking into consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face.

Page 3.9-37 Section 3.9.2.3 has been revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an off-site GHG emissions reduction program.

Page 3.9-45 Impact 3.9-2 has been revised as follows:

Further, the County has developed the Draft 2045 CAP CEQA Streamlining Consistency-Checklist to assist with determining project consistency with the Draft 2045 CAP for purposes of CEQA streamlining. The Draft 2045 CAP CEQA Streamlining Consistency Checklist provides individual projects the opportunity to demonstrate that they are reducing GHG emissions; it also helps ensure that projects facilitated by the Draft 2045 CAP would achieve their proportion of emissions reductions consistent with the assumptions of the Draft 2045 CAP.

3.2.4.10 Section 3.10 Hazards and Hazardous Materials

Page 3.10-19 Section 3.10.2.3 is revised as follows:

Renewable energy generation and infrastructure projects could also be facilitated by measures and actions associated with Strategy 1, Decarbonize the Energy Supply; Measure ES2, Procure Zero-Carbon Electricity; Measure ES3, Increase Renewable Energy Production; Measures T7, T8, and T9, regarding the electrification of vehicles; and Strategy 5, regarding the ~~electrification~~ decarbonization of buildings.

Page 3.10-20 Section 3.10.2.3 is revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review

Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program.

3.2.4.11 Section 3.11 Hydrology and Water Quality

Page 3.11-23 Section 3.11.2.3 has been revised as follows:

These and other relevant measures and actions include: Action T6.7, which could facilitate increased use of green hydrogen vehicles throughout the County (hydrogen fuel generation is a water-intensive process [see, for example, Beswick et al. 2021]); and the renewable energy and related infrastructure projects facilitated by Draft 2045 CAP measures and actions toward (a) decarbonization of the energy supply (e.g., Measure ES2, Procure Zero-Carbon Electricity; Measure ES3, Increase Renewable Energy Production; and Measure ES4, Increase Energy Resilience); (b) the electrification of vehicles (e.g., Measure T6, Increase ZEV Market Share; Measure T7, Electrify County Fleet Vehicles; Measure T8, Accelerate Freight Decarbonization; and Measure T9, Expand Use of Zero-Emission Technologies for Off-Road Vehicles and Equipment); and (c) ~~the electrification of~~ decarbonization buildings (Strategy 5, Decarbonize Buildings).

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program.

Page 3.11-26 Impact 3.11-2 has been revised as follows:

Water demand could be affected by projects facilitated by Draft 2045 CAP measures and actions toward (a) decarbonization of the energy supply (e.g., Measure ES2, Procure Zero-Carbon Electricity; Measure ES3, Increase Renewable Energy Production; and Measure ES4, Increase Energy Resilience); (b) the electrification of vehicles (e.g., Measure T6, Increase ZEV Market Share; Measure T7, Electrify County Fleet Vehicles; Measure T8, Accelerate Freight Decarbonization; and Measure T9, Expand Use of Zero-Emission Technologies for Off-Road Vehicles and Equipment); and (c) ~~the electrification of~~ decarbonization of buildings (Strategy 5, Decarbonize Buildings)—for example, for periodic solar PV panel washing.

Page 3.11-27 Impact 3.11-2 has been revised as follows:

Some projects facilitated by Draft 2045 CAP measures and actions (including those facilitated by Measure E1, ~~Transition~~ Decarbonize Existing Buildings to all Electric, and Measure E4, Improve Energy Efficiency of Existing Buildings) would be limited to redevelopments and reuses of currently developed areas, and so would result in relatively minor increases in impervious areas.

3.2.4.12 Section 3.12 Land Use and Planning

Page 3.12-16 Section 3.12.2.3 is revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program.

Page 3.12-19 Impact 3.12-1 is revised as follows:

These relevant measures and actions include Measure ES2, Standardize All-Electric New Development; Measure T7, Electrify County Fleet Vehicles; and Measure E1, ~~Transition~~ Decarbonize Existing Buildings to all Electric.

One potential outcome of the ~~electrification~~ decarbonization of residential buildings, as encouraged by Measure E1 under Strategy 5, could be the increased use of candles, generators, grills, hibachis, barbeques, fireplaces, charcoal lighters, and chimneys in rural areas subject to power outages.

Page 3.12-20 to 3.12-29 Table 3.12-2 all mentions of Policy AQ3.5 have been revised as follows:

Policy AQ 3.5: ~~Encourage energy conservation in new development and municipal operations. Require the full electrification-decarbonization of new development. Encourage the retrofit of existing development to achieve full electrification~~ decarbonization.

Page 3.12-21 Table 3.12-2 Measure ES5 has been revised as follows:

All new development choosing to streamline their GHG impacts analysis under CEQA is consistent with the Draft 2045 CAP's goals and GHG emissions reduction targets and to develop reach codes, ordinances, and conditions of approval as needed to achieve this objective. ~~All new development not requiring General Plan amendments shall be consistent with the Draft 2045 CAP.~~

Page 3.12-27 Table 3.12-2 Measure E1 has been revised as follows:

Measure E1: ~~Transition~~ Decarbonize Existing Buildings to all Electric.

Page 3.12-28 Table 3.12-2 Measure E2 has been revised as follows:

Measure E2: Decarbonize ~~Standardize All Electric~~ New Development.

3.2.4.13 Section 3.13 Noise

Page 3.13-16 Section 3.13.2.3 is revised as follows:

Further, measures and actions associated with Strategy 1, *Decarbonize the Energy Supply*; Measure ES2, *Procure Zero-Carbon Electricity*; Measure ES3,

Increase Renewable Energy Production; Strategy 4, Institutionalize Low-Carbon Transportation; Measure T6, Increase ZEV Market Share and Reduce Gasoline and Diesel Fuel Sales, Measure T8, Accelerate Freight Decarbonization, and Measure T9, Expand Use of Zero-Emission Technologies for Off-Road Vehicles and Equipment, each regarding the electrification of vehicles; and Strategy 5, Decarbonize Buildings, regarding the ~~electrification~~ decarbonization of buildings, could facilitate renewable energy generation and infrastructure projects, the development of which could cause noise.

Page 3.13-17 Section 3.13.2.3 is revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program.

Page 3.13-18 Impact 3.13-1 is revised as follows:

Measures that would result in construction activities that would require heavy equipment and cause an increase in temporary noise levels in the vicinity of future project sites include expansion of bicycle and pedestrian networks, building ~~electrification~~ decarbonization for existing buildings, new renewable energy facilities, expansion of energy storage, building retrofits for energy efficiency, new or expanded water treatment facilities, new or expanded waste processing facilities, and demolition of impervious surfaces and planting trees.

Page 3.13-21 Impact 3.13-2 is revised as follows:

Measures that would result in construction activities that would require heavy equipment and generate groundborne vibration and groundborne noise include expansion of bicycle and pedestrian networks, building ~~electrification~~ decarbonization for existing buildings, new renewable energy facilities, expansion of energy storage, building retrofits for energy efficiency, new or expanded water treatment facilities, new or expanded waste processing facilities, and demolition of impervious surfaces and planting trees.

3.2.4.14 Section 3.14 Population and Housing

Page 3.14-7 Section 3.14.2.3 is revised as follows:

Decarbonization of energy section measures in the Draft 2045 CAP include: Measure ES2: Procure Zero-Carbon Electricity; Measure ES3: Increase Renewable Energy Production; and Measure ES4: Increase Energy Resilience. Measures that could facilitate the electrification of vehicles include: Measure T6: Increase ZEV Market Share and Reduce Gasoline and Diesel Fuel Sales; Measure T7: Electrify County Fleet Vehicles; Measure T8: Accelerate Freight Decarbonization; and Measure T9: Expand Use of Zero-Emission Technologies for Off-Road Vehicles & Equipment. In addition, Strategy 5, Decarbonize Buildings, could facilitate the ~~electrification~~ decarbonization of buildings.

Page 3.14-8 Section 3.14.2.3 is revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program.

3.2.4.15 Section 3.15 Transportation

Page 3.15-20 Section 3.15.2.3 is revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program.

3.2.4.16 Section 3.16 Tribal Cultural Resources

Page 3.16-8 Section 3.16.2.3 is revised as follows:

These and other relevant measures and actions include the renewable energy and related infrastructure projects that would be facilitated by Draft 2045 CAP measures and actions toward the following categories of strategies: (1) Decarbonization of the energy supply (e.g., Measure ES2, Procure Zero-Carbon Electricity; Measure ES3, Increase Renewable Energy Production; and Measure ES4, Increase Energy Resilience); (2) The electrification of vehicles (e.g., Measure T6, Increase Zero-Emission Vehicle Market Share; Measure T7, Electrify County Fleet Vehicles; Measure T8, Accelerate Freight Decarbonization; and Measure T9, Expand Use of Zero-Emission Technologies for Off-Road Vehicles and Equipment); and (3) The electrification decarbonization of buildings (Strategy 5, Decarbonize Buildings).

Page 3.16-9 Section 3.16.2.3 is revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program.

3.2.4.17 Section 3.17 Utilities and Service Systems

Page 3.17-13 Section 3.17.2.3 is revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), LA County will develop an offsite GHG emissions reduction program.

3.2.4.18 Section 3.18 Wildfire

Page 3.18-16 Section 3.18.2.3 is revised as follows:

These and other relevant measures and actions include: Measure ES2, Procure Zero-Electricity; Measure ES3, Increase Renewable Energy Production; Measure T1, Increase Density Near High-Quality Transit Areas; Measure T2, Develop Land Use Plans Addressing Jobs-Housing Balance and Increase Mixed Use; Measure T3, Expand Bicycle and Pedestrian Network to Serve Residential, Employment, and Recreational Trips; Measure T4, Broaden Options for Transit, Active Transportation, and Alternative Modes of Transportation; Measure T6, Increase Zero-Emissions Vehicle Market Share and Reduce Gasoline and Diesel Fuel Sales; Measure T7, Electrify County Fleet Vehicles; Measure T9, Expand Use of Zero-Emission Technologies for Off-Road Vehicles and Equipment; Measure E1, ~~Transition~~ Decarbonize Existing Buildings to all Electric; and Measure A1, Conserve Forests, Woodlands, Shrublands, Grasslands, Desert, and other Carbon-Sequestering Wildlands and Working Lands.

Page 3.18-17 Section 3.18.2.3 is revised as follows:

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan CEQA Streamlining Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program.

Page 3.18-19 Impact 3.18-2 is revised as follows:

One potential outcome of residential building ~~electrification~~ decarbonization, as encouraged by Measure E1 under Strategy 5, could be the increased use of candles, generators, grills, hibachis, barbeques, fireplaces, charcoal lighters, and chimneys in areas subject to frequent power outages.

Page 3.18-20 Impact 3.18-2 is revised as follows:

Additionally, Measure E1 calls for ~~Transition~~ Decarbonization of existing buildings to all Electric energy while taking into consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face.

3.2.5 Chapter 4, Alternatives

Page 4.9 Section 4.3.6 is revised and modified as follows:

At the time of RDEIR preparation, the County was conducting an amortization study to determine the fastest possible phase-out timeline for all existing oil wells and production facilities. This study will consider the legal, environmental, political, and cost considerations of the phase-out. The amortization study will guide the strategy to phase out oil and gas extractions and facilities. Without having the results of the amortization study in hand, it is not possible to know

when the earliest complete phase-out could occur, or even whether it is feasible to achieve complete phaseout by 2045. ~~Achieving a complete phase-out by 2045 would be a daunting challenge.~~

The Complete Phase-Out of Oil and Gas Operations by 2030 Alternative was not carried forward for more detailed review for several reasons. First, this alternative would not clearly avoid or substantially lessen any of the potential significant impacts of the Project. It is possible that this alternative could worsen or increase the Project's potential significant impacts, such as short-term localized construction-related air quality and health risk impacts from decommissioning of oil and gas wells and remediation activities at contaminated sites.

Page 4-11 Section 4.4.1 is revised and modified as follows:

~~CEQA Guidelines Section 15126.6(e) requires an EIR to evaluate the impacts of a no project alternative to enable a comparison of the potential environmental consequences that would result with and without the proposed project. In this case, An EIR's discussion of alternatives to the proposed project must include a "no project alternative" to allow a comparison of the environmental impacts of approving the proposed project with the effects of not approving it. (CEQA Guidelines, § 15126.6(e)(1).) †The No Project Alternative examines a scenario in which the County would not approve the 2045 CAP for implementation in the unincorporated areas. Under such a scenario, none of the GHG emissions reduction strategies, measures, or actions outlined in the 2045 CAP would be implemented and none of the benefits and co-benefits identified would be realized.~~

Page 4-12 to 4-13 Section 4.4.1 is revised and modified as follows:

~~CEQA Guidelines Section 15126.6(e) requires an EIR to evaluate the impacts of a no project alternative to enable a comparison of the potential environmental consequences that would result with and without the proposed project. In this case, the No Project Alternative examines a scenario in which the County would not implement the Project's GHG emission approve the 2045 CAP for implementation in the unincorporated areas. Under such a scenario, none of the emissions reduction strategies, measures, or actions, which would facilitate fewer projects compared with implementation of the Revised Draft outlined in the 2045 CAP. Because the No Project Alternative would facilitate fewer projects, the No Project Alternative would result in fewer adverse physical environmental impacts on the project area and its surrounding environment in comparison to the impacts associated with implementation of the Revised Draft 2045 CAP strategies, measures, and actions. However, in the long-term, the No Project Alternative would result in fewer environmental would be implemented and none of the benefits and co-benefits to the County overall because air pollutant and GHG emissions would be much higher than emissions levels associated with all other alternatives and the Project - The No Project Alternative would result in greater human health risks associated with exposure to toxic air contaminants than all other alternatives and the Project,~~

because all other alternatives and the Project would substantially reduce toxic air contaminant (TAC) emissions in the County. The No Project Alternative would neither realize the long-term GHG emission reduction benefits associated with implementation of the Revised Draft 2045 CAP (and all the co-benefits that would also occur, such as reduced criteria pollutant and TAC emissions), nor provide a clear pathway for the County to meet and exceed the statewide 2030 GHG reduction goal identified in SB 32 or meet and exceed the 2045 direct emission reduction target and carbon neutrality goal established by AB 1279.

Further, the GHG emissions reduction strategies included in the Air Quality Element of the General Plan—known as the *Unincorporated Los Angeles County Community Climate Action Plan 2020*—expired in 2020. Accordingly, the County would not continue to implement those strategies, which addressed emissions from land use, transportation, building energy, water consumption, and waste generation. The No Project Alternative would not further many County goals and policies. Specifically, the No Project Alternative would not achieve or support the County Board of Supervisors’ motions pertaining to supporting the Paris Agreement, equitable energy grid resiliency, zero-emissions medium- and heavy-duty vehicles, climate resilient communities, and equitable decarbonization of buildings.

The No Project Alternative would also include continued implementation of other plans and programs that would have the result of reducing GHG emissions to the extent that such plans and programs were adopted before January 3, 2022, when the Notice of Preparation was published. The No Project Alternative is essentially captured in the 2045 CAP’s Adjusted business-as-usual forecast, which accounts for future growth under business-as-usual conditions³ but adjusts for federal, state, and County legislation and regulations that were implemented before development of the Draft 2045 CAP.⁴ Further, efforts to reduce GHG emissions would continue outside the study area—for example, in incorporated areas of Los Angeles County, in adjacent jurisdictions, and in other locations outside the County where land use and related activities are governed by regional, state, or federal agencies, such as the Southern California Association of Governments, California Air Resources Board, U.S. Forest Service, and National Park Service. This alternative would not provide a clear pathway for the County to meet and exceed the statewide 2030 GHG emissions reduction goal identified in Senate Bill (SB) 32 or to meet the 2045 carbon neutrality goal established by Assembly Bill (AB) 1279.

³ The “business-as-usual” forecast assumes no action is taken to reduce GHG emissions in the County. 2018 emissions are projected forward using growth indicators such as population, housing, and employment.

⁴ These adjustments include implementation of the California Energy Commission’s 2019 and 2023 Title 24 building energy efficiency requirements, the Renewable Portfolio Standards (SB 350), the California Department of Resources Recycling and Recovery 75 percent waste diversion initiative (AB 341), the Pavley and Advanced Clean Car Standards (AB 1493), and the Low Carbon Fuel Standards (Executive Order S-01-07).

~~In addition~~ Importantly, the No Project Alternative would not ~~meet-achieve~~ any of the Project's basic objectives. ~~For example~~ Specifically, the No Project Alternative would not implement the climate action policies of the General Plan (Objective 1); would not identify GHG emissions reduction targets tailored to the unincorporated County that closely align with state and County climate goals (Objective 2); would not provide a road map to achieve GHG reductions to meet the GHG emission reduction targets (Objective 3); would not encourage sustainable housing production (Objective 4); and would not demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects ("qualified CAP") (Objective 5). Nonetheless, as required by CEQA, the No Project Alternative has been carried forward for more detailed review. See **Table 4-1, Screening Summary: No Project Alternative.**

Page 4-14

Section 4.4.2 has been revised and modified as follows:

Implementation of Alternative 1 would generally result in the same environmental impacts as the Project but would result in greater environmental impacts associated with hazards and hazardous materials as well as utilities and service systems. Implementation of Alternative 1 would facilitate projects that include wind projects with wind turbines that could result in a safety hazard for people residing or working in the project area due to collision risk, interference with radar or other air navigation tools, and other hazards related to air navigation. Additionally, implementation of this alternative would facilitate projects that would not encourage the reduction of solid waste like those facilitated by the Project, and instead would focus on the purchase of carbon offsets. As such, some of the adverse impacts caused by projects facilitated by Alternative 1, as compared to impacts under the Revised Draft 2045 CAP, would occur outside the County and so would not be subject to the same local thresholds that apply to the Project, such as thresholds established in the County General Plan or by the South Coast Air Quality Management District. Alternative 1 would result in fewer environmental benefits to the County overall because the reductions in air pollutant and GHG emissions could be realized elsewhere in Southern California, the State, or the Pacific Southwest, and because greater environmental impacts could result from wind projects facilitated by the purchase of carbon offsets.

Importantly, Alternative 1 would not provide a clear pathway for the County to meet and exceed the statewide 2030 GHG reduction goal identified in SB 32 or meet the 2045 direct emission reduction target established by AB 1279. This is because CARB's statewide targets are to reduce direct emissions occurring within state boundaries, and do not allow for carbon offsets occurring outside of the state to contribute to these targets (for example, AB 1279 states that it is "the policy of the state... to ensure that by 2045, statewide anthropogenic greenhouse

gas emissions are reduced to at least 85% below the 1990 levels”). Only the state’s 2045 net zero GHG emissions target appears to allow offsets. Similarly, Alternative 1 would not provide a clear pathway for the County to meet the County’s local GHG reduction targets identified in the Revised Draft 2045 CAP. Specifically, the Revised Draft 2045 CAP’s GHG reduction targets for 2030, 2035, and 2045 are to reduce direct, in-boundary county emissions to specific levels below 2015 emissions. Carbon offsets would likely not produce emission reductions within unincorporated county boundaries because there likely aren’t enough offsets within the County to achieve these GHG targets. As such, Alternative 1 may not achieve Project Objective 2.

Alternative 1 would also likely not achieve Project Objective 5 to allow CEQA streamlining for future development projects because the Revised Draft 2045 CAP’s GHG emission reduction targets apply to GHG emissions associated with activities occurring within unincorporated county boundaries, reducing emissions outside of county boundaries for activities not covered by the plan through the use of carbon offsets would not contribute toward meeting the represent Revised Draft 2045 CAP’s GHG emission reduction targets.

Page 4-15 Section 4.4.3 has been revised and modified as follows:

Implementation of Alternative 2 would also result in greater transportation impacts compared with the Project, as construction of ZNE buildings would increase the amount of heavy-duty construction vehicles on roadways, which could substantially increase hazards due to incompatible uses with normal vehicles on roadways. Alternative 2 would create safety and mobility concerns for motorists, transit operators, bicyclists, and/or pedestrians during construction activities and result in a greater impact than the Project. This alternative would also contribute to a greater impact on utilities and service systems because projects facilitated by Alternative 2 would not encourage the reduction of solid waste like those facilitated by the Project, and instead would focus on water and energy efficiencies.

Page 4-17 Section 4.4.4 has been revised and modified as follows:

For example, Measure T6, Increase ZEV Market Share, has a 2030 performance goal of a 30 percent ZEV fleetwide percentage for light-duty vehicles in the County; under Alternative 3, this performance objective ~~could~~ would likely be reduced to a 10 percent ZEV market share (or lower)

Page 4-18 Section 4.4.4 has been revised and modified as follows:

For example, many of the Draft EIR’s potential significant and unavoidable impacts arise from the construction and operation of utility-scale solar projects

that may be facilitated by Measure ES2, *Procure Zero Carbon Electricity*.⁵ However, reducing the performance objectives of Measure ES2 toward reducing indirect impacts of utility-scale solar projects facilitated by the Draft 2045 CAP would, for purposes of the analysis, conflict with General Plan Policy AQ 3.9 to “Ensure the availability of zero-carbon electricity to serve unincorporated Los Angeles County.” Inconsistency with General Plan Policy AQ 3.9 would mean that Alternative 3 would not meet Objective 1 of the Project. Measure ES2 is one of the five core measures necessary to meet the Project’s targets for 2030 and 2035. Reducing Measure ES2’s performance objectives would inhibit the County’s ability to exceed the 2030 target by more than 160,000 MTCO₂e and the 2035 target by more than 230,000 MTCO₂e, which would occur under implementation of the Project. Thus, the County would need to reduce Alternative 3 performance goals for other measures and actions for the alternative to be consistent with most of the basic Project objectives.

While Alternative 3’s reduced performance objectives would facilitate fewer projects in the short-term for years 2030 through 2035 compared to the Project, it would likely facilitate the same number of projects through 2045, resulting in the same environmental impacts through 2045 compared to the Project. However, implementation of Alternative 3 would more likely facilitate a greater number of projects in the 2035 to 2045 period than the Project. Consequently, Alternative 3 would delay the realization of its environmental impacts but would not lessen or eliminate these adverse environmental impacts entirely and would likely worsen environmental impacts during the 2035 to 2045 timeframe compared to the Project.

Alternative 3 would result in similar but lesser impacts than the Project on the following resource areas: aesthetics, agriculture and forestry resources, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, transportation, and wildfire. However, Alternative 3 would result in greater impacts than the Project for energy, GHG emissions, air quality, and utilities and service systems. Alternative 3 would result in greater energy impacts than the Project because Alternative 3 would facilitate fewer projects that would reduce Countywide energy use compared to the Project, resulting in greater energy consumption than the Project. Alternative 3 would result in greater GHG emissions impacts than the Project because Alternative 3 would not reduce Countywide GHG emissions as compared to the Project through 2030 and 2035, producing much greater GHG emissions than the Project. Additionally, implementation of Alternative 3 would result in greater air quality impacts than the Project for operational impacts because Alternative 3 would facilitate fewer projects through 2030 and 2035, resulting in much greater emissions of criteria pollutants and TACs throughout

⁵ Even though the construction of new utility-scale solar projects would not be required to achieve Project targets as proposed, this EIR conservatively assumes that new utility-scale solar projects nonetheless would be facilitated by the 2045 CAP.

the county for these years, resulting in greater human health risks as compared to the Project. Finally, Alternative 3 would result in greater utilities and service systems because projects facilitated by Alternative 3 would lead to increased use of recycled and gray water systems compared to the Project, increasing the amount of wastewater requiring treatment by wastewater treatment providers, and thus, would require the development of new water recycling and direct potable reuse facilities.

Additionally, the 2030 target of 40 percent below 1990 levels is ~~quite~~ far off the emissions reduction trajectory needed to achieve emissions of 83 percent below 2015 levels by 2045, which ~~may~~ likely means that Alternative 3 does not align with either County or state emission reduction goals (Recirculated Draft PEIR, pp. 4.18 to 4.19). ~~This is because~~ Specifically, CARB projects that a 48 percent reduction in 1990 emissions levels by 2030 is needed: “The Scoping Plan Scenario achieves the AB 1279 target of 85 percent below 1990 levels by 2045 and identifies a need to accelerate the 2030 target to 48 percent below 1990 levels” (CARB 2022b). This is far beyond the 40 percent reduction required by SB 32. The Project’s 2030 target of 40 percent below 2005 levels is equivalent to 48 percent below 1990 levels, which aligns the Project much more closely with state goals and the 2022 Scoping Plan, which ~~than~~ Alternative 3 would not do. Additionally, Alternative 3 does not align with the statewide targets codified in AB 1279, which establishes the state policy to achieve net zero GHG emissions as soon as possible but no later than 2045 and to achieve and maintain net negative GHG emissions thereafter. AB 1279 also mandates that by 2045, statewide anthropogenic GHG emissions are to be reduced at least 85 percent below 1990 levels.

Alternative 3 may also not meet Project Objective 5 (demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects via the Checklist) because Alternative 3’s lower targets may not meet CEQA standards for a level of GHG emissions that would not be cumulatively considerable for future environmental review of projects, given that Alternative 3’s targets do not align with state goals and consistency with state goals is the criteria for whether the targets represent a level of GHG emissions that would have a less than cumulatively considerable GHG impact for future environmental review projects.

Pages 4-20 to 4-21 Section 4.6 has been revised and modified as follows:

~~The CEQA Guidelines define the *environmentally superior alternative* as that alternative with the least adverse impacts on the project area and its surrounding environment. For this Project, the No Project Alternative is considered the environmentally superior alternative for CEQA purposes because it would avoid all impacts of the Project even though air quality and GHG emissions would be~~

~~the worst among all alternatives under the No Project Alternative. However, the No Project Alternative would fail to meet the basic objectives of the Project. Additionally, selection of the No Project Alternative would result in realization of none of the benefits identified in the Draft 2045 CAP. Because the environmentally superior alternative is the No Project Alternative, the EIR also must identify an environmentally superior alternative from among the other alternatives. (CEQA Guidelines Section 15126.6(e)(2).)~~

An EIR’s discussion of alternatives to the proposed project must include a “no project alternative” to allow a comparison of the environmental impacts of approving the proposed project with the effects of not approving it. (CEQA Guidelines, § 15126.6(e)(1).) CEQA requires an EIR to identify the “environmentally superior alternative” if the no project alternative is environmentally superior. (CEQA Guidelines, § 15126.6 (e)(2).)

The EIR No Project Alternative evaluates the scenario where the County would not approve the Revised Draft 2045 CAP for implementation such that no GHG emissions reduction strategies, measures, or actions identified by the Revised Draft 2045 CAP would be implemented. This would avoid adverse impacts caused by projects facilitated by the Revised Draft 2045 CAP, as compared to impacts under the Revised Draft 2045 CAP. Because the No Project Alternative would not facilitate projects, there would be no project-related impacts when compared to implementation of the Revised Draft 2045 CAP (see Table 4-6, which provides a comparative summary), and thus, the No Project Alternative is identified as the environmentally superior alternative.

However, in the long-term, the No Project Alternative would result in substantially fewer environmental benefits to the County overall for several reasons. First, air pollutant (criteria pollutants and toxic air contaminants) and GHG emissions would be much higher under the No Project Alternative than air pollutant and GHG emissions under with all other alternatives and the Project. This is because the Project would substantially reduce countywide GHG emissions, and many of these emission reductions would produce parallel reductions in criteria pollutants and toxic air contaminants primarily by reducing fuel combustion. The No Project Alternative would result in greater human health risks associated with exposure to toxic air contaminants than all other alternatives and the Project, because all other alternatives and the Project would substantially reduce TAC emissions in the County. The No Project Alternative would neither realize the long-term GHG emission reduction benefits associated with implementation of the Revised Draft 2045 CAP (and all the co-benefits that would also occur, such as reduced criteria pollutant and TAC emissions), nor provide a clear pathway for the County to meet and exceed the statewide 2030 GHG reduction goal identified in SB 32 or meet and exceed the 2045 direct emission reduction target and carbon neutrality goal established by AB 1279. Lastly, the No Project Alternative would not meet any of the Project objectives

and the County is not obligated to select the environmentally superior alternative for implementation if it would not accomplish the basic project objectives. (See CEQA Guidelines, § 15126.6(a), (c), (f).)

CEQA Guidelines Section 15126.6(e)(2) states, “[i]f the environmentally superior alternative is the “no project” alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.”

For purposes of this EIR, Of Alternatives 1-3, Alternative 3 would reduce adverse environmental impacts compared to the Project to the greatest extent in the short-term because it would result in fewer facilitated projects compared with the Revised Draft 2045 CAP. Alternative 3 is considered the environmentally superior alternative for CEQA purposes because it would result in similar but lesser impacts on 11 resource areas relative to the following resource areas: Project (i.e., for aesthetics, agriculture and forestry resources, air quality, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, transportation, utilities and service systems, and wildfire.) and However, Alternative 3 would result in greater impacts than the Project in two resource areas (i.e., for energy, and GHG emissions, air quality, and utilities and service systems). Alternative 3 would have same impacts as the Project with respect to the remaining resources. See Table 4-6 for details.

However, it should be noted that Alternative 3 would likely only delay these impacts as compared to the Project versus rather than lessening these impacts or eliminate ~~ing~~ these ~~m~~ impacts entirely. This is because Alternative 3 has lower GHG emissions reduction targets only for the years 2030 and 2035 compared to the Project; (it has the same targets for the year 2045). This means that Alternative 3 would likely facilitate fewer projects through 2030 and 2035 to achieve the lower lesser targets, resulting in reduced adverse environmental impacts for these years. But However, Alternative 3 would likely facilitate the same number of projects through 2045, resulting in the same environmental impacts through 2045 compared to the Project, and it would likely facilitate more projects in the 2035 to 2045 period than the Project, worsening environmental impacts during the 2035 to 2045 timeframe compared to the Project. Consequently, Alternative 3 would delay the realization of its environmental potential impacts but would not completely lessen or eliminate or permanently lessen these adverse environmental impacts entirely, and could increase or create certain environmental impacts compared to the Project.

Additionally, it should be noted that Alternative 3 ~~has~~ does have some drawbacks compared to the Project. As discussed previously in the description of Alternative 3 (Section 4.4.4), its ability to ~~it would not meet~~ Project Objectives 1, 2, and 5 would be limited compared to the Project. Alternative 3 would not meet Project Objective 1 (identify detailed programs, actions, and performance goals to

achieve the climate policies of the General Plan) because implementation would result in an inconsistency with the County’s General Plan Policy AQ 3.9 (“Ensure the availability of zero-carbon electricity to serve unincorporated Los Angeles County.”). Additionally, the 2030 target of 40 percent below 1990 levels is quite far off the emissions reduction trajectory needed to achieve emissions of 83 percent below 2015 levels by 2045, which may likely means that Alternative 3 does not align with either County or state emissions reduction goals.

Alternative 3 does not align with County or state goals, including AB 1279, which establishes the state policy to achieve net zero GHG emissions as soon as possible but no later than 2045 and to achieve and maintain net negative GHG emissions thereafter. AB 1279 also mandates that by 2045, statewide anthropogenic GHG emissions are to be reduced at least 85 percent below 1990 levels. Finally implementation of Alternative 3 may would likely exclude several recommended priority local GHG emissions reduction strategies recommended by the 2022 Scoping Plan to ensure alignment with State climate goals.

Alternative 3 would also not meet Project Objective 5 (demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects via the Checklist) because Alternative 3’s lower targets would not meet CEQA standards for a level of GHG emissions that would not be cumulatively considerable for future environmental review of projects, given that Alternative 3’s targets do not align with state goals and consistency with state goals is the criteria for whether the targets represent a level of GHG emissions that would have a less than cumulatively considerable GHG impact for future environmental review projects. Nevertheless, in balancing both Alternative 3’s reduction in adverse environmental impacts and long-term beneficial effects compared to the Project, the County has determined that Alternative 3 is the environmentally superior alternative.

Public Notices

NOTICE OF AVAILABILITY

RECIRCULATED DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT FOR THE LOS ANGELES COUNTY 2045 CLIMATE ACTION PLAN

PROJECT TITLE: Los Angeles County 2045 Climate Action Plan

PROJECT LOCATION: Unincorporated areas of Los Angeles County

The Los Angeles County Department of Regional Planning (County), acting as the lead agency pursuant to the California Environmental Quality Act (CEQA), completed a Draft Program Environmental Impact Report (PEIR) for the Los Angeles County 2045 Climate Action Plan (2045 CAP) in May 2022. After the July 2022 conclusion of the comment period for the Draft PEIR, the County elected to revise the Draft 2045 CAP in response to public and other input received, and to transition the 2045 CAP's aspirational goal of carbon neutrality by 2045 into a target consistent with new legislation, Assembly Bill (AB) 1279, which was enacted in September 2022 after the close of the Draft PEIR comment period. The County prepared a Recirculated Draft PEIR, which analyzes changes in the project made after the issuance of the Draft PEIR and which wholly replaces the Draft PEIR that was issued in May 2022.

The County has prepared this Notice of Availability (NOA) to consult with and request comments from responsible agencies, trustee agencies, and other interested parties regarding the environmental analyses presented in the Recirculated Draft PEIR.

PROJECT LOCATION

Unincorporated areas of Los Angeles County.

PROJECT SUMMARY

The Draft 2045 CAP (Project) is the County's plan towards meeting greenhouse gas (GHG) emissions reduction targets for unincorporated Los Angeles County by the years of 2030, 2035, and 2045. It was developed with the goals of implementing the GHG emissions reduction policies of the General Plan Air Quality Element and ensuring that the County contributes its fair share to statewide GHG emissions reductions.

With these goals in mind, the objectives of the Draft 2045 CAP are as follows:

- (1) Identify detailed programs, actions, and performance goals to achieve the climate action policies of the General Plan.
- (2) Identify GHG emissions reduction targets tailored to the unincorporated County that closely align with state and County climate goals.
- (3) Provide a road map for reducing GHG emissions to achieve the County's GHG emissions reduction targets.

NOTICE OF AVAILABILITY

March 2023

Page 2

- (4) Encourage sustainable housing production at all levels of affordability, including increasing housing densities near transit to the extent allowed in the General Plan.
- (5) Demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects (serve as a “qualified CAP”) via the 2045 CAP Consistency Review Checklist.

The Draft 2045 CAP includes the following:

- A greenhouse gas (GHG) emissions inventory for 2018.
- Emissions forecasts for 2030, 2035, and 2045.
- GHG emissions targets for 2030, 2035, and 2045.
- A long-term aspirational goal for carbon neutrality by 2045.
- A suite of GHG emissions reduction strategies, measures, and actions to reduce GHG emissions from major sectors.
- A technical modeling appendix to explain the Draft 2045 CAP’s GHG emissions reduction estimates.
- A consideration of environmental justice and equity concerns.
- Implementation and monitoring measures to ensure successful climate action.
- A new development review consistency checklist to allow future projects to streamline GHG emissions analyses pursuant to the California Environmental Quality Act (CEQA) as anticipated by CEQA Guidelines Section 15183.5 by using the 2045 CAP.

Approval of the Draft 2045 CAP would require an amendment to the General Plan to replace the *Unincorporated Los Angeles County Community Climate Action Plan 2020 (2020 CCAP)*, an implementing component of the General Plan’s Air Quality Element.

LIST OF SIGNIFICANT ENVIRONMENTAL EFFECTS ANTICIPATED AS A RESULT OF THE PROJECT

No changes to General Plan land use designations, zoning, or specific development projects are proposed as part of the Draft 2045 CAP. However, projects facilitated by Draft 2045 CAP measures and actions would have the following significant impacts:

- **Aesthetics:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions would: have a substantial adverse effect on a scenic vista; be visible from or obstruct views from a regional riding, hiking, or multiuse trail; substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway; substantially degrade the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features and/or conflict with applicable zoning and other regulations governing scenic quality; and create a new source of substantial shadows, light, or glare, which would adversely affect day or nighttime views in the area. The Project would also cause significant cumulative impacts to aesthetics resources.

NOTICE OF AVAILABILITY

March 2023

Page 3

- **Agriculture and Forestry:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use; conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract; and involve other changes in the existing environment that, due to their location or nature, could result in conversion of Farmland, to nonagricultural use or conversion of forest land to non-forest use. The Project would also cause significant cumulative impacts to agriculture and forestry resources.
- **Air Quality:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: conflict with or obstruct implementation of the applicable air quality plan; result in a cumulatively considerable net increase of a criteria pollutant for which the Project region is non-attainment under an applicable federal or state ambient air quality standard; expose sensitive receptors to substantial pollutant concentrations for localized air pollutants and TAC emissions; and contribute to a significant cumulative impact to air quality associated with toxic air contaminant emissions.
- **Biological Resources:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: have a substantial adverse indirect impact (i.e., through habitat modifications) on one or more species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS; have a substantial adverse impact on sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS; have a substantial adverse impact on state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.) through direct removal, filling, hydrological interruption, or other means; and interfere substantially with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites; and convert oak woodlands or other unique native woodlands. The Project would also cause significant cumulative impacts to biological resources.
- **Cultural Resources:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5; cause a substantial adverse change in the significance of a unique archaeological resource pursuant to CEQA Guidelines Section 15064.5; directly or indirectly destroy a unique paleontological resource or site or unique geologic feature; and disturb any human remains, including those interred outside of dedicated cemeteries. The Project would also cause significant cumulative impacts to cultural resources.
- **Hazards and Hazardous Materials:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment; emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25-mile of sensitive land uses; and impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan. The Project would also cause significant cumulative impacts to hazards and hazardous materials resources.
- **Hydrology and Water Quality:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would, in flood hazard, tsunami, or seiche zones, risk release of pollutants due to Project

NOTICE OF AVAILABILITY

March 2023

Page 4

inundation. The Project would also cause significant cumulative impacts to hydrology and water quality resources.

- **Noise:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies; and generate excessive groundborne vibration or groundborne noise levels. The Project would also cause significant cumulative impacts on noise.
- **Transportation:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: conflict with an applicable program plan, ordinance or policy addressing the circulation system; and substantially increase hazards due to a road design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment). The Project would also cause significant cumulative impacts to transportation resources.
- **Tribal Cultural Resources:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: cause a substantial adverse change in the significance of a tribal cultural resource, or of a resource determined by the County, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in Public Resources Code Section 5024.1(c). The Project would also cause significant cumulative impacts to tribal cultural resources.
- **Utilities and Service Systems:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: require or result in the relocation or construction of new or expanded water, wastewater treatment, stormwater drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects; and result in a determination by the wastewater treatment provider which serves or may serve the Project that it has inadequate capacity to serve the Project's projected demand in addition to the provider's existing commitments. The Project would also cause significant cumulative impacts to utilities and service systems.
- **Wildfire:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: substantially impair an adopted emergency response plan or emergency evacuation plan; require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment; and expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires. The Project would also cause significant cumulative wildfire impacts.

HAZARDOUS MATERIALS RELEASE SITES

Various sites in unincorporated Los Angeles County are identified on lists enumerated under Section 65962.5 of the Government Code, including known contamination sites identified in the EnviroStor database that need further investigation (i.e., 149 school investigation and school cleanup sites, 165 state response sites, 18 federal Superfund sites, and 370 voluntary cleanup sites) and hazardous materials sites identified in the GeoTracker database as having the potential to affect groundwater quality (i.e., 7,528 leaking underground storage tank sites).

NOTICE OF AVAILABILITY

March 2023

Page 5

PUBLIC REVIEW PERIOD

In accordance with Section 15105 of the State CEQA Guidelines, the County has scheduled a 45-day public review period for the Recirculated Draft PEIR. **The formal public review will start on March 30, 2023, and end on May 15, 2023.**

PUBLIC COMMENTS

The Recirculated Draft PEIR wholly replaces the Draft PEIR that was issued in May 2022. **Public comments on the May 2022 Draft PEIR will not be responded to in the Final PEIR. New public comments are requested on the Recirculated Draft PEIR, and only these will be responded to in the Final PEIR.** Please submit written comments on the Recirculated Draft PEIR no later than 5:00 p.m. on May 15, 2023.

Please send by mail to the following address:

Los Angeles County Department of Regional Planning
Attn: Thuy Hua
320 W. Temple Street, 13th Floor
Los Angeles, CA 90012

For email submittal of your comment letter, send to: climate@planning.lacounty.gov

All written comment letters/emails regarding the Recirculated Draft PEIR will be included in an appendix in the Final EIR and responded to in the Response to Comments section of the final document.

AVAILABILITY OF MATERIALS

A digital copy of the Recirculated Draft PEIR is available on the project website at <https://planning.lacounty.gov/long-range-planning/climate-action-plan/documents/>. A printed copy of the Recirculated Draft PEIR is available for public review by appointment during normal business hours at the Los Angeles County Department of Regional Planning's headquarter office (320 W. Temple Street, Los Angeles, CA 90012) starting March 30, 2023.

To ensure additional public access to the Recirculated Draft PEIR, printed copies of the document (with electronic copies of all appendices) are available for review during normal hours starting March 30, 2023 at the following County libraries:

PROJECT DESCRIPTION

The Draft 2045 Los Angeles County Climate Action Plan (2045 CAP or Project) is the County's plan towards meeting greenhouse gas (GHG) emissions reduction targets for unincorporated Los Angeles County by the years of 2030, 2035, and 2045. It was developed with the goals of implementing the GHG emissions reduction policies of the General Plan Air Quality Element and ensuring that the County contributes its fair share to statewide GHG emissions reductions.

With these goals in mind, the objectives of the Draft 2045 CAP are as follows:

- (1) Identify detailed programs, actions, and performance goals to achieve the climate action policies of the General Plan.
- (2) Identify GHG emissions reduction targets tailored to the unincorporated County that closely align with state and County climate goals.
- (3) Provide a road map for reducing GHG emissions to achieve the County's GHG emissions reduction targets.
- (4) Encourage sustainable housing production at all levels of affordability, including increasing housing densities near transit to the extent allowed in the General Plan.
- (5) Demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects (serve as a "qualified CAP") via the 2045 CAP Consistency Review Checklist.

The Draft 2045 CAP includes the following:

- A greenhouse gas (GHG) emissions inventory for 2018.
- Emissions forecasts for 2030, 2035, and 2045.
- GHG emissions targets for 2030, 2035, and 2045.
- A long-term aspirational goal for carbon neutrality by 2045.
- A suite of GHG emissions reduction strategies, measures, and actions to reduce GHG emissions from major sectors.
- A technical modeling appendix to explain the Draft 2045 CAP's GHG emissions reduction estimates.
- A consideration of environmental justice and equity concerns.
- Implementation and monitoring measures to ensure successful climate action.
- A new development review consistency checklist to allow future projects to streamline GHG emissions analyses pursuant to the California Environmental Quality Act (CEQA) as anticipated by CEQA Guidelines Section 15183.5 by using the 2045 CAP.

Approval of the Draft 2045 CAP would require an amendment to the General Plan to replace the *Unincorporated Los Angeles County Community Climate Action Plan 2020* (2020 CCAP), an implementing component of the General Plan's Air Quality Element.

LIST OF SIGNIFICANT ENVIRONMENTAL EFFECTS ANTICIPATED AS A RESULT OF THE PROJECT

No changes to General Plan land use designations, zoning, or specific development projects are proposed as part of the Draft 2045 CAP. However, projects facilitated by Draft 2045 CAP measures and actions would have the following significant impacts:

- **Aesthetics:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions would: have a substantial adverse effect on a scenic vista; be visible from or obstruct views from a regional riding, hiking, or multiuse trail; substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway; substantially degrade the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features and/or conflict with applicable zoning and other regulations governing scenic quality; and create a new source of substantial shadows, light, or glare, which would adversely affect day or nighttime views in the area. The Project would also cause significant cumulative impacts to aesthetics resources.
- **Agriculture and Forestry:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use; conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract; and involve other changes in the existing environment that, due to their location or nature, could result in conversion of Farmland, to nonagricultural use or conversion of forest land to non-forest use. The Project would also cause significant cumulative impacts to agriculture and forestry resources.
- **Air Quality:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: conflict with or obstruct implementation of the applicable air quality plan; result in a cumulatively considerable net increase of a criteria pollutant for which the Project region is non-attainment under an applicable federal or state ambient air quality standard; expose sensitive receptors to substantial pollutant concentrations for localized air pollutants and TAC emissions; and contribute to a significant cumulative impact to air quality associated with toxic air contaminant emissions.
- **Biological Resources:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: have a substantial adverse indirect impact (i.e., through habitat modifications) on one or more species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS; have a substantial adverse impact on sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS; have a substantial adverse impact on state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.) through direct removal, filling, hydrological interruption, or other means; and interfere substantially with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites; and convert oak woodlands or other unique native woodlands. The Project would also cause significant cumulative impacts to biological resources.
- **Cultural Resources:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5; cause a substantial

adverse change in the significance of a unique archaeological resource pursuant to CEQA Guidelines Section 15064.5; directly or indirectly destroy a unique paleontological resource or site or unique geologic feature; and disturb any human remains, including those interred outside of dedicated cemeteries. The Project would also cause significant cumulative impacts to cultural resources.

- **Hazards and Hazardous Materials:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment; emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25-mile of sensitive land uses; and impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan. The Project would also cause significant cumulative impacts to hazards and hazardous materials resources.
- **Hydrology and Water Quality:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would, in flood hazard, tsunami, or seiche zones, risk release of pollutants due to Project inundation. The Project would also cause significant cumulative impacts to hydrology and water quality resources.
- **Noise:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies; and generate excessive groundborne vibration or groundborne noise levels. The Project would also cause significant cumulative impacts on noise.
- **Transportation:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: conflict with an applicable program plan, ordinance or policy addressing the circulation system; and substantially increase hazards due to a road design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment). The Project would also cause significant cumulative impacts to transportation resources.
- **Tribal Cultural Resources:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: cause a substantial adverse change in the significance of a tribal cultural resource, or of a resource determined by the County, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in Public Resources Code Section 5024.1(c). The Project would also cause significant cumulative impacts to tribal cultural resources.
- **Utilities and Service Systems:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: require or result in the relocation or construction of new or expanded water, wastewater treatment, stormwater drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects; and result in a determination by the wastewater treatment provider which serves or may serve the Project that it has inadequate capacity to serve the Project's projected demand in addition to the provider's existing commitments. The Project would also cause significant cumulative impacts to utilities and service systems.
- **Wildfire:** The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would: substantially impair an adopted emergency response plan or emergency evacuation plan; require the installation or maintenance of associated infrastructure (such as

roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment; and expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires. The Project would also cause significant cumulative wildfire impacts.

Appendix B
**Appendix F of the Revised
Draft 2045 CAP**

APPENDIX F

2045 Climate Action Plan CEQA Streamlining Checklist

Purpose

The ~~2045 Los Angeles County Climate Action Plan (2045 CAP)~~ helps the County of Los Angeles (County) comply with various local, regional, state, and federal regulations to significantly reduce greenhouse gas (GHG) emissions. The County is obligated under the California Environmental Quality Act (CEQA), Assembly Bill (AB) 32 (the California Global Warming Solutions Act of 2006), Senate Bill (SB) 375 (the Sustainable Communities and Climate Protection Act of 2008), and various California executive orders to do its part to reduce GHG emissions in the state. Generally, statewide targets aim to reduce emissions to 1990 levels by 2020 (AB 32), to 40 percent below 1990 levels by 2030 (SB 32), and to 85 percent (anthropogenic) below 1990 levels by 2045 (AB 1279). CEQA Guidelines Section 15183.5 allows public agencies to analyze and mitigate GHG emissions as part of a larger plan for the reduction of GHGs. The ~~2045 CAP itself, the 2045 CAP CEQA Streamlining Checklist (this document), and the certified Final Program Environmental Impact Report (PEIR) (State Clearinghouse #2021120568) for the 2045 CAP together meet all requirements of Section 15183.5(b) of the CEQA Guidelines. Accordingly, the 2045 CAP represents the County's qualified climate action plan (CAP) in compliance with CEQA.~~

The ~~2045 CAP~~ includes 10 strategies, 25 measures, and 95 actions that shall be implemented by the County to achieve its proportional share of state GHG emissions reductions for the target year 2030. These strategies, measures, and actions are organized into four sectors: (1) transportation; (2) stationary energy; (3) waste (including wastewater); and (4) agriculture, forestry, and other land use (AFOLU). The ~~2045 CAP~~ does not include any strategies, measures, or actions to reduce emissions from the fifth sector of the County's GHG inventory, industrial processes and product use (IPPU), given data and modeling limitations for this sector.

The 2045 Climate Action Plan CEQA Streamlining Checklist (referred to herein as the ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist) can be used applies to **discretionary projects that are subject to and not exempt from CEQA, including both new projects and expansion of existing land uses, and including agency and public projects, that intend to streamline the environmental review of their GHG impacts pursuant to CEQA** (referred to herein as *projects*). The purpose of the ~~2045 CAP Checklist~~ is to:

- (1) — Implement relevant GHG emissions reduction actions from the ~~2045 CAP~~ for projects.
- (2) Provide a voluntary streamlined review process for analyzing the impacts of GHG emissions resulting from proposed discretionary projects that are subject to CEQA.

The ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist may be updated administratively to incorporate new GHG emissions reduction techniques or to comply with later amendments to the 2045 CAP or local, state, or federal law ~~without the need for an amendment to the Los Angeles County General Plan 2035 (General Plan).~~

Appendix F Organization

This appendix is organized into the following four sections:

Section F.1: ~~CEQA Compliance and Background Information~~

This section describes the rationale for the checklist and explains how it provides the mechanism for projects that wish to streamline environmental review of their GHG impacts using the 2045 CAP's PEIR pursuant to CEQA Guidelines Section 15183.5(b).

Section F.2: Checklist Instructions

This section includes the submittal requirements for applicants, the applicability of the ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist, and instructions for completing the ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist.

Section F.3: ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist

This section includes the ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist itself along with a table for reporting and documenting alternative project emissions reduction measures and additional GHG reductions.

Section F.4: Offsite GHG Reduction Program Framework

This section includes a framework for the County's forthcoming Offsite GHG Reduction Program. This program will be available for project applicants to use as an alternative GHG reduction measure to the CEQA streamlining requirements, by allowing applicants to fund or implement local projects that reduce GHG emissions within unincorporated Los Angeles County.

F.1 ~~CEQA Compliance and Background Information~~

~~The 2045 CAP's GHG reductions will occur through a combination of County initiatives, as represented by various plans and policies that will provide reductions from both new developments and the expansion of existing developments. The 2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist ~~specifically applies to proposed discretionary projects that require environmental review pursuant to CEQA and intend to streamline the environmental review of their GHG impacts. Therefore, the 2045 CAP Checklist is a critical implementation tool in the County's overall strategy to reduce GHG emissions. Implementing applicable 2045 CAP measures and actions in new developments and expanding existing development projects will help the County achieve incremental reductions toward its 2030, 2035, and 2045 targets.~~

The growth projections outlined in the General Plan's Land Use and Housing Elements were used in the 2045 CAP to estimate unincorporated Los Angeles County's future emissions. Therefore, projects can use the ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist if they are consistent with the Land Use Element. This consistency allows a project to streamline its analysis of GHG impacts by using the existing programmatic environmental review contained in the certified Final PEIR for the 2045 CAP. In doing so, pursuant to CEQA Guidelines Sections 15064(h)(3), 15130(d), and 15183(b), a project's incremental contribution to climate change resulting from the project's GHG emissions may be determined not to be cumulatively considerable. This approach is consistent with the recommendations of the California Air Resources Board (CARB) in the *2022 Scoping Plan for Achieving Carbon Neutrality* (2022 Scoping Plan) that "CEQA-qualified CAPs" can allow eligible projects to streamline their determination of significance for GHG emissions.¹ It is also consistent with the Association of Environmental Professionals Climate Change Committee's best practices for tiering from qualified GHG reduction plans that demonstrate substantial progress toward meeting the next milestone

¹ California Air Resources Board. 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. Appendix D, "Local Actions." November 16, 2022. Available: <https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-appendix-d-local-actions.pdf>. Accessed in January 2023.

statewide planning reduction target (i.e., a 40 percent reduction below 1990 levels by 2030 as set forth by SB 32).²

This ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist provides a mechanism for projects to specifically identify “those requirements specified in the plan that apply to the project, and, if those requirements are not otherwise binding and enforceable, incorporate those requirements as mitigation measures applicable to the project” per Section 15183.5(b)(2) of the CEQA Guidelines.

GHG emissions associated with the construction of projects, including demolition and decommissioning activities, are generally orders of magnitude lower than operational GHG emissions. This is primarily because construction emissions are typically short in duration compared to the project’s overall lifetime. Typically, construction GHG emissions are amortized over 30 years and added to a project’s 30-year lifetime emissions total; after this amortization, construction GHG emissions usually represent a small fraction of a project’s total annual emissions. It is generally difficult to enforce low-emission construction equipment because of the limited availability of zero-emission and near-zero-emission construction equipment, along with contracting requirements. In addition, the 2045 CAP quantifies GHG emissions from off-road construction activity at the unincorporated Los Angeles County level; these emissions are accounted for in the 2045 CAP’s ability to achieve the 2030, 2035, and 2045 targets.

The ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist also requires the use of electric and zero-emission construction equipment during project construction to the maximum extent feasible, to align with Measure T9. Therefore, construction emissions can be assessed qualitatively as part of related CEQA GHG emissions analysis. However, some projects may have long construction periods or entail substantial excavation and grading that could result in construction-related GHG emissions that may be considered significant. Thus, the County retains the discretion on a project-by-project basis to consider whether a project’s construction-related GHG emissions could be cumulatively considerable and require a more detailed quantitative CEQA analysis and mitigation of GHG emissions.

Projects that elect not to use the ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist for CEQA streamlining must prepare a comprehensive project-specific analysis of GHG emissions. The analysis must quantify existing and projected GHG emissions and it is strongly encouraged that the project incorporate all the ~~CEQA~~ streamlining requirements in this ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist, although this is not required. The ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist may be updated to incorporate new GHG emissions reduction techniques or to comply with later amendments to the 2045 CAP or to local, state, or federal law.

2045 CAP Appendix B, *Emissions Forecasting and Reduction Methods*, provides the quantitative basis for CEQA streamlining requirements. This document demonstrates how, based on substantial

² Association of Environmental Professionals. 2016. *Final White Paper Beyond 2020 and Newhall: A Field Guide to New CEQA Greenhouse Gas Thresholds and Climate Action Plan Targets for California*. October 18, 2016. Available: https://califaep.org/docs/AEP-2016_Final_White_Paper.pdf.

evidence,³ implementing these CEQA streamlining requirements on a project-by-project basis will collectively achieve the 2045 CAP's target emissions level for projects by 2030 and 2035, as required by CEQA Guidelines Section 15183.5(b)(1)(D).

Alignment with the 2022 Scoping Plan

Appendix D of CARB's 2022 Scoping Plan provides guidance for local governments and lead agencies for how local climate action planning can support the State of California's climate goals.⁴ CARB reiterates that a CAP that has been adopted through the CEQA review process and meets the criteria specified in CEQA Guidelines Section 15183.5(b) for a "plan for the reduction of greenhouse gas emissions"—such as the 2045 CAP—is a "CEQA-qualified CAP" that can allow eligible projects to streamline their determination of significance for GHG emissions.

Streamlining CEQA GHG analysis for future projects by demonstrating consistency with a CAP involves evaluating whether a project demonstrates consistency with "all applicable GHG reduction measures identified in the CAP." CARB notes that such consistency can be determined by using CAP compliance checklists, which can be "included as part of the proposed project's CEQA analysis documenting the project's consistency with the CEQA-qualified CAP."

The ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist is therefore consistent with CARB's guidance in the 2022 Scoping Plan as a valid way for discretionary projects to streamline their analysis of GHG impacts.

Recommended Project Attributes for Residential and Mixed-Use Projects

Appendix D of the 2022 Scoping Plan includes a list of "key project attributes" for residential and mixed-use projects. CARB states that if a project incorporates these attributes, the project would "accommodate growth in a manner consistent with State GHG reduction and equity prioritization goals" and would be "**clearly** consistent with the State's climate goals." Further, such projects would be "consistent with the Scoping Plan or other plans, policies, or regulations adopted for the purposes of reducing GHGs" and that therefore, "the GHG emissions associated with such projects may result in a less-than-significant GHG impact under CEQA."

Alternative Project Emissions Reduction Measures and Offsite GHG Reduction Programs

As discussed below under *Step 4: Identify Alternative Project Emissions Reduction Measures and Additional GHG Reductions*, project applicants may employ alternative GHG emissions reduction measures to serve as replacements for any CEQA streamlining requirement not feasible to implement at the project-level. Such replacement measures must meet specific criteria and be

³ CEQA Guidelines Section 15384 defines *substantial evidence* as "enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached. Whether a fair argument can be made that the project may have a significant effect on the environment is to be determined by examining the whole record before the lead agency. Argument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence. Substantial evidence shall include facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts."

⁴ California Air Resources Board. 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. Appendix D, "Local Actions." November 16, 2022. Available: <https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-appendix-d-local-actions.pdf>. Accessed in January 2023.

supported by substantial evidence that the measure would achieve the same or greater level of GHG emissions reductions as the ~~2045 CAP~~ CEQA streamlining requirement that it replaces.

CARB supports the idea of “off-site GHG mitigation” in Appendix D of the 2022 Scoping Plan for projects that have maxed out their on-site GHG reduction actions: “If implementation of all feasible on-site GHG reduction measures is insufficient to reduce a project’s impact to a less-than-significant level, the State recommends that the lead agency next explore options to fund or implement **local**, off-site direct GHG reduction strategies.”⁵

As discussed further below, Action ES5.4 of the 2045 CAP would establish an Offsite GHG Reduction Program for new development to use as a GHG reduction or mitigation pathway for 2045 CAP compliance and to fund programs for reducing GHG emissions in the built environment.

CARB cautions that such off-site measures must directly “offset” a project’s GHG emissions and must not be unrelated off-site measures that would occur independently of the proposed project. Lead agencies and project applicants must provide substantial evidence that a specific off-site mitigation measure is not otherwise required by law or regulation and would not have occurred “**but for** the requirement to mitigate a project’s GHG impacts.” CARB goes on to state the following:

There has been concern that GHG emission reductions from off-site GHG mitigation measures... may double count GHG emission reductions from California’s Cap-and-Trade program. However, off-site mitigation measures, such as EV [electric vehicle] charging or building efficiency retrofits, are viable options for mitigation under CEQA and would not be double counted, provided they are not otherwise required by law or regulation and would not have happened but for the mitigation requirements of the project. If the mitigation would have been implemented or required through another statute, regulation, existing local program, or requirement other than the project it is mitigating, then the project being mitigated may not also claim credit for the reductions.

F.2 Checklist Instructions

~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist Submittal Requirements

The ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist shall accompany the project application for all projects and plans proposed within unincorporated Los Angeles County’s land use authority that are subject to CEQA, ~~whether supported by private or government (local or state) funding.~~ The ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist is designed to assist the project applicant in identifying the GHG emissions reduction actions and other applicable sustainability-focused requirements specific to a proposed project-. However, it may be necessary to supplement the completed ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist with supporting materials, calculations, or certifications to demonstrate compliance with all the applicable CEQA streamlining ~~requirements~~ provisions ~~requirements~~ in the 2045 CAP

⁵ California Air Resources Board. 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. Appendix D, “Local Actions.” November 16, 2022. Available: <https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-appendix-d-local-actions.pdf>. Accessed in January 2023.

~~Checklist~~ 2045 CAP CEQA Streamlining Checklist. The ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist shall be included in the respective project conditions of approval.

~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist Applicability

The ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist allows for streamlined project-specific CEQA GHG analysis. The ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist is only required if a project applicant wants to use CEQA streamlining for GHG impacts; it is not required if a project-level environmental analysis of GHG impacts is conducted. As such, the ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist is voluntary. The ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist cannot be used for projects requiring a General Plan amendment associated with land use density increases. Ministerial projects and projects that otherwise are exempt from CEQA are deemed to be consistent with the 2045 CAP, and no further review is necessary, with the exception of the residential infill categorical exemption (CEQA Guidelines Section 15195), for which projects are required to demonstrate consistency with the 2045 CAP through the ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist if the applicant elects to use CEQA streamlining for GHG impacts. All projects using the ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist for CEQA streamlining must demonstrate consistency with the General Plan growth projections. **If a project is not consistent with the General Plan growth projections, then the ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist may not be used for CEQA streamlining.**

~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist Instructions

Project applicants shall complete the following **four steps** to demonstrate ~~compliance~~ compliance with the 2045 CAP for a proposed project.

Step 1. Demonstrate consistency with the General Plan ~~g~~ Growth p ~~Projections~~ (Table F-1).

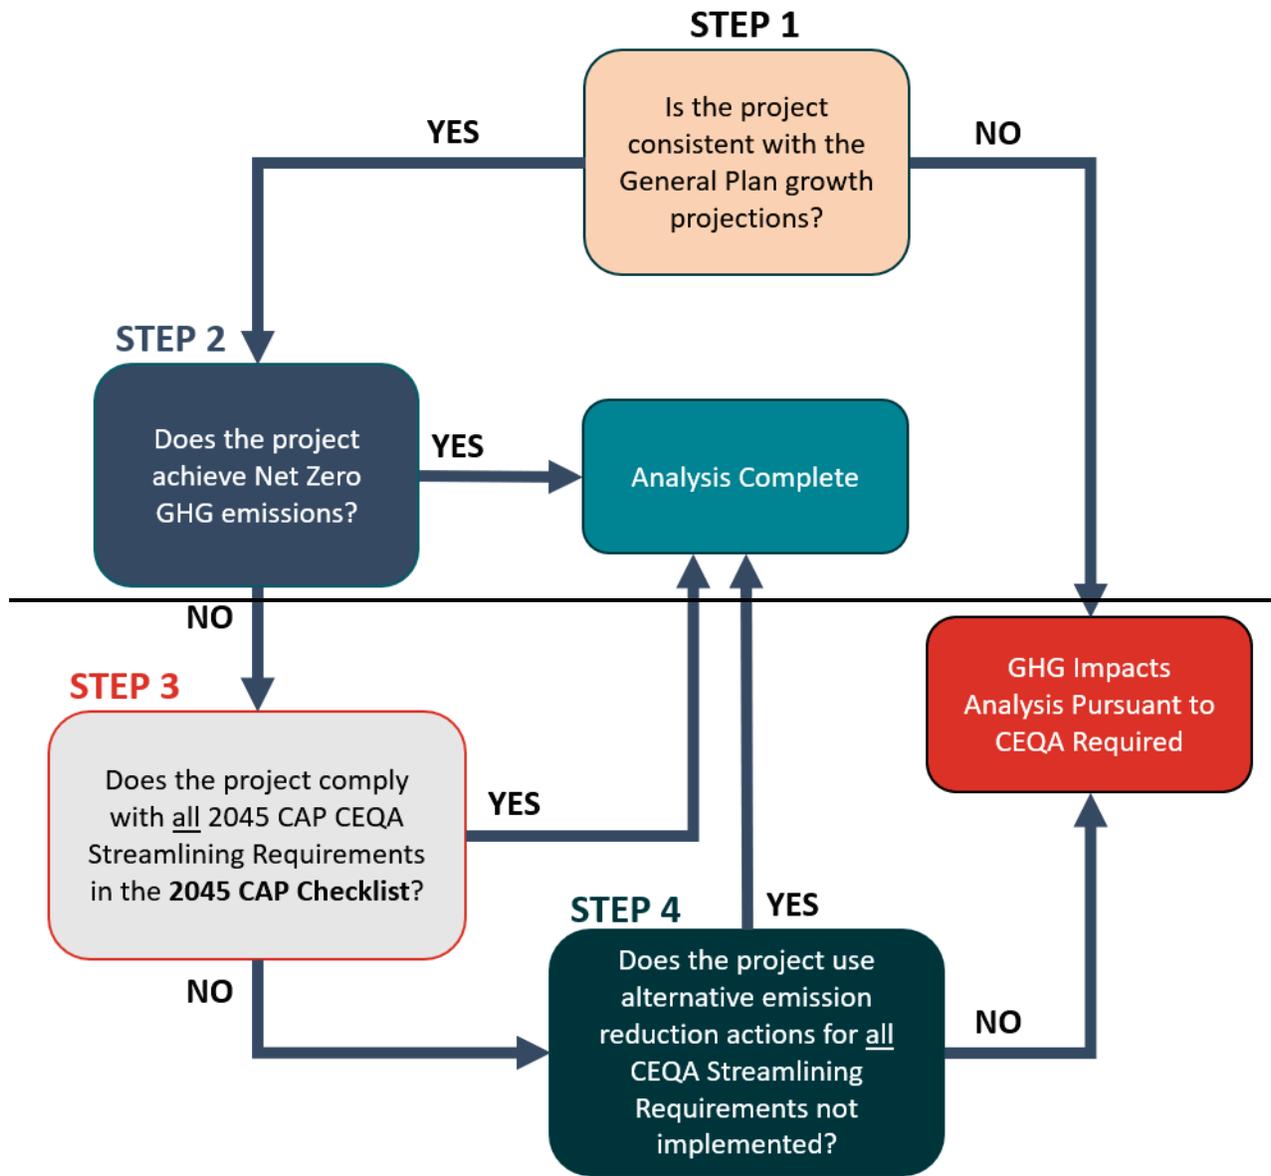

Step 2. Determine whether the project screens out of certain CEQA streamlining requirements (Table F-1).

Step 3. ~~Demonstrate compliance with~~ Complete the 2045 CAP CEQA streamlining ~~requirements~~ Streamlining Checklist (Table F-1).

Step 4. Identify alternative project emissions reduction measures and additional GHG reductions (Table F-2), as needed.

All projects must complete **Step 1: Demonstrate Consistency with the General Plan Growth Projections** and **Step 2: Determine Whether the Project Screens Out of Certain CEQA Streamlining Requirements**. Projects that do not meet the screening criteria must complete **Step 3: ~~Demonstrate Compliance with~~ Complete the 2045 CAP CEQA Streamlining Requirements**. Projects that cannot meet all CEQA streamlining requirements shown in Table F-1 must also complete **Step 4: Identify Alternative Project Emissions Reduction Measures and Additional GHG Reductions** (Table F-2) to describe alternative GHG emissions reduction measures that serve as replacements to any CEQA streamlining requirements not met by the project.

The following ~~process~~^{processs}, illustrated in **Figure F-1**, explains how to demonstrate consistency of a project with the 2045 CAP's GHG emissions reduction measures and actions, and thereby streamline the project's GHG impacts analysis by tiering from the certified Final PEIR for the 2045 CAP.

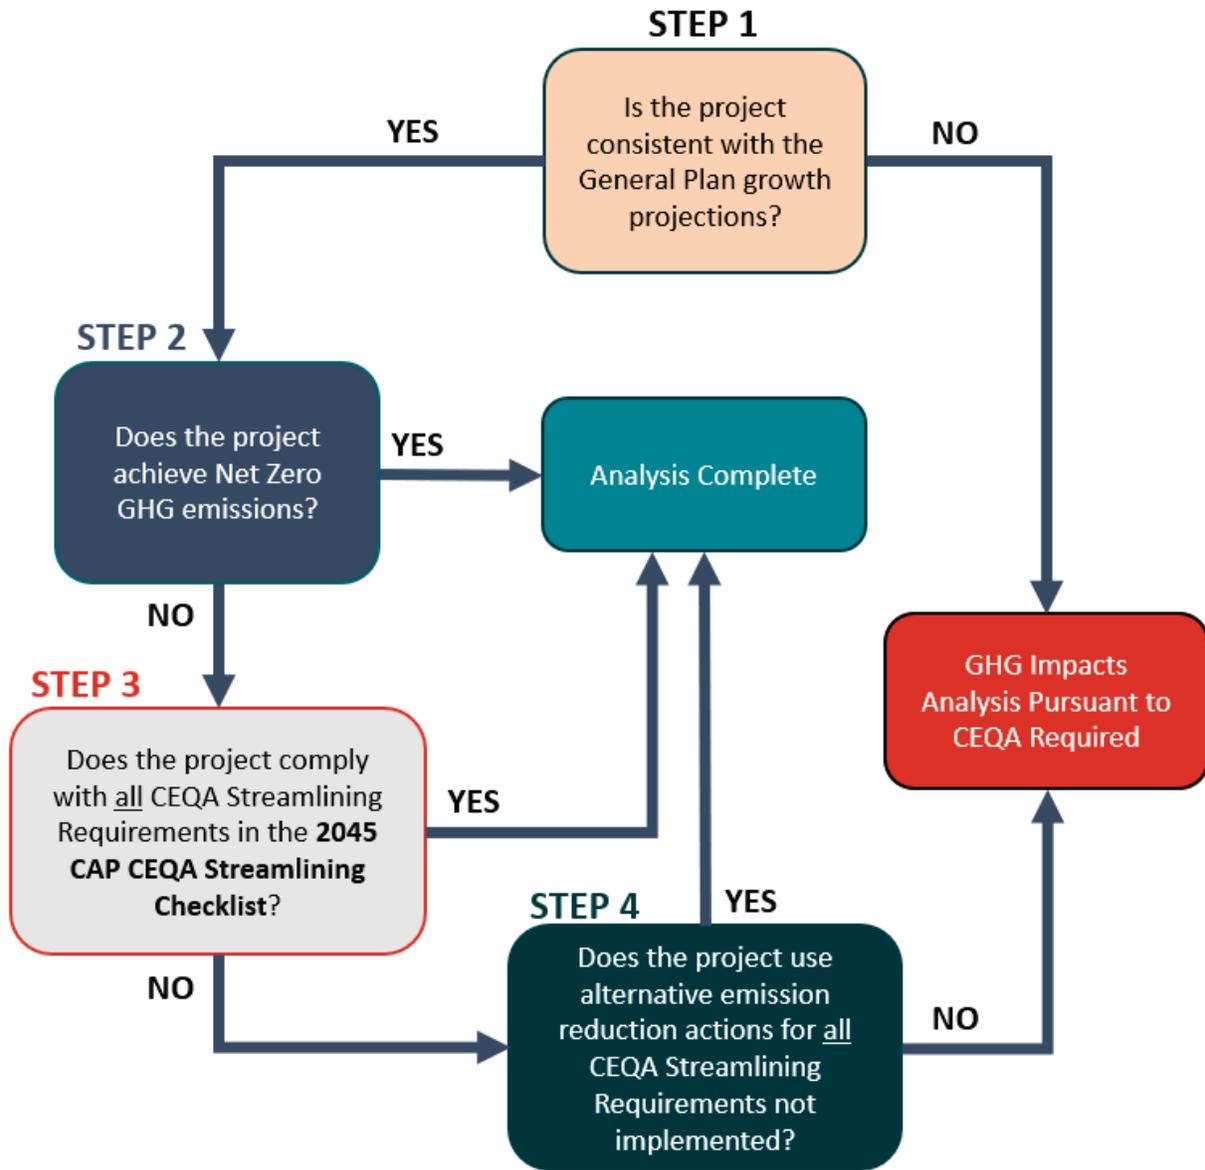

Figure F-1: Determining Consistency with the 2045 CAP for CEQA Streamlining

Step 1: Demonstrate Consistency with the General Plan Growth Projections

All projects must demonstrate consistency with the General Plan growth projections. **If a project is not consistent with the General Plan growth projections, then the 2045 CAP Checklist 2045 CAP CEQA Streamlining Checklist may not be used for CEQA streamlining.** Complete the *General Plan Consistency* section of **Table F-1, General Plan and CEQA Streamlining Requirement Checklist**, below.

The options for determining General Plan consistency (included in Table F-1) are as follows:

- Is the proposed project consistent with the General Plan growth projections? If yes, move to **Step 2** below. If no, the proposed project may not streamline its GHG impacts analysis by using the 2045 CAP’s EIR, and instead must prepare a comprehensive project-specific

analysis of GHG emissions and impacts pursuant to CEQA. Such projects are also encouraged to incorporate all the CEQA streamlining requirements in the 2045 CAP Checklist 2045 CAP CEQA Streamlining Checklist.

Step 2: Determine Whether the Project Screens Out of Certain CEQA Streamlining Requirements

Certain projects may screen out of compliance with certain CEQA streamlining requirements contained in Table F-1 if such projects meet specific criteria. These criteria are designed to ensure high efficiency and low GHG emissions and describe projects that would generally comply with the 2045 CAP.

~~2045 CAP Checklist~~ **2045 CAP CEQA Streamlining Checklist Screening Criteria:** Projects may skip the *Demonstrate Compliance with the CEQA Streamlining Requirements* section of Table F-1 below if they meet the following criteria:

- If the project would achieve ~~net-net zero GHG emissions for project operations at full buildout~~, the project is considered to comply with the 2045 CAP and the analysis is complete.

~~Net z~~ **Net Z** zero GHG emissions ~~for the project operations at full buildout~~ means that the project's GHG emissions from construction and operational activities occurring at full buildout would result in zero total GHG emissions on an annual basis. In other words, all GHGs emitted the atmosphere during construction and operation by a project are balanced completely by GHG sequestration and removal over each calendar year period. Construction GHG emissions should be amortized for the project (typically 30 or 40 years) and added to the annual full buildout operational emissions to determine total annual emissions. Net z In other words, either a project would produce zero total GHG emissions from all sources, or all GHG emissions produced by a project at full buildout operations are balanced completely by carbon sequestration and removal, for each year of operation. Zero GHG emissions for a project does not consider total net-GHG emissions from construction and operation of the proposed project is zero from existing conditions or existing uses at the project site. In other words, all emissions of GHGs emitted the atmosphere during construction and operation are balanced by removals of GHG emissions over each calendar year period. For example, if the project emits 3,000 MTCO₂e per year through both construction and operations but removes or sequesters 3,000 MTCO₂e per year, the project would achieve net zero GHG emissions. For example, if a project implements GHG reducing technologies to reduce its full-buildout operational emissions to emits 1,500 MTCO₂e per year for both construction and operations, but includes the planting of enough new trees to sequester 1,500 MTCO₂e per year, the project would achieve net zero GHG emissions. This zero GHG requirement does not include GHG emissions from construction activities.

To demonstrate that the project achieves ~~net net~~ zero GHG emissions, the applicant must submit a comprehensive quantitative project-specific analysis of all GHG emissions, sinks, and removals, sinks, and removals from construction and operations, consistent with all CEQA guidelines and standard practice for modeling GHG emissions from construction and full buildout full buildout for projects operations, consistent with CEQA guidelines and standard practice for modeling GHG emissions for projects. If the project meets ~~this~~ these criteria, the project does not need to complete **Table F-1** below and the analysis is complete.

Transportation Screening Criteria: Projects may skip CEQA streamlining requirements #3, #4, #5, #11, and #12 of the *Demonstrate Compliance with the CEQA Streamlining Requirements* section of Table F-1 below if they meet the following criteria (based on the 2020 Los Angeles County Department of Public Works Transportation Impact Analysis Guidelines):⁶

1. For development projects:⁷
 - a. If the project does not have a retail component, and the project generates a net increase of less than 110 daily vehicle trips,⁸ then it screens out.
 - b. If the project has a retail component, and it contains retail uses that do not exceed 50,000 square feet of gross floor area,⁹ then it screens out.
 - c. If the project has a residential component, and 100 percent of the units, excluding manager's units, are set aside for lower income households,¹⁰ then it screens out.
 - d. If the project is located within a one-half mile radius of a major transit stop or an existing stop along a high-quality transit corridor¹¹ and meets all of the following criteria, then it screens out:
 - i. Has a Floor Area Ratio greater than 0.75.¹²
 - ii. Provides less parking than required by the Los Angeles County Code.¹³
 - iii. Is consistent with the Southern California Associated of Governments' Regional Transportation Plan/Sustainable Communities Strategy.¹⁴
 - iv. Does not replace residential units set aside for lower income households with a smaller number of market-rate residential units.
2. For transportation projects:¹⁵
 - a. If the project would not include the addition of through traffic lanes on existing or new highways, including general-purpose lanes, high-occupancy vehicle lanes, peak-period lanes, auxiliary lanes, and lanes through grade-separated interchanges (except

⁶ Los Angeles County Department of Public Works. 2020. *Transportation Impact Analysis Guidelines*. July 2020. Available: <https://dpw.lacounty.gov/traffic/trafficreportmsg.cfm>. Accessed February 2022.

⁷ The Transportation Impact Analysis (TIA) Guidelines provide a list of development project types, which include residential, office, manufacturing, institutional, and retail project types. For a complete list, see page 11 of the TIA Guidelines.

⁸ As referenced in: Governor's Office of Planning and Research. 2018. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

¹⁰ Governor's Office of Planning and Research. 2018. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

¹¹ Governor's Office of Planning and Research. 2018. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

¹² Governor's Office of Planning and Research. 2018. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

¹³ Governor's Office of Planning and Research. 2018. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

¹⁴ Governor's Office of Planning and Research. 2018. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

¹⁵ The TIA Guidelines describe transportation projects as projects that would increase vehicular/roadway capacity.

managed lanes, transit lanes, and auxiliary lanes of less than 1 mile in length designed to improve roadway safety),¹⁶ then it screens out.

- b. If the project would reduce roadway capacity and VMT,¹⁷ then it screens out.

If the project meets the above criteria, it may skip certain transportation portions of the ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist (see Table F-1 for details).

Step 3: Demonstrate Compliance with the 2045 CAP CEQA Streamlining Requirements

Table F-1 identifies the CEQA streamlining requirements for projects. Projects must demonstrate compliance with the 2045 CAP CEQA streamlining requirements listed in Table F-1 or document why the requirements are not applicable or are infeasible.¹⁸ The corresponding 2045 CAP measures and actions are indicated in the table to provide additional context. The full text of the 2045 CAP measures and actions is provided in the 2045 CAP (see Chapter 3 and Appendix E).

All applicants shall complete the following steps for the *Transportation, Building Energy and Water, Waste, and Agriculture, Forestry, and Other Land Use (AFOLU)* sections of **Table F-1** below (unless the project meets the transportation screening criteria identified in Step 1 above, in which case the project may skip completion of certain sections of the *Transportation* section of Table F-1):

- Step 3a.** Review the ~~project CEQA~~ CEQA streamlining requirements described in the column titled “2045 CAP Streamlining Requirement.”
- Step 3b.** Use the check boxes in the column titled “Project Complies” to indicate whether the “Project Complies,” the requirement is “Not Applicable,” or the “Project Does Not Comply and Alternative Measure Proposed.”
- Step 3c.** Provide a qualitative analysis of the proposed project’s compliance with the ~~2045 CAP~~ CEQA streamlining requirements in the column titled “Description of Project Measure(s)/Documentation of Compliance.” This will be the basis for the CEQA analysis to demonstrate compliance with the 2045 CAP, and by extension, with SB 32. The qualitative analysis should provide:
 - i. A description of which streamlining requirements are included as part of the proposed project; or
 - ii. A description of why the streamlining requirement is not applicable to the proposed project; or
 - iii. A description of why the streamlining requirements are infeasible. If applicants select “Project Does Not Comply” or “Alternative Measure Proposed,” they must complete Table F-2 to document what alternative project measures will be implemented to achieve a similar level of GHG reduction and how those GHG emissions reduction estimates were calculated.

¹⁶ As noted above, the TIA Guidelines describe transportation projects as projects that would increase vehicular/roadway capacity.

¹⁷ A list of transportation projects that are not likely to lead to a substantial or measurable increase in vehicle miles travelled are included in the County’s TIA Guidelines, pp. 17–19.

¹⁸ Please note that the ~~2045 CAP CEQA streamlining~~ requirements are not mitigation measures as defined by CEQA.

Step 3d. Provide specific project design criteria and/or reporting metrics to support the proposed project's compliance with each ~~2045 CAP CEQA streamlining~~ requirement. Specific information is requested for each respective item in the ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist.

Regarding item #2 above, the project applicant can only select "Not Applicable" if the requirement is not relevant to the project. The project applicant should only select "Project Does Not Comply and Alternative Measure Proposed" if it is infeasible, as defined by the CEQA Guidelines, for the project to comply with the checklist requirement. Sufficient documentation of such infeasibility must be supplied to the County to support such a determination. The County retains ultimate discretion for determining the feasibility of the checklist requirement for the proposed project. Further, if "Project Does Not Comply and Alternative Measure Proposed" is selected for a specific checklist requirement, then the project applicant **must** identify an alternative measure to achieve the same or greater level of GHG emissions reduction as the CEQA streamlining requirement with which the project does not comply.

If the project applicant cannot fully complete these requirements, then the ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist may not be used for CEQA streamlining of GHG emissions impacts. See the *Projects That Cannot Comply*Are Not Eligible for with the CEQA Streamlining Requirements-section for additional instructions.

The 2045 CAP CEQA streamlining requirements are listed as either "Tier 1" or "Tier 2." These two levels are defined as follows:

Tier 1: Required for all discretionary projects in order to use CEQA streamlining for GHG impacts.

Tier 2: Encouraged for all discretionary projects. Although these measures are not required, projects are strongly encouraged to implement them. In Table F.1 below, these voluntary items are colored with gray shading.

In general, Tier 1 requirements were quantified in the 2045 CAP for GHG emissions reductions needed to achieve the 2030, 2035, and 2045 emissions reduction targets. Because these measures were quantified, they would be required for the 2045 CAP to achieve its full emissions reduction potential. Some Tier 1 measures were not quantified, but they either are required through other code or ordinance (such as compliance with the Transportation Demand Management Ordinance) or are deemed essential for the overall success of the 2045 CAP. Tier 2 requirements were identified as supporting actions but are not deemed essential for the overall success of the 2045 CAP.

Some Tier 1 and Tier 2 requirements point to future County regulations or ordinances that have not yet been developed, such as the forthcoming building decarbonization ordinance. In these instances, projects using the Checklist must only comply with currently adopted ordinances and requirements at the time of project approval.

The ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist includes the following Tier 1 and Tier 2 requirements, organized by strategy area:

Energy Supply

1. Tier 1: Sunset Oil and Gas Operations

2. Tier 1: Utilize 100% Zero-Carbon Electricity

Transportation

3. Meets Transportation Screening Criteria
4. Tier 1: Increase Density Near High-Quality Transit Areas
5. Tier 1: Incorporate Bicycle and Pedestrian Infrastructure
6. Tier 1: Comply with the County Transportation Demand Management (TDM) Ordinance
7. Tier 1: Comply with the County's Transportation Impact Guidelines
8. Tier 1: Incorporate Electric Vehicle Charging Infrastructure
9. Tier 1: Decarbonize Trucks
10. Tier 1: Incorporate Zero-Emission Technologies for Off-Road Vehicles & Equipment
11. Tier 1: Electrify County Fleet Vehicles (for municipal projects only)
12. Tier 2: Achieve a High Jobs/Housing Balance
13. Tier 2: Encourage Transit, Active Transportation, and Alternative Modes of Transportation
14. Tier 2: Implement Parking Limitations

Building Energy and Water

15. Tier 2: Decarbonize Existing Buildings
16. Tier 2: Decarbonize New Buildings
17. Tier 1: Increase Building Energy Efficiency
18. Tier 1: Implement Water Use Efficiency and Water Conservation
19. Tier 2: Reduce the Life-Cycle Carbon Intensity of Building Materials and Phase Out the Use of High-Global Warming Potential (GWP) Refrigerants
20. Tier 2: Use Energy Storage and Microgrids
21. Tier 2: Use Recycled Water and Graywater for Non-potable Uses and Include Rainfall Capture

Waste

22. Tier 1: Compost Organic Materials
23. Tier 1: Recycle Recyclable Materials
24. Tier 2: Incorporate On-site Composting, Mulching, and/or Anaerobic Digestion

Agriculture, Forestry, and Other Land Use

25. Tier 1: Incorporate Tree Plantings and Expand Urban Forest Cover
26. Tier 2: Conserve Forests, Woodlands, Shrublands, Grasslands, Desert, and other Carbon-Sequestering Wildlands and Working Lands
27. Tier 2: Implement Regenerative Agricultural Practices

2045 CAP Appendix B, *Emissions Forecasting and Reduction Methods*, provides the quantitative basis for the CEQA streamlining requirements.

Step 4: Identify Alternative Project Emissions Reduction Measures and Additional GHG Reductions

Projects that propose alternative GHG emissions reduction measures to those identified in Table F-1 or propose to include additional GHG emissions reduction measures beyond those described in Table F-1 shall provide a summary explanation of the proposed measures and demonstrate GHG reductions achievable through the proposed measures.¹⁹ Documentation for these alternative or additional project measures shall be documented in **Table F-2, Applicant Proposed Alternative Project Emissions Reduction Measures**. Any applicants who select “Project Does Not Comply and Alternative Measure Proposed” in Table F-1 must complete the following steps for Table F-2.

Step 4a. In the column titled “Description of Alternative Measure,” provide a qualitative description of what measure will be implemented, why it is proposed, and how it will reduce GHG emissions.

Step 4b. In the column titled “Description of GHG Reduction Estimate,” demonstrate how the alternative project measure would achieve the same or greater level of GHG emissions reductions as the 2045 CAP CEQA streamlining requirement that it replaces. Documentation and calculation files must be attached separately.

An example alternative project measure may be installing additional EV charging infrastructure beyond what is required by the California Green Building Standards Code (CALGreen Code), County ordinance, or requirements in the forthcoming Zero Emission Vehicle Master Plan, to support zero-emission vehicles beyond what is specified in the 2045 CAP’s performance objectives for Measure T6 (Increase ZEV Market Share and Reduce Gasoline and Diesel Fuel Sales). The applicant would then demonstrate how this would achieve the same or greater level of GHG emissions reductions as the checklist requirement for which it serves as an alternative.

Carbon offset credits are not permitted to be used as alternative project emissions reduction measures.

Guidance for Quantifying GHG Reductions from Alternative Measures

In order to use alternative GHG emissions reduction measures to replace a CEQA streamlining requirement in Table F-1 below, project applicants must use the three-step process outlined below to quantitatively demonstrate how the alternative project measure would achieve the same or greater level of GHG emissions reductions as the CEQA streamlining requirement (or requirements) that it replaces.

Project applicants should follow these three steps:

Step 4c. Prepare a detailed quantified GHG emissions inventory for the project taking into consideration all GHG-reducing project features and ~~2045 CAP Checklist~~ 2045 CAP CEQA Streamlining Checklist items included as part of the project (including proposed mitigation measures, project design features, strategies being implemented, and other County requirements).

¹⁹ Please note that the alternative GHG emissions reduction measures are not mitigation measures as defined by CEQA.

Project applicants shall prepare a detailed quantified GHG emissions inventory for the project taking into consideration all GHG-reducing project features and CEQA streamlining requirements included as part of the project (including proposed mitigation measures, project design features, strategies being implemented, and other County requirements), **except** for the alternative GHG emissions reduction measures proposed by the applicant to replace any Tier 1 CEQA streamlining requirement (as described in Step 4e). Applicants should use CalEEMod, CARB's Emission FACTor model (EMFAC),²⁰ the CAPCOA Handbook, and other commonly accepted GHG modeling methods and protocols.

- Step 4d.** For each Tier 1 ~~Checklist~~ CEQA streamlining requirement that the project will not meet, include a quantified calculation of the additional GHG emission reductions that would have occurred had the project implemented the Tier 1 Checklist streamlining requirement.

Project applicants shall, for all Tier 1 CEQA streamlining requirements that the project will not meet, a quantified calculation of the additional GHG emission reductions that would have occurred had the project implemented those Tier 1 CEQA streamlining requirements. In order to do this, applicants shall prepare a project model run assuming the implementation of all Tier 1 CEQA streamlining requirement that the project will not meet. Applicants should then compare the project's GHG emissions from this scenario with the project's GHG emissions from Step 4c above. The difference in GHG emissions between the two scenarios represents the GHG emission reductions that would have occurred had the project implemented all Tier 1 CEQA streamlining requirements; this is the amount of GHG emissions required to be reduced in total by the alternative GHG emissions reduction measures.

- Step 4e.** Propose an alternative measure (or set of measures) and demonstrate quantitatively that the alternative measures would achieve a GHG emission reduction equivalent to the GHG emission reduction that would have resulted from complying with the Tier 1 ~~Checklist~~ CEQA streamlining requirement.

Project applicants shall provide a quantified measure or set of measures that closes the gap between the two scenarios as quantified in Step 4c and Step 4d. In order to do this, applicants shall prepare a project model similar to Step 4c but include all alternative GHG emissions reduction measures proposed by the applicant. The resulting GHG emissions from this model run must equal or be less than the GHG emissions resulting from the project model run in Step 4d above which assumes the implementation of all Tier 1 CEQA streamlining requirements. In other words, the GHG emission reductions achieved by the alternative measures must meet or exceed the GHG emission reductions achieved by the Tier 1 CEQA streamlining requirements.

Project applicants shall submit documentation to the City demonstrating all three steps above. This can include model run inputs and/or outputs, excel calculation files, or other documentation of the emission calculations.

²⁰ California Air Resources Board. 2022. EMFAC2021 Model. Version v1.0.2. Available: <https://arb.ca.gov/emfac/>. Accessed June 2023.

Potential alternative GHG emissions reduction measures to be considered include, but are not limited to, measures recommended in the South Coast Air Quality Management District's latest CEQA Air Quality Guidelines, the California Air Resources Board Scoping Plan (December 2022, as may be revised),²¹ the California Air Pollution Control Officers Association (CAPCOA) *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity* (December 2021, as may be revised),²² the CAPCOA California Emissions Estimator Model (CalEEMod),²³ the California Attorney General's *Mitigation for Greenhouse Gas Emissions* guidance,²⁴ and Reference Guides on Leadership in Energy and Environmental Design (LEED) published by the U.S. Green Building Council.²⁵

As for any project design features or mitigation measures implemented via the County's project approval and CEQA review process, the project applicant shall implement all alternative GHG emissions reduction measures proposed. For physical GHG reduction measures to be incorporated into the design of the project, the measures shall be included on the drawings submitted for construction-related permits and implemented during construction. For operational GHG reduction measures to be incorporated into the project, the measures shall be implemented on ongoing basis.

Offsite GHG Reduction Program

~~Action ES5.4 of the 2045 CAP would establish an Offsite GHG Reduction Program for new development to use as a GHG reduction or mitigation pathway for 2045 CAP compliance and to fund programs for reducing GHG emissions in the built environment. This program would allow new development to fund decarbonization programs for existing development to accelerate 2045 CAP measures and actions or go beyond 2045 CAP measures and actions. The Offsite GHG Reduction Program could be used for projects that propose alternative GHG emissions reduction measures to those identified in Table F-1, or that propose to include additional GHG emissions reduction measures beyond those described in Table F-1. Once the Offsite GHG Reduction Program has been instituted by the County, project applicants will be able to use the program to complete Table F-2. Once established, the Offsite GHG Reduction Program should only be used after all feasible on-site GHG reduction measures are implemented at the project site to demonstrate compliance with the CEQA streamlining requirements. See Section F.4 for additional details.~~

Projects That ~~Cannot Comply with~~ Are Not Eligible for the CEQA Streamlining Requirements

In some cases, a project may not be able to comply with ~~demonstrate compliance with all~~ meet all of the 2045 CAP CEQA GHG streamlining requirements. This may be because the project is inconsistent with the General Plan's growth projections as described in Step 1. Or a project may not be able to feasibly incorporate all CEQA streamlining requirements as identified in Table F-1 and discussed in Step 3; such a project may further be unable to adequately identify alternative project measures to achieve a similar level of GHG reduction to ~~infeasible~~ each CEQA streamlining requirements which a project cannot comply with. Such projects are not eligible to

streamline environmental review of their GHG impacts using the 2045 CAP's PEIR and must may be required to prepare a comprehensive project-specific analysis of GHG emissions pursuant to CEQA Guidelines (including the CEQA Guidelines Appendix G Environmental Checklist).

A comprehensive project-specific analysis of GHG emissions must be prepared for any project that elects not to use the Checklist for CEQA streamlining by completing Table F-1 and (if applicable) Table F-2. Such an analysis shall quantify existing and projected GHG emissions and evaluate potential impacts pursuant to the CEQA Guidelines (including the CEQA Guidelines Appendix G Environmental Checklist). It is strongly encouraged that the project incorporate all the CEQA streamlining requirements in the ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist, though this is not required.

F.3 2045 CAP CEQA Streamlining Checklist

Table F-1, *General Plan and 2045 CAP CEQA Streamlining Requirement Checklist*, allows the applicant to demonstrate compliance with the 2045 CAP's GHG emissions reduction measures and actions. This table addresses **Step 1: Demonstrate Consistency with the General Plan Growth Projections**; **Step 2: Determine Whether the Project Screens Out of Certain CEQA Streamlining Requirements**; and **Step 3: Demonstrate Compliance with the CEQA Streamlining Requirements**. This checklist must be completed for all applicable projects electing to streamline their CEQA GHG analysis.

Table F-2, *2045 CAP Greenhouse Gas Emissions Reduction Alternative Measures*, allows the project applicant to document alternative GHG emissions reduction measures used to demonstrate compliance with the Table F-1 CEQA streamlining requirements. This table addresses **Step 4: Identify Alternative Project Emissions Reduction Measures and Additional GHG Reductions**. This checklist is required only for projects that propose to use alternative GHG emissions reduction measures.

Table F-1: General Plan and 2045 CAP CEQA Streamlining Requirement Checklist

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
Step 1: Demonstrate Consistency with the General Plan Growth Projections		
<p>1. The Project is Consistent with the General Plan Growth Projections</p> <p>The growth projections included in the General Plan were used in the 2045 CAP to estimate unincorporated Los Angeles County GHG emissions over time. Therefore, projects must be consistent with the General Plan to comply with the CEQA streamlining requirements. To determine a project’s consistency with the General Plan growth projections, please answer the following question and provide an explanation with supporting documentation.</p> <p>Is the proposed project consistent with the existing land use designation of the Land Use Element and the 2021 Housing Element Update?</p> <p>If “Yes,” proceed to Step 2: Determine Whether the Project Screens Out of Certain CEQA Streamlining Requirements below.</p> <p>If “No,” the proposed project may not streamline its GHG impacts analysis by using the 2045 CAP’s EIR and must prepare a comprehensive project-specific analysis of GHG emissions and impacts pursuant to CEQA.</p>	<p><i>Describe how the project is consistent with the General Plan growth projections. Provide additional supporting documentation as an attachment as needed.</i></p> <p><i>OR,</i></p> <p><i>Explain why the project is not consistent with the General growth projections, and whether the project would include a General Plan amendment. If the project includes a General Plan amendment, STOP HERE.</i></p>	<p><input type="checkbox"/> Yes</p> <p><input type="checkbox"/> No</p>
Step 2: Determine Whether the Project Screens Out of Certain the CEQA Streamlining Requirements		
<p>Certain projects may screen out of the 2045 CAP Checklist <u>2045 CAP CEQA Streamlining Checklist</u> Requirements if they meet the following screening criteria <u>criteria</u>.</p> <p>Does the project achieve net zero GHG emissions? The project must conduct a comprehensive project-specific analysis of all GHG emissions, sinks, and removals, consistent with all CEQA guidelines and standard practice for modeling GHG emissions for projects, to demonstrate that the project achieves net zero GHG emissions.</p> <p>If “Yes,” the project would comply with the CEQA streamlining requirements and no additional analysis is needed (no project-specific GHG impact analysis would be required).</p> <p>If “No,” proceed to Step 3: Demonstrate Compliance with the CEQA Streamlining Requirements below.</p>	<p><i>If “Yes,” attach to this checklist the estimated project GHG emissions. Provide supporting calculation files and documentation for this analysis. If the proposed project is determined to result in net zero GHG emissions, STOP HERE.</i></p> <p><i>If “No,” proceed to Step 3 below.</i></p>	<p><input type="checkbox"/> Yes</p> <p><input type="checkbox"/> No</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
Step 3: Demonstrate Compliance with the CEQA Streamlining Requirements		
Energy Supply		
<p>1. TIER 1: Sunset Oil and Gas Operations For any project involving the decommissioning, replacement, retrofit, or redesign of infrastructure or facilities associated with the oil and gas industry, including energy generation (i.e., cogen), the project must:</p> <ul style="list-style-type: none"> A) Comply with the Oil Well Ordinance (Title 22). B) Reduce fossil fuel–based emissions by at least 80% compared to existing conditions. C) If the project site includes existing active and abandoned oil wells, examine all wells for fugitive emissions of methane. Reduce such existing emissions by a minimum of 80%. D) To reduce any residual fossil fuel–based emissions generated by the project, incorporate carbon removal technologies including direct air capture and carbon and sequestration, as feasible. <p>Supports 2045 CAP Measures (and Actions): ES1 (ES1.1, ES1.2, ES1.3)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed as a replacement strategy (provide additional documentation as described below).</i> <i>IN ADDITION, provide documentation of the project’s ability to reduce fossil fuel–based emissions, including fugitive methane emissions.</i> <i>Provide the number of oil and gas operations/wells closed. Provide documentation of any carbon removal technologies incorporated at the project site.</i></p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>2. TIER 1: Utilize 100% Zero-Carbon Electricity The project must utilize 100% zero-carbon electricity on-site. The project must comply with one of the following options:</p> <ul style="list-style-type: none"> A) Install on-site renewable energy systems or participate in a community solar program to supply 100% of the project’s estimated energy demand to the maximum extent feasible. B) Participate in Southern California Edison at the Green Rate level (i.e., 100% carbon-free electricity) for all electricity accounts associated with the project until SCE provides 100% carbon-free electricity for all accounts by default. C) Participate in the Clean Power Alliance at the Clean Rate level (i.e., 100% carbon-free electricity) for all electricity accounts associated with the project until CPA provides 100% carbon-free electricity for all accounts by default. D) A combination of #1, #2, and #3 above such that 100% of the project’s electricity consumption is supplied by zero-GHG emission sources of power generation, whether by utilities or by on-site electricity generation or both. <p>Supports 2045 CAP Measures (and Actions): ES2 (ES2.1, ES2.2), ES3 (ES3.1, ES3.2, ES3.3, ES3.4, ES3.5, ES3.6)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below)</i> <i>IN ADDITION, provide the project’s anticipated electricity demand, the project’s participation and opt-out rates for SCE’s Green Rate and CPA’s Clean Rate electricity rate options used by tenants; and the total kW of solar PV panels installed at the project site.</i></p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
Transportation		
<p>3. Meets Transportation Screening Criteria</p> <p>For <u>development projects</u>, does the project:</p> <p>A) have no retail component and generate a net increase of less than 110 daily vehicle trips?</p> <p>If “Yes,” skip streamlining requirements #4, #5, #12, #13, and #14 below. Please complete items #6 through #11 below.</p> <p>If “No,” proceed to item (B) below.</p> <p>For <u>development projects</u>, does the project:</p> <p>B) have a retail component and contains retail uses that do not exceed 50,000 square feet of gross floor area?</p> <p>If “Yes,” skip streamlining requirements #4, #5, #12, #13, and #14 below. Please complete items #6 through #11 below. If the project contains retail and is mixed use, proceed to item (C) below.</p> <p>If “No,” proceed to item (C) below.</p> <p>For <u>development projects</u>, does the project:</p> <p>C) have a residential component and 100% of the units, excluding manager’s units, are set aside for lower income households?</p> <p>If “Yes,” skip streamlining requirements #4, #5, #12, #13, and #14 below. Please complete items #6 through #11 below. If the project contains retail and is mixed use, proceed to item (D) below.</p> <p>If “No,” proceed to item (D) below.</p> <p>For <u>development projects</u>:</p> <p>D) Is the project located within a one-half mile radius of a major transit stop or an existing stop along a high-quality transit corridor <u>and</u>:</p> <ul style="list-style-type: none"> i. has a Floor Area Ratio greater than 0.75? ii. provides less parking than required by the Los Angeles County Code? iii. is consistent with the Southern California Association of Governments (SCAG) Regional Transportation Plan / Sustainable Communities Strategy (RTP/SCS)? iv. does not replace residential units set aside for lower income households with a smaller number of market-rate residential units? <p>If “Yes,” skip streamlining requirements #4, #5, #12, #13, and #14 below. Please complete items #6 through #11 below.</p> <p>If “No,” proceed to streamlining requirement #3 below.</p> <p>For <u>transportation projects</u>, does the project meet <u>one</u> of the following transportation screening criteria?</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p><i>OR,</i></p> <p><i>Describe why such actions are infeasible and identify the alternative measure(s) proposed as an alternative strategy (provide additional documentation as necessary).</i></p>	<p><input type="checkbox"/> Yes</p> <p><input type="checkbox"/> No</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
<p>A) The project would not include the addition of through traffic lanes on existing or new highways, including general-purpose lanes, high-occupancy vehicle (HOV) lanes, peak-period lanes, auxiliary lanes, and lanes through grade-separated interchanges (except managed lanes, transit lanes, and auxiliary lanes of less than 1 mile in length designed to improve roadway safety).</p> <p>B) The project would reduce roadway capacity and VMT.</p> <p>If “Yes,” skip streamlining requirements #4, #5, #12, #13, and #14 below. Please complete items #6 through #11 below.</p> <p>If “No,” proceed to streamlining requirement #4 below.</p> <p>Supports 2045 CAP Measures (and Actions): T1 (T1.1, T1.2)</p>		
<p>4. TIER 1: Increase Density Near High-Quality Transit Areas</p> <p>If the project is located within a High Quality Transit Area (HQTA), it must achieve a minimum of 20 dwelling units (DU) per acre, consistent with the Housing Element Rezoning Program.</p> <p>If the project is not located within an HQTA, it must locate residential and employment centers within 1 mile of an HQTA.</p> <p>Supports 2045 CAP Measures (and Actions): T1 (T1.1, T1.2)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p><i>OR,</i></p> <p><i>Describe why this action is not applicable to your project.</i></p> <p><i>OR,</i></p> <p><i>Describe why such actions are infeasible and identify the alternative measure proposed as a replacement strategy (provide additional documentation as described below).</i></p>	<p><input type="checkbox"/> Project Complies</p> <p><input type="checkbox"/> Not Applicable</p> <p><input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>5. TIER 1: Incorporate Bicycle and Pedestrian Infrastructure</p> <p>The project must incorporate pedestrian and bicycle infrastructure into its design:</p> <p>A) Provide pedestrian facilities and connections to public transportation consistent with the Pedestrian Action Plan, Active Transportation Plans, and Vision Zero Action Plan, and any other relevant governing plan.</p> <p>B) Provide bicycle facilities consistent with the Bicycle Master Plan, Active Transportation Plans, and Vision Zero Action Plan, and any other relevant governing plan, and meet or exceed minimum standards for bicycle facilities in the Zoning Code and CALGreen Code.</p> <p>C) Increase sidewalk coverage to improve pedestrian access.</p> <p>D) Improve degraded or substandard sidewalks.</p> <p>E) Incorporate best practices to ensure pedestrian infrastructure is contiguous and links externally with existing and planned pedestrian facilities; best practices include high-visibility crosswalks, pedestrian hybrid beacons, and other pedestrian signals, mid-block crossing walks, pedestrian refuge islands, speed tables, bulb-outs (curb extensions), curb ramps, signage, pavement markings, pedestrian-only connections and districts, landscaping, and other improvements to pedestrian safety.</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p><i>OR,</i></p> <p><i>Describe why this action is not applicable to your project.</i></p> <p><i>OR,</i></p> <p><i>Describe why such actions are infeasible and identify the alternative measure proposed as a replacement strategy (provide additional documentation as described below)</i></p> <p><i>IN ADDITION, provide the length and/or amount of bicycle and pedestrian infrastructure incorporated, such as feet or miles of bikeways.</i></p>	<p><input type="checkbox"/> Project Complies</p> <p><input type="checkbox"/> Not Applicable</p> <p><input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
<p>F) Minimize barriers to pedestrian access and interconnectivity, such as walls, landscaping buffers, slopes, and unprotected crossings.</p> <p>G) Provide bicycle facilities for new and expanded buildings, new dwelling units, change of occupancy, increase of use intensity, and added off-street vehicle parking spaces.</p> <p>H) Provide short- and long-term (secure) bicycle parking for at least 5% of motorized vehicle capacity and nothing less than CALGreen Code requirements, whichever is more restrictive.</p> <p>I) Support the County’s goal to increase bikeway miles by 300 percent by 2030 (including Class I bike paths, Class II bike lanes, and Class III bike routes).</p> <p>Supports 2045 CAP Measures (and Actions): T3 (T3.1, T3.2, T3.3)</p>		
<p>6. TIER 1: Comply with the County Transportation Demand Management (TDM) Ordinance</p> <p>The Project must comply with the TDM ordinance at the time of project approval. This may include preferential carpool/vanpool parking, bicycle parking, and shower facilities and locker rooms; trip reduction plans; transit-supportive infrastructure development; and similar strategies. Comply with any applicable VMT reduction target and incorporate any required monitoring mechanisms for development, subject to the ordinance.</p> <p>Supports 2045 CAP Measures (and Actions): T4 (T4.5)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p><i>OR,</i></p> <p><i>Describe why this action is not applicable to your project.</i></p> <p><i>OR,</i></p> <p><i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below)</i></p> <p><i>IN ADDITION, provide the number of employers participating in the TDM program, the total trip reduction goals for the project’s TDM program, and the total trips and VMT reduced via the project’s TDM program.</i></p>	<p><input type="checkbox"/> Project Complies</p> <p><input type="checkbox"/> Not Applicable</p> <p><input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>7. TIER 1: Comply with the County’s Transportation Impact Guidelines</p> <p>The project must comply with the County’s current Transportation Impact Analysis (TIA) Guidelines. Projects may screen out if they meet certain criteria, such as being located in a transit priority area or local-serving retail development less than 50,000 square feet. Projects that do not screen out must meet the VMT efficiency metrics identified by the TIA Guidelines (e.g., daily VMT per capita for residential projects that is 16.8% below the existing residential VMT per capita for the Baseline Area in which the project is located) and quantitatively demonstrate how these metrics are achieved, pursuant to the TIA Guidelines requirements.</p> <p>Supports 2045 CAP Measures (and Actions): T1, T2, T3, T4, T5</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p><i>OR,</i></p> <p><i>Describe why this action is not applicable to your project.</i></p> <p><i>OR,</i></p> <p><i>Describe why such actions are infeasible and identify the alternative measure proposed strategy (provide additional documentation as described below).</i></p>	<p><input type="checkbox"/> Project Complies</p> <p><input type="checkbox"/> Not Applicable</p> <p><input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
<p>8. TIER 1: Incorporate Electric Vehicle Charging Infrastructure The project must incorporate zero-emission vehicle (ZEV) infrastructure and incentives into its design as follows:</p> <ul style="list-style-type: none"> A) Comply with any CALGreen Code requirement, County ordinance, building code, or condition of approval that requires a certain amount of electric vehicle (EV) charging infrastructure (EVCSs) and readiness. This may include minimum requirements for EV charging stations, EV-capable parking spaces, and EV-ready parking spaces. B) Comply with any provisions and requirements in the forthcoming Zero Emission Vehicle Master Plan.¹ C) Include electric options for promoting active transportation, such as electric scooters and e-bikes. D) Provide education and outreach to tenants and occupants about the benefits of ZEVs and the project's EV infrastructure. <p>Supports 2045 CAP Measures (and Actions): T6 (T6.1, T6.2, T6.3, T6.4, T6.5, T6.6, T6.7)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below)</i> <i>IN ADDITION, provide the number of ZEVs in the project's tenant's and vendor fleet, if available; the number of public and private EVCSs installed; and the number of scooters/e-bikes available to tenants.</i></p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>9. TIER 1: Decarbonize Trucks For projects that include goods movement facilities and/or warehouses, the project must incorporate freight decarbonization technologies and infrastructure, including:</p> <ul style="list-style-type: none"> A) Comply with any CALGreen Code requirement, County ordinance, building code, or condition of approval that requires a certain amount of EV charging infrastructure and readiness for goods movement facilities and trucks. B) Provide EVCSs at all new warehouse loading docks. C) Comply with any provisions and requirements in the forthcoming Zero Emission Vehicle Master Plan related to goods movement. D) Implement freight decarbonization technologies along highway corridors. E) For all goods movement facilities, install alternative fueling infrastructure such as EVCSs, green hydrogen fueling stations, and/or biomethane fueling stations. F) Comply with any established zero-emission delivery zones. <p>Supports 2045 CAP Measures (and Actions): T8 (T8.1, T8.2, T8.3, T8.4, T8.5)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i> <i>IN ADDITION, provide the number of ZEV trucks in the project's tenant's and vendor fleet if available and the number EVCS installed.</i></p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
<p>10. TIER 1: Incorporate Zero-Emission Technologies for Off-Road Vehicles & Equipment</p> <p>The project must:</p> <ul style="list-style-type: none"> A) Prohibit the use of small equipment powered by gasoline, diesel, propane, or other fossil fuels, including lawn and garden equipment and outdoor power equipment, for all tenants and owners. B) Provide educational materials to tenants regarding the SCAQMD Electric Lawn and Garden Equipment Incentive and Exchange Program, Commercial Lawn & Garden Battery Buy-Down Rebate Program, the Residential Lawn Mower Rebate Program, the new requirements of AB 1346, and any other available options and incentives for purchasing zero-emission equipment, including rebates and subsidies offered by CARB, the County, or other agencies and entities. C) Use electric and zero-emission construction equipment during project construction to the maximum extent feasible. Such equipment shall include forklifts, manlifts, loaders, welders, saws, pumps, fixed cranes, air compressors, sweepers, aerial lifts, pressure washers, and other small equipment. At minimum, the project must use off-road construction equipment that meet CARB Tier 4 Final engine emission standards. D) Use electric and zero-emission agriculture and manufacturing equipment to the maximum extent feasible. <p>These requirements must be stipulated in the contract specifications for the project’s construction and for the project’s future tenants and any landscaping contracts for the property or tenants.</p> <p>Supports 2045 CAP Measures (and Actions): T9 (T9.1, T9.2, T9.3)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p><i>OR,</i></p> <p><i>Describe why this action is not applicable to your project.</i></p> <p><i>OR,</i></p> <p><i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i></p> <p><i>IN ADDITION, provide off-road vehicle and equipment fleet count, type, and fuel type, as available.</i></p>	<p><input type="checkbox"/> Project Complies</p> <p><input type="checkbox"/> Not Applicable</p> <p><input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>11. TIER 1: Electrify County Fleet Vehicles (for municipal projects only)</p> <p>For all new municipal projects and facilities that include the purchase or operation of new fleet vehicles, including public transit buses and shuttles, all such fleet vehicles must be ZEVs.</p> <p>Supports 2045 CAP Measures (and Actions): T7 (T7.1, T7.2)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p><i>OR,</i></p> <p><i>Describe why this action is not applicable to your project.</i></p> <p><i>OR,</i></p> <p><i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i></p> <p><i>IN ADDITION, provide the number of new ZEV buses and the total ZEV percentage of the project’s fleet.</i></p>	<p><input type="checkbox"/> Project Complies</p> <p><input type="checkbox"/> Not Applicable</p> <p><input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
<p>12. TIER 2: Achieve a High Jobs/Housing Balance For projects with nonresidential development, the Project must incorporate the following design elements: A) Support the County’s goal to achieve a job density of 300 jobs per acre. Supports 2045 CAP Measures (and Actions): T2 (T2.1)</p>	<p><i>Describe how the project will achieve a job density of 300 jobs per acre.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR <i>Describe why such actions are not incorporated into your project.</i> IN ADDITION, provide the job density of the project in terms of jobs per acre.</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply</p>
<p>13. TIER 2: Encourage Transit, Active Transportation, and Alternative Modes of Transportation For transit projects only, incorporate the following: A) Expand and improve frequency of existing network of County shuttles. B) Install bus-only lanes and signal prioritization along major thoroughfares. C) Install full bus rapid transit infrastructure along priority corridors. For all other projects, incorporate the following: A) Provide new mobility services, such as micro transit, autonomous delivery vehicles, and on-demand autonomous shuttles, in unincorporated Los Angeles County. B) Offer free transit passes for students, youth, seniors, disabled, and low-income populations. C) Implement telecommuting by project tenants and residents. D) Establish temporary and permanent car-free areas at the project site. Supports 2045 CAP Measures (and Actions): T4 (T4.1, T4.2, T4.3, T4.6, T4.7, T4.8, T4.10)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are not incorporated into your project.</i> IN ADDITION, for transit projects, provide the size of area served by transit, the number of employees and residents served by transit, the transit service frequency and headways, the increase in headways or frequencies provided by the project, total transit service hours provided by transit, the number and length of bus-only lanes, and information on signal prioritization on transit routes implemented by the project. For non-transit projects, provide the number of residents within one-half mile of bus or active transportation services; information on any new mobility services offered, information on free transit passes offered, the number of employers participating in telecommuting programs, and the number and location of car-free areas provided by the project.</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply</p>
<p>14. TIER 2: Implement Parking Limitations Projects should include the following characteristics: A) Shared and reduced parking strategies, such as shared parking facilities, carpool/vanpool-only spaces, shuttle facilities, EV-only spaces, and reduced parking below allowable amount B) Minimum amount of required parking C) Unbundled parking costs to reflect cost of parking D) Parking pricing to encourage “park-once” behavior E) Compliance with all County parking reform strategies and policies Supports 2045 CAP Measures (and Actions): T5 (T5.1)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions not incorporated into your project.</i> IN ADDITION, provide the total number of parking spaces, carpool/vanpool-only spaces, shuttle facilities, EV-only spaces; information on parking costs and unbundling; and parking prices.</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply</p>

Building Energy and Water		
<p>15. TIER 2: Decarbonize Existing Buildings This action applies only to projects that include a retrofit, remodel, or redesign of an existing building. If the proposed project does not include a retrofit, remodel, or redesign, select "Not Applicable" in the <i>Project Complies</i> column. The project must incorporate the following design elements: A) Achieve zero GHG emissions for on-site energy use. B) Comply with all applicable Building Performance Standards.² C) Comply with all building carbon intensity limits.³ D) If the project is a major renovation, achieve ZNE and/or comply with the City's ZNE ordinance.⁴ Supports 2045 CAP Measures (and Actions): E1 (E1.1, E1.2, E1.3, E1.4, E1.5, E1.6)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i> IN ADDITION, provide the project's anticipated GHG emissions associated with on-site energy consumption (i.e., natural gas use and electricity use) and the number of existing buildings transitioned to zero-GHG buildings.</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>16. TIER 2: Decarbonize New Buildings For projects under construction before 2030, the project must achieve zero GHG emissions for on-site energy use, and/or comply with the County's building decarbonization ordinance, unless the project meets specific exemptions identified in the ordinance.⁵ For projects under construction after 2030, the project must be zero-net-energy (ZNE) and achieve zero GHG emissions for on-site energy use, and/or comply with the County's ZNE ordinance, unless the project meets specific exemptions identified in the ordinance.⁶ Supports 2045 CAP Measures (and Actions): E2 (E2.1, E2.2, E2.3)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i> IN ADDITION, provide the number and square footage of zero GHG emission buildings built, all ZNE buildings built, and the total GHG emissions anticipated for all buildings.</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
<p>17. TIER 1: Increase Building Energy Efficiency This action applies only to projects that include a retrofit of an existing building. If the proposed project does not include a retrofit, select "Not Applicable" in the <i>Project Complies</i> column. The project shall incorporate the following energy efficiency measures into the design:</p> <ul style="list-style-type: none"> A) Comply with all applicable building performance standards.⁷ B) Incorporate strategic energy management programs to reduce building energy demands. C) Conduct an energy audit or benchmarking analysis to identify potential energy savings opportunities and implement such opportunities. D) Achieve CALGreen Code Tier 2 or voluntary building energy measures as they apply to the retrofit. E) Replace existing appliances with higher-efficiency models. F) Install heat-trapping surfaces to cool or green surfaces, as feasible. G) Participate in SoCalREN, SCE, CPA, or other energy efficiency programs. H) Conduct other energy efficiency retrofits. I) Achieve zero-net-energy, if feasible. <p>Supports 2045 CAP Measures (and Actions): E4 (E4.1, E4.2, E4.3)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i> IN ADDITION, provide the total number of energy retrofits performed, the building size (square footage) retrofit, the total project energy use and anticipated energy savings through retrofits, and the number and area of cool and green roofs installed.</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>18. TIER 1: Implement Water Use Efficiency and Water Conservation The project must comply with the current water conservation ordinance in place, including any requirements for LEED or Sustainable SITES standards.⁸ The project must also incorporate water use efficiency and conservation measures, including:</p> <ul style="list-style-type: none"> A) High-efficiency appliances/fixtures to reduce water use, and/or include water-efficient landscape design B) CALGreen Code Tier 1 and Tier 2 voluntary water conservation measures C) Low-flow or high-efficiency water fixtures D) Water-efficient landscapes with lower water demands than required by the DWR 2015 Model Water Efficient Landscape Ordinance E) Drought-tolerant and native plant species only F) A comprehensive water conservation strategy G) Educational materials provided to future tenants and building occupants about water-saving behaviors and water-conserving landscaping 	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i> IN ADDITION, provide the project's estimated total water consumption (in GPCD or total gallons), the square footage of buildings that are water-neutral, and the project's building size (square footage).</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
<p>Supports 2045 CAP Measures (and Actions): E6 (E6.1, E6.2, E6.3, E6.4, E6.5)</p>		
<p>19. TIER 2: Reduce the Life-Cycle Carbon Intensity of Building Materials and Phase Out the Use of High-GWP Refrigerants</p> <p>The project must incorporate the following design elements to the maximum extent feasible:</p> <ul style="list-style-type: none"> A) For projects that are not fully electric, incorporate biomethane into the natural gas mix in place of traditional natural gas. B) Use negative-carbon concrete for all construction. C) Use low-GWP refrigerants and fire suppression equipment for all uses on-site. D) Comply with all County codes and ordinances regarding building material carbon intensity and high-GWP refrigerants and other gases. <p>Supports 2045 CAP Measures (and Actions): E3 (E3.1, E3.2, E3.3, E3.4)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p><i>OR,</i></p> <p><i>Describe why this action is not applicable to your project.</i></p> <p><i>OR,</i></p> <p><i>Describe why such actions are not incorporated into your project.</i></p> <p><i>IN ADDITION, provide the amount of biomethane used by the project, the quantity of negative-carbon concrete for construction, and the quantity of low-GWP refrigerants and fire suppression equipment used.</i></p>	<ul style="list-style-type: none"> <input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply
<p>20. TIER 2: Use Energy Storage and Microgrids</p> <p>The project must incorporate the following design elements to the maximum extent feasible:</p> <ul style="list-style-type: none"> A) Install energy storage systems. B) Use a building-scale or community microgrid to support demand management and peak shaving. <p>Supports 2045 CAP Measures (and Actions): ES4 (ES4.1, ES4.2, ES4.3, ES4.4, ES4.5)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p><i>OR,</i></p> <p><i>Describe why this action is not applicable to your project.</i></p> <p><i>OR,</i></p> <p><i>Describe why such actions are not incorporated into your project</i></p> <p><i>IN ADDITION, provide the total kW of energy storage capacity installed and operational information for any microgrids utilized, if applicable.</i></p>	<ul style="list-style-type: none"> <input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply
<p>21. TIER 2: Use Recycled Water and Graywater for Non-potable Uses and Include Rainfall Capture</p> <p>The project must implement water reuse strategies onsite through the following design elements:</p> <ul style="list-style-type: none"> A) Require use of reclaimed/recycled water and/or graywater for outdoor uses. B) Install residential graywater systems that meet appropriate regulatory standards. C) Install rainfall capture systems. D) Install dual plumbing for the use of recycled water. <p>Supports 2045 CAP Measures (and Actions): E5 (E5.1, E5.2, E5.3, E5.4)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p><i>OR,</i></p> <p><i>Describe why this action is not applicable to your project.</i></p> <p><i>OR,</i></p> <p><i>Describe why such actions are not incorporated into your project</i></p> <p><i>IN ADDITION, provide the amount of reclaimed/recycled water and/or graywater used by the project.</i></p>	<ul style="list-style-type: none"> <input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
Waste		
<p>22. TIER 1: Compost Organic Materials</p> <p>The project must comply with all state and local requirements for composting and organic waste collection, including but not limited to Chapter 20.91 (Mandatory Organic Waste Disposal Reduction Ordinance) of the Los Angeles County Code, including all County requirements pursuant to AB 1826 and SB 1383. The project must also:</p> <ul style="list-style-type: none"> A) Provide proper storage, collection, and loading of organics in a manner that is convenient and safe for all users of the building. Ensure there are sufficient sizes of collection containers for organics. Containers must be kept clean, be clearly labeled, and are co-located next to any other solid waste receptacles. Ensure sufficient pick-up of collection containers to meet the needs of the occupants. B) Include space for multi-stream collection containers for both recycling and organics in any location where a solid waste container is traditionally housed. This includes both outdoor collection containers serviced by a waste hauler or indoor collection containers utilized by occupants. Provide educational material and training to occupants and tenants in how to properly separate organics from all other solid waste and place organics in a separate container designated for organics. C) Ensure that all project occupants and tenants will separate compostables from all other refuse and place compostables in a separate container designated for composting. D) Require that all single-use food service ware (plates, bowls, cups) and accessories (straws, utensils, condiment cups) used by tenants at the project site be BPI certified compostable fiber, except where certain materials may be deemed medically necessary or necessary to ensure equal access for persons with disabilities. E) Require that any single-use accessories (straws, utensils, condiment cups) be only available on demand. F) Ensure that containers are audited annually to ensure proper service levels and to check for contamination. Report findings back to occupants within 30 days and to the County as requested. G) Work with the waste hauler to provide educational materials to tenants on at least an annual basis. H) Provide compliance data to the County as required for any current auditing program. <p>Supports 2045 CAP Measures (and Actions): W1 (W1.1, W1.2) and W2 (W2.1, W2.2, W2.5)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p><i>OR,</i></p> <p><i>Describe why this action is not applicable to your project.</i></p> <p><i>OR,</i></p> <p><i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i></p> <p><i>IN ADDITION, provide the project's estimated organic waste generation (tons), the amount of organic waste sent to landfills, and the amount of organic waste generated by the project which is diverted from landfills.</i></p>	<p><input type="checkbox"/> Project Complies</p> <p><input type="checkbox"/> Not Applicable</p> <p><input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
<p>23. TIER 1: Recycle Recyclable Materials</p> <p>The project must comply with all state and local requirements for recycling, also including but not limited to Section 20.72.170 (Recyclable Materials Collection Program) of the Los Angeles County Code and all County requirements pursuant to AB 341 and AB 1826. The project must also:</p> <ul style="list-style-type: none"> A) Comply with any zero waste ordinance in place at the time of project approval. B) Comply with all Mandatory Construction & Demolition (C&D) Recycling Program Requirements, including Chapter 20.87 (Construction and Demolition Debris Recycling and Reuse). C) Provide substantial storage, collection, and loading of recyclables in a manner that is convenient and safe for all users of the building. Ensure there are sufficient sizes and amount of collection containers for recyclables. Containers must be kept clean, be clearly labeled, and are co-located next to any other solid waste receptacles. Ensure sufficient pick-up of collection containers to meet the needs of the occupants. D) Include space for multi-stream collection containers in any location where a solid waste container is traditionally housed. This includes both outdoor collection containers serviced by a waste hauler or indoor collection containers utilized by occupants. Provide educational materials and training to occupants and tenants in how to properly separate recyclables from all other solid waste and place recyclables in a separate container designated for recycling. E) Ensure that all project occupants and tenants separate recyclables from all other refuse and place recyclables in a separate container designated for recycling. F) Require that all single-use food service ware (plates, bowls, cups) and accessories (straws, utensils, condiment cups) used by tenants at the project site be BPI certified compostable fiber, except where certain materials may be deemed medically necessary or necessary to ensure equal access for persons with disabilities. G) Require that any single-use accessories (straws, utensils, condiment cups) be only available on demand. H) Ensure that containers are audited annually to ensure proper service levels and to check for contamination. Report findings back to occupants within 30 days and to the County as requested. I) Work with the waste hauler to provide educational materials to tenants on at least an annual basis. J) Provide compliance data to the County as required for any current auditing program. <p>Supports 2045 CAP Measures (and Actions): W1 (W1.1, W1.3)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p>OR,</p> <p><i>Describe why this action is not applicable to your project.</i></p> <p>OR,</p> <p><i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i></p> <p><i>IN ADDITION, provide the total C&D tonnage recycled and/or diverted from landfills, the project's estimated recyclable waste generation (tons), the amount of recyclable waste sent to landfills, and the amount of recyclable waste generated by the project which is diverted from landfills.</i></p>	<ul style="list-style-type: none"> <input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed

F.4 Offsite GHG Reduction Program Framework

Introduction

Action ES5.4 of the 2045 CAP would establish an Offsite GHG Emissions Reduction Program (Offsite Program) for new development to use as a GHG reduction or mitigation pathway for 2045 CAP compliance and to fund programs for reducing GHG emissions in the built environment. This program would allow new development to fund decarbonization programs for existing development to accelerate 2045 CAP measures and actions or go beyond 2045 CAP measures and actions. An Offsite GHG Emissions Reduction Program (Offsite Program) will be developed. Future projects that cannot achieve net-zero GHG emissions or are unable to comply with all required CEQA streamlining requirements would have the option to participate in the Offsite Program. The Offsite GHG Reduction Program could be used for projects that propose alternative GHG emissions reduction measures to those identified in Table F-1, or that propose to include additional GHG emissions reduction measures beyond those described in Table F-1. This program would allow project applicants to implement local projects that reduce GHG emissions in unincorporated Los Angeles County (referred to herein as *offsite projects*). Such offsite projects must not otherwise be required by law or regulation and would not have happened but for the requirements placed on the project by the 2045 CAP Checklist/2045 CAP CEQA Streamlining Checklist.

Offsite GHG Reduction Program

Action ES5.4 of the 2045 CAP would establish an Offsite GHG Emissions Reduction Program for new development to use as a GHG reduction or mitigation pathway for 2045 CAP compliance and to fund programs for reducing GHG emissions in the built environment. This program would allow new development to fund decarbonization programs for existing development to accelerate 2045 CAP measures and actions or go beyond 2045 CAP measures and actions. The Offsite GHG Reduction Program could be used for projects that propose alternative GHG emissions reduction measures to those identified in Table F-1, or that propose to include additional GHG emissions reduction measures beyond those described in Table F-1. Once the Offsite GHG Reduction Program has been instituted by the County, project applicants will be able to use the program to complete Table F-2. Once established, the Offsite GHG Reduction Program should only be used after all feasible on-site GHG reduction measures are implemented at the project site to demonstrate compliance with the CEQA streamlining requirements. See Section F.4 for additional details.

This section represents a *framework* for the forthcoming Offsite Program; the actual program will be developed after the 2045 CAP is adopted.

CARB Guidance on Offsite GHG Reductions

As discussed in Section F.1, CARB supports “off-site GHG mitigation” in Appendix D of the 2022 Scoping Plan for projects that have implemented all feasible on-site GHG reductions: “If implementation of all feasible on-site GHG reduction measures is insufficient to reduce a project’s impact to a less-than-significant level, the State recommends that the lead agency next explore

options to fund or implement *local*, off-site direct GHG reduction strategies.”²⁶ The Offsite Program would achieve these goals.

Relationship to 2045 CAP Measures and Actions

The offsite projects that will be allowed in the program fall into two general categories:

1. Offsite projects *included* in the 2045 CAP’s measures and actions.
2. Offsite projects *not included* in the 2045 CAP’s measures and actions.

Offsite Projects Included in the 2045 CAP

This category represents projects (and the GHG emissions reductions they create) that *are* already included in the 2045 CAP’s measures and actions. An allowable offsite project could involve, for example, accelerating measures, actions, and/or programs that are already identified in the 2045 CAP by providing additional funding to that program. Such projects would not add new programs or actions not already included in the 2045 CAP; they would expand upon and/or accelerate these programs and actions. Example projects are discussed below.

Offsite Projects Not Included in the 2045 CAP

This category represents projects (and the GHG emissions reductions they create) that are *not* already included in the 2045 CAP’s measures and actions. An allowable offsite project could involve, for example, creating or funding programs for implementing new technologies (e.g., zero-emission construction equipment) or implementing new emissions reduction measures or actions not considered in the 2045 CAP. Example projects are discussed below.

Offsite Projects Not Eligible

Offsite projects that are implementing planned 2045 CAP measures and actions on the 2045 CAP’s identified timeline are not eligible for the Offsite Program. Additionally, an offsite project activity that would be mandated by any current or future ordinance (such as a future ZNE ordinance for new buildings) cannot be used in the Offsite Program.

Carbon offset credits are not permitted to be used as offsite projects. In other words, projects that generate carbon offset credits to be traded on a voluntary market registry are not permitted to be used in this program.

Location

All offsite projects must be located within the jurisdictional boundaries of unincorporated Los Angeles County. Therefore, emissions reductions achieved by such offsite projects will be accounted for in future GHG inventory updates and will contribute toward the emissions reduction targets, which are based on the jurisdictional boundaries of unincorporated Los Angeles County. See 2045 CAP Appendix A for a discussion of the inventory and forecast boundaries.

Offsite projects shall be in the following locations, in order of priority, to the extent available: (1) Within the neighborhood surrounding the project site; (2) within the greater surrounding

²⁶ California Air Resources Board. 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. Appendix D, “Local Actions.” November 16, 2022. Available: <https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-appendix-d-local-actions.pdf>. Accessed in January 2023.

community (i.e., town); (3) within the same Planning Area; and (4) in other Planning Areas, but within unincorporated Los Angeles County.

Standards

All offsite projects must achieve **six specific standards** to ensure that the GHG reductions produced by offsite projects are environmentally sound; namely that the GHG reductions be real, permanent, quantifiable, verifiable, enforceable, and additional, defined as follows:

- **Real** means that the offsite project's GHG reductions are the direct result of complete emissions accounting. In other words, *real* means that GHG reductions or GHG enhancements result from a demonstrable action or set of actions, and are quantified using appropriate, accurate, and conservative methodologies that account for all GHG emissions sources, GHG sinks, and GHG reservoirs within the offsite project boundary and account for uncertainty.²⁷
- **Permanent** means either that GHG reductions and GHG removal enhancements are not reversible, or that when GHG reductions and GHG removal enhancements may be reversible, mechanisms are in place to replace any reversed GHG emissions reductions and GHG removal enhancements to ensure that all credited reductions endure for at least 100 years.
- **Quantifiable** means the ability to accurately measure and calculate GHG reductions or GHG removal enhancements relative to an offsite project's baseline in a reliable and replicable manner for all GHG emissions sources, GHG sinks, or GHG reservoirs included within the offsite project boundary, while accounting for uncertainty. GHG emissions reductions from an activity must be rigorously quantified, and such GHG reductions would only be permitted in an amount that corresponds to the GHG emissions that have been quantified. GHG emissions accounting must be accurate and adhere to standardized quantification methodologies, which are discussed further below.
- **Verifiable** means that an offsite project's assertion of GHG emissions reductions is well documented and transparent, such that it lends itself to an objective review by an accredited verification body. The forthcoming Offsite Program itself may require third-party verification.²⁸
- **Enforceable** means the authority of the County to hold a particular party responsible to take appropriate action if any of the provisions of the Offsite Program are violated.
- **Additional** means that the offsite project is not otherwise required by law, regulation, or legally binding mandate, and none of the offsite project's GHG emissions reductions would otherwise occur. In other words, an offsite project activity is additional if it can be demonstrated that the activity would result in emissions reductions or removals exceeding what would be achieved in the absence of the incentive provided by the proposed project and the ~~2045 CAP Checklist~~2045 CAP CEQA Streamlining Checklist. Additionality is an

²⁷ In general, uncertainty should be accounted for by using conservative assumptions and/or parameter values that tend to underestimate, rather than overestimate, total GHG emissions reductions.

²⁸ Generally, third-party verification includes a review of all documentation, monitoring data, and procedures used to estimate GHG reductions, and culminate in the verification body's issuance of a report and statement that identifies the quantity of GHG reductions that can be issued to the offsite project. As part of the report and statement, the independent third party verifies that the offsite project has adhered to the pertinent protocol or methodology, to confirm that the offsite project's GHG reductions are real, permanent, quantifiable, enforceable, and additional.

important characteristic the Offsite Program because it indicates that the GHG reductions represent a net environmental benefit and a real reduction of GHG emissions and can thus be used to offset a project's new GHG emissions.

Proposed Process

If an applicant selects to use the Offsite Program as an alternative GHG emissions reduction measure beyond those described in Table F-1, a specific process must be followed. The process will consider the following topics, which are subject to modification by the County in the forthcoming Offsite Program.

Quantification: Project applicants shall provide evidence to the County showing that the offsite project(s) proposed achieve the amount of GHG emissions reductions required. Examples of such evidence include applicable methodologies associated with the GHG emissions reductions, quantification calculations, and supporting documentation.

Standards: Project applicants must demonstrate, with substantial evidence, that all six of the offsite project standards are met: *real, permanent, quantifiable, verifiable, enforceable, and additional*.

Enforcement: Project applicants shall obtain all necessary permits and approvals for implementation of the offsite project implementation and such materials shall be submitted to the County for review and approval before project approval.

Timing: Project applicants shall submit documentation to the County identifying the quantity of GHG emissions reductions required by the offsite project over a specific time frame to be identified in the Offsite Program (e.g., before project approval or permit issuance, over the course of buildout of the project).

Monitoring: Project applicants shall submit regular reports documenting the offsite project's achieved GHG emissions reductions over a specified time period (such as the previous or current calendar year).

Example Offsite Projects

- **Local building electrification programs:** Programs that target existing residential and commercial buildings in the project's vicinity for electrification, provided that such electrification actions are not already required by law or regulation, County building performance standards, or reach code requirements. For example, replacing a natural gas-fired heating, ventilation, and air conditioning system with an electric heat pump or replacing a gas stove with an induction cooktop.
- **Off-site EV chargers:** Programs that install EV charging stations, provided that such installations are not already required by law or regulation, or County reach code requirements and the forthcoming Zero Emission Vehicle Master Plan (Measure T6). For example, funding or directly installing EV chargers in multi-unit dwellings in disadvantaged or low-income areas, public locations (schools, libraries, city centers), workplaces, and key destinations (e.g., parks, recreation areas, sports arenas).
- **Local building solar programs:** Programs that target existing residential and commercial buildings in the project's vicinity for rooftop solar photovoltaic installations, provided that such installations are not already required by law or regulation, County building

performance standards, or reach code requirements. For example, funding or directly installing rooftop solar installations or community solar systems.

- **Energy storage and microgrids:** Funding for or direct implementation of a microgrid to balance generation from non-controllable renewable power sources, such as solar, with distributed, controllable generation, such as natural gas–fueled combustion turbines; or a strategically deployed battery storage system to make the grid more flexible by unlocking renewable energy and replacing fossil fuel–generated electricity, especially during peak hours. Such programs would be allowed provided they are not already required by law or regulation, County building performance standards, or reach code requirements.
- **Truck and bus electrification programs:** Funding for the purchase of zero-emission vehicle trucks and buses to replace existing fossil fuel–powered trucks and buses; coordination with local transportation agencies and school districts and replacement of diesel- or gasoline-fueled buses with less-polluting technologies such as compressed natural gas, electric, hybrid-electric, fuel cell, or other commercially available technologies. Such programs would be allowed provided they are not already required by law or regulation, County building performance standards, or reach code requirements.
- **Hydrogen fuel:** Funding for or programs that provide renewable hydrogen fueling stations to nearby truck fleets, such as at logistics warehouses, or other uses of renewable hydrogen fuel as a replacement for fossil fuels. Such programs would be allowed provided they are not already required by law or regulation, County building performance standards, or reach code requirements.

Environmental Impacts Pursuant to CEQA

Project applicants' CEQA documents would be required to disclose the impacts of any offsite projects that are proposed for funding or implementation. The Final PEIR for the 2045 CAP evaluates the potential environmental impacts of the 2045 CAP's measures and actions. For any offsite projects implemented via this program, then, to the extent that such projects include types of activities similar to those contemplated by the 2045 CAP's measures and actions, the resulting environmental impacts would be expected to be similar to those disclosed in the Final PEIR. Project applicants' CEQA documents may rely on the Final PEIR impact analysis for an offsite project similar to those contemplated by the 2045 CAP, unless a specific offsite project causes a new or substantially more severe impact for that project type not addressed in the Final PEIR.

Next Steps and Additional Guidance

This section represents a *framework* for the Offsite Program. The actual Offsite Program will be developed separately after the 2045 CAP is formally adopted and the Final PEIR is certified. Once the formal Offsite Program is developed, project applicants may use it to demonstrate compliance with the CEQA streamlining requirements as indicated above.

This page intentionally left blank

APPENDIX F

2045 Climate Action Plan CEQA Streamlining Checklist

Purpose

The 2045 Climate Action Plan CEQA Streamlining Checklist (referred to herein as the *2045 CAP CEQA Streamlining Checklist*) can be used to provide a voluntary streamlined review process for analyzing the impacts of GHG emissions resulting from proposed discretionary projects that are subject to CEQA.

The 2045 CAP CEQA Streamlining Checklist may be updated administratively to incorporate new GHG emissions reduction techniques or to comply with later amendments to the 2045 CAP or local, state, or federal law.

Appendix F Organization

This appendix is organized into the following four sections:

Section F.1: Background

This section describes the rationale for the checklist and explains how it provides the mechanism for projects that wish to streamline environmental review of their GHG impacts using the 2045 CAP's PEIR pursuant to CEQA Guidelines Section 15183.5(b).

Section F.2: Checklist Instructions

This section includes the submittal requirements for applicants, the applicability of the 2045 CAP CEQA Streamlining Checklist, and instructions for completing the 2045 CAP CEQA Streamlining Checklist.

Section F.3: 2045 CAP CEQA Streamlining Checklist

This section includes the 2045 CAP CEQA Streamlining Checklist itself along with a table for reporting and documenting alternative project emissions reduction measures and additional GHG reductions.

Section F.4: Offsite GHG Reduction Program Framework

This section includes a framework for the County's forthcoming Offsite GHG Reduction Program. This program will be available for project applicants to use as an alternative GHG reduction measure to the CEQA streamlining requirements, by allowing applicants to fund or implement local projects that reduce GHG emissions within unincorporated Los Angeles County.

F.1 Background

2045 CAP CEQA Streamlining ChecklistThe growth projections outlined in the General Plan's Land Use and Housing Elements were used in the 2045 CAP to estimate unincorporated Los Angeles County's future emissions. Therefore, projects can use the 2045 CAP CEQA Streamlining Checklist if they are consistent with the Land Use Element. This consistency allows a project to streamline its analysis of GHG impacts by using the existing programmatic environmental review contained in the certified Final PEIR for the 2045 CAP. In doing so, pursuant to CEQA Guidelines Sections 15064(h)(3), 15130(d), and 15183(b), a project's incremental contribution to climate change resulting from the project's GHG emissions may be determined not to be cumulatively considerable. This approach is consistent with the recommendations of the California Air Resources Board (CARB) in the *2022 Scoping Plan for Achieving Carbon Neutrality* (2022 Scoping Plan) that "CEQA-qualified CAPs" can allow eligible

projects to streamline their determination of significance for GHG emissions.¹ It is also consistent with the Association of Environmental Professionals Climate Change Committee’s best practices for tiering from qualified GHG reduction plans that demonstrate substantial progress toward meeting the next milestone statewide planning reduction target (i.e., a 40 percent reduction below 1990 levels by 2030 as set forth by SB 32).²

This 2045 CAP CEQA Streamlining Checklist provides a mechanism for projects to specifically identify “those requirements specified in the plan that apply to the project, and, if those requirements are not otherwise binding and enforceable, incorporate those requirements as mitigation measures applicable to the project” per Section 15183.5(b)(2) of the CEQA Guidelines.

GHG emissions associated with the construction of projects, including demolition and decommissioning activities, are generally orders of magnitude lower than operational GHG emissions. This is primarily because construction emissions are typically short in duration compared to the project’s overall lifetime. Typically, construction GHG emissions are amortized over 30 years and added to a project’s 30-year lifetime emissions total; after this amortization, construction GHG emissions usually represent a small fraction of a project’s total annual emissions. It is generally difficult to enforce low-emission construction equipment because of the limited availability of zero-emission and near-zero-emission construction equipment, along with contracting requirements. In addition, the 2045 CAP quantifies GHG emissions from off-road construction activity at the unincorporated Los Angeles County level; these emissions are accounted for in the 2045 CAP’s ability to achieve the 2030, 2035, and 2045 targets.

The 2045 CAP CEQA Streamlining Checklist also requires the use of electric and zero-emission construction equipment during project construction to the maximum extent feasible, to align with Measure T9. Therefore, construction emissions can be assessed qualitatively as part of related CEQA GHG emissions analysis. However, some projects may have long construction periods or entail substantial excavation and grading that could result in construction-related GHG emissions that may be considered significant. Thus, the County retains the discretion on a project-by-project basis to consider whether a project’s construction-related GHG emissions could be cumulatively considerable and require a more detailed quantitative CEQA analysis and mitigation of GHG emissions.

Projects that elect not to use the 2045 CAP CEQA Streamlining Checklist for CEQA streamlining must prepare a comprehensive project-specific analysis of GHG emissions. The analysis must quantify existing and projected GHG emissions and it is strongly encouraged that the project incorporate all CEQA streamlining requirements in this 2045 CAP CEQA Streamlining Checklist, although this is not required. The 2045 CAP CEQA Streamlining Checklist may be updated to incorporate new GHG emissions reduction techniques or to comply with later amendments to the 2045 CAP or to local, state, or federal law.

2045 CAP Appendix B, *Emissions Forecasting and Reduction Methods*, provides the quantitative basis for CEQA streamlining requirements. This document demonstrates how, based on substantial

¹ California Air Resources Board. 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. Appendix D, “Local Actions.” November 16, 2022. Available: <https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-appendix-d-local-actions.pdf>. Accessed in January 2023.

² Association of Environmental Professionals. 2016. *Final White Paper Beyond 2020 and Newhall: A Field Guide to New CEQA Greenhouse Gas Thresholds and Climate Action Plan Targets for California*. October 18, 2016. Available: https://califaep.org/docs/AEP-2016_Final_White_Paper.pdf.

evidence,³ implementing these CEQA streamlining requirements on a project-by-project basis will collectively achieve the 2045 CAP's target emissions level for projects by 2030 and 2035, as required by CEQA Guidelines Section 15183.5(b)(1)(D).

Alignment with the 2022 Scoping Plan

Appendix D of CARB's 2022 Scoping Plan provides guidance for local governments and lead agencies for how local climate action planning can support the State of California's climate goals.⁴ CARB reiterates that a CAP that has been adopted through the CEQA review process and meets the criteria specified in CEQA Guidelines Section 15183.5(b) for a "plan for the reduction of greenhouse gas emissions"—such as the 2045 CAP—is a "CEQA-qualified CAP" that can allow eligible projects to streamline their determination of significance for GHG emissions.

Streamlining CEQA GHG analysis for future projects by demonstrating consistency with a CAP involves evaluating whether a project demonstrates consistency with "all applicable GHG reduction measures identified in the CAP." CARB notes that such consistency can be determined by using CAP compliance checklists, which can be "included as part of the proposed project's CEQA analysis documenting the project's consistency with the CEQA-qualified CAP."

The 2045 CAP CEQA Streamlining Checklist is therefore consistent with CARB's guidance in the 2022 Scoping Plan as a valid way for discretionary projects to streamline their analysis of GHG impacts.

Recommended Project Attributes for Residential and Mixed-Use Projects

Appendix D of the 2022 Scoping Plan includes a list of "key project attributes" for residential and mixed-use projects. CARB states that if a project incorporates these attributes, the project would "accommodate growth in a manner consistent with State GHG reduction and equity prioritization goals" and would be "**clearly** consistent with the State's climate goals." Further, such projects would be "consistent with the Scoping Plan or other plans, policies, or regulations adopted for the purposes of reducing GHGs" and that therefore, "the GHG emissions associated with such projects may result in a less-than-significant GHG impact under CEQA."

Alternative Project Emissions Reduction Measures and Offsite GHG Reduction Programs

As discussed below under *Step 4: Identify Alternative Project Emissions Reduction Measures and Additional GHG Reductions*, project applicants may employ alternative GHG emissions reduction measures to serve as replacements for any CEQA streamlining requirement not feasible to implement at the project-level. Such replacement measures must meet specific criteria and be

³ CEQA Guidelines Section 15384 defines *substantial evidence* as "enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached. Whether a fair argument can be made that the project may have a significant effect on the environment is to be determined by examining the whole record before the lead agency. Argument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence. Substantial evidence shall include facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts."

⁴ California Air Resources Board. 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. Appendix D, "Local Actions." November 16, 2022. Available: <https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-appendix-d-local-actions.pdf>. Accessed in January 2023.

supported by substantial evidence that the measure would achieve the same or greater level of GHG emissions reductions as the CEQA streamlining requirement that it replaces.

CARB supports the idea of “off-site GHG mitigation” in Appendix D of the 2022 Scoping Plan for projects that have maxed out their on-site GHG reduction actions: “If implementation of all feasible on-site GHG reduction measures is insufficient to reduce a project’s impact to a less-than-significant level, the State recommends that the lead agency next explore options to fund or implement **local**, off-site direct GHG reduction strategies.”⁵

As discussed further below, Action ES5.4 of the 2045 CAP would establish an Offsite GHG Reduction Program for new development to use as a GHG reduction or mitigation pathway for 2045 CAP compliance and to fund programs for reducing GHG emissions in the built environment.

CARB cautions that such off-site measures must directly “offset” a project’s GHG emissions and must not be unrelated off-site measures that would occur independently of the proposed project. Lead agencies and project applicants must provide substantial evidence that a specific off-site mitigation measure is not otherwise required by law or regulation and would not have occurred “**but for** the requirement to mitigate a project’s GHG impacts.” CARB goes on to state the following:

There has been concern that GHG emission reductions from off-site GHG mitigation measures... may double count GHG emission reductions from California’s Cap-and-Trade program. However, off-site mitigation measures, such as EV [electric vehicle] charging or building efficiency retrofits, are viable options for mitigation under CEQA and would not be double counted, provided they are not otherwise required by law or regulation and would not have happened but for the mitigation requirements of the project. If the mitigation would have been implemented or required through another statute, regulation, existing local program, or requirement other than the project it is mitigating, then the project being mitigated may not also claim credit for the reductions.

F.2 Checklist Instructions

2045 CAP CEQA Streamlining Checklist Submittal Requirements

The 2045 CAP CEQA Streamlining Checklist shall accompany the project application for all projects and plans proposed within unincorporated Los Angeles County’s land use authority that are subject to CEQA. The 2045 CAP CEQA Streamlining Checklist is designed to assist in identifying the GHG emissions reduction actions and other applicable sustainability-focused requirements specific to a proposed project. However, it may be necessary to supplement the completed 2045 CAP CEQA Streamlining Checklist with supporting materials, calculations, or certifications to demonstrate compliance with all the applicable CEQA streamlining requirements in the 2045 CAP CEQA Streamlining Checklist. The 2045 CAP CEQA Streamlining Checklist shall be included in the respective project conditions of approval.

⁵ California Air Resources Board. 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. Appendix D, “Local Actions.” November 16, 2022. Available: <https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-appendix-d-local-actions.pdf>. Accessed in January 2023.

2045 CAP CEQA Streamlining Checklist Applicability

The 2045 CAP CEQA Streamlining Checklist allows for streamlined project-specific CEQA GHG analysis. The 2045 CAP CEQA Streamlining Checklist is only required if a project applicant wants to use CEQA streamlining for GHG impacts; it is not required if a project-level environmental analysis of GHG impacts is conducted. As such, the 2045 CAP CEQA Streamlining Checklist is voluntary. The 2045 CAP CEQA Streamlining Checklist cannot be used for projects requiring a General Plan amendment associated with land use density increases. Ministerial projects and projects that otherwise are exempt from CEQA are deemed to be consistent with the 2045 CAP, and no further review is necessary, with the exception of the residential infill categorical exemption (CEQA Guidelines Section 15195), for which projects are required to demonstrate consistency with the 2045 CAP through the 2045 CAP CEQA Streamlining Checklist if the applicant elects to use CEQA streamlining for GHG impacts. All projects using the 2045 CAP CEQA Streamlining Checklist for CEQA streamlining must demonstrate consistency with the General Plan growth projections. **If a project is not consistent with the General Plan growth projections, then the 2045 CAP CEQA Streamlining Checklist may not be used for CEQA streamlining.**

2045 CAP CEQA Streamlining Checklist Instructions

Project applicants shall complete the following **four steps** to demonstrate compliance with the 2045 CAP for a proposed project.

Step 1. Demonstrate consistency with the General Plan growth projections (**Table F-1**).

Step 2. Determine whether the project screens out of certain CEQA streamlining requirements (Table F-1).

Step 3. Complete the 2045 CAP CEQA Streamlining Checklist (Table F-1).

Step 4. Identify alternative project emissions reduction measures and additional GHG reductions (**Table F-2**), as needed.

All projects must complete **Step 1: Demonstrate Consistency with the General Plan Growth Projections** and **Step 2: Determine Whether the Project Screens Out of Certain CEQA Streamlining Requirements**. Projects that do not meet the screening criteria must complete **Step 3: Complete the 2045 CAP CEQA Streamlining Requirements**. Projects that cannot meet all CEQA streamlining requirements shown in Table F-1 must also complete **Step 4: Identify Alternative Project Emissions Reduction Measures and Additional GHG Reductions** (Table F-2) to describe alternative GHG emissions reduction measures that serve as replacements to any CEQA streamlining requirements not met by the project.

The following process, illustrated in **Figure F-1**, explains how to demonstrate consistency of a project with the 2045 CAP's GHG emissions reduction measures and actions, and thereby streamline the project's GHG impacts analysis by tiering from the certified Final PEIR for the 2045 CAP.

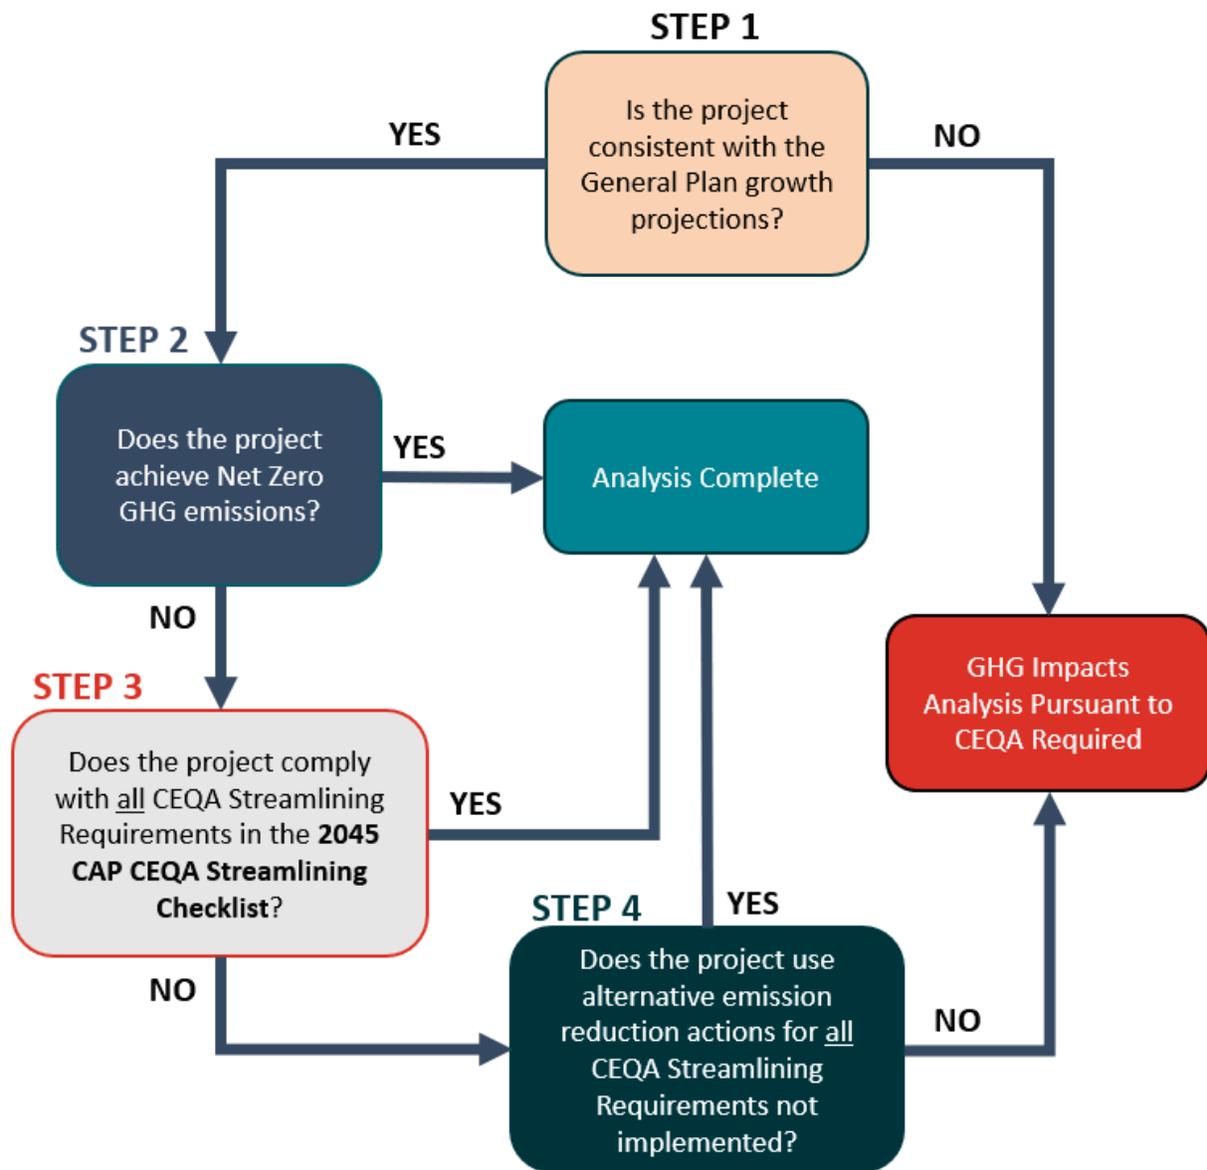

Figure F-1: Determining Consistency with the 2045 CAP for CEQA Streamlining

Step 1: Demonstrate Consistency with the General Plan Growth Projections

All projects must demonstrate consistency with the General Plan growth projections. **If a project is not consistent with the General Plan growth projections, then the 2045 CAP CEQA Streamlining Checklist may not be used for CEQA streamlining.** Complete the *General Plan Consistency* section of **Table F-1, General Plan and CEQA Streamlining Requirement Checklist**, below.

The options for determining General Plan consistency (included in Table F-1) are as follows:

- Is the proposed project consistent with the General Plan growth projections? If yes, move to **Step 2** below. If no, the proposed project may not streamline its GHG impacts analysis

by using the 2045 CAP's EIR, and instead must prepare a comprehensive project-specific analysis of GHG emissions and impacts pursuant to CEQA. Such projects are also encouraged to incorporate all the CEQA streamlining requirements in the 2045 CAP CEQA Streamlining Checklist.

Step 2: Determine Whether the Project Screens Out of Certain CEQA Streamlining Requirements

Certain projects may screen out of compliance with certain CEQA streamlining requirements contained in Table F-1 if such projects meet specific criteria. These criteria are designed to ensure high efficiency and low GHG emissions and describe projects that would generally comply with the 2045 CAP.

2045 CAP CEQA Streamlining Checklist Screening Criteria: Projects may skip the *Demonstrate Compliance with the CEQA Streamlining Requirements* section of Table F-1 below if they meet the following criteria:

- If the project would achieve **net zero GHG emissions** the project is considered to comply with the 2045 CAP and the analysis is complete.

Net zero GHG emissions means that the project's GHG emissions from construction and operational activities occurring at full buildout would result in zero total GHG emissions on an annual basis. In other words, all GHGs emitted the atmosphere during construction and operation by a project are balanced completely by GHG sequestration and removal over each calendar year period. Construction GHG emissions should be amortized for the project (typically 30 or 40 years) and added to the annual full buildout operational emissions to determine total annual emissions. Net zero GHG emissions for a project does not consider GHG emissions from existing conditions or existing uses at the project site. For example, if a project emits 1,500 MTCO_{2e} per year for both construction and operations but includes the planting of enough new trees to sequester 1,500 MTCO_{2e} per year, the project would achieve net zero GHG emissions.

To demonstrate that the project achieves net zero GHG emissions, the applicant must submit a comprehensive quantitative project-specific analysis of all GHG emissions, sinks, and removals from construction and full buildout operations, consistent with CEQA guidelines and standard practice for modeling GHG emissions for projects. If the project meets this criterion, the project does not need to complete **Table F-1** below and the analysis is complete.

Transportation Screening Criteria: Projects may skip CEQA streamlining requirements #3, #4, #5, #11, and #12 of the *Demonstrate Compliance with the CEQA Streamlining Requirements* section of Table F-1 below if they meet the following criteria (based on the 2020 Los Angeles County Department of Public Works Transportation Impact Analysis Guidelines):⁶

⁶ Los Angeles County Department of Public Works. 2020. *Transportation Impact Analysis Guidelines*. July 2020. Available: <https://dpw.lacounty.gov/traffic/trafficreportmsg.cfm>. Accessed February 2022.

1. For development projects:⁷
 - a. If the project does not have a retail component, and the project generates a net increase of less than 110 daily vehicle trips,⁸ then it screens out.
 - b. If the project has a retail component, and it contains retail uses that do not exceed 50,000 square feet of gross floor area,⁹ then it screens out.
 - c. If the project has a residential component, and 100 percent of the units, excluding manager's units, are set aside for lower income households,¹⁰ then it screens out.
 - d. If the project is located within a one-half mile radius of a major transit stop or an existing stop along a high-quality transit corridor¹¹ and meets all of the following criteria, then it screens out:
 - i. Has a Floor Area Ratio greater than 0.75.¹²
 - ii. Provides less parking than required by the Los Angeles County Code.¹³
 - iii. Is consistent with the Southern California Associated of Governments' Regional Transportation Plan/Sustainable Communities Strategy.¹⁴
 - iv. Does not replace residential units set aside for lower income households with a smaller number of market-rate residential units.
2. For transportation projects:¹⁵
 - a. If the project would not include the addition of through traffic lanes on existing or new highways, including general-purpose lanes, high-occupancy vehicle lanes, peak-period lanes, auxiliary lanes, and lanes through grade-separated interchanges (except managed lanes, transit lanes, and auxiliary lanes of less than 1 mile in length designed to improve roadway safety),¹⁶ then it screens out.
 - b. If the project would reduce roadway capacity and VMT,¹⁷ then it screens out.

If the project meets the above criteria, it may skip certain transportation portions of the 2045 CAP CEQA Streamlining Checklist (see Table F-1 for details).

⁷ The Transportation Impact Analysis (TIA) Guidelines provide a list of development project types, which include residential, office, manufacturing, institutional, and retail project types. For a complete list, see page 11 of the TIA Guidelines.

⁸ As referenced in: Governor's Office of Planning and Research. 2018. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

⁹ Governor's Office of Planning and Research. 2018. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

¹⁰ Governor's Office of Planning and Research. 2018. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

¹¹ Governor's Office of Planning and Research. 2018. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

¹² Governor's Office of Planning and Research. 2018. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

¹³ Governor's Office of Planning and Research. 2018. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

¹⁴ Governor's Office of Planning and Research. 2018. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

¹⁵ The TIA Guidelines describe transportation projects as projects that would increase vehicular/roadway capacity.

¹⁶ As noted above, the TIA Guidelines describe transportation projects as projects that would increase vehicular/roadway capacity.

¹⁷ A list of transportation projects that are not likely to lead to a substantial or measurable increase in vehicle miles travelled are included in the County's TIA Guidelines, pp. 17–19.

Step 3: Demonstrate Compliance with the 2045 CAP CEQA Streamlining Requirements

Table F-1 identifies the CEQA streamlining requirements for projects. Projects must demonstrate compliance with the 2045 CAP CEQA streamlining requirements listed in Table F-1 or document why the requirements are not applicable or are infeasible.¹⁸ The corresponding 2045 CAP measures and actions are indicated in the table to provide additional context. The full text of the 2045 CAP measures and actions is provided in the 2045 CAP (see Chapter 3 and Appendix E).

All applicants shall complete the following steps for the *Transportation, Building Energy and Water, Waste, and Agriculture, Forestry, and Other Land Use (AFOLU)* sections of **Table F-1** below (unless the project meets the transportation screening criteria identified in Step 1 above, in which case the project may skip completion of certain sections of the *Transportation* section of Table F-1):

- Step 3a.** Review the CEQA streamlining requirements described in the column titled “2045 CAP Streamlining Requirement.”
- Step 3b.** Use the check boxes in the column titled “Project Complies” to indicate whether the “Project Complies,” the requirement is “Not Applicable,” or the “Project Does Not Comply and Alternative Measure Proposed.”
- Step 3c.** Provide a qualitative analysis of the proposed project’s compliance with the CEQA streamlining requirements in the column titled “Description of Project Measure(s)/Documentation of Compliance.” This will be the basis for the CEQA analysis to demonstrate compliance with the 2045 CAP, and by extension, with SB 32. The qualitative analysis should provide:
 - i. A description of which streamlining requirements are included as part of the proposed project; or
 - ii. A description of why the streamlining requirement is not applicable to the proposed project; or
 - iii. A description of why the streamlining requirements are infeasible. If applicants select “Project Does Not Comply” or “Alternative Measure Proposed,” they must complete Table F-2 to document what alternative project measures will be implemented to achieve a similar level of GHG reduction and how those GHG emissions reduction estimates were calculated.
- Step 3d.** Provide specific project design criteria and/or reporting metrics to support the proposed project’s compliance with each CEQA streamlining requirement. Specific information is requested for each respective item in the 2045 CAP CEQA Streamlining Checklist.

Regarding item #2 above, the project applicant can only select “Not Applicable” if the requirement is not relevant to the project. The project applicant should only select “Project Does Not Comply and Alternative Measure Proposed” if it is infeasible, as defined by the CEQA Guidelines, for the project to comply with the checklist requirement. Sufficient documentation of such infeasibility must be supplied to the County to support such a determination. The County retains ultimate

¹⁸ Please note that the CEQA streamlining requirements are not mitigation measures as defined by CEQA.

discretion for determining the feasibility of the checklist requirement for the proposed project. Further, if “Project Does Not Comply and Alternative Measure Proposed” is selected for a specific checklist requirement, then the project applicant **must** identify an alternative measure to achieve the same or greater level of GHG emissions reduction as the CEQA streamlining requirement with which the project does not comply.

If the project applicant cannot fully complete these requirements, then the 2045 CAP CEQA Streamlining Checklist may not be used for CEQA streamlining of GHG emissions impacts. See the *Projects That Are Not Eligible for CEQA Streamlining* section for additional instructions.

The 2045 CAP CEQA streamlining requirements are listed as either “Tier 1” or “Tier 2.” These two levels are defined as follows:

Tier 1: Required for all discretionary projects in order to use CEQA streamlining for GHG impacts.

Tier 2: Encouraged for all discretionary projects. Although these measures are not required, projects are strongly encouraged to implement them. In Table F.1 below, these voluntary items are colored with gray shading.

In general, Tier 1 requirements were quantified in the 2045 CAP for GHG emissions reductions needed to achieve the 2030, 2035, and 2045 emissions reduction targets. Because these measures were quantified, they would be required for the 2045 CAP to achieve its full emissions reduction potential. Some Tier 1 measures were not quantified, but they either are required through other code or ordinance (such as compliance with the Transportation Demand Management Ordinance) or are deemed essential for the overall success of the 2045 CAP. Tier 2 requirements were identified as supporting actions but are not deemed essential for the overall success of the 2045 CAP.

Some Tier 1 and Tier 2 requirements point to future County regulations or ordinances that have not yet been developed, such as the forthcoming building decarbonization ordinance. In these instances, projects using the Checklist must only comply with currently adopted ordinances and requirements at the time of project approval.

The 2045 CAP CEQA Streamlining Checklist includes the following Tier 1 and Tier 2 requirements, organized by strategy area:

Energy Supply

1. Tier 1: Sunset Oil and Gas Operations
2. Tier 1: Utilize 100% Zero-Carbon Electricity

Transportation

3. Meets Transportation Screening Criteria
4. Tier 1: Increase Density Near High-Quality Transit Areas
5. Tier 1: Incorporate Bicycle and Pedestrian Infrastructure
6. Tier 1: Comply with the County Transportation Demand Management (TDM) Ordinance
7. Tier 1: Comply with the County’s Transportation Impact Guidelines

8. Tier 1: Incorporate Electric Vehicle Charging Infrastructure
9. Tier 1: Decarbonize Trucks
10. Tier 1: Incorporate Zero-Emission Technologies for Off-Road Vehicles & Equipment
11. Tier 1: Electrify County Fleet Vehicles (for municipal projects only)
12. Tier 2: Achieve a High Jobs/Housing Balance
13. Tier 2: Encourage Transit, Active Transportation, and Alternative Modes of Transportation
14. Tier 2: Implement Parking Limitations

Building Energy and Water

15. Tier 2: Decarbonize Existing Buildings
16. Tier 2: Decarbonize New Buildings
17. Tier 1: Increase Building Energy Efficiency
18. Tier 1: Implement Water Use Efficiency and Water Conservation
19. Tier 2: Reduce the Life-Cycle Carbon Intensity of Building Materials and Phase Out the Use of High-Global Warming Potential (GWP) Refrigerants
20. Tier 2: Use Energy Storage and Microgrids
21. Tier 2: Use Recycled Water and Graywater for Non-potable Uses and Include Rainfall Capture

Waste

22. Tier 1: Compost Organic Materials
23. Tier 1: Recycle Recyclable Materials
24. Tier 2: Incorporate On-site Composting, Mulching, and/or Anaerobic Digestion

Agriculture, Forestry, and Other Land Use

25. Tier 1: Incorporate Tree Plantings and Expand Urban Forest Cover
26. Tier 2: Conserve Forests, Woodlands, Shrublands, Grasslands, Desert, and other Carbon-Sequestering Wildlands and Working Lands
27. Tier 2: Implement Regenerative Agricultural Practices

2045 CAP Appendix B, *Emissions Forecasting and Reduction Methods*, provides the quantitative basis for the CEQA streamlining requirements.

Step 4: Identify Alternative Project Emissions Reduction Measures and Additional GHG Reductions

Projects that propose alternative GHG emissions reduction measures to those identified in Table F-1 or propose to include additional GHG emissions reduction measures beyond those described in Table F-1 shall provide a summary explanation of the proposed measures and demonstrate GHG reductions achievable through the proposed measures.¹⁹ Documentation for these alternative or additional project measures shall be documented in **Table F-2, Applicant Proposed**

¹⁹ Please note that the alternative GHG emissions reduction measures are not mitigation measures as defined by CEQA.

Alternative Project Emissions Reduction Measures. Any applicants who select “Project Does Not Comply and Alternative Measure Proposed” in Table F-1 must complete the following steps for Table F-2.

- Step 4a.** In the column titled “Description of Alternative Measure,” provide a qualitative description of what measure will be implemented, why it is proposed, and how it will reduce GHG emissions.
- Step 4b.** In the column titled “Description of GHG Reduction Estimate,” demonstrate how the alternative project measure would achieve the same or greater level of GHG emissions reductions as the CEQA streamlining requirement that it replaces. Documentation and calculation files must be attached separately.

An example alternative project measure may be installing additional EV charging infrastructure beyond what is required by the California Green Building Standards Code (CALGreen Code), County ordinance, or requirements in the forthcoming Zero Emission Vehicle Master Plan, to support zero-emission vehicles beyond what is specified in the 2045 CAP’s performance objectives for Measure T6 (Increase ZEV Market Share and Reduce Gasoline and Diesel Fuel Sales). The applicant would then demonstrate how this would achieve the same or greater level of GHG emissions reductions as the checklist requirement for which it serves as an alternative.

Carbon offset credits are not permitted to be used as alternative project emissions reduction measures.

Guidance for Quantifying GHG Reductions from Alternative Measures

In order to use alternative GHG emissions reduction measures to replace a CEQA streamlining requirement in Table F-1 below, project applicants must use the three-step process outlined below to quantitatively demonstrate how the alternative project measure would achieve the same or greater level of GHG emissions reductions as the CEQA streamlining requirement (or requirements) that it replaces.

Project applicants should follow these three steps:

- Step 4c.** Prepare a detailed quantified GHG emissions inventory for the project taking into consideration all GHG-reducing project features and 2045 CAP CEQA Streamlining Checklist items included as part of the project (including proposed mitigation measures, project design features, strategies being implemented, and other County requirements).

Project applicants shall prepare a detailed quantified GHG emissions inventory for the project taking into consideration all GHG-reducing project features and CEQA streamlining requirements included as part of the project (including proposed mitigation measures, project design features, strategies being implemented, and other County requirements), **except** for the alternative GHG emissions reduction measures proposed by the applicant to replace any Tier 1 CEQA streamlining requirement (as described in Step 4e). Applicants should use CalEEMod, CARB’s Emission FACTor

model (EMFAC),²⁰ the CAPCOA Handbook, and other commonly accepted GHG modeling methods and protocols.

- Step 4d.** For each Tier 1 CEQA streamlining requirement that the project will not meet, include a quantified calculation of the additional GHG emission reductions that would have occurred had the project implemented the Tier 1 Checklist streamlining requirement.

Project applicants shall, for all Tier 1 CEQA streamlining requirements that the project will not meet, a quantified calculation of the additional GHG emission reductions that would have occurred had the project implemented those Tier 1 CEQA streamlining requirements. In order to do this, applicants shall prepare a project model run assuming the implementation of all Tier 1 CEQA streamlining requirement that the project will not meet. Applicants should then compare the project's GHG emissions from this scenario with the project's GHG emissions from Step 4c above. The difference in GHG emissions between the two scenarios represents the GHG emission reductions that would have occurred had the project implemented all Tier 1 CEQA streamlining requirements; this is the amount of GHG emissions required to be reduced in total by the alternative GHG emissions reduction measures.

- Step 4e.** Propose an alternative measure (or set of measures) and demonstrate quantitatively that the alternative measures would achieve a GHG emission reduction equivalent to the GHG emission reduction that would have resulted from complying with the Tier 1 CEQA streamlining requirement.

Project applicants shall provide a quantified measure or set of measures that closes the gap between the two scenarios as quantified in Step 4c and Step 4d. In order to do this, applicants shall prepare a project model similar to Step 4c but include all alternative GHG emissions reduction measures proposed by the applicant. The resulting GHG emissions from this model run must equal or be less than the GHG emissions resulting from the project model run in Step 4d above which assumes the implementation of all Tier 1 CEQA streamlining requirements. In other words, the GHG emission reductions achieved by the alternative measures must meet or exceed the GHG emission reductions achieved by the Tier 1 CEQA streamlining requirements.

Project applicants shall submit documentation to the City demonstrating all three steps above. This can include model run inputs and/or outputs, excel calculation files, or other documentation of the emission calculations.

Potential alternative GHG emissions reduction measures to be considered include, but are not be limited to, measures recommended in the South Coast Air Quality Management District's latest CEQA Air Quality Guidelines, the California Air Resources Board Scoping Plan (December 2022, as may be revised), the California Air Pollution Control Officers Association (CAPCOA) *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity* (December 2021, as may be revised), the CAPCOA California Emissions Estimator Model (CalEEMod), the California Attorney General's *Mitigation for*

²⁰ California Air Resources Board. 2022. EMFAC2021 Model. Version v1.0.2. Available: <https://arb.ca.gov/emfac/>. Accessed June 2023.

Greenhouse Gas Emissions guidance, and Reference Guides on Leadership in Energy and Environmental Design (LEED) published by the U.S. Green Building Council.

As for any project design features or mitigation measures implemented via the County's project approval and CEQA review process, the project applicant shall implement all alternative GHG emissions reduction measures proposed. For physical GHG reduction measures to be incorporated into the design of the project, the measures shall be included on the drawings submitted for construction-related permits and implemented during construction. For operational GHG reduction measures to be incorporated into the project, the measures shall be implemented on ongoing basis.

Projects That Are Not Eligible for CEQA Streamlining

In some cases, a project may not be able to comply with all of the 2045 CAP CEQA streamlining requirements. This may be because the project is inconsistent with the General Plan's growth projections as described in Step 1. Or a project may not be able to feasibly incorporate all CEQA streamlining requirements as identified in Table F-1 and discussed in Step 3; such a project may further be unable to adequately identify alternative project measures to achieve a similar level of GHG reduction to each CEQA streamlining requirement which a project cannot comply with. Such projects are not eligible to streamline environmental review of their GHG impacts using the 2045 CAP's PEIR and may be required to prepare a comprehensive project-specific analysis of GHG emissions pursuant to CEQA Guidelines (including the CEQA Guidelines Appendix G Environmental Checklist).

A comprehensive project-specific analysis of GHG emissions must be prepared for any project that elects not to use the Checklist for CEQA streamlining by completing Table F-1 and (if applicable) Table F-2. Such an analysis shall quantify existing and projected GHG emissions and evaluate potential impacts pursuant to the CEQA Guidelines (including the CEQA Guidelines Appendix G Environmental Checklist). It is strongly encouraged that the project incorporate all the CEQA streamlining requirements in the 2045 CAP CEQA Streamlining Checklist, though this is not required.

F.3 2045 CAP CEQA Streamlining Checklist

Table F-1, *General Plan and 2045 CAP CEQA Streamlining Checklist*, allows the applicant to demonstrate compliance with the 2045 CAP's GHG emissions reduction measures and actions. This table addresses **Step 1: Demonstrate Consistency with the General Plan Growth Projections**; **Step 2: Determine Whether the Project Screens Out of Certain CEQA Streamlining Requirements**; and **Step 3: Demonstrate Compliance with the CEQA Streamlining Requirements**. This checklist must be completed for all applicable projects electing to streamline their CEQA GHG analysis.

Table F-2, *2045 CAP Greenhouse Gas Emissions Reduction Alternative Measures*, allows the project applicant to document alternative GHG emissions reduction measures used to demonstrate compliance with the Table F-1 CEQA streamlining requirements. This table addresses **Step 4: Identify Alternative Project Emissions Reduction Measures and Additional GHG Reductions**. This checklist is required only for projects that propose to use alternative GHG emissions reduction measures.

Table F-1: General Plan and 2045 CAP CEQA Streamlining Checklist

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
Step 1: Demonstrate Consistency with the General Plan Growth Projections		
<p>1. The Project is Consistent with the General Plan Growth Projections The growth projections included in the General Plan were used in the 2045 CAP to estimate unincorporated Los Angeles County GHG emissions over time. Therefore, projects must be consistent with the General Plan to comply with the CEQA streamlining requirements. To determine a project’s consistency with the General Plan growth projections, please answer the following question and provide an explanation with supporting documentation.</p> <p>Is the proposed project consistent with the existing land use designation of the Land Use Element and the 2021 Housing Element Update? If “Yes,” proceed to Step 2: Determine Whether the Project Screens Out of Certain CEQA Streamlining Requirements below. If “No,” the proposed project may not streamline its GHG impacts analysis by using the 2045 CAP’s EIR and must prepare a comprehensive project-specific analysis of GHG emissions and impacts pursuant to CEQA.</p>	<p><i>Describe how the project is consistent with the General Plan growth projections. Provide additional supporting documentation as an attachment as needed.</i></p> <p><i>OR,</i></p> <p><i>Explain why the project is not consistent with the General Plan growth projections, and whether the project would include a General Plan amendment. If the project includes a General Plan amendment, STOP HERE.</i></p>	<p><input type="checkbox"/> Yes <input type="checkbox"/> No</p>
Step 2: Determine Whether the Project Screens Out of the CEQA Streamlining Requirements		
<p>Certain projects may screen out of the 2045 CAP CEQA Streamlining Requirements if they meet the following screening criterion.</p> <p>Does the project achieve net zero GHG emissions? The project must conduct a comprehensive project-specific analysis of all GHG emissions, sinks, and removals, consistent with all CEQA guidelines and standard practice for modeling GHG emissions for projects, to demonstrate that the project achieves net zero GHG emissions.</p> <p>If “Yes,” the project would comply with the CEQA streamlining requirements and no additional analysis is needed (no project-specific GHG impact analysis would be required).</p> <p>If “No,” proceed to Step 3: Demonstrate Compliance with the CEQA Streamlining Requirements below.</p>	<p><i>If “Yes,” attach to this checklist the estimated project GHG emissions. Provide supporting calculation files and documentation for this analysis. If the proposed project is determined to result in net zero GHG emissions, STOP HERE.</i></p> <p><i>If “No,” proceed to Step 3 below.</i></p>	<p><input type="checkbox"/> Yes <input type="checkbox"/> No</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
Step 3: Demonstrate Compliance with the CEQA Streamlining Requirements		
Energy Supply		
<p>1. TIER 1: Sunset Oil and Gas Operations For any project involving the decommissioning, replacement, retrofit, or redesign of infrastructure or facilities associated with the oil and gas industry, including energy generation (i.e., cogen), the project must:</p> <ul style="list-style-type: none"> A) Comply with the Oil Well Ordinance (Title 22). B) Reduce fossil fuel–based emissions by at least 80% compared to existing conditions. C) If the project site includes existing active and abandoned oil wells, examine all wells for fugitive emissions of methane. Reduce such existing emissions by a minimum of 80%. D) To reduce any residual fossil fuel–based emissions generated by the project, incorporate carbon removal technologies including direct air capture and carbon and sequestration, as feasible. <p>Supports 2045 CAP Measures (and Actions): ES1 (ES1.1, ES1.2, ES1.3)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed as a replacement strategy (provide additional documentation as described below).</i> <i>IN ADDITION, provide documentation of the project’s ability to reduce fossil fuel–based emissions, including fugitive methane emissions.</i> <i>Provide the number of oil and gas operations/wells closed.</i> <i>Provide documentation of any carbon removal technologies incorporated at the project site.</i></p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>2. TIER 1: Utilize 100% Zero-Carbon Electricity The project must utilize 100% zero-carbon electricity on-site. The project must comply with one of the following options:</p> <ul style="list-style-type: none"> A) Install on-site renewable energy systems or participate in a community solar program to supply 100% of the project’s estimated energy demand to the maximum extent feasible. B) Participate in Southern California Edison at the Green Rate level (i.e., 100% carbon-free electricity) for all electricity accounts associated with the project until SCE provides 100% carbon-free electricity for all accounts by default. C) Participate in the Clean Power Alliance at the Clean Rate level (i.e., 100% carbon-free electricity) for all electricity accounts associated with the project until CPA provides 100% carbon-free electricity for all accounts by default. D) A combination of #1, #2, and #3 above such that 100% of the project’s electricity consumption is supplied by zero-GHG emission sources of power generation, whether by utilities or by on-site electricity generation or both. <p>Supports 2045 CAP Measures (and Actions): ES2 (ES2.1, ES2.2), ES3 (ES3.1, ES3.2, ES3.3, ES3.4, ES3.5, ES3.6)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below)</i> <i>IN ADDITION, provide the project’s anticipated electricity demand, the project’s participation and opt-out rates for SCE’s Green Rate and CPA’s Clean Rate electricity rate options used by tenants; and the total kW of solar PV panels installed at the project site.</i></p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
Transportation		
<p>3. Meets Transportation Screening Criteria</p> <p>For <u>development projects</u>, does the project:</p> <p>A) have no retail component and generate a net increase of less than 110 daily vehicle trips?</p> <p>If “Yes,” skip streamlining requirements #4, #5, #12, #13, and #14 below. Please complete items #6 through #11 below.</p> <p>If “No,” proceed to item (B) below.</p> <p>For <u>development projects</u>, does the project:</p> <p>B) have a retail component and contains retail uses that do not exceed 50,000 square feet of gross floor area?</p> <p>If “Yes,” skip streamlining requirements #4, #5, #12, #13, and #14 below. Please complete items #6 through #11 below. If the project contains retail and is mixed use, proceed to item (C) below.</p> <p>If “No,” proceed to item (C) below.</p> <p>For <u>development projects</u>, does the project:</p> <p>C) have a residential component and 100% of the units, excluding manager’s units, are set aside for lower income households?</p> <p>If “Yes,” skip streamlining requirements #4, #5, #12, #13, and #14 below. Please complete items #6 through #11 below. If the project contains retail and is mixed use, proceed to item (D) below.</p> <p>If “No,” proceed to item (D) below.</p> <p>For <u>development projects</u>:</p> <p>D) Is the project located within a one-half mile radius of a major transit stop or an existing stop along a high-quality transit corridor <u>and</u>:</p> <ul style="list-style-type: none"> i. has a Floor Area Ratio greater than 0.75? ii. provides less parking than required by the Los Angeles County Code? iii. is consistent with the Southern California Association of Governments (SCAG) Regional Transportation Plan / Sustainable Communities Strategy (RTP/SCS)? iv. does not replace residential units set aside for lower income households with a smaller number of market-rate residential units? <p>If “Yes,” skip streamlining requirements #4, #5, #12, #13, and #14 below. Please complete items #6 through #11 below.</p> <p>If “No,” proceed to streamlining requirement #3 below.</p> <p>For <u>transportation projects</u>, does the project meet <u>one</u> of the following transportation screening criteria?</p> <p>A) The project would not include the addition of through traffic lanes on existing or new highways, including general-purpose lanes, high-occupancy vehicle (HOV) lanes, peak-period lanes, auxiliary lanes, and lanes through grade-</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p>OR,</p> <p><i>Describe why such actions are infeasible and identify the alternative measure(s) proposed as an alternative strategy (provide additional documentation as necessary).</i></p>	<p><input type="checkbox"/> Yes</p> <p><input type="checkbox"/> No</p>

<p>separated interchanges (except managed lanes, transit lanes, and auxiliary lanes of less than 1 mile in length designed to improve roadway safety).</p> <p>B) The project would reduce roadway capacity and VMT.</p> <p>If “Yes,” skip streamlining requirements #4, #5, #12, #13, and #14 below. Please complete items #6 through #11 below.</p> <p>If “No,” proceed to streamlining requirement #4 below.</p> <p>Supports 2045 CAP Measures (and Actions): T1 (T1.1, T1.2)</p>		
<p>4. TIER 1: Increase Density Near High-Quality Transit Areas</p> <p>If the project is located within a High Quality Transit Area (HQTAs), it must achieve a minimum of 20 dwelling units (DU) per acre, consistent with the Housing Element Rezoning Program.</p> <p>If the project is not located within an HQTAs, it must locate residential and employment centers within 1 mile of an HQTAs.</p> <p>Supports 2045 CAP Measures (and Actions): T1 (T1.1, T1.2)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p>OR,</p> <p><i>Describe why this action is not applicable to your project.</i></p> <p>OR,</p> <p><i>Describe why such actions are infeasible and identify the alternative measure proposed as a replacement strategy (provide additional documentation as described below).</i></p>	<p><input type="checkbox"/> Project Complies</p> <p><input type="checkbox"/> Not Applicable</p> <p><input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>5. TIER 1: Incorporate Bicycle and Pedestrian Infrastructure</p> <p>The project must incorporate pedestrian and bicycle infrastructure into its design:</p> <p>A) Provide pedestrian facilities and connections to public transportation consistent with the Pedestrian Action Plan, Active Transportation Plans, and Vision Zero Action Plan, and any other relevant governing plan.</p> <p>B) Provide bicycle facilities consistent with the Bicycle Master Plan, Active Transportation Plans, and Vision Zero Action Plan, and any other relevant governing plan, and meet or exceed minimum standards for bicycle facilities in the Zoning Code and CALGreen Code.</p> <p>C) Increase sidewalk coverage to improve pedestrian access.</p> <p>D) Improve degraded or substandard sidewalks.</p> <p>E) Incorporate best practices to ensure pedestrian infrastructure is contiguous and links externally with existing and planned pedestrian facilities; best practices include high-visibility crosswalks, pedestrian hybrid beacons, and other pedestrian signals, mid-block crossing walks, pedestrian refuge islands, speed tables, bulb-outs (curb extensions), curb ramps, signage, pavement markings, pedestrian-only connections and districts, landscaping, and other improvements to pedestrian safety.</p> <p>F) Minimize barriers to pedestrian access and interconnectivity, such as walls, landscaping buffers, slopes, and unprotected crossings.</p> <p>G) Provide bicycle facilities for new and expanded buildings, new dwelling units, change of occupancy, increase of use intensity, and added off-street vehicle parking spaces.</p> <p>H) Provide short- and long-term (secure) bicycle parking for at least 5% of motorized vehicle capacity and nothing less than CALGreen Code requirements, whichever is more restrictive.</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p>OR,</p> <p><i>Describe why this action is not applicable to your project.</i></p> <p>OR,</p> <p><i>Describe why such actions are infeasible and identify the alternative measure proposed as a replacement strategy (provide additional documentation as described below)</i></p> <p><i>IN ADDITION, provide the length and/or amount of bicycle and pedestrian infrastructure incorporated, such as feet or miles of bikeways.</i></p>	<p><input type="checkbox"/> Project Complies</p> <p><input type="checkbox"/> Not Applicable</p> <p><input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
<p>I) Support the County’s goal to increase bikeway miles by 300 percent by 2030 (including Class I bike paths, Class II bike lanes, and Class III bike routes). Supports 2045 CAP Measures (and Actions): T3 (T3.1, T3.2, T3.3)</p>		
<p>6. TIER 1: Comply with the County Transportation Demand Management (TDM) Ordinance The Project must comply with the TDM ordinance at the time of project approval. This may include preferential carpool/vanpool parking, bicycle parking, and shower facilities and locker rooms; trip reduction plans; transit-supportive infrastructure development; and similar strategies. Comply with any applicable VMT reduction target and incorporate any required monitoring mechanisms for development, subject to the ordinance. Supports 2045 CAP Measures (and Actions): T4 (T4.5)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below)</i> IN ADDITION, provide the number of employers participating in the TDM program, the total trip reduction goals for the project’s TDM program, and the total trips and VMT reduced via the project’s TDM program.</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>7. TIER 1: Comply with the County’s Transportation Impact Guidelines The project must comply with the County’s current Transportation Impact Analysis (TIA) Guidelines. Projects may screen out if they meet certain criteria, such as being located in a transit priority area or local-serving retail development less than 50,000 square feet. Projects that do not screen out must meet the VMT efficiency metrics identified by the TIA Guidelines (e.g., daily VMT per capita for residential projects that is 16.8% below the existing residential VMT per capita for the Baseline Area in which the project is located) and quantitatively demonstrate how these metrics are achieved, pursuant to the TIA Guidelines requirements. Supports 2045 CAP Measures (and Actions): T1, T2, T3, T4, T5</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed strategy (provide additional documentation as described below).</i></p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>8. TIER 1: Incorporate Electric Vehicle Charging Infrastructure The project must incorporate zero-emission vehicle (ZEV) infrastructure and incentives into its design as follows: A) Comply with any CALGreen Code requirement, County ordinance, building code, or condition of approval that requires a certain amount of electric vehicle (EV) charging infrastructure (EVCSs) and readiness. This may include minimum requirements for EV charging stations, EV-capable parking spaces, and EV-ready parking spaces. B) Comply with any provisions and requirements in the forthcoming Zero Emission Vehicle Master Plan.¹ C) Include electric options for promoting active transportation, such as electric scooters and e-bikes. D) Provide education and outreach to tenants and occupants about the benefits of ZEVs and the project’s EV infrastructure.</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below)</i> IN ADDITION, provide the number of ZEVs in the project’s tenant’s and vendor fleet, if available; the number of public and private EVCSs installed; and the number of scooters/e-bikes available to tenants.</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

<p>Supports 2045 CAP Measures (and Actions): T6 (T6.1, T6.2, T6.3, T6.4, T6.5, T6.6, T6.7)</p>		
<p>9. TIER 1: Decarbonize Trucks For projects that include goods movement facilities and/or warehouses, the project must incorporate freight decarbonization technologies and infrastructure, including:</p> <ul style="list-style-type: none"> A) Comply with any CALGreen Code requirement, County ordinance, building code, or condition of approval that requires a certain amount of EV charging infrastructure and readiness for goods movement facilities and trucks. B) Provide EVCSs at all new warehouse loading docks. C) Comply with any provisions and requirements in the forthcoming Zero Emission Vehicle Master Plan related to goods movement. D) Implement freight decarbonization technologies along highway corridors. E) For all goods movement facilities, install alternative fueling infrastructure such as EVCSs, green hydrogen fueling stations, and/or biomethane fueling stations. F) Comply with any established zero-emission delivery zones. <p>Supports 2045 CAP Measures (and Actions): T8 (T8.1, T8.2, T8.3, T8.4, T8.5)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i> <i>IN ADDITION, provide the number of ZEV trucks in the project's tenant's and vendor fleet if available and the number EVCS installed.</i></p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>10. TIER 1: Incorporate Zero-Emission Technologies for Off-Road Vehicles & Equipment The project must:</p> <ul style="list-style-type: none"> A) Prohibit the use of small equipment powered by gasoline, diesel, propane, or other fossil fuels, including lawn and garden equipment and outdoor power equipment, for all tenants and owners. B) Provide educational materials to tenants regarding the SCAQMD Electric Lawn and Garden Equipment Incentive and Exchange Program, Commercial Lawn & Garden Battery Buy-Down Rebate Program, the Residential Lawn Mower Rebate Program, the new requirements of AB 1346, and any other available options and incentives for purchasing zero-emission equipment, including rebates and subsidies offered by CARB, the County, or other agencies and entities. C) Use electric and zero-emission construction equipment during project construction to the maximum extent feasible. Such equipment shall include forklifts, manlifts, loaders, welders, saws, pumps, fixed cranes, air compressors, sweepers, aerial lifts, pressure washers, and other small equipment. At minimum, the project must use off-road construction equipment that meet CARB Tier 4 Final engine emission standards. D) Use electric and zero-emission agriculture and manufacturing equipment to the maximum extent feasible. <p>These requirements must be stipulated in the contract specifications for the project's construction and for the project's future tenants and any landscaping contracts for the property or tenants.</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i> <i>IN ADDITION, provide off-road vehicle and equipment fleet count, type, and fuel type, as available.</i></p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
<p>Supports 2045 CAP Measures (and Actions): T9 (T9.1, T9.2, T9.3)</p>		
<p>11. TIER 1: Electrify County Fleet Vehicles (for municipal projects only) For all new municipal projects and facilities that include the purchase or operation of new fleet vehicles, including public transit buses and shuttles, all such fleet vehicles must be ZEVs. Supports 2045 CAP Measures (and Actions): T7 (T7.1, T7.2)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i> IN ADDITION, provide the number of new ZEV buses and the total ZEV percentage of the project's fleet.</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>12. TIER 2: Achieve a High Jobs/Housing Balance For projects with nonresidential development, the Project must incorporate the following design elements: A) Support the County's goal to achieve a job density of 300 jobs per acre. Supports 2045 CAP Measures (and Actions): T2 (T2.1)</p>	<p><i>Describe how the project will achieve a job density of 300 jobs per acre.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR <i>Describe why such actions are not incorporated into your project.</i> IN ADDITION, provide the job density of the project in terms of jobs per acre.</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply</p>
<p>13. TIER 2: Encourage Transit, Active Transportation, and Alternative Modes of Transportation For transit projects only, incorporate the following: A) Expand and improve frequency of existing network of County shuttles. B) Install bus-only lanes and signal prioritization along major thoroughfares. C) Install full bus rapid transit infrastructure along priority corridors. For all other projects, incorporate the following: A) Provide new mobility services, such as micro transit, autonomous delivery vehicles, and on-demand autonomous shuttles, in unincorporated Los Angeles County. B) Offer free transit passes for students, youth, seniors, disabled, and low-income populations. C) Implement telecommuting by project tenants and residents. D) Establish temporary and permanent car-free areas at the project site. Supports 2045 CAP Measures (and Actions): T4 (T4.1, T4.2, T4.3, T4.6, T4.7, T4.8, T4.10)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are not incorporated into your project.</i> IN ADDITION, for transit projects, provide the size of area served by transit, the number of employees and residents served by transit, the transit service frequency and headways, the increase in headways or frequencies provided by the project, total transit service hours provided by transit, the number and length of bus-only lanes, and information on signal prioritization on transit routes implemented by the project. For non-transit projects, provide the number of residents within one-half mile of bus or active transportation services; information on any new mobility services offered, information on free transit passes offered, the number of employers</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
	<i>participating in telecommuting programs, and the number and location of car-free areas provided by the project.</i>	
<p>14. TIER 2: Implement Parking Limitations Projects should include the following characteristics:</p> <ul style="list-style-type: none"> A) Shared and reduced parking strategies, such as shared parking facilities, carpool/vanpool-only spaces, shuttle facilities, EV-only spaces, and reduced parking below allowable amount B) Minimum amount of required parking C) Unbundled parking costs to reflect cost of parking D) Parking pricing to encourage “park-once” behavior E) Compliance with all County parking reform strategies and policies <p>Supports 2045 CAP Measures (and Actions): T5 (T5.1)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions not incorporated into your project.</i> <i>IN ADDITION, provide the total number of parking spaces, carpool/vanpool-only spaces, shuttle facilities, EV-only spaces; information on parking costs and unbundling; and parking prices.</i></p>	<ul style="list-style-type: none"> <input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply
Building Energy and Water		
<p>15. TIER 2: Decarbonize Existing Buildings This action applies only to projects that include a retrofit, remodel, or redesign of an existing building. If the proposed project does not include a retrofit, remodel, or redesign, select “Not Applicable” in the <i>Project Complies</i> column. The project must incorporate the following design elements:</p> <ul style="list-style-type: none"> A) Achieve zero GHG emissions for on-site energy use. B) Comply with all applicable Building Performance Standards.² C) Comply with all building carbon intensity limits.³ D) If the project is a major renovation, achieve ZNE and/or comply with the City’s ZNE ordinance.⁴ <p>Supports 2045 CAP Measures (and Actions): E1 (E1.1, E1.2, E1.3, E1.4, E1.5, E1.6)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i> <i>IN ADDITION, provide the project’s anticipated GHG emissions associated with on-site energy consumption (i.e., natural gas use and electricity use) and the number of existing buildings transitioned to zero-GHG buildings.</i></p>	<ul style="list-style-type: none"> <input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed
<p>16. TIER 2: Decarbonize New Buildings For projects under construction before 2030, the project must achieve zero GHG emissions for on-site energy use, and/or comply with the County’s building decarbonization ordinance, unless the project meets specific exemptions identified in the ordinance.⁵ For projects under construction after 2030, the project must be zero-net-energy (ZNE) and achieve zero GHG emissions for on-site energy use, and/or comply with the County’s ZNE ordinance, unless the project meets specific exemptions identified in the ordinance.⁶</p> <p>Supports 2045 CAP Measures (and Actions): E2 (E2.1, E2.2, E2.3)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i> <i>IN ADDITION, provide the number and square footage of zero GHG emission buildings built, all ZNE buildings built, and the total GHG emissions anticipated for all buildings.</i></p>	<ul style="list-style-type: none"> <input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
<p>17. TIER 1: Increase Building Energy Efficiency This action applies only to projects that include a retrofit of an existing building. If the proposed project does not include a retrofit, select “Not Applicable” in the <i>Project Complies</i> column. The project shall incorporate the following energy efficiency measures into the design:</p> <ul style="list-style-type: none"> A) Comply with all applicable building performance standards.⁷ B) Incorporate strategic energy management programs to reduce building energy demands. C) Conduct an energy audit or benchmarking analysis to identify potential energy savings opportunities and implement such opportunities. D) Achieve CALGreen Code Tier 2 or voluntary building energy measures as they apply to the retrofit. E) Replace existing appliances with higher-efficiency models. F) Install heat-trapping surfaces to cool or green surfaces, as feasible. G) Participate in SoCalIREN, SCE, CPA, or other energy efficiency programs. H) Conduct other energy efficiency retrofits. I) Achieve zero-net-energy, if feasible. <p>Supports 2045 CAP Measures (and Actions): E4 (E4.1, E4.2, E4.3)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i> IN ADDITION, provide the total number of energy retrofits performed, the building size (square footage) retrofit, the total project energy use and anticipated energy savings through retrofits, and the number and area of cool and green roofs installed.</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>18. TIER 1: Implement Water Use Efficiency and Water Conservation The project must comply with the current water conservation ordinance in place, including any requirements for LEED or Sustainable SITES standards.⁸ The project must also incorporate water use efficiency and conservation measures, including:</p> <ul style="list-style-type: none"> A) High-efficiency appliances/fixtures to reduce water use, and/or include water-efficient landscape design B) CALGreen Code Tier 1 and Tier 2 voluntary water conservation measures C) Low-flow or high-efficiency water fixtures D) Water-efficient landscapes with lower water demands than required by the DWR 2015 Model Water Efficient Landscape Ordinance E) Drought-tolerant and native plant species only F) A comprehensive water conservation strategy G) Educational materials provided to future tenants and building occupants about water-saving behaviors and water-conserving landscaping <p>Supports 2045 CAP Measures (and Actions): E6 (E6.1, E6.2, E6.3, E6.4, E6.5)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i> OR, <i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i> IN ADDITION, provide the project’s estimated total water consumption (in GPCD or total gallons), the square footage of buildings that are water-neutral, and the project’s building size (square footage).</p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>
<p>19. TIER 2: Reduce the Life-Cycle Carbon Intensity of Building Materials and Phase Out the Use of High-GWP Refrigerants The project must incorporate the following design elements to the maximum extent feasible:</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i> OR, <i>Describe why this action is not applicable to your project.</i></p>	<p><input type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
<p>A) For projects that are not fully electric, incorporate biomethane into the natural gas mix in place of traditional natural gas.</p> <p>B) Use negative-carbon concrete for all construction.</p> <p>C) Use low-GWP refrigerants and fire suppression equipment for all uses on-site.</p> <p>D) Comply with all County codes and ordinances regarding building material carbon intensity and high-GWP refrigerants and other gases.</p> <p>Supports 2045 CAP Measures (and Actions): E3 (E3.1, E3.2, E3.3, E3.4)</p>	<p>OR,</p> <p><i>Describe why such actions are not incorporated into your project.</i></p> <p><i>IN ADDITION, provide the amount of biomethane used by the project, the quantity of negative-carbon concrete for construction, and the quantity of low-GWP refrigerants and fire suppression equipment used.</i></p>	
<p>20. TIER 2: Use Energy Storage and Microgrids</p> <p>The project must incorporate the following design elements to the maximum extent feasible:</p> <p>A) Install energy storage systems.</p> <p>B) Use a building-scale or community microgrid to support demand management and peak shaving.</p> <p>Supports 2045 CAP Measures (and Actions): ES4 (ES4.1, ES4.2, ES4.3, ES4.4, ES4.5)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p>OR,</p> <p><i>Describe why this action is not applicable to your project.</i></p> <p>OR,</p> <p><i>Describe why such actions are not incorporated into your project</i></p> <p><i>IN ADDITION, provide the total kW of energy storage capacity installed and operational information for any microgrids utilized, if applicable.</i></p>	<p><input type="checkbox"/> Project Complies</p> <p><input type="checkbox"/> Not Applicable</p> <p><input type="checkbox"/> Project Does Not Comply</p>
<p>21. TIER 2: Use Recycled Water and Graywater for Non-potable Uses and Include Rainfall Capture</p> <p>The project must implement water reuse strategies onsite through the following design elements:</p> <p>A) Require use of reclaimed/recycled water and/or graywater for outdoor uses.</p> <p>B) Install residential graywater systems that meet appropriate regulatory standards.</p> <p>C) Install rainfall capture systems.</p> <p>D) Install dual plumbing for the use of recycled water.</p> <p>Supports 2045 CAP Measures (and Actions): E5 (E5.1, E5.2, E5.3, E5.4)</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p>OR,</p> <p><i>Describe why this action is not applicable to your project.</i></p> <p>OR,</p> <p><i>Describe why such actions are not incorporated into your project</i></p> <p><i>IN ADDITION, provide the amount of reclaimed/recycled water and/or graywater used by the project.</i></p>	<p><input type="checkbox"/> Project Complies</p> <p><input type="checkbox"/> Not Applicable</p> <p><input type="checkbox"/> Project Does Not Comply</p>
Waste		
<p>22. TIER 1: Compost Organic Materials</p> <p>The project must comply with all state and local requirements for composting and organic waste collection, including but not limited to Chapter 20.91 (Mandatory Organic Waste Disposal Reduction Ordinance) of the Los Angeles County Code, including all County requirements pursuant to AB 1826 and SB 1383. The project must also:</p> <p>A) Provide proper storage, collection, and loading of organics in a manner that is convenient and safe for all users of the building. Ensure there are sufficient sizes of collection containers for organics. Containers must be kept clean, be clearly labeled, and are co-located next to any other solid waste receptacles.</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p>OR,</p> <p><i>Describe why this action is not applicable to your project.</i></p> <p>OR,</p> <p><i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i></p>	<p><input type="checkbox"/> Project Complies</p> <p><input type="checkbox"/> Not Applicable</p> <p><input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

CEQA STREAMLINING REQUIREMENT	DESCRIPTION OF PROJECT MEASURE(S) / DOCUMENTATION OF COMPLIANCE / EXPLANATION OF NON-COMPLIANCE	PROJECT COMPLIES
<p>Ensure sufficient pick-up of collection containers to meet the needs of the occupants.</p> <p>B) Include space for multi-stream collection containers for both recycling and organics in any location where a solid waste container is traditionally housed. This includes both outdoor collection containers serviced by a waste hauler or indoor collection containers utilized by occupants. Provide educational material and training to occupants and tenants in how to properly separate organics from all other solid waste and place organics in a separate container designated for organics.</p> <p>C) Ensure that all project occupants and tenants will separate compostables from all other refuse and place compostables in a separate container designated for composting.</p> <p>D) Require that all single-use food service ware (plates, bowls, cups) and accessories (straws, utensils, condiment cups) used by tenants at the project site be BPI certified compostable fiber, except where certain materials may be deemed medically necessary or necessary to ensure equal access for persons with disabilities.</p> <p>E) Require that any single-use accessories (straws, utensils, condiment cups) be only available on demand.</p> <p>F) Ensure that containers are audited annually to ensure proper service levels and to check for contamination. Report findings back to occupants within 30 days and to the County as requested.</p> <p>G) Work with the waste hauler to provide educational materials to tenants on at least an annual basis.</p> <p>H) Provide compliance data to the County as required for any current auditing program.</p> <p>Supports 2045 CAP Measures (and Actions): W1 (W1.1, W1.2) and W2 (W2.1, W2.2, W2.5)</p>	<p><i>IN ADDITION, provide the project's estimated organic waste generation (tons), the amount of organic waste sent to landfills, and the amount of organic waste generated by the project which is diverted from landfills.</i></p>	
<p>23. TIER 1: Recycle Recyclable Materials</p> <p>The project must comply with all state and local requirements for recycling, also including but not limited to Section 20.72.170 (Recyclable Materials Collection Program) of the Los Angeles County Code and all County requirements pursuant to AB 341 and AB 1826. The project must also:</p> <p>A) Comply with any zero waste ordinance in place at the time of project approval.</p> <p>B) Comply with all Mandatory Construction & Demolition (C&D) Recycling Program Requirements, including Chapter 20.87 (Construction and Demolition Debris Recycling and Reuse).</p> <p>C) Provide substantial storage, collection, and loading of recyclables in a manner that is convenient and safe for all users of the building. Ensure there are sufficient sizes and amount of collection containers for recyclables. Containers must be kept clean, be clearly labeled, and are co-located next to any other solid waste</p>	<p><i>Describe which project compliance options from the leftmost column you are implementing.</i></p> <p><i>OR,</i></p> <p><i>Describe why this action is not applicable to your project.</i></p> <p><i>OR,</i></p> <p><i>Describe why such actions are infeasible and identify the alternative measure proposed (provide additional documentation as described below).</i></p> <p><i>IN ADDITION, provide the total C&D tonnage recycled and/or diverted from landfills, the project's estimated recyclable waste generation (tons), the amount of recyclable waste sent to landfills, and the amount of recyclable waste generated by the project which is diverted from landfills.</i></p>	<p><input type="checkbox"/> Project Complies</p> <p><input type="checkbox"/> Not Applicable</p> <p><input type="checkbox"/> Project Does Not Comply and Alternative Measure Proposed</p>

F.4 Offsite GHG Reduction Program Framework

Introduction

Action ES5.4 of the 2045 CAP would establish an Offsite GHG Emissions Reduction Program (Offsite Program) for new development to use as a GHG reduction or mitigation pathway for 2045 CAP compliance and to fund programs for reducing GHG emissions in the built environment. This program would allow new development to fund decarbonization programs for existing development to accelerate 2045 CAP measures and actions or go beyond 2045 CAP measures and actions. Future projects that cannot achieve net-zero GHG emissions or are unable to comply with all CEQA streamlining requirements would have the option to participate in the Offsite Program. The Offsite GHG Reduction Program could be used for projects that propose alternative GHG emissions reduction measures to those identified in Table F-1, or that propose to include additional GHG emissions reduction measures beyond those described in Table F-1. This program would allow project applicants to implement local projects that reduce GHG emissions in unincorporated Los Angeles County (referred to herein as *offsite projects*). Such offsite projects must not otherwise be required by law or regulation and would not have happened but for the requirements placed on the project by the 2045 CAP CEQA Streamlining Checklist.

Once the Offsite GHG Reduction Program has been instituted by the County, project applicants will be able to use the program to complete Table F-2. Once established, the Offsite GHG Reduction Program should only be used after all feasible on-site GHG reduction measures are implemented at the project site to demonstrate compliance with the CEQA streamlining requirements.

This section represents a *framework* for the forthcoming Offsite Program; the actual program will be developed after the 2045 CAP is adopted.

CARB Guidance on Offsite GHG Reductions

As discussed in Section F.1, CARB supports “off-site GHG mitigation” in Appendix D of the 2022 Scoping Plan for projects that have implemented all feasible on-site GHG reductions: “If implementation of all feasible on-site GHG reduction measures is insufficient to reduce a project’s impact to a less-than-significant level, the State recommends that the lead agency next explore options to fund or implement *local*, off-site direct GHG reduction strategies.”²¹ The Offsite Program would achieve these goals.

Relationship to 2045 CAP Measures and Actions

The offsite projects that will be allowed in the program fall into two general categories:

1. Offsite projects *included* in the 2045 CAP’s measures and actions.
2. Offsite projects *not included* in the 2045 CAP’s measures and actions.

²¹ California Air Resources Board. 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. Appendix D, “Local Actions.” November 16, 2022. Available: <https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-appendix-d-local-actions.pdf>. Accessed in January 2023.

Offsite Projects Included in the 2045 CAP

This category represents projects (and the GHG emissions reductions they create) that *are* already included in the 2045 CAP's measures and actions. An allowable offsite project could involve, for example, accelerating measures, actions, and/or programs that are already identified in the 2045 CAP by providing additional funding to that program. Such projects would not add new programs or actions not already included in the 2045 CAP; they would expand upon and/or accelerate these programs and actions. Example projects are discussed below.

Offsite Projects Not Included in the 2045 CAP

This category represents projects (and the GHG emissions reductions they create) that are *not* already included in the 2045 CAP's measures and actions. An allowable offsite project could involve, for example, creating or funding programs for implementing new technologies (e.g., zero-emission construction equipment) or implementing new emissions reduction measures or actions not considered in the 2045 CAP. Example projects are discussed below.

Offsite Projects Not Eligible

Offsite projects that are implementing planned 2045 CAP measures and actions on the 2045 CAP's identified timeline are not eligible for the Offsite Program. Additionally, an offsite project activity that would be mandated by any current or future ordinance (such as a future ZNE ordinance for new buildings) cannot be used in the Offsite Program.

Carbon offset credits are not permitted to be used as offsite projects. In other words, projects that generate carbon offset credits to be traded on a voluntary market registry are not permitted to be used in this program.

Location

All offsite projects must be located within the jurisdictional boundaries of unincorporated Los Angeles County. Therefore, emissions reductions achieved by such offsite projects will be accounted for in future GHG inventory updates and will contribute toward the emissions reduction targets, which are based on the jurisdictional boundaries of unincorporated Los Angeles County. See 2045 CAP Appendix A for a discussion of the inventory and forecast boundaries.

Offsite projects shall be in the following locations, in order of priority, to the extent available: (1) Within the neighborhood surrounding the project site; (2) within the greater surrounding community (i.e., town); (3) within the same Planning Area; and (4) in other Planning Areas, but within unincorporated Los Angeles County.

Standards

All offsite projects must achieve **six specific standards** to ensure that the GHG reductions produced by offsite projects are environmentally sound; namely that the GHG reductions be real, permanent, quantifiable, verifiable, enforceable, and additional, defined as follows:

- **Real** means that the offsite project's GHG reductions are the direct result of complete emissions accounting. In other words, *real* means that GHG reductions or GHG enhancements result from a demonstrable action or set of actions, and are quantified using appropriate, accurate, and conservative methodologies that account for all GHG

emissions sources, GHG sinks, and GHG reservoirs within the offsite project boundary and account for uncertainty.²²

- **Permanent** means either that GHG reductions and GHG removal enhancements are not reversible, or that when GHG reductions and GHG removal enhancements may be reversible, mechanisms are in place to replace any reversed GHG emissions reductions and GHG removal enhancements to ensure that all credited reductions endure for at least 100 years.
- **Quantifiable** means the ability to accurately measure and calculate GHG reductions or GHG removal enhancements relative to an offsite project's baseline in a reliable and replicable manner for all GHG emissions sources, GHG sinks, or GHG reservoirs included within the offsite project boundary, while accounting for uncertainty. GHG emissions reductions from an activity must be rigorously quantified, and such GHG reductions would only be permitted in an amount that corresponds to the GHG emissions that have been quantified. GHG emissions accounting must be accurate and adhere to standardized quantification methodologies, which are discussed further below.
- **Verifiable** means that an offsite project's assertion of GHG emissions reductions is well documented and transparent, such that it lends itself to an objective review by an accredited verification body. The forthcoming Offsite Program itself may require third-party verification.²³
- **Enforceable** means the authority of the County to hold a particular party responsible to take appropriate action if any of the provisions of the Offsite Program are violated.
- **Additional** means that the offsite project is not otherwise required by law, regulation, or legally binding mandate, and none of the offsite project's GHG emissions reductions would otherwise occur. In other words, an offsite project activity is additional if it can be demonstrated that the activity would result in emissions reductions or removals exceeding what would be achieved in the absence of the incentive provided by the proposed project and the 2045 CAP CEQA Streamlining Checklist. Additionality is an important characteristic the Offsite Program because it indicates that the GHG reductions represent a net environmental benefit and a real reduction of GHG emissions and can thus be used to offset a project's new GHG emissions.

Proposed Process

If an applicant selects to use the Offsite Program as an alternative GHG emissions reduction measure beyond those described in Table F-1, a specific process must be followed. The process will consider the following topics, which are subject to modification by the County in the forthcoming Offsite Program.

Quantification: Project applicants shall provide evidence to the County showing that the offsite project(s) proposed achieve the amount of GHG emissions reductions required. Examples of

²² In general, uncertainty should be accounted for by using conservative assumptions and/or parameter values that tend to underestimate, rather than overestimate, total GHG emissions reductions.

²³ Generally, third-party verification includes a review of all documentation, monitoring data, and procedures used to estimate GHG reductions, and culminate in the verification body's issuance of a report and statement that identifies the quantity of GHG reductions that can be issued to the offsite project. As part of the report and statement, the independent third party verifies that the offsite project has adhered to the pertinent protocol or methodology, to confirm that the offsite project's GHG reductions are real, permanent, quantifiable, enforceable, and additional.

such evidence include applicable methodologies associated with the GHG emissions reductions, quantification calculations, and supporting documentation.

Standards: Project applicants must demonstrate, with substantial evidence, that all six of the offsite project standards are met: *real, permanent, quantifiable, verifiable, enforceable, and additional*.

Enforcement: Project applicants shall obtain all necessary permits and approvals for implementation of the offsite project implementation and such materials shall be submitted to the County for review and approval before project approval.

Timing: Project applicants shall submit documentation to the County identifying the quantity of GHG emissions reductions required by the offsite project over a specific time frame to be identified in the Offsite Program (e.g., before project approval or permit issuance, over the course of buildout of the project).

Monitoring: Project applicants shall submit regular reports documenting the offsite project's achieved GHG emissions reductions over a specified time period (such as the previous or current calendar year).

Example Offsite Projects

- **Local building electrification programs:** Programs that target existing residential and commercial buildings in the project's vicinity for electrification, provided that such electrification actions are not already required by law or regulation, County building performance standards, or reach code requirements. For example, replacing a natural gas-fired heating, ventilation, and air conditioning system with an electric heat pump or replacing a gas stove with an induction cooktop.
- **Off-site EV chargers:** Programs that install EV charging stations, provided that such installations are not already required by law or regulation, or County reach code requirements and the forthcoming Zero Emission Vehicle Master Plan (Measure T6). For example, funding or directly installing EV chargers in multi-unit dwellings in disadvantaged or low-income areas, public locations (schools, libraries, city centers), workplaces, and key destinations (e.g., parks, recreation areas, sports arenas).
- **Local building solar programs:** Programs that target existing residential and commercial buildings in the project's vicinity for rooftop solar photovoltaic installations, provided that such installations are not already required by law or regulation, County building performance standards, or reach code requirements. For example, funding or directly installing rooftop solar installations or community solar systems.
- **Energy storage and microgrids:** Funding for or direct implementation of a microgrid to balance generation from non-controllable renewable power sources, such as solar, with distributed, controllable generation, such as natural gas-fueled combustion turbines; or a strategically deployed battery storage system to make the grid more flexible by unlocking renewable energy and replacing fossil fuel-generated electricity, especially during peak hours. Such programs would be allowed provided they are not already required by law or regulation, County building performance standards, or reach code requirements.
- **Truck and bus electrification programs:** Funding for the purchase of zero-emission vehicle trucks and buses to replace existing fossil fuel-powered trucks and buses;

coordination with local transportation agencies and school districts and replacement of diesel- or gasoline-fueled buses with less-polluting technologies such as compressed natural gas, electric, hybrid-electric, fuel cell, or other commercially available technologies. Such programs would be allowed provided they are not already required by law or regulation, County building performance standards, or reach code requirements.

- **Hydrogen fuel:** Funding for or programs that provide renewable hydrogen fueling stations to nearby truck fleets, such as at logistics warehouses, or other uses of renewable hydrogen fuel as a replacement for fossil fuels. Such programs would be allowed provided they are not already required by law or regulation, County building performance standards, or reach code requirements.

Environmental Impacts Pursuant to CEQA

Project applicants' CEQA documents would be required to disclose the impacts of any offsite projects that are proposed for funding or implementation. The Final PEIR for the 2045 CAP evaluates the potential environmental impacts of the 2045 CAP's measures and actions. For any offsite projects implemented via this program, then, to the extent that such projects include types of activities similar to those contemplated by the 2045 CAP's measures and actions, the resulting environmental impacts would be expected to be similar to those disclosed in the Final PEIR. Project applicants' CEQA documents may rely on the Final PEIR impact analysis for an offsite project similar to those contemplated by the 2045 CAP, unless a specific offsite project causes a new or substantially more severe impact for that project type not addressed in the Final PEIR.

Next Steps and Additional Guidance

This section represents a *framework* for the Offsite Program. The actual Offsite Program will be developed separately after the 2045 CAP is formally adopted and the Final PEIR is certified. Once the formal Offsite Program is developed, project applicants may use it to demonstrate compliance with the CEQA streamlining requirements as indicated above.

2.6.2.1 Strategy 1: Decarbonize the Energy Supply	2-22
2.6.2.2 Strategy 2: Increase Densities and Diversity of Land Uses near Transit	2-23
2.6.2.3 Strategy 3: Reduce Single-Occupancy Vehicle Trips	2-24
2.6.2.4 Strategy 4: Institutionalize Low-Carbon Transportation	2-24
2.6.2.5 Strategy 5: Decarbonize Buildings.....	2-25
2.6.2.6 Strategy 6: Improve Efficiency of Existing Building Energy Use.....	2-26
2.6.2.7 Strategy 7: Conserve Water	2-27
2.6.2.8 Strategy 8: Minimize Waste and Recover Energy and Materials from the Waste Stream	2-27
2.6.2.9 Strategy 9: Conserve and Connect Wildlands and Working Lands.....	2-28
2.6.2.10 Strategy 10: Sequester Carbon and Implement Sustainable Agriculture.....	2-28
2.6.3 Greenhouse Gas Reduction Potential of the Draft 2045 Climate Action Plan Measures	2-29
2.7 2045 Climate Action Plan Implementation	2-31
2.7.1 2045 Climate Action Plan Consistency Checklist	2-40
2.8 2045 Climate Action Plan Monitoring and Reporting.....	2-41
2.9 Required Approvals: Environmental Review and Consultation Requirements.....	2-42

Chapter 3, Environmental Setting, Impacts, and Mitigation Measures	3.1-1
3.1 Introduction to Environmental Analysis	3.1-1
3.1.1 Regional Environmental Setting	3.1-1
3.1.1.1 Aesthetics	3.1-3
3.1.1.2 Agriculture and Forestry	3.1-3
3.1.1.3 Air Quality	3.1-3
3.1.1.4 Biological Resources	3.1-4
3.1.1.5 Cultural and Tribal Cultural Resources	3.1-5
3.1.1.6 Energy	3.1-5
3.1.1.7 Geology and Soils	3.1-5
3.1.1.8 Greenhouse Gas Emissions	3.1-5
3.1.1.9 Hazards and Hazardous Materials	3.1-6
3.1.1.10 Hydrology and Water Quality	3.1-6
3.1.1.11 Land Use and Planning	3.1-7
3.1.1.12 Noise	3.1-8
3.1.1.13 Population and Housing	3.1-8
3.1.1.14 Transportation	3.1-8
3.1.1.15 Utilities and Service Systems	3.1-9
3.1.1.16 Wildfire.....	3.1-9
3.1.2 Baseline.....	3.1-10
3.1.3 Approach to Impact Analysis	3.1-10
3.1.3.1 Significance Criteria.....	3.1-10
3.1.3.2 Significance Thresholds	3.1-10
3.1.3.3 Significance Conclusions.....	3.1-11
3.1.3.4 Resources Eliminated from Detailed Consideration in This Program EIR	3.1-12
3.1.3.5 Mitigation Measures	3.1-12
3.1.3.6 Future Projects Facilitated by the Draft 2045 CAP	3.1-13
3.1.3.7 Timing of CAP Impacts.....	3.1-15
3.1.4 Approach to Cumulative Impacts Analysis	3.1-15
3.2 Aesthetics.....	3.2-1
3.2.1 Setting	3.2-1
3.2.1.1 Study Area.....	3.2-1
3.2.1.2 Environmental Setting	3.2-1
3.2.1.3 Regulatory Setting	3.2-3
3.2.2 Impact Analysis	3.2-7
3.2.2.1 Significance Criteria.....	3.2-7
3.2.2.2 Methodology	3.2-7
3.2.2.3 Project Impacts.....	3.2-7
3.2.2.4 Cumulative Impacts	3.2-19
3.3 Agriculture and Forestry Resources.....	3.3-1
3.3.1 Setting	3.3-1
3.3.1.1 Study Area.....	3.3-1
3.3.1.2 Environmental Setting	3.3-2
3.3.1.3 Regulatory Setting	3.3-7
3.3.2 Impact Analysis	3.3-10
3.3.2.1 Significance Criteria.....	3.3-10
3.3.2.2 Methodology	3.3-11
3.3.2.3 Project Impacts.....	3.3-11
3.3.2.4 Cumulative Impacts	3.3-19

Chapter 3, Environmental Setting, Impacts, and Mitigation Measures (continued)	
3.4 Air Quality.....	3.4-1
3.4.1 Setting.....	3.4-1
3.4.1.1 Study Area.....	3.4-1
3.4.1.2 Environmental Setting.....	3.4-1
3.4.1.3 Regulatory Setting.....	3.4-13
3.4.2 Impact Analysis.....	3.4-30
3.4.2.1 Significance Criteria.....	3.4-30
3.4.2.2 Methodology.....	3.4-30
3.4.2.3 Project Impacts.....	3.4-33
3.4.2.4 Cumulative Impacts.....	3.4-73
3.5 Biological Resources.....	3.5-1
3.5.1 Setting.....	3.5-1
3.5.1.1 Study Area.....	3.5-1
3.5.1.2 Environmental Setting.....	3.5-1
3.5.1.3 Regulatory Setting.....	3.5-11
3.5.2 Impact Analysis.....	3.5-15
3.5.2.1 Significance Criteria.....	3.5-15
3.5.2.2 Methodology.....	3.5-16
3.5.2.3 Project Impacts.....	3.5-16
3.5.2.4 Cumulative Impacts.....	3.5-27
3.6 Cultural Resources.....	3.6-1
3.6.1 Setting.....	3.6-1
3.6.1.1 Study Area.....	3.6-1
3.6.1.2 Environmental Setting.....	3.6-1
3.6.1.3 Identified Cultural Resources.....	3.6-7
3.6.1.4 Regulatory Setting.....	3.6-12
3.6.2 Impact Analysis.....	3.6-20
3.6.2.1 Significance Criteria.....	3.6-20
3.6.2.2 Methodology.....	3.6-21
3.6.2.3 Project Impacts.....	3.6-21
3.6.2.4 Cumulative Impacts.....	3.6-31
3.7 Energy.....	3.7-1
3.7.1 Setting.....	3.7-1
3.7.1.1 Study Area.....	3.7-1
3.7.1.2 Environmental Setting.....	3.7-1
3.7.1.3 Regulatory Setting.....	3.7-3
3.7.2 Impact Analysis.....	3.7-9
3.7.2.1 Significance Criteria.....	3.7-9
3.7.2.2 Methodology.....	3.7-9
3.7.2.3 Project Impacts.....	3.7-9
3.7.2.4 Cumulative Impacts.....	3.7-15
3.8 Geology and Soils.....	3.8-1
3.8.1 Setting.....	3.8-1
3.8.1.1 Study Area.....	3.8-1
3.8.1.2 Environmental Setting.....	3.8-1
3.8.1.3 Regulatory Setting.....	3.8-8
3.8.2 Impact Analysis.....	3.8-13
3.8.2.1 Significance Criteria.....	3.8-13
3.8.2.2 Methodology.....	3.8-14
3.8.2.3 Project Impacts.....	3.8-14
3.8.2.4 Cumulative Impacts.....	3.8-25

Chapter 4, Alternatives	4-1
4.1 Introduction to Alternatives.....	4-1
4.2 Alternatives Development and Screening	4-1
4.3 Alternatives Rejected from Detailed Consideration	4-3
4.3.1 Carbon Neutrality Target by 2045 Alternative.....	4-3
4.3.2 More Aggressive Timeline to Carbon Neutrality Alternative	4-4
4.3.3 Minimize Loss of Carbon Sequestration Caused by Development Alternative	4-5
4.3.4 Substantially Reduced Vehicle Miles Traveled Alternative	4-5
4.3.5 Aquatic Impact Avoidance Alternative	4-7
4.3.6 Complete Phase-Out of Oil and Gas Operations by 2030 Alternative	4-9
4.3.7 Limited-Scope CAP Alternative	4-10
4.4 Alternatives Evaluated in Detail in this EIR	4-11
4.4.1 No Project Alternative.....	4-11
4.4.2 Alternative 1: Carbon Offset Alternative	4-13
4.4.3 Alternative 2: Zero Net Energy Buildings Alternative	4-14
4.4.4 Alternative 3: Lower Targets Alternative.....	4-16
4.5 Comparative Analysis of Alternatives	4-20
4.6 Environmentally Superior Alternative	4-20
Chapter 5, Other CEQA Considerations	5-1
5.1 Introduction	5-1
5.2 Significant Unavoidable Impacts	5-1
5.3 Significant Irreversible Changes.....	5-2
5.4 Growth-Inducing Impacts	5-3
Chapter 6, Report Preparation	6-1
6.1 Lead Agency	6-1
6.2 Consultant	6-1
6.3 Subconsultants.....	6-2
6.4 Entities Consulted and Recipients of the Recirculated Draft PEIR and/or the Notice of Availability	6-2
Chapter 7, References	7-1
7.1 Executive Summary	7-1
7.2 Chapter 1, Introduction.....	7-2
7.3 Chapter 2, Project Description	7-2
7.4 Chapter 3, Environmental Setting, Impacts, and Mitigation Measures	7-4
7.4.1 Section 3.1, Introduction to Environmental Analysis.....	7-4
7.4.2 Section 3.2, Aesthetics.....	7-6
7.4.3 Section 3.3, Agriculture and Forestry	7-8
7.4.4 Section 3.4, Air Quality	7-8
7.4.5 Section 3.5, Biological Resources	7-13
7.4.6 Section 3.6, Cultural Resources	7-14
7.4.7 Section 3.7, Energy	7-18
7.4.8 Section 3.8, Geology and Soils	7-20
7.4.9 Section 3.9, Greenhouse Gas Emissions	7-23
7.4.10 Section 3.10, Hazards and Hazardous Materials	7-28
7.4.11 Section 3.11, Hydrology and Water Quality.....	7-31
7.4.12 Section 3.12, Land Use and Planning	7-34
7.4.13 Section 3.13, Noise	7-35
7.4.14 Section 3.14, Population and Housing	7-35

Chapter 7, References (continued)

7.4.15	Section 3.15, Transportation	7-36
7.4.16	Section 3.16, Tribal Cultural Resources	7-37
7.4.17	Section 3.17, Utilities and Service Systems	7-37
7.4.18	Section 3.18, Wildfire	7-38
7.5	Chapter 4, Alternatives.....	7-41
7.6	Chapter 5, Other CEQA Considerations	7-43
7.7	Chapter 6, Report Preparation	7-43

Appendices

Appendix A: Scoping

- A.1 Notice of Preparation
- A.2 Initial Study
- A.3 Newspaper Notifications
- A.4 Scoping Meeting Materials
- A.5 Scoping Input Received

Appendix B: Air Quality

Appendix C: Biological Resources

Appendix D: Greenhouse Gas Emissions

Appendix E: Noise

Appendix F: Transportation

Appendix G Tribal Cultural Resources

ZNE	zero net energy

EXECUTIVE SUMMARY

ES.1 Introduction

This recirculated draft program environmental impact report (PEIR) has been prepared in accordance with the California Environmental Quality Act (CEQA) (Public Resources Code Section 21000 et seq.) and its implementing regulations (CEQA Guidelines) (California Code of Regulations Title 14, Section 15000 et seq.). In accordance with Section 15168 of the CEQA Guidelines, this Recirculated Draft PEIR analyzes the environmental impacts that could result from implementation of the *Draft 2045 Los Angeles County Climate Action Plan* (Draft 2045 CAP or Project) and alternatives. This Recirculated Draft PEIR is an informational document whose purpose is not to recommend either approval or denial, but to inform agency decision-makers and the public about the environmental impacts of the Project at a program level.

The County of Los Angeles (County) issued a Draft PEIR for the Draft 2045 CAP on May 25, 2022. After the July 18, 2022 conclusion of the comment period for the Draft PEIR, the County elected to revise the Draft 2045 CAP in response to public and other input received, and to transition the 2045 CAP’s aspirational goal of carbon neutrality by 2045 into a target consistent with new legislation, Assembly Bill (AB) 1279. This Recirculated Draft PEIR describes changes to the Draft 2045 CAP in Chapter 2, Project Description, and analyzes the Project as revised. It also adds a new Alternative 3 that includes the minimum targets needed to “align” with California’s codified statewide targets for 2030 and 2045, includes other content to address issues raised by public comments on the Draft PEIR, and makes other minor clarifications. This Recirculated Draft PEIR wholly replaces the May 2022 Draft PEIR. See Section 1.4.3, Recirculated Draft Program EIR, for a list summarizing the types of changes the Recirculated Draft PEIR has made to the Draft PEIR.

The CEQA process includes public involvement at several steps, including consultation with California Native American Tribes consistent with Assembly Bill (AB) 52 (Public Resources Code Section 21080.3.1). AB 52 establishes a process for CEQA lead agencies to consult with tribes that are traditionally and culturally affiliated with a project area—here, the unincorporated areas of Los Angeles County. For this Project, the County also invited public involvement in the form of public review of the Draft 2045 CAP and as part of the CEQA scoping process. All resource areas in the CEQA Guidelines Appendix G Environmental Checklist have been analyzed either in the Initial Study (see Appendix A.2, *Initial Study*) or in Chapter 3, *Environmental Setting, Impacts, and Mitigation Measures*. A summary of the Draft 2045 CAP’s strategies and measures, and the environmental resource areas that could be affected by their adoption or by projects facilitating Draft 2045 CAP measures and actions, is provided in **Table ES-1, Summary of Draft 2045 CAP Measures and Affected Resource Areas**.

Informed by public involvement, the CEQA process includes preparation of this Recirculated Draft PEIR, which has been issued for public review and input, and preparation of a Final PEIR, which will respond to comments received on the Recirculated Draft PEIR and will revise the Recirculated Draft PEIR as appropriate. Comments on the May 2022 Draft PEIR, though part of the administrative record, will not be responded to in the Final PEIR; new comments must be submitted on the Recirculated Draft PEIR. Following release of the Final PEIR, the Regional Planning Commission will then consider recommending whether the County Board of Supervisors should certify the Final PEIR and approve the 2045 CAP, following which the Board of Supervisors will consider Final PEIR certification and 2045 CAP approval.

The County will consider the Final EIR, along with other information in the administrative record, when it decides whether to approve the Project, approve it with modifications, or disapprove the Project. Other agencies also may rely on this document in decision-making processes for later projects facilitated by the Draft 2045 CAP. For additional details, see Section 2.9, *Required Approvals: Environmental Review and Consultation Requirements*, in Chapter 2, *Project Description*.

**TABLE ES-1
SUMMARY OF DRAFT 2045 CAP MEASURES AND AFFECTED RESOURCE AREAS**

Draft 2045 CAP Strategies and Measures	Implementing Actions and Primarily Affected Resource Areas
Strategy 1: Decarbonize the Energy Supply	
Measure ES1: Develop a Sunset Strategy for All Oil and Gas Operations	<p>Air Quality:</p> <ul style="list-style-type: none"> • Action ES1.2 - Develop a policy that requires the examination of all active, idle, and abandoned oil wells for fugitive emissions of GHGs. Coordinate with federal and state agencies conducting fugitive emissions data. <p>Energy:</p> <ul style="list-style-type: none"> • Action ES1.1 - Collaborate with other local jurisdictions and utilities to develop a sunset strategy for all oil and gas operations that prioritizes disproportionately affected communities. Develop an ordinance. • Action ES1.2 - Develop a policy that requires the examination of all active, idle, and abandoned oil wells for fugitive emissions of GHGs. Coordinate with federal and state agencies conducting fugitive emissions data. <p>GHG Emissions:</p> <ul style="list-style-type: none"> • Action ES1.3 - Develop a carbon removal strategy that considers direct air capture and carbon capture and sequestration (CCS). • Action ES1.2 - Develop a policy that requires the examination of all active, idle, and abandoned oil wells for fugitive emissions of GHGs. Coordinate with federal and state agencies conducting fugitive emissions data. <p>Land Use and Planning:</p> <ul style="list-style-type: none"> • Action ES1.1 - Collaborate with other local jurisdictions and utilities to develop a sunset strategy for all oil and gas operations that prioritizes disproportionately affected communities. Develop an ordinance.
Measure ES2: Procure Zero-Carbon Electricity	<p>Energy:</p> <ul style="list-style-type: none"> • Action ES2.1 - Transition all County facilities within unincorporated areas to CPA's 100% Green Power option, SCE's 100% Green Rate option, or other available 100% renewable electricity service. • Action ES2.2 – Complete enrollment of the community in CPA's 100% Green Power option or SCE's Green Rate option. <p>Air Quality:</p> <ul style="list-style-type: none"> • Action ES2.2 – Complete enrollment of the community in CPA's 100% Green Power option or SCE's Green Rate option. <p>GHG Emissions:</p> <ul style="list-style-type: none"> • Action ES2.2 – Complete enrollment of the community in CPA's 100% Green Power option or SCE's Green Rate option.
Measure ES3: Increase Renewable Energy Production	<p>Energy:</p> <ul style="list-style-type: none"> • Action ES3.1 - Require rooftop solar PV for all new development. • Action ES3.2 - Install rooftop solar PV at existing buildings. • Action ES3.3 - Identify and install solar PV systems at existing viable County facilities and properties. • Action ES3.4 - Explore the feasibility to install community-shared solar facilities on County properties where opportunities exist. • Action ES3.5 - Require and incentivize renewable energy for affordable housing developments for both new development and existing buildings. • Action ES3.6 - Streamline and prioritize permitting for solar and battery storage projects.

TABLE ES-1 (CONTINUED)
SUMMARY OF DRAFT 2045 CAP MEASURES AND AFFECTED RESOURCE AREAS

Draft 2045 CAP Strategies and Measures	Implementing Actions and Primarily Affected Resource Areas
Strategy 1: Decarbonize the Energy Supply (cont.)	
Measure ES3 (cont.)	<p>GHG Emissions:</p> <ul style="list-style-type: none"> • Action ES3.1 - Require rooftop solar PV for all new development. • Action ES3.2 - Install rooftop solar PV at existing buildings. • Action ES3.3 - Identify and install solar PV systems at existing viable County facilities and properties. <p>Population and Housing:</p> <ul style="list-style-type: none"> • Action ES3.4 - Explore the feasibility to install community-shared solar facilities on County properties where opportunities exist. • Action ES3.5 - Require and incentivize renewable energy for affordable housing developments for both new development and existing buildings. • Action ES3.6 - Streamline and prioritize permitting for solar and battery storage projects.
Measure ES4: Increase Energy Resilience	<p>Energy:</p> <ul style="list-style-type: none"> • Action ES4.2 - Invest in energy storage and microgrids at critical County facilities through CPA’s Power Ready Program. • Action ES4.4 - Conduct feasibility studies to identify priority areas for solar and storage, combined with building- and community-scale microgrids and alternative technologies such as fuel cells and grid paralleling, to support demand management, peak shaving, and load shifting to increase grid resilience. Study implementation, costs, barriers, and obstacles and identify partnerships. Adopt regulations that establish this use and standards for its development. Limiting peak energy demand can eliminate or reduce the use of high-carbon peaker plants. <p>Hazards and Hazardous Materials:</p> <ul style="list-style-type: none"> • Action ES4.1 - Develop a program to deploy community resilience hubs at scale. • Action ES4.3 - Develop a publicly accessible community energy map that identifies opportunities for deploying distributed energy resources and microgrids to improve energy resiliency. • Action ES4.4 - Conduct feasibility studies to identify priority areas for solar and storage, combined with building- and community-scale microgrids and alternative technologies such as fuel cells and grid paralleling, to support demand management, peak shaving, and load shifting to increase grid resilience. Study implementation, costs, barriers, and obstacles and identify partnerships. Adopt regulations that establish this use and standards for its development. Limiting peak energy demand can eliminate or reduce the use of high-carbon peaker plants. • Action ES4.5 - Develop a Countywide program to promote energy efficiency and resilience measures in facilities providing critical community services.
Measure ES5: Establish GHG Requirements for New Development	<p>Energy:</p> <ul style="list-style-type: none"> • Action ES5.1 - Identify new requirements for new development, including reach codes, ordinances, and conditions of approval to reduce GHG emissions from energy use, transportation, waste, water, and other sources. Include affordable housing considerations in these requirements, and develop supporting measures (financial support, technical assistance, or other incentives) to defray potential additional first costs in order to maintain housing affordability. <p>GHG Emissions:</p> <ul style="list-style-type: none"> • Action ES5.1 - Identify new requirements for new development, including reach codes, ordinances, and conditions of approval to reduce GHG emissions from energy use, transportation, waste, water, and other sources. Include affordable housing considerations in these requirements, and develop supporting measures (financial support, technical assistance, or other incentives) to defray potential additional first costs in order to maintain housing affordability. • Action ES5.3 - Evaluate a program for reducing GHG emissions for new development that require General Plan amendments. • Action ES5.4 - Establish an Offsite GHG Reduction Program for new development to use as a GHG reduction or mitigation pathway for 2045 CAP compliance and to fund programs for reducing GHG emissions in the built environment.

**TABLE ES-1 (CONTINUED)
SUMMARY OF DRAFT 2045 CAP MEASURES AND AFFECTED RESOURCE AREAS**

Draft 2045 CAP Strategies and Measures	Implementing Actions and Primarily Affected Resource Areas
Strategy 1: Decarbonize the Energy Supply (cont.)	
Measure ES5 (cont.)	<p>Population and Housing:</p> <ul style="list-style-type: none"> • Action ES5.1 - Identify new requirements for new development, including reach codes, ordinances, and conditions of approval to reduce GHG emissions from energy use, transportation, waste, water, and other sources. Include affordable housing considerations in these requirements, and develop supporting measures (financial support, technical assistance, or other incentives) to defray potential additional first costs in order to maintain housing affordability. <p>Land Use and Planning:</p> <ul style="list-style-type: none"> • Action ES5.1 - Identify new requirements for new development, including reach codes, ordinances, and conditions of approval to reduce GHG emissions from energy use, transportation, waste, water, and other sources. Include affordable housing considerations in these requirements, and develop supporting measures (financial support, technical assistance, or other incentives) to defray potential additional first costs in order to maintain housing affordability. • Action ES5.2 - Implement the 2045 CAP consistency review checklist for new development to demonstrate consistency with the 2045 CAP's strategies, measures, and actions. • Action ES5.3 - Evaluate a program for reducing GHG emissions for new development that require General Plan amendments. • Action ES5.4 - Establish an Offsite GHG Reduction Program for new development to use as a GHG reduction or mitigation pathway for 2045 CAP compliance and to fund programs for reducing GHG emissions in the built environment.
Strategy 2: Increase Densities and Diversity of Land Uses Near Transit	
Measure T1: Increase Density Near High-Quality Transit Areas	<p>Land Use and Planning:</p> <ul style="list-style-type: none"> • Action T1.1 - Incentivize residential and community-serving uses to be developed in high quality transit areas (HQTAs), while ensuring inclusion of vital public amenities, such as parks and active transportation infrastructure. <p>Population and Housing:</p> <ul style="list-style-type: none"> • Action T1.1 - Incentivize residential and community-serving uses to be developed in high quality transit areas (HQTAs), while ensuring inclusion of vital public amenities, such as parks and active transportation infrastructure. • Action T1.2 - Develop land use tools that will increase the production of a diversity of housing types, such as missing middle housing.
Measure T2: Develop Land Use Plans Addressing Jobs-Housing Balance and Increase Mixed Use	<p>Population and Housing:</p> <ul style="list-style-type: none"> • Action T2.1 - Develop community plans that will increase the percentage of residents who could live and work within the same community, and that could decrease VMT. <p>Transportation:</p> <ul style="list-style-type: none"> • Action T2.1 - Develop community plans that will increase the percentage of residents who could live and work within the same community, and that could decrease VMT.

**TABLE ES-1 (CONTINUED)
SUMMARY OF DRAFT 2045 CAP MEASURES AND AFFECTED RESOURCE AREAS**

Draft 2045 CAP Strategies and Measures	Implementing Actions and Primarily Affected Resource Areas
Strategy 3: Reduce Single-Occupancy Vehicle Trips	
Measure T3: Expand Bicycle and Pedestrian Network to Serve Residential, Employment, and Recreational Trips	Aesthetics: <ul style="list-style-type: none"> • Action T3.3 - Collaborate with Metro and other transit providers to enhance pedestrian and bicycle environments through energy efficient lighting and shading to promote active transportation. Build shade structures at major transit stops, such as those identified in Metro's Active Transportation Strategic Plan, prioritizing communities with high heat vulnerability. Develop and implement a Shaded Corridors Program. Transportation: <ul style="list-style-type: none"> • Action T3.1 - Create a more connected and safer bikeway network by expanding bikeway facilities and implementing protected and separated lanes. • Action T3.2 - Implement and regularly update the County's Pedestrian Action Plan, Bicycle Master Plan, and Active Transportation Plans. • Action T3.3 - Collaborate with Metro and other transit providers to enhance pedestrian and bicycle environments through energy efficient lighting and shading to promote active transportation. Build shade structures at major transit stops, such as those identified in Metro's Active Transportation Strategic Plan, prioritizing communities with high heat vulnerability. Develop and implement a Shaded Corridors Program.
Measure T4: Broaden Options for Transit, Active Transportation, and Alternative Modes of Transportation	Transportation: <ul style="list-style-type: none"> • Action T4.1 - Expand and improve the frequency of service of unincorporated Los Angeles County shuttles and explore new mobility services, such as micro transit, autonomous delivery vehicles, micro mobility, and on-demand autonomous shuttles. • Action T4.2 - Collaborate with Metro and other transit providers to install bus-only lanes and/or signal prioritization along major thoroughfares, and work with transit agencies and neighboring jurisdictions to plan and install full bus rapid transit infrastructure along priority corridors, as appropriate. • Action T4.3 - Collaborate with Metro and other transit providers to develop a transportation technology strategy to proactively address how evolving tech-enabled mobility options can support public transit. • Action T4.4 - Collaborate with Metro and other transit providers to set aside maintenance funds to ensure that public transit facilities, including stations and stops, are safe and clean to enhance the transit experience and increase ridership. • Action T4.5 - Collaborate with Metro and other transit providers to develop and implement a transportation demand management (TDM) ordinance that requires future development projects to incorporate measures such as subsidized transit passes and car share. • Action T4.6 - Offer free and/or discounted transit passes for students, youth, seniors, people with disabilities, and low-income populations. • Action T4.7 - Expand and improve the County's Telecommuting Policy, using data gathered through the alternative work program. • Action T4.8 - Establish temporary and permanent car-free areas. • Action T4.9 - Develop a VMT bank or exchange program. • Action T4.10 - Collaborate with Metro and other transit providers to ensure that all new forms of public transportation (e.g., new bus lines, new light rail service) are low- or zero-emission.
Measure T5: Limit and Remove Parking Minimums	Transportation: <ul style="list-style-type: none"> • Action T5.1 - Implement a comprehensive parking reform strategy, which should include, but not be limited to: elimination of minimum parking requirements for all new residential units, establishment of parking maximums within one-half mile of high-quality transit stops, creation and expansion of parking benefit districts, development of planning strategies for transitioning land dedicated to parking to alternative transit and public uses, and incentives for developers to provide less than maximum allowable parking.

TABLE ES-1 (CONTINUED)
SUMMARY OF DRAFT 2045 CAP MEASURES AND AFFECTED RESOURCE AREAS

Draft 2045 CAP Strategies and Measures	Implementing Actions and Primarily Affected Resource Areas
Strategy 4: Institutionalize Low-Carbon Transportation	
Measure T6: Increase ZEV Market Share and Reduce Gasoline and Diesel Fuel Sales	<p>Air Quality:</p> <ul style="list-style-type: none"> • Action T6.1 - Develop a Zero Emission Vehicle Master Plan. Collaborate with other regional agencies and jurisdictions to share infrastructure. • Action T6.2 - Install EVCSs at existing buildings and right-of-way infrastructure throughout unincorporated Los Angeles County • Action T6.3 - Require all new development to install EVCSs through a condition of approval/ordinance. Residential development must install EVCSs; nonresidential development must install EVCSs at a percentage of total parking spaces. • Action T6.4 - Install EVCSs at County facilities and properties for public, employee, and fleet use, prioritizing locations in frontline, BIPOC, and disadvantaged communities. Complete an assessment of EV charging locations, identifying gaps in publicly accessible stations for frontline, BIPOC, and disadvantaged communities. Provide EV purchase incentive information in multiple languages to frontline communities. • Action T6.5 - Continue to pilot vehicle-grid integration applications at workplaces to maximize the benefits that daytime charging for plug-in electric vehicles (PEVs) can have on the grid, including demand response to reduce peak loads and energy storage during periods of renewable overproduction. • Action T6.6 - Expand electric options for active transportation, such as electric scooters and e-bikes. Provide access to neighborhood electric vehicles, such as golf carts, shared EVs, and others. Develop policies and/or ordinances to expand these options. • Action T6.7 - Increase the use of green hydrogen vehicles. Use biomethane and biogas created from organic waste as a "bridge fuel" to achieve 100% green hydrogen and electric vehicles. Consider the use of other zero-emission fuel sources. <p>Energy:</p> <ul style="list-style-type: none"> • Action T6.2 - Install EVCSs at existing buildings and right-of-way infrastructure throughout unincorporated Los Angeles County. • Action T6.5 - Continue to pilot vehicle-grid integration applications at workplaces to maximize the benefits that daytime charging for plug-in electric vehicles (PEVs) can have on the grid, including demand response to reduce peak loads and energy storage during periods of renewable overproduction. • Action T6.7 - Increase the use of green hydrogen vehicles. Use biomethane and biogas created from organic waste as a "bridge fuel" to achieve 100% green hydrogen and electric vehicles. Consider the use of other zero-emission fuel sources. <p>GHG Emissions:</p> <ul style="list-style-type: none"> • Action T6.1 - Develop a Zero Emission Vehicle Master Plan. Collaborate with other regional agencies and jurisdictions to share infrastructure. • Action T6.2 - Install EVCSs at existing buildings and right-of-way infrastructure throughout unincorporated Los Angeles County • Action T6.3 - Require all new development to install EVCSs through a condition of approval/ordinance. Residential development must install EVCSs; nonresidential development must install EVCSs at a percentage of total parking spaces. • Action T6.4 - Install EVCSs at County facilities and properties for public, employee, and fleet use, prioritizing locations in frontline, BIPOC, and disadvantaged communities. Complete an assessment of EV charging locations, identifying gaps in publicly accessible stations for frontline, BIPOC, and disadvantaged communities. Provide EV purchase incentive information in multiple languages to frontline communities. • Action T6.5 - Continue to pilot vehicle-grid integration applications at workplaces to maximize the benefits that daytime charging for plug-in electric vehicles (PEVs) can have on the grid, including demand response to reduce peak loads and energy storage during periods of renewable overproduction. • Action T6.6 - Expand electric options for active transportation, such as electric scooters and e-bikes. SUMMARY OF DRAFT 2045 CAP MEASURES AND AFFECTED RESOURCE AREAS**

Draft 2045 CAP Strategies and Measures	Implementing Actions and Primarily Affected Resource Areas
Strategy 4: Institutionalize Low-Carbon Transportation (cont.)	
<p>Measure T9: Expand Use of Zero-Emission Technologies for Off-Road Vehicles and Equipment</p>	<p>Air Quality:</p> <ul style="list-style-type: none"> • Action T9.1 - Partner with the South Coast Air Quality Management District and Antelope Valley Air Quality Management District to increase the use of zero-emission and near-zero-emission construction, agriculture, and manufacturing equipment. • Action T9.2 - Identify types of ZEV equipment and green hydrogen equipment that are commercially available (e.g., forklifts, loaders, welders, saws, pumps, fixed cranes, air compressors, sweepers, aerial lifts, pressure washers) and require the use of these types of equipment on all new projects through an ordinance or conditions of approval. • Action T9.3 - Require, to the maximum extent feasible, the use of zero-emission and near-zero-emission construction, agriculture, and manufacturing equipment for County projects. <p>Hydrology and Water Quality:</p> <ul style="list-style-type: none"> • Action T9.2 - Identify types of ZEV equipment and green hydrogen equipment that are commercially available (e.g., forklifts, loaders, welders, saws, pumps, fixed cranes, air compressors, sweepers, aerial lifts, pressure washers) and require the use of these types of equipment on all new projects through an ordinance or conditions of approval. <p>Utilities and Service Systems:</p> <ul style="list-style-type: none"> • Action T9.2 - Identify types of ZEV equipment and green hydrogen equipment that are commercially available (e.g., forklifts, loaders, welders, saws, pumps, fixed cranes, air compressors, sweepers, aerial lifts, pressure washers) and require the use of these types of equipment on all new projects through an ordinance or conditions of approval.
Strategy 5: Decarbonize Buildings	
<p>Measure E1: Transition Existing Buildings to All-Electric</p>	<p>Energy:</p> <ul style="list-style-type: none"> • Action E1.1 – Adopt Building Performance Standards for existing buildings and reach code requirements for major retrofits and renovations that require electric water and space heating. Require buildings to retrofit natural gas water and space heating to electric water and space heating at the point of sale. • Action E1.2 – Increase alternatives to natural gas uses, such as for cooking, in existing buildings. Establish carbon intensity limits for existing nonresidential and residential buildings over a certain size. • Action E1.3 – Adopt a ZNE ordinance for building renovations, based on certain criteria (such as commercial facilities with 10,000 square feet of additions). Adopt ZNE Building Performance Standards for certain buildings not undergoing major renovations or retrofits. • Action E1.4 – Create a plan for phased electrification of County facilities. Phase out gas-powered infrastructure and appliances as they need replacement. <p>Land Use and Planning:</p> <ul style="list-style-type: none"> • Action E1.1 – Adopt Building Performance Standards for existing buildings and reach code requirements for major retrofits and renovations that require electric water and space heating. Require buildings to retrofit natural gas water and space heating to electric water and space heating at the point of sale. • Action E1.3 – Adopt a ZNE ordinance for building renovations, based on certain criteria (such as commercial facilities with 10,000 square feet of additions). Adopt ZNE Building Performance Standards for certain buildings not undergoing major renovations or retrofits. <p>Population and Housing:</p> <ul style="list-style-type: none"> • Action E1.5 – Create a comprehensive fund aggregation program to support energy efficiency, decarbonization, and resilience in new and existing affordable housing. • Action E1.6 – Create and resource an energy retrofit accelerator to provide a one-stop shop for guidance, technical support, training, and access to aggregated funds to support building owners and contractors. Target support to low-income communities and affordable housing.

**TABLE ES-1 (CONTINUED)
SUMMARY OF DRAFT 2045 CAP MEASURES AND AFFECTED RESOURCE AREAS**

Draft 2045 CAP Strategies and Measures	Implementing Actions and Primarily Affected Resource Areas
Strategy 5: Decarbonize Buildings (cont.)	
Measure E1 (cont.)	<p>Utilities and Service Systems:</p> <ul style="list-style-type: none"> • Action E1.1 – Adopt Building Performance Standards for existing buildings and reach code requirements for major retrofits and renovations that require electric water and space heating. Require buildings to retrofit natural gas water and space heating to electric water and space heating at the point of sale. • Action E1.2 – Increase alternatives to natural gas uses, such as for cooking, in existing buildings. SUMMARY OF DRAFT 2045 CAP MEASURES AND AFFECTED RESOURCE AREAS**

Draft 2045 CAP Strategies and Measures	Implementing Actions and Primarily Affected Resource Areas
Strategy 8: Minimize Waste and Recover Energy and Materials from the Waste Stream	
Measure W1: Institutionalize Sustainable Waste Systems and Practices	<p>Hazards and Hazardous Materials:</p> <ul style="list-style-type: none"> • <u>Action W1.1</u> – Identify best practice waste pricing programs to reduce waste generation to the maximum extent feasible, including but not limited to differential prices for waste based on amount generated in the residential sector and reforms to tipping rate structures. • <u>Action W1.2</u> – Implement, enforce, and expand to the maximum extent feasible the single-use plastics ordinance and polystyrene ban. <p>Utilities and Service Systems:</p> <ul style="list-style-type: none"> • <u>Action W1.3</u> – Increase the diversion requirements in the County’s Construction and Demolition Debris Ordinance and allow the use of recycled construction materials in new projects.
Measure W2: Increase Organic Waste Diversion	<p>Land Use and Planning:</p> <ul style="list-style-type: none"> • <u>Action W2.1</u> – Require organic waste generators to properly manage organic waste as per the Organic Waste Disposal Reduction Ordinance. Improve upon and expand existing practices and programs to minimize organic waste disposal in landfills. • <u>Action W2.2</u> – Develop organic waste collection, management, and diversion programs for constituents in unincorporated communities and all County operations; establish a contamination monitoring plan for organic waste programs. • <u>Action W2.3</u> – Collaborate with the Los Angeles County Sanitation Districts and other waste and wastewater service providers to utilize unused anaerobic digestion capacity of existing wastewater treatment plants and solid waste facilities to generate vehicle fuel (electricity and/or biomethane) from newly diverted organic waste. Develop a strategy for using bioenergy created from recycled organic waste. <p>Utilities and Service Systems:</p> <ul style="list-style-type: none"> • <u>Action W2.2</u> – Develop organic waste collection, management, and diversion programs for constituents in unincorporated communities and all County operations; establish a contamination monitoring plan for organic waste programs. • <u>Action W2.3</u> – Collaborate with the Los Angeles County Sanitation Districts and other waste and wastewater service providers to utilize unused anaerobic digestion capacity of existing wastewater treatment plants and solid waste facilities to generate vehicle fuel (electricity and/or biomethane) from newly diverted organic waste. Develop a strategy for using bioenergy created from recycled organic waste. • <u>Action W2.5</u> – Enhance and expand the County’s existing Food DROP food donation and redistribution program to divert edible food from landfills and make it available to food insecure communities.
Strategy 9: Conserve and Connect Wildlands and Working Lands	
Measure A1: Conserve Forests, Woodlands, Shrublands, Grasslands, Desert, and Other Carbon-Sequestering Wildlands and Working Lands	<p>Agriculture and Forestry:</p> <ul style="list-style-type: none"> • <u>Action A1.1</u> – Develop an open space conservation and land acquisition strategy that prioritizes wildlife connectivity to conserve native habitats for carbon sequestration. • <u>Action A1.2</u> – Employ ecosystem-appropriate vegetation management of wildlands based on the best available science to reduce unintended human ignitions and wildfire risk and prevent carbon loss in forest lands. Leverage tools such as the Unified Land Management Plan and the Countywide Community Wildfire Prevention Plan. <p>Wildfire:</p> <ul style="list-style-type: none"> • <u>Action A1.2</u> – Employ ecosystem-appropriate vegetation management of wildlands based on the best available science to reduce unintended human ignitions and wildfire risk and prevent carbon loss in forest lands. Leverage tools such as the Unified Land Management Plan and Countywide Community Wildfire Prevention Plan.

**TABLE ES-1 (CONTINUED)
SUMMARY OF DRAFT 2045 CAP MEASURES AND AFFECTED RESOURCE AREAS**

Draft 2045 CAP Strategies and Measures	Implementing Actions and Primarily Affected Resource Areas
Strategy 10: Sequester Carbon and Implement Sustainable Agriculture	
Measure A2: Support Regenerative Agriculture	<p>Agriculture and Forestry:</p> <ul style="list-style-type: none"> • <u>Action A2.1</u> – Create fallow and field resting incentives to reduce bare-fallow land by adding cover crops and promoting crop rotation for active agricultural sites to improve soil quality and limit risks of nutrient erosion, pollutant runoff, and yield reduction. Create a carbon farming plan with the primary objectives of carbon removal and regenerative agriculture. • <u>Action A2.2</u> – Provide compost and/or organic or nonsynthetic fertilizer to farmers free of charge or at a discounted rate. <p>Utilities and Service Systems:</p> <ul style="list-style-type: none"> • <u>Action A2.2</u> – Provide compost and/or organic or nonsynthetic fertilizer to farmers free of charge or at a discounted rate.
Measure A3: Expand Unincorporated Los Angeles County’s Tree Canopy and Green Spaces	<p>Agriculture and Forestry Resources:</p> <ul style="list-style-type: none"> • <u>Action A3.1</u> – Create and implement an equitable Urban Forest Management Plan that prioritizes: (1) tree- and parks-poor communities; (2) climate- and watershed-appropriate and drought/pest-resistant vegetation; (3) appropriate watering, maintenance, and disposal practices; (4) provision of shade; and (5) biodiversity. • <u>Action A3.2</u> - Expand tree planting on County property and in the public right-of-way within unincorporated Los Angeles County. Encourage tree planting on private property. • <u>Action A3.3</u>– Develop an ordinance requiring that all removed trees be replaced by an equal or greater number of new trees.

NOTES:

BIPOC = Black, Indigenous, People of Color; CALGreen Code = California Green Building Standards Code; CCS = capture and carbon and sequestration; Countywide = Los Angeles County in its entirety, inclusive of both unincorporated areas and all 88 incorporated cities; CPA = Clean Power Alliance; Draft 2045 CAP = *Draft 2045 Los Angeles County Climate Action Plan*; EV = electric vehicle; EVCS = electric vehicle charging station; GHG = greenhouse gas; GWP = global warming potential; County = County of Los Angeles; LACSD = Los Angeles County Sanitation Districts; LEED = Leadership in Energy and Environmental Design; Metro = Los Angeles County Metropolitan Transportation Authority; PEV = plug-in electric vehicle; PV = photovoltaic; SCE = Southern California Edison; SITES = Sustainable SITES Initiative; SoCalREN = Southern California Regional Energy Network; TDM = Transportation Demand Management; VMT = vehicle miles traveled

SOURCE: Draft 2045 CAP

ES.2 Project Summary

ES.2.1 Project Overview

Approval of the Draft 2045 CAP would require an amendment to the *Los Angeles County General Plan 2035* (General Plan) to replace the *Unincorporated Los Angeles County Community Climate Action Plan 2020* (2020 CCAP), an implementing component of the General Plan's Air Quality Element.

In early 2020, the Los Angeles County Department of Regional Planning released a public discussion draft of the Draft 2045 CAP. After receiving significant comments from stakeholders, the County determined the need to substantially revise and update the public discussion draft. Revisions to the public discussion draft that are reflected in the Draft 2045 CAP include the following:

- An updated greenhouse gas (GHG) emissions inventory for 2018.
- New emissions forecasts for 2030, 2035, and 2045.
- New GHG emissions targets for 2030, 2035, and 2045.
- A revised suite of GHG emissions reduction strategies, measures, and actions in response to public comments to be more clear, specific, feasible, and quantifiable.
- A technical modeling appendix to explain the Draft 2045 CAP's GHG emissions reduction estimates.
- A consideration of environmental justice and equity concerns.
- A new development review consistency checklist to allow projects to streamline CEQA compliance by using the Draft 2045 CAP, per CEQA Guidelines Section 15183.5.
- An offsite GHG emissions reduction program to allow project applicants to fund or implement local projects that reduce GHG emissions within unincorporated Los Angeles County.

ES.2.2 Project Objectives

From Executive Order S-3-05, which expressed the intent of the State of California in 2005 to address the issue of climate change through reducing GHGs, to AB 32 and other more recent legislative and other governmental actions, two things are clear: (1) Preventing or mitigating climate change is a key component of the state's sustainable future, and (2) local governments play a key role in reducing communitywide emissions with their control over local land use planning. In 2016, for example, Senate Bill (SB) 32 and its companion bill, AB 197, established a new statewide GHG emissions reduction target of 40 percent below 1990 levels by 2030 and included provisions to ensure that the benefits of state climate policies accrue to disadvantaged communities.

In response to the state’s efforts, the County is preparing the Draft 2045 CAP with the following objectives:

- (1) Identify detailed programs, actions, and performance goals to achieve the climate action policies of the General Plan.
- (2) Identify GHG emissions reduction targets tailored to the unincorporated County that closely align with state and County climate goals.
- (3) Provide a road map for reducing GHG emissions to achieve the County’s GHG emissions reduction targets.
- (4) Encourage sustainable housing production at all levels of affordability, including increasing housing densities near transit to the extent allowed in the General Plan.
- (5) Demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects (serve as a “qualified CAP”) via a Draft 2045 CAP Consistency Checklist.

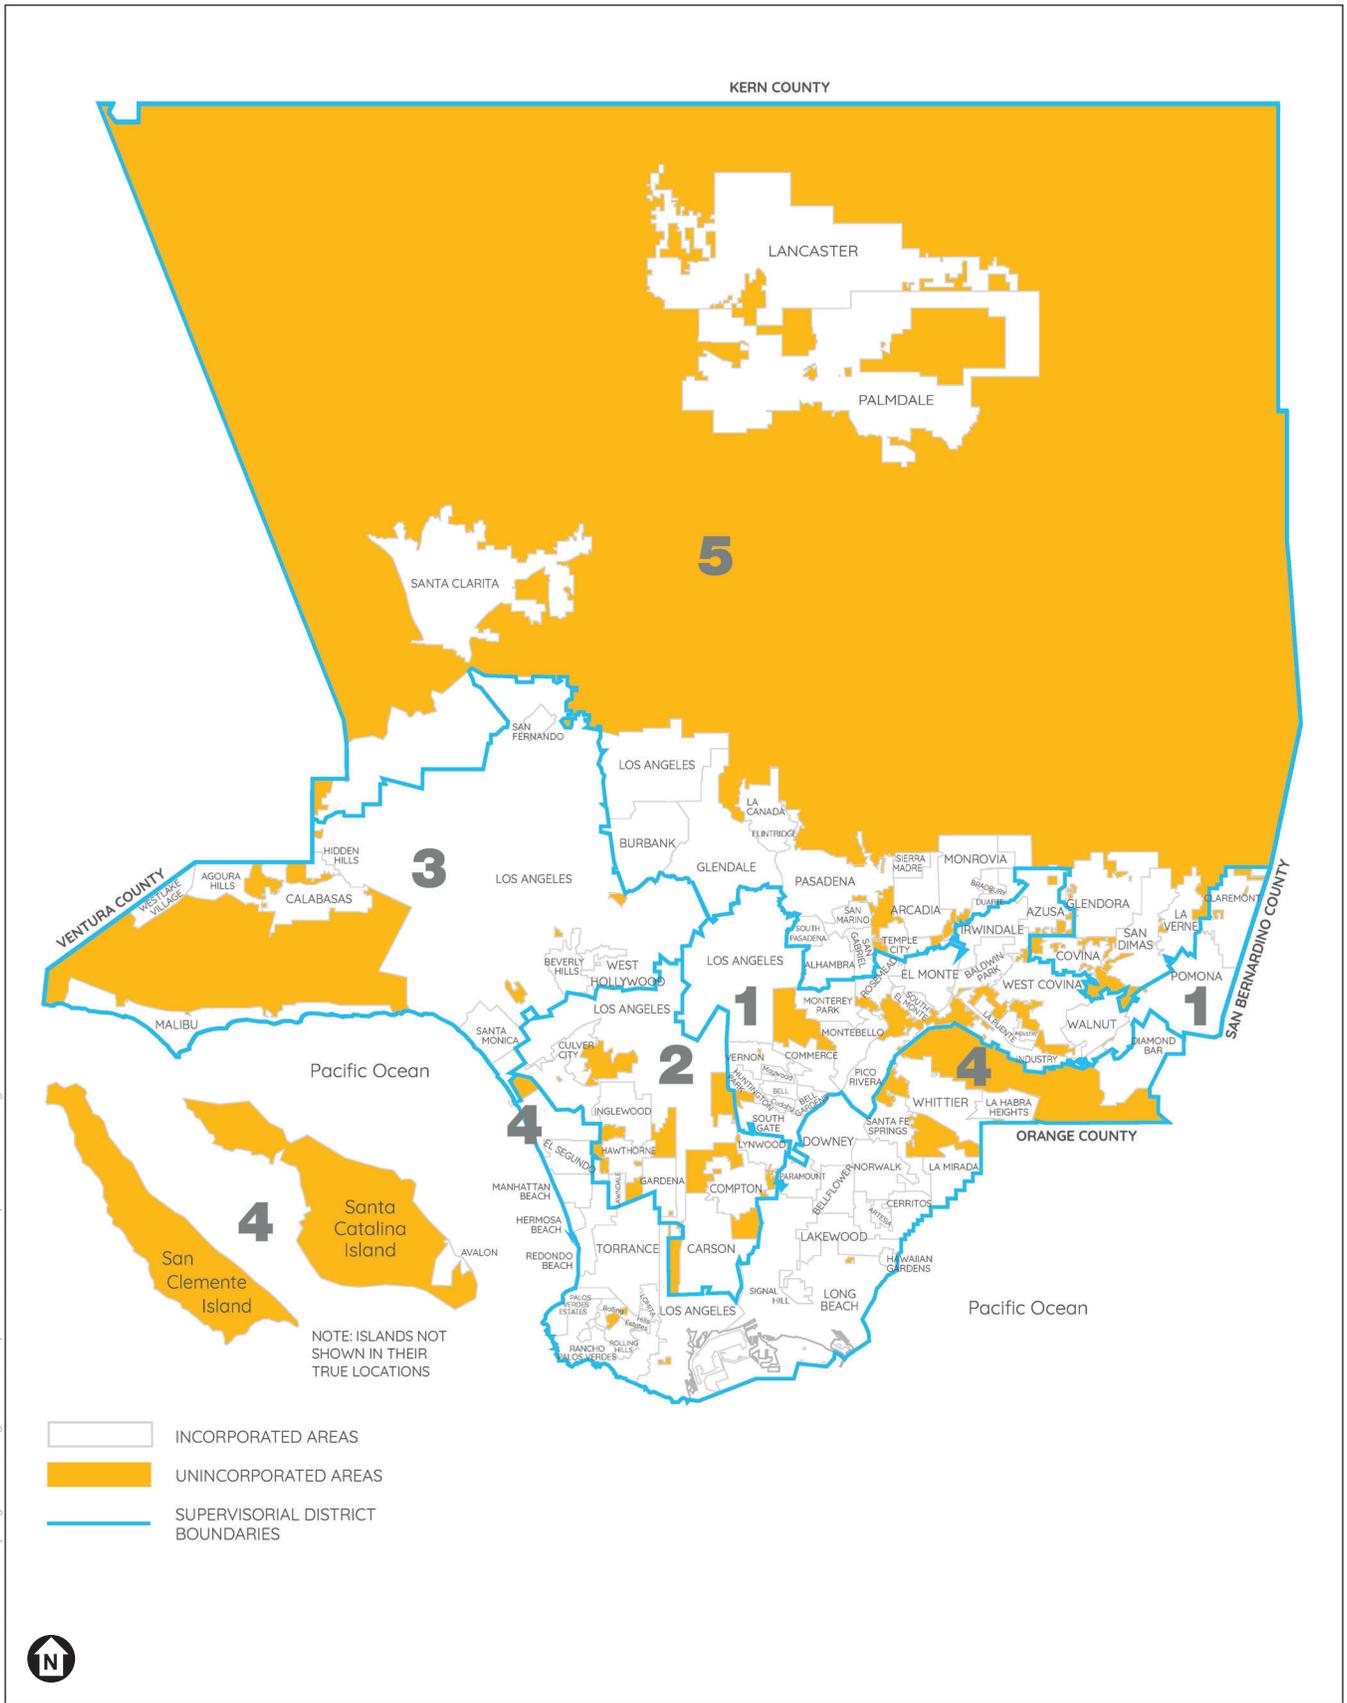

ES.2.3 Project Location

Los Angeles County stretches along 75 miles of the Pacific coast of Southern California. It is bordered to the south by Orange County, to the east by San Bernardino County, to the north by Kern County, and to the west by Ventura County. Los Angeles County includes two offshore islands: Santa Catalina Island and San Clemente Island. The Draft 2045 CAP would be implemented in all unincorporated areas of the County, which make up an approximately 1,696,000-acre (approximately 2,650-square-mile) area that is approximately 65 percent of the total land area of Los Angeles County. See **Figure ES-1, Map of Unincorporated Los Angeles County**.

The unincorporated areas in the northern portion of Los Angeles County include Angeles National Forest, parts of Los Padres National Forest and the Mojave Desert, and the Antelope Valley. In the western portion of the county, the unincorporated areas include Marina del Rey and the Santa Monica Mountains. The unincorporated areas in the southern and eastern portions consist of noncontiguous land areas including unincorporated areas in South Los Angeles, East Los Angeles, and the San Gabriel Valley.

ES.3 Project Impacts and Mitigation Measures

Section 3.1, *Introduction to Environmental Analysis*, in Chapter 3 introduces key topics and concepts to establish a common understanding of the approach to the environmental analysis undertaken in this PEIR. Sections 3.2 through 3.18 provide an overview of the setting; analyze the impacts of the Project; and identify mitigation measures designed to reduce potential significant impacts below established thresholds.

SOURCE: Los Angeles County Climate Action Plan
March 2020 Public Review Draft

Los Angeles County 2045 Climate Action Plan (2045 CAP)

Figure ES-1
Map of Unincorporated Los Angeles County

ES 3.1 Impacts and Mitigation Measures

Table ES-2, *Summary of Impacts and Mitigation Measures*, summarizes the Draft 2045 CAP's environmental impacts, lists mitigation measures for significant impacts, and for each impact indicates levels of significance after mitigation. The identification of a significant and unavoidable program-level impact in this PEIR does not preclude the finding of a future less-than-significant impact for individual projects that may tier from the PEIR.

None of the proposed measures or actions indicate locations where individual projects would be constructed, their size, or their specific characteristics, because the locations and design specifics of projects that would facilitate the Draft 2045 CAP measures and actions are unknown at this time. Mitigation measures to reduce impacts would apply only if specific projects have potentially significant impacts.

**TABLE ES-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Aesthetics		
<p>Impact 3.2-1: Projects facilitated by the Draft 2045 CAP would have a substantial adverse effect on a scenic vista.</p>	<p>Mitigation Measure 3.2-1: Alternative Design. Projects facilitated by the Draft 2045 CAP that would obstruct views from publicly-accessible vantage points as defined in this analysis (such as from a vista point or a regional riding, hiking, or multiuse trail) shall identify and protect public views and significant landscape features or landforms visible from such views, and shall implement project-specific mitigation as applicable. If it is determined that a project would obstruct scenic views, the County shall consider alternative designs that seek to avoid and/or minimize these impacts. Project-specific design measures may include reduction in height of improvements or width of improvements to reduce obstruction of views or other adverse visual effects, or relocation of improvements to reduce obstruction of views. The County shall consider taking the following (or equivalent) actions: i) Require that the scale and massing of new development provide appropriate transitions in structure height and bulk that are sensitive to the physical and visual character of the affected area; ii) ensure structure heights are stepped back to maintain appropriate transitions in scale and to protect scenic views; and iii) avoid siting electric towers, solar power facilities, wind power facilities, communication transmission facilities and/or above ground lines where they could obstruct views from public vantage points, such as a regional riding, hiking, or multiuse trail, along scenic roadways and routes, or scenic vista points.</p> <p>Mitigation Measure 3.2-2: Visual Screening and Other View Protection Measures. To partially screen views of projects facilitated by Draft 2045 CAP measures and actions in locations where they would be visible from publicly accessible vantage points (e.g., scenic vistas, trails, scenic roadways and routes) and affect visual character or quality, if feasible and effective, the County shall (and other implementing state or local agencies can and should) require the construction of a berm, vegetative screening, or other form of visual barrier of sufficient height to provide a visual transition from ground level to surrounding hills or ridgelines. The color of proposed building facades and roofs shall be designed to visually blend in and minimize the potential for visual contrast between the project elements and their natural landscape surroundings. Bright or very light colors (including white) shall be avoided. Re-contouring and revegetation of temporarily disturbed, graded areas shall be completed to provide a natural appearing landform upon completion of construction.</p>	<p>Significant and Unavoidable</p>
<p>Impact 3.2-2: Projects facilitated by the Draft 2045 CAP would be visible from or obstruct views from a regional riding, hiking, or multiuse trail.</p>	<p>Mitigation: Implement Mitigation Measures 3.2-1 and 3.2-2.</p>	<p>Significant and Unavoidable</p>
<p>Impact 3.2-3: Projects facilitated by the Draft 2045 CAP would substantially damage scenic resources, including, but not limited to, trees, rocks, outcropping, and historic building within a state scenic highway.</p>	<p>Mitigation: Implement Mitigation Measures 3.2-1 and 3.2-2.</p>	<p>Significant and Unavoidable</p>
<p>Impact 3.2-4: Projects facilitated by the Draft 2045 CAP would substantially degrade the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features and/or conflict with applicable zoning and other regulations of governing scenic quality. (Public views are those that are experienced from a publicly accessible vantage point.)</p>	<p>Mitigation: Implement Mitigation Measures 3.2-1 and 3.2-2.</p>	<p>Significant and Unavoidable</p>

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Aesthetics (cont.)		
<p>Impact 3.2-5: Projects facilitated by the Draft 2045 CAP would create a new source of substantial shadow, light, or glare, which would adversely affect day or nighttime views in the area.</p>	<p>Mitigation Measure 3.2-3: Reduce Light and Glare Impacts. To reduce significant light and glare impacts of projects facilitated by the Draft 2045 CAP, the County shall require the following measures to be incorporated: a) All lighting shall be focused toward the site and outdoor lighting shall be directed downward; b) The design of exterior light fixtures shall incorporate shielding to prevent glare and offsite light spillage; c) Outdoor lighting shall include non-glare fixtures; and d) Structure design shall include exterior finishes and materials that would be minimally reflective or sited or oriented in such a way as to direct glare away from sensitive receptors.</p>	Less than Significant
<p>Impact 3.2-6: Projects facilitated by the Draft 2045 CAP would cause or contribute to a significant cumulative impact to scenic vistas.</p>	<p>Mitigation: Implement Mitigation Measures 3.2-1 and 3.2-2.</p>	Significant and Unavoidable
<p>Impact 3.2-7: Projects facilitated by the Draft 2045 CAP would cause or contribute to significant cumulative impacts on views from a regional riding, hiking, or multiuse trail.</p>	<p>Mitigation: Implement Mitigation Measures 3.2-1 and 3.2-2.</p>	Significant and Unavoidable
<p>Impact 3.2-8: Projects facilitated by the Draft 2045 CAP would cause or contribute to a significant cumulative impact due to substantial cumulative damage to scenic resources, including, but not limited to, trees, rocks, outcropping, and historic building within a state scenic highway.</p>	<p>Mitigation: Implement Mitigation Measures 3.2-1 and 3.2-2.</p>	Significant and Unavoidable
<p>Impact 3.2-9: Projects facilitated by the Draft 2045 CAP would cause or contribute to significant cumulative degradation of the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features and/or conflict with applicable zoning and other regulations governing scenic quality.</p>	<p>Mitigation: Implement Mitigation Measures 3.2-1 and 3.2-2.</p>	Significant and Unavoidable
<p>Impact 3.2-10: Projects facilitated by the Draft 2045 CAP would not cause or contribute to a new source of substantial shadow, light or glare, which would result in a significant cumulative impact to views in the area.</p>	<p>Mitigation: Implement Mitigation Measure 3.2-3.</p>	Less than Significant

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Agriculture and Forestry		
Impact 3.3-1: Projects facilitated by the Draft 2045 CAP would convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.	Mitigation Measure 3.3-1: Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar and Energy Storage Development. To reduce the impacts of converting Farmland in physical use for agriculture to nonagricultural uses when a utility-scale solar development is proposed on actively farmed land, the County shall require renewable energy project applicants to demonstrate their consideration of alternate sites consisting of formerly developed and/or contaminated lands such as landfills and mine sites located within one mile of the proposed project site when such development is consistent with General Plan and zoning requirements.	Significant and Unavoidable
Impact 3.3-2: Projects facilitated by the Draft 2045 CAP would conflict with the existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract.	Mitigation: Implement Mitigation Measure 3.3-1.	Significant and Unavoidable
Impact 3.3-3: Projects facilitated by the Draft 2045 CAP would not conflict with the existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined in Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined in Government Code Section 51104(g)).	None required.	Less than Significant
Impact 3.3-4: Projects facilitated by the Draft 2045 CAP would not result in the loss of forest land or conversion of forest land to non-forest use.	None required.	Less than Significant
Impact 3.3-5: Projects facilitated by the Draft 2045 CAP would involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.	Mitigation: Implement Mitigation Measure 3.3-1.	Significant and Unavoidable
Impact 3.3-6: Projects facilitated by the Draft 2045 CAP would not involve other changes in the existing environment which, due to their location or nature, could result in conversion of forest land to non-forest use.	None required.	Less than Significant

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Agriculture and Forestry (cont.)		
Impact 3.3-7: Projects facilitated by the Draft 2045 CAP would result in a significant cumulative impact related to the conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use.	Mitigation: Implement Mitigation Measure 3.3-1.	Significant and Unavoidable
Impact 3.3-8: Projects facilitated by the Draft 2045 CAP would result in a cumulative significant impact related to conflicts with existing zoning for agricultural use, or with a designated Agricultural Resource Area.	Mitigation: Implement Mitigation Measure 3.3-1.	Significant and Unavoidable
Impact 3.3-9: Projects facilitated by the Draft 2045 CAP would not conflict with the existing zoning for, or cause rezoning of, forest land, timberland, or timberland zoned Timberland Production.	None required.	No Cumulative Impact
Impact 3.3-10: Projects facilitated by the Draft 2045 CAP would not result in the loss of forest land or conversion of forest land to non-forest use.	None required.	Less than Significant
Impact 3.3-11: Projects facilitated by the Draft 2045 CAP would involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland.	Mitigation: Implement Mitigation Measure 3.3-1.	Significant and Unavoidable
Impact 3.3-12: Projects facilitated by the Draft 2045 CAP would not involve other changes in the existing environment which, due to their location or nature, could result in cumulative conversion of forest land to non-forest use.	None required.	Less than Significant

**TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Air Quality		
<p>Impact 3.4-1: The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would conflict with or obstruct implementation of the applicable air quality plan.</p>	<p>Mitigation Measure 3.4-1: Construction Emissions. If, during subsequent project-level environmental review, construction-related criteria air pollutants are determined to have the potential to exceed the applicable air quality management district (AQMD) adopted thresholds of significance, the lead agency shall require applicants for new projects facilitated by the Draft 2045 CAP measures and actions to incorporate mitigation measures to avoid or reduce air pollutant emissions during construction activities. Mitigation measures that may be identified during the environmental review include, but are not limited to:</p> <ul style="list-style-type: none"> • When wind gusts exceed 25 miles per hour, cease all active construction activities or follow the applicable guidelines outlined in Table 3 of SCAQMD Rule 403 or Sections (C)(10) through (C)(14) of AVAQMD Rule 403. • Use construction equipment rated by the U.S. Environmental Protection Agency (USEPA) as having Tier 3 (model year 2006 or newer) or Tier 4 (model year 2008 or newer) emission limits, applicable for engines between 50 and 750 horsepower, as commercially available. • Ensure that construction equipment is properly serviced and maintained to the manufacturer's standards. • Limit nonessential idling of construction equipment to no more than five consecutive minutes. • Where acceptable to the fire department, control weed growth by mowing instead of disking, thereby leaving the ground undisturbed and with a mulch covering. • Water all active construction areas at least three times daily or four times daily if needed to control dust emissions. Watering should be sufficient to prevent airborne visible dust from leaving the site. Where local water supplies are not available in sufficient quantities within unincorporated areas of the County, use nontoxic chemical soil stabilizers or dust suppressants to control dust emissions in sufficient amounts to prevent airborne visible dust from leaving the site. • Increase watering frequency and/or application frequency of nontoxic chemical soil stabilizers or dust suppressants whenever wind speeds exceed 25 miles per hour. Reclaimed water shall be used whenever possible. • Cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least two feet of freeboard (i.e., the minimum required space between the top of the load and the top of the trailer). • Pave, apply water three times daily or as often as necessary to control dust, or where local water supplies are not available in sufficient quantities within unincorporated areas of the County, apply (nontoxic) soil stabilizers or dust suppressants on all unpaved access roads, parking areas, and staging areas at construction sites. • Sweep daily (with water sweepers using reclaimed water if possible), or as often as needed, all paved access roads, parking areas, and staging areas at the construction site to control dust. • Sweep public streets daily (with water sweepers using reclaimed water if possible) in the vicinity of the Project site, or as often as needed, to keep streets free of visible soil material. 	<p>Significant and Unavoidable</p>

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Air Quality (cont.)		
Impact 3.4-1 (cont.)	<ul style="list-style-type: none"> • Where local water supplies are not available in sufficient quantities within unincorporated areas of Los Angeles County, hydroseed or apply nontoxic chemical soil stabilizers or dust suppressants to inactive construction areas. • Enclose, cover, water three times daily, or apply nontoxic chemical soil stabilizers or dust suppressants to exposed stockpiles (dirt, sand, etc.). • In areas with existing vegetation, install the facility components with minimal disturbance. Take all necessary precautions to not use vehicles or machinery for grading or alter the existing grade in these areas. • Design project facilities to limit ground disturbance or grading to only the access roads, substations and related underground transmission lines, tanks, basins, inverter pads, or other areas required by the County. Ensure that the facilities comply with all applicable grading standards. • Site utility-scale renewable energy projects in a way that minimizes site disturbance, such as grading, brush clearance, and other forms of earthwork. • In areas with existing vegetation, install facility components with minimal disturbance. Take all necessary precautions to avoid using vehicles or machinery for grading, or altering the existing grade in these areas. • Establish and maintain a landscaped buffer: <ul style="list-style-type: none"> ○ Maintain a landscaped area at least 10 feet deep along any facility perimeter fencing and between such fencing and any public right-of-way or adjacent property with an existing residential or agricultural use. ○ Establish the landscaped area in such manner that adequate corner sight distance is maintained from all access roads to the public right-of-way to the satisfaction of the County of Los Angeles Department of Public Works. ○ Maintain the landscaped area throughout the life of the facility. <p>Mitigation Measure 3.4-2: Operational Fugitive Dust Emissions. If, during subsequent project-level environmental review, operational fugitive dust emissions are determined to have the potential to be significant, the lead agency shall require applicants for new projects facilitated by the Draft 2045 CAP measures and actions to incorporate mitigation measures to avoid or reduce air pollutant emissions during operational activities. Mitigation measures that may be identified during the environmental review include, but are not limited to, the following:</p> <ul style="list-style-type: none"> • Unpaved main access roads for operational vehicle trips shall be paved or effectively stabilized using soil stabilizers that can be determined to be as efficient as or more efficient for fugitive dust control than California Air Resources Board–approved soil stabilizers, and that shall not increase any other environmental impacts, including loss of vegetation. • All other unpaved roads shall be stabilized using water or soil stabilizers so that vehicle travel on these roads does not cause visible dust plumes. 	

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Air Quality (cont.)		
Impact 3.4-1 (cont.)	<ul style="list-style-type: none"> • Gravel pads, grizzly strips, or other material track-out control methods approved for use by the local AQMD shall be installed where vehicles enter or exit unpaved roads onto paved roadways. • Traffic speeds on unpaved roads shall be limited to no more than 10 miles per hour, except that vehicles may travel up to 25 miles per hour on stabilized unpaved roads as long as such speeds do not create visible dust emissions. Traffic speed signs shall be displayed prominently at all site entrances and at egress point(s) from the central maintenance complex. • Where acceptable to the local and County fire departments, all unpaved, non-road surfaces that may potentially be disturbed shall be covered with a minimum of 3 inches of mulch. Where acceptable to the local and County fire departments, vegetation shall be maintained at 6 inches height. • All trucks hauling dirt, sand, soil, or other loose materials shall be covered or shall maintain at least 6 inches of freeboard (minimum vertical distance between top of the load and top of the trailer) in accordance with California Vehicle Code Section 23114. • A fugitive dust control plan that includes a dust plume response plan shall be prepared for review and approval by applicable agencies before any earthwork activities. • Where acceptable to the local and County fire departments, weed control shall be accomplished by mowing instead of disking, thereby leaving the ground undisturbed and with a mulch covering. • Existing vegetation may be mowed, but removal of existing vegetation root systems shall be prohibited, except where necessary for construction of access roads, substations and related underground transmission lines, tanks, basins, inverter pads, or other areas required by the County. • Continuous particulate monitors shall be installed at the discretion of the lead agency. <p>Mitigation Measure 3.4-3: Architectural Coating VOC Emissions. If, during subsequent project-level environmental review, it is determined that VOC emissions impacts may be significant, the lead agency shall require Super-Compliant VOC-content architectural coatings (0 grams per liter to less than 10 grams per liter VOC) to be used during construction and operational application of paints and other architectural coatings to reduce ozone precursors. If paints and coatings with VOC content of 0 grams/liter to less than 10 grams/liter cannot be utilized, the developer shall avoid application of architectural coatings during days when the USEPA, CARB, or SCAQMD has forecasted the Air Quality Index for ozone to be greater than 100 for the project location.</p>	

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Air Quality (cont.)		
<p>Impact 3.4-2: The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, could result in a cumulatively considerable net increase of a criteria pollutant for which the Project region is nonattainment under an applicable federal or state ambient air quality standard.</p>	<p>Mitigation: Implement Mitigation Measures 3.4-1, 3.4-2, and 3.4-3.</p> <p>Mitigation Measure 3.4-4: Enhanced Energy Conservation. If, during subsequent project-level environmental review, it is determined that operational emissions impacts are significant, the lead agency shall require the project to incorporate enhanced energy conservation measures beyond those required by federal or state law, County ordinance, and the Draft 2045 CAP measures and actions to reduce energy-related emissions. Enhanced energy conservation measures shall include one or more of the following as applicable:</p> <ul style="list-style-type: none"> • Install Energy Star rated heating, cooling, lighting, and appliances. • Use of heating, ventilation, and air conditioning equipment with a Seasonal Energy Efficiency Ratio of 12 or higher. • Installation of water heaters with an energy factor of 0.92 or higher. • Install solar water heaters or tankless water heaters. • Use passive solar cooling/heating. • Reduce building natural gas infrastructure, use renewable natural gas in place of fossil fuel-derived natural gas, or eliminate building natural gas infrastructure and fully electrify buildings. <p>Mitigation Measure 3.4-5: Low-VOC/Green Cleaning Product Educational Program. If, during subsequent project-level environmental review, it is determined that operational emissions impacts may be significant, the lead agency shall require the project applicant or developer to provide tenants and residents with information about low-VOC/green cleaning products and paints, including materials educating how to identify low-VOC cleaners and products.</p>	Significant and Unavoidable
<p>Impact 3.4-3a: The Project, as a result of projects facilitated by the Draft 2045 CAP measures and actions, would expose sensitive receptors to substantial pollutant concentrations for localized air pollutants and TAC emissions.</p>	<p>Mitigation: Implement Mitigation Measures 3.4-1, 3.4-2, 3.4-3, 3.4-4, and 3.4-5.</p> <p>Mitigation Measure 3.4-6: Stationary Sources. Applicants for new or modified stationary sources facilitated by the Draft 2045 CAP measures and actions that: (1) have the potential to generate 40 or more diesel trucks per day and (2) are located within 1,000 feet of a sensitive land use (e.g., residential, schools, hospitals, nursing homes), as measured from the property line of the project to the property line of the nearest sensitive use, shall submit a health risk assessment (HRA) to the County Department of Regional Planning prior to future discretionary project approval. The HRA shall be prepared in accordance with policies and procedures of the state Office of Environmental Health Hazard Assessment and the applicable air quality management district. If the HRA shows that the incremental cancer risk exceeds ten in one million (10E-06), particulate matter concentrations would exceed 2.5 µg/m³, or the appropriate noncancer hazard index exceeds 1.0, the applicant will be required to identify and demonstrate that best available control technologies for toxics (T-BACTs) are capable of reducing potential cancer and noncancer risks to an acceptable level, including appropriate enforcement mechanisms. T-BACTs may include, but are not limited to, restricting idling onsite or electrifying warehousing docks to reduce diesel particulate matter, or requiring use of newer equipment and/or vehicles. T-BACTs identified in the HRA shall be identified as mitigation measures in the environmental document and/or incorporated into the site development plan as a component of the project.</p>	Significant and Unavoidable

**TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Air Quality (cont.)		
<p>Impact 3.4-3a (cont.)</p>	<p>Mitigation Measure 3.4-7: Health Risk Assessment. Applicants shall submit a health risk assessment (HRA) to the County prior to future discretionary project approval for sensitive land uses facilitated by the Draft 2045 CAP measures and actions within the following distances as measured from the property line of the project to the property line of the source/edge of the nearest travel lane, from these facilities or similar types of facilities that produce TAC emissions:</p> <ul style="list-style-type: none"> • Industrial facilities within 1,000 feet • Distribution centers (40 or more trucks per day) within 1,000 feet • Major transportation projects (50,000 or more vehicles per day) within 1,000 feet • Gasoline dispensing facilities within 300 feet <p>Applicants proposing projects facilitated by the Draft 2045 CAP measures and actions which produce TAC emissions may be required to submit an HRA based on local rules and regulations, and/or at the discretion of the lead agency.</p> <p>The HRA shall be prepared in accordance with policies and procedures of the applicable Air Quality Management District. If the HRA shows that the incremental cancer risk exceeds ten in one million (10E-06) or the appropriate noncancer hazard index exceeds 1.0, the applicant will be required to identify and demonstrate that mitigation measures are capable of reducing potential cancer and non-cancer risks to an acceptable level (i.e., below ten in one million or a hazard index of 1.0), including appropriate enforcement mechanisms. Measures to reduce risk may include but are not limited to:</p> <ul style="list-style-type: none"> • Air intakes located away from high-volume roadways and/or truck loading zones, unless it can be demonstrated to County Department of Regional Planning that there are operational limitations. • Heating, ventilation, and air conditioning systems of the buildings provided with appropriately sized maximum efficiency rating value (MERV) filters. <p>Mitigation measures identified in the HRA shall be identified as mitigation measures in the environmental document and/or incorporated into the site development plan as a component of the Project. The air intake design and MERV filter requirements shall be noted and/or reflected on all building plans submitted to the County and shall be verified by County Department of Regional Planning.</p>	
<p>Impact 3.4-3b: The Project, as a result of projects facilitated by the Draft 2045 CAP measures and actions, would not expose sensitive receptors to substantial pollutant concentrations relating to Valley Fever.</p>	<p>Mitigation: Implement Mitigation Measures 3.4-1 and 3.4-2.</p> <p>Mitigation Measure 3.4-8: Valley Fever. During heavy grading where the top 12–18 inches of soil would be disturbed, and in locations with potential Valley Fever fungal spores, applicants for projects facilitated by the Draft 2045 CAP measures shall require construction contractors to comply with the following measures as feasible to reduce potential Valley Fever impacts:</p> <ul style="list-style-type: none"> • Require crews to use respirators during project clearing, grading, and excavation operations in accordance with California Division of Occupational Safety and Health regulations. • Require that the cabs of grading and construction equipment be air-conditioned or enclosed with sufficient ventilation and particulate matter filtration systems. • Require crews to work upwind from excavation sites where possible. • Where acceptable to the fire department, control weed growth by mowing instead of disking, thereby leaving the ground undisturbed and with a mulch covering. • During rough grading and construction, ensure that the access way into the project site from adjoining paved roadways is paved or treated with environmentally safe dust control agents. 	<p>Less than Significant</p>

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Air Quality (cont.)		
Impact 3.4-4: The Draft 2045 CAP measures and actions would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.	None required.	Less than Significant
Impact 3.4-5: The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would make a cumulatively considerable contribution to a significant cumulative impact due to a conflict with or obstruction of implementation of the applicable air quality plan.	Mitigation: Implement Mitigation Measures 3.4-1, 3.4-2, and 3.4-3.	Significant and Unavoidable.
Impact 3.4-6: The Draft 2045 CAP would make a cumulatively considerable contribution to a significant cumulative impact to air quality associated with criteria pollutants.	Mitigation: Implement Mitigation Measures 3.4-1, 3.4-2, 3.4-3, 3.4-4, and 3.4-5.	Significant and Unavoidable.
Impact 3.4-7: The Project, as a result of projects facilitated by the Draft 2045 CAP, could contribute to a significant cumulative impact to air quality associated with localized air pollutant and TAC emissions.	Mitigation: Implement Mitigation Measures 3.4-1, 3.4-2, 3.4-3, 3.4-4, 3.4-5, 3.4-6, 3.4-7, and 3.4-8.	Significant and Unavoidable for localized air pollutant and TAC emissions Less than Significant for Valley Fever
Impact 3.4-8: The Project, as a result of projects facilitated by the Draft 2045 CAP measures and actions, would not make a cumulatively considerable contribution to a significant cumulative impact due to other emissions (such as those leading to odors) adversely affecting a substantial number of people.	None required.	Less than Significant

**TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Biological Resources		
<p>Impact 3.5-1: The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would have a substantial direct adverse impact on one or more species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS.</p>	<p>Mitigation Measure 3.5-1: The County shall require biological resources to be analyzed on a project-specific level by a qualified biological consultant. Prior to or during the preparation of project-level environmental documents, and prior to the start of construction activities, a biological resources assessment shall be conducted to characterize the project site. Suitable buffer areas surrounding the project site shall be included where native habitat is contiguous with off-site habitat areas. The assessment and analysis shall emphasize identifying endangered, threatened, rare, and other special-status species; regionally and locally unique species; and sensitive natural communities, jurisdictional waters, and oak woodlands. Focused surveys shall be conducted as necessary to determine the presence of special-status species (e.g., focused sensitive plant or wildlife surveys). Focused surveys shall be conducted according to established CDFW or USFWS protocols, if available for the object species. Natural communities shall be mapped and identified according to floristic alliance- and/or association-based mapping protocols consistent with CDFW natural communities. A jurisdictional delineation may be required if there are signs of potentially regulated wetlands and non-wetland waters. A biological resources assessment report shall be prepared to characterize the biological resources on-site, analyze direct and indirect impacts on biological resources, and propose mitigation measures to offset those impacts. The report shall include site location, literature sources, methodology, timing of surveys, vegetation map, site photographs, and descriptions of biological resources on-site (e.g., observed and detected species as well as those species with potential to occur on-site).</p> <p>Mitigation Measure 3.5-2: If there is potential for direct impacts to special-status species with implementation of construction activities, the project-specific biological resources assessment report (as described in Mitigation Measure 3.5-1) shall include a mitigation measure requiring pre-construction surveys for special-status species and/or construction monitoring to ensure avoidance, relocation, or safe escape of special-status species from the construction activities, as appropriate. The mitigation measures shall also include consultation with and obtaining permits from USFWS or CDFW prior to construction, if required by FESA or CESA for listed endangered and threatened species. If special-status species are found to be nesting, brooding, denning, etc. on-site during the pre-construction survey or monitoring, construction activity shall be halted until offspring are weaned, fledged, etc. and are able to escape the site or be safely relocated to appropriate offsite habitat areas. Relocation of such species into areas of appropriate restored habitat would have the best chance of replacing/incrementing populations that are lost due to habitat converted to development. Relocation to restored habitat areas shall be the preferred goal of this measure. A qualified biologist shall be on site to conduct surveys, to perform or oversee implementation of protective measures, and to determine when construction activity may resume.</p>	<p>Less than Significant</p>
<p>Impact 3.5-2: The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would have a substantial adverse indirect impact (i.e., through habitat modifications) on one or more species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS.</p>	<p>Mitigation: Implement Mitigation Measures 3.5-1 and 3.5-2.</p>	<p>Significant and Unavoidable</p>

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Biological Resources (cont.)		
<p>Impact 3.5-3: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would have a substantial adverse impact on sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS.</p>	<p>Mitigation: Implement Mitigation Measures 3.5-1 and 3.5-5.</p>	Significant and Unavoidable
<p>Impact 3.5-4: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would have a substantial adverse impact on state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.) through direct removal, filling, hydrological interruption, or other means.</p>	<p>Mitigation: Implement Mitigation Measure 3.5-1. Mitigation Measure 3.5-3: Prior to the issuance of any grading permit for permanent impacts in the areas designated as jurisdictional features, the project applicant shall obtain a Clean Water Act Section 404 permit from USACE, a Clean Water Act Section 401 certification from the RWQCB, and a Streambed Alteration Agreement/LSAA permit under Section 1602 of the California Fish and Game Code from CDFW, where the project warrants.</p>	Less than Significant
<p>Impact 3.5-5: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would interfere substantially with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.</p>	<p>Mitigation: Implement Mitigation Measure 3.5-1. Mitigation Measure 3.5-4: Proponents for individual projects facilitated by the Draft 2045 CAP provisions shall analyze impacts on wildlife movement and corridors that may introduce new or additional barriers to wildlife dispersal or constrain existing wildlife corridors to future movement, or indirect impacts constraining future wildlife movement. Where projects may interfere with wildlife movement, alternative designs shall be included in the analysis to reduce wildlife movement impacts. Corridors, linkages, and pinch points shall not be entirely closed by any development, and partial mitigation shall be mandatory for project-specific impacts on wildlife corridors and wildlife nursery sites. This shall include provision of a minimum of half the corridor width. (The width shall be at least what is needed to remain connective for the top predators using the corridor.) Mitigation can include preservation by deed in perpetuity of other parts of the wildlife corridor connecting through the development area; it can include native landscaping to provide cover on the corridor. For nursery site impacts, mitigation shall include preservation by deed in perpetuity for another comparable nursery site of the same species.</p>	Significant and Unavoidable
<p>Impact 3.5-6: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would convert oak woodlands (as defined by the state, oak woodlands are oak stands with greater than 10 percent canopy cover with oaks at least 5 inches in diameter measured at 4.5 feet above mean natural grade) or other unique native woodlands (juniper, Joshua tree, Southern California black walnut, etc.).</p>	<p>Mitigation: Implement Mitigation Measure 3.5-1. Mitigation Measure 3.5-5: Proponents of projects resulting in the loss of oak woodlands shall mitigate with in-kind replacement habitat at a minimum of 1:1 mitigation ratio documented through a County-approved habitat mitigation plan. The plan shall include the number of replacement trees (or acreage and average density of woodland), location of replacement woodland, understory habitat components, sequencing for any phased tree removal, and performance standards for mitigation. The plan shall include monitoring for a minimum of five years, with annual reports submitted to the County. For oak woodlands impacts, project mitigation shall be consistent with recommendations in the County's Oak Woodland Conservation Management Plan and its 2014 Guide. If a project cannot be redesigned to avoid impacts to oak woodlands, an appropriate mitigation strategy would be developed by selecting from the Guide's list of recommended mitigation measures, prioritizing the acquisition of oak woodland habitat comparable to the habitat that as affected over the restoration of degraded off-site and in-lieu fees. A Mitigation Monitoring Plan consistent with the Guide's recommendations would be prepared and implemented.</p>	Less than Significant

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Biological Resources (cont.)		
Impact 3.5-7: The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would result in a cumulatively considerable contribution to a significant cumulative impact through habitat modifications on one or more species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS.	Mitigation: Implement Mitigation Measures 3.5-1 and 3.5-2.	Significant and Unavoidable
Impact 3.5-8: The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would result in a cumulatively considerable contribution to a significant cumulative impact on sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS.	Mitigation: Implement Mitigation Measures 3.5-1 and 3.5-5.	Significant and Unavoidable
Impact 3.5-9: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to a substantial cumulative adverse impact on state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.) through direct removal, filling, hydrological interruption, or other means.	Mitigation: Implement Mitigation Measures 3.5-1 and 3.5-3.	Less than Significant
Impact 3.5-10: The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to a significant cumulative impact relating to substantial interference with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impediment of the use of native wildlife nursery sites.	Mitigation: Implement Mitigation Measures 3.5-1 and 3.5-4.	Significant and Unavoidable
Impact 3.5-11: The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to the cumulative conversion of oak woodlands or other unique native woodlands.	Mitigation: Implement Mitigation Measures 3.5-1 and 3.5-5.	Significant and Unavoidable

**TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Cultural Resources		
<p>Impact 3.6-1: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5.</p>	<p>Mitigation Measure 3.6-1: Historic Resources Assessment. Prior to demolition or alteration of buildings and/or structures or the construction of aboveground infrastructure with potentially significant impacts on historic architectural resources, the project proponent shall retain an architectural historian meeting the minimum professional qualifications standards (PQS) set forth by the Secretary of the Interior (codified in 36 CFR Part 61; 48 FR 44738-44739) (Qualified Architectural Historian) to conduct a historic resources assessment of affected properties. The assessment shall include a records search at the South Central Coastal Information Center or review of a prior record search conducted within the previous one year; a review of other pertinent archives and sources; a pedestrian field survey; recordation of all identified historic architectural resources on California Department of Parks and Recreation (DPR) 523 forms; evaluation of resources which may be eligible for listing in the California Register (i.e., meets the definition for historical resource in CEQA Guidelines Section 15064.5[a]), and for local listing; and preparation of a technical report documenting the methods and results of the assessment for each future project facilitated by 2045 CAP measures and actions. If a historic architectural resource is found eligible by the Qualified Architectural Historian, then the Qualified Architectural Historian shall coordinate with the project proponent and the County to ensure the project is constructed in conformance with the Secretary of the Interior's Standards. All reports resulting from implementation of this measure shall be filed with the South Central Coastal Information Center (including but not limited to historic resources assessments and Secretary of the Interior's Standards plan reviews).</p> <p>Mitigation Measure 3.6-2: Archaeological Resources Assessment. Prior to conducting construction activities that would involve ground disturbance, the project proponent shall retain an archaeologist meeting the minimum PQS set forth by the Secretary of the Interior (codified in 36 CFR Part 61; 48 FR 44738-44739) (Qualified Archaeologist) to conduct an archaeological resources assessment. The assessment shall include a records search at the South Central Coastal Information Center or review of a prior record search conducted within the previous one year; a Sacred Lands File search at the California Native American Heritage Commission (NAHC); geoarchaeological review including a focused assessment of land use history and any available geotechnical data to assess the potential for subsurface archaeological resources; a pedestrian field survey in instances where ground surface is exposed; recordation of all identified archaeological resources on DPR 523 forms; evaluation of resources affected by the project for eligibility for listing in the California Register (i.e., meets the definition for historical resource in CEQA Guidelines Section 15064.5[a]), and for local listing; and preparation of a technical report documenting the methods and results of the assessment. Resources that do not qualify as historical resources shall be considered by the Qualified Archaeologist for qualification as unique archaeological resources as defined in Public Resources Code Section 21083.2(g). The technical report also shall provide recommendations as to whether additional studies are warranted to further identify or evaluate archaeological resources (i.e., Extended Phase I boundary delineation, Phase II testing and evaluation) and if archaeological monitoring and Native American monitoring of ground disturbing activities is warranted (e.g., in areas where there is a higher potential to encounter buried resources). Prior to the initiation of field work for any Extended Phase I or Phase II investigation, the Qualified Archaeologist shall prepare a work plan outlining the investigation's objectives, goals, and methodology. When developing a work plan for Native American resources, the County shall consult with local Native American tribes. If archaeological/Native American monitoring</p>	<p>Less than Significant</p>

**TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Cultural Resources (cont.)		
<p>Impact 3.6-1 (cont.)</p>	<p>is warranted, the Qualified Archaeologist shall determine the locations and duration of monitoring and reporting requirements. All reports resulting from implementation of this measure shall be filed with the South Central Coastal Information Center (including but not limited to archaeological resources assessments, Extended Phase I and Phase II reports, and monitoring reports).</p> <p>Mitigation Measure 3.6-3: Construction Worker Cultural Resources Sensitivity Training. For projects with ground-disturbing activities that may encounter potentially significant archaeological resources, the Qualified Archaeologist shall implement a cultural resources sensitivity training program. The Qualified Archaeologist, or its designee, shall instruct all construction personnel of the types of archaeological resources that may be encountered, the proper procedures to be enacted in the event of an inadvertent discovery of archaeological resources or human remains, applicable laws protecting archaeological resources, and confidentiality of discoveries. Native American monitor(s) shall be invited to participate in presenting tribal perspectives as part of the training curriculum. In the event that construction crews are phased, additional trainings shall be conducted for new construction personnel. The project proponent or its contractors shall ensure construction personnel are made available for and attend the training. The project proponent shall retain documentation demonstrating attendance and provide it to the County.</p> <p>Mitigation Measure 3.6-4: Archaeological Resources Discoveries. In the event archaeological resources are encountered during construction of a project, the project proponent shall cease all activity within 50 feet of the find shall cease. The discovery shall be evaluated for significance by the Qualified Archaeologist. When assessing significance and developing treatment for resources that are Native American in origin, the County shall consult with local Native American tribes. If the Qualified Archaeologist determines that the resource is significant (i.e., meets the definition for historical resource in CEQA Guidelines Section 15064.5[a] or for unique archaeological resource in Public Resources Code Section 21083.2[g]), the Qualified Archaeologist shall provide a method for avoidance and preservation in place, which shall be the preferred manner of mitigating impacts. If avoidance is infeasible, the Qualified Archaeologist shall develop a Phase III Archaeological Resources Data Recovery and Treatment Plan consistent with Mitigation Measure 3.6-5. The Qualified Archaeologist also shall determine, based on the initial assessment of the discovery, whether the 50-foot buffer may be reduced. All reports resulting from implementation of this measure shall be filed with the South Central Coastal Information Center (including but not limited to Extended Phase I, Phase II, and Phase III reports).</p> <p>Mitigation Measure 3.6-5: Treatment of Archaeological Resources. If the assessment conducted under Mitigation Measure 3.6-2 or Mitigation Measure 3.6-4 identifies significant archaeological resources (i.e., meets the definition for historical resource in CEQA Guidelines Section 15064.5[a] or for unique archaeological resource in Public Resources Code Section 21083.2[g]), then avoidance and preservation in place shall be the preferred manner of mitigating impacts. Preservation in place may be accomplished by, but is not limited to, avoidance, incorporating the resource into open space, capping, or deeding the site into a permanent conservation easement. If avoidance and preservation in place of significant archaeological resources is determined by the County to be infeasible, then the Qualified Archaeologist shall prepare a Phase III Archaeological Resources Data Recovery and Treatment Plan. The plan shall include: a detailed research design; justification for data recovery or other treatment methods depending on the nature of the resource's eligibility; excavation methodology; and, reporting</p>	

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Cultural Resources (cont.)		
Impact 3.6-1 (cont.)	<p>and curation requirements. When developing treatment for resources that are Native American in origin, the County shall consult with local Native American tribes. All Phase III reports resulting from implementation of this measure shall be filed with the South Central Coastal Information Center.</p> <p>Mitigation Measure 3.6-6: Curation and Disposition of Cultural Materials. The project proponent shall arrange curation for all Native American archaeological materials, with the exception of funerary objects or grave goods (i.e., artifacts associated with Native American human remains). For significant Native American archaeological materials, the project proponent shall first consider repositories that are accredited by the American Association of Museums and that meet the standards outlined in 36 CFR 79.9. If a suitable accredited repository is not identified, then the project proponent shall consider nonaccredited repositories as long as they meet the minimum standards set forth by 36 CFR 79.9. If a suitable nonaccredited repository is not identified, then the project proponent shall donate the collection to a local California Native American tribe(s). Nonsignificant archeological materials shall be donated to a local California Native American tribe(s). If neither an accredited or nonaccredited repository or tribe accepts the collection, then the project proponent may offer the collection to a public, nonprofit institution with a research interest in the materials, or to a local school or historical society in the area for educational purposes. Disposition of Native American human remains and associated funerary objects or grave goods shall be determined by the landowner in consultation with the County and the MLD.</p> <p>The project proponent shall curate all significant historic-period archaeological material, or portions thereof at the discretion of the Qualified Archaeologist, at a repository accredited by the American Association of Museums that meets the standards outlined in 36 CFR 79.9. If no accredited repository accepts the collection, then the project proponent may curate it at a nonaccredited repository as long as it meets the minimum standards set forth in 36 CFR 79.9. If neither an accredited nor a nonaccredited repository accepts the collection, then the project proponent may offer the collection to a public, nonprofit institution with a research interest in the materials, or to a local school or historical society in the area for educational purposes.</p>	
Impact 3.6-2: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would cause a substantial adverse change in the significance of a unique archaeological resource pursuant to CEQA Guidelines Section 15064.5.	Mitigation: Implement Mitigation Measures 3.6-2 through 3.6-6.	Less than Significant
Impact 3.6-3: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.	Mitigation Measure 3.6-7: Paleontological Resources Assessment and Monitoring. For projects facilitated by Draft 2045 CAP measures and actions that involve ground disturbance, the project proponent shall retain a paleontologist who meets the Society of Vertebrate Paleontology's (SVP 2010) definition for qualified professional paleontologist (Qualified Paleontologist) to prepare a paleontological resources assessment report prior to the start of construction activities. The report shall include methods and results of the paleontological resources assessment, monitoring requirements (including depths, frequency, and reporting), and maps that outline where monitoring is required. Monitoring shall follow SVP Guidelines: no monitoring of ground-disturbing activities within units of <i>Low Sensitivity</i> or <i>No Potential</i> ; monitoring of all ground-disturbing activities (with depths specified) in units of <i>Low to High</i>	Less than Significant

**TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Cultural Resources (cont.)		
<p>Impact 3.6-3 (cont.)</p>	<p><i>Significance</i>; and at all depths within units of <i>High Significance</i> unless the Qualified Paleontologist’s report identifies previous disturbances or the use of construction methods which do not warrant monitoring; and monitoring at the initiation of excavation in units of <i>Undetermined Significance</i>. The report also shall stipulate whether screen washing is necessary to recover small specimens following SVP Guidelines and determine whether unique geologic features are present onsite. If monitoring is conducted, then the Qualified Paleontologist shall prepare a final report summarizing monitoring results and submit it to the project proponent and the County.</p> <p>Mitigation Measure 3.6-8: Paleontological Resources Sensitivity Training. Prior to the start of ground-disturbing activities for projects facilitated by Draft 2045 CAP measures and actions with potentially significant impacts on paleontological resources, the Qualified Paleontologist or its designee shall conduct construction worker paleontological resources sensitivity training (or may be provided via digital recording) for all construction workers. Construction workers shall be informed on how to identify the types of paleontological resources that may be encountered, the proper procedures to be enacted in the event of an inadvertent discovery of paleontological resources, and safety precautions to be taken when working with paleontological monitors. The project proponent shall ensure that construction workers are made available for and attend the training. The project proponent shall retain documentation demonstrating attendance and provide it to the County.</p> <p>Mitigation Measure 3.6-9: Paleontological Discoveries. If a potential fossil is found, the paleontological monitor shall be allowed to temporarily divert or redirect grading and excavation activities in the area of the exposed fossil to facilitate evaluation of the discovery. An appropriate buffer area determined by the paleontological monitor shall be established around the find where construction activities shall not be allowed to continue. Work shall be allowed to continue outside of the buffer area. At the monitor’s discretion, and to reduce any construction delay, the grading/excavation contractor shall assist, where feasible, in removing rock/sediment samples for initial processing and evaluation. If a fossil is determined to be significant, the Qualified Paleontologist shall implement a paleontological salvage program to remove the resources from their location, following the guidelines of the SVP (2010). Any fossils encountered and recovered shall be prepared to the point of identification, catalogued, and curated at a public, nonprofit institution with a research interest in the material and with retrievable storage, such as the Natural History Museum of Los Angeles County, if such an institution agrees to accept the fossils. Accompanying notes, maps, and photographs shall also be filed at the repository. If no institution accepts the fossil collection, it may be donated to a local school or other interested organization in the area for educational purposes.</p> <p>If construction workers discover any potential fossils during construction while the paleontological monitor is not present, regardless of the depth of work or location, work at the discovery location shall cease in a 50-foot radius of the discovery until the Qualified Paleontologist has assessed the discovery and recommended and implemented appropriate treatment as described earlier in this measure.</p> <p>Any salvage reports resulting from implementation of this measure shall be filed with the Natural History Museum of Los Angeles County.</p>	

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Cultural Resources (cont.)		
<p>Impact 3.6-4: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would disturb any human remains, including those interred outside of dedicated cemeteries.</p>	<p>Mitigation Measure 3.6-10: Human Remains Discoveries. If human remains are encountered, then the project proponent or its contractor shall immediately halt work within 50 feet of the discovery and contact the County Coroner in accordance with Public Resources Code Section 5097.98 and Health and Safety Code Section 7050.5, which require that no further disturbance shall occur until the County Coroner has made the necessary findings as to the remains' origin and disposition. If the County Coroner determines that the remains are Native American, then the County Coroner will notify the NAHC within 24 hours in accordance with Health and Safety Code Section 7050.5(c), and Public Resources Code Section 5097.98. The NAHC shall then identify the person(s) thought to be the MLD. The MLD may, with the permission of the land owner, or their authorized representative, inspect the site of the discovery of the Native American remains and may recommend to the owner or the person responsible for the excavation work means for treating or disposing, with appropriate dignity, the human remains and any associated grave goods. The MLD shall complete their inspection and make their recommendation within 48 hours of being granted access by the landowner to inspect the discovery. The recommendation may include the scientific removal and nondestructive analysis of human remains and items associated with Native American burials. The project proponent, County, and the landowner shall discuss and confer with the MLD on all reasonable options regarding the MLD's preferences for treatment.</p> <p>Until the project proponent, the County, and the landowner have conferred with the MLD, the contractor shall ensure that the immediate vicinity where the discovery occurred is not disturbed by further activity and is adequately protected according to generally accepted cultural or archaeological standards or practices (e.g., the <i>NAHC's A Professional Guide for the Preservation and Protection of Native American Human Remains and Associated Grave Goods</i> [NAHC 2022], which reiterates statutory requirements), and that further activities take into account the possibility of multiple burials.</p> <p>If the NAHC is unable to identify an MLD, or the MLD identified fails to make a recommendation, or the landowner rejects the recommendation of the MLD and the mediation provided for in Public Resources Code Section 5097.94(k), if invoked, fails to provide measures acceptable to the landowner, the landowner or his or her authorized representative shall inter the human remains and items associated with Native American human remains with appropriate dignity on the property in a location not subject to further and future subsurface disturbance.</p>	Less than Significant
<p>Impact 3.6-5: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would incrementally contribute to a significant cumulative impact on historical resources.</p>	<p>Mitigation: Implement Mitigation Measures 3.6-1 through 3.6-6.</p>	Less than Significant
<p>Impact 3.6-6: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would incrementally contribute to a significant cumulative impact on unique archaeological resources.</p>	<p>Mitigation: Implement Mitigation Measures 3.6-2 through 3.6-6.</p>	Less than Significant

**TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Cultural Resources (cont.)		
<p>Impact 3.6-7: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would incrementally contribute to a significant cumulative impact on unique paleontological resources or sites or unique geologic features.</p>	<p>Mitigation: Implement Mitigation Measures 3.6-7 through 3.6-9.</p>	<p>Less than Significant</p>
<p>Impact 3.6-8: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would incrementally contribute to a significant cumulative impact on human remains, including those interred outside of dedicated cemeteries.</p>	<p>Mitigation: Implement Mitigation Measure 3.6-10.</p>	<p>Less than Significant</p>
Energy		
<p>Impact 3.7-1: The Project would not result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during Project construction or operation.</p>	<p>None required.</p>	<p>No Impact</p>
<p>Impact 3.7-2: The Project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.</p>	<p>None required.</p>	<p>No Impact</p>
<p>Impact 3.7-3: The project would not result in a significant cumulative impact due to wasteful, inefficient, or unnecessary consumption of energy resources during Project construction or operation, or conflict with or obstruct a state or local plan for renewable energy or energy efficiency.</p>	<p>None required.</p>	<p>No Impact.</p>
Geology and Soils		
<p>Impact 3.8-1: The Project would not directly or indirectly cause potential substantial adverse impacts, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known active fault trace.</p>	<p>None required.</p>	<p>Less than Significant</p>

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Geology and Soils (cont.)		
Impact 3.8-2: The Project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking.	None required.	Less than Significant
Impact 3.8-3: The Project would not directly or indirectly cause potential substantial adverse impacts, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction and lateral spreading.	None required.	Less than Significant
Impact 3.8-4: The Project would not directly or indirectly cause potential substantial adverse impacts, including the risk of loss, injury, or death involving landslides.	None required.	Less than Significant
Impact 3.8-5: The Project would not result in substantial soil erosion or loss of topsoil.	None required.	Less than Significant
Impact 3.8-6: The Project would not be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.	None required.	Less than Significant
Impact 3.8-7: The Project would not be located on expansive soil, creating substantial direct or indirect risks to life or property.	None required.	Less than Significant
Impact 3.8-8: The Project would not have soils incapable of adequately supporting the use of onsite wastewater treatment systems where sewers are not available for the disposal of wastewater.	None required.	Less than Significant
Impact 3.8-9: The Project would not conflict with the Hillside Management Area Ordinance.	None required.	Less than Significant
Impact 3.8-10: The Project would result in less-than-significant cumulative impacts related to geology and soils.	None required.	Less than Significant

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Greenhouse Gas Emissions		
Impact 3.9-1: The Draft 2045 CAP would not generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.	None required.	Less than Significant
Impact 3.9-2: The Draft 2045 CAP would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.	None required.	Less than Significant
Hazards and Hazardous Materials		
Impact 3.10-1: Projects facilitated by the Draft 2045 CAP would not create a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials.	None required.	Less than Significant
Impact 3.10-2: The Project, as a result of solar PV and other projects facilitated by the Draft 2045 CAP measures and actions, could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment.	Mitigation Measure 3.10-2: The County shall require applicants of solar PV installation projects that include the use of CdTe modules to dispose of panels or recycle panels in accordance with current local, state, and federal regulations. Broken and end-of-project-life PV modules, materials, and components shall be: <ul style="list-style-type: none"> • Stored on-site in a manner that complies with federal and state laws until recycling or disposal actions can be taken. • Stored on-site no longer than allowed by federal and state laws. • Recycled in accordance with federal and state laws applicable at that time. 	Less than Significant
Impact 3.10-3: Projects facilitated by the Draft 2045 CAP would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of sensitive land uses.	Mitigation: Implement Mitigation Measure 3.10-2.	Less than Significant
Impact 3.10-4: Projects facilitated by the Draft 2045 CAP may be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, but would not create a significant hazard to the public or the environment.	None required.	Less than Significant

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Hazards and Hazardous Materials (cont.)		
Impact 3.10-5: Projects facilitated by the Draft 2045 CAP would not, for a project located within an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport, result in a safety hazard or excessive noise for people residing or working in the Project area.	None required.	Less than Significant
Impact 3.10-6: Projects facilitated by the Draft 2045 CAP would not impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan.	Mitigation: Implement Mitigation Measure 3.15-1.	Less than Significant
Impact 3.10-7: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to cumulative hazards to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials.	None required	Less than Significant
Impact 3.10-8: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to a significant cumulative adverse impact with regard to hazards to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment.	Mitigation: Implement Mitigation Measure 3.10-2.	Less than Significant
Impact 3.10-9: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to a significant cumulative adverse impact related to hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses.	Mitigation: Implement Mitigation Measure 3.10-2.	Less than Significant
Impact 3.10-10: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to cumulative impacts related to being located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, but would not create a significant hazard to the public or the environment.	None required.	Less than Significant

**TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Hazards and Hazardous Materials (cont.)		
Impact 3.10-11: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to cumulative safety hazards or excessive noise for people residing or working in the project area.	None required.	Less than Significant
Impact 3.10-12: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to cumulative impairment of the implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan.	Mitigation: Implement Mitigation Measure 3.15-1.	Less than Significant
Hydrology and Water Quality		
Impact 3.11-1: Projects facilitated by the Draft 2045 CAP would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.	None required.	Less than Significant
Impact 3.11-2: Projects facilitated by the Draft 2045 CAP would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the basin.	None required.	Less than Significant
Impact 3.11-3: Projects facilitated by the Draft 2045 CAP would not substantially alter the existing drainage pattern of the site or area, including through the alteration of a Federal 100-year flood hazard area or County Capital Flood floodplain; the alteration of the course of a stream or river; or through the addition of impervious surfaces, in a manner which would: (i) result in substantial erosion or siltation on- or off-site; (ii) substantially increase the rate, amount, or depth of surface runoff in a manner which would result in flooding on- or off-site; (iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or (iv) impede or redirect flood flows which would expose existing housing or other insurable structures in a Federal 100-year flood hazard area or County Capital Flood floodplain to a significant risk of loss or damage involving flooding.	None required.	Less than Significant

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Hydrology and Water Quality (cont.)		
Impact 3.11-4: Projects facilitated by the Draft 2045 CAP would not otherwise place structures in Federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements.	None required.	Less than Significant
Impact 3.11-5: Projects facilitated by the Draft 2045 CAP would not, in flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation.	Mitigation: Implement Mitigation Measure 3.10-2.	Less than Significant
Impact 3.11-6: Projects facilitated by the Draft 2045 CAP would not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.	None required.	Less than Significant
Impact 3.11-7: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to cumulative violations of water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.	None required.	Less than Significant
Impact 3.11-8: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to cumulative decreases groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the basin.	None required.	Less than Significant
Impact 3.11-9: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to cumulative alterations to the existing drainage pattern of the site or area.	None required.	Less than Significant
Impact 3.11-10: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to cumulative placement of structures in federal 100-year flood hazard or County Capital Flood floodplain areas which would require additional flood proofing and flood insurance requirements.	None required.	Less than Significant

**TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Hydrology and Water Quality (cont.)		
Impact 3.11-11: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to cumulative conditions of flood hazard, tsunami, or seiche zones, or risk release of pollutants due to project inundation.	Mitigation: Implement Mitigation Measure 3.10-2.	Less than Significant
Impact 3.11-12: The Draft 2045 CAP, as a result of projects facilitated by Draft 2045 CAP measures and actions, would contribute to cumulative conflicts with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.	None required.	Less than Significant
Land Use and Planning		
Impact 3.12-1: Projects facilitated by the Draft 2045 CAP would not cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental impact.	None required.	Less than Significant
Impact 3.12-2: Projects facilitated by the Draft 2045 CAP would not cause or contribute to a significant impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental impact.	None required.	Less than Significant
Noise		
Impact 3.13-1: Projects facilitated by the Draft 2045 CAP could generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	Mitigation Measure 3.13-1: Construction Noise. Construction activities associated with new projects facilitated by the Draft 2045 CAP that occur within 500 feet of noise-sensitive receptors (i.e., residences, parks, schools, historic sites, cemeteries, and recreation areas) shall be evaluated by the project applicant for noise impacts that would result in a 5 dBA increase over existing ambient noise levels at any sensitive receptor. Mitigation measures such as installing temporary sound barriers for construction activities that occur adjacent to occupied noise-sensitive structures; equipping construction equipment with more effective mufflers, sound-insulating hoods or enclosures, vibration dampers, and other Best Available Control Technology (BACT); and reducing non-essential idling of construction equipment to no more than five minutes shall be incorporated into construction activities to reduce construction-related noise.	Significant and Unavoidable

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Noise (cont.)		
Impact 3.13-1 (cont.)	Mitigation Measure 3.13-2: Stationary-Source Noise. For any project that involves a noise-sensitive use within the 65 dBA CNEL contour (i.e., areas in or above 65 dBA CNEL) exposed to project stationary-source noise levels in excess of applicable standards in the Los Angeles County Noise Ordinance, the project applicant shall submit an acoustic analysis prior to project approval. The acoustic analysis shall identify site design features (e.g., setbacks, berms, parapets, equipment enclosures, equipment mufflers, sound walls, or other similar noise control device or noise barrier) and/or required building acoustical improvements (e.g., sound transmission class rated windows, doors, and attic baffling) to ensure compliance with the County's Noise Compatibility Criteria, the California Building Code, and the California Noise Insulation Standards (Title 24 of the California Code of Regulations).	Significant and Unavoidable
Impact 3.13-2: Projects facilitated by the Draft 2045 CAP could generate excessive groundborne vibration or groundborne noise levels.	Mitigation Measure 3.13-3: Construction Vibration. Individual projects that use vibration-intensive construction equipment, such as pile drivers, jackhammers, and vibratory rollers near vibration-sensitive receptors shall be evaluated by the applicant for potential vibration impacts. If construction-related vibration is determined to be perceptible at vibration-sensitive uses (i.e., exceed the County's standard of 0.01 inches per second (in/sec) vibration velocity [within the range of 1 to 100 Hz frequency]), additional requirements shall be implemented during construction, such as the use of less-vibration-intensive equipment or vibration-reduction construction techniques or strategies (e.g., drilled piles to eliminate the use of a vibration-intensive pile driver, increased setback distances).	Significant and Unavoidable
Impact 3.13-3: Projects facilitated by the Draft 2045 CAP could make a cumulatively considerable contribution to a significant cumulative impact related to the generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	Mitigation: Implement Mitigation Measures 3.13-1 and 3.13-2.	Significant and Unavoidable
Impact 3.13-4: Projects facilitated by the Draft 2045 CAP could make a cumulatively considerable contribution to a significant cumulative impact relating to the generation of excessive groundborne vibration or groundborne noise levels from construction activities.	Mitigation: Implement Mitigation Measure 3.13-3. Mitigation Measure 3.13-4: New Development Near Railroad Tracks. New development that occurs within 200 feet of a railroad track (according to the FTA's vibration screening distances) shall be evaluated for potential vibration impacts. The project property owner/developers shall retain an acoustical engineer to conduct an acoustic analysis and identify, where appropriate, site design features and/or required building construction improvements to ensure that vibration impacts would remain below acceptable levels of 0.08 in/sec RMS for residential uses.	Significant and Unavoidable
Population and Housing		
Impact 3.14-1: Projects facilitated by the Draft 2045 CAP would not induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).	None required.	Less than Significant

**TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Population and Housing (cont.)		
<p>Impact 3.14-2: Projects facilitated by the Draft 2045 CAP would not displace substantial numbers of existing people or housing, especially affordable housing, necessitating the construction of replacement housing elsewhere.</p>	None required.	Less than Significant
<p>Impact 3.14-3: Projects facilitated by the Draft 2045 CAP would cause or make a cumulatively considerable contribution to any significant cumulative impact relating to the inducement of substantial unplanned population growth in an area, either directly or indirectly.</p>	None required.	Less than Significant
<p>Impact 3.14-4: Projects facilitated by the Draft 2045 CAP would not cause or make a cumulatively considerable contribution to any significant cumulative impact relating to displacement of substantial numbers of existing people or housing, especially affordable housing, necessitating the construction of replacement housing elsewhere.</p>	None required.	Less than Significant
Transportation		
<p>Impact 3.15-1: The Project, as a result of projects facilitated by the Draft 2045 CAP measures and actions, would conflict with an applicable program plan, ordinance, or policy addressing the circulation system.</p>	<p>Mitigation Measure 3.15-1, Traffic Control Plan: The County shall require project applicants and construction contractors to coordinate with relevant County departments, transit providers, and emergency service providers to develop a traffic control plan to reduce the impacts of construction traffic on transit service, roadway operations, emergency responders, pedestrian and bicycle facilities, and public safety in the surrounding area. (A traffic control plan may not be required for minor construction activities.) The project applicant shall be responsible for monitoring to ensure that the plan is effectively implemented by the construction contractor(s). Measures that may be employed throughout the course of the construction period include, but are not limited, to the following.</p> <ul style="list-style-type: none"> • Provide advance notice of lane and sidewalk closures, durations, and alternative routes to emergency service providers, motorists, bicyclists, and pedestrians. • Provide clearly marked pedestrian detours if any sidewalk or pedestrian walkway closures are necessary. • Provide clearly marked bicycle detours if heavily used bicycle routes must be closed, or if bicyclist safety may otherwise be comprised. • Provide crossing-guards and/or flag persons as needed to avoid traffic conflicts and ensure pedestrian and bicyclist safety. • Locate all stationary equipment as far as possible from areas used heavily by vehicles, bicyclists, and pedestrians. • Use nonskid traffic plates over open trenches to reduce hazards. 	Less than Significant

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Transportation (cont.)		
Impact 3.15-1 (cont.)	<ul style="list-style-type: none"> • Implement traffic control measures to reduce vehicle travel delays through construction zones. • Maintain acceptable response times and performance objectives for emergency response services. • Avoid routing construction traffic through residential areas to the extent feasible. • Prohibit mobilization and demobilization of heavy construction equipment during AM and PM peak traffic hours. • Maintain access for driveways and private roads outside the immediate construction zone by using steel plates or temporary backfill, as necessary. • Provide designated areas for construction worker parking wherever feasible to reduce use of parking on streets or in city center areas. 	
Impact 3.15-2: Projects facilitated by the Draft 2045 CAP would not conflict or be inconsistent with CEQA Guidelines Section 15064.3(b).	None required.	Less than Significant
Impact 3.15-3: The Project, as a result of projects facilitated by the Draft 2045 CAP measures and actions, would substantially increase hazards due to a road design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).	Mitigation: Implement Mitigation Measure 3.15-1.	Less than Significant
Impact 3.15-4: The Project, as a result of projects facilitated by the Draft 2045 CAP measures and actions, would not cause a cumulatively considerable contribution to a significant cumulative impact relating to conflict with an applicable program plan, ordinance or policy addressing the circulation system.	Mitigation: Implement Mitigation Measure 3.15-1.	Less than Significant
Impact 3.15-5: The Project would not cause a cumulatively considerable contribution to a significant cumulative impact relating to conflict or inconsistency with CEQA Guidelines Section 15064.3(b).	None required.	Less than Significant
Impact 3.15-6: The Project, as a result of projects facilitated by the Draft 2045 CAP measures and actions, would not cause a cumulatively considerable contribution to a significant cumulative impact relating to a substantial increase in hazards due to a road design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).	Mitigation: Implement Mitigation Measure 3.15-1.	Less than Significant

**TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Tribal Cultural Resources		
<p>Impact 3.16-1: The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would cause a substantial adverse change in the significance of a tribal cultural resource or of a resource determined by the County, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in Public Resources Code Section 5024.1(c).</p>	<p>Mitigation: Implement Mitigation Measures 3.6-2 through 3.6-6.</p> <p>Mitigation Measure 3.16-1: AB 52 Consultation. Consistent with AB 52, before the release of a negative declaration, mitigated negative declaration, or EIR, the County shall initiate consultation within 14 days of a decision to undertake a project facilitated by Draft 2045 CAP measures or actions. The County shall provide formal notification to the designated contact of, or a tribal representative of, each traditionally and culturally affiliated California Native American tribe that has requested notice. The County shall begin the consultation process within 30 days after receiving a California Native American tribe's request for consultation. The purpose of the consultation shall be to identify sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that meet the definition of tribal cultural resources provided in CEQA Section 21074(a)(1) or Section 21074(a)(2). In addition, the California Native American tribe may request consultation regarding the type of environmental review necessary, the significance of tribal cultural resources, the significance of the project's impacts on the tribal cultural resources, and, if necessary, project alternatives or the appropriate measures for preservation or mitigation.</p> <p>If tribal cultural resources are identified, the County shall implement mitigation measures that could avoid or substantially lessen significant impacts on such resources, including but not limited to the measures recommended in Public Resources Code Section 21084.3, or shall implement alternatives that would avoid significant impacts on the tribal cultural resources. Such measures shall be implemented in consultation with the California Native American tribe.</p>	<p>Less than Significant</p>
<p>Impact 3.16-2: The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would cause a cumulatively considerable contribution to a significant cumulative impact caused by an adverse change in the significance of a tribal cultural resource or of a resource determined by the County, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in Public Resources Code Section 5024.1(c).</p>	<p>Mitigation: Implement Mitigation Measure 3.16-1 and Mitigation Measures 3.6-2 through 3.6-6.</p>	<p>Less than Significant</p>
Utilities and Service Systems		
<p>Impact 3.17-1: Projects facilitated by the Draft 2045 CAP would require or result in the relocation or construction of new or expanded water, wastewater treatment, stormwater drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects.</p>	<p>Mitigation: Implement Mitigation Measures 3.4-1 through 3.4-4; Mitigation Measures 3.5-1 through 3.5-6; Mitigation Measures 3.6-1 through 3.6-10; Mitigation Measure 3.10-2; Mitigation Measures 3.13-1 through 3.13-4; and Mitigation Measure 3.15-1.</p>	<p>Significant and Unavoidable</p>

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Utilities and Service Systems (cont.)		
Impact 3.17-2: Projects facilitated by the Draft 2045 CAP would have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.	None required.	Less than Significant
Impact 3.17-3: Projects facilitated by the Draft 2045 CAP would result in a determination by the wastewater treatment provider which serves or may serve the Project that it has inadequate capacity to serve the Project's projected demand in addition to the provider's existing commitments.	Mitigation: Implement Mitigation Measures 3.4-1 3.4-4; Mitigation Measures 3.5-1 through 3.5-6; Mitigation Measures 3.6-1 through 3.6-10; Mitigation Measure 3.10-2; Mitigation Measures 3.13-1 through 3.13-4; and Mitigation Measure 3.15-1.	Significant and Unavoidable
Impact 3.17-4: Projects facilitated by the Draft 2045 CAP would not generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.	None required.	Less than Significant
Impact 3.17-5: Projects facilitated by the Draft 2045 CAP would cause or contribute a cumulatively considerable contribution to a significant cumulative impact relating to the relocation or construction of new or expanded water, wastewater treatment, stormwater drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects.	Mitigation: Implement Mitigation Measures 3.4-1 through 3.4-4; Mitigation Measures 3.5-1 through 3.5-6; Mitigation Measures 3.6-1 through 3.6-10; Mitigation Measure 3.10-2; Mitigation Measures 3.13-1 through 3.13-4; and Mitigation Measure 3.15-1.	Significant and Unavoidable
Impact 3.17-6: Projects facilitated by the Draft 2045 CAP would not cause or contribute a cumulatively considerable contribution to a significant cumulative impact relating to insufficient water supplies.	None required.	Less than Significant
Impact 3.17-7: Projects facilitated by the Draft 2045 CAP would cause or contribute a cumulatively considerable contribution to a significant cumulative impact relating to inadequate wastewater treatment capacity.	Mitigation: Implement Mitigation Measures 3.4-1 through 3.4-4; Mitigation Measures 3.5-1 through 3.5-6; Mitigation Measures 3.6-1 through 3.6-10; Mitigation Measure 3.10-2; Mitigation Measures 3.13-1 through 3.13-4; and Mitigation Measure 3.15-1.	Significant and Unavoidable

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Utilities and Service Systems (cont.)		
Impact 3.17-8: Projects facilitated by the Draft 2045 CAP would not cause or contribute a cumulatively considerable contribution to a significant cumulative impact relating to the generation of solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.	None required.	Less than Significant
Wildfire		
Impact 3.18-1: Projects facilitated by the Draft 2045 CAP would not substantially impair an adopted emergency response plan or emergency evacuation plan.	Mitigation: Implement Mitigation Measure 3.15-1.	Less than Significant
Impact 3.18-2: Projects facilitated by the Draft 2045 CAP would not, due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and would not thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.	None required.	Less than Significant
Impact 3.18-3: Projects facilitated by the Draft 2045 CAP could require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, composting facilities, power lines, or other utilities) that may exacerbate fire risk or may result in temporary or ongoing impacts on the environment.	Mitigation Measure 3.18-3: Fire Safety During Construction and Operation. Future applicants and/or their contractors shall prepare and implement project-specific fire protection plans for projects located in the VHFHSZ to ensure that wildfire-related hazards are not exacerbated by projects facilitated by the Draft 2045 CAP measures or goals. The applicant shall prepare and submit a fire protection plan to the County for review and approval at least 60 days before the start of construction activities. The fire protection plan shall include or require, but not be limited to, the following measures along with Fire Code compliance, as applicable to address construction and operation: <ul style="list-style-type: none"> • A training module within the pre-construction worker training (e.g., Worker Environmental Awareness training, safety training, fire equipment and procedures) on the specifics of the approved plan for all construction crew members before the start of construction. • List project site roles and responsibilities and identify appropriate emergency notification procedures and site-specific emergency response and evacuation measures and routes that would be followed during emergency situations. All construction vehicles shall have fire suppression equipment. • Instruct construction personnel to park vehicles within roads, road shoulders, graveled areas, and/or cleared areas (i.e., away from dry vegetation) wherever such surfaces are present at the construction site. • Protocol for the project contractor and/or the applicant to perform visual inspections to ensure that all ignition risks are reduced or eliminated before leaving the worksite. Identify fire safety and prevention measures for project-specific infrastructure that can ignite fires, such as power lines, battery storage facilities, and composting facilities. 	Less than Significant

TABLE ES-2 (CONTINUED)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Level of Significance after Mitigation
Wildfire (cont.)		
Impact 3.18-4: Projects facilitated by the Draft 2045 CAP would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.	None required.	Less than Significant
Impact 3.18-5: Projects facilitated by the Draft 2045 CAP could expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires.	Mitigation: Implement Mitigation Measure 3.18-3.	Less than Significant
Impact 3.18-6: Projects facilitated by the Draft 2045 CAP could result in significant cumulative impacts with regard to impairing an adopted emergency response plan or emergency evacuation plan.	Mitigation: Implement Mitigation Measure 3.15-1.	Less than Significant
Impact 3.18-7: Projects facilitated by the Draft 2045 CAP would not, due to slope, prevailing winds, and other factors, exacerbate cumulative wildfire risks, and would not thereby expose project occupants to significant pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.	None required.	Less than Significant
Impact 3.18-8: Projects facilitated by the Draft 2045 CAP could require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, composting facilities, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing cumulative impacts on the environment.	Mitigation: Implement Mitigation Measure 3.18-3.	Less than Significant
Impact 3.18-9: Projects facilitated by the Draft 2045 CAP would not expose people or structures, either directly or indirectly, to significant cumulative risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.	None required.	Less than Significant
Impact 3.18-10: Projects facilitated by the Draft 2045 CAP could expose people or structures, either directly or indirectly, to a significant cumulative risk of loss, injury, or death involving wildland fires.	Mitigation: Implement Mitigation Measure 3.18-3.	Less than Significant

ES.3.2 Significant and Unavoidable Impacts

This PEIR does not speculate on the specific environmental impacts of individual projects that could be facilitated by the Draft 2045 CAP measures and actions. However, impacts of the implementation of specific measures and actions were considered as part of this analysis to the degree that specific information about individual project implementation is known. The timeframe during which the implementation of measures and actions would cause impacts would depend on the specific implementation timing.

Section 15126.2(b) of the CEQA Guidelines requires an EIR (including a PEIR) to describe any significant impacts, including those that can be mitigated but not reduced to less-than-significant levels. The Project would have a significant and unavoidable impact regarding the resource considerations identified in **Table ES-3, Significant and Unavoidable Impacts**.

**TABLE ES-3
SIGNIFICANT AND UNAVOIDABLE IMPACTS**

Resource Consideration	Location of Additional Details
Aesthetics	Section 3.2
The Project, as a result of projects facilitated by the Draft 2045 CAP, would:	
<ul style="list-style-type: none"> • Have a substantial adverse effect on a scenic vista at the Project level (Impact 3.2-1) and cumulatively (Impact 3.2-6). • Be visible from or obstruct views from a regional riding, hiking, or multiuse trail at the Project level (Impact 3.2-2) and cumulatively (Impact 3.2-7). • Substantially damage scenic resources, including, but not limited to, trees, rocks, outcroppings, and historic buildings within a state scenic highway at the Project level (Impact 3.2-3) and cumulatively (Impact 3.2-8). • Substantially degrade the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features and/or conflict with applicable zoning and other regulations of governing scenic quality. (Public views are those that are experienced from a publicly accessible vantage point.) The impact would occur at the Project level (Impact 3.2-4) and cumulatively (Impact 3.2-9). 	
Agriculture and Forestry Resources	Section 3.3
<ul style="list-style-type: none"> • Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use at the Project level (Impact 3.3-1) and cumulatively (Impact 3.3-7). • Conflict with zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract at the Project level (Impact 3.3-2) and cumulatively (Impact 3.3-8). • Involve changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to nonagricultural use or conversion of forest land to non-forest use at the Project level (Impact 3.3-5) and cumulatively (Impact 3.3-11). 	
Air Quality	Section 3.4
The Project, as a result of projects facilitated by the Draft 2045 CAP, would:	
<ul style="list-style-type: none"> • Conflict with or obstruct implementation of the applicable air quality plan at the Project level (Impact 3.4-1) and cumulatively (Impact 3.4-5). • Result in a cumulatively considerable net increase of a criteria pollutant for which the Project region is nonattainment under an applicable federal or state ambient air quality standard (Impact 3.4-2 and Impact 3.4-6). • Potentially expose sensitive receptors to substantial pollutant concentrations associated with localized air pollutant toxic air contaminant (TAC) emissions (Impact 3.4-3a) and cumulatively (Impact 3.4-7). 	

TABLE ES-3 (CONTINUED)
SIGNIFICANT AND UNAVOIDABLE IMPACTS

Resource Consideration	Location of Additional Details
Biological Resources	Section 3.5
<p>The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would:</p> <ul style="list-style-type: none"> • Have a substantial adverse indirect impact (i.e., through habitat modifications) on one or more species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife (CDFW) or U.S. Fish and Wildlife Service (USFWS). This impact would be significant and unavoidable at the Project level (Impact 3.5-2) and cumulatively (Impact 3.5-7). • Have a substantial adverse impact on sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS at the Project level (Impact 3.5-3) and cumulatively (Impact 3.4-8). • Interfere substantially with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. This impact would be significant and unavoidable at the Project level (Impact 3.5-5) and cumulatively (Impact 3.5-10). • Contribute to the cumulative conversion of oak woodlands or other unique native woodlands (Impact 3.5-11). 	
Noise	Section 3.13
<p>The Project, as a result of projects facilitated by the Draft 2045 CAP, could:</p> <ul style="list-style-type: none"> • Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. This impact would be significant and unavoidable at the Project level (Impact 3.13-1) and cumulatively (Impact 3.13-3). • Generate excessive groundborne vibration or groundborne noise levels. This impact would be significant and unavoidable at the Project level (Impact 3.13-2) and cumulatively (Impact 3.13-4). 	
Utilities and Service Systems	Section 3.17
<ul style="list-style-type: none"> • Require or result in the relocation or construction of new or expanded water, wastewater treatment, stormwater drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects at the Project level (Impact 3.17-1) and cumulatively (Impact 3.17-5). • Result in a determination by the wastewater treatment provider which serves or may serve the Project that it has inadequate capacity to serve the Project's projected demand in addition to the provider's existing commitments at the Project level (Impact 3.17-3) and cumulatively (Impact 3.17-7). 	

ES.4 Alternatives

CEQA requires a lead agency to analyze a reasonable range of alternatives to the project that could feasibly attain the basic objectives of the project while substantially reducing or eliminating significant environmental effects. CEQA also requires a PEIR to evaluate a “no project” alternative to allow decision makers to compare the impacts of approving a project with the impacts of not approving it. The alternatives development process, alternatives eliminated from further consideration, and alternatives considered in the PEIR are described in greater detail in Chapter 4, *Alternatives*.

ES.4.1 Alternatives Eliminated from Further Consideration

Alternatives may be eliminated from detailed consideration in an EIR if they fail to meet most of the project objectives, are infeasible, or do not avoid or substantially reduce any significant environmental effects (CEQA Guidelines Section 15126.6[c]). Alternatives that are remote or speculative, or the effects of which cannot be reasonably predicted, also do not need to be considered (CEQA Guidelines Section 15126[f][2]). The potential alternatives listed below were eliminated from further consideration in this PEIR because they failed to meet most of the Project

objectives, were infeasible, and/or did not avoid or substantially reduce any significant environmental effects. See Section 4.3, *Alternatives Rejected from Detailed Consideration*, in Chapter 4, *Alternatives*, for details.

- Carbon Neutrality Target by 2045 Alternative
- More Aggressive Timeline to Carbon Neutrality Alternative
- Minimize Loss of Carbon Sequestration Caused by Development Alternative
- Substantially Reduced Vehicle Miles Traveled Alternative
- Aquatic Impact Avoidance Alternative
- Complete Phase-Out of Oil and Gas Operations by 2030 Alternative
- Limited-Scope CAP Alternative

ES.4.2 Alternatives Analyzed in Detail

The reasonable range of alternatives analyzed in this Recirculated Draft PEIR is summarized below. Three alternatives to the Project are considered in detail. These alternatives were selected for more detailed consideration through the screening process described in greater detail in Section 4.2, *Alternatives Development and Screening*.

ES.4.2.1 No Project Alternative

CEQA Guidelines Section 15126.6(e) requires an EIR to evaluate the impacts of a no project alternative to enable a comparison of the potential environmental consequences that would result with and without the proposed project. In this case, the No Project Alternative examines a scenario in which the County would not approve the Draft 2045 CAP for implementation in the unincorporated areas, and none of the emissions reduction strategies, measures, or actions outlined in the 2045 CAP would be implemented and none of the benefits and co-benefits identified in the 2045 CAP would be realized. Further, the GHG emissions reduction strategies included in the Air Quality Element of the General Plan—known as the 2020 CCAP—expired in 2020. Accordingly, those strategies (which addressed emissions from land use, transportation, building energy, water consumption, and waste generation) would not continue to be implemented.

The No Project Alternative scenario would also include continued implementation of other plans and programs that would have the result of reducing GHG emissions to the extent that such plans and programs were adopted before January 3, 2022, when the Notice of Preparation was published. The No Project Alternative is essentially captured in the Draft 2045 CAP's Adjusted business-as-usual (BAU) forecast, which accounts for future growth under BAU conditions¹ but adjusts for federal, state, and County legislation and regulations that were implemented before

¹ The “business-as-usual, forecast assumes that no action is taken to reduce GHG emissions in the County. 2018 emissions are projected forward using growth indicators such as population, housing, and employment.

development of the Draft 2045 CAP.² Further, efforts to reduce GHG emissions would continue outside the study area—for example, in incorporated areas of Los Angeles County, in adjacent jurisdictions, and in other locations outside the County where land use and related activities are governed by regional, state, or federal agencies, such as the Southern California Association of Governments, California Air Resources Board, U.S. Forest Service, and National Park Service. This alternative would not provide a clear pathway for the County to meet and exceed the statewide 2030 GHG emissions reduction goal identified in SB 32 or to meet the 2045 carbon neutrality goal established by AB 1279.

In addition, the No Project Alternative would not meet any of the Project objectives. For example, the No Project Alternative would not implement the climate action policies of the General Plan (Objective 1); would not provide a road map to achieve GHG reductions to meet the GHG emissions reduction targets (Objective 3); would not encourage sustainable housing production (Objective 4); and would not demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide CEQA streamlining for development projects (“qualified CAP”) (Objective 5). Nonetheless, as required by CEQA, the No Project Alternative has been carried forward for more detailed review.

ES.4.2.2 Alternative 1: Carbon Offset Alternative

Under Alternative 1, in addition to implementing the measures and actions called for by the Draft 2045 CAP, the County would reduce GHG emissions by purchasing carbon offsets. Carbon offset projects could increase or protect carbon sequestration, invest in solar or wind projects, improve water or energy efficiency, capture methane at animal farms or landfills, replace high-global-warming-potential gas use with a gas that has a lower global warming potential, or implement other measures. To achieve the greatest environmental co-benefits to the County, priority would be given, from highest to lowest, to offsets purchased from local projects (within Los Angeles County), regional projects (from within Southern California), projects within California, projects outside of California but within the Pacific Southwest (within Arizona, Hawaii, Utah, or Nevada), and projects elsewhere in the United States.

In January 2022, during the scoping period for this PEIR, the cost of carbon allowances in the California cap-and-trade system was approximately \$28 per metric ton (ClimateWire 2022). The compliance carbon offsets that are allowable in California’s cap-and-trade system tend to be priced about the same as allowances. However, the County would have to purchase and retire carbon offsets from the voluntary market, which is not regulated. Prices in the voluntary carbon market are generally lower, but can vary widely depending on the type, size, and location of the project generating the offset, as well as the protocol or standard under which it was developed. A spot check of over-the-counter reputable offset retailers, conducted in April 2022, reveals current prices for voluntary offsets ranging from approximately \$15 to \$25 per metric ton of carbon

² These adjustments include implementation of the California Energy Commission’s 2019 and 2023 Title 24 building energy efficiency requirements, the Renewable Portfolio Standards (SB 350), the California Department of Resources Recycling and Recovery’s 75 percent waste diversion initiative (AB 341), the Pavley and Advanced Clean Car Standards (AB 1493), and the Low Carbon Fuel Standards (Executive Order S-01-07).

dioxide equivalent (MTCO_{2e}).³ Based on these prices, the 2022 purchase of 1.25 million MTCO_{2e} could range from \$17 million to \$36 million per year. Funding sources would have to be identified, but theoretically could be sourced from the County General Fund, existing or new development fees, or other sources.

ES.4.2.3 Alternative 2: Zero Net Energy Buildings Alternative

A building is a zero net energy (ZNE) building if it is energy-efficient and if the actual energy it consumes annually on a source-energy basis is less than or equal to the on-site renewable generated energy (California Department of General Services 2017). Stated another way, ZNE buildings produce enough renewable energy to meet their own annual energy consumption requirements, thereby reducing the use of nonrenewable energy in the building sector. These buildings achieve ZNE first through high levels of energy efficiency to minimize energy use, then through the addition of on-site renewable power generation and renewable energy storage systems (e.g., batteries).

Energy efficiency measures include building design elements that reduce energy demand such as high-performance building envelopes, air barrier systems, daylighting, sun control and shading design, window selection and glazing, passive solar heating, natural ventilation, and water conservation. Energy use could be managed with efficient equipment and systems, such as energy-efficient lighting; electric lighting controls; high-performing heating, ventilation, and air-conditioning; and energy-conversion devices. Once efficiency measures have been incorporated, the remaining energy needs of the building can be met with on-site renewable energy generation and storage. Common on-site electricity generation strategies include photovoltaic solar panels on rooftops or over surface parking, and solar water heating.

In 2008, the California Public Utilities Commission (CPUC) adopted (and then in 2011, updated) the *California Energy Efficiency Strategic Plan* (CPUC 2008; Engage 360 2011). This strategic plan outlined ambitious goals for the development of ZNE buildings for the 2009 to 2020 time period. In April 2012, Governor Edmund G. Brown Jr. furthered the goals of the California Energy Efficiency Strategic Plan when he issued Executive Order B-18-12, which ordered that all new state buildings and major renovations beginning design after 2025 be constructed as ZNE facilities. The executive order included an interim target for 50 percent of new facilities beginning design after 2020 to be ZNE. Executive Order B-18-12 also directed state agencies to take measures toward achieving ZNE for 50 percent of the square footage of existing state-owned building area by 2025.

Although the strategic plan has reached its sunset, and although Executive Order B-18-12 does not directly apply to local agencies, the goals of both measures remain relevant to the reduction of GHG emissions by local governments. As the 2011 Update to the Strategic Plan recognized (Engage 360 2011):

³ Offset prices offered by four retailers were reviewed on April 11, 2022: atmosfair (<https://www.atmosfair.de/en>); CoolEffect (<https://www.cooleffect.org>), NativeEnergy (<https://native.eco>), and TerraPass (<https://www.terrapass.com>).

Local governments have significant powers that can improve the energy efficiency of new and existing buildings. ...Local governments can be significant energy end users in their own buildings and facilities, from public schools to wastewater treatment plants to City Hall. These facilities provide an opportunity to “lead by example” by improving energy efficiency, reducing CO2 emissions, and cutting government energy bills.

In addition to implementation of the Draft 2045 CAP measures and actions, a Zero Net Energy Buildings Alternative would include the following elements:

- All new residential and commercial construction in unincorporated areas of the County would be ZNE by 2025.
- 50 percent of residential and commercial buildings in unincorporated areas of the County would be retrofitted to ZNE by 2030.
- Projects in unincorporated areas of the County that voluntarily exceed state and local minimum energy codes would be rewarded with expedited permitting and favorable fee structures.
- 50 percent of new major renovations of County buildings would be ZNE by 2025.
- The energy usage footprint of local government buildings would be 50 percent below 2015 levels by 2030.

The Zero Net Energy Buildings Alternative has the potential to reduce GHG emissions and energy-related impacts of the Project, which the County has determined in Section 3.9 and Section 3.7, respectively, to be less than significant. However, this alternative also has the potential to worsen or increase the Project’s potential significant and unavoidable air quality impacts as determined in Section 3.4, related to operational criteria pollutant emissions and localized construction-related health risks from toxic air contaminants, and the Project’s potential significant and unavoidable localized noise impacts as determined in Section 3.13, as a result of the construction of ZNE buildings.

ES.4.2.4 Alternative 3: Lower Targets Alternative

Input received during the public comment period on the Draft EIR suggested an alternative with lower GHG emissions reduction targets than the Draft 2045 CAP released in spring 2022, i.e., a Lower Targets Alternative. The targets suggested by public comments were a 40 percent reduction in 1990 levels by 2030 and a 50 percent reduction in 1990 levels by 2035 to align with state-level, codified targets in place prior to AB 1279.

Under Alternative 3, the GHG emissions reduction targets of the Draft 2045 CAP would be lower than those contained in the current Draft 2045 CAP. These targets would represent the minimum targets needed to “align” with California’s codified statewide targets for 2030 and 2045.

Specifically, the targets under Alternative 3 would be:

- By 2030, reduce emissions to 31 percent below 2015 levels (equivalent to a 40 percent reduction below 1990 levels).
- By 2035, maintain the same level of GHG reductions achieved in 2030.

- By 2045, reduce emissions to 83 percent below 2015 levels (equivalent to an 85 percent reduction below 1990 levels).

These targets compare to the Draft 2045 CAP's targets of a 40 percent reduction below 2015 levels by 2030 (equivalent to a 48 percent reduction below 1990 levels), a 50 percent reduction below 2015 levels by 2035 (equivalent to a 57 percent reduction below 1990 levels), and an 83 percent reduction below 2015 levels by 2045 (equivalent to an 85 percent reduction below 1990 levels).

Note that since the public comments on the Draft EIR were received, with the passage of AB 1279, the State of California has codified the 2045 target of net zero GHG emissions and an 85 percent reduction in direct anthropogenic emissions compared to 1990 levels. AB 1279's targets are more aggressive than those in Executive Order B-55-18 (net zero emissions by 2050) and Executive Order S-3-05 (80 percent below 1990 levels by 2050). Thus, the targets evaluated under Alternative 3 differ slightly from the targets suggested by the commenters. This is also the reason that the 2045 target is the same for Alternative 3 as for the Project, given that the Draft 2045 CAP must align with the statewide targets codified in AB 1279 pursuant to Objective 2 of the Project.

To achieve the GHG emissions reduction targets under Alternative 3, fewer measures and actions would be needed, and/or performance objectives for the measures and actions would be reduced, compared to the Project. This is because the County would need to take fewer actions to reduce GHG emissions to achieve the less aggressive reduction targets. For example, Measure T6, Increase ZEV Market Share, has a 2030 performance goal of a 30 percent ZEV fleetwide percentage for light-duty vehicles in the County; under Alternative 3, this performance objective could be reduced to a 10 percent ZEV market share (or lower). These reduced performance objective could reduce or eliminate the unavoidable adverse impacts of implementation of projects facilitated by the 2045 CAP.

Alternative 3 would meet most of the Project objectives. However, if Alternative 3 is structured to substantially reduce or eliminate the unavoidable adverse impacts of the implementation of projects facilitated by the 2045 CAP, its ability to meet Project Objectives 1, 2, and 5 would be limited compared to the Project. For example, many of the Draft EIR's potential significant and unavoidable impacts arise from the construction and operation of utility-scale solar projects that may be facilitated by Measure ES2, *Procure Zero Carbon Electricity*.⁴ In order to reduce indirect impacts of utility-scale solar projects facilitated by the Draft 2045 CAP, Alternative 3 would need to reduce the performance objectives of Measure ES2. This may conflict with General Plan Policy AQ 3.9 to "Ensure the availability of zero-carbon electricity to serve unincorporated Los Angeles County," in which case Alternative 3 would not meet Objective 1 of the Project.

⁴ Even though the construction of new utility-scale solar projects would not be required to achieve Project targets as proposed, this EIR conservatively assumes that new utility-scale solar projects nonetheless would be facilitated by the 2045 CAP.

Additionally, the 2030 target of 40 percent below 1990 levels is quite far off the emissions reduction trajectory needed to achieve emissions of 83 percent below 2015 levels by 2045, which may mean that Alternative 3 does not align with either County or state goals. Alternative 3 would likely not align with the state’s GHG emissions reduction goals. This would make Alternative 3 inconsistent with Project Objectives 1, 2, and 5 unless Alternative 3 included measures and actions that align with the local strategies listed in the 2022 Scoping Plan (CARB 2022b). Inclusion of such strategies would limit the alternative’s capacity to reduce significant unavoidable impacts compared to the Project, because many of the Project’s potential unavoidable adverse impacts arise from projects facilitated by CAP measures and actions that align with CARB recommended priority GHG reduction strategies.

ES.4.3 Comparison of Alternatives

Recirculated Draft PEIR Section 4.6, *Comparison of Alternatives*, compares the potential environmental impacts of the Project to those of the No Project Alternative, Alternative 1, and Alternative 2. See **Table 4-4** in Chapter 4, *Alternatives*, which provides a comparative summary.

ES.4.4 Environmentally Superior Alternative

The CEQA Guidelines define the *environmentally superior alternative* as that alternative with the least adverse impacts on the project area and its surrounding environment. The No Project Alternative (Alternative 1) is considered the environmentally superior alternative for CEQA purposes because it would avoid all impacts of the Project, even though air pollutant and GHG emissions would be highest among all alternatives under the No Project Alternative. However, the No Project Alternative would fail to meet the basic objectives of the Project. Additionally, selection of the No Project Alternative would result in realization of none of the benefits identified in the Draft 2045 CAP. Because the environmentally superior alternative is the No Project Alternative, the PEIR also must identify an environmentally superior alternative from among the other alternatives. (CEQA Guidelines Section 15126.6[e][2].)

In this PEIR, Alternative 3 is considered the environmentally superior alternative for CEQA purposes because it would result in similar but less impacts in 11 resource areas relative to the Project (aesthetics, agriculture and forestry resources, air quality, biological resources, cultural resources, geology and soils, hazards and hazardous materials, air quality, energy, GHG emissions, hydrology and water quality, land use and planning, utilities and service systems, transportation, and wildfire) and greater impacts than the Project in two resource areas (i.e., energy and GHG emissions). Alternative 3 would have same impacts as the Project with respect to the remaining resources. See Table 4-4 in Chapter 4, *Alternatives*, for details. However, it should be noted that Alternative 3 would likely may only delay impacts as compared to the Project versus lessening these impacts or eliminating them entirely. This is because Alternative 3 has lower targets only for the years 2030 and 2035 compared to the Project; it has the same targets for the year 2045. This means that Alternative 3 would likely facilitate fewer projects through 2030 and 2035 to achieve the lesser targets, resulting in reduced impacts for these years. But Alternative 3 would likely facilitate the same number of projects through 2045, resulting in the same impacts through 2045. Consequently, Alternative 3 would delay the potential impacts but would not completely eliminate or permanently lessen these impacts.

It should be noted that Alternative 3 does have some drawbacks compared to the Project. Alternative 3's ability to meet Project Objectives 1, 2, and 5 would be limited compared to the Project. Additionally, the 2030 target of 40 percent below 1990 levels is quite far off the emissions reduction trajectory needed to achieve emissions of 83 percent below 2015 levels by 2045, which may mean that Alternative 3 does not align with either County or state goals. Finally Alternative 3 may exclude several recommended priority local GHG emissions reduction strategies recommended by the 2022 Scoping Plan to ensure alignment with State climate goals.

ES.5 Areas of Controversy and Issues to Be Resolved

Section 15123(b)(3) of the CEQA Guidelines requires that an EIR identify areas of controversy known to the lead agency. The County has identified areas of controversy as including controversial issues raised in agency and public comments received during scoping, which are included in **Appendix A.5** to this Recirculated Draft PEIR. Briefly, scoping input expressed potential controversy related to: specific elements of the Draft 2045 CAP, including on Strategies 1, 2, 3, 5, 6, 8, and 9; and the impacts of electrification, particularly including health and safety considerations associated with grid reliability in an all-electric future, and the impacts of future renewable energy development (including ground-mounted, utility-scale solar development) and related infrastructure that could be facilitated by Draft 2045 CAP measures and actions.

Additional areas of controversy made known to the County as a result of agency and public comment letters submitted on the original Draft EIR include the potential for projects facilitated by Draft 2045 CAP measures and actions to cause conversion of oak woodlands or other unique native woodlands or wastewater treatment capacity issues, and whether the County should adopt a 2045 CAP with either more or less aggressive GHG reduction targets than the ones proposed.

Section 15123(b)(3) of the CEQA Guidelines also requires that an EIR identify issues to be resolved, which include the choice among alternatives and whether or how to mitigate significant impacts. The following major issues are to be resolved:

- Choose among alternatives.
- Determine whether the recommended mitigation measures should be adopted or modified.
- Determine whether additional mitigation measures should be applied to the Project.

CHAPTER 1

Introduction

1.1 Project Overview

The Draft *2045 Los Angeles County Climate Action Plan* (2045 CAP or Project) would require an amendment to the *Los Angeles County General Plan 2035* (General Plan) to replace the *Unincorporated Los Angeles County Community Climate Action Plan 2020* (2020 CCAP) (County Planning 2015a), which is an implementing component of the General Plan’s Air Quality Element (County Planning 2015b). In early 2020, the County of Los Angeles (County¹) released a public discussion draft of the 2045 CAP (Public Discussion Draft). After receiving comments from stakeholders, the County determined that the Public Discussion Draft would need to be substantially revised and updated. The County issued the initial Draft 2045 CAP in April 2020, and issued a revised Draft 2045 CAP in March 2023.

The following revisions to the Public Discussion Draft are reflected in the Draft 2045 CAP, as revised:

- An updated greenhouse gas (GHG) emissions inventory for 2018.
- New emissions forecasts for 2030, 2035, and 2045.
- New GHG emissions targets for 2030, 2035, and 2045.
- A suite of GHG reduction strategies, measures, and actions revised in response to public comments to be more clear, specific, feasible, and quantifiable.
- A technical modeling appendix to explain the Draft 2045 CAP’s GHG emissions reduction estimates.
- A consideration of environmental justice and equity concerns.
- A new development review consistency checklist to allow future projects to streamline GHG emissions analyses pursuant to the California Environmental Quality Act (CEQA)² as anticipated by CEQA Guidelines Section 15183.5 by using the Draft 2045 CAP.

¹ Please note the use of the following terms in this document and the 2045 CAP: “Unincorporated Los Angeles County” refers to the unincorporated areas of Los Angeles County; “Countywide” refers to Los Angeles County in its entirety, inclusive of both unincorporated areas and all 88 incorporated cities; and “County” refers to County of Los Angeles government.

² This analysis is being prepared in accordance with CEQA (Public Resources Code Section 21000 et seq.) and its implementing regulations, the CEQA Guidelines (California Code of Regulations Title 14, Section 15000 et seq.).

1.2 Purpose of This Document

This program environmental impact report (EIR) is an informational document intended to disclose to the public and decision-makers the environmental impacts of the Draft 2045 CAP, as revised in early 2023. The County is the lead agency under CEQA and is responsible for considering adoption and implementation of the Draft 2045 CAP. The County has prepared this Recirculated Draft Program EIR (Recirculated Draft PEIR) to document its analysis of the environmental impacts of the Draft 2045 CAP described in Chapter 2, *Project Description*, and the alternatives described in Chapter 4, *Alternatives*, to assist the decision-making body in determining whether to approve the Draft 2045 CAP.

The County issued a Draft PEIR for the Draft 2045 CAP on May 25, 2022. After the July 18, 2022 conclusion of the comment period for the Draft PEIR, the County elected to revise the Draft 2045 CAP in response to public and other input received, and to transition the 2045 CAP's aspirational goal of carbon neutrality by 2045 into a target consistent with new legislation, Assembly Bill (AB) 1279, which was enacted in September 2022 after the close of the Draft PEIR comment period.³ This Recirculated Draft PEIR describes changes to the Draft 2045 CAP in Chapter 2, *Project Description*, and analyzes the Project as revised on a resource-by-resource basis throughout Chapter 3, *Environmental Setting, Impacts, and Mitigation Measures*. It also adds content to address issues raised by public comments on the Draft PEIR and makes other minor clarifications. This Recirculated Draft PEIR wholly replaces the May 2022 Draft PEIR.

All resource areas in the CEQA Guidelines Appendix G Environmental Checklist have been studied. See Appendix A.1, *Notice of Preparation and Initial Study*, regarding mineral resources, public services, and recreation. These environmental resource areas have been screened out of detailed review based on evidence that the Draft 2045 CAP would have no impact or a less-than-significant impact on the environment. For the remaining resource considerations, the Initial Study either stated that while significant impacts are not anticipated, the PEIR would provide further evaluation or determined that a potentially significant impact could result. Accordingly, in Chapter 3, *Environmental Setting, Impacts, and Mitigation Measures*, Sections 3.2 through 3.18 document a more detailed analysis as to whether the Draft 2045 CAP would result in significant environmental impacts on aesthetics, agriculture and forestry resources, air quality, biological resources, cultural resources, energy, geology and soils, GHG emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, population and housing, transportation, tribal cultural resources, utilities and service systems, and wildfire.

1.3 Program-Level Analysis and Tiering

This is a program EIR. A *program EIR* is a type of EIR prepared pursuant to CEQA that is used to evaluate a plan or program that has multiple components or actions that are related either geographically; as logical parts in the chain of contemplated actions; in connection with application of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program; or as individual activities carried out under the same authorizing statutory or

³ AB 1279 requires the state to achieve net zero GHG emissions as soon as possible, but no later than 2045 and also requires the state to reduce anthropogenic GHG emissions by 85 percent below 1990 levels.

regulatory authority and having generally similar environmental impacts which can be mitigated in similar ways (Public Resources Code Sections 21068.5 and 21093; California Code of Regulations Title 14, Section 15168[a]). It evaluates the general impacts of the plan or program, but does not examine the potential site-specific impacts of the many individual projects that may be proposed in the future consistent with the plan.

This program EIR describes planned activities that would implement the Draft 2045 CAP and addresses related environmental impacts as comprehensively as possible, based on information reasonably available at the time the Notice of Preparation (NOP) was published. Nonetheless, this program EIR is a “first-tier” document that focuses on the “big picture” and anticipates later environmental review of specific projects.⁴

Later activities facilitated by Draft 2045 CAP goals would be examined in the light of this program EIR to determine whether an additional environmental review is needed. For example, if a later activity would have impacts that are not examined in this PEIR, then preparation of either a project-specific negative declaration or EIR could be appropriate. That later analysis may tier to this PEIR as provided in CEQA Guidelines Section 15152. The County would incorporate the mitigation measures developed in the program EIR into later activities in furtherance of the Draft 2045 CAP’s goals. Alternatively, if the County finds (pursuant to CEQA Guidelines Section 15162) that no subsequent negative declaration or EIR would be required, then the County could approve the activity as being within the scope of the project covered by this program EIR, and no additional environmental review would be required.

1.4 CEQA Process Overview

CEQA requires state and local government agencies to consider the environmental consequences (or “impacts”) of projects over which they have discretionary authority before taking action on those projects. As defined in CEQA Guidelines Section 15378, a *project* is any action that “has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment.” The County considered the impacts of the Draft 2045 CAP in an initial study before determining that an EIR would provide the appropriate level of CEQA documentation for the Project. The Initial Study is included in Appendix A.1, *Notice of Preparation and Initial Study*.

1.4.1 Public Involvement

The Los Angeles County Climate Action Plan (CAP) update project began in summer 2019. The first steps of the update required gathering GHG emissions data and discussing best practice strategies for GHG emissions reductions. The initial analysis of potential emissions reductions began at the end of 2019 along with the initial drafting of an initial study assessment. During this

⁴ *Tiering* is defined in CEQA Guidelines Section 15385 as referring “to the coverage of general matters in broader EIRs (such as on general plans or policy statements) with subsequent narrower EIRs or ultimately site-specific EIRs incorporating by reference the general discussions and concentrating solely on the issues specific to the EIR subsequently prepared. Tiering is appropriate when the sequence of EIRs is from a...program EIR to a program, plan, or policy EIR of lesser scope or to a site-specific EIR.”

time, the notification and consultation process with California Native American tribes began pursuant to Senate Bill (SB) 18 and Assembly Bill (AB) 52, each of which is summarized below.

1.4.1.1 Tribal Consultation Pursuant to Assembly Bill 52

Pursuant to the AB 52 tribal consultation process, CEQA lead agencies consult with tribes that are traditionally and culturally affiliated with the project area and that have requested consultation pursuant to Public Resources Code Section 21080.3.1. The purpose of the consultation is to determine whether a proposed project may result in a significant impact on tribal cultural resources.

In letters dated November 13, 2019, the County sent notification and requests to consult pursuant to AB 52 to five representatives of Native American tribes: Gabrieleno Band of Mission Indians–Kizh Nation; Gabrieleno Tongva San Gabriel Band of Mission Indians; Fernandeño Tataviam Band of Mission Indians; San Manuel Band of Mission Indians; and Tejon Indian Tribe. No responses were received pursuant to AB 52. Therefore, AB 52 tribal consultation is concluded pursuant to Public Resources Code Section 21080.3.2(b).

Copies of all AB 52 outreach communications are included in Appendix G, *Tribal Cultural Resources*.

1.4.1.2 Senate Bill 18 Consultation Process

SB 18 (Government Code Section 65352.3) outlines the process by which cities and counties contact and consult with California Native American tribes before amending or adopting a general plan or specific plan:

- (1) The County must notify the tribes identified on a contact list, maintained for this purpose by the Native American Heritage Commission (NAHC), regarding the opportunity to consult for the purpose of preserving, or mitigating impacts on, cultural places located on land within the County’s jurisdiction that would be affected by the proposed plan adoption or amendment. Tribes generally have 90 days from the date on which they receive notification to request consultation (Government Code Section 65352.3).
- (2) The County must refer the proposed action to those tribes that are on the NAHC contact list and have traditional lands located within the County’s jurisdiction, regardless of whether prior consultation has taken place. The referral must allow a 45-day comment period (Government Code Section 65352).
- (3) The County must send notice of a public hearing at least 10 days before the hearing to tribes that have filed a written request for such notice (Government Code Section 65092).

See Section 3.16.1.3, *Regulatory Setting*, in Section 3.16, *Tribal Cultural Resources*, for additional information about SB 18.

In letters dated November 13, 2019, the County sent notification and requests to consult pursuant to SB 18 to the 24 individuals and tribes identified in Section 3.16.1.2, *Environmental Setting*, in Section 3.16, *Tribal Cultural Resources*. Five responses were received from the individuals/organizations pursuant to SB 18. The Juaneño Band of Mission Indians, Acjachemen Nation-Belardes, Morongo Band of Mission Indians; and San Manuel Band of Mission Indians

indicated that they had no concerns regarding the Project and did not request consultation. The Santa Ynez Band of Chumash Indians also did not request consultation; however, they indicated that should supplementary literature reveal additional information, or if the scope of work were to change, they would like to be notified.

The Coastal Band of Chumash Indians requested consultation. In response, the County sent emails on November 21, 2019, and January 8, 2020, to schedule a consultation meeting with the Coastal Band of Chumash Indians, but no response was received. The County also sent a letter via regular mail and email on March 11, 2020, to once again schedule a consultation call with the Coastal Band of Chumash Indians; however, no response was received.

Copies of all SB 18 outreach communications are included in Appendix G, *Tribal Cultural Resources*.

1.4.1.3 Public Review Draft Climate Action Plan

As mentioned above, the County released a public discussion draft of the 2045 CAP in early 2020. After receiving comments from the public, the County determined the need to substantially revise and update the Public Discussion Draft.

1.4.1.4 Revised Draft 2045 Climate Action Plan

As mentioned above, the County issued the initial Draft 2045 CAP in April 2002, and issued a revised Draft 2045 CAP in March 2023. The Draft 2045 CAP, as revised, is available for review (under separate cover) at the same time as this Recirculated Draft EIR. Briefly, it contains an executive summary and four chapters, as well as Appendices A through G, which provide additional detail on topics covered in the Draft 2045 CAP. Each component of the Draft 2045 CAP is summarized in Section 2.4 of Chapter 2, *Project Description*.

1.4.1.5 Scoping

CEQA Guidelines Section 15083 provides that a “Lead Agency may...consult directly with any person...it believes will be concerned with the environmental effects of the project.” *Scoping* is the process of early consultation with affected agencies and the public prior to completion of a draft EIR. Section 15083(a) states that scoping can be “helpful to agencies in identifying the range of actions, alternatives, mitigation measures, and significant effects to be analyzed in depth in an EIR and in eliminating from detailed study issues found not to be important.” The purpose of scoping is to determine the scope of information and analysis to be included in an EIR, and thus, to ensure that an appropriately comprehensive and focused EIR will be prepared that provides a firm basis for informed decision-making.

The scoping process for this EIR included the following:

- (1) **Notice of Preparation:** The County published and distributed an NOP on December 23, 2021, which was accompanied by an initial study, to advise interested federal, state, regional, and local agencies and the public that a PEIR would be prepared for the Project. The County sent the NOP package to the Governor’s Office of Planning and Research, State Clearinghouse; potentially affected federal, state, and local agencies; and others included on a

distribution list established for this Project that included tribes, nearby property owners, and other interested parties. The NOP and Initial Study also were posted in the office of the County Clerk and online from December 29, 2021, through February 1, 2022. The NOP was published in the following 14 different newspapers throughout Los Angeles County on or before January 3, 2022: *Acton/Agua Dulce News*, *Antelope Valley News*, *Gardena Valley News*, *Glendale Independent*, *La Opinión*, *Sentinel*, *Malibu Times*, *Pasadena Star-News*, *San Gabriel Valley News*, *The Acorn*, *The Argonaut*, *The Daily Breeze*, *The Signal*, and *Whittier Daily*. The NOP, Initial Study, and mailing list are provided in Appendix A of this EIR.

- (2) **Public scoping meeting:** A virtual scoping meeting was held via Zoom on January 13, 2022, at 5:00 p.m. to provide information to the public about the Project and the CEQA process, and to solicit input from attendees. The County provided details about the Draft 2045 CAP (including the Project objectives), as well as the CEQA process (including the timeline and schedule for environmental review, CEQA resource areas, and the purpose of the scoping meeting), and then opened the meeting to receive comments and questions. Information about the location of documents for review, contact information for the receipt of scoping input, and the deadline to provide scoping input also was provided. The presentation slides are provided in Appendix A.4.
- (3) **Scoping period:** The EIR scoping period lasted from January 3, 2022, through and including February 1, 2022. In addition to oral comments made at the public meeting, written input was received from 21 entities. See **Table 1-1**, *Providers of Scoping Letters*. Appendix A.5 presents all input received during the scoping period. Scoping input was received regarding the project description, alternatives, impacts and mitigation generally, aesthetics, agriculture and forestry, air quality, biological resources, cultural resources, energy, geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, population and housing, transportation, tribal cultural resources, utilities and service systems, wildfire, and CEQA procedural comments. Scoping input also was received regarding comments outside the scope of CEQA. All input received pursuant to the scoping period has been considered in the preparation of this EIR.

1.4.2 Draft Program EIR

As previously mentioned, the County issued a Draft Program EIR for the Project on May 25, 2022. The Draft PEIR was informed by the scoping process and was organized pursuant to Article 9 of the CEQA Guidelines (California Code of Regulations Title 14, Sections 15120–15132), which identifies the required contents of an EIR.

**TABLE 1-1
PROVIDERS OF SCOPING LETTERS**

Letter No.	Entity or Organization	Signatory
1	Acton Town Council	Jeremiah Owen, President
2	Association of Rural Town Councils c/o Three Points Liebre Mountain Town Council	Susan Zahnter, Director
3	Ballona Ecosystem Education Project	Kathy Knight, Board Member
4	BizFed Los Angeles County Business Federation	Brissa Sotelo-Vargas (BizFed Chair, Valero), David Fleming (BizFed Founding Chair), Tracy Hernandez (BizFed Founding CEO, IMPOWER, Inc.)
5	Boyle Heights–East Los Angeles Coalition	Sofía G. Quiñonez
6	Building Industry Association of Southern California, Inc., Los Angeles/Ventura Chapter	Carlos Rodriguez, Chief Policy Officer
7	California Department of Fish and Wildlife	Erinn Wilson-Olgin, Environmental Program Manager I, South Coast Region

1.4.3 Recirculated Draft Program EIR

As mentioned, previously, the County has elected to issue this Recirculated Draft PEIR to reflect changes to the Draft 2045 CAP, address issues raised by public comments on the Draft EIR, and make other minor clarifications. This Recirculated Draft PEIR wholly replaces the May 2022 Draft PEIR.

The following list is a summary of the types of changes the Recirculated Draft PEIR has made to the Draft PEIR:

- Revisions across all resource areas to transition the Draft EIR’s analysis of a 2045 aspirational goal to an analysis of a 2045 GHG emissions reduction target consisting of analyses of impacts for the additional period between 2035 and 2045;

- Updates to analysis in each resource section to capture revisions to the GHG reduction strategies, measures, and actions that have been made in the Draft 2045 CAP since the close of the public comment period on the Draft EIR, including: discussion of changes to rooftop solar; expanded discussions of renewable energy goals and performance goals for EV charging stations; updates to the land use types discussions for agricultural and forestry based measures and restoration goals, as well as waste diversion goals; increase of urban tree planting goals; removal of net-zero water ordinance; and clarification that the Draft 2045 CAP is not a land use planning document;
- Analysis of an offsite GHG emissions reduction program;
- New mitigation measures added for Air Quality, Biological Resources, Utilities and Service Systems, and Wildfire;
- Changes to impact findings for Biological Resources and Utilities and Service Systems; and
- Description and analysis of a new Lower Targets Alternative as Alternative 3, which, if adopted, would lower the GHG emissions reduction targets relative to the 2045 CAP. The targets included in Alternative 3 would represent the minimum targets needed to “align” with California’s codified statewide targets for 2030 and 2045.

1.4.4 Agency and Public Review

As required by CEQA, this Recirculated Draft PEIR is being made available for agency and public review and comment for a period of at least 45 days. Copies were provided to the State Clearinghouse for circulation to interested state agencies. Printed copies of the Recirculated Draft PEIR and electronic copies of all appendices and all documents referenced in the Recirculated Draft PEIR are available for public review during normal hours at the following libraries:

A. C. Bilbrew Library
150 E. El Segundo Blvd.
Los Angeles, CA 90061

Hacienda Heights Library
16010 La Monde St.
Hacienda Heights, CA 91745

Acton Agua Dulce Library
33792 Crown Valley Road
Acton, CA 93510

La Crescenta Library
2809 Foothill Blvd.
La Crescenta, CA 91214

Charter Oak Library
20540 E. Arrow Highway, Suite K
Covina, CA 91724

Stevenson Ranch Library
25950 The Old Road
Stevenson Ranch, CA 91381

East Los Angeles Library
4837 E. 3rd St.
Los Angeles, CA 90022

Topanga Library
122 N. Topanga Canyon Blvd.
Topanga, CA 90290

A digital copy of the Recirculated Draft PEIR is available on the Project website at <https://planning.lacounty.gov/long-range-planning/climate-action-plan/documents/>. A printed copy of the Recirculated Draft PEIR is available for public review by appointment during normal business hours at the County Department of Regional Planning’s headquarters office (320 W. Temple Street, Los Angeles, CA 90012).

Notification of the availability of the Recirculated Draft PEIR and information about how to access it were sent directly to potentially affected agencies; the County Clerk; and the tribal entities identified in Section 6.4, *Entities Consulted and Recipients of the Recirculated Draft PEIR*, of Chapter 6, *Report Preparation*. Notice of the availability of the Recirculated Draft PEIR also was published on the Department of Regional Planning’s CEQA Notice web page, the website of the County Clerk, and in the 14 newspapers of general circulation noted above.

Please submit any written comments on the Recirculated Draft PEIR to the following address:

Los Angeles County Department of Regional Planning
 Attention: Thuy Hua
 320 West Temple Street, 13th Floor
 Los Angeles, CA 90012
 Email: climate@planning.lacounty.gov

The County will review all substantive comments received during the review period on the Recirculated Draft PEIR and provide written responses in a Final PEIR. As noted above, this Recirculated Draft PEIR wholly replaces the previously issued Draft PEIR. In light of the number and nature of Project changes described in Chapter 2 and other information added to the Draft PEIR, ***comments on the May 2022 Draft PEIR will not be included or responded to in the Final PEIR***. Comments on the May 2022 Draft PEIR, though part of the administrative record, do not require a written response in the Final PEIR; ***new comments must be submitted on the Recirculated Draft PEIR*** (See CEQA Guidelines section 15088.5(f)(1)). As such, the Final PEIR will provide responses only to comments submitted in response to the Recirculated Draft PEIR. The Final PEIR will be made available to agencies and the public, and will provide a basis for agency decision-making.

1.4.5 Final Program EIR

After the end of the Recirculated Draft PEIR’s public review period, the County will prepare a Final PEIR for consideration by the public and County decision-makers. The Final PEIR will include a list of commenters, comments, and recommendations received on the Recirculated Draft PEIR either verbatim or in summary; written responses to significant environmental points raised in the review and consultation process from comments received; and revisions to the Recirculated Draft PEIR made in response to the comments received. The Planning Commission and Board of Supervisors will review and consider the Final PEIR before taking action on the Project.

1.4.6 Findings of Fact and Decision-Making

After publication of the Final PEIR and before deciding whether to certify the PEIR or approve, modify, or deny the Project, the County will make the following findings regarding each significant impact on the environment, consistent with Public Resources Code Section 21081:

- (1) Changes or alterations have been required in, or incorporated into, the Project that mitigate or avoid the significant effects on the environment;
- (2) Those changes or alterations are within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that other agency; or

- (3) Specific economic, legal, social, technological, or other considerations, including considerations for the provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or alternatives identified in the PEIR.

With respect to any significant impacts that are subject to the third finding, the County must find that specific overriding economic, legal, social, technological, or other benefits of the Project outweigh its potential to result in significant unavoidable adverse impacts on the environment before it could approve the Project.

1.5 Scope and Organization of this Program EIR

This Recirculated Draft PEIR is organized as follows:

- **Executive Summary.** The Executive Summary summarizes the Project, purpose and uses of the PEIR, Project impacts and mitigation measures, alternatives to the Project and impact comparisons, the CEQA process, and areas of controversy and issues to be resolved.
- **Chapter 1, *Introduction*.** The Introduction introduces the Project; the purpose of the PEIR; the CEQA process, including discussion of program-level review and tiering; and the organization of the PEIR.
- **Chapter 2, *Project Description*.** The Project Description describes the Project area, Project purpose and objectives, and the background for the Draft 2045 CAP and its relationship to the General Plan; the contents of the Draft 2045 CAP; existing emissions; the Draft 2045 CAP's GHG emissions inventory and reduction potential; GHG emissions reduction strategies and actions included in the Draft 2045 CAP, and explanations of how the Draft 2045 CAP would be implemented, how monitoring and reporting would occur in connection with the Draft 2045 CAP; and identification of the approvals that would be required (including environmental review and consultation).
- **Chapter 3, *Environmental Setting, Impacts, and Mitigation Measures*.** Chapter 3 introduces the environmental analysis and provides a detailed evaluation of potential impacts of the Draft 2045 CAP on aesthetics, agriculture and forestry resources, air quality, biological resources, cultural resources, energy, geology and soils, GHG emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, transportation, tribal cultural resources, utilities and service systems, and wildfire. Each resource section describes the relevant environmental and regulatory setting, significance criteria considered, and methodology and significance thresholds used, and documents the analysis of potential impacts.
- **Chapter 4, *Alternatives*.** Chapter 4 describes the alternatives development and screening process and outcome, describes the potential alternatives carried forward for detailed analysis as well as those that were rejected from detailed consideration, compares the alternatives analyzed in detail (including the No Project Alternative), and discusses the environmentally superior alternative.
- **Chapter 5, *Other CEQA Considerations*.** Chapter 5 documents the County's consideration of significant unavoidable impacts, significant irreversible environmental changes, and growth-inducing impacts that may result if the Draft 2045 CAP is approved and implemented.

- **Chapter 6, *Report Preparation*.** Chapter 6 identifies those who participated in the preparation of the PEIR, including County personnel and consultants, as well as the organizations and persons who were consulted during the preparation of the PEIR.
- **Chapter 7, *References*.** Chapter 7 identifies the reference materials relied upon in preparing the PEIR, except for the project-specific technical studies prepared specifically for the Project, which are included in the Appendices. Copies of cited reference material are available in the locations identified in the Notice of Availability of the Recirculated Draft PEIR.
- **Appendices.** The Appendices contain Project-specific documents relating to the scoping process and Project-specific technical information relied upon in the drafting of the PEIR. They include the following:
 - Appendix A: Scoping
 - Appendix B: Air Quality
 - Appendix C: Biological Resources
 - Appendix D: Greenhouse Gas Emissions
 - Appendix E: Noise
 - Appendix F: Transportation
 - Appendix G: Tribal Cultural Resources

This page intentionally left blank

CHAPTER 2

Project Description

2.1 Project Area

The Project area for the Draft 2045 Los Angeles County Climate Action Plan (2045 CAP) consists only of the unincorporated areas of Los Angeles County¹. These areas occupy approximately 1,696,000 acres, or 2,650 square miles (approximately 65 percent of the total land area of Los Angeles County), as identified in **Figure 2-1, Map of Unincorporated Los Angeles County**.² Los Angeles County is geographically diverse:

- The unincorporated areas in northern Los Angeles County are covered by large amounts of sparsely populated land, including Angeles National Forest and parts of Los Padres National Forest and the Mojave Desert.
- In western Los Angeles County, the unincorporated areas include Marina del Rey and the Santa Monica Mountains.
- The unincorporated areas in southern and eastern Los Angeles County consist of many non-contiguous land areas, often referred to as the *unincorporated urban islands*, including areas in South Los Angeles, East Los Angeles, and the San Gabriel Valley.

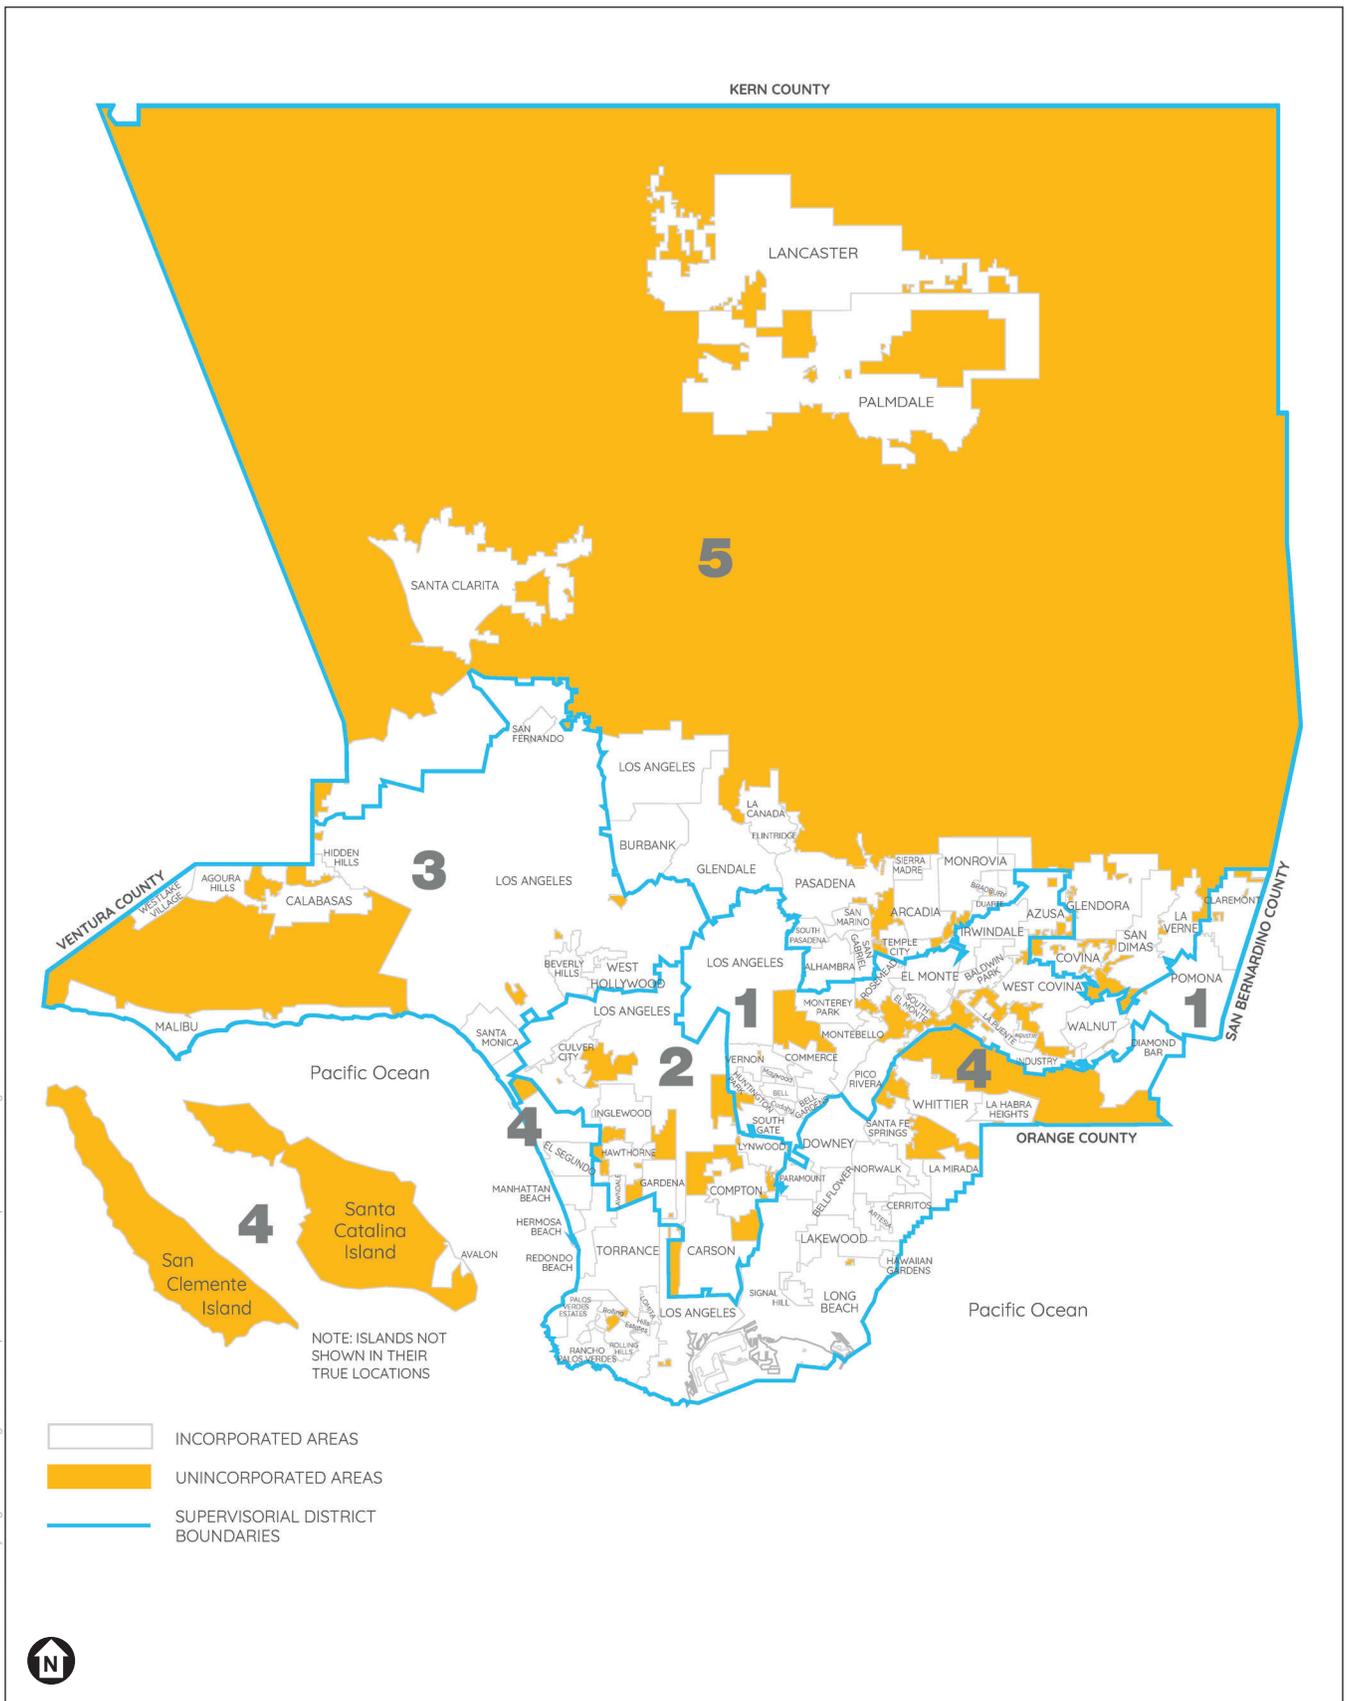

2.2 Background and Relation to County Plans and Statewide Emissions Targets

2.2.1 Relationship to the Los Angeles County General Plan

The *Los Angeles County General Plan 2035* (General Plan) provides the policy framework and establishes the long-range vision for how and where the unincorporated areas grow (County Planning 2015a). It establishes goals, policies, and programs to foster healthy, livable, and sustainable communities and provides a guide for future land use, housing, and economic development.

¹ This document and the 2045 CAP use the following terminology: “Unincorporated Los Angeles County” refers to the unincorporated areas of Los Angeles County; “Countywide” refers to Los Angeles County in its entirety, inclusive of both unincorporated areas and all 88 incorporated cities; and “County” refers to County of Los Angeles government.

² This area has been selected as the most operationally feasible extent of implementation. In these locations, future projects facilitated by the strategies and measures of the Draft 2045 CAP could be made subject to Los Angeles County’s land use oversight and enforcement authority, which does not extend to land, facilities, or infrastructure outside the unincorporated areas. Although the County encourages other governmental entities to undertake actions to reduce greenhouse gas emissions within their own jurisdictions, any such other actions would not enable the County to create emissions reductions.

Los Angeles County 2045 Climate Action Plan (2045 CAP)

Figure 2-1
Map of Unincorporated Los Angeles County

The General Plan includes a Planning Areas Framework, which serves as a mechanism for local communities to work with County to develop plans that respond to their unique and diverse characters.

The County adopted the *Unincorporated Los Angeles County Community Climate Action Plan 2020* (2020 CCAP) in 2015 as a component of the Air Quality Element of the General Plan (County Planning 2015b). The 2020 CCAP aligned with General Plan goals, policies, and programs, as well as several other existing programs in Los Angeles County. The 2020 CCAP was the first attempt to set greenhouse gas (GHG) emissions reduction goals in Los Angeles County. Although the targets for the 2020 CCAP were ultimately not fully met, the plan provided a road map for implementing the County’s GHG reduction measures. The 2020 CCAP actions were implemented through County Code amendments and programs related to climate action.

The Draft 2045 CAP builds on previous work and defines new reduction targets beyond the year 2020. The Draft 2045 CAP details the GHG emissions reduction vision and goals of *OurCounty: Los Angeles Countywide Sustainability Plan* for the unincorporated Los Angeles County and would implement the GHG emissions reduction strategies of the General Plan’s Air Quality Element. Specifically, the Draft 2045 CAP, once approved, would replace the existing implementation strategy of the Air Quality Element (i.e., the 2020 CCAP, as described above). The Draft 2045 CAP is a policy document intended to reduce community-wide GHG emissions and would support development already allowed under the General Plan’s land use assumptions as identified in the Land Use Element and 2021-2029 Revised County of Los Angeles Housing Element (2021–2029 Housing Element). No changes to General Plan land use designations, zoning, or land use, or specific projects, are proposed as part of the Draft 2045 CAP.

Approval of the Draft 2045 CAP would result in updates to the General Plan as shown in **Table 2-1, Proposed Updates to the Los Angeles County General Plan 2035 Air Quality Element**, and **Table 2-2, Proposed Updates to the Los Angeles County General Plan 2035 Implementation Program**. In both tables, updates are shown in tracked changes, with additions underlined and deletions shown in ~~strike-out~~. The proposed update to the General Plan Air Quality Element sets the policy foundation for actions in the Draft 2045 CAP that were not previously addressed in the 2020 CCAP.

**TABLE 2-1
PROPOSED UPDATES TO THE LOS ANGELES COUNTY GENERAL PLAN 2035 AIR QUALITY ELEMENT**

Topic	Policy
Goal AQ 1: Protection from exposure to harmful air pollutants.	
Air Pollutants	Policy AQ 1.1: Minimize health risks to people from industrial toxic or hazardous air pollutant emissions, with an emphasis on local hot spots, such as existing point sources affecting immediate sensitive receptors.
	Policy AQ 1.2: Encourage the use of low or no volatile organic compound (VOC) emitting materials.
	Policy AQ 1.3: Reduce particulate inorganic and biological emissions from construction, grading, excavation, and demolition to the maximum extent feasible.
	Policy AQ 1.4: Work with local air quality management districts to publicize air quality warnings, and to track potential sources of airborne toxics from identified mobile and stationary sources.
	Policy AQ 1.5: Encourage new residential buildings and other sensitive land uses in areas with high levels or localized air pollution be designed to achieve good indoor air quality through landscaping, ventilation systems, or other measures.

**TABLE 2-1 (CONTINUED)
PROPOSED UPDATES TO THE LOS ANGELES COUNTY GENERAL PLAN 2035 AIR QUALITY ELEMENT**

Topic	Policy
Goal AQ 2: The reduction of air pollution and mobile source emissions through coordinated land use, transportation, and air quality planning.	
Air Quality, Land Use, & Transportation	Policy AQ 2.1: Discourage the siting of sensitive uses, such as residences, schools, senior centers, daycare centers, medical facilities, or parks with active recreational facilities within proximity to major sources of air pollution, such as freeways.
	Participate in, and effectively e- Coordinate with local, regional, state, and federal agencies the to development and implementation of community and regional air quality plans and programs.
	Support the conservation of natural resources and vegetation to reduce and mitigate air pollution impacts. Encourage land use development and design that integrates GHG emission reduction strategies through increasing residential density and infill development, especially affordable housing and diversity of destinations near High-Quality Transit Areas.
	Policy AQ 2.4: Coordinate with different agencies to minimize fugitive dust from different sources, activities, and uses.
	Policy AQ 2.5: Expand infrastructure to accommodate transit and alternative modes of transportation to serve residential, employment, and recreational trips.
	Policy AQ 2.6: Explore the feasibility of parking strategies that limit or remove parking minimums to reduce vehicular trips.
	Policy AQ 2.7: Encourage and support the development and implementation of Zero-Emission technology and infrastructure in an equitable manner to ensure access to all County residents.
	Policy AQ 2.8: Electrify entire County light-duty and bus and shuttle fleet vehicles.
	Policy AQ 2.9: Encourage the use of zero-emission and near-zero-emission construction, agriculture, and manufacturing equipment and freight decarbonization technologies, such as charging infrastructure for freight vehicles.
Goal AQ 3: Implementation of plans and programs to address the impacts of climate change and reduce greenhouse gas emissions through climate action and mitigation.	
Climate Change Climate Action and Mitigation	Policy AQ 3.1: Facilitate the implementation and maintenance of the LA County Climate Action Plan to ensure that the County reaches its climate change action and greenhouse gas emission reduction goals.
	Policy AQ 3.2: Reduce energy consumption in existing buildings and County operations through energy efficiency retrofits.
	Reduce water consumption in County operations. Encourage carbon sequestration through sustainable agricultural practices and conservation of agricultural and working lands, forest lands, and wildlands.
	Policy AQ 3.4: Participate in local, regional and state programs to reduce greenhouse gas emissions.
	Encourage energy conservation in new development and municipal operations. Require the full electrification of new development. Encourage the retrofit of existing development to achieve full electrification.
	Policy AQ 3.6: Support local rooftop solar facilities power generation on new and existing buildings and parking lots.
	Policy AQ 3.7: Support and expand urban forest programs within the unincorporated areas.
	Develop, implement, and maintain countywide climate change adaptation strategies to ensure that the community and public services are resilient to climate change impacts.
	Policy AQ 3.8: Develop a sunset strategy for all oil and gas operations that prioritizes disproportionately affected communities.
	Policy AQ 3.9: Ensure the availability of zero-carbon electricity to serve unincorporated Los Angeles County.
Policy AQ 3.10: Reduce the life-cycle carbon intensity of building materials and phase out the use of high-global-warming-potential refrigerants.	

TABLE 2-1 (CONTINUED)
PROPOSED UPDATES TO THE LOS ANGELES COUNTY GENERAL PLAN 2035 AIR QUALITY ELEMENT

Topic	Policy
Goal AQ 3 (cont.)	
<u>Climate Action and Mitigation (cont.)</u>	<u>Policy AQ 3.11: Promote sustainable waste practices through public outreach, educational programs, and mandates.</u>
	<u>Policy AQ 3.12: Ensure and promote the availability of organics waste and recyclable materials diversion services for beneficial use, such as composting, energy production, and upcycling.</u>
	<u>Policy AQ 3.13: Collaborate with environmental organizations, businesses, schools, and the general public to promote the importance of climate action.</u>

TABLE 2-2
PROPOSED UPDATES TO THE LOS ANGELES COUNTY GENERAL PLAN 2035 IMPLEMENTATION PROGRAM

Program No.	Program Description	General Plan Goals and Policies	Lead and Partner Agencies	Time Frame
AQ-1	PACE Financing Program Pursuant to AB 811, establish a countywide property assessed clean energy (PACE) financing program to provide municipal financing for energy and water efficiency and renewable energy projects on private property.	Air Quality Element: Policies AQ 3.2, AQ 3.3 Public Services and Facilities Element: Policy 6.5 Economic Development Element: Policy ED 1.2	Lead: ISD	Years 1-2
AQ-2	Climate Change Adaptation Program <ul style="list-style-type: none"> Develop strategies to address the impacts of climate change related but not limited to agriculture, public health, ecosystems and natural resources, energy, infrastructure, and emergency management. Climate change adaptation strategies may be conducted sequentially, starting with the evaluation of threats, vulnerability and risk assessments, identification of mitigation actions, and implementation. Investigate short and long-term funding mechanisms. Amend the General Plan accordingly to incorporate proposed climate change adaptation actions. 	Air Quality Element: Policy AQ 3.8	Lead: CEO	Years 1-2
<u>AQ-1</u>	Climate Action Plan Implementation <ul style="list-style-type: none"> Implement the actions identified in the <u>Los Angeles County Climate Action Plan to reduce greenhouse gas emissions.</u> 	<u>Air Quality Element:</u> <u>Goal AQ 2, AQ 3</u>	<u>Lead: Chief Executive Office, Department of Public Health, Department of Parks and Recreation, Department of Regional Planning, Fire, Internal Services Department, Public Works</u>	<u>Ongoing</u>

NOTES:

- The PACE Financing Program (existing program number AQ-1) is being deleted because the County of Los Angeles's contracts with Renovate America and Renew Financial expired on April 3, 2020. The County stopped approving new assessment contracts through PACE Funding Group on May 13, 2020. The County continues to work with its PACE administrators to manage existing assessment contracts and provide appropriate consumer protection.
- The Climate Change Adaptation Program (existing program number AQ-2) is being deleted because the Safety Element Update developed adaptation strategies to address climate change impacts and because the OurCounty Sustainability Plan strategically addressed this directive.

2.2.2 Relationship to the OurCounty Sustainability Plan

OurCounty: Los Angeles Countywide Sustainability Plan (OurCounty Sustainability Plan) is a regional sustainability plan for Los Angeles County (Los Angeles County Chief Sustainability Office 2019). It includes a cross-cutting set of goals, strategies, actions, and targets for creating a resilient, inclusive, and sustainable County. The OurCounty Sustainability Plan does not supersede the General Plan, which addresses land use policy in the unincorporated areas. Instead, it is a forward-looking strategic plan toward a common sustainability vision for the 88 cities and unincorporated areas of Los Angeles County. It adds to the County’s strategic framework for creating a more equitable and resilient community in the face of climate change.

The Draft 2045 CAP shares the OurCounty Sustainability Plan’s vision for the region (see Section 3.12, *Land Use and Planning*, for details). However, the Draft 2045 CAP differs in that it is part of the General Plan’s Air Quality Element and focuses specifically on reducing GHG emissions from municipal and community activities projected for the unincorporated areas of Los Angeles County.

2.2.3 Relationship to Statewide Emissions Targets

In 2005, Governor Arnold Schwarzenegger’s Executive Order (EO) S-3-05 established the 2050 statewide GHG emissions reduction target of 80 percent below 1990 levels, expressing the intent of the State of California to address the issue of climate change through reducing GHG emissions. In 2015, Governor Edmund G. Brown Jr.’s EO B-30-15 established the 2030 statewide GHG reduction target of 40 percent below 1990 levels.

Following EO S-3-05, in 2006, the California Legislature enacted Assembly Bill (AB) 32 (Health and Safety Code Section 38500 et seq.). AB 32 required the California Air Resources Board (CARB) to design and implement feasible and cost-effective emissions limits, regulations, and other measures, such that statewide GHG emissions would be reduced to 1990 levels by 2020 (representing a 25 percent reduction in emissions). CARB identified a GHG emissions reduction target of 15 percent from 2010 levels by 2020 for local governments (municipal and community-wide) and noted that successful implementation of the plan would rely on local governments’ land use planning and urban growth decisions, as local governments have primary authority for planning, zoning, approving, and permitting land development to accommodate population growth and the changing needs of their jurisdictions.

In 2016, Senate Bill (SB) 32 and its companion bill, AB 197, amended the Health and Safety Code by establishing a new climate pollution reduction target of 40 percent below 1990 levels by 2030 and included provisions to ensure that the benefits of state climate policies would accrue to disadvantaged communities. Further, in 2018, Governor Brown signed EO B-55-18, committing California to total, economy-wide carbon neutrality by 2045.³

³ *Carbon neutrality* means “net zero” emissions of GHGs. In other words, it means that GHG emissions generated by sources such as transportation, power plants, and industrial processes must be less than or equal to the amount of carbon dioxide that is stored, both in natural sinks and through mechanical sequestration.

In December 2017, CARB approved the 2017 Climate Change Scoping Plan Update (2017 Scoping Plan), which outlines the proposed framework of action for achieving the 2030 target of a 40 percent reduction in GHG emissions relative to 1990 levels as codified by SB 32 (CARB 2017). The primary focus areas identified in the 2017 Scoping Plan are associated with energy, transportation, agriculture, water, waste management, natural and working lands, short-lived climate pollutants, green buildings, and cap-and-trade.

In August 2022, the California Legislature enacted a package of significant climate legislation that included a codification of the state’s goal to reach net-zero GHG emissions by 2045. With the passage of AB 1279, California has established a policy to reach net zero GHG emissions by no later than 2045. AB 1279 also establishes a policy for California to cut anthropogenic GHG emissions by 85 percent compared to 1990 levels. Governor Gavin Newsom signed AB 1279 into law on September 16, 2022.

On December 15, 2022, CARB adopted the 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan) in response to AB 1279 and other legislation (CARB 2022a). The 2022 Scoping Plan lays out a path to achieve carbon neutrality no later than 2045 and to reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045, as directed by AB 1279. The actions and outcomes in the plan will achieve the following: significant reductions in fossil fuel combustion by deploying clean technologies and fuels; further reductions in short-lived climate pollutants; support for sustainable development; increased action on natural and working lands to reduce emissions and sequester carbon; and the capture and storage of carbon (CARB 2022b). Appendix D of the 2022 Scoping Plan includes recommendations for local government actions to align with the state’s climate goals, focusing on local GHG emissions reduction strategies (CARB 2022c). According to CARB, “local government actions are crucial for supporting attainment of the state’s climate goals” and local government leadership is “critical to implementing State-level measures to address GHG emissions associated with transportation and the built environment.”

Table 2-3, *Sources of Statewide Emissions Targets*, summarizes legislation regarding statewide emissions targets. These targets inform the project purpose and objectives described below.

**TABLE 2-3
SOURCES OF STATEWIDE EMISSIONS TARGETS**

Legislation/Regulation	Year	Summary
EO S-3-05	2005	Established the State of California’s first GHG emissions reduction targets: reduction to 2000 levels by 2010, 1990 levels by 2020, and 80 percent below 1990 levels by 2050.
AB 32, Global Warming Solutions Act	2006	Codified EO S-3-05 and authorized CARB to implement a comprehensive, multi-year program to reduce GHG emissions from all sources throughout the state.
AB 32 Scoping Plan	2008	Described the long-term road map for achieving the AB 32 target of reducing emissions to 1990 levels by 2020.
SB 535, Greenhouse Gas Reduction Fund and Disadvantaged Communities	2012	Required that 25 percent of all funds allocated pursuant to an investment plan for the use of state monies collected through a Cap-and-Trade program be allocated to projects that benefit disadvantaged communities and that at least 10 percent of these be spent on projects located in disadvantaged communities.

TABLE 2-3 (CONTINUED)
SOURCES OF STATEWIDE EMISSIONS TARGETS

Legislation/Regulation	Year	Summary
EO B-30-15	2015	Established a GHG emissions reduction target of 40 percent below 1990 levels by 2030.
SB 32, California Global Warming Solutions Act of 2006 and its companion bill, AB 197: emissions limit	2016	Codified EO B-30-15.
2017 Scoping Plan Update	2017	Described the long-term road map for achieving the SB 32 target of reducing emissions by 40 percent below 1990 levels by 2030.
AB 398, California's Cap-and-Trade Program	2017	Extended the state's Cap-and-Trade Program through 2030, a key strategy for reducing GHG emissions in California. The Cap-and-Trade Program sets total allowable emissions for facilities and creates carbon offset credits through carbon sequestration projects.
EO B-55-18	2018	Established a target of carbon neutrality (net zero GHG emissions) by 2045.
AB 1279	2022	Codified EO B-55-18's 2045 carbon neutrality target and established an additional GHG emissions target to reduce anthropogenic emissions 85 percent below 1990 levels by 2045.
2022 Scoping Plan	2022	Describes the long-term, sector-by-sector road map for achieving the AB 1279 targets of carbon neutrality and reducing anthropogenic emissions by 85 percent below 1990 levels, both by 2045.

NOTES:

2022 Scoping Plan = 2022 Scoping Plan for Achieving Carbon Neutrality; AB = Assembly Bill; CARB = California Air Resources Board; EO = Executive Order; GHG = greenhouse gas; SB = Senate Bill

SOURCE: Draft 2045 CAP, Table 1-2.

2.3 Project Purpose and Objectives

2.3.1 Project Purpose

While several state-level initiatives will help reduce GHG emissions, they alone will not be sufficient to meet the 2030 target mandated by SB 32. In response to the State of California's efforts and to ensure that the County contributes its fair share to statewide GHG reductions, the County is preparing the Draft 2045 CAP. The Draft 2045 CAP identifies measures to effectively meet GHG emissions reduction targets for 2030, 2035, and 2045 that are consistent with the state's targets and legislative actions described above. The Draft 2045 CAP also includes an aspirational GHG emissions reduction goal of carbon neutrality by 2045. The Draft 2045 CAP furthers the vision and goals of the OurCounty Sustainability Plan and implements the GHG emissions reduction strategies of the General Plan's Air Quality Element. Specifically, the Draft 2045 CAP, once finalized and approved, would replace the existing implementation strategy of the Air Quality Element, known as the *Unincorporated Los Angeles County Community Climate Action Plan 2020* (referred to in this environmental impact report [EIR] as the "2020 CCAP"). The 2045 CAP would serve as the overarching implementation plan through the 2045 target year and is expected to be updated every five years to reflect new advances and technologies in GHG emissions reduction strategies.

2.3.2 Project Objectives

The objectives of the Draft 2045 CAP are as follows:

1. Identify detailed programs, actions, and performance goals to achieve the climate action policies of the General Plan.
2. Identify GHG emissions reduction targets tailored to the unincorporated County that closely align with state and County climate goals.
3. Provide a road map for reducing GHG emissions to achieve the County’s GHG emissions reduction targets.
4. Encourage sustainable housing production at all levels of affordability, including increasing housing densities near transit to the extent allowed in the General Plan.
5. Demonstrate a level of GHG emissions below which the County would have less than cumulatively considerable GHG impacts for future environmental review projects and provide California Environmental Quality Act (CEQA) streamlining for development projects (serve as a “qualified CAP”) via the 2045 Climate Action Plan Consistency Review Checklist (2045 CAP Checklist).

2.3.3 Qualified Greenhouse Gas Emissions Reduction Plan

CEQA Guidelines Section 15183.5(b) stipulates that project-specific environmental documents can find that project-level GHG emissions would not be cumulatively considerable if the project complies with the requirements of a qualified GHG emissions reduction plan. The project-specific environmental document must identify those requirements in the GHG emissions reduction plan that applies to the project, and if they are not otherwise enforceable, must incorporate those requirements as project-specific mitigation measures. To meet the requirements of CEQA Guidelines Section 15183.5(b), a qualified GHG emissions reduction plan must do the following:

1. Quantify existing and projected GHG emissions resulting from activities within a defined geographic area.
2. Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable.
3. Identify and analyze sector-specific GHG emissions within the plan’s geographic area.
4. Specify measures or a group of measures, including performance standards, that if implemented at the project-by-project basis, would collectively achieve the specified emissions level.
5. Establish a mechanism to monitor the plan’s progress toward achieving the GHG emissions level and to require amendment if the plan is not achieving specified levels.
6. Be adopted in a public process following environmental review.

Table 2-4, *Consistency of the Draft 2045 Climate Action Plan with CEQA Guidelines Section 15183.5(b)(1) for Years 2030, 2035, and 2045*, summarizes the consistency of the Draft 2045 CAP with these requirements. As shown in Table 2-4, upon certification of this EIR and

approval of the plan, the 2045 CAP would meet the requirements of a qualified GHG emissions reduction plan per CEQA Guidelines Section 15183.5(b)(1).

**TABLE 2-4
CONSISTENCY OF THE DRAFT 2045 CLIMATE ACTION PLAN
WITH CEQA GUIDELINES SECTION 15183.5(B)(1) FOR YEARS 2030, 2035, AND 2045**

CEQA Guidelines Section 15183.5(b)(1) Requirement	2045 Draft CAP Consistency
(A) Quantify greenhouse gas emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area.	Consistent. The Draft 2045 CAP includes a 2015 baseline GHG emissions inventory, a 2018 GHG emissions inventory update, and projections of 2030, 2035, and 2045 emissions. GHG emissions for all of these years include emissions associated with all activities occurring within the boundaries of the unincorporated areas of Los Angeles County. The inventories and forecasts were prepared pursuant to the <i>Global Protocol for Community-scale GHG Emission Inventories</i> (World Resources Institute et al. 2021a, 2021b). Further, the inventories and forecasts include sources over which the County has some level of jurisdictional control or influence (such as building energy use) and exclude those sources over which the County has no jurisdictional control or influence (such as military vehicles and power plants). This information is contained in Chapter 2, Appendix A, and Appendix B of the Draft 2045 CAP.
(B) Establish a level, based on substantial evidence, below which the contribution to greenhouse gas emissions from activities covered by the plan would not be cumulatively considerable.	Consistent. The Draft 2045 CAP establishes targets for 2030, 2035, and 2045. The Draft 2045 CAP identifies a GHG emissions reduction target for the year 2030 of 40% below baseline 2015 levels. This is equivalent to 48% below 1990 levels within unincorporated areas of Los Angeles County. Compared to the statewide target of 40% below 1990 levels by 2030 pursuant to SB 32, the Draft 2045 CAP's 2030 target is more stringent than the statewide target. Consistency with the 2017 Scoping Plan and SB 32 is an appropriate metric by which to determine the significance of the Draft 2045 CAP's GHG emissions through 2030. As stipulated by CEQA Guidelines Section 15064.4(b)(3), a lead agency "may consider a project's consistency with the state's long-term climate goals or strategies" when determining the significance of a project's cumulative GHG emissions impacts. Therefore, the Draft 2045 CAP's 2030 target represents the level below which GHG emissions would not be cumulatively considerable in the year 2030. The Draft 2045 CAP also identifies a GHG emissions reduction target for the year 2045 of 83% below baseline 2015 levels, which is equivalent to 85% below 1990 levels. Compared to the statewide target of 85% below 1990 levels by 2045 pursuant to AB 1279, the Draft 2045 CAP's 2045 target is aligned with the statewide target. Consistency with the 2022 Scoping Plan and AB 1279 is an appropriate method of determining that the Draft CAPs 2045 GHG emissions are not cumulatively considerable. Finally, the Draft 2045 CAP includes a 2035 GHG emissions reduction target of 40% below baseline 2015 levels, which is equivalent to 57% below 1990 levels. This 2035 target puts the County on a path to achieve both its 2045 target and its long-term aspirational goal of carbon neutrality by 2045, consistent with the state's 2045 target as stipulated in AB 1279. Consequently, pursuant to CEQA Guidelines Section 15064.4(b)(3), the Draft 2045 CAP's 2035 target represents the level below which GHG emissions would not be cumulatively considerable through the year 2035.
(C) Identify and analyze the greenhouse gas emissions resulting from specific actions or categories of actions anticipated within the geographic area.	Consistent. The Draft 2045 CAP identifies 10 strategies, 26 measures, and numerous implementing actions to reduce GHG emissions within unincorporated areas of Los Angeles County to achieve the 2030, 2035, and 2045 targets. These strategies and measures also put the County on a path toward its 2045 aspirational goal of carbon neutrality. They address emissions in the sectors of stationary energy, transportation, water, waste, industrial process and product use, and agriculture and forestry. This information is contained in Chapter 3 and Appendix E of the Draft 2045 CAP.

TABLE 2-4 (CONTINUED)
CONSISTENCY OF THE DRAFT 2045 CLIMATE ACTION PLAN
WITH CEQA GUIDELINES SECTION 15183.5(B)(1) FOR YEARS 2030, 2035, AND 2045

CEQA Guidelines Section 15183.5(b)(1) Requirement	2045 Draft CAP Consistency
<p>(D) Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level.</p>	<p>Consistent. The Draft 2045 CAP quantifies the GHG emissions reduction potential of strategies, measures, and additional implementing actions to reduce GHG emissions within unincorporated areas of Los Angeles County to achieve the 2030, 2035, and 2045 targets. The Draft 2045 CAP also identifies how, if these measures were implemented on a project-by-project basis, the measures collectively would achieve the 2030, 2035, and 2045 targets. This is demonstrated through quantitative GHG emissions modeling as detailed in Appendix B of the Draft 2045 CAP.</p> <p>The Draft 2045 CAP includes a preponderance of mandatory (versus voluntary) measures and actions, measures that address the largest GHG emissions sources (such as building energy use and transportation), a focus on core measures that are likely to reduce large amounts of emissions, transparency in methods of quantification (see Appendix B of the Draft 2045 CAP), and no reliance on voluntary carbon offsets.</p> <p>Based on a quantitative analysis, the Draft 2045 CAP is anticipated to result in more than 1.5 million MTCO₂e of GHG emission reductions by 2030, which is equivalent to a 47% reduction in 2015 baseline emissions levels and a 54% reduction in 1990 emissions levels for the County, exceeding the 2030 target of a 40% reduction in 2015 levels. As such, implementation of the Draft 2045 CAP would result in lower emissions than an equivalent state target (40% emissions reduction in 1990 levels by 2030).</p> <p>The Draft 2045 CAP also is anticipated to result in more than 1.9 million MTCO₂e of GHG emissions reductions by 2035, which is equivalent to a 59% reduction in 2015 baseline emissions levels and a 64% reduction in 1990 emissions levels for the County, exceeding the 2035 target of a 50% reduction in 2015 levels.</p> <p>Finally, the Draft 2045 CAP also is anticipated to result in nearly 2.9 million MTCO₂e of GHG emissions reductions by 2045, which is equivalent to a 83% reduction in 2015 baseline emissions levels and a 85% reduction in 1990 emissions levels for the County, meeting the 2045 target of a 83% reduction relative to 2015 levels. The Draft 2045 CAP therefore achieves the County's 2030, 2035, and 2045 GHG emissions reduction targets. Further, the Draft 2045 CAP demonstrates substantial progress toward achieving the County's aspirational goal of carbon neutrality by 2045.</p>
<p>(E) Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels.</p>	<p>Consistent. The Draft 2045 CAP includes an Implementation Plan (see Chapter 4 of the Draft 2045 CAP), which contains performance indicators and targets for all GHG reduction measures. The Implementation Plan also includes details regarding funding and financing strategies and a list of available and expected funding sources, along with a table for monitoring and reporting progress on the measures and their implementing actions. The Draft 2045 CAP also includes a process to update the CAP every five years to adjust existing and incorporate new measures and technologies that would further the County's efforts toward meeting its GHG emissions targets and long-term aspirational goal of carbon neutrality by 2045. This information is contained in Chapter 4 and Appendix E of the Draft 2045 CAP.</p>
<p>(F) Be adopted in a public process following environmental review.</p>	<p>Consistent. The County has prepared this Draft EIR for the Draft 2045 CAP and is circulating both for public review and comment. The County would consider the environmental review record prior to deciding whether to certify the EIR or approve the 2045 CAP at a noticed public meeting.</p>

NOTES:

2017 Scoping Plan = 2017 Climate Change Scoping Plan Update; CEQA = California Environmental Quality Act; Unincorporated Los Angeles County = unincorporated areas of Los Angeles County; Draft 2045 CAP = 2045 Los Angeles County Climate Action Plan; EIR = environmental impact report; EO = Executive Order; GHG = greenhouse gas; County = County of Los Angeles government; MTCO₂e = metric tons of carbon dioxide equivalent; SB = Senate Bill

SOURCES: Draft 2045 CAP, including Appendices A, B, E, and F; World Resources Institute et al. 2021a, 2021b

The Draft 2045 CAP is consistent with the requirements for a qualified GHG emissions reduction plan pursuant to CEQA as identified in Table 2-4 for the years 2030 and 2035. If the Final EIR is certified and the Draft 2045 CAP is adopted, then the 2045 CAP may be used to streamline the GHG analysis for future projects facilitated by Draft 2045 CAP measures and actions pursuant to CEQA Guidelines Section 15183.5(b)(1). CEQA review of projects that are consistent with the GHG reduction strategies and targets in the 2045 CAP may take advantage of CEQA streamlining on a project-by-project basis.

2.4 Contents of the 2045 Climate Action Plan

The Draft 2045 CAP contains an executive summary and four chapters, as well as Appendices A through G, which provide additional detail on topics covered in the Draft 2045 CAP. Published under separate cover, the Draft 2045 CAP is available for public review and comment concurrently with the Draft EIR. A summary of each component of the Draft 2045 CAP is presented below.

- **Executive Summary:** The executive summary includes a synopsis of the Draft 2045 CAP, including its goals, GHG inventories, and business-as-usual (BAU) forecasts⁴; new 2030 and 2035 targets, and its long-term aspirational goal for 2045; and an overview of the Draft 2045 CAP’s strategies for achieving the targets.
- **Chapter 1—Introduction:** This chapter provides a summary of the latest climate change science and regulations, and discusses policies implemented since the 2020 CCAP was adopted. Chapter 1 also includes a section on social equity, and summarizes prior County planning efforts related to climate change, including the OurCounty Sustainability Plan and the recently completed Los Angeles County Climate Vulnerability Assessment.
- **Chapter 2—GHG Emissions Inventory, Forecasts, and Reduction Targets:** This chapter presents the results of the 2010, 2015, and 2018 GHG inventories and the emissions forecasts for 2030, 2035, and 2045. It also presents a 1990 GHG emissions backcast⁵ as it relates to the Draft 2045 CAP’s emission reduction targets for 2030, 2035, and 2045. The chapter includes a discussion of each emissions sector and its major sources of GHG emissions and describes how existing state and County standards and regulations are expected to affect emissions forecasts. Lastly, the chapter establishes the Draft 2045 CAP’s GHG emissions targets for 2030, 2035, and 2045, along with its aspirational goal of carbon neutrality for 2045.
- **Chapter 3—GHG Emissions Reduction Strategies, Measures, and Actions:** This chapter describes the strategies, measures, and actions the County would implement to achieve its reduction targets, covering topics such as energy, transportation, solid waste, and natural resources. A timeline for implementation is provided, along with estimated GHG emissions reductions for each future target year. Details of quantification methods and assumptions are provided in a technical appendix. The Draft 2045 CAP includes 10 overarching strategies and 25 measures, each of which has one or more implementing actions. The general definitions of “strategy,” “measure,” and “action” are as follows:
 - *Strategy:* An overall, sector-level goal of the Draft 2045 CAP. Strategies are broad, aiming for overarching goals within each emissions sector. For example, “Decarbonize the Energy Supply” is a strategy (i.e., Strategy 1).

⁴ The “business-as-usual” or BAU forecast assumes that no action is taken to reduce GHG emissions in Los Angeles County. 2018 emissions are projected forward using growth indicators such as population, housing, and employment.

⁵ A *backcast* is an estimation method that, similar to a forecast, projects activities and emissions from a current year into the past based on proxy data and known trends including population, housing, and employment.

- *Measure*: A focused, sub-sector-specific program and goal that include performance standards designed to be quantified for GHG emissions reductions. Measures support strategies and are to be achieved through individual implementing actions. For example, “Procure Zero-Carbon Electricity” is a measure (i.e., Measure ES2, supporting Strategy 1). The quantitative GHG emissions reduction analysis is provided primarily at the measure level.
- *Action*: A specific policy, program, or tool that would be implemented for each measure. Actions are intended to be implemented in a coordinated manner to make meaningful progress toward the associated measure and strategy. For example, “Complete enrollment of the community in the Clean Power Alliance’s (CPA’s) 100% Green Power option or Southern California Edison’s (SCE’s) Green Rate option” is an action (i.e., Action ES2.2 associated with Measure ES2 and Strategy 1).
- **Chapter 4—Implementation and Monitoring**: This chapter includes the Draft 2045 CAP’s implementation and monitoring program, outlining for each GHG emissions reduction measure the specific actions to be taken, the needs for operational and capital resources, policy and regulatory changes, and the department and/or other entities responsible for implementation. The implementation plan includes performance indicators for each measure (and select actions) that would be used to track progress toward achieving each future target, which would be monitored on an annual basis. This chapter also summarizes CEQA provisions and any development project review requirements for CEQA streamlining.
- **Appendix A—Greenhouse Gas Accounting Methods, Business as Usual Forecast, and Emission Reduction Targets**: This appendix includes revised inventories for 2015 and 2018; backcasting methods to 2010 and 1990; assumptions for the BAU forecast; and a derivation of the 2045 CAP’s aspirational goal for GHG emissions reduction.
- **Appendix B—Emissions Forecasting and Reduction Methods**: This appendix includes assumptions for the Adjusted BAU forecast⁶ and assumptions and quantification methods for emissions reduction strategies and measures.
- **Appendix C—Prior and Current County Actions on Climate Change**: This appendix includes a description of the County’s past and current activities on climate change.
- **Appendix D—Planning Area Profiles**: This appendix provides an overview of each of the 11 planning areas as outlined in the General Plan and provides information about them from a climate action perspective, identifying “Key Climate Actions” for each area.
- **Appendix E—Implementation Details**: This appendix provides implementation details on each of the measures and actions presented in Chapter 3 of the 2045 CAP.
- **Appendix F—2045 Climate Action Plan Consistency Review Checklist**: This appendix includes the consistency review checklist for new development.
- **Appendix G—Funding Sources**: This appendix includes a list of potential funding sources for implementing the 2045 CAP.
- **Appendix H—Consistency with the 2022 Scoping Plan**: This appendix the 2045 CAP with CARB’s recommendations for local governments contained in the 2022 Scoping Plan.

⁶ The Adjusted BAU forecast accounts for future growth under BAU conditions but makes adjustments for federal, state, and County legislative regulations that were implemented before the development of the Draft 2045 CAP.

2.5 Draft 2045 Climate Action Greenhouse Gas Inventory, Future Emissions, Targets, and Greenhouse Gas Reduction Potential

2.5.1 Baseline 2015 and Updated 2018 Greenhouse Gas Inventories

As shown in **Table 2-5, 2010, 2015, and 2018 Greenhouse Gas Inventories for the Unincorporated County**, GHG emissions in unincorporated areas of Los Angeles County in 2010 totaled 6.0 million metric tons of carbon dioxide equivalent (MTCO_{2e}),⁷ which equates to 5.7 MTCO_{2e} per County resident and 4.6 MTCO_{2e} per service population (SP) (i.e., residents plus employees). In 2015, the baseline year for the Draft 2045 CAP selected for consistency with the OurCounty Sustainability Plan and the General Plan, the unincorporated County's GHG emissions totaled 5.5 million MTCO_{2e}, which equates to 5.2 MTCO_{2e} per County resident and 4.2 MTCO_{2e} per SP. In 2018, emissions were 5.2 million MTCO_{2e}, representing a 6 percent decline from 2015 baseline levels; this is equivalent to 4.8 MTCO_{2e} per County resident and 3.8 MTCO_{2e} per SP.

**TABLE 2-5
2010, 2015, AND 2018 GREENHOUSE GAS INVENTORIES FOR THE UNINCORPORATED COUNTY**

Emissions Sector	GHG Emissions (MTCO _{2e})		
	2010	2015	2018
Stationary Energy	2,146,743	1,908,637	1,698,809
Transportation	3,015,442	2,811,779	2,708,758
Waste	564,503	469,997	469,382
IPPU	243,456	253,529	239,505
AFOLU	60,860	60,860	60,860
<i>Total GHG Emissions</i>	6,031,003	5,531,155	5,173,240
Population	1,057,194	1,058,871	1,082,365
Employment	244,745	255,287	261,612
Service Population (Population + Employment)	1,301,939	1,314,158	1,343,977
GHG Emissions per Capita	5.7	5.2	4.8
GHG Emissions per Service Population	4.6	4.2	3.8

NOTES:

AFOLU = agriculture, forestry, and other land use; GHG = greenhouse gas; IPPU = industrial processes and product use; MTCO_{2e} = metric tons of carbon dioxide equivalent

SOURCE: Draft 2045 CAP Appendix A.

Emissions in the inventories were included for five major sectors: stationary energy; transportation; waste; industrial processes and product use; and agriculture, forestry and other land use. These emissions are associated with a variety of sources, including direct combustion of fossil fuels, purchased electricity, transportation (gasoline and diesel), solid waste landfilling, potable water use,

⁷ To account for the global warming potential of different GHGs, emissions are often quantified and reported as carbon dioxide equivalents (CO_{2e}). For example, methane is a much more potent GHG than carbon dioxide (CO₂) with 28 times the global warming potential as CO₂; one ton of methane is equivalent to 28 tons of CO_{2e}.

wastewater treatment, and materials. These sources are described in greater detail in Appendix A of the Draft 2045 CAP. The largest sector of emissions in 2015 was transportation at 51.3 percent, followed by stationary energy at 34.5 percent; waste contributed 8.5 percent, followed by industrial processes and product use at 4.6 percent, and finally agriculture, forestry and other land use at 1.1 percent. Table 2-5 presents emissions for 2010, 2015, and 2018 for the unincorporated area.

2.5.2 Emissions Forecasts

The Draft 2045 CAP includes forecasts of GHG emissions for the future target years of 2030, 2035, and 2045. Two forecast scenarios were prepared: a “business-as-usual” or BAU forecast, and an “Adjusted” BAU forecast. The BAU forecast represents how emissions could change in the future if no federal, state, regional, or local action is taken. For the Draft 2045 CAP, the BAU scenario accounts for implementation of the Southern California Association of Governments (SCAG) 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), the most current available RTP/SCS with a complete data set at the time of forecasting, which affects vehicle trips and vehicle miles traveled (SCAG 2016). The Adjusted BAU forecast accounts for the influence of adopted federal, state, and regional regulations, policies, and actions on GHG emissions within the unincorporated areas. These actions include the California Energy Commission’s 2019 and 2023 Title 24 building energy efficiency requirements, the Renewable Portfolio Standards (SB 350), the California Department of Resources Recycling and Recovery (CalRecycle) 75 percent waste diversion initiative (AB 341), the Pavley and Advanced Clean Car Standards (AB 1493), and the Low Carbon Fuel Standards (EO S-01-07). **Table 2-6, *Business-as-Usual and Adjusted Business-as-Usual Greenhouse Gas Emissions Forecasts for Unincorporated Los Angeles County***, presents GHG emissions forecasts for 2030, 2035, and 2045.

**TABLE 2-6
BUSINESS-AS-USUAL AND ADJUSTED BUSINESS-AS-USUAL GREENHOUSE GAS EMISSIONS FORECASTS
FOR UNINCORPORATED LOS ANGELES COUNTY**

Emissions Sector	BAU Forecast (MTCO ₂ e)			Adjusted BAU Forecast (MTCO ₂ e)		
	2030	2035	2045	2030	2035	2045
Transportation	2,784,518	2,815,094	2,876,247	2,205,885	2,080,234	1,993,281
Stationary Energy	1,681,160	1,721,212	1,820,612	1,502,306	1,341,401	1,018,793
Waste	451,919	454,097	482,489	451,919	454,097	482,489
IPPU	259,605	267,981	284,731	259,605	267,981	284,731
AFOLU	60,860	60,860	60,860	60,860	60,860	60,860
<i>Total GHG Emissions</i>	<i>5,238,062</i>	<i>5,319,243</i>	<i>5,524,939</i>	<i>4,480,574</i>	<i>4,204,572</i>	<i>3,840,154</i>

NOTES:

AFOLU = agriculture, forestry, and other land use; BAU = business-as-usual; GHG = greenhouse gas; IPPU = industrial processes and product use; MTCO₂e = metric tons of carbon dioxide equivalent

SOURCE: Draft 2045 CAP Appendices A and B.

2.5.3 Greenhouse Gas Emissions Reduction Targets and Goals

The County evaluated a series of options for GHG emissions reduction targets during development of the OurCounty Sustainability Plan. The targets selected represent the County’s commitment to doing its fair share and meeting its requirements to help California achieve its ambitious statewide GHG targets. See **Table 2-7**, *State of California Greenhouse Gas Targets*.

**TABLE 2-7
STATE OF CALIFORNIA GREENHOUSE GAS TARGETS**

Target Year	GHG Emissions Target	Corresponding Legislation
2020	1990 levels	Assembly Bill 32, the California Global Warming Solutions Act (2006)
2030	40% below 1990 levels	Senate Bill 32, the Global Warming Solutions Act (2006)
2045	85% below 1990 levels (anthropogenic emissions) Net zero ^a	Assembly Bill 1279, the California Climate Crisis Act (2022)

NOTES:

GHG = greenhouse gas

^a *Net zero* means that emissions of GHGs to the atmosphere are balanced by removals of GHGs over a period of time, as determined by the California Air Resources Board. In other words, it means that GHG emissions generated by sources such as transportation, power plants, and industrial processes must be less than or equal to the amount of carbon dioxide that is removed from the atmosphere, both in natural sinks (such as trees) and through mechanical sequestration (such as direct air capture).

The Draft 2045 CAP’s 2030 GHG emission reduction target was selected based on guidance provided in the 2017 Scoping Plan and was developed to demonstrate consistency with the statewide 2030 target shown in Table 2-7. The Draft 2045 CAP’s 2030 target is based on a reduction from 2015 baseline levels and is equal to 40 percent below 2015 emissions (3.3 million MTCO_{2e}). This compares to the County’s 2030 BAU forecast of 5.2 million MTCO_{2e}. A 40 percent reduction below 2015 levels is also equivalent to a 48 percent reduction below the County’s 1990 GHG emissions levels, which is more stringent than the state target of a 40 percent reduction below 1990 levels by 2030.

The Draft 2045 CAP’s 2035 GHG emission reduction target was selected based on guidance provided in both the 2017 Scoping Plan and the 2022 Scoping Plan and was chosen as a milestone target to put the County on the trend to achieve a long-term aspirational goal of carbon neutrality by 2045. This target was developed to demonstrate consistency with the pathway needed to achieve the statewide 2045 target shown in Table 2-7. The Draft 2045 CAP’s 2035 target is based on a reduction from 2015 baseline levels and is equal to 50 percent below 2015 emissions (2.8 million MTCO_{2e}). This compares to the County’s 2035 BAU forecast of 5.3 million MTCO_{2e}. A 50 percent reduction below 2015 levels is also equivalent to a 57 percent reduction below the County’s 1990 GHG emissions levels.

The Draft 2045 CAP’s 2045 GHG emission reduction target was selected based on guidance provided in the 2022 Scoping Plan and was developed to demonstrate consistency with the statewide 2045 target for anthropogenic emissions shown in Table 2-7. The Draft 2045 CAP’s 2045 target is based on a reduction from 2015 baseline levels and is equal to 83 percent below

2015 emissions (958,000 MTCO_{2e}). This compares to the County’s 2045 BAU forecast of 5.5 million MTCO_{2e}. An 83 percent reduction below 2015 levels is also equivalent to an 85 percent reduction below the County’s 1990 GHG emissions levels, which in turn is equivalent to the state target of reducing anthropogenic emissions to 85 percent below 1990 levels by 2045.

Table 2-8, *Greenhouse Gas Emissions Targets and Goals for the Draft 2045 Climate Action Plan and the OurCounty Sustainability Plan*, compares the Draft 2045 CAP’s targets for 2030 and 2035, along with its aspirational 2045 goal, and the OurCounty Sustainability Plan targets for each future year considered.

TABLE 2-8
GREENHOUSE GAS EMISSIONS TARGETS AND GOALS FOR THE DRAFT 2045 CLIMATE ACTION PLAN AND THE OURCOUNTY SUSTAINABILITY PLAN

Year	2045 CAP (Unincorporated County only)	OurCounty Sustainability Plan (Unincorporated County and Cities)	GHG Emissions (MTCO _{2e}) (Unincorporated County)
2025	N/A	25% below 2015 levels	4,148,366
2030	40% below 2015 levels	N/A	3,318,693
2035	50% below 2015 levels	50% below 2015 levels	2,765,578
2045	83% below 2015 levels (85% below 1990 levels) Carbon neutrality ^a	Carbon neutrality by 2045 for County operations (by 2050 Countywide)	958,088

NOTES:

2045 CAP = 2045 Los Angeles County Climate Action Plan; GHG = greenhouse gas; MTCO_{2e} = metric tons of carbon dioxide equivalent; N/A = not applicable; OurCounty Sustainability Plan = *OurCounty: Los Angeles Countywide Sustainability Plan*

^a The Draft 2045 CAP includes an aspirational goal, rather than a target, of carbon neutrality by 2045.

SOURCE: Draft 2045 CAP, including Appendices A and B.

Consistency with the CARB Scoping Plan and the state’s legal GHG emissions reduction targets is an appropriate metric by which to determine the significance of the Draft 2045 CAP’s GHG emissions. CEQA Guidelines Section 15064.4(b)(3) states that a lead agency “may consider a project’s consistency with the state’s long-term climate goals or strategies” when determining the significance of a project’s impacts.” Additionally, in *Center for Biological Diversity v. Department of Fish and Wildlife* (2015) 62 Cal.4th 204, the California Supreme Court sanctioned the use of such a threshold: The court stated that assessing a project’s GHG impacts based on a “consistency with a GHG emission reduction plan” threshold of significance is legally permissible under CEQA.

The Draft 2045 CAP’s 2030 target of 40 percent below 2015 levels aligns with the statewide 2030 target as codified in SB 32 and both the 2017 Scoping Plan and the 2022 Scoping Plan. This is because the County’s 2030 target of 40 percent below 2015 levels is equivalent to a 48 percent reduction below 1990 levels, which exceeds the State of California’s target of 40 percent below 1990 levels. The County’s emissions in 2015 are estimated to have been 12 percent lower than 1990 emissions; this compares to statewide emissions, which were 2.3 percent higher in 2015 than in 1990 (CARB 2014, 2021). Consequently, the Draft 2045 CAP is more stringent than the state target both when comparing to 1990 levels and when comparing to per-capita emissions

levels.⁸ The Draft 2045 CAP's 2030 target also sets the County on a trend to achieve California's 2045 and 2050 GHG emissions reduction targets.

The Draft 2045 CAP's 2030 target is derived using the 2017 Scoping Plan's recommendations for local land use development to contribute their "fair share" of emissions reductions to the statewide GHG target for 2030. This is also consistent with the Association of Environmental Professionals (AEP) 2016 white paper recommendation for "Substantial Progress" thresholds for land use development to show consistency with statewide targets (AEP 2016). Consequently, pursuant to CEQA Guidelines Section 15064.4(b)(3), the Draft 2045 CAP's 2030 target represents the level below which GHG emissions would not be cumulatively considerable through the year 2030.

The Draft 2045 CAP's 2035 target of 50 percent below 2015 levels puts the County on a path to achieve the statewide 2045 target as stipulated in AB 1279. This is because the County's 2035 target of 50 percent below 2015 levels is equivalent to a 57 percent reduction below 1990 levels, which exceeds the state's target of 40 percent below 1990 levels by 2030. Consequently, pursuant to CEQA Guidelines Section 15064.4(b)(3), the Draft 2045 CAP's 2035 target represents the level below which GHG emissions would not be cumulatively considerable through the year 2035.

The Draft 2045 CAP's 2045 target of 83 percent below 2015 levels aligns with the statewide 2045 target, as codified in AB 1279 and the 2022 Scoping Plan. This is because the County's 2045 target of 83 percent below 2015 levels is equivalent to an 85 percent reduction below the County's 1990 levels, which aligns with the State of California's target of 85 percent below 1990 levels. Consequently, the Draft 2045 CAP's target is equivalent to the state target. The Draft 2045 CAP's 2045 target also sets the County on a trend to achieve California's 2045 carbon neutrality target. Consequently, pursuant to CEQA Guidelines Section 15064.4(b)(3), the Draft 2045 CAP's 2045 target represents the level below which GHG emissions would not be cumulatively considerable through the year 2045.

The Draft 2045 CAP's 2045 aspirational goal of carbon neutrality aligns with the statewide 2045 target of carbon neutrality stipulated in AB 1279.

GHG emissions and global climate change represent cumulative impacts of human activities and development projects locally, regionally, statewide, nationally, and worldwide. GHG emissions from all these sources cumulatively contribute to the significant adverse environmental impacts of global climate change. No single project could generate enough GHG emissions to noticeably change the global average temperature; instead, the combination of GHG emissions from past, present, and future projects around the world have contributed and will continue to contribute to global climate change and its associated environmental impacts. Given that analysis of GHG emissions is cumulative in context, the 2030 and 2035 emissions targets discussed above represent the level by which the Draft 2045 CAP's emissions would not be cumulatively considerable.

⁸ The 2017 Scoping Plan Update recommends local government goals of 6 MTCO_{2e} per capita by 2030 and 2 MTCO_{2e} per capita by 2050. The 2045 CAP's targets are equivalent to 2.8 MTCO_{2e} per capita by 2030, 2.3 MTCO_{2e} per capita by 2030, and 0 MTCO_{2e} per capita by 2045.

2.5.4 Climate Action Plan Greenhouse Gas Emissions Reduction Potential

With implementation of the Draft 2045 CAP, the County aims to reduce emissions to 40 percent below the 2015 baseline by 2030 to approximately 3.3 million MTCO_{2e}; to reduce emissions to 50 percent below the 2015 baseline by 2035 to approximately 2.8 million MTCO_{2e}; to reduce emissions to 83 percent below the 2015 baseline by 2045 to approximately 958,000 MTCO_{2e}; and to be on a path toward carbon neutrality (zero net emissions) by 2045. With implementation of the Draft 2045 CAP, it is anticipated that Los Angeles County would exceed its reduction target by approximately 375,000 MTCO_{2e} in 2030, 496,000 MTCO_{2e} in 2035, and 13,000 MTCO_{2e} in 2045.

The Draft 2045 CAP is not sufficient to reduce Los Angeles County’s emissions to net zero by 2045; residual emissions are estimated to be 850,000 MTCO_{2e} in 2045. However, this EIR focuses on the 2045 CAP’s ability to achieve the 2030, 2035, and 2045 targets, and not the 2045 carbon-neutral aspirational goal to directly align with AB 1279’s statewide net-zero target. This is because the 2045 CAP can demonstrate a quantitative pathway for how the County can achieve the 2045 target but not the aspirational carbon-neutral goal, and because the 2045 target aligns with the statewide 2045 target as codified in AB 1279 and the 2022 Scoping Plan as discussed above. Further, the 2022 Scoping Plan states that local governments do not need to adopt carbon neutrality targets to align with the state’s goals, but should instead adopt targets and strategies that *support* the state’s climate goals that align with the *trajectory* to statewide carbon neutrality: “CARB recommends that jurisdictions focus on developing locally appropriate, plan-level targets that align with the trajectory to carbon neutrality” (CARB 2022c).

Table 2-9, *Estimated Greenhouse Gas Reduction Potential of Draft 2045 Climate Action Plan Strategies*, summarizes the County’s baseline 2015 GHG inventory, emissions projections, and target achievement anticipated through implementation of the Draft 2045 CAP.

TABLE 2-9
ESTIMATED GREENHOUSE GAS REDUCTION POTENTIAL OF DRAFT 2045 CLIMATE ACTION PLAN STRATEGIES

Emissions Category	GHG Emissions and Reductions (MTCO _{2e})		
	2030	2035	2045
2015 Baseline Emissions	5,531,155	5,531,155	5,531,155
Total Projected Emissions (BAU)	5,238,062	5,319,243	5,524,939
Total Projected Emissions (Adjusted BAU)	4,480,574	4,204,572	3,840,154
Estimated GHG Reductions from the Draft 2045 CAP	1,580,723	2,033,420	2,988,956
GHG Emissions with Implementation of the Draft 2045 CAP	2,899,852	2,171,152	851,199
County Target Emissions Levels	3,318,693	2,765,578	958,088
<i>Additional Reduction Below Target</i>	418,841	594,425	106,890

NOTES:

2045 CAP = 2045 Los Angeles County Climate Action Plan; BAU = business-as-usual; MTCO_{2e} = metric tons of carbon dioxide equivalent.

SOURCE: Draft 2045 CAP; Draft 2045 CAP Appendix B.

2.6 Greenhouse Gas Reduction Strategies, Measures, and Actions

The Draft 2045 CAP relies on continued implementation of federal and state mandates, regional actions, and local actions for achieving the 2030 and 2035 targets. The Adjusted BAU forecast accounts for implementation of the federal and state mandates, and regional actions, discussed below.

2.6.1 State and Regional Actions

State and regional actions include regional land use and transportation planning efforts undertaken by SCAG, pursuant to the Sustainable Communities and Climate Protection Act of 2008 (SB 375), through its 2016 RTP/SCS, as well as renewable energy legislation at the state level through the Renewables Portfolio Standard and California Solar Programs. Although the 2020 RTP/SCS (Connect SoCal) has been adopted, SCAG had not publicly released its 2020 RTP/SCS transportation model by the time modeling for the Draft 2045 CAP was conducted; therefore, it was not possible to model the County's transportation emissions and emission reductions using the 2020 RTP/SCS transportation model. Additional state actions include vehicle fuel efficiency and lowering the carbon content of vehicle fuels. The following state and regional actions were considered in the Adjusted BAU emissions forecast:

- SCAG 2016 RTP/SCS, which affects vehicle trips and vehicle miles traveled.
- California Energy Commission's 2019 and 2023 Title 24 building energy efficiency standards.
- Renewables Portfolio Standard (SB 350 and SB 1020).⁹
- CalRecycle 75 percent waste diversion initiative (AB 341).
- Pavley and Advanced Clean Car Standards (AB 1493).¹⁰
- Low Carbon Fuel Standards (EO S-01-07).

⁹ SB 1020, signed by Governor Newsom on September 16, 2022, requires that eligible renewable energy resources and zero-carbon resources supply 90 percent of all retail sales of electricity to California end-use customers by December 31, 2035; 95 percent of all retail sales of electricity to California end-use customers by December 31, 2040; 100 percent of all retail sales of electricity to California end-use customers by December 31, 2045; and 100 percent of electricity procured to serve all state agencies by December 31, 2035. This was not included in the adjusted BAU forecast because all customers in the County were automatically enrolled in the CPA's 100 percent renewable energy option starting in October 2022, and this was accounted for in Measure ES2, *Procure Zero-Carbon Electricity*. Further, the bill was enacted after the development of the adjusted BAU forecast.

¹⁰ The Advanced Clean Cars II (ACC II) regulations were approved by the Office of Administrative Law on November 30, 2022. First, the ACC II regulations amend the Zero-Emission Vehicle Regulation to require an increasing number of zero-emission vehicles, and they rely on advanced vehicle technologies, including battery-electric, hydrogen fuel cell electric, and plug-in hybrid electric vehicles, to meet air quality and climate change emissions standards. These amendments support Governor Newsom's 2020 Executive Order N-79-20, which requires that all new passenger vehicles sold in California be zero emissions by 2035. Second, the Low-Emission Vehicle Regulations were amended to include increasingly stringent standards for gasoline cars and heavier passenger trucks to continue to reduce smog-forming emissions. The ACC II regulations were not included in the adjusted BAU forecast because ACC II is not incorporated in the version of CARB's EMFAC2021 model (v1.0.1), which was used to forecast GHG emissions from mobile sources.

2.6.1.1 Senate Bill 375 and Transit Priority Areas

An important regional action upon which the Draft 2045 CAP relies is the implementation of SB 375, which establishes mechanisms for the development of regional targets for reducing GHG emissions from passenger vehicles. SB 375 was adopted by the state on September 30, 2008. In compliance with SB 375, SCAG adopted the 2016 RTP/SCS in April 2016.

The 2016 RTP/SCS serves as the region’s comprehensive long-range transportation planning document by encouraging public policy decisions that will result in balanced investments for a wide range of multimodal transportation improvements. The RTP/SCS is intended to achieve the goals of SB 375, and can be implemented through existing and planned programs or policies. The RTP/SCS consists of strategies to guide new policies and infrastructure development based on recent household and job growth forecasts, market demand and economic studies, and transportation studies. The RTP/SCS addresses both Transit Priority Areas (TPAs) and High Quality Transit Corridors (also called *High Quality Transit Areas*, or HQTAs) to align regional transportation, land use, housing, and GHG emissions planning through the SCS, which illustrates how SCAG would meet a GHG emissions reduction target for passenger vehicles established by CARB. As defined in SB 743,¹¹ a *TPA* is an area within 0.5 mile of high-quality transit (such as a rail stop or a bus corridor) that provides or will provide at least 15-minute frequency service during peak hours by the year 2035, and an *HQT corridor* means a corridor with fixed-route bus service with service intervals no longer than 15 minutes during peak commute hours.

Consistent with the General Plan, future growth would be centered around transportation corridors and villages. Additional information is provided in the Housing Element, which addresses HQTAs and TPAs as a part of the Transit Oriented Districts (TODs), where the County encourages infill development, with pedestrian-friendly and community-serving uses near transit stops. The goal in these areas is to encourage walking, bicycling, and transit use. The General Plan adds new TODs and expands existing TODs from an approximately 0.25-mile radius to a 0.5-mile radius from transit stations (County Planning 2009).

2.6.2 County Measures and Implementing Actions

The Draft 2045 CAP is organized around 10 primary strategies that would be implemented by 25 measures and additional implementing actions that include new ordinances, policies, resolutions, programs, incentives, and outreach and education activities, which together would achieve the estimated reduction in GHG emissions presented above.

Each measure identifies a performance goal, tracking metrics, an implementation lead and partners, general timeline (short, medium, long), County costs (high-level, i.e., planning-level), and one or more implementing actions. At the strategy level, information is provided regarding

¹¹ To further the state’s commitment to the goals of the Sustainable Communities and Climate Protection Act of 2008 (SB 375), the California Global Warming Solutions Act of 2006 (AB 32), and the California Complete Streets Act of 2008 (AB 1358), SB 743 added Chapter 2.7, *Modernization of Transportation Analysis for Transit-Oriented Infill Projects*, to CEQA (Public Resources Code Section 21099). Key provisions of SB 743 reformed the CEQA methodology for analyzing the impacts of urban infill projects to aesthetics and parking and eliminated the measurement of auto delay, including level of service, as a metric for use in measuring traffic impacts in “transit priority areas.”

the co-benefits of implementing each strategy and the Draft 2045 CAP's alignment with relevant state and County initiatives, including the OurCounty Sustainability Plan. For any new ordinances developed pursuant to these measures, there will be a public input and review process and the County will consider many factors, including feasibility, cost, and exceptions such as weather or climate limitations.

The strategies and measures in the Draft 2045 CAP are described in more detail below. Additional detail for the measures, including implementing actions and tracking metrics, is provided in the Draft 2045 CAP itself. Also, implementing actions that could cause environmental impacts are listed in Table ES-1, *Summary of Draft 2045 CAP Measures and Affected Resource Areas*, in the Executive Summary.

2.6.2.1 Strategy 1: Decarbonize the Energy Supply

The County's goal to shift to a renewable energy-based electricity supply ensures equitable access to affordable, local, and reliable energy sources. A comprehensive community energy map would identify the geographic opportunities to deploy these distributed energy resources in an equitable manner. Common examples of distributed energy resources include rooftop solar photovoltaic (PV) units, battery storage, electric vehicles (EVs), and EV chargers. Prioritizing wildfire-prone communities would provide an alternative to the costly infrastructure upgrades that would be required to maintain uninterrupted power service. Enabling community-shared solar would allow access to local renewable energy for renters and other potential customers. The recently formed Clean Power Alliance (CPA) enables Los Angeles County to transition to a low-carbon energy future at an accelerated pace: "Starting in October 2022, customers in unincorporated areas of L.A. County will be getting 100% renewable energy—wind, solar, geothermal—from CPA, compared to the 50 percent clean energy they receive now... low-income customers on a subsidized rate will not have any rate increase" (CPA 2021; Los Angeles County Chief Sustainability Office 2021). The CPA is a community-choice aggregation program that offers CPA participants the option to increase their share of renewable energy. The County realistically can procure electricity that is generated by 100 percent renewable sources from the CPA with a realistic expectation of resiliency.

Measure ES1: Develop a Sunset Strategy for All Oil and Gas Operations.

The performance objectives for Measure ES1 are to reduce oil and gas operations 40 percent below 2015 levels by 2030, 60 percent by 2035, and 80 percent by 2045.

Measure ES2: Procure Zero-Carbon Electricity.

The performance objectives for Measure ES2 are to achieve 100 percent participation in the CPA's Green Power option, Southern California Edison's (SCE's) Green Rate option, or other available 100 percent zero-carbon electricity service by 2030 for municipal accounts, and for community accounts to achieve 96 percent participation in the CPA's Green Power option, SCE's Green Rate option, or other available 100 percent zero-carbon electricity service by 2030 (accounting for an approximately 4 percent opt-out rate).

Measure ES3: Increase Renewable Energy Production.

The performance objectives for Measure ES3 are to: (1) install rooftop solar PV on 20 percent of existing residential buildings (multifamily and single-family), 25 percent by 2035, and 35 percent by 2045; (2) install rooftop solar PV on 15 percent of existing

commercial buildings by 2030, 22 percent by 2035, and 32 percent by 2045; (3) install rooftop solar PV on 80 percent of new multi-family residential buildings by 2030, 85 percent by 2035, and 95 percent by 2045; (4) install rooftop solar PV installations on 40 percent of new commercial buildings by 2030, 50 percent by 2035, and 70 percent by 2045; (5) install 20,000 kilowatts of solar PV at County facilities by 2030; and (6) install rooftop solar PV at all affordable housing developments.

Measure ES4: Increase Energy Resilience.

The performance objectives for Measure E4 are to: (1) achieve community electricity storage and generation capacity equal to the community-wide 24-hour average usage by 2035/2045; (2) establish a community resilience hub program to equip community-serving County facilities (e.g., libraries, recreation centers, senior centers); (3) provide solar and battery systems sufficient to support emergency cooling and other emergency functions; (4) locate at least one hub in each County district, with a focus on vulnerable populations; (5) install microgrids based on a feasibility study; and (6) obtain a grant and establish a program to support an energy efficiency and assurance program for facilities that are large energy users and support critical community functions.

Measure ES5: Establish GHG Requirements for New Development.

The performance objective for Measure ES5 is to require that new development is consistent with the Draft 2045 CAP's goals and GHG emissions reduction targets and to develop reach codes, ordinances, and conditions of approval as needed to achieve this objective. All new development not requiring General Plan amendments shall be consistent with the Draft 2045 CAP.

2.6.2.2 Strategy 2: Increase Densities and Diversity of Land Uses near Transit

Strategy 2 focuses on coordinating land use development that leads to outcomes associated with reduced vehicle miles traveled, such as increased densities near transit, jobs-housing balance, and strategically located land uses that can reduce travel distances for many trip purposes.

Measure T1: Increase Density near High-Quality Transit Areas.

The performance objectives for Measure T1 are to: (1) achieve a minimum of 20 dwelling units (DUs) per acre (maximum of 30–150 DUs per acre) for HQTAs; (2) locate a majority of residential and employment centers in the unincorporated Los Angeles County within 1 mile of an HQTA; and (3) achieve a 27 percent increase in dwelling units within HQTAs. These densities would be achieved through implementation of the Housing Element Update rezoning programs.

Measure T2: Develop Land Use Plans Addressing Jobs-Housing Balance and Increase Mixed Use.

The performance objective for Measure T2 is to achieve a job density of 300 jobs per acre for all new projects with nonresidential development by 2030. For communities with an imbalance of jobs/housing (± 20 percent), community plans will identify and quantify strategies for bringing that imbalance below 20 percent. This density would be achieved through implementation of the Housing Element Update rezoning programs.

2.6.2.3 Strategy 3: Reduce Single-Occupancy Vehicle Trips

Strategy 3 focuses on development of transportation networks that increase the accessibility, comfort, and convenience of active travel modes to help reduce trips made in single-occupancy vehicles.

Measure T3: Expand Bicycle and Pedestrian Network to Serve Residential, Employment, and Recreational Trips.

The performance objective for Measure T3 is to increase bikeway miles by 300 percent by 2035. This measure also requires implementing the County Bicycle Master Plan and completing updates to County’s Pedestrian Action Plan, Bicycle Master Plan, and Active Transportation Plans every five years.

Measure T4: Broaden Options for Transit, Active Transportation, and Alternative Modes of Transportation.

The performance objectives for Measure T4 are by 2030 to: (1) double transit service hours from 560,000 to 1.12 million; (2) install bus-only lanes and signal prioritization on all major transit thoroughfares; and (3) have a minimum of 75 percent of unincorporated Los Angeles County residents live within one-half mile of a bus or active transportation option;¹².

Measure T5: Limit and Remove Parking Minimums.

The performance objectives for Measure T5 are to: (1) reduce parking stipulations to reduce parking supply and encourage transit use; (2) unbundle parking costs to reflect the cost of parking; and (3) implement parking pricing to encourage “park-once” behavior.¹³

2.6.2.4 Strategy 4: Institutionalize Low-Carbon Transportation

Motorized vehicles needed for travel must transition to zero-carbon and near-zero-carbon technologies, such as EVs and zero-emission vehicles (ZEVs).¹⁴ Expanding access to charging infrastructure would address a key barrier to the adoption of EVs. The County will work to provide access to clean motorized transportation by developing programs that include e-bikes, zero-emission buses and shuttles, and electrified trains. The County also would endeavor to install EV charging stations (EVCSs) at County properties and in the public right-of-way, require new development to install EVCSs, and develop incentives and requirements for existing buildings to install EVCSs.

Strategy 4 also aims to reduce emissions from diesel- and gasoline-powered off-road equipment, including construction, landscaping, recreational, and commercial and industrial equipment. This strategy encourages the use of electric-powered equipment by establishing a goal for a portion of

¹² *Active transportation* refers to human-powered transportation and low-speed electronic-assist devices, such as bicycles, tricycles, wheelchairs, electric wheelchairs, scooters, skates, and skateboards.

¹³ The goal of “park-once” behavior is for visitors to find a parking structure and then walk to their various destinations (e.g., work, lunch, entertainment, shopping), rather than using the vehicle as the mode by which these various trips are accomplished.

¹⁴ A ZEV is a vehicle that produces zero exhaust emissions of any criteria pollutant (or precursor pollutant) or GHG under any possible operational modes or conditions. Examples of current-technology ZEV fuels include electricity, hydrogen, and compressed air.

all equipment to be electric-powered. Other technologies include hydrogen fuel cell and natural gas.

Measure T6: Increase ZEV Market Share and Reduce Gasoline and Diesel Fuel Sales.

The performance objectives¹⁵ for Measure T6 are to: (1) increase the fleetwide percentage of light-duty vehicles in the unincorporated Los Angeles County that are ZEVs to 30 percent by 2030, 50 percent by 2035, and 90 percent by 2045; (2) increase the sales of new light-duty vehicles in the unincorporated Los Angeles County that are ZEVs to 68 percent by 2030 and 100 percent by 2035; (3) install 37,000 total new public and private shared EVCSs (including EVCSs at County facilities and properties) by 2030, 74,000 by 2035, and 140,000 by 2045; and (4) install 5,000 total new EVCSs at County facilities and properties by 2030, 10,000 by 2035, and 25,000 by 2045.

Measure T7: Electrify County Fleet Vehicles.

The performance objectives for Measure T7 are to: (1) electrify the County bus and shuttle fleets by 2035; (2) increase the fleetwide percentage of light-duty vehicles in the County-owned fleet that are ZEVs to 35 percent by 2030, 60 percent by 2035, and 100 percent by 2045; and (3) support the state's goal that all new light-duty vehicle fleet purchases, with certain exceptions, will be ZEVs.

Measure T8: Accelerate Freight Decarbonization.

The performance objectives for Measure T8 are to: (1) increase the fleetwide percentage of medium-duty and heavy-duty vehicles in the unincorporated Los Angeles County that are ZEVs to 40 percent by 2030, 60 percent by 2035, and 90 percent by 2045; (2) increase the fleetwide percentage of medium-duty and heavy-duty trucks in the County-owned fleet that are ZEVs to 50 percent by 2030, 70 percent by 2035, and 95 percent by 2045; (3) ensure that 100 percent of the drayage truck fleet is ZEV by 2035; (4) ensure that 100 percent of sales of medium- and heavy-duty trucks are ZEVs by 2045; (5) require that all new warehouse loading docks have EVCSs by 2030; and (6) require that all existing warehouse loading docks have EVCSs by 2030.

Measure T9: Expand Use of Zero-Emission Technologies for Off-Road Vehicles and Equipment.

The performance objectives for Measure T9 are to: (1) increase the fleetwide percentage of off-road fleet and equipment in the unincorporated Los Angeles County that are ZEVs to 20 percent by 2030, 50 percent by 2035, and 95 percent by 2045; and (2) increase the fleetwide percentage of construction, agriculture, and manufacturing equipment in the unincorporated Los Angeles County that are ZEVs to 50 percent by 2030, 75 percent by 2035, and 100 percent by 2045.

2.6.2.5 Strategy 5: Decarbonize Buildings

Building decarbonization requires two complementary components: procuring clean, renewable sources of energy and shifting building energy loads for heating and cooking to electricity or renewable fuels rather than fossil fuels. Distributed, on-site renewable energy can be promoted in a variety of ways. Because grid-supplied energy is now cleaner than on-site natural gas use, building

¹⁵ The performance objectives provided here serve as a general metric and may be refined upon completion of the Zero Emission Vehicle Master Plan.

electrification and, to some extent, the use of biomethane on-site in buildings are key to decarbonization.

Measure E1: Transition Existing Buildings to All-Electric.

The primary performance objectives for Measure E1 are to: (1) electrify 25 percent of the existing residential buildings by 2030, 40 percent by 2035, and 80 percent by 2045; (2) electrify 15 percent of the existing nonresidential buildings by 2030, 25 percent by 2035, and 60 percent by 2045; and (3) require zero net energy (ZNE)¹⁶ for 50 percent of all major renovations by 2030, 75 percent by 2035, and 100 percent by 2045.

Measure E2: Standardize All-Electric New Development.

The performance objectives for Measure E2 are to: (1) require that all applicable new buildings are all-electric (taking into consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face), such that 90 percent of new residential and nonresidential buildings are all-electric by 2030, 95 percent by 2035, and 100 percent by 2045; and (2) require that all applicable new residential and nonresidential buildings are ZNE, such that 90 percent of new residential and nonresidential are ZNE by in 2030.

Measure E3: Implement Other Decarbonization Actions.

The performance objectives of Measure E3 are to: (1) increase the proportion of biomethane in the utility natural gas mix to 20 percent by 2030, 30 percent by 2035, and 80 percent by 2045; (2) use low-carbon, carbon-neutral, or negative-carbon concrete for all new construction; and (3) replace high-global-warming-potential refrigerants with low-global-warming-potential refrigerants 15 percent by 2030, 25 percent by 2035, and 50 percent by 2045.

2.6.2.6 Strategy 6: Improve Efficiency of Existing Building Energy Use

Increasing the energy efficiency of existing buildings reduces GHG emissions by decreasing the consumption of natural gas, electricity that is not 100 percent carbon-free, and other nonrenewable energy sources. Energy efficiency improvements can be achieved through a variety of methods, including energy audits, benchmarking, appliance rebates, building retrofits, and education of consumers. In addition to reducing GHG emissions, energy-efficient building improvements can lower energy bills, create local green jobs, and improve the longevity of existing buildings. The County will improve energy efficiency of existing buildings through coordination with agencies and organizations, as well as public outreach.

Measure E4: Improve Energy Efficiency of Existing Buildings.

The performance objective of Measure E4 is to reduce building Energy Use Intensity (thousand British thermal units per square foot) below 2015 levels by 20 percent for residential, 15 percent for industrial, and 25 percent for commercial by 2030; 25 percent for residential and industrial and 35 percent for commercial by 2035; and 50 percent for residential, industrial, and commercial by 2045.

¹⁶ *Zero net energy* is defined by the U.S. Department of Energy as follows: “An energy-efficient building where, on a source energy basis, the actual annual delivered energy is less than or equal to the on-site renewable exported energy” (U.S. Department of Energy 2015).

2.6.2.7 Strategy 7: Conserve Water

The GHG emissions associated with water consumption are the result of the electricity and natural gas used to pump, treat, and convey water. Strategy 7 aims to reduce GHG emissions by decreasing the total amount of water consumed, as well as the energy intensity of the water consumed.

Measure E5: Increase Use of Recycled Water and Gray Water Systems.

The performance objectives of Measure E5 are to: (1) meet 25 percent of total unincorporated Los Angeles County water demand with recycled water, gray water, or potable reuse¹⁷ by 2025, 50 percent by 2030, and 90 percent by 2045; (2) meet 30 percent of water demand for agricultural and industrial uses with recycled water or gray water by 2025, 50 percent by 2030, and 80 percent by 2045; and (3) implement a successful direct potable reuse project by 2025.

Measure E6: Reduce Indoor and Outdoor Water Consumption.

The performance objectives of Measure E6 are to: (1) reduce total water use to less than 110 gallons per capita per day (GPCD) by 2030, 100 GPCD by 2035, and 85 GPCD by 2045; (2) reduce outdoor landscaping water use to 10 percent by 2030, 20 percent by 2035, and 50 percent by 2045; and (3) reduce municipal water consumption 10 percent by 2030, 20 percent by 2035, and 50 percent by 2045.

2.6.2.8 Strategy 8: Minimize Waste and Recover Energy and Materials from the Waste Stream

The County would reduce GHG emissions from waste in a manner that prioritizes overall environmental benefit. This would start with expanded efforts to reduce and reuse waste at the source. Incentives and educational programs would be used to increase awareness and bolster participation in recycling programs. Organic waste, which is responsible for the vast majority of GHG emissions in the waste sector, would be addressed through source reduction, donation of edible food, and composting. Organic waste would also be addressed through waste conversion technologies such as anaerobic digestion and biomass conversion, which produce biogas that can be used to produce heat and electricity, pipeline gas, vehicle fuel, and other beneficial products like compost and fertilizer. At wastewater treatment plants, biogas would be captured and converted into electricity, heat, pipeline gas, or vehicle fuel.

Measure W1: Institutionalize Sustainable Waste Systems and Practices.

The performance objectives of Measure W1 are to: (1) increase the total unincorporated Los Angeles County waste diversion rate to 85 percent by 2030, 90 percent by 2035, and 95 percent by 2045; (2) reduce the disposal of single-use plastics in landfills; (3) increase the Construction and Demolition Ordinance to 70 percent diversion; and (4) increase the percentage of construction and demolition debris reused in new projects (private and public).

¹⁷ The California Water Boards define *direct potable reuse* as “the planned introduction of recycled water either directly into a public drinking water system, or into a raw water supply immediately upstream of a drinking water treatment plant” (California Water Boards 2022).

Measure W2: Increase Organic Waste Diversion.

The performance objectives of Measure W2 are to maximize organic waste diversion to support the unincorporated Los Angeles County’s overall waste diversion rate goals identified in Measure W1.

2.6.2.9 Strategy 9: Conserve and Connect Wildlands and Working Lands

Forests, chaparral shrublands, and wetlands serve as carbon sinks that can sequester carbon dioxide resulting from human activity. When these natural and working lands are converted to residential and other urbanized uses, that stored carbon dioxide is released into the atmosphere. Conserving and restoring these lands keeps carbon in the ground and provides a multitude of benefits, from maintaining biodiversity in the Significant Ecological Areas (SEAs)¹⁸ to preserving the character of the County’s rural areas.

Measure A1: Conserve Forests, Woodlands, Shrublands, Grasslands, Desert, and other Carbon-Sequestering Wildlands and Working Lands.

The performance objectives of Measure A1 are to: (1) reduce the average annual amount of natural land converted for urbanized uses 25 percent by 2030 (53 hectares conserved annually), 50 percent by 2035 (106 hectares conserved annually), and 75 percent by 2045 (159 hectares conserved annually); (2) conserve and restore 2,000 acres of natural forest lands by 2030, 4,000 acres by 2035, and 6,000 acres by 2045; and (3) manage 10,000 acres of wildland for wildfire risk reduction and carbon stock savings by 2030, 20,000 acres by 2035, and 50,000 acres by 2045.

2.6.2.10 Strategy 10: Sequester Carbon and Implement Sustainable Agriculture

Agricultural practices can either strip the environment of its rich resources or work to maintain and utilize the resources in ways that benefit farms and the environment. Farming practices that increase biodiversity, enrich soils, improve watersheds, and enhance ecosystem services are known as *regenerative agriculture practices*. These practices can have positive impacts for the climate, reducing GHG emissions and supporting practices that are environmentally friendly. Additionally, adding tree canopy cover and green spaces back into developed areas can help sequester carbon and reduce the urban heat island effect.

Measure A2: Support Regenerative Agriculture.

The performance objectives of Measure A2 are to reduce the quantity of synthetic fertilizers used/applied and increase in the number of acres of cover crops using regenerative agriculture techniques.

¹⁸ County Municipal Code Section 22.14.190–S defines an *SEA* as “land that is identified to hold important biological resources representing the wide-ranging biodiversity of the County, based on the criteria for SEA designation established by the General Plan and as mapped in the adopted SEA Policy Map.” To protect such areas, the County’s SEA Ordinance “establishes the permitting, design standards, and review process for development within SEAs, balancing preservation of the County’s natural biodiversity with private property rights” (County Planning 2022).

Measure A3: Expand Unincorporated Los Angeles County’s Tree Canopy and Green Spaces.

The performance objectives¹⁹ of Measure A3 are to: (1) plant 130,000 total new trees by 2030, 200,000 total new trees by 2035, and 270,000 total new trees by 2045; and (2) develop and implement an Urban Forest Management Plan.

2.6.3 Greenhouse Gas Reduction Potential of the Draft 2045 Climate Action Plan Measures

Table 2-10, *Estimated Greenhouse Gas Reduction Potential of Draft 2045 Climate Action Plan Measures*, shows the GHG emissions reduction potential of 19 of the Draft 2045 CAP’s measures. Emissions reductions were calculated for these measures given the quantitative nature of their performance goals and the availability of underlying activity and emissions data to facilitate emissions modeling. The remaining Draft 2045 CAP measures were not quantified given their more qualitative and supportive nature, or because of data or modeling limitations. In general, implementing actions are not quantified individually, but rather are accounted for collectively in the GHG emissions reduction estimates for the measures.

TABLE 2-10
ESTIMATED GREENHOUSE GAS EMISSIONS REDUCTION POTENTIAL
OF DRAFT 2045 CLIMATE ACTION PLAN MEASURES

Sector and Measure	2030 MTCO ₂ e ^a		2035 MTCO ₂ e ^a		2045 MTCO ₂ e ^a	
	Number	Percent ^b	Number	Percent ^b	Number	Percent ^b
Stationary Energy						
ES1 Develop a Sunset Strategy for All Oil and Gas Operations	28,368	2%	40,178	2%	52,148	2%
ES2 Procure Zero-Carbon Electricity	477,188	30%	317,915	16%	0	0%
ES3 Increase Renewable Energy Production	5,919	0.4%	5,219	0.3%	0	0%
E1 Transition Existing Buildings to All-Electric	176,072	11%	280,988	14%	477,221	16%
E2 Standardize All-Electric New Development	7,452	0.5%	12,588	0.6%	22,639	0.8%
E4 Improve Energy Efficiency of Existing Buildings	22,274	1.4%	41,255	2.0%	203,455	6.8%
E6 Reduce Indoor and Outdoor Water consumption	10,575	0.7%	15,122	0.7%	11,764	0.4%
Transportation						
T1 Increase Density near High-Quality Transit Areas	27,357	1.7%	26,019	1.3%	25,276	0.8%
T2 Develop Land Use Plans Addressing Jobs-Housing Balance and Increase Mixed Use	39,184	2.5%	37,267	1.8%	36,204	1.2%
T3 Expand Bicycle and Pedestrian Network to Serve Residential, Employment, and Recreational Trips	0	0.0%	2,811	0.1%	2,730	0.1%

¹⁹ The performance objectives provided here serve as a general metric and may be refined upon completion of the Urban Forest Management Plan.

NOTES:

^a MTCO₂e = metric tons of carbon dioxide equivalent; ZEV = zero-emission vehicle

^b "Percent" = Percent of Total Reduction

^c Numbers may not add to 100% due to rounding.

SOURCE: Draft 2045 CAP, Chapter 3

As shown in the table, in 2030, nearly half (46 percent) of the anticipated reductions would be attributed to energy-related measures, including zero-carbon electricity, the sunset strategy for oil and gas operations, electrification of the existing building stock, local renewable energy generation, all-electric new development, and energy efficiency. Approximately 43 percent of the anticipated reductions in 2030 are attributed to transportation-related measures, including the expansion of the ZEV market share, increased density and jobs/housing balance, mass transit service and alternative modes of transportation, County fleet vehicle electrification, freight decarbonization, and zero-emission off-road technologies. Another significant local action in 2030 includes implementation of sustainable waste systems, representing approximately ten percent of the total local reductions. In 2030, agriculture, forestry and other land use programs make up a relatively small portion of the total local reductions, at one percent.

2.7 2045 Climate Action Plan Implementation

In the Draft 2045 CAP, Appendix E, Table E-1 identifies implementation details for the strategies, measures, and actions. These details include timing-related performance objectives and tracking metrics that represent guideposts for the successful implementation of each measure and for the 2045 CAP as a whole. Although many of these guideposts are not specific mandates, they may evolve as the 2045 CAP is implemented and adapted over time. The timing indicated in Draft 2045 CAP Table E-1 (summarized below) reflects the best information available during development of this Recirculated Draft EIR about when the impacts of projects facilitated by the Draft 2045 CAP may be expected to occur. See **Table 2-11, *Anticipated 2045 CAP Implementation Timing***. The table shows (consistent with the Draft 2045 CAP, Table E-1) that implementation of the Draft 2045 CAP would occur over three phases, which take advantage of easier short-term measures and actions to meet the 2030 target and then build up to more complex solutions as the 2035 target and 2045 target dates approach.

- **Phase 1: Short-Term Actions (2024–2030)**—Short-term actions that are high-priority with large emissions reductions that would lay the foundation for longer term actions. The short-term target of the Draft 2045 CAP is to reduce GHG emissions in the County by 40 percent below 2015 levels by 2030.
- **Phase 2: Medium-Term Actions (2031–2035)**—Actions needed to achieve the 2030 or 2035 GHG emissions reduction targets that may need additional time, funding, or new technology to implement. The medium-term target of the Draft 2045 CAP is to reduce GHG emissions in the County by 50 percent below 2015 levels by 2035.
- **Phase 3: Long-Term Actions (2036–2045)**—Actions needed to achieve the 2045 GHG emissions reduction target that may need substantial time, funding, or new technology to implement. The long-term target of the Draft 2045 CAP is to reduce GHG emissions in the County by 83 percent below 2015 levels by 2045. The long-term aspirational goal of the Draft 2045 CAP is to achieve carbon neutrality in the County by 2045.

Although Table 2-11 indicates when a measure would first be implemented, there may be environmental impacts and GHG emission reduction benefits resulting from implementation that would typically continue and increase following initial implementation. For example, although implementing Strategy 1 (Decarbonize the Energy Supply) measures could result in short-term adverse impacts, it also would result in benefits that would increase beyond the short term to help achieve the related performance objectives of reducing oil and gas operations 40 percent by 2030, 60 percent by 2035, and 80 percent by 2045. Anticipated implementation timing is identified in Table 2-11; the analysis of related impacts is summarized in EIR Section 3.1.3.7 and is documented on a resource-by-resource basis in Chapter 3, *Environmental Setting, Impacts, and Mitigation Measures*.

**TABLE 2-11
ANTICIPATED 2045 CLIMATE ACTION PLAN IMPLEMENTATION TIMING**

	Short-Term (2024–2030)	Medium-Term (2031–2035)	Long-Term (2036–2045)
Strategy 1: Decarbonize the Energy Supply			
ES1 Develop a Sunset Strategy for All Oil and Gas Operations: Develop a sunset strategy for all oil and gas operations that prioritizes disproportionately affected communities and develop a strategy for carbon removal.	X	X	X
ES1.1 Collaborate with other local jurisdictions and utilities to develop a sunset strategy for all oil and gas operations that prioritizes disproportionately affected communities. Develop an ordinance.	X		
ES1.2 Develop a policy that requires the examination of all active, idle, and abandoned oil wells for fugitive emissions of GHGs. Coordinate with federal and state agencies conducting fugitive emissions data.	X		
ES1.3 Develop a carbon removal strategy that considers direct air capture and carbon and sequestration (CCS).		X	
ES2 (Core) Procure Zero-Carbon Electricity: Supplying the unincorporated Los Angeles County’s power demand with zero-carbon electricity is critical to achieving significant GHG emissions reductions. The Clean Power Alliance (CPA) is a nonprofit and community choice energy provider that currently serves 32 communities across Southern California.	X		
ES2.1 Transition all County facilities within unincorporated areas to CPA’s 100% Green Power option, SCE’s 100% Green Rate option, or other available 100% renewable electricity service.	X		
ES2.2 Complete enrollment of the community in CPA’s 100% Green Power or SCE’s Green Rate option.	X		
ES3 Increase Renewable Energy Production: Expand local solar power generation on existing and new development and for County projects.	X	X	X
ES3.1 Require rooftop solar PV for all new development.	X		
ES3.2 Install rooftop solar PV at existing buildings.	X		
ES3.3 Identify and install solar PV systems at existing viable County facilities and properties.	X		
ES3.4 Explore the feasibility to install community-shared solar facilities on County properties where opportunities exist.		X	
ES3.5 Require and incentivize renewable energy for affordable housing developments for both new development and existing buildings.	X		
ES3.6 Streamline and prioritize permitting for solar and battery storage projects	X		
ES4 Increase Energy Resilience: Expand energy storage and microgrids throughout the community and for County operations.		X	X
ES4.1 Develop a program to deploy community resilience hubs at scale.	X	X	
ES4.2 Invest in energy storage and microgrids at critical County facilities through CPA’s Power Ready Program.	X	X	
ES4.3 Develop a publicly accessible community energy map that identifies opportunities for deploying distributed energy resources and microgrids to improve energy resiliency.		X	X
ES4.4 Conduct feasibility studies to identify priority areas for solar and storage, combined with building- and community-scale microgrids and alternative technologies such as fuel cells and grid paralleling, to support demand management and peak shaving to increase grid resilience. Study implementation, costs, barriers, and obstacles and identify partnerships. Adopt regulations that establish this use and standards for its development. Limiting peak energy demand can eliminate or reduce the use of high-carbon peaker plants.	X	X	
ES4.5 Develop a Countywide program to promote energy efficiency and resilience measures in facilities providing critical community services.	X	X	

TABLE 2-11 (CONTINUED)
ANTICIPATED 2045 CLIMATE ACTION PLAN IMPLEMENTATION TIMING

	Short-Term (2024–2030)	Medium-Term (2031–2035)	Long-Term (2036–2045)
Strategy 1: Decarbonize the Energy Supply (cont.)			
ES5 Establish GHG Requirements for New Development: Develop and implement requirements to ensure that new development is consistent with the 2045 CAP goals as well as its milestone targets for 2030, 2035, and 2045. These requirements include applicant completion of a project review consistency checklist for non-CEQA exempt new development requiring discretionary approvals to demonstrate consistency with the 2045 CAP. To demonstrate consistency with the 2045 CAP, all projects that do not screen out of the 2045 CAP consistency review process must implement either: 1) all feasible applicable checklist measures, or 2) for infeasible checklist measures, alternative project emission reduction measures. The project review checklist will be used in one two ways: 1) for projects consistent with the 2045 CAP, to demonstrate CAP consistency that allows for streamlined project-specific CEQA GHG analysis, or 2) for projects required or electing to prepare project-specific CEQA GHG analyses, to demonstrate that all feasible applicable checklist measures or alternative project emission reduction measures have nevertheless been implemented, either as project features or GHG mitigation measures. Projects that do not implement all feasible applicable checklist measures or alternative project emission reduction measures may have significant GHG impacts because they could conflict with an applicable GHG reduction plan per Guidelines Appendix G Section VII. They may also be inconsistent with the General Plan because the CAP is a component of the Air Quality Element. In addition, the County will assess the feasibility of developing a GHG offsets/credit program to create a pathway toward achieving the aspirational 2045 goal of carbon neutrality.	X	X	X
ES5.1 Identify new requirements for new development, including reach codes, ordinances, and conditions of approval to reduce GHG emissions from energy use, transportation, waste, water, and other sources. Include affordable housing considerations in these requirements, and develop supporting measures (financial support, technical assistance, or other incentives) to defray potential additional first costs in order to maintain housing affordability.	X		
ES5.2 Implement the 2045 CAP consistency review checklist for new development to demonstrate consistency with the 2045 CAP's strategies, measures, and actions.	X		
ES5.3 Evaluate a program for reducing GHG emissions for new development that require General Plan amendments.	X		
ES5.4 Establish an Offsite GHG Reduction Program for new development to use as a GHG reduction or mitigation pathway for 2045 CAP compliance and to fund programs for reducing GHG emissions in the built environment.	X		
Strategy 2: Increase Densities and Diversity of Land Uses Near Transit			
T1 Increase Density Near High-Quality Transit Areas: Increase housing opportunities that are affordable and near transit, to reduce VMT.	X		
T.1.1 Incentivize residential and community-serving uses to be developed in high quality transit areas (HQTAs), while ensuring inclusion of vital public amenities, such as parks and active transportation infrastructure.	X		
T.1.2 Develop land use tools that will increase the production of a diversity of housing types, such as missing middle housing.	X		
T.2 Develop Land Use Plans Addressing Jobs-Housing Balance and Increase Mixed Use: Increasing density and the mix of land uses can help reduce single-occupancy trips, the number of trips, and trip lengths.	X		
T.2.1 Develop community plans that will increase the percentage of residents who could live and work within the same community, and that could decrease VMT.	X		

**TABLE 2-11 (CONTINUED)
ANTICIPATED 2045 CLIMATE ACTION PLAN IMPLEMENTATION TIMING**

	Short-Term (2024–2030)	Medium-Term (2031–2035)	Long-Term (2036–2045)
Strategy 3: Reduce Single-Occupancy Vehicle Trips			
T3 Expand Bicycle and Pedestrian Network to Serve Residential, Employment, and Recreational Trips: Travel options that serve a variety of land uses and trip purposes can help shift some trips away from single-occupancy vehicles.	X	X	X
T3.1 Create a more connected and safer bikeway network by expanding bikeway facilities and implementing protected and separated lanes.		X	X
T3.2 Implement and regularly update the County's Pedestrian Action Plan, Bicycle Master Plan, and Active Transportation Plans.			X
T3.3 Collaborate with Metro and other transit providers to enhance pedestrian and bicycle environments through energy efficient lighting and shading to promote active transportation. Build shade structures at major transit stops, such as those identified in Metro's Active Transportation Strategic Plan, prioritizing communities with high heat vulnerability. Develop and implement a Shaded Corridors Program.		X	
T4 Broaden Options for Transit, Active Transportation, and Alternative Modes of Transportation: Transit service, micro mobility services (such as bike-share, scooter-share, and drone deliveries), and access to these transportation options can help reduce VMT.	X	X	X
T4.1 Expand and improve the frequency of service of unincorporated Los Angeles County shuttles and explore new mobility services, such as micro transit, autonomous delivery vehicles, micro mobility, and on-demand autonomous shuttles.		X	
T4.2 Collaborate with Metro and other transit providers to install bus-only lanes and/or signal prioritization along major thoroughfares, and work with transit agencies and neighboring jurisdictions to plan and install full bus rapid transit infrastructure along priority corridors, as appropriate.			X
T4.3 Collaborate with Metro and other transit providers to develop a transportation technology strategy to proactively address how evolving tech-enabled mobility options can support public transit.		X	
T4.4 Collaborate with Metro and other transit providers to set aside maintenance funds to ensure that public transit facilities, including stations and stops, are safe and clean to enhance the transit experience and increase ridership.	X		
T4.5 Collaborate with Metro and other transit providers to develop and implement a transportation demand management (TDM) ordinance that requires future development projects to incorporate measures such as subsidized transit passes and car share.	X	X	
T4.6 Offer free and/or discounted transit passes for students, youth, seniors, people with disabilities, and low-income populations.	X		
T4.7 Expand and improve the County's Telecommuting Policy, using data gathered through the alternative work program.	X		
T4.8 Establish temporary and permanent car-free areas.			X
T4.9 Develop a VMT bank or exchange program.	X	X	
T4.10 Collaborate with Metro and other transit providers to ensure that all new forms of public transportation (e.g., new bus lines, new light rail service) are low- or zero-emission.	X	X	
T5 Limit and Remove Parking Minimums: Parking strategies such as parking maximums, unbundling parking, or market price parking can help reduce VMT.	X		
T5.1 Implement a comprehensive parking reform strategy, which should include, but not be limited to: elimination of minimum parking requirements for all new residential units, establishment of parking maximums within one-half mile of high-quality transit stops, creation and expansion of parking benefit districts, development of planning strategies for transitioning land dedicated to parking to alternative transit and public uses, and incentives for developers to provide less than maximum allowable parking.	X		

TABLE 2-11 (CONTINUED)
ANTICIPATED 2045 CLIMATE ACTION PLAN IMPLEMENTATION TIMING

	Short-Term (2024–2030)	Medium-Term (2031–2035)	Long-Term (2036–2045)
Strategy 4: Institutionalize Low-Carbon Transportation			
T6 (Core) Increase ZEV Market Share and Reduce Gasoline and Diesel Fuel Sales: Increase the unincorporated Los Angeles County's ZEV market share and vehicle penetration to the maximum extent feasible to replace internal combustion engine vehicles. Set targets for reducing total gasoline and diesel vehicle fuel sales.	X	X	X
T6.1 Develop a Zero Emission Vehicle Master Plan. Collaborate with other regional agencies and jurisdictions to share infrastructure.	X		
T6.2 Install EVCSs at existing buildings and right-of-way infrastructure throughout unincorporated Los Angeles County.	X	X	X
T6.3 Require all new development to install EVCSs through a condition of approval/ordinance. Residential development must install EVCSs; nonresidential development must install EVCSs at a percentage of total parking spaces.	X		
T6.4 Install EVCSs at County facilities and properties for public, employee, and fleet use, prioritizing locations in BIPOC and disadvantaged communities. Complete an assessment of EV charging locations, identifying gaps in publicly accessible stations for BIPOC and disadvantaged communities. Provide EV purchase incentive information in multiple languages to frontline communities.	X	X	X
T6.5 Continue to pilot vehicle-grid integration applications at workplaces to maximize the benefits that daytime charging for plug-in electric vehicles (PEVs) can have on the grid, including demand response to reduce peak loads and energy storage during periods of renewable overproduction.	X		
T6.6 Expand electric options for active transportation, such as electric scooters and e-bikes. Provide access to neighborhood electric vehicles, such as golf carts, shared EVs, and others. Develop policies and/or ordinances to expand these options.		X	
T6.7 Increase the use of green hydrogen vehicles. Use biomethane and biogas created from organic waste as a "bridge fuel" to achieve 100% green hydrogen and electric vehicles. Consider the use of other zero-emission fuel sources.		X	
T7 Electrify County Fleet Vehicles: Electrify the County bus, shuttle, and light-duty vehicle fleet and shuttles.	X	X	
T7.1 Electrify the County bus fleet, inmate transfer fleet, and shuttles, and partner with transit agencies for group purchasing and siting of shared charging and/or fueling infrastructure. ^M	X	X	
T7.2 Electrify light-duty County fleet vehicles. ^M	X	X	
T8 (Core) Accelerate Freight Decarbonization: Incentivize and implement freight decarbonization technologies, specifically focusing on charging infrastructure.	X	X	X
T8.1 Implement freight decarbonization technologies along highway corridors passing through unincorporated Los Angeles County communities through programs such as zero-emission delivery zones.		X	X
T8.2 Create an ordinance requiring new goods movement facilities to install alternative fueling infrastructure	X		
T8.3 Adopt Building Performance Standards for existing goods movement facilities and reach code requirements for major retrofits and renovations that require alternative fueling infrastructure for medium- and heavy-duty vehicles. Require goods movement facilities to install alternative fueling infrastructure for medium- and heavy-duty vehicles at the point of sale.	X		
T8.4 Streamline permitting of ZEV charging and fueling infrastructure for medium- and heavy-duty vehicles.	X	X	
T8.5 Electrify the County medium- and heavy-duty vehicle fleet.	X	X	X

**TABLE 2-11 (CONTINUED)
ANTICIPATED 2045 CLIMATE ACTION PLAN IMPLEMENTATION TIMING**

	Short-Term (2024–2030)	Medium-Term (2031–2035)	Long-Term (2036–2045)
Strategy 4: Institutionalize Low-Carbon Transportation (cont)			
T9 Expand Use of Zero-Emission Technologies for Off-Road Vehicles and Equipment: Prohibit the use of gas- and diesel-powered small (≤25 horsepower) off-road equipment and increase the use of zero-emission and near-zero-emission construction, agriculture, and manufacturing equipment.	X		
T9.1 Partner with the South Coast Air Quality Management District and Antelope Valley Air Quality Management District to increase the use of zero-emission and near-zero-emission construction, agriculture, and manufacturing equipment.	X		
T9.2 Identify types of ZEV equipment and green hydrogen equipment that are commercially available (e.g., forklifts, loaders, welders, saws, pumps, fixed cranes, air compressors, sweepers, aerial lifts, pressure washers) and require the use of these types of equipment on all new projects through an ordinance or conditions of approval.	X		
T9.3 Require, to the maximum extent feasible, the use of zero-emission and near-zero-emission construction, agriculture, and manufacturing equipment for County projects. ^M	X		
Strategy 5: Decarbonize Buildings			
E1 (Core) Transition Existing Buildings to All-Electric: As the carbon intensity of grid-supplied energy decreases, decarbonization must be combined with building electrification, shifting more load toward cleaner sources while taking into consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face. This measure aims to electrify applicable existing buildings. Biomethane is another preferred alternative to fossil natural gas; however, the existing opportunities for widespread use of biomethane are limited. Consider the use of other zero-emission fuel sources for buildings.	X	X	X
E1.1 Adopt Building Performance Standards for existing buildings and reach code requirements for major retrofits and renovations that require electric water and space heating. Require buildings to retrofit natural gas water and space heating to electric water and space heating at the point of sale.	X	X	
E1.2 Increase alternatives to natural gas uses, such as for cooking, in existing buildings. Establish carbon intensity limits for existing nonresidential and residential buildings over a certain size.	X	X	
E1.3 Adopt a ZNE ordinance for building renovations, based on certain criteria (such as commercial facilities with 10,000 square feet of additions). Adopt ZNE Building Performance Standards for certain buildings not undergoing major renovations or retrofits.	X		
E1.4 Create a plan for phased electrification of County facilities. Phase out gas-powered infrastructure and appliances as they need replacement.	X	X	X
E1.5 Create a comprehensive fund aggregation program to support energy efficiency, decarbonization, and resilience in new and existing affordable housing.	X	X	
E1.6 Create an energy retrofit accelerator to provide a one-stop shop for guidance, technical support, training, and access to aggregated funds to support building owners and contractors. Target support to low-income communities and affordable housing.	X	X	
E2 Standardize All-Electric New Development: This measure aims to electrify all applicable new buildings, while taking into consideration the varying climate, geography, infrastructure, and sole-source dependency challenges that rural communities and unique industries may face.	X		
E2.1 Adopt an ordinance requiring all applicable new buildings to be fully electric with no natural gas hookups. Include affordable housing considerations in these requirements, and develop supporting measures (financial support, technical assistance, or other incentives) to defray potential additional first costs in order to maintain housing affordability.	X		
E2.2 Adopt a ZNE ordinance for all new residential buildings built after 2025 and all new nonresidential buildings built after 2030. Include renter protections for affordable housing. Provide affordable housing set-aside to offset first cost.	X		

TABLE 2-11 (CONTINUED)
ANTICIPATED 2045 CLIMATE ACTION PLAN IMPLEMENTATION TIMING

	Short-Term (2024–2030)	Medium-Term (2031–2035)	Long-Term (2036–2045)
Strategy 5: Decarbonize Buildings (cont.)			
E2.3 Adopt CALGreen Code Tier 1 green building standards and identify which Tier 2 standards could be adopted as code amendments.	X		
E3 Other Decarbonization Actions: Reduce the life-cycle carbon intensity of building materials and phase out the use of high-GWP refrigerants.	X	X	
E3.1 Work with utilities to incorporate increasing levels of biomethane into the natural gas mix.	X	X	
E3.2 Adopt a concrete code for new construction that limits embodied carbon emissions; specify code requirements of carbon intensity limit for concrete.	X	X	
E3.3 Adopt reach code requirements that include performance standards to limit the amount of embodied carbon associated with construction.	X		
E3.4 Develop a refrigerant management program that establishes a phase-out timeline for high-GWP refrigerants in existing buildings, incentivizes industrial equipment replacement, and specifies requirements for new development to use low-GWP refrigerants.	X		
Strategy 6: Improve Efficiency of Existing Building Energy Use			
E4 Improve Energy Efficiency of Existing Buildings: Retrofit existing building stock to reduce overall unincorporated Los Angeles County energy use.	X	X	
E4.1 Adopt Building Performance Standards for energy efficiency in existing buildings. Require all buildings to perform energy efficiency retrofits at the point of sale. Expand and enhance the energy efficiency programs offered by the Southern California Regional Energy Network (SoCalREN). Include affordable housing considerations in these requirements, and develop additional renter protections and supporting measures (financial support, technical assistance, or other incentives) to limit the amount of first costs being passed on to low-income renters. (See Actions E1.5 and E1.6.)	X	X	
E4.2 Adopt an energy efficiency ordinance for existing buildings, requiring all buildings over 20,000 square feet to benchmark and report their energy use and demonstrate their pathway to efficiency.	X		
E4.3 Convert existing County-owned heat-trapping surfaces to cool or green surfaces.		X	
Strategy 7: Conserve Water			
E5 Increase Use of Recycled Water and Gray Water Systems: Increasing the use of alternative water sources (e.g., recycled water, gray water, indirect potable reuse) reduces the demand for water sources with higher energy and carbon intensities (e.g., imported water, groundwater).	X	X	X
E5.1 Require dual waste piping to be installed in new residential developments to allow for future graywater irrigation systems.			X
E5.2 Require the use of recycled water and gray water for agricultural purposes where recycled water is available. Identify soil and water conservation best practices for agricultural uses. Work with LACSD and other water suppliers to assess the feasibility of new recycled water facilities for unserved communities.	X	X	X
E5.3 Require the use of recycled water and gray water for industrial purposes where recycled water is available. Identify water conservation best practices for industrial uses. Work with LACSD and other water suppliers to assess the feasibility of new recycled water facilities for unserved communities.	X	X	X
E5.4 Require the use of recycled water and gray water for landscaping irrigation purposes where recycled water is available.	X	X	X
E5.5 Partner with the County water districts and retail suppliers to explore the potential for widespread utilization of direct potable reuse through pilot projects.	X		

**TABLE 2-11 (CONTINUED)
ANTICIPATED 2045 CLIMATE ACTION PLAN IMPLEMENTATION TIMING**

	Short-Term (2024–2030)	Medium-Term (2031–2035)	Long-Term (2036–2045)
Strategy 7: Conserve Water (cont.)			
E6 Reduce Indoor and Outdoor Water Consumption: Reducing indoor and outdoor water consumption is essential as the state experiences longer and more severe droughts. Not only will water conservation improve regional resiliency, but it will also reduce GHG emissions through the reduction of energy consumption associated with the processing, treatment, and conveyance of water and wastewater.	X		
E6.1 Develop a water conservation ordinance for new development (public and private). Utilize Leadership in Energy and Environmental Design (LEED) or Sustainable SITES Initiative (SITES) standards. A future ordinance may include a net-zero water requirement for new greenfield development.	X		
E6.2 Adopt a water efficiency ordinance for existing buildings, requiring all buildings over 20,000 square feet to benchmark and report their water use and demonstrate their pathway to efficiency.	X	X	
E6.3 Incentivize residents to replace water-intensive landscaping, such as decorative turf, with water-conserving landscaping and/or California native plants through a new ordinance along with education and incentive programs.	X		
E6.4 Implement strategies to improve water efficiency and increase water conservation at County facilities	X		
E6.5 Integrate water related programs into the County’s affordable housing preservation program to protect the housing affordability of units and to keep the units fit for their purpose in a changing climate.	X	X	
Strategy 8: Minimize Waste and Recover Energy and Materials from the Waste Stream			
W1 (Core) Institutionalize Sustainable Waste Systems and Practices: Undertake actions that result in sustainable waste systems. Responsible and sustainable waste practices are learned behaviors, which the County can facilitate through outreach, education, and mandates. Increase diversion of recyclable materials and organics from landfills through ordinances, service improvements, education and outreach, and promotion of product stewardship and markets for material reuse. An increased diversion rate indirectly reduces the demand for virgin materials, which reduces the life-cycle carbon intensity of any resulting products. Through action taken at the County level, waste-conscious habits and thoughtful consumption can become the default.	X		
W1.1 Identify best practice waste pricing programs to reduce waste generation to the maximum extent feasible, including but not limited to differential prices for waste based on amount generated in the residential sector and reforms to tipping rate structures.	X		
W1.2 Implement, enforce, and expand to the maximum extent feasible the single-use plastics ordinance and polystyrene ban.			
W1.3 Increase the diversion requirements in the County’s Construction and Demolition Debris Ordinance and allow the use of recycled construction materials in new projects.	X		
W2 Increase Organic Waste Diversion: Provide services for diverting yard waste, food scraps, and compostable paper from landfills to beneficial uses, including compost, food rescue, and energy production.	X	X	X
W2.1 Require organic waste generators to properly manage organic waste as per the Organic Waste Disposal Reduction Ordinance. Improve upon and expand existing practices and programs to minimize organic waste disposal in landfills.			
W2.2 Develop organic waste collection, management, and diversion programs for constituents in unincorporated communities and all County operations; establish a contamination monitoring plan for organic waste programs.		X	
W2.3 Collaborate with the LA County Sanitation Districts and other waste and wastewater service providers to utilize unused anaerobic digestion capacity of existing wastewater treatment plants and solid waste facilities to generate vehicle fuel (electricity and/or biomethane) from newly diverted organic waste. Develop a strategy for using bioenergy created from recycled organic waste.		X	X

TABLE 2-11 (CONTINUED)
ANTICIPATED 2045 CLIMATE ACTION PLAN IMPLEMENTATION TIMING

	Short-Term (2024–2030)	Medium-Term (2031–2035)	Long-Term (2036–2045)
Strategy 8: Minimize Waste and Recover Energy and Materials from the Waste Stream (cont.)			
W2.4 Provide regional leadership for organic waste processing capacity planning and infrastructure development.		X	X
W2.5 Enhance and expand the County's existing Food DROP food donation and redistribution program to divert edible food from landfills and make it available to food insecure communities.	X	X	
Strategy 9: Conserve and Connect Wildlands and Working Lands			
A1 Conserve Forests, Woodlands, Shrublands, Grasslands, Desert, and other Carbon-Sequestering Wildlands and Working Lands: Preserve, conserve, and restore agricultural lands, working lands, rangelands, forest lands, wetlands, and other wildlands in unincorporated Los Angeles County.	X	X	X
A1.1 Develop an open space conservation and land acquisition strategy that prioritizes wildlife connectivity to conserve native habitats for carbon sequestration.	X	X	X
A1.2 Employ ecosystem-appropriate vegetation management of wildlands based on the best available science to reduce unintended human ignitions and wildfire risk and prevent carbon loss in forest lands. Leverage tools such as the Unified Land Management Plan and the Countywide Community Wildfire Prevention Plan.	X	X	X
Strategy 10: Sequester Carbon and Implement Sustainable Agriculture			
A2 Support Regenerative Agriculture: Promote agricultural practices that sequester carbon and restore soil quality, biodiversity, ecosystems health, and water quality.	X	X	
A2.1 Create fallow and field resting incentives to reduce bare-fallow land by adding cover crops and promoting crop rotation for active agricultural sites to improve soil quality and limit risks of nutrient erosion, pollutant runoff, and yield reduction. Create a carbon farming plan with the primary objectives of carbon removal and regenerative agriculture.		X	
A2.2 Provide compost and/or organic or nonsynthetic fertilizer to farmers free of charge or at a discounted rate.	X		
A3 Expand Unincorporated Los Angeles County's Tree Canopy and Green Spaces: Create an Urban Forest Management Plan to plant trees, increase the unincorporated Los Angeles County's tree canopy cover, add green space, and convert impervious surfaces. Focus tree planting on frontline communities with insufficient tree cover and green spaces.	X	X	X
A3.1 Create and implement an equitable Urban Forest Management Plan that prioritizes: (1) tree- and parks-poor communities; (2) climate- and watershed-appropriate and drought/pest-resistant vegetation; (3) appropriate watering, maintenance, and disposal practices; (4) provision of shade; and (5) biodiversity.	X	X	X
A3.2 Expand tree planting on County property and in the public right-of-way within unincorporated Los Angeles County. Encourage tree planting on private property.	X	X	X
A3.3 Develop an ordinance requiring that all removed trees must be replaced by an equal or greater number of new trees	X		

NOTES:

2045 CAP = 2045 Los Angeles County Climate Action Plan; BIPOC = Black, Indigenous, and People of Color; CALGreen Code = California Green Building Standards Code; Unincorporated Los Angeles County = unincorporated areas of Los Angeles County; Countywide = Los Angeles County in its entirety, inclusive of both unincorporated areas and all 88 incorporated cities; CPA = Clean Power Alliance; EV = electric vehicle; EVCS = electric vehicle charging station; GHG = greenhouse gas; GWP = global warming potential; HQTA = High Quality Transit Area; County = County of Los Angeles government; LACSD = Los Angeles County Sanitation Districts; LEED = Leadership in Energy and Environmental Design; Metro = Los Angeles County Metropolitan Transportation Authority; PV = photovoltaic; SCE = Southern California Edison; TDM = Transportation Demand Management; VMT = vehicle miles traveled; ZEV = zero-emissions vehicle; ZNE = zero net energy. Actions that are specifically designed to reduce emissions for County municipal operations are identified with an "M" superscript.

2.7.1 2045 Climate Action Plan Consistency Checklist

As discussed in Section 2.3.3, *Qualified Greenhouse Gas Emissions Reduction Plan*, projects in the County can demonstrate consistency with the Draft 2045 CAP (as a qualified GHG emissions reduction plan) if they are consistent with the 2045 CAP's future growth projections and with its GHG emissions reduction measures. As discussed above, any project that is consistent with a qualified GHG emissions reduction plan, and that conforms to specific performance standards applicable to new development identified in the plan, would not require additional GHG emissions analysis or mitigation under CEQA Guidelines Section 15183.5(b)(2).

A project's incremental contribution to a cumulative impact may not be cumulatively considerable if the project would comply with the requirements in a previously approved plan or mitigation program (including plans or regulations for the reduction of GHG emissions) that provides specific requirements that would avoid or substantially lessen the cumulative problem within the geographic area in which the project is proposed (CEQA Guidelines Sections 15064[h][3] and 15064.4[b]). Once final, the Draft 2045 CAP would represent the County's approved emissions reduction program for all new development within the unincorporated areas.

The County has developed the 2045 CAP Checklist to assist with determining the consistency of projects with the Draft 2045 CAP. This is included as Appendix F to the Draft 2045 CAP. The 2045 CAP Checklist provides individual projects the opportunity to demonstrate that they are reducing GHG emissions; it also ensures that future projects would achieve their proportion of emissions reductions consistent with the assumptions of the Draft 2045 CAP. A project would demonstrate consistency with the Draft 2045 CAP by incorporating the GHG emissions reduction measures included in the Draft 2045 CAP that apply to new projects. The 2045 CAP Checklist for projects facilitated by the Draft 2045 CAP provides a mechanism for projects to specifically identify "those requirements specified in the plan that apply to the project, and, if those requirements are not otherwise binding and enforceable, incorporate those requirements as mitigation measures applicable to the project" per CEQA Guidelines Section 15183.5(b)(2).

Because it is a qualified climate action plan pursuant to CEQA Guidelines Section 15183.5, the Draft 2045 CAP would be used as the basis for future assessments of consistency with this plan in lieu of a project-specific GHG CEQA analysis for future projects, by using the 2045 CAP Checklist. Future discretionary projects—both projects proposed by private developers and public projects—would be reviewed to determine whether they meet certain screening criteria included in the 2045 CAP Checklist:

- If a project would be consistent with the General Plan and Housing Element *and* could demonstrate consistency with the Draft 2045 CAP by completing the 2045 CAP Checklist, then the project would be considered consistent with the Draft 2045 CAP and would be eligible for CEQA streamlining of its project-level GHG analysis.
- Also, if a project would achieve net-zero GHG emissions compared to existing on-site development at the project site, provided that existing on-site development is similar to the proposed project and that GHG emissions from existing on-site development are not substantially larger than emissions from the proposed project, the project would be considered consistent with the 2045 CAP and would be eligible for CEQA streamlining of its project-level GHG analysis.

- If the project would be inconsistent with the Housing Element and require a General Plan amendment, then it would not be able to use this the 2045 CAP for CEQA streamlining. Such a project would have to undergo its own project-level analysis of GHG impacts pursuant to CEQA.
- If a project could not demonstrate consistency with the Draft 2045 CAP by completing the 2045 CAP Checklist or by implementing equivalent replacement strategies or by implementing a qualified off-site GHG emission reduction project, as provided for in the 2045 CAP Checklist, then a project-specific GHG analysis would be required. In this case, implementation of applicable CAP Checklist items that are feasible would still be required.

Consistency with General Plan Land Use Assumptions. Projects consistent with the demographic forecasts and land use assumptions used in the Draft 2045 CAP can use the 2045 CAP Checklist to demonstrate consistency with the 2045 CAP. If consistent, these projects could rely on the programmatic environmental review contained in the certified EIR for the 2045 CAP.

If a project would not be consistent with the General Plan’s land use designations, then it would not be eligible for streamlining by using the 2045 CAP Checklist. Projects inconsistent with the General Plan’s land use designations would prepare a project-specific analysis of GHG emissions. Such an analysis would quantify existing and projected GHG emissions for the project and incorporate applicable items from the 2045 CAP Checklist to the maximum extent feasible, along with any identified project-specific mitigation measures.

Offsite GHG Emission Reduction Projects. As part of the 2045 CAP Checklist, the County will develop an offsite GHG emissions reduction program. Future development projects that cannot achieve net-zero GHG emissions or are unable to comply with all required 2045 CAP Checklist items, would have the option to participate in the offsite GHG emissions reduction program. This program would allow project applicants to fund or implement local projects that reduce GHG emissions within unincorporated Los Angeles County. Such projects must not otherwise be required by law or regulation and would not have happened on the 2045 CAP’s proposed schedule but for the requirements placed on the project by the 2045 CAP Checklist. If offsite GHG reduction projects are implemented via this program, then, to the extent that such projects include types of activities similar to those contemplated by the Draft 2045 CAP’s measures and actions, the resulting environmental impacts would be similar to those disclosed in this Draft EIR. Further, project applicants’ CEQA documents would be required to disclose the impacts of any offsite GHG reduction projects that are proposed to be funded or implemented.

2.8 2045 Climate Action Plan Monitoring and Reporting

To ensure that the Draft 2045 CAP remains qualified for use with later activities under CEQA Guidelines Section 15183.5(b)(2) and that the 2045 CAP Checklist remains valid, the Project includes the following monitoring and reporting responsibilities, which would be administered by the County:

- The County will conduct an inventory of the unincorporated County’s GHG emissions at minimum every five years and would include a timeline with milestones toward meeting targets.

- The County will collect data to report through an annual report identifying the progress of measures and actions. In the first two years of implementation, the County will identify where further efforts and additional resources may be needed.
- The County will develop a dashboard as part of the reporting on the implementation of the 2045 CAP that will be updated on an annual basis, based on data availability, and will provide information on the ongoing efforts of the CAP actions through data and spatial displays.
- The County will annually evaluate County policies, plans, and codes as needed to ensure that the 2045 CAP reduction targets are met.
- The County staff will evaluate the 2045 CAP and the 2045 CAP Checklist every five years (at minimum) to determine whether updates are necessary.

2.9 Required Approvals: Environmental Review and Consultation Requirements

CEQA Guidelines Section 15124(d) requires that an EIR to contain a statement briefly describing the intended uses of the EIR. The County has approval authority over the Draft 2045 CAP. Approval from other public agencies is not required. The County would certify the Final EIR, approve the General Plan amendment, and adopt the Draft 2045 CAP. No other agency approvals would be required, as these are policy matters for the County.

Some projects facilitated by Draft 2045 CAP measures and actions would be implemented by the County while others would be implemented by other agencies, such as transit agencies for expanded transit service; however, such projects would require project-level CEQA evaluation, at which time implementing agencies would be involved as a lead or responsible agencies.

CEQA Guidelines Section 15124(d) requires that an EIR integrate CEQA review with related federal, state, or local environmental review and consultation requirements. Aside from SB 18 tribal consultation (see Chapter 1, *Introduction*), at the plan level no other directly related environmental review and consultation requirements are applicable to the Draft 2045 CAP. Implementation of projects facilitated by Draft 2045 CAP measures and actions would require compliance with applicable project-specific federal, state, or local environmental review and consultation requirements.

CHAPTER 3

Environmental Setting, Impacts, and Mitigation Measures

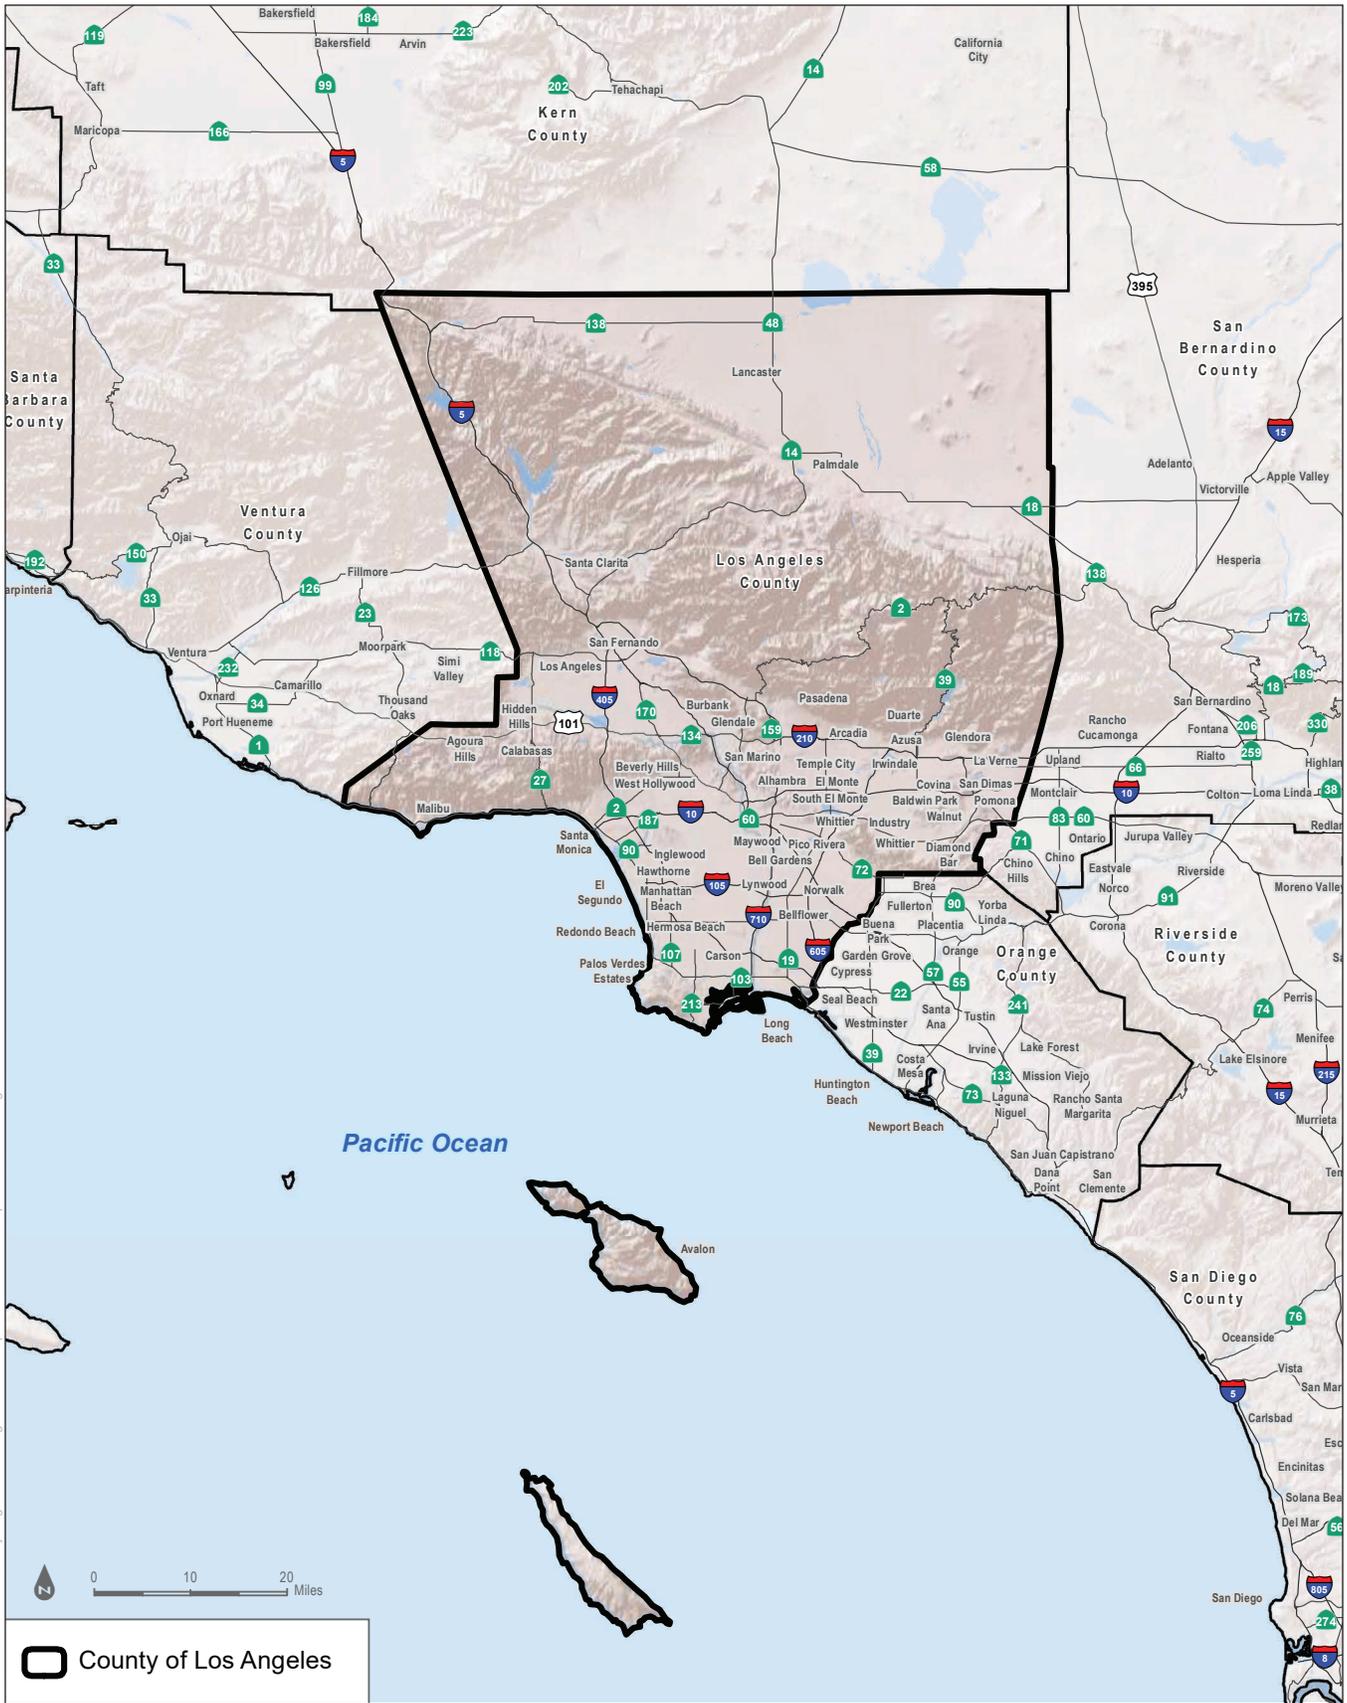

3.1 Introduction to Environmental Analysis

This chapter describes the environmental setting from a regional and local perspective and the regulatory setting for the analysis of impacts. See Section 3.1.1, *Regional Environmental Setting*, and each of the resource sections that follow for setting information. This chapter also analyzes the environmental impacts of the Draft 2045 CAP and projects facilitated by the Draft 2045 CAP as they relate to the following areas of environmental consideration: aesthetics, agriculture and forestry, air quality, biological resources, cultural resources, energy, geology and soils, greenhouse gas (GHG) emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, population and housing, transportation, tribal cultural resources, utilities and service systems, and wildfire.

3.1.1 Regional Environmental Setting

CEQA Guidelines Section 15125 requires an EIR to include “a description of the physical environmental conditions in the vicinity of the project.... from both a local and regional perspective.” The regional environmental setting is described here; the local environmental setting is described on a resource-by-resource basis elsewhere in this Chapter 3.

With approximately 4,083 square miles, including a 75-mile stretch of the Pacific Coast, Los Angeles County is geographically one of the largest counties in the United States. The County is bordered to the south by Orange County, to the east by San Bernardino County, to the north by Kern County, and to the west by Ventura County, and includes two offshore islands: Santa Catalina Island and San Clemente Island. Los Angeles County includes 88 cities and approximately 2,656 square miles of unincorporated area. The unincorporated areas are home to one million people. See **Figure 3.1-1**, *Regional Vicinity Map*.

D:\2019\04\03\02 - LA County Regional Planning - CAP 2045 Update and EIR\05 Graphics-GIS-Modeling-USE AZURE

SOURCE: Los Angeles County, 2021

Los Angeles County 2045 Climate Action Plan (2045 CAP)

Figure 3.1-1
Regional Vicinity Map

3.1.1.1 Aesthetics

Los Angeles County is a visually diverse area where the visual setting includes built environments, natural environments, and places that interface between the two. Built environments include commercial, office, residential, industrial, institutional, and public uses. Natural environments include coastlines, beaches, foothills, mountains and ridgelines, forests, and desert environments. Scenic hillsides include the San Gabriel Mountains, Verdugo Hills, Santa Monica Mountains, Santa Susana Mountains, Simi Hills, and Puente Hills. Scenic viewsheds vary by location and community and can include ridgelines, unique rock outcroppings, waterfalls, ocean views, or various other unusual or scenic landforms. Numerous ridgelines provide dramatic views for the unincorporated areas.

The varied topography of the County allows for an assortment of long-range views from the Los Angeles Basin to the foothills and mountains, as well as long-range views from the foothills and mountains to the Los Angeles Basin and the coast. There are three adopted state scenic highways within the County: Angeles Crest Highway (State Route [SR] 2), from 2.7 miles north of Interstate 210 to the San Bernardino County line; Mulholland Highway (two sections), from SR 1 to Kanan Dume Road, and from west of Cornell Road to east of Las Virgenes Road; and Malibu Canyon–Las Virgenes Highway, from SR 1 to Lost Hills Road. Overall, the visual character of Los Angeles County is quite varied (Los Angeles County 2021). See Section 3.2.1, *Setting*, in Section 3.2 for additional details.

3.1.1.2 Agriculture and Forestry

Farmland Mapping and Monitoring Program maps identify farmland of the following types: Agricultural Land, Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, and Grazing Land. Mapped Important Farmland exists in the Antelope Valley, Santa Clarita Valley, and Santa Monica Mountains planning areas. The County also has land use jurisdiction over approximately 40,000 acres of forest land. See Section 3.3.1, *Setting*, in Section 3.3 for additional details.

3.1.1.3 Air Quality

From an air quality perspective, Los Angeles County can be reflected as the two distinct geographical areas of the Los Angeles Basin and Antelope Valley. The Los Angeles Basin is part of the South Coast Air Basin (SCAB), which includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties; and the Antelope Valley is part of the Mojave Desert Air Basin, which encompasses the northeastern portion of Los Angeles County, the eastern portion of Kern County, and the majority of San Bernardino County. Most of Los Angeles County is in the SCAB, which is managed by the South Coast Air Quality Management District (SCAQMD). The SCAQMD's jurisdiction is approximately 10,743 square miles and includes Los Angeles County except for the Antelope Valley, which is under the jurisdiction of the Antelope Valley Air Quality Management District (AVAQMD). The SCAQMD and AVAQMD both implement a wide range of programs and regulations that address point- and area-source emissions and mobile-source emissions.

The entire SCAB, including the portion in unincorporated Los Angeles County, is designated as a nonattainment area for both the federal and state standards for ozone, particulate matter with an aerodynamic diameter less than or equal to 2.5 microns in size (PM_{2.5}), and particulate matter with an aerodynamic diameter less than or equal to 10 microns in size (PM₁₀) (CARB 2022; USEPA 2022a). The Los Angeles County portion of the SCAB is designated as a nonattainment area for both federal and state ozone standards and is designated as a nonattainment area for state PM₁₀ standards (CARB 2022; USEPA 2022a).

The air people breathe has a direct correlation with health, and Los Angeles County has some of the most polluted air in the country (Los Angeles County Department of Public Health 2022). Children, the elderly, and individuals with respiratory or cardiovascular health issues are most negatively affected by poor air quality (AVAQMD 2022). Exposure to six air pollutants in particular can cause health problems: particulate matter, ground-level ozone, lead, carbon monoxide, nitrogen oxides and sulfur oxides. Exposure can cause respiratory symptoms (e.g., coughing and breathing difficulties, chronic bronchitis, and asthma), cardiovascular diseases, and can trigger a host of harmful effects (e.g., behavioral problems, learning deficits, headaches, fatigue) (Los Angeles County Department of Public Health 2022).

See Section 3.4.1, *Setting*, in Section 3.4 for additional details.

3.1.1.4 Biological Resources

Los Angeles County comprises a diverse variety of ecosystems that include coastal areas, islands, plains, mountains, and deserts. Elevations range from sea level to over 10,000 feet above mean sea level. Climates range from mild near the coast to severe in the high mountains and desert regions. The soils and underlying geology vary according to prehistoric volcanic activity, marine sedimentation, and river deposition. This wide variation in physical environments has produced the diverse collection of habitats, vegetation, and wildlife found in the County today (Los Angeles County 2021).

Sensitive biological resources are habitats or individual species that have special recognition by federal, state, or local conservation agencies and organizations as endangered, threatened, and/or rare. This is due to the species' declining or limited population sizes, which usually result from habitat loss. Watch lists of such resources are maintained by the U.S. Fish and Wildlife Service, the California Department of Fish and Wildlife, and special groups, such as the California Native Plant Society. Los Angeles County contains multiple habitats as well as plant and animal species, which have been accorded special recognition. For example, the Biodiversity Atlas of Los Angeles, prepared by the University of California Los Angeles, showcases the striking biodiversity present in the County, which hosts more than 4,000 distinct species of plants and animals, including 52 endangered species—more than any county outside of Hawaii (UCLA 2020). See Section 3.5.1, *Setting*, in Section 3.5 for additional details.

3.1.1.5 Cultural and Tribal Cultural Resources

Evidence of continuous human occupation in Southern California spans the last 10,000 years (Los Angeles County 2021). Cultural resources include prehistoric, historical, archaeological, and paleontological resources. Examples of such resources in Los Angeles County include historic buildings, structures, artifacts, sites, and districts of historic, architectural, archaeological, and paleontological significance. These resources may also be locations of important events in history or unique structures or groups of structures possessing distinctive architectural features that depict a historic period. Historical, cultural, and paleontological resources are considered nonrenewable and irreplaceable. Tribal cultural resources that exist in Los Angeles County are sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that is listed, or determined to be eligible for listing, on the national, state, or local register of historical resources. The Native American Heritage Commission has identified 24 tribes with traditional lands or cultural places within the unincorporated areas. For additional details, see Section 1.4.1.1, *Senate Bill 18 Consultation Process*, and Section 1.4.1.2, *Tribal Consultation Pursuant to Assembly Bill 52*, in Chapter 1 and the setting sections for cultural resources (Section 3.6.1 in Section 3.6), paleontological resources (Section 3.8.1 in Section 3.8) and tribal cultural resources (Section 3.16.1 in Section 3.16).

3.1.1.6 Energy

Los Angeles County's population is served by a variety of energy sources, including electricity, natural gas, and petroleum. Southern California Edison and the Clean Power Alliance (CPA) provide electricity to the unincorporated areas. The Southern California Gas Company provides natural gas service to the County. Petroleum usage in the County includes products such as gasoline, distillate fuel, liquefied petroleum gases, and jet fuel (Los Angeles County 2021). See Section 3.7.1, *Setting*, in Section 3.7 for additional details.

3.1.1.7 Geology and Soils

Since 1800, more than 90 significant earthquakes have shaken the Los Angeles region, including the moment magnitude 6.7 1994 Northridge earthquake. Within the County, there are more than 50 active and potentially active fault segments, an undetermined number of buried faults, and at least four blind thrust faults capable of producing damaging earthquakes. The primary issues in the unincorporated areas associated with geology and soils include: seismic hazards and the associated effects and damage caused by earthquakes; and geotechnical, or hillside, hazards. The vast majority of hillside hazards include mud and debris flows, active deep-seated landslides, hillside erosion, and human-induced slope instability (Los Angeles County 2021). See Section 3.8.1, *Setting*, in Section 3.8 for additional details.

3.1.1.8 Greenhouse Gas Emissions

A GHG is any gas that absorbs infrared radiation in the atmosphere. As defined in Health and Safety Code Section 38505(g), for purposes of administering many of the state's primary GHG emissions reduction programs, GHGs include carbon dioxide (CO₂), methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, sulfur hexafluoride, and nitrogen trifluoride (see also

California Code of Regulations Title 14, Section 15364.5). Some GHGs, such as CO₂, methane, and nitrous oxide, are emitted into the atmosphere through natural processes and human activities. Of these, CO₂ and methane are emitted in the greatest quantities from human activities. Manufactured GHGs have a much greater heat-absorption potential than CO₂ and include fluorinated gases, such as hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride, which are associated with certain industrial products and processes (Los Angeles County 2021).

The primary GHG sources in California attributable to human activities include transportation, stationary energy (used by buildings and other facilities), waste, and industrial, agricultural, and other land use. In 2020, GHG emissions nationwide totaled 5,215.6 million metric tons of CO₂ equivalents after accounting for sequestration from the land sector; the 2020 level is 22 percent below 2005 levels (USEPA 2022b). See Section 3.9.1, *Setting*, in Section 3.9 for additional details.

3.1.1.9 Hazards and Hazardous Materials

Hazardous materials refer generally to hazardous substances that exhibit corrosive, poisonous, toxic, flammable, and/or reactive properties and have the potential to harm human health and/or the environment. Hazardous materials are used in products (e.g., household cleaners, industrial solvents, paint, pesticides) and in the manufacturing of products (e.g., electronics, newspapers, plastic products). Hazardous materials can include petroleum, natural gas, synthetic gas, acutely toxic chemicals, and other toxic chemicals that are used in agriculture, commercial, and industrial uses; businesses; hospitals; and households. Accidental releases of hazardous materials have a variety of causes, including highway incidents, warehouse fires, train derailments, shipping accidents, industrial incidents, and unintentional releases (Los Angeles County 2021).

Regarding emergency response planning, the County's Office of Emergency Management maintains the *Los Angeles County Operational Area Emergency Response Plan* (Los Angeles County 2012) and the *County of Los Angeles All-Hazard Mitigation Plan* (Los Angeles County Chief Executive Office 2019). The County Office of Emergency Management leads and coordinates disaster plans and disaster preparedness exercises for all cities and 288 special districts in the County. Additionally, hazardous material response in the Project area would be handled by the hazardous materials response firefighters with the Los Angeles County Fire Department. See Section 3.10.1, *Setting*, in Section 3.10 for additional details.

3.1.1.10 Hydrology and Water Quality

Los Angeles County spans parts of three hydrologic regions: the South Coast Region, the South Lahontan Region, and the Tulare Lake Hydrologic Region. Within the County, there are six major watershed areas that include more than 900 miles of major river systems, 3,600 miles of smaller streams, and 25 square miles of pond, lake, and reservoir surface (Los Angeles County 2021; Los Angeles County Department of Public Works 2009).

Also located within Los Angeles County are regional groundwater recharge areas called *spreading grounds*, which capture close to 80 percent of the runoff that flows from the mountains (Los Angeles County 2021; Los Angeles County Department of Public Works 2022a, 2022b). Los Angeles County groundwater basins are grouped under five major geographic areas: the

Antelope Valley, Coastal Plain, San Fernando Valley, San Gabriel Valley, and Santa Clarita Valley (Los Angeles County Department of Public Works 2022c). Except during times of drought, groundwater extraction accounts for nearly 33 percent of the water usage in the unincorporated areas (Los Angeles County 2021). In rural areas, hundreds of households depend on private wells (Los Angeles County 2021).

Regarding surface water, the Los Angeles Regional Water Quality Control Board has adopted two water quality control plans (also called *basin plans*) that govern different areas of the County: one for the Santa Clara Basin, the other for the Los Angeles Basin. The basin plans designate beneficial uses for inland and coastal surface waters, establish water quality objectives and implementation programs and policies to protect those uses. The County's Stormwater Ordinance regulates the discharge, deposit, or disposal of stormwater and/or runoff to storm drains in accordance with the National Pollutant Discharge Elimination System program established pursuant to the federal Clean Water Act. The County Flood Control District oversees activities on more than 2,700 square miles within six major watersheds, including drainage infrastructure within 86 incorporated cities as well as the unincorporated County areas (Los Angeles County Flood Control District 2022). See Section 3.11.1, *Setting*, in Section 3.11 for additional details.

3.1.1.11 Land Use and Planning

The County oversees land use and planning within all of the unincorporated areas, which comprise an approximately 1,696,000-acre (approximately 2,650-square-mile) area that is approximately 65 percent of the total land area of the County. See Figure ES-1, *Map of Unincorporated Los Angeles County*.

The unincorporated areas in the northern portion of Los Angeles County include the Angeles National Forest and parts of the Los Padres National Forest (together encompassing nearly 650,000 acres within the unincorporated areas—more than 25 percent of the County's total land area), and the western tip of the Mojave Desert known as the Antelope Valley. In the western portion of the County, the unincorporated areas include Marina del Rey and the Santa Monica Mountains. The unincorporated areas in the southern and eastern portions consist of non-contiguous land areas including unincorporated areas in South Los Angeles, East Los Angeles, and the San Gabriel Valley.

There are five unincorporated areas of Los Angeles County in the state-designated coastal zone: Santa Catalina Island, Marina del Rey, a portion of the Santa Monica Mountains, Ballona Wetlands, and San Clemente Island. The General Plan identifies 11 Planning Areas, where uses reflect the distinctive and diverse character of the different areas as well as their environmental and other constraints (County Planning 2015). See Section 3.12.1, *Setting*, in Section 3.12 for additional details.

Other governmental entities besides the County have oversight over land use and planning in the unincorporated areas. For example, although the County retains responsibility for land use regulation for the nearly 40,000 acres of private in-holdings within the national forest lands, the remaining national forest lands in unincorporated areas are under the stewardship of the

U.S. Forest Service. Additionally, the Santa Monica Mountains National Recreation Area is a part of the National Park System and is managed by the U.S. Department of the Interior’s National Park Service. The U.S. Department of Defense also oversees areas (military installations) within the County. See Section 3.12.1, *Setting*, in Section 3.12 for additional details.

3.1.1.12 Noise

The unincorporated areas of the County contain urbanized and rural environments, both of which experience noise disturbance. The major sources of noise in the unincorporated areas come from transportation systems, such as commercial and private airports, rail and bus networks, and the regional freeway and highway system. Urban residential areas are also affected by commercial and industrial spillover noise. Other major sources of noise historically have been associated with industrial uses, such as manufacturing plants. Non-transportation noise sources include industrial processing; mechanical equipment; and pump stations and heating, ventilation, and air conditioning equipment. Some non-transportation sources are not stationary, but typically are assessed in environmental reviews as “point” or “area” sources due to the limited area in which they operate; examples include truck deliveries, agricultural field machinery, and mining equipment (County Planning 2015).

Noise-sensitive land uses include areas where an excessive amount of noise would interfere with normal activities. Primary noise-sensitive land uses in unincorporated include residential uses, public and private educational facilities, hospitals, convalescent homes, hotels/motels, daycare facilities, and passive recreational parks. Sleep disturbance tend to be a critical concern for noise-sensitive land uses (County Planning 2015). See Section 3.13.1, *Setting*, in Section 3.13 for additional details.

3.1.1.13 Population and Housing

This regional setting information for population and housing is based on information presented in the County’s 2021-2029 Housing Element, which presented data as of 2018 (Los Angeles County 2021). In 2018, the population in unincorporated Los Angeles County was estimated to be 1,057,162 persons, representing approximately 10.3 percent of the County’s total population. Regarding housing stock, there were 294,730 housing units in the unincorporated areas at that time, representing approximately 8.8 percent of the Countywide total. The majority of homes in unincorporated Los Angeles County are single-family detached units, although there also are mobile homes, apartments of varying scales, and single-family attached units (e.g., townhomes). The high percentage of single-family detached and attached housing units reflects the current suburban nature of several unincorporated areas (Los Angeles County 2021). See Section 3.14.1, *Setting*, in Section 3.14 for additional details.

3.1.1.14 Transportation

Los Angeles County has one of the largest transportation systems in the world, and the County’s growing population, coupled with the diversity of activities that take place Countywide, creates burdens on the transportation system and its infrastructure (County Planning 2015). Among the six counties that are part of the Southern California Association of Governments (SCAG)—

Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties—Los Angeles County has the highest daily vehicle miles traveled (VMT) at over 231,455,000 miles, which represents half of all the average daily VMT generated in the six-county SCAG region. In addition, Los Angeles County drivers experience the highest rate of vehicle hour delays out of the six-county SCAG region counties, with 65 percent of travel delay hours in the region occurring in Los Angeles County (SCAG 2020). Unincorporated areas are served by the interstate highway system, state highways, and a network of County and local roads; as well as by bicycle facilities as described in the County’s 2012 Bicycle Master Plan (Los Angeles County Department of Public Works 2012); and public bus and rail transit throughout the five sectors within Metro’s service area (Metro 2022). See Section 3.15.1, *Setting*, in Section 3.15 for additional details.

3.1.1.15 Utilities and Service Systems

Multiple entities provide wastewater treatment to the unincorporated areas: Los Angeles County Sanitation Districts (LACSD), the City of Los Angeles Bureau of Sanitation (LABS), and Las Virgenes Municipal Water District. The Consolidated Sewer Maintenance District of Los Angeles County, which is administered by the Department of Public Works, operates and maintains more than 4,600 miles of sanitary sewers serving the unincorporated areas (except for Marina del Rey); the LACSD owns, operates, and maintains about 1,400 miles of sewers; and LABS operates and maintains more than 6,700 miles of sewers. See Section 3.17.1, *Setting*, in Section 3.17 for additional details; see also Section 4.19, *Utilities and Service Systems*, in the County’s 2021-2029 Housing Element (Los Angeles County 2021).

3.1.1.16 Wildfire

A *wildfire*, also called *wildland fire* or *rural fire*, is an uncontrolled fire that occurs in an area with combustible vegetation. Much of Los Angeles County is subject to some degree of fire hazard, but specific features make some areas more hazardous than others. Some of those features are found in the unincorporated areas.

Overall, the County faces wildland fire threats as a result of its topography, rainfall patterns, and fire-adapted vegetation. At-risk areas mapped by the California Department of Forestry and Fire Protection (CAL FIRE) as Fire Hazard Severity Zones are further classified as Very High, High, and Moderate in State Responsibility Areas and as Very High in Local and Federal responsibility areas (County Planning 2022).

Some of the largest and most destructive wildfires in the County have been recent: In September 2020, the Bobcat Fire burned 115,796 acres in Angeles National Forest (from north of Monrovia to Juniper Hills) and destroyed 170 structures, including 87 homes (Los Angeles Almanac 2022). Two 2019 fires in Angeles National Forest, the Ravenna Fire in Big Tujunga Canyon and the San Gabriel Fire in San Gabriel Canyon, combined to burn an additional 135,000 acres (Los Angeles Almanac 2022).

CAL FIRE describes the 2022 fire season as follows (CAL FIRE 2022):

California continues to experience longer wildfire seasons as a direct result of Climate Change. Extended dryness originating from January is expected to continue into the Spring with little precipitation leaving most of the state in moderate to extreme drought conditions prior to Summer. These continued dry conditions with above normal temperatures through Spring will leave fuel moisture levels lower than normal increasing the potential for wildland fire activity.

See Section 3.18.1, *Setting*, and Figure 3.18-1, *Fire Hazard Severity Zones and Responsibility Areas*, in Section 3.18 for additional details.

3.1.2 Baseline

The analysis of each environmental resource issue begins with a description of the actual physical environmental conditions in the area where a project and its alternatives would be implemented. These conditions also are referred to as the “baseline” relative to which project-caused changes are analyzed to determine whether the change is significant for purposes of CEQA (CEQA Guidelines Sections 15125 and 15126.2). For this EIR, unless as otherwise noted, baseline conditions are those as they existed on or about January 3, 2022, shortly after the Notice of Preparation was published.

The impacts of the Project (and alternatives analyzed in Chapter 4, *Alternatives*) are defined as changes to the environmental setting that are attributable to Project components or activities. Consistent with CEQA, an EIR need not analyze the impacts of the existing environment on a project (including its users or occupants) unless the project exacerbates those conditions. The regional setting is summarized in Section 3.1.1, *Regional Environmental Setting*. The environmental setting is further described for purposes of establishing baseline environmental conditions on a resource-by-resource basis throughout this Chapter 3.

3.1.3 Approach to Impact Analysis

3.1.3.1 Significance Criteria

CEQA lead agencies rely on impact significance criteria as benchmarks to determine whether changes to the existing environment caused by a project or an alternative would cause a significant adverse effect. A *significant effect on the environment* is “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project” (CEQA Guidelines Section 15382). The significance criteria for this EIR are generally based on the series of questions provided in the CEQA Guidelines Appendix G Environmental Checklist.

3.1.3.2 Significance Thresholds

To determine whether the impact of a project-caused change compared to any of the significance criteria could be significant, CEQA lead agencies evaluate the degree of that change relative to an

established threshold. CEQA Guidelines Section 15064.7 defines *threshold of significance* as “an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant.” Such thresholds may be sourced from a variety of places including general plan policies, ordinances, other agencies’ thresholds, and industry standards. The thresholds used in this EIR are identified together with the relevant criteria on a resource-by-resource basis throughout this Chapter 3.

3.1.3.3 Significance Conclusions

Impact significance conclusions in this EIR are reached based on information in the record, including scientific and factual data as well as professional knowledge and judgment. Consistent with CEQA and the CEQA Guidelines, each significance conclusion is characterized as one of the following:

1. **No Impact:** This signifies that the Project or an alternative would not cause any change in the environment relative to the applicable significance threshold; under these circumstances, no mitigation measures are required. Resources for which the Initial Study prepared for the Project (**Appendix A2**) concluded that no impact would result are not analyzed in detail in this EIR.
2. **Less-than-Significant Impact:** This signifies that the Project or an alternative could cause an adverse change in the environment, but not one that would be substantial, relative to the applicable significance threshold. Under these circumstances, no mitigation measures are required. Resources for which the Initial Study prepared for the Project (**Appendix A2**) concluded that a less-than-significant impact would result are not analyzed in detail in this EIR.
3. **Less than Significant with Mitigation Incorporated:** This signifies that the Project or an alternative could cause an adverse change in the environment that would be substantial relative to the applicable significance threshold, but that the implementation of one or more feasible mitigation measures would reduce the significance of the impact below the threshold.
4. **Significant and Unavoidable:** This signifies that the Project or an alternative could cause a substantial adverse change in the environment relative to the applicable significance threshold; however, either no feasible mitigation measures are available, or, even with implementation of feasible mitigation measures, the significance of the impact would remain above the threshold.
5. **Cumulatively Considerable:** This signifies that the Project-specific or alternative-specific contribution to a significant cumulative impact would be considerable when viewed in connection with the incremental impacts of past projects, the impacts of other current projects, and the impacts of reasonably foreseeable probable future projects (as defined in CEQA Guidelines Section 15130).

3.1.3.4 Resources Eliminated from Detailed Consideration in This Program EIR

Table 3.1-1, *Resources and Significance Criteria Eliminated from Detailed Consideration*, identifies the resources and their significance criteria that were scoped out of the EIR based on conclusions in the Initial Study (Appendix A2) of “no impact” or “less-than-significant impact.” Certain other resources and significance criteria for which the Initial Study concluded that “no impact” or a “less-than-significant impact” would result nonetheless have been brought forward for more detailed environmental significance impact analysis in this Chapter 3 based on scoping comments and input received.

3.1.3.5 Mitigation Measures

Mitigation measures are feasible actions intended to avoid or substantially lessen significant impacts identified in the impact analysis. To avoid or reduce significant impacts, feasible mitigation measures have been recommended to address them. The effectiveness of recommended mitigation measures has been evaluated by analyzing the impact remaining after the implementation of the measure. In some cases, the implementation of more than one mitigation measure may be needed to reduce the significance of an impact below the threshold. Impacts that remain significant after feasible mitigation measures are applied are identified as significant and unavoidable impacts.

**TABLE 3.1-1
 RESOURCES AND SIGNIFICANCE CRITERIA ELIMINATED FROM DETAILED CONSIDERATION**

Biological Resources	
f) Conflict with any local policies or ordinances protecting biological resources, including Wildflower Reserve Areas (L.A. County Code, Title 12, Ch. 12.36), the Los Angeles County Oak Tree Ordinance (L.A. County Code, Title 22, Ch. 22.174), the Significant Ecological Areas (SEAs) (L.A. County Code, Title 22, Ch. 102), Specific Plans (L.A. County Code, Title 22, Ch. 22.46), Community Standards Districts (L.A. County Code, Title 22, Ch. 22.300 et seq.), and/or Coastal Resource Areas (L.A. County General Plan, Figure 9.3)?	Less-than-Significant Impact
Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved state, regional, or local habitat conservation plan?	No Impact
Hydrology and Water Quality	
e) Conflict with the Los Angeles County Low Impact Development Ordinance (L.A. County Code, Title 12, Ch. 12.84)?	No Impact
Land Use and Planning	
a) Physically divide an established community?	No Impact
c) Conflict with the goals and policies of the General Plan related to Hillside Management Areas or Significant Ecological Areas?	Less-than-Significant Impact
Mineral Resources	
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	Less-than-Significant Impact
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	Less-than-Significant Impact
Noise	
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	Less-than-Significant Impact

**TABLE 3.1-1 (CONTINUED)
 RESOURCES AND SIGNIFICANCE CRITERIA ELIMINATED FROM DETAILED CONSIDERATION**

Public Services	
a) Would the project create capacity or service level problems, or result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: Fire protection, sheriff protection, schools, parks, libraries?	Less-than-Significant Impact
Recreation	
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	Less-than-Significant Impact
b) Does the project include neighborhood and regional parks or other recreational facilities or require the construction or expansion of such facilities which might have an adverse physical effect on the environment?	Less-than-Significant Impact
c) Would the project interfere with regional trail connectivity?	Less-than-Significant Impact
Transportation	
d) Result in inadequate emergency access?	Less-than-Significant Impact
Utilities and Service Systems	
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	Less-than-Significant Impact

SOURCE: Draft EIR Appendix A2.

3.1.3.6 Future Projects Facilitated by the Draft 2045 CAP

The Draft 2045 CAP is a policy document that does not propose any specific development or any other specific physical change to the environment. No growth would result from implementation of the CAP beyond what the General Plan (including the Housing Element) currently anticipates. No changes to General Plan land use designations, zoning, or land use-specific projects are proposed as part of the Draft 2045 CAP. Future developments will be subject to project-level environmental review where they are not exempt from CEQA.

Nonetheless, future projects facilitated by Draft 2045 CAP measures and actions may cause environmental impacts. For example, Strategy 1, Strategy 4, and Strategy 5 (regarding decarbonization of the energy supply, vehicles, and buildings, respectively) would incentivize new or upgraded energy generation and related infrastructure. Examples of such projects could include distributed generation via solar roofs, community solar, or microgrids; battery storage and electric vehicle charging stations; utility-scale solar photovoltaic (PV) development; and/or energy transmission and subtransmission facilities. New or upgraded water recycling systems and waste management facilities, and the decommissioning of existing oil and gas operations also could be facilitated by Draft 2045 CAP measures and actions. Details about any specific such projects that could be facilitated by Draft 2045 CAP measures and actions are unknown.

Regarding new utility-scale solar projects, it would be speculative to quantify the amount of renewable energy that could be facilitated by the Draft 2045 CAP that would be provided by new utility-scale solar projects, or identify where that demand would be met, since the increased

renewable energy demand could be met in a variety of additional ways, other than through new utility-scale solar projects. In particular, the importation of renewable energy into the unincorporated areas by providers such as the CPA and further development of rooftop solar are described below as reasonable, feasible steps on the County’s overall path to meeting its targets and advancing toward its goal of carbon neutrality. However, because the future development of new utility-scale, ground-mounted solar PV could be part of the mix, the impacts of such future development are evaluated qualitatively in this EIR.

Section 2.6.2.1 in Chapter 2, *Project Description*, describes the CPA, which enables the County to transition to a low-carbon energy future at an accelerated pace: “Starting in October 2022, customers in unincorporated areas of L.A. County will be getting 100% renewable energy – wind, solar, geothermal – from CPA, compared to the 50 percent clean energy they receive now... low-income customers on a subsidized rate will not have any rate increase” (CPA 2021; County of Los Angeles Chief Sustainability Office 2021). Not all of CPA’s clean energy would be generated in Los Angeles County: “Almost all this energy will come from wind and solar farms in California with a little bit coming from other western states and a little coming from geothermal and small hydroelectric” (County of Los Angeles Chief Sustainability Office 2021).

The County realistically can procure electricity that is generated by 100 percent renewable sources from CPA with a realistic expectation of resiliency.¹ CPA currently provides “100% renewable energy to nearly 1 million residents and businesses” across its service territory “without any supply shortages” (County of Los Angeles Chief Sustainability Office 2021). Further regarding challenges with the power grid, resiliency and reliance on 100 percent renewable energy, the Chief Sustainability Office has stated, “The power grid definitely needs to be upgraded, but for the most part the grid doesn’t care whether it is moving electricity that came from a coal plant or a solar project. So, transitioning away from dirty electricity to cleaner isn’t going to cause the grid to breakdown.” To assure that energy is available, CPA “procures extra power to have as a back-up, including from renewable resources like geothermal that operate around the clock. It is also the third largest purchaser of battery energy storage in California so that when there is extra wind or solar power, it can be stored for use when power is needed” (County of Los Angeles Chief Sustainability Office 2021).

Separate from renewable energy provided by CPA, a substantial amount of solar energy generation would likely occur on rooftops within the County. For example, a 2016 National Renewable Energy Laboratory (NREL) study that found that Los Angeles could support 9 gigawatts of rooftop solar, or 60 percent of its estimated total energy demand, using fairly conservative estimates (Gagnon et al. 2016). A 2020 study by the Institute of the Environment and Sustainability at the University of California, Los Angeles (UCLA) that considered 1.2 million parcels as part of its evaluation of urban rooftop solar capacity in the County also was encouraging in its conclusion that rooftop solar can provide 30 percent of building demands and additional net grid exports in the County (Porse et al. 2020).

¹ *Energy resiliency* means there is a reliable, regular supply of energy as well as contingency measures in place to provide backup in the event of a power failure.

The County is not alone in reasonably concluding that a 100 percent clean energy future would not be comprised exclusively of utility-scale ground-mounted solar PV. Others in the region independently are pursuing a similar path. For example, the City of Los Angeles Department of Water and Power (LADWP) in coordination with NREL also is considering feasible options toward a carbon neutral 2045 that anticipates significant growth in the development of rooftop solar and higher levels of building energy efficiency in addition to new ground-mounted solar energy generation system deployment and power system upgrades (Cochran et al. 2021). “Keeping the lights on was a foundational part” of the LADWP/NREL study, which concluded that “[r]eliable, 100% renewable electricity is achievable” (Cochran et al. 2021).

The County similarly expects that no single renewable energy approach will be sufficient to achieve necessary GHG emissions reductions. Further, even if new utility-scale solar projects would meet some of the increased renewable energy demand associated with the 2045 CAP, it would be speculative to predict whether these projects would be located in Los Angeles County versus other locations. The precise locations or composition of future utility-scale, ground-mounted solar PV that may be facilitated by the Draft 2045 CAP cannot now be known with sufficient certainty for this EIR to provide more than a qualitative analysis of impacts. The qualitative programmatic analysis considers the potential impacts of new utility-scale, ground-mounted solar PV projects, and associated infrastructure, e.g., battery storage, substation or transmission projects).

3.1.3.7 Timing of CAP Impacts

In the Draft 2045 CAP, Table E-1 identifies implementation details for the strategies, measures, and actions, including timing-related performance objectives that represent guideposts for the successful implementation of each measure and the 2045 CAP as a whole. See Table 2-11, Anticipated 2045 CAP Implementation Timing, in Chapter 2, *Project Description*, which shows (consistent with Draft 2045 CAP, Table E-1) that implementation of the Draft 2045 CAP would occur over three phases, which take advantage of easier short-term measures and actions to meet the 2030 target and then build up to more complex solutions as the 2035 target and 2045 target dates approach. Although Table 2-11 shows when an implementation action would first be implemented, the environmental impacts resulting from implementation would typically continue and increase following initial implementation. For example, although implementation in the short term (2024-2030) of actions to decarbonize the energy supply would result in short term adverse impacts, it also would result in benefits that would increase beyond the short term to help achieve related performance objectives of reducing oil and gas operations 40% by 2030, 60% by 2035 and 80% by 2045. Anticipated implementation timing is identified in Table 2-11; the analysis of related impacts is documented on a resource by resource basis in this chapter.

3.1.4 Approach to Cumulative Impacts Analysis

As defined in CEQA Guidelines Section 15355, the term *cumulative impacts* refers to two or more individual impacts, which, when considered together, are considerable or that compound or increase other environmental impacts. The cumulative impact from multiple projects is the change in the physical environment that results from the incremental impact of the proposed project when

added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time (CEQA Guidelines Sections 15355[b] and 15130[a][1]).

The analysis in this section evaluates cumulative impacts on a resource-by-resource basis by considering the incremental impacts of the Project together with the ongoing effects of past, present, and reasonably foreseeable probable future projects that could cause environmental impacts that are closely related to those caused by the Project. Factors considered in determining whether a project is included in the cumulative impact analysis include whether it would cause impacts of the same nature as the Project in the same area at the same time. In each case, the analysis follows the steps listed below. The analysis of whether an alternative could cause or contribute to cumulative impacts is provided in Chapter 4, *Alternatives*, and follows these same steps.

- (1) Determine if the Project would result in no impact for any resource area or consideration, then the Project could not cause or contribute to any significant cumulative impact. No additional discussion is needed in such instances. For all other instances, the analysis continues.
- (2) Define the geographic scope of the impacts associated with each resource area affected by the Project. The geographic scope of the cumulative impacts analysis for each resource area is tailored to the natural boundaries of the affected resource or area of consideration. See **Table 3.1-2, *Geographic Areas for Cumulative Analysis***, which identifies the geographic scope of the impacts associated with each resource area affected by the Draft 2045 CAP. Only those projects that could cause impacts in the same geographic area are relevant for a given resource.
- (3) Define the temporal scope of the impacts associated with each resource area affected by the Project. For example, are the Project's impacts restricted to a certain period or have the potential to occur at any point during the planning horizon?
- (4) Identify relevant plans, projections, and projects for cumulative impact analysis, which consists of resource area-specific trends; projections contained in one or more local, regional, or statewide planning documents; and past, present, and reasonably foreseeable probable future projects.² The incremental contribution of past projects generally is reflected in the existing environmental conditions within the cumulative impacts area, which reflect a combination of the natural condition and the ongoing effects of past actions in the affected area.
- (5) Identify, on a significance criterion-by-criterion basis, the incremental Project-specific impact before the implementation of any identified mitigation measures. Note whether they are temporary or permanent, as well as whether limited to a specific issue (e.g., emissions of nitrogen oxides but not PM₁₀).
- (6) Describe the impacts associated with the plans/projections and projects within the geographic and temporal scopes of the respective resource's impacts and determine whether the Project's impacts and the cumulative projects' impacts (when combined) would be significant. If not, the analysis concludes that a less-than-significant cumulative impact would result.
- (7) If when combined, the Project's impacts and the cumulative plans', projections' or projects' impacts would be significant, then determine whether the Project's incremental impact is

² CEQA Guidelines Section 15130(b) recommends that cumulative impacts be analyzed using a "project" or "projection" approach. This EIR uses a blended hybrid approach.

cumulatively considerable. A less-than-significant incremental impact may, nonetheless, be cumulatively considerable. The Project’s contribution to a significant cumulative impact may not be cumulatively considerable based on the implementation of appropriate mitigation. The cumulative impact analyses first determine whether the Draft 2045 CAP’s incremental impacts would be cumulatively considerable pre-mitigation, and then consider whether they would be cumulatively considerable post-mitigation. Mitigation measures identified at the Project-specific level can be considered in this context to determine whether their implementation would reduce the significance of the cumulative contribution below the established threshold. If with mitigation the Project’s contribution would not be cumulatively considerable, then the analysis concludes that the Project’s cumulative impact would be less than significant. Alternatively, even with the implementation of feasible mitigation measures, if the Project’s contribution would remain above the identified threshold, then the analysis concludes that the Project’s cumulative impact would be significant and unavoidable.

**TABLE 3.1-2
 GEOGRAPHIC AREAS FOR CUMULATIVE ANALYSIS**

Resource Area	Geographic Area
Aesthetics	Public viewsheds, e.g., scenic views of hillsides and mountains and the three adopted scenic highways within the unincorporated areas.
Agriculture and Forestry	Farmland in the unincorporated areas that has been designated pursuant to Farmland Mapping and Monitoring Program as Prime Farmland, Farmland of Statewide Importance or Unique Farmland; that has been designated by the County as Farmland of Local Importance or Grazing Land; or that is subject to a Williamson Act contract. Forest land in the unincorporated areas includes Angeles National Forest and a small portion of Los Padres National Forest (which are managed by the U.S. Forest Service) and approximately 40,000 acres of private inholdings within these forests that are subject to the County’s land use jurisdiction.
Air Quality	The South Coast Air Basin and the Mojave Desert Air Basin.
Biological Resources	Los Angeles County, the adjacent Tehachapi Mountains and Mojave Desert within Kern County to the north, the Mojave Desert and San Bernardino National Forest within San Bernardino County to the east, the Cleveland National Forest within Orange and Riverside counties to the southeast, and Santa Monica Mountains and Los Padres National Forest within Ventura County to the west.
Cultural Resources, Tribal Cultural Resources, and Paleontological Resources	Countywide.
Energy	Countywide (electricity) and 40-mile travel radius (fuel).
Geology and Soils	Geologic and soils impacts are site specific, and therefore would not contribute to cumulative impacts.
GHGs	Statewide, with a focus on the unincorporated areas.
Hazards and Hazardous Materials	The unincorporated areas.
Hydrology and Water Quality	The hydrologic regions, major watershed areas, regional groundwater recharge areas, and groundwater basins in the County.
Land Use and Planning	The unincorporated areas.
Noise	Countywide, including the sites of future development facilitated by the Draft 2045 CAP.
Population and Housing	The unincorporated areas.
Transportation	Countywide.
Utilities and Service Systems	Service areas of regional utility and service providers.

TABLE 3.1-2 (CONTINUED)
GEOGRAPHIC AREAS FOR CUMULATIVE ANALYSIS

Resource Area	Geographic Area
Wildfire	Region, including areas within the County mapped by the California Department of Forestry and Fire Protection (CAL FIRE) as Very High, High, and Moderate Fire Hazard Severity Zones.

NOTES: 2045 CAP = 2045 Los Angeles County Climate Action Plan; Unincorporated Los Angeles County = unincorporated areas of Los Angeles County; Countywide = Los Angeles County in its entirety, inclusive of both unincorporated areas and all 88 incorporated cities; GHG = greenhouse gas; County = County of Los Angeles government
SOURCE: Data compiled by Environmental Science Associates in 2022.

3.2 Aesthetics

This section identifies and evaluates issues related to aesthetics to determine whether the Project would result in a significant impact related to scenic vistas; views from a regional trail; scenic resources in a state scenic highway; existing visual character or quality; or shadows, light, or glare that would adversely affect day or nighttime views in the area. This section describes the physical environmental and regulatory setting, the criteria and thresholds used to evaluate the significance of impacts, the methods used in evaluating these impacts, and the results of the impact assessment.

During the scoping period for the EIR, written and oral comments were received from agencies, organizations, and the public. These comments identified various concerns and questions related to the EIR. **Appendix A.5, *Scoping Input Received***, includes all comments received during the scoping comment period. In addition to suggestions that the EIR evaluate the impacts of new and upgraded renewable energy infrastructure, comments suggest that the Draft 2045 CAP could facilitate the development of new waste handling and composting (mulch generation) facilities, renewable energy generation facilities, and water recycling facilities in the Los Angeles County's more rural communities, and that such future development could cause impacts on aesthetics. Comments relevant to aesthetics note that the Antelope Valley has two existing dumps and multiple solar farms and request consideration of the cumulative impacts of adding the Draft 2045 CAP's incremental contribution to the existing environment.

3.2.1 Setting

3.2.1.1 Study Area

The study area for this analysis of aesthetics impacts consists of the area where the Draft 2045 CAP would be implemented, i.e., the approximately 1,696,000-acre (approximately 2,650-square-mile) area that comprises the unincorporated areas of Los Angeles County. See Figure 2-1, *Map of Unincorporated Los Angeles County*, in Chapter 2. Some portions of the unincorporated County are urban centers with large populations of more than 150,000, whereas other areas (such as the high desert) have sparse populations.

3.2.1.2 Environmental Setting

Regional Visual Character

Los Angeles County is a large region with a diverse visual setting that includes both natural and built environments. Natural environments in the region include the coastal resources, beaches, foothills, mountains, and ridgelines, and the high desert environment of the Antelope Valley. Coastal landscapes range from open sandy beaches to rugged, cliff-edged shores with offshore rocks. The San Gabriel Mountains, Verdugo Hills, Santa Susana Mountains, Simi Hills, Santa Monica Mountains, and Puente Hills shape the topography of the region and create distinct communities with varying aesthetic character. These landforms, along with the coastline, define the region's scenic character.

Urban and built environments include industrial, commercial, residential, office, institutional, and public land uses (Los Angeles County 2015a, 2021a). Each of the 11 County Planning Areas has a different visual character defined by the surrounding topography and landforms, and natural environments, built environment, and communities. For example, the visual character of the East San Gabriel Valley Planning Area, in the easternmost part of Los Angeles County, is predominantly suburban with predominantly single-family residential uses, particularly in the areas closer to the foothills on the northern border of the Planning Area (Los Angeles County 2021b).

Scenic Vistas and Viewsheds

The General Plan does not designate scenic vistas, but identifies them as a key feature of a *scenic viewshed*, which is a scenic vista from a given location, such as a highway, park, hiking trail, river/waterway, or particular neighborhood. The roadway network, including highways, is described in Section 3.15, *Transportation*. Local parks, regional recreation parks, regional open space, natural areas, and the local and regional park systems are described in Section 4.16, *Recreation*, of the County’s Housing Update EIR (Los Angeles County 2021c). The Santa Monica Mountains, unincorporated areas surrounding the city of Santa Clarita, and the Antelope Valley support a high concentration of County trails (Los Angeles County 2015a). Notably, the Pacific Crest Trail traverses the San Gabriel Mountains within Angeles National Forest, extending generally west–east across the San Gabriel Mountains. The boundaries of scenic viewsheds are defined by the field of view from the nearest ridgeline. Scenic vistas are available, for example, from the San Gabriel Mountains, Verdugo Hills, Santa Monica Mountains, Simi Hills, and Puente Hills. Scenic viewsheds may include ridgelines, unique rock outcroppings, waterfalls, ocean views, or other usual or scenic landforms (Los Angeles County 2015a).

Using the County’s definitions of scenic viewsheds and significant scenic resources, individual communities within the unincorporated areas may designate specific scenic viewsheds, routes, or resources. For example, Goal COS 5 in the Antelope Valley Area Plan identifies scenic resources in the Antelope Valley as including scenic drives, significant ridgelines, Hillside Management Areas (HMAs), Significant Ecological Areas (SEAs), water features, and buttes (Los Angeles County 2015b). Designated scenic drives are shown in the area Antelope Valley Area Plan’s Map 4.2, *Antelope Valley Scenic Drives* (Los Angeles County 2015b).

Scenic Highways

Through the California Scenic Highway Mapping Program, the California Department of Transportation (Caltrans) designates routes that are eligible to become state or Los Angeles County scenic highways. These determinations are based on the scenic value of the lands surrounding these roadways, and on how readily visible these resources are to those driving on the roadway (Los Angeles County 2021b). According to state guidelines, a highway may be designated scenic depending on the amount of the natural landscape that can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes on the traveler’s enjoyment of the view (Caltrans 2022).

Caltrans has designated the following highways in Los Angeles County as scenic (Caltrans 2015, 2017):

- Two designated state scenic highways: Angeles Crest Highway (State Route [SR] 2) from 2.7 miles north of Interstate 210 to the San Bernardino County line, and Topanga Canyon State Scenic Highway (a 2.5-mile segment of State Route 27 that runs through the County and City of Los Angeles in the Santa Monica Mountains National Recreation Area near the Pacific coast).
- Two designated Los Angeles County scenic highways:
 - Two sections of Mulholland Highway—from SR 1 to Kanan Dume Road, and from west of Cornell Road to east of Las Virgenes Road.
 - Malibu Canyon–Las Virgenes Highway, from SR 1 to Lost Hills Road.

Eight highways in unincorporated Los Angeles County are eligible for designation (Caltrans 2019). The Los Angeles County Scenic Highway Element was created in 1974 to conform to the State Scenic Highway Program (Los Angeles County 1974).

Dark Skies

Although the more urbanized areas of Los Angeles County are heavily affected by nighttime lighting, light pollution is less evident in less densely populated parts of the County, such as in foothill communities located away from the Los Angeles Basin and in the Antelope Valley. In darker areas of the County, the best times of the year for clear skies, good weather, and interesting astronomical sights are between March and May and between September and November (Space Tourism Guide 2022).

3.2.1.3 Regulatory Setting

Federal Laws, Regulations, and Policies

No federal laws, regulations, or policies pertaining to aesthetics would apply to the Draft 2045 CAP.

State Laws, Regulations, and Policies

California Department of Transportation Scenic Highway Program

The California Scenic Highway Program (Streets and Highways Code Sections 260–263) is maintained by Caltrans to “protect and enhance the natural scenic beauty of California highways and adjacent corridors, through special conservation treatment” (Caltrans 2022). Caltrans either officially designates state scenic highways or determines them to be eligible for such designation. Factors considered in determining whether a highway is “scenic” include the amount of natural landscape visible by motorists, the scenic quality of the landscape, and the extent to which development intrudes on the motorist’s enjoyment of the view (Caltrans 2022).

California Building Code

The California Building Code (California Code of Regulations Title 24) consists of 12 parts that combine building standards contained in or based on provisions of the International Building Code, or that have been adopted by the California Legislature to address particular California

concerns (California Department of General Services, Division of the State Architect 2021). It includes standards for outdoor lighting that are intended to improve energy efficiency, and to reduce light pollution and glare by regulating backlighting, uplighting, and glare as well as light power and brightness, shielding, and automatic sensor controls. Minimum light intensities for pedestrian pathways, circulation ways, parking lots, and paths of egress are stipulated in Part 1; lighting control requirements are stipulated in Part 6. Outdoor lighting power density allowances and nighttime dimming requirements for outdoor lighted signs are also provided.

Regional and Local Laws, Regulations, and Policies

Los Angeles County General Plan 2035

The Conservation and Natural Resources Element of the General Plan includes the following policies that are relevant to aesthetic impacts in the unincorporated areas:

Policy C/NR 13.1: Protect scenic resources through land use regulations that mitigate development impacts.

Policy C/NR 13.2: Protect ridgelines from incompatible development that diminishes their scenic value.

Policy C/NR 13.4: Encourage developments to be designed to create a consistent visual relationship with the natural terrain and vegetation.

Policy C/NR 13.6: Prohibit outdoor advertising and billboards along scenic routes, corridors, waterways, and other scenic areas.

Policy C/NR 13.8: Manage development in Hillside Management Areas (HMAs) to protect their natural and scenic character and minimize risks from natural hazards, such as fire, flood, erosion, and landslides.

As part of the General Plan's Conservation/Open Space and Land Use Elements, the County has identified and adopted policies for SEAs. The objective of the SEAs is to preserve Los Angeles County's genetic and physical ecological diversity by designating biological resources areas capable of sustaining themselves into the future. The SEA designation is given to land that contains irreplaceable biological resources and includes undisturbed or lightly disturbed habitats that support valuable and threatened species and linkages and corridors to promote species movements. SEAs represent a wide range of ecological communities and provide aesthetic enjoyment.

The Land Use Element of the General Plan includes the following goals and policies that are relevant to analyzing the Project's aesthetics impacts:

Policy LU 10.2: Design development adjacent to natural features in a sensitive manner to complement the natural environment.

Policy LU 10.3: Consider the built environment of the surrounding area and location in the design and scale of new or remodeled buildings, architectural styles, and reflect appropriate features such as massing, materials, color, detailing or ornament.

Policy LU 10.5: Encourage the use of distinctive landscaping, signage and other features to define the unique character of districts, neighborhoods or communities, and engender community identity, pride and community interaction.

Policy LU 10.10: Promote architecturally distinctive buildings and focal points at prominent locations, such as major commercial intersections and near transit stations or open spaces.

Goal LU 6: Protected rural communities characterized by living in a non-urban or agricultural environment at low densities without typical urban services.

Policy LU 6.2: Encourage land uses and developments that are compatible with the natural environment and landscape.

Goal LU 7: Compatible land uses that complement neighborhood character and the natural environment.

Goal LU 10: Well-designed and healthy places that support a diversity of built environments.

Policy LU 10.2: Design development adjacent to natural features in a sensitive manner to complement the natural environment.

Policy LU 10.3: Consider the built environment of the surrounding area and location in the design and scale of new or remodeled buildings, architectural styles, and reflect appropriate features such as massing, materials, color, detailing or ornament.

Policy LU 10.5: Encourage the use of distinctive landscaping, signage and other features to define the unique character of districts, neighborhoods or communities, and engender community identity, pride and community interaction.

Policy LU 10.10: Promote architecturally distinctive buildings and focal points at prominent locations, such as major commercial intersections and near transit stations or open spaces.

Area Plans and Community Plans

The County has adopted three area plans: the Antelope Valley Area Plan, Santa Clarita Valley Area Plan, and Santa Monica Mountains North Area Plan. Consideration of two other area plans is pending: the Metro Area Plan and the East San Gabriel Valley Area Plan. The County also has adopted seven community plans (one each for Altadena, East Los Angeles, Hacienda Heights, Rowland Heights, Twin Lakes, Walnut Park [a “neighborhood plan”], and West Athens–Westmont) and three local coastal land use plans: the Marina del Rey, Santa Monica Mountains, and Santa Catalina Island Local Coastal Land Use Plans. These community-based plans contain policies and standards that regulate visual resources in their respective areas. For example, Issue 2 in the Altadena Community Plan calls for the preservation of existing single-family character in Altadena (Los Angeles County 1986).

Los Angeles County Code

Several sections of the County Code address visual resources. Title 21, governing subdivisions, would apply to new subdivisions that could be facilitated by the Draft 2045 CAP and contains provisions related to the design of highways, local streets, lots, and aspects of landscaping. Title 22, governing planning and zoning, describes the development standards that apply to each

zone. Chapter 22.80, for example, regulates light and glare and Division 10 contains development regulations and standards for community standards districts.

Rural Outdoor Lighting District Ordinance

The County's Rural Outdoor Lighting District Ordinance is part of Title 22 of the County Code (the Zoning Code). It was developed to promote dark skies and minimize the impacts of light pollution that are detrimental in rural areas to observations of the nighttime sky and to the health of wildlife. The Rural Outdoor Lighting District encompasses several small portions of the unincorporated urban islands (mostly foothill areas, such as in the San Gabriel Mountains), many of the unincorporated areas in the Santa Clarita Valley Planning Area and the Santa Monica Mountains Planning Area, and nearly all of the Antelope Valley Planning Area.

Los Angeles County Hillside Management Areas Ordinance

The HMA Ordinance applies to all unincorporated areas of the County that contain terrain with a natural slope of 25 percent or greater. The goal of the ordinance is to ensure that development preserves the physical integrity and scenic value of HMAs, provides open space, and enhances community character. It encourages locating development outside of HMAs to the greatest extent feasible. Where avoidance is not feasible, development of HMAs is to be located in the lowest and flattest areas of the hillside to minimize impacts on steeper hillside areas. Last, development is to utilize a variety of sensitive hillside design techniques to ensure compatibility with the hillside and enhance community character. Development within HMAs is regulated under the Special Management Area provisions of Chapter 22.104 of the Los Angeles County Planning and Zoning Code.

Los Angeles County Mills Act Program

Chapter 22.168 of the Zoning Ordinance is the County's Mills Act Program. The program provides an incentive for owners of qualified historical properties within the unincorporated areas to preserve, restore, and rehabilitate the historic character of such properties, thereby providing a historical, architectural, social, artistic, and cultural benefit to the citizens of Los Angeles County, as authorized by the Mills Act (Government Code Section 50280).

Los Angeles County Oak Tree Ordinance

Chapter 22.174 of the Los Angeles County Code of Ordinances is the Oak Tree Ordinance. The ordinance recognizes oak trees in Los Angeles County as a historical, aesthetic, and ecological resource. The ordinance applies to all unincorporated areas of the County. Under the ordinance, it is unlawful to "cut, destroy, remove, relocate, inflict damage, or encroach into the protected zone of any tree of the oak genus" that is 8 inches or more in diameter.

Renewable Energy Ordinance

The County's Renewable Energy Ordinance helps California meet its goals for renewable energy generation and generation of greenhouse gas emissions. The two primary goals of this ordinance are:

- Incentivize small-scale and structure-mounted projects to generate energy for on-site use, and structure-mounted projects (such as on rooftops and over parking lots) to reduce dependence on ground-mounted utility-scale projects.

- Regulate ground-mounted, utility-scale projects to better address community concerns and minimize environmental impacts, including impacts on visual resources, that could be caused by aboveground placement of transmission lines and the generation of fugitive dust associated with ground-disturbing activities or vegetation clearance.

The Renewable Energy Ordinance prohibits ground-mounted, utility-scale solar facilities in SEAs and Economic Opportunity Areas designated in the General Plan and the Antelope Valley Area Plan (Los Angeles County 2016). The Renewable Energy Ordinance also contains a suite of provisions to minimize the impacts of utility-scale, ground-mounted solar energy facilities on visual resources, including setbacks, provisions requiring the placement of transmission lines underground, and the incorporation of measures to minimize fugitive dust.

3.2.2 Impact Analysis

3.2.2.1 Significance Criteria

To determine the level of significance of an identified impact, the analysis uses the following thresholds, which are consistent with and modified from the CEQA Guidelines Appendix G Environmental Checklist.

The Project would have a significant impact on aesthetics if it would:

- a) Have a substantial adverse effect on a scenic vista;
- b) Be visible from or obstruct views from a regional riding, hiking, or multiuse trail;
- c) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;
- d) Substantially degrade the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features and/or conflict with applicable zoning and other regulations governing scenic quality (public views are those that are experienced from a publicly accessible vantage point); or
- e) Create a new source of substantial shadows, light, or glare which would adversely affect day or nighttime views in the area.

3.2.2.2 Methodology

The aesthetics analysis considers whether implementation of the Draft 2045 CAP would cause a significant impact on visual resources in unincorporated areas of the County. This section addresses scenic vistas, views from trails, visual character, and shadows, light, and glare. The assessment of aesthetics impacts is a qualitative evaluation, for which no discrete set of quantifiable parameters exists that can be applied. In determining the level of significance, the analysis assumes that projects facilitated by the Draft 2045 CAP measures and actions would comply with relevant federal, state, and local laws, ordinances, and regulations.

3.2.2.3 Project Impacts

The Draft 2045 CAP identifies 10 strategies, 25 measures, and various implementing actions to reduce greenhouse gas emissions in unincorporated areas of the County. See also Section 2.6.2, *Local County Measures and Implementing Actions*, of Chapter 2, *Project Description*, which lists

the proposed greenhouse gas emissions reduction strategies and measures. None of the proposed measures or actions indicate locations where individual projects would be constructed, their size, or their specific characteristics, because the locations and design specifics of projects that would facilitate the Draft 2045 CAP measures and actions are unknown at this time.

As a program EIR, this Draft EIR does not speculate on the specific environmental impacts of individual projects that could be facilitated by Draft 2045 CAP measures and actions. However, impacts of the implementation of specific measures and actions were considered as part of this analysis to the degree that specific information about individual project implementation is known. The potential impacts of new utility-scale, ground-mounted solar photovoltaic projects, and associated energy storage and distribution facilities are evaluated qualitatively at a programmatic level. (For further explanation, see Draft EIR Section 3.1.3.6, *Future Projects Facilitated by the Draft 2045 CAP*.)

The Draft 2045 CAP details the GHG emission reduction vision and goals of the OurCounty Sustainability Plan for unincorporated Los Angeles County and would implement the GHG emissions reduction strategies of the Air Quality Element of the General Plan. Specifically, the Draft 2045 CAP, once approved, would replace the existing implementation strategy of the Air Quality Element, known as the 2020 CCAP. The Draft 2045 CAP is a policy document intended to reduce community-wide GHG emissions and would support development already allowed under the General Plan’s land use assumptions in the Land Use Element and 2021–2029 Housing Element. No changes to General Plan land use designations, zoning, or land use specific projects are proposed as part of the Draft 2045 CAP.

Consistent with CEQA Guidelines Section 15168, this EIR provides a program-level discussion of the potential impacts of implementing these measures and actions, rather than project-level or site-specific physical impacts of such actions. Table ES-1, Summary of Draft 2045 CAP Measures and Affected Resource Areas, in the Executive Summary, identifies certain measures and actions relevant to this analysis of aesthetics-related impacts. These and other relevant measures and actions include Action T3.3 (which would facilitate the use of shading [shadow] and shade structures); measures and actions associated with Strategy 1, Decarbonize the Energy Supply; Measure ES2, Procure Zero-Carbon Electricity; Measure ES3, Increase Renewable Energy Production; Measures T6, T7, T8, and T9, each regarding the electrification of vehicles; and Strategy 5, regarding the electrification of buildings. These measures and actions could facilitate renewable energy generation and infrastructure projects, the development of which could affect aesthetics.

The timeframe during which the implementation of these actions and measures would cause impacts related to aesthetics and visual resources would depend on the specific implementation timing (as shown in Table 2-11 in Chapter 2, *Project Description*) and whether their implementation actually creates an impact on a scenic vistas, obstructs views, damages scenic resources, degrades the existing visual character or quality of public views, or creates a new source of light or glare, for one or more of the specified reasons. If an impact occurs, it would occur immediately and could be short term (e.g., the presence of substantial nighttime construction lighting in a “dark skies” area during a meteor shower or other period of particular

astronomical interest) or continue in effect for the long term (e.g., new feature or structure visible from a regional trail). The magnitude of long-term impacts would increase over time to the extent that more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets. Specific aesthetics impacts of implementing Draft 2045 CAP measures and actions are analyzed below.

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program. Future development projects that cannot achieve net-zero GHG emissions or are unable to comply with all required checklist items would have the option to participate in the offsite GHG emissions reduction program. This program would allow project applicants to fund or implement local projects that reduce GHG emissions within unincorporated Los Angeles County. Such projects must not otherwise be required by law or regulation and would not have happened on the 2045 CAP's proposed schedule but for the requirements placed on the project by the 2045 CAP Checklist. If offsite GHG reduction projects are implemented via this program, then, to the extent that such projects include types of activities similar to those contemplated by the Draft 2045 CAP's measures and actions, the resulting environmental impacts would be similar to those disclosed below. Further, project applicants' CEQA documents would be required to disclose the impacts of any GHG reduction projects that are proposed to be funded or implemented.

Criterion a) Whether the Project would have a substantial adverse effect on a scenic vista.

Impact 3.2-1: Projects facilitated by the Draft 2045 CAP would have a substantial adverse effect on a scenic vista. (*Significant and Unavoidable*)

The Draft 2045 CAP is a policy document that does not include specific projects that would have a direct, adverse effect on scenic vistas. Nonetheless, many of the projects facilitated by Draft 2045 CAP measures and actions would involve retrofitting of existing buildings, development along existing transit areas, infill projects in urban locations that are already developed, electric vehicle charging stations, or distributed energy resources like rooftop photovoltaic panels on existing structures. Where located in developed areas, these types of projects are not expected to significantly substantially affect views from scenic vistas or viewsheds because at a distance, they would be more likely to blend in with the surrounding existing development and visual environment, and they would not be likely to create changes to visual character or quality that would be visible from a scenic vista or that would noticeably significantly interrupt views available from scenic vistas. For example, rooftop photovoltaic panels generally do not noticeably alter rooflines or create large features that could be substantially visible from the street level, because (by code) they are not allowed to exceed the height limit for the zone in which the project is developed by more than 5 feet. In some cases, photovoltaic panels could be installed on sloped roofs facing public vantage points, making them visible from public areas. However, the visual pattern and positioning of the panels would be at the same slope as the roof upon which they are mounted. From a distance, if the roofs are part of a scenic vista, the addition of panels would not be discernible to the naked eye.

However, larger-scale projects facilitated by the Draft 2045 CAP in more rural or open areas (such as utility-scale solar generation facilities, waste handling facilities, or water recycling facilities) and ground-mounted energy systems on a hillside or desertscape could, depending on project specifics and siting details, alter scenic views by introducing elements that break existing horizon lines or otherwise detract from a scenic vista or viewshed. Impacts could include short-term, temporary visual impacts from construction vehicles, dust, or lighting, or long-term impacts from the introduction of new forms (such as straight lines or sharp angles of areas cleared for new access roads to and through new projects or from cleared areas beneath power lines) or structures (such as power poles and lines, photovoltaic panels, operation and maintenance buildings, battery enclosures and substations) that have height, forms, or colors that contrast with existing conditions. HMA Ordinance protections would apply if a project would involve cut and fill of 15,000 cubic yards of material or more, but would not apply to smaller projects or those located in areas with slopes of less than 25 percent. The Renewable Energy Ordinance contains a suite of provisions to minimize the impacts of utility-scale, ground-mounted solar energy facilities on visual resources, including setbacks, provisions requiring the placement of transmission lines underground, and the incorporation of measures to minimize fugitive dust. Where the HMA Ordinance or the Renewable Energy Ordinance requires a conditional use permit (Los Angeles County 2016), projects implementing Draft 2045 CAP measures and actions would be subject to site-specific, project-specific CEQA review; however, such review would not ensure that significant impacts on scenic views and viewsheds would be reduced to a less-than-significant level. In addition, projects not governed by the HMA Ordinance and/or the Renewable Energy Ordinance, as well as larger (e.g., utility-scale) renewable energy projects facilitated by Draft 2045 CAP actions and measures, could result in a significant impact.

Projects facilitated by Draft 2045 CAP measures and actions, potentially including wastewater treatment plants or organic waste processing facilities as well as energy-related projects, would be required to be consistent with the General Plan provisions summarized in Section 3.2.1.2, *Environmental Setting*. Such projects also must comply with applicable sections of the County Code, which regulate the appearance and siting of physical developments to protect hillside views, the modification of scenic resources, and the visual quality of new development. Projects requiring a conditional use permit or other discretionary authorization would have to meet development standards of the County Code. Additionally, compliance with the County Code provisions relating to the protection of HMAs would help preserve the scenic character of affected ridgelines and hillsides. Because Los Angeles County's varied topography allows for myriad long-range views from the Los Angeles Basin to the foothills and mountains, as well as long-range views from the foothills and mountains to the Los Angeles Basin and coast, compliance with the HMA Ordinance would potentially reduce aesthetics impacts from hillside and ridgeline scenic vistas and viewsheds (Los Angeles County 2015a). However, depending on the size and scale of a given project, aesthetics impacts may not be avoided simply by this regulatory adherence.

The Draft 2045 CAP includes Measure A1, which would preserve agricultural and forest lands, and Measure A3, which would expand Los Angeles County's tree canopy and green spaces. These policies would preserve existing open spaces that contribute to the visual quality of scenic vistas and would result in a beneficial impact. Additionally, Measure T3 would expand bicycle

and pedestrian networks, which could result in an expansion in the number and accessibility of publicly accessible scenic vistas, resulting in a beneficial impact.

Therefore, consistency with the HMA and Renewable Energy ordinances and General Plan and zoning provisions, as well as implementation of Draft 2045 CAP measures and actions, could reduce certain impacts on scenic vistas and provide some beneficial changes. However, as also noted in detail above, smaller renewable energy projects and those not governed by the HMA Ordinance and/or the Renewable Energy Ordinance, as well as larger (e.g., utility-scale) renewable energy projects facilitated by Draft 2045 CAP actions and measures, could result in a significant impact. Additionally, depending on the size and scale of projects that may facilitate the Draft 2045 CAP, compliance with the applicable plans, policies, and regulations discussed above may not be sufficient to reduce aesthetic impacts to a less-than-significant level. Consistent with the findings of the County's Renewable Energy Ordinance EIR (Los Angeles County 2015c), no feasible mitigation measures are available to reduce these impacts attributable to the Draft 2045 CAP. Thus, the impact would be significant. Mitigation measures to reduce this impact would apply only if specific projects have potentially significant impacts.

Mitigation Measure 3.2-1, Alternative Design: Projects facilitated by the Draft 2045 CAP that would obstruct views from publicly-accessible vantage points as defined in this analysis (such as from a vista point or a regional riding, hiking, or multiuse trail) shall identify and protect public views and significant landscape features or landforms visible from such views, and shall implement project-specific mitigation as applicable. If it is determined that a project would obstruct scenic views, the County shall consider alternative designs that seek to avoid and/or minimize these impacts. Project-specific design measures may include reduction in height of improvements or width of improvements to reduce obstruction of views or other adverse visual effects, or relocation of improvements to reduce obstruction of views. The County shall consider taking the following (or equivalent) actions: i) Require that the scale and massing of new development provide appropriate transitions in structure height and bulk that are sensitive to the physical and visual character of the affected area; ii) ensure structure heights are stepped back to maintain appropriate transitions in scale and to protect scenic views; and iii) avoid siting electric towers, solar power facilities, wind power facilities, communication transmission facilities and/or above ground lines where they could obstruct views from public vantage points, such as a regional riding, hiking, or multiuse trail, along scenic roadways and routes, or scenic vista points.

Mitigation Measure 3.2-2, Visual Screening and Other View Protection Measures: To partially screen views of projects facilitated by Draft 2045 CAP measures and actions in locations where they would be visible from publicly accessible vantage points (e.g., scenic vistas, trails, scenic roadways and routes) and affect visual character or quality, if feasible and effective, the County shall (and other implementing state or local agencies can and should) require the construction of a berm, vegetative screening, or other form of visual barrier of sufficient height to provide a visual transition from ground level to surrounding hills or ridgelines. The color of proposed building facades and roofs shall be designed to visually blend in and minimize the potential for visual contrast between the project elements and their natural landscape surroundings. Bright or very light colors (including white) shall be avoided. Re-contouring and revegetation of temporarily disturbed, graded areas shall be completed to provide a natural appearing landform upon completion of construction.

Significance after Mitigation: Impacts would be significant and unavoidable. The implementation of Mitigation Measure 3.2-1, Alternative Design, and Mitigation Measure 3.2-2, Visual Screening and Other View Protection Measures, would reduce the severity of an impact on scenic vistas by adjusting the scaling and massing of structures, using step-backs from sensitive adjoining uses, planning for project/facility siting, and installing visual screening; however, these measures would not on their own merits ensure that the impact would be less than significant. For example, details about the siting and design of future utility-scale projects facilitated by the Draft 2045 CAP, and the feasibility and effectiveness of project specific mitigation measures, are unavailable. No additional feasible mitigation measures are available. Accordingly, with the implementation of Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2, Impact 3.2-1 would remain significant and unavoidable.

Criterion b) Whether the Project would be visible from or obstruct views from a regional riding, hiking, or multiuse trail.

Impact 3.2-2: Projects facilitated by the Draft 2045 CAP would be visible from or obstruct views from a regional riding, hiking, or multiuse trail. (*Significant and Unavoidable*)

A wide variety of trail types are found throughout Los Angeles County, including multiuse trails that are accessible to pedestrians, equestrians, and mountain bikers. Trails provide connectivity to parks, open spaces, and wilderness areas. The highest concentration of trails in Los Angeles County exists in the Santa Monica Mountains, around Angeles National Forest, throughout the Antelope Valley and near the foothills of the San Gabriel Mountains, and in the eastern areas of Los Angeles County near Lancaster and Palmdale (Los Angeles County 2015a).

As described above, the Draft 2045 CAP does not propose any site-specific projects. Nonetheless, projects facilitated by Draft 2045 measures and actions could result in visual changes that would be visible or obstruct views from a regional riding, hiking, or multiuse trail. For example, the development of utility scale solar or other renewable energy projects facilitated by the Draft 2045 CAP would result in visual changes that would obstruct views or that would be visible from a regional riding, hiking, or multiuse trail if the photovoltaic solar panel arrays or security fencing or other project infrastructure were to be installed between regional trail users and views otherwise available from those trails.

Draft 2045 CAP strategies such as Strategy 5, Strategy 6, and Strategy 7 would include measures that would require retrofits to existing buildings to electrify appliances, increase energy efficiency, and reduce water consumption. For example, Measure E1 would transition many existing buildings to all-electric and Measure E4 would improve the energy efficiency of existing buildings. These types of building retrofits would not be expected to result in changes to the mass, height, or color of buildings or other changes that could create a visual change visible from regional trails.

Although these types of projects would not result in significant visual impacts, other projects could result in more noticeable visual contrast and changes, especially if the projects are located in more rural or open-land areas of Los Angeles County. As evaluated under Impact 3.2-1, projects facilitated by Draft 2045 CAP measures and actions must be consistent with the General

Plan, comply with applicable, independently enforceable provisions of the County Code (including the HMA and Renewable Energy Ordinances), and site-specific environmental review for projects requiring a conditional use permit or other discretionary approval from a state or local agency. These requirements would reduce aesthetics impacts, but not necessarily to less-than-significant levels. As also noted above, smaller renewable energy projects not governed by the HMA Ordinance and larger (e.g., utility-scale) renewable energy projects facilitated by Draft 2045 CAP actions and measures could still result in a significant impact. Therefore, the impacts would be significant. Mitigation measures to reduce this impact would apply only if specific projects have potentially significant impacts.

Mitigation: Implement Mitigation Measure 3.2-1, Alternative Design, and Mitigation Measure 3.2-2, Visual Screening and Other View Protection Measures.

Significance after Mitigation: Impacts would be significant and unavoidable. The implementation of Mitigation Measure 3.2-1, Alternative Design, and Mitigation Measure 3.2-2, Visual Screening and Other View Protection Measures, would reduce the severity of an impact on a public regional riding, hiking, or multiuse trail by adjusting the scaling and massing of structures, using step-backs from sensitive adjoining uses, planning for project/facility siting, and installing visual screening; however, these measures would not on their own merits ensure that the impact would be less than significant. For example, details about siting and design of future utility-scale projects facilitated by the Draft 2045 CAP, and the feasibility and effectiveness of mitigation measures are unavailable. No additional feasible mitigation measures are available. Accordingly, with the implementation of Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2, Impact 3.2-2 would remain significant and unavoidable.

Criterion c) Whether the Project would substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.

Impact 3.2-3: Projects facilitated by the Draft 2045 CAP would substantially damage scenic resources, including, but not limited to, trees, rocks, outcropping, and historic building within a state scenic highway. (*Significant and Unavoidable*)

Caltrans has designated two highways in Los Angeles County as state scenic highways: Angeles Crest Highway (SR 2) from 2.7 miles north of Interstate 210 to the San Bernardino County line and the Topanga Canyon State Scenic Highway (a 2.5-mile segment of SR 27 located in the Santa Monica Mountains National Recreation Area near the Pacific coast). All but two of the parcels adjacent to the designated portion of SR 2 are within the watershed (W) zone, where permitted uses are those uses owned and maintained by the U.S. Forest Service and recreational uses approved by the Forest Service (County Code Section 22.40.250). One of the other parcels is designated R-R (Resort and Recreation), where permitted uses include recreation, amusement, and agricultural uses (County Code Section 22.40.190); the other is designated A-1 (Light Agricultural), where permitted uses include single-family residences, crops (field, tree, bush, berry, row, and nursery stock), greenhouses, and raising of cattle, horses, sheep, goats, poultry, birds, earthworms, and the like (County Code Section 22.24.070).

As disclosed above, the Draft 2045 CAP measures and actions could facilitate projects that would result in visual contrast or changes during the construction of projects or by creating new structures that would create changes to existing visual conditions. These projects could occur near designated scenic highways and could, depending on the location and design of the projects, result in changes to the visual resources visible along a scenic highway such as trees, rock outcroppings, or historic buildings. Most projects facilitated by Draft 2045 CAP measures and actions would involve modifications to existing buildings or would be located in areas that are already developed and are not as likely to be located near scenic resources, such as rock outcroppings or trees (Measures E1 and E4). These projects would not be likely to damage scenic resources.

As described above, the Draft 2045 CAP does not propose any site-specific projects. Nonetheless, Draft 2045 CAP Measure T3 could facilitate projects that would expand the bicycle and pedestrian network to serve residential, employment, and recreational trips; and Action T6.3 would result in the installation of electrical vehicle charging stations for new development. Such projects could be permitted uses on land adjacent to the portion of SR 2 that is a designated state scenic highway.

Other types of projects that could be facilitated by Draft 2045 CAP measures and actions (such as infill mixed-use projects, composting facilities, wastewater treatment facilities, or utility-scale, ground-mounted renewable energy projects) would not currently be allowable uses in locations adjacent to the specified portions of SR 2 or SR 27. Requisite consistency with the existing General Plan would tend to protect scenic resources, protect ridgelines and hillsides, prohibit advertising along scenic routes, protect historical resources, and support the preservation of historic buildings. Compliance with zoning requirements (including the Oak Tree and HMA Ordinances) would protect trees and views of hillsides and ridgelines in the state scenic highway corridors. Further, incentives provided by the Mills Act Program would reduce the potential for a project facilitated by Draft 2045 CAP measures and actions to substantially damage scenic resources within a state scenic highway because they would incentivize the protection of historic buildings. Nonetheless, if projects facilitated by Draft 2045 CAP measures and actions were to be constructed within the designated portions of SR 2 or SR 27 (or within areas that could affect the scenic highway designation eligibility factors), then substantial damage to scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings, could occur as a result of tree removal or blasting required for the construction of access roads or power line tower footings, maintenance of power line clearance zones or the implementation of vegetation management activities within the utility right of way, or burying underground utility lines. Thus, the impact would be significant. Mitigation measures to reduce this impact would apply only if specific projects have potentially significant impacts.

Mitigation: Implement Mitigation Measure 3.2-1, Alternative Design, and Mitigation Measure 3.2-2, Visual Screening and Other View Protection Measures.

Significance after Mitigation: The impact would be significant and unavoidable. The implementation of Mitigation Measure 3.2-1, Alternative Design, and Mitigation Measure 3.2-2, Visual Screening and Other View Protection Measures would reduce the severity of an impact relating to substantial damage to scenic resources within a state scenic highway by adjusting the scaling and massing of structures, using step-backs from

sensitive adjoining uses, planning for project/facility siting, and installing visual screening; however, these measures would not on their own merits ensure that the impact would be less than significant. For example, details about the siting and design of future utility-scale projects facilitated by the Draft 2045 CAP, and the feasibility and effectiveness of mitigation measures, are unavailable. No additional feasible mitigation measures are available. Accordingly, with the implementation of these two mitigation measures, Impact 3.2-3 would remain significant and unavoidable.

Criterion d) Whether the Project would substantially degrade the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features and/or conflict with applicable zoning and other regulations governing scenic quality. (Public views are those that are experienced from a publicly accessible vantage point.)

Impact 3.2-4: Projects facilitated by the Draft 2045 CAP would substantially degrade the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features and/or conflict with applicable zoning and other regulations of governing scenic quality. (Public views are those that are experienced from a publicly accessible vantage point.) (Significant and Unavoidable)

Neither the Draft 2045 CAP nor projects facilitated by Draft 2045 CAP measures and actions would conflict with applicable zoning and other regulations governing scenic quality because no changes to existing zoning or other regulations governing scenic quality are proposed. Although the Draft 2045 CAP does not include specific proposed projects that could directly result in new or expanded development that could substantially degrade the existing visual character or quality of public views of the site and its surroundings due to their height, bulk, pattern, scale, character, or other features, projects facilitated by Draft 2045 CAP measures and actions could do so.

The Draft 2045 CAP includes measures and actions that would incentivize mixed-use developments, infill developments along transit-oriented areas, and the development of water recycling, waste management, and/or compost processing facilities, as well as renewable energy generation and infrastructure projects. Some of these types of projects (like infill developments along transit-oriented areas) could be proposed in developed areas where they would not substantially degrade the existing visual character or quality of public views of sites and their surroundings. However, other types of projects (like utility-scale, ground-mounted energy generation and infrastructure projects or solid waste or composting facilities) are more likely to be proposed in more rural, open land areas of Los Angeles County, where the resulting visual contrast to existing conditions would be greater. All projects facilitated by Draft 2045 CAP measures and actions must be consistent with the General Plan and the HMA and Renewable Energy ordinances, and comply with applicable provisions of the County Code, including its regulation of height limits, setbacks, bulk, and the like as well as development standards appropriate to each zone. The County Code also includes specific ordinances to protect the visual quality of HMAs and ridgelines. This consistency and compliance would reduce impacts on visual character, but not necessarily to a less-than-significant level.

Projects resulting from implementation of Draft 2045 CAP measures and actions that are proposed in areas that feature existing urban development could introduce higher density

development, mixed uses, rooftop solar, and the adjustment of landscaping to drought tolerant plants. Such changes in such locations are expected to result in small adjustments to community character and visual appearance. Retrofits to existing buildings to incorporate water and energy efficiency measures would likely involve changes to the interior of building structures and would not be visible from publicly accessible viewpoints.

Other projects facilitated by Draft 2045 CAP measures and actions, such as water recycling, waste management, and/or compost processing facilities, and utility-scale, ground-mounted renewable energy generation or infrastructure projects, could be proposed in more rural areas such as the Antelope Valley, where the introduction of project components could affect the existing visual character or quality of public views of the site and its surroundings because of their height, bulk, pattern, scale, character, or other features. For example, the introduction into the existing landscape of industrial features (such as the pavement, settling ponds, tanks and piping characteristic of a wastewater treatment facility; the composting windrows and related facilities, equipment, roads, parking and storage areas needed for a composting facility; and photovoltaic solar panel arrays, battery enclosures, substations, and switching stations needed for renewable energy generation and transmission) would transform and potentially contrast with the existing visual character or quality of public views of currently undeveloped sites and their surroundings. Thus, the impact would be significant. Mitigation measures to reduce this impact would apply only if specific projects have potentially significant impacts.

Mitigation: Implement Mitigation Measure 3.2-1, Alternative Design, and Mitigation Measure 3.2-2, Visual Screening and Other View Protection Measures.

Significance after Mitigation: The impact would be significant and unavoidable. The implementation of Mitigation Measure 3.2-1, Alternative Design, and Mitigation Measure 3.2-2, Visual Screening and Other View Protect Measures, would reduce the significance of project-caused changes to existing visual character or quality by adjusting the scaling and massing of structures, using step-backs from sensitive adjoining uses, planning for project/facility siting, and installing visual screening; however, these measures would not on their own merits ensure that the impact would be less than significant. For example, details about the siting of future utility-scale projects facilitated by the Draft 2045 CAP, and the feasibility and effectiveness of mitigation measures, are unavailable. Therefore, the impacts of such projects relative to visual character or quality cannot be accurately assessed at this time, nor can project-specific mitigation be developed. No additional feasible mitigation measures are available. Accordingly, with the implementation of these two mitigation measures, Impact 3.2-4 would remain significant and unavoidable.

Criterion e) Whether the Project would create a new source of substantial shadows, light, or glare, which would adversely affect day or nighttime views in the area.

Impact 3.2-5: Projects facilitated by the Draft 2045 CAP would create a new source of substantial shadow, light, or glare, which would adversely affect day or nighttime views in the area. (*Less-than-Significant with Mitigation Incorporated*)

Shade, shadow, and glare could be created if buildings or structures were to block or direct the sunlight relative to adjacent properties, thereby affecting the users or occupants of adjacent properties. Related impacts can be influenced by the time of day, season, weather, height and bulk of buildings, spacing, topography, and other factors. Shade and shadow can result in positive effects, such as cooling, or negative effects, such as the loss of natural light. Projects facilitated by Draft 2045 CAP, Action T3.3 for example, would affect shade and shadow conditions because their implementation would enhance the shading of pedestrian and bicycle environments, include energy-efficient pedestrian-scale lighting, and result in the construction of shade structures at major transit stops. This would be an environmental benefit.

The Draft 2045 CAP measures and actions could result in the introduction of lighting to the environment as a result of the development of projects such as mixed-use or infill developments, building retrofits, composting facilities, water recycling facilities, or solar energy generation facilities. Depending on the location and design of these projects, they have the potential to create shade, shadows, daytime or nighttime glare, or nighttime lighting of proposed buildings or other structures.

Anything that scatters light between its source and the back of a person's eye can cause glare. Rain, snow, fog, or smoke can scatter sunlight, for example, and cracked, dirty, or frosty windshields can scatter light from street lamps or headlights. Glare can be caused by reflective surfaces, such as glass and glossy finishes on vehicles or structures. Draft 2045 CAP measures and actions could facilitate projects that cause glare, including new building construction, rooftop or ground-mounted solar projects, or other infrastructure projects that include components that reflect light. New structures could cause glare if they have glossy or bright finishes (e.g., paint, light-colored concrete) or large areas of exterior glass or reflective metal. Should these structures be located in developed areas, they could cause significant impacts related to glare.

Photovoltaic panels, which convert the sun's energy into electricity, can result in reflections and glare depending on the time of day, the angle of the sun, cloud cover, and other factors. Rooftop photovoltaic panels generally would be unnoticeable from ground level, where most viewers would be located. By code, these rooftop panels are not allowed to exceed the height limit for the zone in which the project is developed by more than 5 feet. However, rooftop photovoltaic panels could be installed on sloped roofs facing receptors, potentially making them visible or susceptible to glare in elevated locations. Photovoltaic panels are designed and the surfaces coated to absorb as much light as possible, rather than to reflect it (NREL 2018). Although the panels can result in some reflection or glare, the glare created by photovoltaic panels is generally considered to be less than that created by water or common building materials such as metal, glass, and Portland white cement concrete (Shields 2010; Riley and Olson 2011). Based on a review of existing

technical documentation on the effect of glare produced from photovoltaic panels and its effect on aviation safety, the Massachusetts Department of Energy Resources states that such panels reflect only approximately 2.0 percent of incoming sunlight, given the anti-reflective glass designed to capture and retain the solar spectrum (Massachusetts Department of Energy Resources 2015). For these reasons, impacts related to glare associated with rooftop photovoltaic panels would not be substantial and would be less than significant.

Similarly, utility-scale solar projects would also use anti-reflective photovoltaic panels and would be required to comply with the Renewable Energy Ordinance's permit conditions regarding glare minimization and all projects subject to a state or local discretionary authorization would be subject to site-specific, project-specific environmental review, which would address project siting or location and project-specific impacts and measures to reduce glare. For these reasons, impacts related to glare associated with utility-scale solar projects would not be substantial and would be less than significant.

Nighttime lighting would mostly be limited to lighting from infill and mixed-use projects or safety lighting needed on larger-scale project sites, such as water recycling, waste treatment, or energy generation facilities. Projects facilitated by the Draft 2045 CAP measures and actions could be located in more urbanized areas developed with considerable existing sources of nighttime lighting, or in more rural locations, in compliance with state and local lighting requirements summarized above. Compliance with applicable requirements for nighttime lighting (including requirements of the County's Dark Skies Ordinance within the Rural Outdoor Lighting District) would minimize projects' impacts on existing nighttime lighting conditions. Although compliance with this component of the Zoning Ordinance would reduce potential impacts for projects in rural areas, it would not address potential lighting impacts in more developed areas or areas not subject to this component of the Zoning Ordinance. In these cases, projects facilitated by the Draft 2045 CAP could still result in a significant lighting impact.

Improperly installed building lighting could result in a significant impact to those with a direct line of sight to a project area and could be perceived as a slight glow on the horizon for others who cannot see the facilities directly. Even if non-reflective, non-glare finishes are used on all structures for projects facilitated by the Draft 2045 CAP, some glare associated with glass or metal of new buildings could occur on sunny days. Unless mitigated, a significant impact would result. Mitigation measures would apply only if specific projects have potentially significant impacts.

Mitigation Measure 3.2-3, Reduce Light and Glare Impacts: To reduce significant light and glare impacts of projects facilitated by the Draft 2045 CAP, the County shall require the following measures to be incorporated: a) All lighting shall be focused toward the site and outdoor lighting shall be directed downward; b) The design of exterior light fixtures shall incorporate shielding to prevent glare and offsite light spillage; c) Outdoor lighting shall include non-glare fixtures; and d) Structure design shall include exterior finishes and materials that would be minimally reflective or sited or oriented in such a way as to direct glare away from sensitive receptors.

Significance after Mitigation: The impact would be less than significant. The implementation of Mitigation Measure 3.2-3, Reduce Light and Glare Impacts, would

ensure that project-related lighting would not substantially intrude on daytime or nighttime views in the area because its provisions would substantially limit light trespass and confine generated light to within project boundaries. Also, adhering to design and siting requirements would reduce the potential for glare. Accordingly, with the implementation of Mitigation Measure 3.2-3, Impact 3.2-5 would be less than significant.

3.2.2.4 Cumulative Impacts

Criterion a)

For the purpose of analyzing cumulative impacts on aesthetics, the geographic scope is Countywide, inclusive of both incorporated and unincorporated areas. Cumulative impacts could result at various locations within this area from implementation of projects facilitated by the Draft 2045 CAP measures and actions that could introduce sources of light, new facilities, or modifications to existing facilities until the features of projects facilitated by the Draft 2045 CAP measures and actions are removed. Construction and operational activities and conditions for past, present, and reasonably foreseeable future projects, including projects implemented in accordance with the Housing Element and other General Plan elements, with the Antelope Valley Area Plan (Los Angeles County 2015b) and other area plans, and with the Renewable Energy Ordinance and other municipal code requirements (see, for example, Los Angeles County 2009, 2015a, 2021a), would combine with the incremental impacts of the Project to cause or contribute to cumulative aesthetic conditions within Los Angeles County.

Impact 3.2-6: Projects facilitated by the Draft 2045 CAP would cause or contribute to a significant cumulative impact to scenic vistas. (*Significant and Unavoidable*)

Los Angeles County's scenic vistas are varied and dispersed. In locations where scenic vistas are of exceptionally high quality, such as in the Antelope Valley, the addition of incremental impacts from projects facilitated by Draft 2045 CAP measures and actions could be more likely to cause or make a cumulatively considerable contribution to a significant cumulative impact on scenic vistas. By contrast, in locations where the quality of scenic vistas is of lesser quality and more mundane, there is a decreased likelihood that projects facilitated by the Draft 2045 CAP measures and actions would cause or contribute to a significant cumulative impact on scenic vistas. Projects facilitated by the Draft 205 CAP would cause a cumulatively considerable contribution to significant cumulative impacts to scenic vistas for which no feasible mitigation is available.

Some projects facilitated by the Draft 2045 CAP measures and actions could be located in more rural or open areas of Los Angeles County, and therefore have the potential to result in greater visual contrast. Consistency with the General Plan and compliance with state and local requirements intended to protect scenic vistas would minimize potential impacts; however, the incremental impacts of the Project, together with the incremental impacts of past, present and reasonably foreseeable future projects, including past and present utility-scale solar projects in the Antelope Valley, would result in a significant cumulative impact. The Project's contribution to this impact would be cumulatively considerable. The implementation of Mitigation Measure 3.2-1, Alternative Design, and Mitigation Measure 3.2-2, Visual Screening and Other View Protection Measures, would reduce the severity of the Project's incremental contribution to cumulative impacts, but would not ensure that the Project's contribution would be less than

cumulatively considerable. Accordingly, this cumulative impact would remain significant and unavoidable. No additional feasible mitigation measures are available.

Mitigation: Implement Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2.

Significance after Mitigation: Impacts would be significant and unavoidable. No additional feasible mitigation measures are available.

Criterion b)

Impact 3.2-7: Projects facilitated by the Draft 2045 CAP would cause or contribute to significant cumulative impacts on views from a regional riding, hiking, or multiuse trail. (Significant and Unavoidable)

Implementation of the Draft 2045 CAP would cause or contribute to a significant cumulative impact on views from regional trails if future projects facilitated by Draft 2045 CAP measures and actions were located near other past, present, or reasonably foreseeable projects that have significant impacts on views from regional trails.

As analyzed under Impact 3.2-2, many of the projects facilitated by Draft 2045 CAP measures and actions would involve retrofits to buildings or development along urban corridors or infill areas. These types of projects are expected to involve small adjustments to visual character that are not expected to result in substantial changes to existing views from regional trails. Further, some projects would involve the preservation of open space and provision of regional walking and biking trails, which would likely result in beneficial impacts under this criterion. Other projects facilitated by Draft 2045 CAP measures and actions could be located in more rural or open areas of Los Angeles County, where their introduction could result in more visual contrast. Consistency with the General Plan, applicable area plans, the County Code requirements established to protect aesthetic resources would minimize impacts on views from regional trails, but would not ensure that such impacts would be less than significant.

The Project's incremental contribution to cumulative impacts, in combination with the incremental impacts of other cumulative projects, would cause (or result in a cumulatively considerable contribution to) a significant cumulative impact on views from regional trails. The Project's contribution to this impact would be cumulatively considerable. The implementation of Mitigation Measure 3.2-1, *Alternative Design*, and Mitigation Measure 3.2-2, *Visual Screening and Other View Protection Measures*, would reduce the severity of the Project's incremental contribution to cumulative impacts, but would not ensure that the Project's contribution would be less than cumulatively considerable. Accordingly, this cumulative impact would remain significant and unavoidable. No additional feasible mitigation measures are available.

Mitigation: Implement Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2.

Significance after Mitigation: The impact would be significant and unavoidable. No additional feasible mitigation measures are available to reduce impacts.

Criterion c)

Impact 3.2-8: Projects facilitated by the Draft 2045 CAP would cause or contribute to a significant cumulative impact due to substantial cumulative damage to scenic resources, including, but not limited to, trees, rocks, outcropping, and historic building within a state scenic highway. (Significant and Unavoidable)

Implementation of the Draft 2045 CAP measures and actions could result in a cumulative impact on scenic resources within a designated state scenic highway (SR 2 and/or SR 27) if future projects facilitated by the Draft 2045 CAP measures and actions were located near other closely related past, present, and reasonably foreseeable future projects that affect resources within or adjacent to these designated scenic highways. As reflected by these roadways' designation as a state scenic highway, aesthetic resources within and adjacent to them are of exceptionally high quality. Thus, there is no significant adverse cumulative impact on such resources as a result of past projects.

Nonetheless, in combination with the incremental contributions of other closely related past present and reasonably foreseeable future projects that have been or may be approved within these state routes or within the areas to contribute to their eligibility for designation as a scenic highway, the Project's incremental contribution could cause a significant cumulative impact to occur. The Project's contribution to this impact would be cumulatively considerable. The implementation of Mitigation Measure 3.2-1, *Alternative Design*, and Mitigation Measure 3.2-2, *Visual Screening and Other View Protection Measures*, would reduce the severity of the Project's incremental contribution relating to substantial damage to scenic resources within a state scenic highway but would ensure that, in combination with the incremental impacts of other projects, the resulting cumulative impact would be less than significant. Accordingly, even with the implementation of these mitigation measures, the Project's contribution to significant cumulative impact would remain significant and unavoidable. No additional feasible mitigation measures are available.

Mitigation: Implement Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2.

Significance after Mitigation: The impact would be significant and unavoidable. No additional feasible mitigation measures are available to reduce impacts.

Criterion d)

Impact 3.2-9: Projects facilitated by the Draft 2045 CAP would cause or contribute to significant cumulative degradation of the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features and/or conflict with applicable zoning and other regulations governing scenic quality. (Significant and Unavoidable)

Los Angeles County's visual character is diverse, including both natural and built environments. Implementation of the Draft 2045 CAP measures and actions could result in a cumulative impact on visual character if future implementing projects were to be located near other cumulative projects that change or affect visual character. Past, present, and reasonably foreseeable future projects have been and would be developed in accordance with requirements of the Housing

Element and other General Plan elements, the various area plans, the Renewable Energy, Hillside Management, and other County ordinances, and with the mitigation measures or conditions of approval imposed as part of project-specific CEQA and permitting processes. Nonetheless, the incremental impacts of the Project, in combination with the incremental contributions of other closely related past present and reasonably foreseeable future projects, could cause or contribute to a significant cumulative impact regarding the degradation of the existing visual character or quality of public views of the site and its surroundings as a result of the transformation of existing undeveloped landscape to a more industrial look and feel as would be associated with the development of a water recycling, waste management, or compost processing facility or with the development of utility-scale, ground-mounted renewable energy generation or infrastructure projects if proposed in more rural areas. The implementation of Mitigation Measure 3.2-1, *Alternative Design*, and Mitigation Measure 3.2-2, *Visual Screening and Other View Protection Measures*, would reduce the Project's incremental contribution to cumulative impacts, but would not ensure that the contribution would not be cumulatively considerable. Accordingly, with the implementation of these mitigation measures, this cumulative would be significant and unavoidable. No additional feasible mitigation measures are available.

Mitigation: Implement Mitigation Measure 3.2-1 and Mitigation Measure 3.2-2.

Significance after Mitigation: The impact would be significant and unavoidable. No additional feasible mitigation measures are available to reduce impacts.

Criterion e)

Impact 3.2-10: Projects facilitated by the Draft 2045 CAP would not cause or contribute to a new source of substantial shadow, light or glare, which would result in a significant cumulative impact to views in the area. (*Less-than-Significant Cumulative Impact*)

Ongoing shadow, light, and glare impacts of past Countywide projects are summarized in the environmental setting. Closely related present and reasonably foreseeable future projects would be developed in accordance with requirements of the housing and other elements of the General Plan, various area plans, the Renewable Energy, Hillside Management, and other County ordinances, and with the mitigation measures or conditions of approval imposed as part of project-specific CEQA and permitting processes. The incremental contribution of projects facilitated by the Draft 2045 CAP could result in a cumulative impact related to shadow, light, or glare if one or more of the projects were to be located near other closely related past, present, and reasonably foreseeable future cumulative projects that are significant sources of light or glare.

The discussion under Impact 3.2-5 explains that photovoltaic solar panels can result in reflection and glare, although rooftop solar would generally be unnoticeable from ground level. Although codes limit the height of the rooftop panels, panels could be installed on sloped roofs, potentially making them visible to receptors sensitive to glare. However, it is also noted that photovoltaic panels are designed and constructed to absorb as much light as possible for energy generation, as opposed to reflecting the sunlight back into the atmosphere (NREL 2018). In addition to the use of minimally reflective panels, large utility-scale projects would be required to comply with permit conditions and would be subject to site-specific, project-specific environmental review, as also explained under Impact 3.2-5. The impacts related to glare for rooftop and large utility-scale

projects associated with the Draft 2045 CAP would be less than significant. As noted above, closely related present and reasonably foreseeable future projects would be subject to the same or similar permit requirements and approval conditions. Based on the design and construction of photovoltaic panels, coupled with regulatory requirements, the Project's contribution to cumulative impacts would be less than cumulatively considerable, and therefore less than significant.

Pre-mitigation, the cumulative impact attributable to nighttime lighting could be significant, and the Project's contribution to this impact could be cumulatively considerable. However, the implementation of Mitigation Measure 3.2-3, *Reduce Light and Glare Impacts*, would ensure that nighttime lighting associated with projects facilitated by the Draft 2045 CAP would not substantially intrude on daytime or nighttime views in the area because its provisions would substantially confine generated light to within project boundaries. Accordingly, with the implementation of Mitigation Measure 3.2-3, the Project's contribution to cumulative impacts would be less than cumulatively considerable, and therefore less than significant.

Mitigation: Implement Mitigation Measure 3.2-3.

Significance after Mitigation: Not cumulatively considerable, and therefore less than significant.

This page intentionally left blank

3.3 Agriculture and Forestry Resources

This section identifies and evaluates agriculture and forestry resources issues to determine whether the Project would result in a significant impact related to the loss or conversion of agricultural resources (e.g., protected farmland, agricultural zoning, a designated Agricultural Resource Area, or Williamson Act contract) or forestry resources (e.g., forest land, timberland, or Timberland Production zoning). This section describes the physical environmental and regulatory setting, the criteria and thresholds used to evaluate the significance of impacts, the methods used in evaluating these impacts, and the results of the impact assessment.

During the scoping period for the EIR, written and oral comments were received from agencies, organizations, and the public. These comments identified various concerns and questions related to the EIR. **Appendix A.5, *Scoping Input Received***, includes all comments received during the scoping comment period. Comments relevant to agriculture and forestry resources request consideration of impacts from anticipated agricultural land and open space conversion due to future renewable energy projects facilitated by Draft 2045 CAP measures and actions.

3.3.1 Setting

3.3.1.1 Study Area

The study area for this analysis of impacts on agriculture and forestry resources consists of the area where the 2045 CAP would be implemented, i.e., the approximately 1,696,000-acre (approximately 2,650-square-mile) area that composes the unincorporated area of the County. See Figure 2-1, *Map of Unincorporated Los Angeles County*, in Chapter 2.

Population growth and accompanying development in Los Angeles County has resulted in the conversion of agricultural land to nonagricultural uses. This process threatens agricultural land and has led to land use conflicts between existing farms and new residential developments that are being developed adjacent to existing agricultural areas. The remaining agricultural land is considered an important nonrenewable resource. Los Angeles County includes a relatively small quantity of land that is designated pursuant to the Farmland Mapping and Monitoring Program (FMMP), meaning that it meets one of the designations described in this section and therefore is “Important Farmland.” Approximately 90 percent of Los Angeles County’s Important Farmland is located in the Antelope Valley; the remainder is located in the Santa Clarita Valley, the Santa Monica Mountains, and the San Fernando Valley.

The study area for this analysis of impacts on agriculture and forestry resources includes Prime Farmland, Unique Farmland, and Farmland of Statewide Importance as designated pursuant to the FMMP, as well as forestland within the County’s unincorporated areas that is subject to the County’s land use authority.

3.3.1.2 Environmental Setting

Agricultural Land Use

A variety of programs administered by the State of California and the County classify and help protect agricultural lands in the County. The FMMP, administered by the state and described in Section 3.3.1.3, *Regulatory Setting*, identifies important areas of farmland based on soil types and land use history. Agriculture zoning in the County identifies areas under agricultural use or areas that could be developed with agricultural use and sets forth development regulations and allowable uses for areas in agricultural zones. The County also designates agricultural areas where agriculture is encouraged and/or preserved by policies, development guidelines, and regulations.

Farmland Mapping and Monitoring Program-designated Farmland

As part of the FMMP, the California Department of Conservation produces Important Farmland maps that assess the locations, quality, and quantity of agricultural lands in California on a county-by-county basis, as well as the conversion of these lands over time. The classification of Important Farmlands is based on land use and soil. Agricultural land is rated according to the soil quality and irrigation status, with the best-quality land called Prime Farmland. Maps are updated every two years by the U.S. Natural Resources Conservation Service (NRCS), part of the U.S. Department of Agriculture; current land use information is gathered from aerial photographs, a computer mapping system, public review, and field reconnaissance.

The FMMP maps approximately 47.9 million acres of land in 49 of California’s 58 counties. FMMP designations do not affect local land use decisions; rather, they are identification tools that local governments can use for policy purposes.

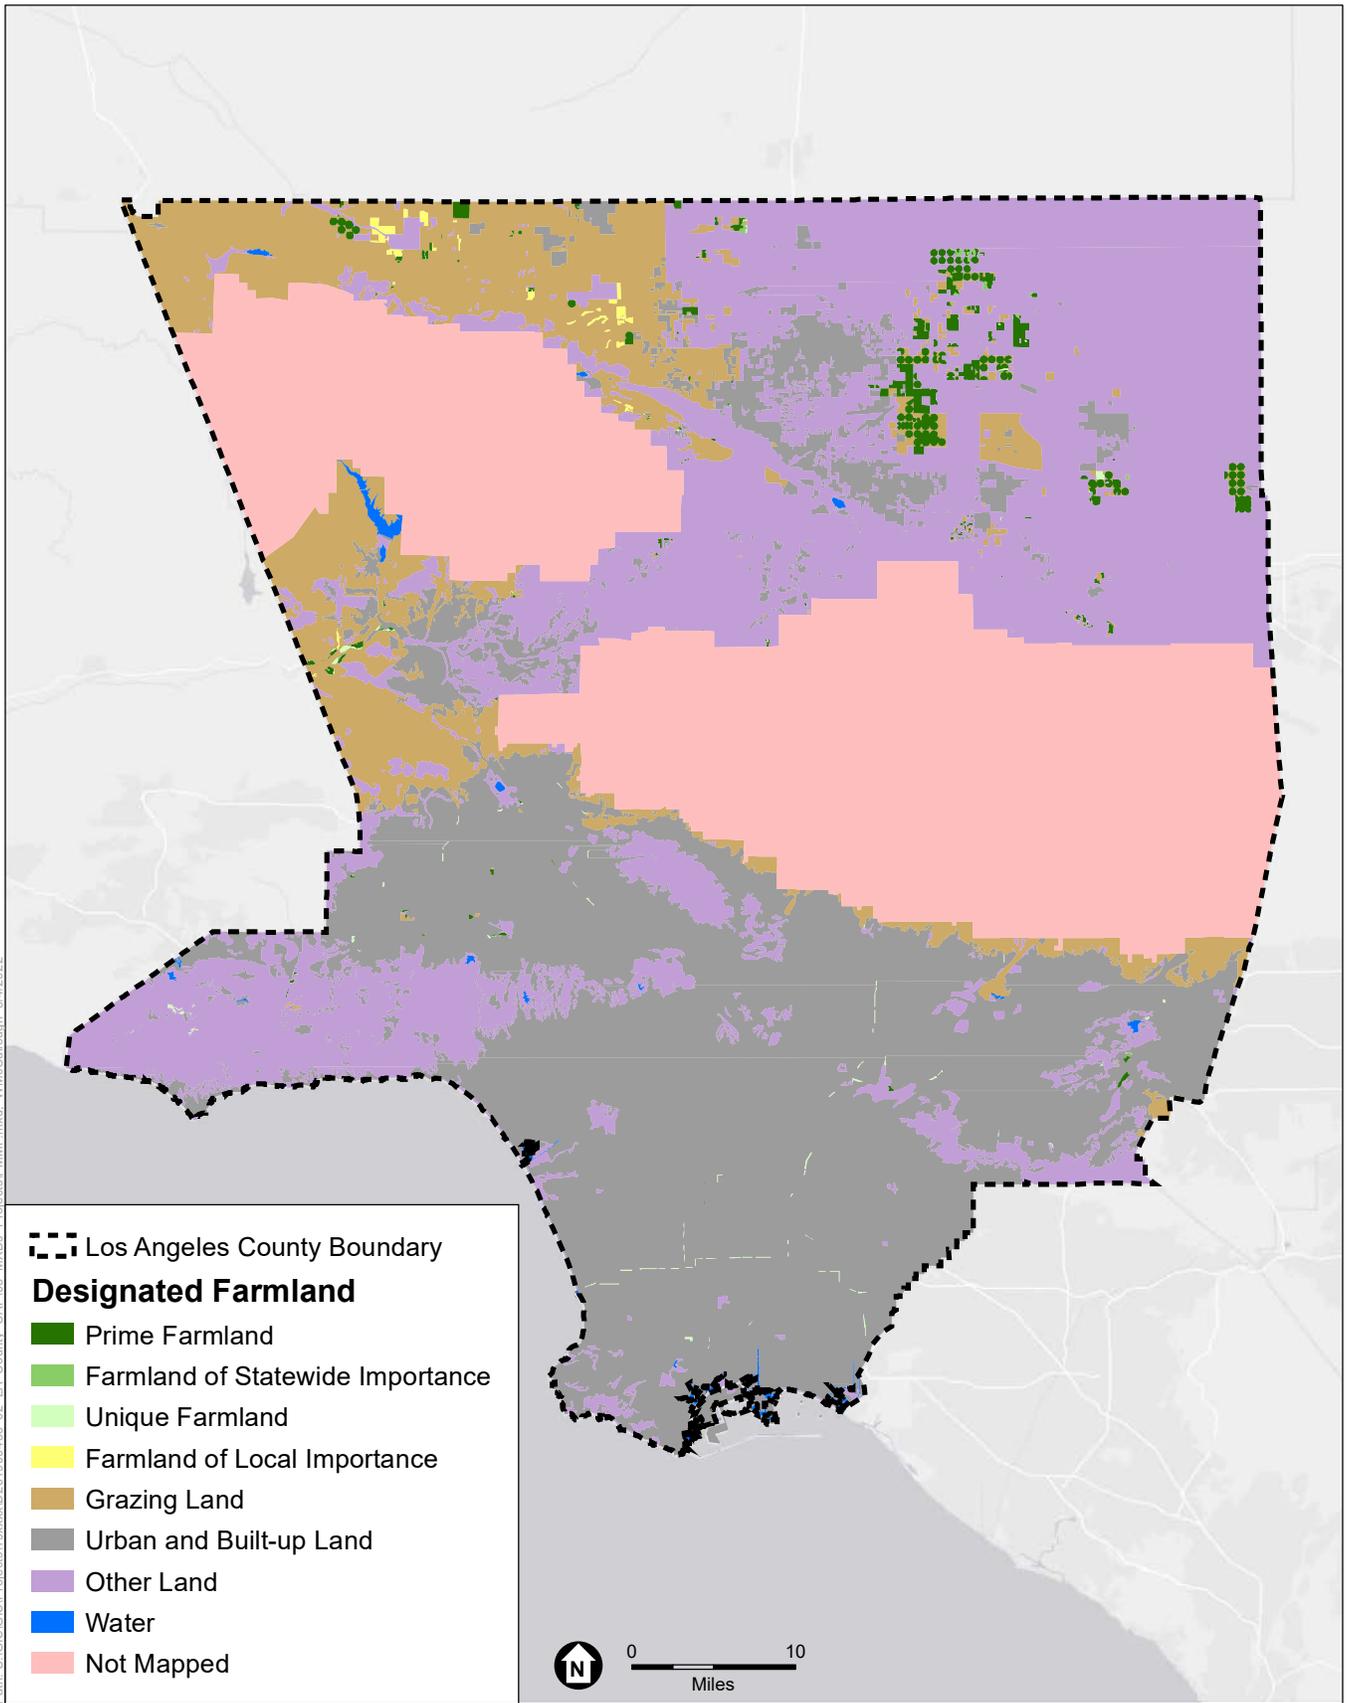

The acreages listed in this section represent data from the 2018 FMMP maps for Los Angeles County and include mapped Farmland in the unincorporated areas only.¹ Farmland as mapped by the FMMP can be found in roughly half of the County, excluding national forest land and the Los Angeles Basin, the San Gabriel Valley, and most of the eastern San Fernando Valley, which are categorized as Urban and Built-Up Land. See **Figure 3.3-1, *Farmland Mapping and Monitoring Program–Designated Farmland in Los Angeles County***, which shows the locations of designated Farmland as well as urban and built-up land, other land, water, and national forest land (which is labeled as “not mapped” for purposes of the California Department of Conservation’s Important Farmland maps). The FMMP maps identify the following Farmland types:

- (1) **Prime Farmland:** Prime Farmland has the most favorable combination of physical and chemical features, enabling it to sustain long-term production of agricultural crops. This land possesses the soil quality, growing season, and moisture supply needed to produce sustained high yields. To qualify for this classification, the land must have produced irrigated crops at some point during the two update cycles before NRCS mapping. The unincorporated County contains 16,969 acres of designated Prime Farmland (DOC 2019), which equates to approximately 1.00 percent of the unincorporated County’s total acreage and represents a reduction of 7,405 acres since the 2010 FMMP maps (County Planning 2014).

¹ Three other FMMP designations exist but are not used in Los Angeles County: Urban and Built-Up Land, Other Land, and Land Committed to Non-agricultural Use.

- (2) **Farmland of Statewide Importance:** Farmland of Statewide Importance is similar to Prime Farmland, but it possesses minor shortcomings, such as greater slopes and/or less ability to store moisture. To qualify for this classification, the land must have produced irrigated crops at some point during the two update cycles before NRCS mapping. The unincorporated County contains approximately 690 acres of designated Farmland of Statewide Importance, which equates to about 0.04 percent of the unincorporated County's total acreage and represents a reduction of 240 acres since the 2010 FMMP maps (County Planning 2014).
- (3) **Unique Farmland:** Unique Farmland is of lesser-quality soils and is used to produce the state's leading agricultural crops. Unique Farmland does not meet the previously stated criteria for Prime Farmland or Farmland of Statewide Importance, but it consists of areas that have been used for the production of specific crops with high economic value during the two update cycles before the mapping date. It has the special combination of soil quality, location, growing season, and moisture supply needed to produce sustained, high-quality crops and/or high yields of a specific crop when treated and managed according to current farming methods. This land is usually irrigated, but it may include non-irrigated orchards or vineyards, as found in some climatic zones in California. Land must have been cropped sometime during the four years before the mapping date. The unincorporated County contains approximately 865 acres designated as Unique Farmland (DOC 2019), which is 0.05 percent of the unincorporated County's total acreage and represents a reduction of 66 acres since the 2010 FMMP maps (County Planning 2014).
- (4) **Farmland of Local Importance:** Farmland of Local Importance is important to the local agricultural economy, as determined in Los Angeles County by the County Board of Supervisors and a local advisory committee. The County defines Farmland of Local Importance as lands that would meet the criteria for Prime Farmland or Farmland of Statewide Importance but are not irrigated. Approximately 2,739 acres of the unincorporated County are designated as Farmland of Local Importance (DOC 2019), which is 0.16 percent of the unincorporated County's total acreage and represents a reduction of 4,114 acres since the 2010 FMMP maps (County Planning 2014).
- (5) **Grazing Land:** Grazing Land is land on which the existing vegetation is suited to the grazing of livestock. This category was developed in cooperation with the California Cattlemen's Association, University of California Cooperative Extension, and other groups interested in the extent of grazing activities. The minimum mapping unit for Grazing Land is 40 acres. Approximately 216,378 acres of the unincorporated County is designated as Grazing Land (DOC 2019), which is 12.76 percent of the unincorporated County's total acreage and represents an increase of 11,185 acres since the 2010 FMMP maps (County Planning 2014).

The quality of farmland in the County has shifted in the past several decades. For example, in the Antelope Valley, the highest value categories (Prime Farmland and Farmland of State Importance) have declined in size, while the lowest value categories (Farmland of Local Importance, Grazing Land, Urban and Built-Up Land, and Other Land) have expanded (Farr 2021).

Figure 3.3-1
 Farmland Mapping and Monitoring
 Program-Designated Farmland in Los Angeles County

Agricultural Zoning

The County has two agricultural zones: Light Agricultural (A-1) and Heavy Agricultural (A-2). Both agricultural zones allow for variety of uses. The A-1 zone allows the development of single-family residences and small group homes, community gardens, livestock, and agricultural uses, including the raising of cattle, horses, sheep, goats, poultry, birds, and earthworms.

The A-2 zone allows for a wider variety of agricultural and nonagricultural uses than the A-1 zone. Fruit and vegetable packing plants, dairies, and manure processing facilities are examples of heavier land uses that are allowed in A-2 but not in A-1. With a conditional use permit, the types of uses for agriculturally zoned land broaden, and can include uses such as airports, universities, and golf courses.

Electricity generation plants, including utility-scale, ground-mounted solar projects, are an allowed use in the A-2 zone with a conditional use permit outside Significant Ecological Areas and Economic Opportunity Areas (each of which is described in Section 3.3.1.3, *Regulatory Setting*). For example, an analysis done in 2021 indicates that of the 14 solar projects approved in the Antelope Valley as of that year, 12 are located in the A-2 zone; of these 12, three contain land identified as Prime Farmland. However, although solar projects in the Antelope Valley have been approved on agriculturally zoned land, they have mostly been sited on vacant, undeveloped land, not on land that has historically been used for agricultural production. Only one of the 14 approved projects was sited on what was previously contained productive farmland (Farr 2021).

As shown in **Table 3.3-1, *Distribution of Agricultural Zones by Planning Area***, most (about 80 percent) of the agriculturally zoned lands are found in the Antelope Valley. The Santa Clarita Valley Planning Area is home to another 11 percent, and the San Fernando Valley Planning Area to about 3.5 percent. Other planning areas in the County each represent less than 3 percent (and most less than 1 percent) of the total agricultural zoning in the County (Farr 2021, Table 7).

In the Antelope Valley, existing uses of lands in the A-1 zone consist primarily of residential uses (64.4 percent), specifically mobile homes (37.3 percent) and single-family homes (26.4 percent). Irrigated farms make up 24.1 percent of the A-1 zone, specifically the Irrigated Farm category for “Desert” (22.7 percent). Government parcels make up 26 percent of the A-1 zone. By comparison, lands in the A-2 zone in the Antelope Valley consist primarily of Irrigated Farm (75.2 percent), particularly land that falls under the category of Desert (69.5 percent), with residential land uses (19 percent) and government parcels (1.9 percent) making up the rest. Commercial, industrial, institutional, miscellaneous, and recreational physical land use categories each make up less than 1 percent of the A-1 and A-2 zones within the Antelope Valley (Farr 2021).

**TABLE 3.3-1
 DISTRIBUTION OF AGRICULTURAL ZONES BY PLANNING AREA**

Planning Area	Zone A-1 Light Agricultural	Zone A-2 Heavy Agricultural	Zones A-1 & A-2 All Agricultural
Antelope Valley Planning Area	50.01%	84.34%	79.57%
Coastal Islands Planning Area	0.00%	0.00%	0.00%
East San Gabriel Valley Planning Area	13.72%	0.78%	2.58%
Gateway Planning Area	1.48%	0.47%	0.61%
Metro Planning Area	0.29%	0.00%	0.04%
San Fernando Valley Planning Area	1.75%	3.73%	3.46%
Santa Clarita Valley Planning Area	17.57%	10.35%	11.35%
Santa Monica Mountains Planning Area	13.32%	0.16%	1.99%
South Bay Planning Area	0.46%	0.00%	0.06%
West San Gabriel Valley Planning Area	1.04%	0.00%	0.15%
Westside Planning Area	0.35%	0.17%	0.19%
TOTAL	100.00%	100.00%	100.00%

SOURCE: Farr 2021: Table 7

Agricultural Resource Areas

Agricultural Resource Areas (ARAs) are identified in the General Plan and the Antelope Valley Area Plan. A key purpose of this designation is to encourage preservation and sustainable uses of agricultural land, agricultural activities, and compatible uses within these areas. The following land types are ARAs:

- Prime Farmland
- Farmland of Statewide Importance
- Farmland of Local Importance
- Unique Farmland
- Lands that have received permits from the County Agricultural Commissioner/Weights and Measures

The ARAs are within the Antelope Valley Planning Area and Santa Clarita Valley Planning Area. The following land uses and County land use designations are not considered for the ARA designation and are not part of any existing ARAs:

- Significant Ecological Areas
- Approved specific plans
- Approved large-scale renewable energy facilities
- Land outside of the Santa Clarita Valley and Antelope Valley planning areas
- Lands designated as Public and Semi-Public land uses

Williamson Act Contract Lands

The purpose of a Williamson Act contract is to preserve agricultural and open space lands by discouraging premature and unnecessary conversion to urban uses. The only Williamson Act contract lands in Los Angeles County are located on Santa Catalina Island; those lands are held by the Catalina Island Conservancy and set aside for open space and recreational purposes.

Forest Resources

Forest land is defined in the California Public Resources Code (Section 12220[g]) as land that can support 10 percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetic, fish and wildlife, biodiversity, water quality, recreation, and other public benefits. *Timberland* is considered land that is available for and capable of growing a crop of trees of any commercial species used to produce lumber and other forest products, including Christmas trees (Public Resources Code Section 4526).

Within the unincorporated areas of the County, Angeles National Forest, coupled with a small portion of Los Padres National Forest, encompasses 650,000 acres. Angeles National Forest extends along the San Gabriel Mountains and is divided into two sections totaling 1,018 square miles, which equates to approximately 25 percent of the County's land area. The U.S. Forest Service is responsible for managing public forest lands, However, nearly 40,000 acres of the national forests are privately owned. These privately owned areas are commonly referred to as *in-holdings*, and the County retains responsibility for their land use regulation. The County also includes small areas of forest outside of the National Forests. These consist primarily of smaller areas in the Santa Monica Mountains, the Sierra Pelona, and areas of the San Gabriel Mountains adjacent to Angeles National Forest. Forest lands within the County are generally zoned Open Space (O-S) and Watershed (W) zones.

The majority of Angeles National Forest is composed of chaparral, rather than forest. The forests in the County are limited and generally consist of small stands of trees growing in riparian areas and in the higher elevations of the San Gabriel Mountains. Because of the limited amount of forest resources, there is no timberland in the County.

3.3.1.3 Regulatory Setting

Federal Laws, Regulations, and Policies

Farmland Protection Policy Act

The U.S. Department of Agriculture administers the Farmland Protection Policy Act of 1981. The act discourages federal activities that would convert farmland to nonagricultural purposes and assures to the extent possible that federal programs are administered to be compatible with state, local government, and private programs and policies to protect farmland. For purposes of the act, *farmland* includes land defined as prime, unique, or farmlands of statewide or local importance as well as forest land, pastureland, or cropland; it does not include water or urban built-up land. Projects are subject to Farmland Protection Policy Act requirements if they could irreversibly convert farmland (directly or indirectly) to nonagricultural use and are completed by a federal agency or with assistance from a federal agency (NRCS 2022).

Federal agency representatives of projects that have the potential to convert farmland to non-farm use coordinate with their local office of the NRCS or U.S. Department of Agriculture Service Center. The NRCS uses a land evaluation and site assessment (LESA) system to establish a farmland conversion impact rating score on proposed sites of federally funded and assisted projects. The resulting score is used as an indicator for the project sponsor to consider alternative sites if the potential adverse impacts on the farmland exceed the recommended allowable level.

Agricultural Improvement Act of 2018

The Agricultural Improvement Act of 2018 (sometimes called the “2018 Farm Bill”) was approved in 2018 and remains in effect through 2023. It builds upon and continues to implement many of the crucial programs that serve agricultural producers. The U.S. Department of Agriculture is charged with implementing this law, which reauthorized previous programs to serve producers now while they seek public input for future programs. The 2018 Farm Bill continued funding for major programs but did include some changes to NRCS programs, such as expanding support to producers who address significant natural resources concerns by adopting conservation practices and activities. All major conservation programs are continued, although some have been modified (USDA 2022).

State Laws, Regulations, and Policies

California Public Resources Code

Section 4526 of the California Public Resources Code defines *timberland* as land (other than land owned by the federal government and land designated by the county board of supervisors as experimental forest land) that is available for, and capable of, growing a crop of trees of any commercial species used to produce lumber and other forest products, including Christmas trees. Commercial species are determined by the county board of supervisors on a district basis after consultation with district committees and others.

According to Section 12220(g) of the California Public Resources Code, *forest land* refers to “land that can support 10 percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits.” California Civil Code Section 3482.5 (Right to Farm Act)

The Right to Farm Act is designed to protect commercial agricultural operations from nuisance complaints that may arise when an agricultural operation is conducting business in a “manner consistent with proper and accepted customs.” The law specifies that established operations that have been in business for three or more years that were not nuisances at the time they began shall not be considered a nuisance as a result of a new land use.

Farmland Mapping and Monitoring Program

As noted above, the FMMP produces maps and statistical data used for analyzing impacts on California’s agricultural resources. For the purposes of this environmental analysis, the term *Farmland* refers to the FMMP map categories *Prime Farmland*, *Unique Farmland*, and *Farmland of Statewide Importance* (hereafter collectively referred to as “Farmland”). Generally, any conversion of land from one of these categories to a lesser quality category or a nonagricultural

use would be considered an adverse impact. These map categories are defined in Section 3.3.1.2, *Environmental Setting*.

California Land Conservation Act (Williamson Act)

The Williamson Act of 1965 provides an incentive to retain prime agricultural land and open space in agricultural use, thereby slowing its conversion to urban and suburban development. The program requires a 10-year contract between the county where the subject land is located and the landowner. While subject to contract, the land is taxed on the basis of its agricultural use rather than its market value. The land becomes subject to certain enforceable restrictions, and certain conditions need to be met prior to approval of an agreement. The goal of the Williamson Act is to protect agriculture and open space. The only Williamson Act contract lands in Los Angeles County are located on Santa Catalina Island and are preserved for open space and recreational purposes.

California Government Code

California Government Code Section 51104(g) defines a *timberland production zone* as an area that has been zoned pursuant to Section 51112 or 51113 and is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses. The County Code does not identify timberland production zones within the unincorporated portion of the County.

Regional and Local Laws, Regulations, and Policies

Los Angeles County General Plan 2035

The General Plan includes an implementing program to adopt an Agricultural Resources Areas Ordinance, the intent of which would be to encourage the retention and sustainable use of agricultural land for agricultural uses. Relevant agricultural resources policies set forth in the General Plan include protection of ARAs and other land identified as Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Farmland of Local Importance from encroaching development. The Conservation and Natural Resources Element of the General Plan encourages the preservation and sustainable utilization of agricultural land, agricultural activities, and compatible uses within these areas (County Planning 2015a). The relevant ARA-related policies set forth in the General Plan include protecting ARAs from encroaching development, discouraging incompatible land uses in areas adjacent to or within these farmland areas, and encouraging agricultural activity within ARAs (Policies C/NR 8.1 through 8.3). Additional policies support sustainable agricultural practices (Policies C/NR 9.1 through 9.5).

Antelope Valley Area Plan

The 2015 Antelope Valley Area Plan was adopted by the County Board of Supervisors on June 16, 2015 (County Planning 2015b). This plan sets forth specific goals, policies, land use and zoning maps, and other planning instruments to guide future development and preservation activities in the Antelope Valley Planning Area. The Conservation and Open Space Element of this plan contains policies related to agricultural resources. Relevant policies include limiting the amount of potential residential development in ARAs (shown on Map 4.3 of the Antelope Valley Area Plan) through appropriate land use designations with low densities; limiting incompatible uses in ARAs; requiring buffering and appropriate development standards where nonagricultural uses in ARAs are necessary to meet regional or community needs; supporting innovative agricultural business

practices such as agricultural tourism by streamlining regulations; and supporting the use of alternative and renewable energy systems in conjunction with agricultural activities (County Planning 2015b). The Antelope Valley Area Plan also contains the ARA designations for the Antelope Valley.

Los Angeles County Code

The County Code Title 22, Chapter 22.16 regulates uses within the County’s agricultural zones, which include A-1 and A-2, and the forest land zones, which include W (Watershed) and O-S (Open Space).

The purpose of the W zone, as defined in the County Code, is to provide for conservation of water and other natural resources within a watershed area and to protect areas subject to fire, flood, erosion, or similar hazards. This zone allows for limited recreational development of the land and necessary public facilities. The purpose of the O-S zone is to provide for the preservation, maintenance, and enhancement of the recreational, natural, and environmental resources of the County as defined in the General Plan.

Chapter 22.16 of the County Code contains a list of allowable uses for each of these zones, allowable uses with director’s review and approval, and allowable uses with the appropriate permits, as well as a list of development standards (County Code, Chapter 22.16).

Only some renewable energy uses are allowed within agricultural zones. Utility-scale (i.e., primarily for offsite use and generally greater than 50 kW), ground-mounted solar energy facilities are allowed in the A-2 zone with a conditional use permit, but are not allowed in the A-1 zone. Structure-mounted (e.g., rooftop) utility-scale and structure- or ground-mounted small-scale (i.e., primarily for on-site use and generally smaller than 50 kW) solar is permitted in both zones. Small-scale wind energy systems are allowed with a minor conditional use permit in both zones. The categories of “energy generating or storage devices, including but not limited to solar, wind, or geothermal devices” and utility-scale wind energy facilities are not allowed in either use (LA County Zoning Code Section 22.16.030). The County adopted a Renewable Energy Ordinance in 2016, establishing the land use type and development standards. The ordinance prohibits ground-mounted utility-scale energy facilities in Significant Ecological Areas and Economic Opportunity Areas.

3.3.2 Impact Analysis

3.3.2.1 Significance Criteria

To determine the level of significance of an identified impact, the following thresholds are consistent with and modified from the CEQA Guidelines Appendix G Environmental Checklist.

The Project would have a significant impact on agriculture and forestry resources if it would:

- a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use;

- b) Conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract;
- c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220[g]), timberland (as defined in Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined in Government Code Section 51104[g]);
- d) Result in the loss of forest land or conversion of forest land to non-forest use; or
- e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to nonagricultural use or conversion of forest land to non-forest use.

3.3.2.2 Methodology

The analysis of agriculture and forestry resources in this section is based on a review of the project description and available literature from state and local agencies. The analysis focuses on the compatibility of the Draft 2045 CAP with existing agricultural uses and policies in the County and evaluating whether projects facilitated by Draft 2045 CAP measures and actions would result in physical impacts on agriculture and forestry resources. In determining the level of significance, the analysis assumes that projects facilitated by the Draft 2045 CAP measures and actions would comply with relevant federal, state, and local regulations, laws, and policies.

3.3.2.3 Project Impacts

The Draft 2045 CAP identifies 10 strategies, 25 measures, and various implementing actions to reduce greenhouse gas (GHG) emissions in unincorporated areas of Los Angeles County. See also Section 2.6.2 of Chapter 2, *Project Description*, which lists the proposed GHG emissions reduction strategies and measures. None of the proposed measures or actions indicate where specific projects would be constructed, their sizes, or their specific characteristics. As a program EIR, this Draft EIR does not speculate on the specific environmental impacts of individual projects that could be facilitated by Draft 2045 CAP measures and actions. However, impacts of implementing specific measures and actions were considered as part of this analysis to the degree that specific information about implementation is known. As explained in Draft EIR Section 3.1.3.6, the potential impacts of new utility-scale, ground-mounted solar photovoltaic (PV) projects and associated energy storage and distribution facilities are qualitatively evaluated at a programmatic level.

The Draft 2045 CAP details the GHG emission reduction vision and goals of the OurCounty Sustainability Plan for unincorporated Los Angeles County and would implement the GHG emissions reduction strategies of the Air Quality Element of the General Plan. Specifically, the Draft 2045 CAP, once approved, would replace the existing implementation strategy of the Air Quality Element, known as the 2020 CCAP. The Draft 2045 CAP is a policy document intended to reduce community-wide GHG emissions and would support development already allowed under the General Plan's land use assumptions in the Land Use Element and 2021–2029 Housing Element. No changes to General Plan land use designations, zoning, or land use specific projects are proposed as part of the Draft 2045 CAP.

Consistent with the requirements of CEQA Guidelines Section 15168, this EIR provides a program-level discussion of the potential impacts of implementing these measures, rather than project-level or site-specific physical impacts of such actions. Table ES-1, *Summary of Draft 2045 CAP Measures and Affected Resource Areas*, in the Executive Summary, identifies certain measures and actions relevant to this analysis of agriculture and forestry-related impacts. These and other relevant measures and actions include those actions associated with Strategy 9, Conserve and Connect Wildlands and Working Lands, and Strategy 10, Sequester Carbon and Implement Sustainable Agriculture. These measures and actions could result in a beneficial effect on agriculture and forestry resources.

By contrast, renewable energy and related infrastructure projects facilitated by some of the Draft 2045 CAP measures and actions could result in adverse impacts on agriculture and forestry resources via conversion. These include projects facilitated by Draft 2045 CAP measures and actions involving: (1) decarbonization of the energy supply (e.g., Measure ES2, Procure Zero-Carbon Electricity; Measure ES3, Increase Renewable Energy Production; and Measure ES4, Increase Energy Resilience); (2) the electrification of vehicles (e.g., Measure T6, Increase ZEV Market Share and Reduce Gasoline and Diesel Fuel Sales; Measure T7, Electrify County Fleet Vehicles; Measure T8, Accelerate Freight Decarbonization; and Measure T9, Expand Use of Zero-Emission Technologies for Off-Road Vehicles and Equipment); and (3) the electrification of buildings (Strategy 5, Decarbonize Buildings).

The timeframe during which the implementation of these actions and measures would affect agriculture and forestry resources would depend on the specific implementation timing (as shown in Table 2-11 in Chapter 2, *Project Description*) and whether their implementation actually impacts one or more of these resources. The impact would occur immediately and, once it occurs, could be long-term. The magnitude of long-term impacts would increase over time to the extent that more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets.

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will be developing an offsite GHG emissions reduction program. Future development projects that cannot achieve net-zero GHG emissions or are unable to comply with all required checklist items would have the option to participate in the offsite GHG emissions reduction program. This program would allow project applicants to fund or implement local projects that reduce GHG emissions within unincorporated Los Angeles County. Such projects must not otherwise be required by law or regulation and would not have happened on the 2045 CAP's proposed schedule but for the requirements placed on the project by the 2045 CAP Checklist. If offsite GHG reduction projects are implemented via this program, then, to the extent that such projects include types of activities similar to those contemplated by the Draft 2045 CAP's measures and actions, the resulting environmental impacts would be similar to those disclosed below. Further, project applicants' CEQA documents would be required to disclose the impacts of any GHG reduction projects that are proposed to be funded or implemented.

Specific agriculture and forestry impacts of implementing Draft 2045 CAP measures and actions are analyzed below.

Criterion a) Whether the Project would convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use.

Impact 3.3-1: Projects facilitated by the Draft 2045 CAP would convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use. (Significant and Unavoidable)

Projects facilitated by Draft 2045 CAP Strategy 9, Conserve and Connect Wildlands and Working Lands, and Strategy 10, Sequester Carbon and Implement Sustainable Agriculture, could facilitate projects that conserve working lands (Measure A1) or implement regenerative agricultural practices (Measure A2), which would result in a beneficial effect on Farmland. For example, projects facilitated by Action A2.1 would create fallow and field resting incentives to reduce bare-fallow land by adding cover crops and promoting crop rotation for active agricultural sites to improve soil quality and limit risks of nutrient erosion, pollutant runoff, and yield reduction. Action A2.2 would provide compost and/or organic or non-synthetic fertilizer to farmers free of charge or at a discounted rate. In addition to improving carbon removal on sites that benefit from these actions, the results of the actions would improve the long-term viability and productivity of agricultural lands in the County, making them less susceptible to conversion due to economic and/or environmental pressures.

However, depending on the location, projects facilitated by GHG emissions reduction measures and actions in the Draft 2045 CAP that involve ground disturbance could result in the conversion of farmland to nonagricultural use. For most types of projects that may be proposed in furtherance of the Draft 2045 CAP's measures and actions, construction and improvements are anticipated to occur primarily in developed areas such as parking lots, existing structures, and urban areas near public transportation. However, other types of projects facilitated by Draft 2045 CAP measures and actions, such as utility-scale energy projects (solar energy generation, battery storage, substations, and related transmission infrastructure), could convert Farmland to nonagricultural use in the Antelope Valley, the Santa Clarita Valley, the Santa Monica Mountains, and the San Fernando Valley where most of the Farmland in the County has been identified. See Figure 3.3-1, which shows the locations of state-identified Farmland.

Elements of a utility-scale, structure- or ground-mounted solar PV facility that could be facilitated by the Draft 2045 CAP measures and actions may include, but would not be limited to, solar collector arrays, mounting posts, on-site substations, electrical infrastructure, transmission lines, operations and maintenance buildings, battery-storage facilities, and other accessory structures. Utility-scale solar facilities could require development on hundreds of acres; therefore, if developed in agricultural areas of the Antelope Valley, these developments could have a substantial effect on Farmland. Utility-owned substation upgrades to increase load capacity would most likely be contained within the existing substation fence line and would be regulated by the California Public Utilities Commission if owned by an investor-owned utility such as Southern

California Edison. Upgrades to existing transmission lines may also be required at specific tower locations, which could permanently disturb Farmland in the area where the work would occur.

Should future utility-scale renewable energy facilities be proposed on Farmland that is used for the production of agricultural products (i.e., rather than used for residential, governmental, or other allowable nonagricultural uses of agricultural zoned lands), they could convert an agricultural use to a nonagricultural use. This impact would be significant.

In project-specific contexts for utility-scale, ground-mounted renewable energy facilities, the County has required mitigation of the net acreage of lost Farmland at a 1:1 ratio through various measures: purchase of agricultural conservation easements; purchase of credits from an established agricultural farmland mitigation bank; contribution of agricultural land or equivalent funding to an organization that provides for the preservation of Farmland in California; or participation in an agricultural land mitigation program adopted by the County. However, efforts to preserve offsite farmland through agricultural or conservation easements, or via mitigation banks, reduce conversion impacts but do not offset the reduction in total mapped Farmland resulting from the implementation of a project. Therefore, the impact would remain significant. Nonetheless, mitigation actions described below could be taken to avoid or reduce the impacts of the conversion of mapped Farmland that actually is in physical agricultural use. The mitigation actions would apply only if specific projects have potentially significant impacts.

Mitigation Measure 3.3-1: Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar and Energy Storage Development. To reduce the impacts of converting Farmland in physical use for agriculture to nonagricultural uses when a utility-scale solar development is proposed on actively farmed land, the County shall require renewable energy project applicants to demonstrate their consideration of alternate sites consisting of formerly developed and/or contaminated lands such as landfills and mine sites located within one mile of the proposed project site when such development is consistent with General Plan and zoning requirements.

Significance After Mitigation: Implementing Mitigation Measure 3.3-1 would lessen the impact of the conversion of mapped Farmland to nonagricultural uses by avoiding the development of actively farmed lands for purposes of utility-scale solar and energy storage when there is an otherwise suitable site available. However, this measure would not ensure that such conversion could be avoided. Accordingly, with implementation of Mitigation Measure 3.3-1, Impact 3.3-1 would be significant and unavoidable. No additional feasible mitigation measures are available.

Criterion b) Whether the Project would conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract.

Impact 3.3-2: Projects facilitated by the Draft 2045 CAP would conflict with the existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract. (Significant and Unavoidable)

Agricultural Resource Areas include the following land types: Prime Farmland, Farmland of Statewide Importance, Farmland of Local Importance, and Unique Farmland (which fall within

the definition of Farmland, as analyzed above), and lands that have received permits from the County Agricultural Commissioner/Weights and Measures.

The Draft 2045 CAP is a policy document intended to reduce GHG emissions throughout the unincorporated County. The Draft 2045 CAP would not propose changes to the General Plan's land use designations that would directly require changes to zoning, nor does it include specific projects that would conflict with existing zoning.

Further, to help preserve existing agricultural lands, the Draft 2045 CAP includes Measure A1, Conserve Forests, Woodlands, Shrublands, Grasslands, Desert, and other Carbon-Sequestering Wildlands and Working Lands. Conserving and restoring forests, carbon-sequestering wildlands, and working lands keeps carbon in the ground and provides a multitude of benefits, including maintaining biodiversity in Significant Ecological Areas and preserving the character of the unincorporated County's rural areas. Draft 2045 CAP Action A1.1 calls for the creation of open space easements to conserve natural habitats for carbon sequestration.

Nonetheless, projects facilitated by Draft 2045 CAP measures and actions (especially if approved in the Antelope Valley, the Santa Clarita Valley, the Santa Monica Mountains, or the San Fernando Valley) could conflict with a designated Agricultural Resource Area. The potential for such impacts would be reduced by compliance with the requirements of Title 22 (Zoning Code) Chapter 22.16 (Agricultural, Open Space, Resort and Recreation, and Watershed Zones), which establishes the Light Agricultural Zone (A-1) and Heavy Agricultural Zone (A-2). These zones allow for a comprehensive range of agricultural and residential uses. As described in the context of criterion a), ground-mounted, utility-scale solar and other renewable energy projects facilitated by Draft 2045 CAP measures and actions could be approved on lands designated as Farmland, and so also in an Agricultural Resource Area. The development of a wastewater treatment plant, organic waste processing facility, or energy-related project in a designated Agricultural Resource Area would be a significant impact. Mitigation Measure 3.3-1 (identified above) would be implemented to reduce this significant impact, but it would not reduce the impact to a less-than-significant level.

The Williamson Act, also known as the California Land Conservation Act of 1965, enables local governments to enter into contracts with private landowners to restrict specific parcels of land to agricultural or related open space use. The only Williamson Act contracts in effect in Los Angeles County are for land on Santa Catalina Island (County Planning 2015a), which would not be affected by projects facilitated by the Draft 2045 CAP. Therefore, the Draft 2045 CAP would have no impact related to Williamson Act contracts.

Mitigation Measure: Implement Mitigation Measure 3.3-1.

Significance After Mitigation: Implementing Mitigation Measure 3.3-1, Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar Development, would lessen impacts caused by a conflict with a designated Agricultural Resource Area, but would not ensure that no such conflict would occur. Accordingly, with implementation of Mitigation Measure 3.3-1, Impact 3.3-2 would be significant and unavoidable. No additional feasible mitigation measures are available.

Criterion c) Whether the Project would conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220[g]), timberland (as defined in Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined in Government Code Section 51104[g]).

Impact 3.3-3: Projects facilitated by the Draft 2045 CAP would not conflict with the existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220[g]), timberland (as defined in Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined in Government Code Section 51104[g]). (*Less-than-Significant Impact*)

There is no timberland in the unincorporated areas; therefore, neither the Draft 2045 CAP nor projects facilitated by the Draft 2045 CAP measures and actions would result in an adverse impact on timberland.

Regarding forestland, Draft 2045 CAP measures and actions do not propose changes to the General Plan's land use designations. The Draft 2045 CAP is a policy document that does not conflict with existing zoning for, or cause rezoning of, forest land. On the contrary, projects facilitated by Strategies 9 and 10 of the Draft 2045 CAP could result in a beneficial effect because they would conserve forest lands (Measure A1), conserve and restore natural forest lands through land acquisitions and conservation easements (Action A1.1), and create and implement a community-informed Urban Forest Management Plan that incorporates equitable urban forest practices (Action A3.1).

Nonetheless, projects facilitated by other Draft 2045 CAP measures and actions could conflict with existing zoning for, or cause rezoning of, forest land if they were to be approved in such areas. *Forest land* is defined as "land that can support 10-percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits" (Public Resources Code Section 12220[g]).

Angeles National Forest and Los Padres National Forest encompass approximately 650,000 acres of land within unincorporated Los Angeles County. These forests occupy a large portion of Los Angeles County and support oak woodlands, black walnut, grey pine, and other native tree species (County Planning 2014; California Wilderness Coalition 2020). For example, 11 of California's 20 species of native oaks are found in Los Padres National Forest, including blue oak, valley oak, and California black oak. California shrub oak species, including leather oak and Nuttall's ("coastal") scrub oak, are also found in Los Padres National Forest. (Los Padres ForestWatch 2013).

However, forest land would not be suitable for many of the types of projects that would be facilitated by Draft 2045 CAP measures and actions. For example, generating solar energy requires access to sunlight. Forested areas do not provide that resource and would not be deforested to serve a solar energy generation use (which itself would run counter to another implementing action of the Draft 2045 CAP).

Additionally, private inholdings within the national forests have many owners, and these landowners do not necessarily own large contiguous parcels that would be conducive to development of a utility-scale, ground-mounted solar energy generation project. Except for the private inholdings, the County has no land use authority to approve development proposed in national forests like Angeles National Forest and Los Padres National Forest. Instead, the U.S. Forest Service, which provides land use oversight in those locations, may authorize uses in national forests that benefit the general public and protect public and natural resources values. The construction of new private residences on national forest lands is prohibited by the Forest Reserve Act of 1891, and U.S. Forest Service land usually is not made available if the overall needs of an individual project proponent or business can be met on nonfederal lands (U.S. Forest Service 2013). The County is not aware of any applications to develop future utility-scale renewable energy facility projects on Angeles National Forest or Los Padres National Forest lands, and determining whether the U.S. Forest Service would allow such development in the future would be speculative.

For these reasons, implementation of the Draft 2045 CAP measures and actions would not conflict with existing zoning of forest land, and this impact would be less than significant.

Mitigation: None required.

Criterion d) Whether the Project would result in the loss of forest land or conversion of forest land to non-forest use.

Impact 3.3-4: Projects facilitated by the Draft 2045 CAP would not result in the loss of forest land or conversion of forest land to non-forest use. (*Less-than-Significant Impact*)

As discussed in Impact 3.3-3, the Draft 2045 CAP is a policy document that would not directly result in the loss of forest land or conversion of forest land to non-forest use. On the contrary, projects facilitated by Strategies 9 and 10 of the Draft 2045 CAP could result in a beneficial effect because they would conserve forest lands (Measure A1), conserve and restore natural forest lands through land acquisitions and conservation easements (Action A1.1) and create and implement a community-informed urban forest management plan that would incorporate equitable urban forest practices (Action A3.1).

Nonetheless, Draft 2045 CAP measures and actions could facilitate projects that could result in the loss of forest land or the conversion of forest land to non-forest use. However, as discussed in the context of Impact 3.3-3 above, the risk of this occurrence is low. All of the forest land located in unincorporated areas (i.e., in Angeles National Forest and Los Padres National Forest), except for approximately 40,000 acres of private inholdings, is outside of the County's land use jurisdiction and would not likely be developed in the future with projects facilitated by Draft 2045 CAP measures and actions. Further, even if projects facilitated by the Draft 2045 CAP were approved on forest lands, the relatively minor acreage (approximately 40,000 acres) within the County's land use jurisdiction would be protected by the facilitated projects' consistency with the General Plan and compliance with applicable provisions of the zoning code summarized in Section 3.3.1.3, *Regulatory Setting*. As a result, this impact would be less than significant.

Mitigation: None required.

Criterion e) Whether the Project would involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to nonagricultural use or conversion of forest land to non-forest use.

Impact 3.3-5: Projects facilitated by the Draft 2045 CAP would involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to nonagricultural use. (*Significant and Unavoidable*)

As discussed in the context of Impacts 3.3-1 and 3.3-2, some projects facilitated by the Draft 2045 CAP could result in a beneficial effect on Farmland, while other projects (e.g., wastewater treatment plants, organic waste processing facilities, or energy-related projects, if sited on Farmland) would cause a significant impact related to Farmland conversion. Such projects could cause other changes in the existing environment that, due to their location or nature, could result in conversion of Farmland to nonagricultural use if, for example, they were to divide productive agricultural lands into less productive units for reasons of access, irrigation, or scale of production. If this land conversion were to occur, the impact would be significant. Mitigation Measure 3.3-1 (identified above) would be implemented to reduce this significant impact, but would not reduce it to a less-than-significant level.

Mitigation Measure: Implement Mitigation Measure 3.3-1.

Significance After Mitigation: Implementing Mitigation Measure 3.3-1, Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar Development, would lessen impacts related to the conversion of Farmland to utility-scale solar development (a nonagricultural use), but would not ensure that land in agricultural use would not be converted. Accordingly, with the implementation of Mitigation Measure 3.3-1, Impact 3.3-5 would be significant and unavoidable. No additional feasible mitigation measures are available.

Impact 3.3-6: Projects facilitated by the Draft 2045 CAP would not involve other changes in the existing environment which, due to their location or nature, could result in conversion of forest land to non-forest use. (*Less-than-Significant Impact*)

As discussed in the context of Impacts 3.3-3 and 3.3-4, projects facilitated by the Draft 2045 CAP would not likely be proposed on forest land because the characteristics of forest land make it unsuitable for the implementation of many of the types of projects that would be facilitated by Draft 2045 CAP measures and actions. Even if projects facilitated by the Draft 2045 CAP were approved on forest lands, the relatively minor acreage (approximately 40,000 acres) within the County's land use jurisdiction would be protected by the facilitated projects' consistency with the General Plan and compliance with applicable provisions of the zoning code summarized in Section 3.3.1.3, *Regulatory Setting*. The resulting impacts would be less than significant.

Mitigation: None required.

3.3.2.4 Cumulative Impacts

For the purposes of this analysis of cumulative impacts on agriculture and forestry resources, the geographic area of consideration includes unincorporated areas of the County that are designated as Farmland pursuant to the FMMP, land that is subject to a Williamson Act contract, and forest land in the unincorporated areas. Impacts could result at various locations in this area from the initiation of on-the-ground work in furtherance of a project facilitated by Draft 2045 CAP measures and actions until such projects are decommissioned and the sites restored.

Criterion a)

Impact 3.3-7: Projects facilitated by the Draft 2045 CAP would result in a significant cumulative impact related to the conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use. (*Significant and Unavoidable*)

Projects facilitated by Draft 2045 CAP measures and actions, in combination with the incremental impacts of other closely related past, present, and reasonably foreseeable future projects (including projects proceeding consistent with existing General Plan and zoning requirements), would cause or contribute to a significant cumulative impact due to the conversion of Farmland, including Farmland in actual physical agricultural use, if they would occur in previously undeveloped areas. The Project's contribution to this impact would be cumulatively considerable. Mitigation Measure 3.3-1 (identified above) would be implemented to reduce this impact.

Mitigation Measure: Implement Mitigation Measure 3.3-1.

Significance After Mitigation: Implementing Mitigation Measure 3.3-1, Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar Development, would lessen the Project's contribution to the significant cumulative impact. However, implementation of this measure would not ensure that the conversion of mapped Farmland could be avoided and would have no impact on the conversion of mapped Farmland for residential or other uses of that land consistent with General Plan and zoning provisions. Accordingly, even with implementation of Mitigation Measure 3.3-1, the Project's incremental contribution to the cumulative impact would be cumulatively considerable, and therefore, significant and unavoidable. No additional feasible mitigation measures are available.

Criterion b)

Impact 3.3-8: Projects facilitated by the Draft 2045 CAP would result in a significant cumulative impact related to conflicts with existing zoning for agricultural use, or with a designated Agricultural Resource Area. (*Significant and Unavoidable*)

As described in the context of Impact 3.3-2, the only Williamson Act contract in Los Angeles County is on Santa Catalina Island and would not be affected by the implementation of projects facilitated by the Draft 2045 CAP.

Regarding designated Agricultural Resource Areas, the Draft 2045 CAP includes measures to preserve agricultural land, which has the potential to improve cumulative conditions with regard to agricultural zoning. Some projects implementing Draft 2045 CAP measures and actions—

potentially utility-scale, ground-mounted energy-related projects—would not conflict with existing zoning for agricultural use (which allow for renewable energy uses with a conditional use permit), but would conflict with a designated Agricultural Resource Area if approved on Farmland. The incremental impacts of the Project in this regard could combine with the incremental impacts of other closely related past, present, and reasonably foreseeable future projects (including projects that would proceed consistent with existing General Plan and zoning requirements) to cause or contribute to a significant cumulative impact. The Project’s contribution to this impact would be cumulatively considerable. Mitigation Measure 3.3-1 (identified above) would be implemented to reduce this impact.

Mitigation Measure: Implement Mitigation Measure 3.3-1.

Significance After Mitigation: Implementing Mitigation Measure 3.3-1, Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar Development, would lessen the Project’s contribution to the significant cumulative impact, but would not ensure that a conflict with a designated Agricultural Resource Area would be avoided. Accordingly, even with implementation of Mitigation Measure 3.3-1, the Project’s incremental contribution to the cumulative impact would be cumulatively considerable, and therefore, significant and unavoidable. No additional feasible mitigation measures are available.

Criterion c)

Impact 3.3-9: Projects facilitated by the Draft 2045 CAP would not conflict with the existing zoning for, or cause rezoning of, forest land, timberland, or timberland zoned Timberland Production. (No Cumulative Impact)

The Project could result in a cumulative impact on the zoning of forest land if a project implementing Draft 2045 CAP measures and actions were to conflict with the zoning of forest land and occur within the same time frame or geography as similar past, present, and reasonably foreseeable future cumulative projects located on forest land. The County does not have existing zoning specific to forest use or timberland; it also does not have land use authority over development in national forests such as Angeles National Forest and Los Padres National Forest, where most of the County’s forest land exists. As described above under Impact 3.3-3, the construction of new private residences in national forest lands is prohibited by the Forest Reserve Act of 1891, and U.S. Forest Service land usually is not made available if the overall needs of an individual project proponent or business can be met on nonfederal lands (U.S. Forest Service 2013).

The County has no existing zoning specific to forest land and private projects are generally prohibited on national forest land. For this reason, the cumulative impact related to conflicts with zoning for forest land would not be significant, and the Project’s incremental contribution to the cumulative impact would not be cumulatively considerable when taking into consideration similar past, present, and reasonably foreseeable future cumulative projects.

Mitigation: None required.

Criterion d)

Impact 3.3-10: Projects facilitated by the Draft 2045 CAP would not result in the loss of forest land or conversion of forest land to non-forest use. (*Less-than-Significant Impact*)

As described in the context of Impact 3.3-4, all of the land within the County that is considered forest land is located in Angeles National Forest and Los Padres National Forest. All of this land is outside the County's land use jurisdiction except for approximately 40,000 acres of private inholdings. As described above, the construction of new private residences in National Forest lands is prohibited by the Forest Reserve Act of 1891, and U.S. Forest Service land usually is not made available if the overall needs of an individual project proponent or business can be met on nonfederal lands. Additionally, the Draft 2045 CAP includes measures intended to protect and conserve forest land, and forest lands generally would not be suitable for the implementation of Draft 2045 CAP measures and actions.

Although the potential exists for some development of the private inholdings as facilitated by the Draft 2045 CAP, the incremental impacts of the Project, together with the incremental impacts of other closely related past, present, and reasonably foreseeable future projects, would not cause or contribute to a significant cumulative impact, and the Project's contribution to this impact would not be cumulatively considerable.

Mitigation: None required.

Criterion e)

Impact 3.3-11: Projects facilitated by the Draft 2045 CAP would involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland. (*Significant and Unavoidable*)

As discussed in the context of Impact 3.3-5, some projects facilitated by the Draft 2045 CAP could cause other changes in the existing environment that, due to their location or nature, could result in conversion of Farmland to nonagricultural use if, for example, they would divide productive agricultural lands into less productive units for reasons of access, irrigation, or scale of production. This incremental impact, together with the incremental impacts of other closely related past, present, and reasonably foreseeable future projects (including projects developed consistent with existing General Plan and zoning code provisions), would cause or contribute to a significant cumulative impact. The Project's contribution to this impact would be cumulatively considerable. Mitigation Measure 3.3-1 (identified above) would be implemented to reduce this impact.

Mitigation Measure: Implement Mitigation Measure 3.3-1.

Significance After Mitigation: Implementing Mitigation Measure 3.3-1, Avoidance of Actively Farmed Lands When Siting Utility-Scale Solar Development, would lessen the Project's cumulative contribution to conversion-related impacts, but would not ensure that other changes resulting in conversion would not occur. Accordingly, even with the implementation of Mitigation Measure 3.3-1, the Project's incremental contribution to cumulative impacts would be cumulatively considerable and Impact 3.3-5 would be significant and unavoidable. No additional feasible mitigation measures are available.

Impact 3.3-12: Projects facilitated by the Draft 2045 CAP would not involve other changes in the existing environment which, due to their location or nature, could result in a significant cumulative impact due to conversion of forest land to non-forest use. (*Less-than-Significant Impact*)

As discussed above, projects facilitated by the Draft 2045 CAP would not likely be proposed on forest land because the characteristics of forest land make it unsuitable for the implementation of many of the types of projects that would be facilitated by Draft 2045 CAP measures and actions. Even if projects facilitated by the Draft 2045 CAP were approved on forest lands, the relatively minor acreage (approximately 40,000 acres) within the County’s land use jurisdiction would be protected by the facilitated projects’ consistency with the General Plan and compliance with applicable provisions of the zoning code summarized in Section 3.3.1.3, *Regulatory Setting*. Although the potential exists for some development facilitated by the Draft 2045 CAP to convert forest land to non-forest use, the incremental impacts of the Project, together with the incremental impacts of other closely related past, present, and reasonably foreseeable future projects, would not cause or contribute to a significant cumulative impact, and the Project’s contribution to this impact would not be cumulatively considerable.

Mitigation: None required.

3.4 Air Quality

This section identifies and evaluates issues related to air quality to determine whether the Project would result in a significant impact related to the applicable air quality plan, criteria pollutants, the exposure of sensitive receptors to air pollutants, or other emissions. This section describes the physical environmental and regulatory setting, the criteria and thresholds used to evaluate the significance of impacts, the methods used in evaluating these impacts, and the results of the impact assessment.

During the scoping period for the EIR, written and oral comments were received from agencies, organizations, and the public. These comments identified various concerns and questions related to the EIR. **Appendix A.5, *Scoping Input Received***, includes all comments received during the scoping comment period. Comments relevant to air quality request consideration of dust-related impacts due to future renewable energy projects facilitated by the Draft 2045 CAP, including related health impacts like Valley Fever and asthma, and recommend a prohibition on gas-powered lawn and yard maintenance equipment (including mowers and blowers).

3.4.1 Setting

3.4.1.1 Study Area

The study area for this analysis of air quality impacts consists of the area where the Draft 2045 CAP would be implemented, i.e., the approximately 1,696,000-acre (approximately 2,650-square-mile) area that comprises the unincorporated area of Los Angeles County. The unincorporated areas are located in the South Coast Air Basin (SCAB) and the Mojave Desert Air Basin (MDAB). See Figure 2-1, *Map of Unincorporated Los Angeles County*, in Chapter 2.

3.4.1.2 Environmental Setting

Regional Air Quality

Los Angeles County spans two air basins: the SCAB in the metropolitan portion of the County and the MDAB in the northeast desert portion of the County.

The SCAB is an approximately 6,745-square-mile area bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto mountains to the north and east. The SCAB consists of Orange County, Los Angeles County (excluding the Antelope Valley portion), and the western, non-desert portions of San Bernardino and Riverside counties, in addition to the San Geronio Pass area in Riverside County. The terrain and geographical location determine the distinctive climate of the SCAB, as it is a coastal plain with broad valleys and low hills. The SCAB lies in the semi-permanent high-pressure zone of the eastern Pacific Ocean. The usually mild climatological pattern is interrupted by periods of hot weather, winter storms, or Santa Ana winds.

The extent and severity of pollutant concentrations in the SCAB is a function of the area's natural physical characteristics (weather and topography) and man-made influences (development patterns and lifestyle). Factors such as wind, sunlight, temperature, humidity, rainfall, and topography all affect the accumulation and dispersion of pollutants throughout the SCAB, making

it an area of high pollution potential. The SCAB's meteorological conditions, in combination with regional topography, are conducive to the formation and retention of ozone, a secondary pollutant that forms through photochemical reactions in the atmosphere. Thus, the greatest air pollution impacts throughout the SCAB typically occur from June through September. This condition generally is attributed to the emissions occurring in the SCAB, light winds, and shallow vertical atmospheric mixing. These factors reduce the potential for pollutant dispersion, causing elevated air pollutant levels. Pollutant concentrations in the SCAB vary with location, season, and time of day. Concentrations of ozone, for example, tend to be lower along the coast, higher in the near inland valleys, and lower in the far inland areas of the SCAB and adjacent desert.

The MDAB includes the eastern half of Kern County, the northern part of Los Angeles County, most of San Bernardino County (except the southwest corner), and the eastern edge of Riverside County. It is separated from the SCAB, to its south, by the San Gabriel and San Bernardino Mountains. It is separated from the San Joaquin Valley, to the northwest, by the Tehachapi Mountains and the south end of the Sierra Nevada.

The MDAB is characterized by hot summers, cold winters, large diurnal ranges in temperature, low relative humidity, and irregular rainfall. The MDAB is an assemblage of mountain ranges interspersed with long broad valleys that often contain dry lakes. Many of the lower mountains rise from 1,000 to 4,000 feet above the valley floor. Prevailing winds in the MDAB blow from out of the west and southwest, because of the proximity of the MDAB to the Pacific Ocean and the blocking nature of the Sierra Nevada to the north. Air masses, pushed onshore in Southern California by differential heating, are channeled through the MDAB. The MDAB is separated from the Southern California coastal and Central California valley regions by mountains (highest elevation approximately 10,000 feet above mean sea level), the passes of which form the main channels for these air masses.

During the summer, the MDAB is generally influenced by a Pacific subtropical high-pressure cell that sits off the coast to the west, inhibiting cloud formation and encouraging daytime solar heating. The MDAB is rarely influenced by cold air masses moving south from Canada and Alaska, as these frontal systems are weak and diffuse by when they reach the desert. Most desert moisture arrives from infrequent warm, moist and unstable air masses from the south.

Criteria Pollutants

Certain air pollutants have been recognized to cause notable health problems and consequential damage to the environment either directly or in reaction with other pollutants, as a result of their presence in elevated concentrations in the atmosphere. Such pollutants have been identified and regulated as part of the overall endeavor to prevent further deterioration and facilitate improvement in air quality. The following pollutants are regulated by the U.S. Environmental Protection Agency (USEPA) and are subject to emissions control requirements adopted by federal, state, and local regulatory agencies. These regulated air pollutants, known as *criteria air pollutants*, are ozone, nitrogen dioxide (NO₂), carbon monoxide (CO), sulfur dioxide (SO₂), inhalable particulate matter with an aerodynamic diameter less than or equal to 10 microns in size (PM₁₀), fine inhalable particulate matter with an aerodynamic diameter less than or equal to 2.5 microns in size (PM_{2.5}), and lead. These pollutants are referred to as criteria air pollutants as a

result of the specific standards, or *criteria*, that have been adopted for them. Brief descriptions of the health effects of these criteria air pollutants are provided below.

Ozone

Ozone is a secondary pollutant formed by the chemical reaction of volatile organic compounds (VOCs) and nitrogen oxides (NO_x) in the presence of sunlight under favorable meteorological conditions, such as high temperature and stagnation episodes. Ozone concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable.

According to the USEPA, ozone can cause the muscles in the airways to constrict potentially leading to wheezing and shortness of breath (USEPA 2018a). Ozone can make it more difficult to breathe deeply and vigorously; cause shortness of breath and pain when taking a deep breath; cause coughing and sore or scratchy throat; inflame and damage the airways; aggravate lung diseases such as asthma, emphysema and chronic bronchitis; increase the frequency of asthma attacks; make the lungs more susceptible to infection; continue to damage the lungs even when the symptoms have disappeared; and cause chronic obstructive pulmonary disease (USEPA 2018a).

Long-term exposure to ozone is linked to aggravation of asthma and is likely to be one of many causes of asthma development and long-term exposures to higher concentrations of ozone may also be linked to permanent lung damage, such as abnormal lung development in children (USEPA 2018a). According to the California Air Resources Board (CARB), inhalation of ozone causes inflammation and irritation of the tissues lining human airways, causing and worsening a variety of symptoms and exposure to ozone can reduce the volume of air that the lungs breathe in and cause shortness of breath (CARB 2021h).

The USEPA states that people most at risk from breathing air containing ozone include people with asthma, children, older adults, and people who are active outdoors, especially outdoor workers. Children are at greatest risk from exposure to ozone because their lungs are still developing and they are more likely to be active outdoors when ozone levels are high, which increases their exposure (USEPA 2018a). According to CARB, studies show that children are no more or less likely to suffer harmful effects than adults; however, children and teens may be more susceptible to ozone and other pollutants because they spend nearly twice as much time outdoors and engaged in vigorous activities compared to adults. Children breathe more rapidly than adults and inhale more pollution per pound of their body weight than adults and are less likely than adults to notice their own symptoms and avoid harmful exposures. Further research may be able to better distinguish between health effects in children and adults (CARB 2021h).

Volatile Organic Compounds

VOCs are organic chemical compounds of carbon and are not “criteria” pollutants themselves; however, they contribute with NO_x to form ozone, and are regulated to prevent the formation of ozone (USEPA 2017a). According to CARB, some VOCs are highly reactive and play a critical role in the formation of ozone, other VOCs have adverse health effects, and in some cases, VOCs can be both highly reactive and have adverse health effects. VOCs are typically formed from combustion of fuels and/or released through evaporation of organic liquids, internal combustion

associated with motor vehicle usage, and consumer products (e.g., architectural coatings) (CARB 2021i).

Nitrogen Dioxide and Nitrogen Oxides

NO_x is a term that refers to a group of compounds containing nitrogen and oxygen. The primary compounds of air quality concern include *NO₂* and nitric oxide (NO). Ambient air quality standards have been promulgated for *NO₂*, which is a reddish-brown, reactive gas. The principal form of *NO_x* produced by combustion is NO, but NO reacts quickly in the atmosphere to form *NO₂*, creating the mixture of NO and *NO₂* referred to as *NO_x* (CARB 2021j). Major sources of *NO_x* include emissions from cars, trucks and buses, power plants, and off-road equipment (USEPA 2016a).

The terms *NO_x* and *NO₂* are sometimes used interchangeably. However, the term *NO_x* typically is used when discussing emissions, usually from combustion-related activities, and the term *NO₂* typically is used when discussing ambient air quality standards. Where *NO_x* emissions are discussed in the context of the thresholds of significance or impact analyses, the discussions are based on the conservative assumption that all *NO_x* emissions would oxidize in the atmosphere to form *NO₂*.

According to the USEPA, short-term exposures to *NO₂* can potentially aggravate respiratory diseases, particularly asthma, leading to respiratory symptoms (such as coughing, wheezing, or difficulty breathing), hospital admissions and visits to emergency rooms while longer exposures to elevated concentrations of *NO₂* may contribute to the development of asthma and potentially increase susceptibility to respiratory infections (USEPA 2016a). According to CARB, controlled human-exposure studies that show that *NO₂* exposure can intensify responses to allergens in allergic asthmatics. In addition, a number of epidemiological studies have demonstrated associations between *NO₂* exposure and premature death, cardiopulmonary effects, decreased lung function growth in children, respiratory symptoms, emergency room visits for asthma, and intensified allergic responses. Infants and children are particularly at risk from exposure to *NO₂* because they have disproportionately higher exposure to *NO₂* than adults due to their greater breathing rate for their body weight and their typically greater outdoor exposure duration while in adults, the greatest risk is to people who have chronic respiratory diseases, such as asthma and chronic obstructive pulmonary disease.

CARB states that much of the information on distribution in air, human exposure and dose, and health effects is specifically for *NO₂* and there is only limited information for NO and *NO_x*, as well as large uncertainty in relating health effects to NO or *NO_x* exposure (CARB 2021j).

Carbon Monoxide

CO is primarily emitted from combustion processes and motor vehicles due to the incomplete combustion of fuel, such as natural gas, gasoline, or wood, with the majority of outdoor CO emissions from mobile sources (CARB 2021k). According to the USEPA, breathing air with a high concentration of CO reduces the amount of oxygen that can be transported in the blood stream to critical organs like the heart and brain and at very high levels, which are possible indoors or in other enclosed environments, CO can cause dizziness, confusion, unconsciousness and death.

Very high levels of CO are not likely to occur outdoors; however, when CO levels are elevated outdoors, they can be of particular concern for people with some types of heart disease because these people already have a reduced ability for getting oxygenated blood to their hearts and are especially vulnerable to the effects of CO when exercising or under increased stress. In these situations, short-term exposure to elevated CO may result in reduced oxygen to the heart, accompanied by chest pain also known as angina (USEPA 2016b).

According to CARB, the most common effects of CO exposure are fatigue, headaches, confusion, and dizziness due to inadequate oxygen delivery to the brain. For people with cardiovascular disease, short-term CO exposure can further reduce their body's already compromised ability to respond to the increased oxygen demands of exercise, exertion, or stress; inadequate oxygen delivery to the heart muscle leads to chest pain and decreased exercise tolerance. Unborn babies, infants, elderly people, and people with anemia or with a history of heart or respiratory disease are most likely to experience health effects with exposure to elevated levels of CO (CARB 2021k).

Sulfur Dioxide

According to the USEPA, the largest source of SO₂ emissions in the atmosphere is the burning of fossil fuels by power plants and other industrial facilities, while smaller sources of SO₂ emissions include industrial processes such as extracting metal from ore; natural sources such as volcanoes; and locomotives, ships and other vehicles and heavy equipment that burn fuel with a high sulfur content (USEPA 2018b). In 2006, California phased-in the ultra-low-sulfur diesel regulation limiting vehicle diesel fuel to a sulfur content not exceeding 15 parts per million, down from the previous requirement of 500 parts per million, substantially reducing emissions of sulfur from diesel combustion (CARB 2004).

According to the USEPA, short-term exposures to SO₂ can harm the human respiratory system and make breathing difficult (USEPA 2018b). According to CARB, health effects at levels near the state one-hour standard are those of asthma exacerbation, including bronchoconstriction accompanied by symptoms of respiratory irritation such as wheezing, shortness of breath and chest tightness, especially during exercise or physical activity and exposure at elevated levels of SO₂ (above 1 part per million [ppm]) results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality (CARB 2021d). Children, the elderly, and those with asthma, cardiovascular disease, or chronic lung disease (such as bronchitis or emphysema) are most likely to experience the adverse effects of SO₂ (CARB 2021d; USEPA 2018b).

Particulate Matter (PM₁₀ and PM_{2.5})

Particulate matter air pollution is a mixture of solid particles and liquid droplets found in the air. Some particles, such as dust, dirt, soot, or smoke, are large or dark enough to be seen with the naked eye while other particles are so small that they can only be detected using an electron microscope. Particles are defined by their diameter for air quality regulatory purposes: inhalable particles with diameters that are generally 10 micrometers and smaller (PM₁₀); and fine inhalable particles with diameters that are generally 2.5 micrometers and smaller (PM_{2.5}) (USEPA 2018c). Thus, PM_{2.5} is a portion or a subset of PM₁₀.

Sources of PM₁₀ emissions include dust from construction sites and some operational activities (such as maintenance occurring on unpaved surfaces), landfills and agriculture, wildfires and brush/waste burning, industrial sources, and wind-blown dust from open lands. Sources of PM_{2.5} emissions include combustion of gasoline, oil, diesel fuel, or wood. PM₁₀ and PM_{2.5} may be either directly emitted from sources (primary particles) or formed in the atmosphere through chemical reactions of gases (secondary particles) such as SO₂, NO_x, and certain organic compounds.

According to CARB, both PM₁₀ and PM_{2.5} can be inhaled, with some depositing throughout the airways. PM₁₀ is more likely to deposit on the surfaces of the larger airways of the upper region of the lung, while PM_{2.5} is more likely to travel into and deposit on the surface of the deeper parts of the lung, which can induce tissue damage, and lung inflammation. Short-term (up to 24 hours duration) exposure to PM₁₀ has been associated primarily with worsening of respiratory diseases, including asthma and chronic obstructive pulmonary disease, leading to hospitalization and emergency department visits. The effects of long-term (months or years) exposure to PM₁₀ are less clear, although studies suggest a link between long-term PM₁₀ exposure and respiratory mortality. The International Agency for Research on Cancer published a review in 2015 that concluded that particulate matter in outdoor air pollution causes lung cancer (WHO and IARC 2015). Short-term exposure to PM_{2.5} has been associated with premature mortality, increased hospital admissions for heart or lung causes, acute and chronic bronchitis, asthma attacks, emergency room visits, respiratory symptoms, and restricted activity days and long-term exposure to PM_{2.5} has been linked to premature death, particularly in people who have chronic heart or lung diseases, and reduced lung function growth in children (WHO and IARC 2015).

According to CARB, populations most likely to experience adverse health effects with exposure to PM₁₀ and PM_{2.5} include older adults with chronic heart or lung disease, children, and asthmatics and children and infants are more susceptible to harm from inhaling pollutants such as PM₁₀ and PM_{2.5} compared to healthy adults because they inhale more air per pound of body weight than do adults, spend more time outdoors, and have developing immune systems (CARB 2021n).

Lead

Major sources of lead emissions include ore and metals processing, piston-engine aircraft operating on leaded aviation fuel, waste incinerators, utilities, and lead-acid battery manufacturers. In the past, leaded gasoline was a major source of lead emissions; however, the removal of lead from gasoline has resulted in a decrease of lead in the air by 98 percent between 1980 and 2014.

Lead can adversely affect the nervous system, kidney function, immune system, reproductive and developmental systems and the cardiovascular system, and affects the oxygen carrying capacity of blood (USEPA 2017b). The effects most commonly encountered in current populations are neurological effects in children, such as behavioral problems and reduced intelligence, anemia, and liver or kidney damage. Excessive lead exposure in adults can cause reproductive problems in men and women, high blood pressure, kidney disease, digestive problems, nerve disorders, memory and concentration problems, and muscle and joint pain (CARB 2021o).

Other Criteria Pollutants (California Only)

The California ambient air quality standards (CAAQS) regulate the same criteria pollutants as the national ambient air quality standards (NAAQS) as well as state-identified criteria pollutants, including sulfates, hydrogen sulfide, visibility-reducing particles, and vinyl chloride (CARB 2021a). With respect to the state-identified criteria pollutants (i.e., sulfates, hydrogen sulfide, visibility-reducing particles, and vinyl chloride), the Draft 2045 CAP would either not emit them (i.e., hydrogen sulfide and vinyl chloride), or they would be accounted for as part of the pollutants estimated in this analysis (i.e., sulfates and visibility reducing particles). For example, visibility reducing particles are associated with particulate matter emissions and sulfates are associated with sulfur oxides (SO_x) emissions. Both particulate matter and SO_x are included in the emissions estimates for the Project. A description of the health effects of the state-identified criteria air pollutants is provided below.

Sulfates

Sulfates in the environment occur as a result of sulfur dioxide (SO₂) being converted to sulfate compounds in the atmosphere where sulfur is first oxidized to SO₂ during the combustion process of sulfur containing, petroleum-derived fuels (e.g., gasoline and diesel fuel). Exposure to sulfates, which are part of PM_{2.5}, results in health effects similar to those from exposure to PM_{2.5} including reduced lung function, aggravated asthmatic symptoms, and increased risk of emergency department visits, hospitalizations, and death in people who have chronic heart or lung diseases. Population groups with higher risks of experiencing adverse health effects with exposure to sulfates include children, asthmatics, and older adults who have chronic heart or lung diseases (CARB 2021e).

Hydrogen Sulfide

Hydrogen sulfide is a colorless gas with a strong odor of rotten eggs. The most common sources of hydrogen sulfide emissions are oil and natural gas extraction and processing, and natural emissions from geothermal fields. Industrial sources of hydrogen sulfide include petrochemical plants and kraft paper mills. Hydrogen sulfide is also formed during bacterial decomposition of human and animal wastes, and is present in emissions from sewage treatment facilities and landfills.

Exposure to hydrogen sulfide can induce tearing of the eyes and symptoms related to overstimulation of the sense of smell, including headache, nausea, or vomiting; additional health effects of eye irritation have only been reported with exposures greater than 50 ppm, which is considerably higher than the odor threshold. Hydrogen sulfide is regulated as a nuisance based on its odor detection level; if the standard were based on adverse health effects, it would be set at a much higher level. According to CARB, there are insufficient data available to determine whether or not some groups are at greater risk than others (CARB 2021d).

Visibility-Reducing Particles

Visibility-reducing particles come from a variety of natural and manmade sources and can vary greatly in shape, size and chemical composition. Visibility reduction is caused by the absorption and scattering of light by the particles in the atmosphere before it reaches the observer. Certain visibility-reducing particles are directly emitted to the air such as windblown dust and soot, while

others are formed in the atmosphere through chemical transformations of gaseous pollutants (e.g., sulfates, nitrates, organic carbon particles) which are the major constituents of particulate matter. As the number of visibility-reducing particles increases, more light is absorbed and scattered, resulting in less clarity, color, and visual range. Exposure to some haze-causing pollutants have been linked to adverse health impacts similar to PM₁₀ and PM_{2.5} (CARB 2021g).

Vinyl Chloride

Vinyl chloride is a colorless gas with a mild, sweet odor. Most vinyl chloride is used to make polyvinyl chloride (PVC) plastic and vinyl products and are generally emitted from industrial processes and other major sources of vinyl chloride have been detected near landfills, sewage plants, and hazardous waste sites, due to microbial breakdown of chlorinated solvents. Short-term health effects of exposure to high levels of vinyl chloride in the air include central nervous system effects, such as dizziness, drowsiness, and headaches while long-term exposure to vinyl chloride through inhalation and oral exposure causes liver damage and has been shown to increase the risk of angiosarcoma, a rare form of liver cancer in humans. Most health data on vinyl chloride relate to carcinogenicity; thus, the people most at risk are those who have long-term exposure to elevated levels, which is more likely to occur in occupational or industrial settings; however, control methodologies applied to industrial facilities generally prevent emissions to the ambient air (CARB 2021f).

Toxic Air Contaminants

In addition to criteria pollutants, the South Coast Air Quality Management District (SCAQMD) periodically assesses levels of toxic air contaminants (TACs) in the SCAB. A TAC is defined by Health and Safety Code Section 39655:

“Toxic air contaminant” means an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health. A substance that is listed as a hazardous air pollutant pursuant to subsection (b) of Section 112 of the federal act (42 U.S.C. [United States Code] § 7412(b)) is a toxic air contaminant.

Diesel particulate matter, which is emitted in the exhaust from diesel engines, was listed by the State of California as a toxic air contaminant in 1998. Most major sources of diesel emissions, such as ships, trains, and trucks operate in and around ports, railyards, and heavily traveled roadways. These areas often are located near highly populated areas resulting in greater health consequences for urban areas than rural areas (CARB 2021c). Diesel particulate matter has historically been used as a surrogate measure of exposure for all diesel exhaust emissions. Diesel particulate matter consists of fine particles (fine particles have a diameter less than 2.5 micrometers), including a subgroup of ultrafine particles (ultrafine particles have a diameter less than 0.1 micrometer). Collectively, these particles have a large surface area which makes them an excellent medium for absorbing organics. The visible emissions in diesel exhaust include carbon particles or “soot.” Diesel exhaust also contains a variety of harmful gases and cancer-causing substances.

Exposure to diesel particulate matter may be a health hazard, particularly to children whose lungs are still developing and the elderly who may have other serious health problems. Diesel

particulate matter levels and resultant potential health effects may be higher in proximity to heavily traveled roadways with substantial truck traffic or near industrial facilities. According to CARB, diesel particulate matter exposure may lead to the following adverse health effects: aggravated asthma, chronic bronchitis, increased respiratory and cardiovascular hospitalizations, decreased lung function in children, lung cancer, and premature deaths for people with heart or lung disease (CARB 2008, 2021b).

In August 2021, the SCAQMD released the Final Multiple Air Toxics Exposure Study V (MATES V) (SCAQMD 2021a). The MATES V study includes a fixed-site monitoring program with ten stations, an updated emissions inventory of TACs, and a modeling effort to characterize risk across the SCAB. The purpose of the fixed-site monitoring is to characterize long-term regional air toxics levels in residential and commercial areas.

In addition to new measurements and updated modeling results, several key updates were implemented in MATES V. First, MATES V estimates cancer risks by taking into account multiple exposure pathways, which includes inhalation and non-inhalation pathways. This approach is consistent with how cancer risks are estimated in SCAQMD's programs such as permitting, Air Toxics Hot Spots (Assembly Bill [AB] 2588), and CEQA. Previous MATES studies quantified the cancer risks based on the inhalation pathway only. Second, along with cancer risk estimates, MATES V includes information on the chronic noncancer risks from inhalation and non-inhalation pathways for the first time.

Cancer risks and chronic noncancer risks from MATES II through IV measurements have been reexamined using current Office of Environmental Health Hazard Assessment and California Environmental Protection Agency risk assessment methodologies and modern statistical methods to examine the trends over time. This has led to a reduction of the SCAB average air toxics cancer risk from 997 in a million in MATES IV to 455 in a million in MATES V (SCAQMD 2021b).

The key takeaways from the MATES V study (SCAQMD 2021c):

- Air toxics cancer risk has decreased by about 50 percent since MATES IV based on modeling data.
- MATES V basin average multi-pathway air toxics cancer risk is 455 in a million, with the highest risk locations being in the Los Angeles International Airport, downtown, and ports areas.
- Diesel particulate matter is the main risk driver for air toxics cancer risk.
- Goods movement and transportation corridors have the highest air toxics cancer risks.
- The chronic non-cancer risk was estimated for the first time with a chronic hazard index of approximately 5 to 9 across all 10 fixed stations.

The MDAQMD does not publish health risk estimates for areas within its jurisdiction.

Airborne Fungus (Valley Fever)

Coccidioidomycosis, commonly referred to as *San Joaquin Valley Fever* or *Valley Fever*, is one of the most studied and oldest known fungal infections. Valley Fever most commonly affects people who live in hot dry areas with alkaline soil and varies with the season. This disease, which affects both humans and animals, is caused by inhalation of arthroconidia (spores) of the fungus *Coccidioides immitis*.

Coccidioides immitis spores are found in the top few inches of soil. The cocci fungus lives as a saprophyte in dry, alkaline soil. When weather and moisture conditions are favorable, the fungus "blooms" and forms many tiny spores that lie dormant in the soil until they are stirred up by wind, vehicles, excavation, or other ground-moving activities and become airborne.

Agricultural workers, construction workers, and other people who work outdoors and who are exposed to wind and dust are more likely to contract Valley Fever. Children and adults whose hobbies or sports activities expose them to wind and dust also are more likely to contract Valley Fever. After the fungal spores have settled in the lungs, they change into a multicellular structure called a spherule. Fungal growth in the lungs occurs as the spherule grows and bursts, releasing endospores, which then develop into more spherules.

Approximately 60 percent of Valley Fever cases are mild and display flu-like symptoms or no symptoms at all. Of those who are exposed and seek medical treatment, the most common symptoms include fatigue, cough, loss of appetite, rash, headache, and joint aches. In some cases, painful red bumps may develop on the skin. Because these symptoms are not unique to Valley Fever and also may be caused by other illnesses, identifying and confirming this disease requires specific laboratory tests, such as the following (Valley Fever Center for Excellence 2022):

- Microscopic identification of the fungal spherules in infected tissue, sputum or body fluid sample.
- Growing a culture of *Coccidioides immitis* from a tissue specimen, sputum, or body fluid.
- Detection of antibodies (serological tests specifically for Valley Fever) against the fungus in blood serum or other body fluids.
- Administering the Valley Fever Skin Test (called coccidioidin or spherulin), which indicate prior exposure to the fungus.

The highest incidence rate within California occurs in Kern County within the San Joaquin Valley Air Basin, with 2,790 annual cases reported for the period ending February 28, 2022. Within Los Angeles County, there were 1,484 annual reported cases for the period ending February 28, 2022 (CDPH 2022).¹

Valley Fever is not contagious, and therefore cannot be passed on from person to person. Most of those who are infected recover without treatment within six months and thereafter have a lifelong immunity to the fungal spores. In severe cases, especially in those patients with rapid and

¹ The data presented may change as a result of delays inherent to case reporting, laboratory reporting, and epidemiologic investigation.

extensive primary illness, those who are at risk for dissemination of disease, and those who have disseminated disease, antifungal drug therapy is used.

The type of medication used and the duration of drug therapy are determined by the severity of disease and response to the therapy. The medications used include ketoconazole, itraconazole, and fluconazole in chronic, mild-to-moderate disease, and amphotericin B, given intravenously or inserted into the spinal fluid, for rapidly progressive disease. Although these treatments are often helpful, evidence of disease may persist and years of treatment may be required (Valley Fever Center for Excellence 2022). Approximately 60 percent of people infected are asymptomatic and do not seek medical attention. In the remaining 40 percent, symptoms range from mild to severe. A small percentage, less than 1 percent, die as a result of the disease (VCAPCD 2003).

Local Air Quality

CARB maintains a website with technical information on all of monitoring stations operated throughout the state (CARB 2021m). Within the County, 21 monitoring stations measure ambient pollutant concentrations. Criteria pollutants monitored vary by station and may include ozone, NO₂, CO, SO₂, PM₁₀, PM_{2.5}, and hydrogen sulfide. The locations of these stations were chosen to meet monitoring objectives, which call for stations that monitor the highest pollutant concentrations, representative concentrations in areas of high population density, the impact of major pollution emissions sources, and general background concentration levels.

Table 3.4-1, Ambient Air Quality Monitoring Summary—South Coast Air Basin, summarizes the number of days the NAAQS or CAAQS were exceeded and the maximum pollutant levels during such exceedances. The data show that the County regularly exceeds the state one-hour and state and federal eight-hour ozone standards and the federal PM_{2.5} standard within the last five recorded years. The NO₂ standards have not been exceeded in the last five years in the SCAB.

Table 3.4-2, Ambient Air Quality Monitoring Summary—Mojave Desert Air Basin, summarizes the number of days the NAAQS or CAAQS were exceeded and the maximum pollutant levels during such exceedances. The data show that the County regularly exceeds the state one-hour and the state and federal eight-hour ozone standards and the federal PM_{2.5} standard within the last five recorded years. The NO₂ standards have not been exceeded in the last five years in Los Angeles County.

Sensitive Receptors

Sensitive receptors are land uses or people considered to be more sensitive than others to air pollutants. The reasons for greater than average sensitivity include preexisting health problems, proximity to emissions sources, or duration of exposure to air pollutants. Residences, schools, hospitals, convalescent homes, and parks are considered to be relatively sensitive to poor air quality because children, elderly people, and the infirm are more susceptible to respiratory distress and other air quality–related health problems than the general public. Residential areas are considered sensitive to poor air quality because people usually stay home for extended periods of time, with associated greater exposure to ambient air quality. Recreational uses are also considered sensitive due to greater exposure to ambient air quality conditions because vigorous exercise associated with recreation places a high demand on the human respiratory system.

**TABLE 3.4-1
 AMBIENT AIR QUALITY MONITORING SUMMARY—SOUTH COAST AIR BASIN**

Pollutant / Standard	Number of Days Thresholds Were Exceeded and Maximum Levels during Such Exceedances				
	2017	2018	2019	2020	2021
Ozone (O₃)					
State 1-Hour ≥ 0.09 ppm	81	63	73	104	74
State 8-Hour ≥ 0.07 ppm	116	113	111	145	118
Federal 8-Hour ≥ 0.07 ppm	117	113	109	141	114
Max 1-Hour Concentration (ppm)	0.158	0.142	0.137	0.185	0.148
Max 8-Hour Concentration (ppm)	0.136	0.125	0.118	0.140	0.120
Nitrogen Dioxide (NO₂)					
State 1-Hour ≥ 0.18 ppm	0	0	0	0	0
Max 1-Hour Concentration (ppb)	115	90	97	101	91
Fire Particulates (PM_{2.5})					
Federal 24-Hour ≥ 35 µg/m ³	18	17	12	28	22
Max 24-Hour Concentration (µg/m ³)	85.4	103.8	81.3	175.0	102.1

NOTES: µg/m³ = micrograms per cubic meter; PM_{2.5} = inhalable particles with diameters that are generally 2.5 micrometers and smaller; ppb = parts per billion; ppm = parts per million.

3.4.1.3 Regulatory Setting

A number of statutes, regulations, plans, and policies have been adopted that address air quality concerns. The Draft 2045 CAP, once approved, would be subject to air quality regulations developed and implemented at the federal, state, and local levels. At the federal level, the USEPA is responsible for implementation of the federal Clean Air Act (CAA). Some portions of the CAA (e.g., certain mobile-source requirements and other requirements) are implemented directly by the USEPA. Other portions of the CAA (e.g., stationary-source requirements) are implemented through delegation of authority to state and local agencies. A number of plans and policies have been adopted by various agencies that address air quality concerns. Those plans and policies that are relevant to the Project are discussed below.

Federal Laws, Regulations, and Policies

The federal CAA (United States Code Title 42, Section 7401), as amended, is the comprehensive federal law that regulates air emissions to protect public health and welfare (USEPA 2021a). The USEPA is responsible for the implementation and enforcement of the CAA, which establishes federal NAAQS, specifies future dates for achieving compliance, and requires USEPA to designate areas as attainment, nonattainment, or maintenance. The CAA also mandates that each state submit and implement a State Implementation Plan (SIP) for each criteria pollutant for which the state has not achieved the applicable NAAQS. The SIP includes pollution control measures that demonstrate how the standards for those pollutants will be met. The sections of the CAA most applicable to the Draft 2045 CAP include Title I (Nonattainment Provisions) and Title II (Mobile Source Provisions) (USEPA 2017c).²

Title I requirements are implemented for the purpose of attaining NAAQS for criteria air pollutants. **Table 3.4-3, *Ambient Air Quality Standards***, shows the NAAQS currently in effect for each criteria pollutant. The NAAQS and their California equivalent (CAAQS) for state criteria air pollutants (discussed below) have been set at levels considered safe to protect public health, including the health of sensitive populations such as asthmatics, children, and the elderly with a margin of safety; and to protect public welfare, including against decreased visibility and damage to animals, crops, vegetation, and buildings (USEPA 2021b). In addition to criteria pollutants, Title I includes air toxics provisions that require USEPA to develop and enforce regulations to protect the public from exposure to airborne contaminants that are known to be hazardous to human health. In accordance with Section 112, USEPA establishes National Emission Standards for Hazardous Air Pollutants. The list of hazardous air pollutants, or air toxics, includes specific compounds that are known or suspected to cause cancer or other serious health effects.

² *Mobile sources* include on-road vehicles (e.g., cars, buses, motorcycles) and non-road vehicles (e.g., aircraft, trains, construction equipment). *Stationary sources* consist of both point and area sources. *Point sources* are stationary facilities that emit large amount of pollutants (e.g., municipal waste incinerators, power plants). *Area sources* are smaller stationary sources that alone are not large emitters, but combined can account for large amounts of pollutants (e.g., consumer products, residential heating, dry cleaners).

**TABLE 3.4-3
 AMBIENT AIR QUALITY STANDARDS**

Pollutant	Average Time	California Standards ^a		National Standards ^b		
		Concentration ^c	Method ^d	Primary ^{c,e}	Secondary ^{c,f}	Method ^g
Ozone (O ₃) ^h	1 Hour	0.09 ppm (180 µg/m ³)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m ³)		0.070 ppm (137 µg/m ³)		
Nitrogen Dioxide (NO ₂) ⁱ	1 Hour	0.18 ppm (339 µg/m ³)	Gas Phase Chemi- luminescence	100 ppb (188 µg/m ³)	None	Gas Phase Chemi- luminescence
	Annual Arithmetic Mean	0.030 ppm (57 µg/m ³)		53 ppb (100 µg/m ³)	Same as Primary Standard	
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m ³)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m ³)	None	Non-Dispersive Infrared Photometry (NDIR)
	8 Hour	9.0 ppm (10 mg/m ³)		9 ppm (10 mg/m ³)		
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m ³)		—		
Sulfur Dioxide (SO ₂) ^j	1 Hour	0.25 ppm (655 µg/m ³)	Ultraviolet Fluorescence	75 ppb (196 µg/m ³)	—	Ultraviolet Fluorescence; Spectrophotome- try (Pararosaniline Method) ⁹
	3 Hour	—		—	0.5 ppm (1300 µg/m ³)	
	24 Hour	0.04 ppm (105 µg/m ³)		0.14 ppm (for certain areas) ^j	—	
	Annual Arithmetic Mean	—		0.030 ppm (for certain areas) ^j	—

	Calendar Quarter	—		1.5 µg/m ³ (for certain areas) ^m	Same as Primary Standard	
	Rolling 3-Month Average ^m	--		0.15 µg/m ³		

TABLE 3.4-3 (CONTINUED)
AMBIENT AIR QUALITY STANDARDS

Pollutant	Average Time	California Standards ^a		National Standards ^b		
		Concentration ^c	Method ^d	Primary ^{c,e}	Secondary ^{c,f}	Method ^g
Visibility-Reducing Particles ⁿ	8 Hour	Extinction coefficient of 0.23 per kilometer — visibility of 10 miles or more (0.07 — 30 miles or more for Lake Tahoe) due to particles when relative humidity is less than 70 percent. Method: Beta Attenuation and Transmittance through Filter Tape.		No Federal Standards		
Sulfates (SO ₄)	24 Hour	25 µg/m ³	Ion Chromatography			
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m ³)	Ultraviolet Fluorescence			
Vinyl Chloride ^l	24 Hour	0.01 ppm (26 µg/m ³)	Gas Chromatography			

NOTES:

µg/m³ = micrograms per cubic meter; mg/m³ = milligrams per cubic meter; PM_{2.5} = inhalable particles with diameters that are generally 2.5 micrometers and smaller; PM₁₀ = inhalable particles with diameters that are generally 10 micrometers and smaller; ppm = parts per million

- California's standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM₁₀, PM_{2.5}, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equalled or exceeded. California ambient air quality standards are listed in the Table of Standards in California Code of Regulations Title 17, Section 70200.
- National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM₁₀, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m³ is equal to or less than one. For PM_{2.5}, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard.
- Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25 degrees Celsius (°C) and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
- Any equivalent procedure which can be shown to the satisfaction of the California Air Resources Board (CARB) to give equivalent results at or near the level of the air quality standard may be used.
- National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
- National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
- Reference method as described by the U.S. Environmental Protection Agency (USEPA). An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the USEPA.
- On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
- To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.
- On June 2, 2010, a new 1-hour SO₂ standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO₂ national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.
- On December 14, 2012, the national annual PM_{2.5} primary standard was lowered from 15 µg/m³ to 12.0 µg/m³.
- CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
- The national standard for lead was revised on October 15, 2008 to a rolling three-month average. The 1978 lead standard (1.5 µg/m³ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
- In 1989, CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

SOURCE: CARB 2016

Title II requirements pertain to mobile sources, such as cars, trucks, buses, and planes. Reformulated gasoline, automobile pollution control devices, and vapor recovery nozzles on gas pumps are a few of the mechanisms the USEPA uses to regulate mobile air emission sources. The provisions of Title II have resulted in tailpipe emissions standards for vehicles, which have been strengthened in recent years to improve air quality. For example, the standards for nitrogen oxides (NO_x) emissions have been made more stringent to reduce the amount of emissions allowed. See Section 3.9, *Greenhouse Gas Emissions*, which discusses the most recently proposed federal motor vehicle tailpipe emissions standards. Notable federal actions include:

- *Revocation of the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule:* On March 14, 2022, the USEPA published its Notice of Decision to restore California’s waiver, which allows California to set more stringent vehicle fuel efficiency standards, rescinding the SAFE Vehicles Rule (*Federal Register* Volume 87, page 14332).
- *Issuance of the Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards:* The issuance of these standards revises the GHG standards for vehicles from model year 2023 through model year 2026 and establishes the most stringent GHG standards ever set for the light-duty vehicle sector, which are expected to result in average fuel economy label values of 40 miles per gallon, while the standards they replace (the SAFE rule standards) would achieve only 32 miles per gallon in model year 2026 vehicles (USEPA 2021c).

State Laws, Regulations, and Policies

California Clean Air Act

The California Clean Air Act, signed into law in 1988, requires all areas of the state to achieve and maintain the CAAQS by the earliest practical date. The CAAQS are established to protect the health of the most sensitive groups and apply to the same criteria pollutants as the federal Clean Air Act and also includes state-identified criteria pollutants, which are sulfates, visibility-reducing particles, hydrogen sulfide, and vinyl chloride (CARB 2021a). CARB has primary responsibility for ensuring the implementation of the California Clean Air Act, responding to the federal CAA planning requirements applicable to the state, and regulating emissions from motor vehicles and consumer products within the state.

California Air Resources Board

CARB, a part of the California Environmental Protection Agency, is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, CARB conducts research, sets the CAAQS (see Table 3.4-1), compiles emission inventories, develops suggested control measures, and provides oversight of local programs. CARB establishes emissions standards for motor vehicles sold in California, consumer products (such as hairspray, aerosol paints, and barbecue lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions. CARB has primary responsibility for the development of California’s SIP, for which it works closely with the federal government and the local air districts. The SIP is required for the state to take over implementation of the federal CAA from USEPA.

On-Road Equipment, Trucks, and Buses

In 2004, CARB adopted an Airborne Toxic Control Measure (ATCM) limiting heavy-duty diesel motor vehicle idling to reduce public exposure to diesel PM and other TACs (California Code of Regulations Title 13, Section 2485 [13 CCR Section 2485]). The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure does not allow diesel-fueled commercial vehicles to idle for more than five minutes at any given time.

In 2008, CARB approved the Truck and Bus regulation to reduce NO_x, PM₁₀, and PM_{2.5} emissions from existing diesel vehicles operating in California (13 CCR Section 2025). The requirements were amended to apply to nearly all diesel-fueled trucks and buses with a gross vehicle weight rating greater than 14,000 pounds. For the largest trucks in the fleet, those with a gross vehicle weight rating greater than 26,000 pounds, all must be equipped with diesel particulate filters from 2014 and onward and must have 2010 model year engines by January 1, 2023. For trucks and buses with a gross vehicle weight rating of 14,001–26,000 pounds, those with engine model years 14–20 years or older must be replaced with 2010 model year engines in accordance with the schedule specified in the regulation.

Off-Road Equipment

In addition to limiting exhaust from idling trucks, CARB promulgated emissions standards for off-road diesel construction equipment of greater than 25 horsepower such as bulldozers, loaders, backhoes and forklifts, as well as many other self-propelled off-road diesel vehicles. The regulation, adopted by the CARB on July 26, 2007, aims to reduce emissions by the installation of diesel soot filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emissions-controlled models (13 CCR Section 2449).

Each fleet must demonstrate compliance through one of two methods. The first option is to calculate and maintain fleet average emissions targets, which encourages the retirement or repowering of older equipment and rewards the introduction of newer cleaner units into the fleet. The second option is to meet the Best Available Control Technology (BACT) requirements by turning over or installing Verified Diesel Emission Control Strategies on a certain percentage of its total fleet horsepower. The compliance schedule requires that BACT turn overs or retrofits (Verified Diesel Emission Control Strategies installation) be fully implemented by 2023 in all equipment for large and medium fleets and by 2028 for small fleets.

Light- and Medium-Duty Vehicles

In 2012, CARB approved the Advanced Clean Cars Program, which includes low-emission vehicle and zero-emission vehicle regulations that reduce criteria pollutants and greenhouse gas (GHG) emissions from light- and medium-duty vehicles (CARB 2022b). On November 30, 2022, CARB approved the Advanced Clean Cars II rule, which requires that all new passenger cars, trucks, and sport utility vehicles (SUVs) sold in California be zero emissions by 2035 (CARB 2023b). See Section 3.5, *Greenhouse Gas Emissions*, which discusses the state light- and medium-duty vehicle emissions standards.

Diesel Commercial Vehicle Idling and Engine Regulations

As stated in 13 CCR Section 2485, idling by all diesel-fueled commercial vehicles (weighing over 10,000 pounds) during construction is limited to five minutes at any location. In addition, 17 CCR Section 93115 of the regulations states that operations of any stationary, diesel-fueled, compression-ignition engines shall meet specified fuel and fuel additive requirements and emissions standards.

Nuisance Regulations

Health and Safety Code Section 41700 states, “a person shall not discharge from any source whatsoever quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or that endanger the comfort, repose, health, or safety of any of those persons or the public, or that cause, or have a natural tendency to cause, injury or damage to business or property.” This section also applies to objectionable odors.

Toxic Air Contaminants

The California Air Toxics Program was established to address potential health effects from exposure to toxic substances in the air. In the risk identification step, CARB and the Office of Environmental Health Hazard Assessment determine whether a substance should be formally identified, or “listed,” as a TAC in California. The SCAQMD has not adopted guidance applicable to land use projects that requires quantitative health risk assessments to be performed for construction exposures to TAC emissions.

In the risk management step, CARB reviews emission sources of an identified TAC to determine whether regulatory action is needed to reduce risk. Based on the results of that review, CARB has promulgated a number of ATCMs, both for mobile and stationary sources. As discussed above, in 2004, CARB adopted an ATCM to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel particulate matter (DPM) and other TACs. The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure does not allow diesel-fueled commercial vehicles to idle for more than five minutes at any given time.

In addition to limiting exhaust from idling trucks, as discussed above, CARB promulgated emission standards for off-road diesel construction equipment such as bulldozers, loaders, backhoes, and forklifts, as well as many other self-propelled off-road diesel vehicles. The regulation, adopted by CARB on July 26, 2007, aims to reduce emissions by the installation of diesel particulate filters and encouraging the replacement of older, dirtier engines with newer emission-controlled models.

The AB 1807 program is supplemented by the AB 2588 Air Toxics “Hot Spots” program, which requires facilities to report their air toxics emissions, assess health risks, and notify nearby residents and workers of significant risks if present. Facilities that pose a significant health risk to the community must reduce their risk through implementation of a risk management plan.

Regional and Local Laws, Regulations, and Policies

While CARB is responsible for the regulation of mobile emissions sources within the state, local air quality management districts and air pollution control districts are responsible for enforcing standards and regulating stationary sources. SCAQMD is the regional agency responsible for the regulation and enforcement of federal, state, and local air pollution control regulations in the SCAB, and the Antelope Valley Air Quality Management District (AVAQMD) is the regional agency responsible for the regulation and enforcement of federal, state, and local air pollution control regulations in the Los Angeles portion of the MDAB. The metropolitan portions of the County are within the SCAB under the jurisdiction of the SCAQMD, and the desert portions of the County lie within the MDAB under the jurisdiction of the AVAQMD. The SCAQMD and the AVAQMD are discussed below.

South Coast Air Quality Management District

The SCAQMD is primarily responsible for planning, implementing, and enforcing air quality standards for the SCAB, which includes all of Orange County, Los Angeles County (excluding the Antelope Valley portion), the western, non-desert portion of San Bernardino County, and the western Coachella Valley and San Gorgonio Pass portions of Riverside County. The SCAB is an approximately 6,745-square-mile area bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The SCAB is a subregion within the western portion of the SCAQMD jurisdiction. While air quality in the SCAB has improved, the SCAB requires continued diligence to meet the air quality standards.

Air Quality Management Plan

The SCAQMD has adopted air quality management plans (AQMPs) to meet the CAAQS and NAAQS. Most recently, SCAQMD has adopted the 2022 AQMP to address the attainment of the 2015 8-hour ozone standard (70 parts per billion [ppb]) for the SCAB and Coachella Valley. On January 26, 2023, CARB adopted Resolution 23-4, which directs the CARB Executive Officer to submit the 2022 AQMP, as adopted by SCAQMD and the relevant portions of the CARB Staff Report, to USEPA for inclusion in the California SIP. The 2022 AQMP would become effective, for purposes of federal law, after notice and public hearing as required by Section 110(l) of the Clean Air Act and Code of Federal Regulations Title 40, Section 51.102 and approval by USEPA, and upon appropriate action, if required, to resolve any completeness or approvability issues that may arise regarding the SIP submission, including to meet applicable requirements for contingency measures. Because USEPA approval has not yet been obtained, the 2016 AQMP remains the appropriate version to consider when discussing a project's consistency with the AQMP. The SCAB is classified as an "extreme" nonattainment area and the Coachella Valley is classified as a "severe-15" nonattainment area for the 2015 Ozone NAAQS (SCAQMD 2016a). In 2021, SCAQMD and CARB established Mobile Source Working Groups to support the development of mobile-source strategies. SCAQMD also established Residential and Commercial Buildings Working Groups to support the development of control measures.

The SCAQMD Governing Board adopted the 2016 AQMP on March 3, 2017 (SCAQMD 2017). CARB approved the 2016 AQMP on March 23, 2017 (CARB 2017). Key elements of the 2016 AQMP include implementing fair-share emissions reductions strategies at the federal, state, and local levels; establishing partnerships, funding, and incentives to accelerate deployment of zero

and near-zero-emissions technologies; and taking credit from co-benefits from GHG emissions, energy, transportation, and other planning efforts (SCAQMD 2017). The strategies included in the 2016 AQMP build on the strategies from the previous 2012 AQMP and are intended to demonstrate attainment of the NAAQS, which are set at levels considered safe to protect public health, including the health of sensitive populations such as asthmatics, children, and the elderly with a margin of safety; and to protect public welfare, including against decreased visibility and damage to animals, crops, vegetation, and buildings, for the federal nonattainment pollutants ozone and PM_{2.5} while accounting for regional growth, increasing development, and maintaining a healthy economy. In general, SCAQMD's criteria for evaluating control strategies for stationary and mobile sources is based on the following: (1) cost effectiveness; (2) emissions reduction potential; (3) enforceability; (4) legal authority; (5) public acceptability; (6) rate of emission reduction; and (7) technological feasibility. The 2016 AQMP includes both stationary- and mobile-source emission reductions from traditional regulatory control measures, incentive-based programs, co-benefits from climate programs, mobile-source strategies, and reductions from federal sources (SCAQMD 2017).

As detailed in the AQMP, the major sources of air pollution in SCAB are divided into four major source classifications: point, and area stationary sources, and on-road and off-road mobile sources. Point and area sources are the two major subcategories of stationary sources (SCAQMD 2017). Point sources are permitted facilities that contain one or more emission sources at an identified location (e.g., power plants, refineries, emergency generator exhaust stacks). Area sources consist of many small emission sources (e.g., residential water heaters, architectural coatings, consumer products, restaurant charbroilers and permitted sources such as large boilers) which are distributed across the region. Mobile sources consist of two main subcategories: On-road sources (such as cars and trucks) and off-road sources (such as heavy construction equipment).

South Coast Air Quality Management District Air Quality Guidance Documents

SCAQMD's *CEQA Air Quality Handbook* (SCAQMD 1993) provides local governments with guidance for analyzing and mitigating project-specific air quality impacts, including standards, methodologies, and procedures for conducting air quality analyses in EIRs. The Handbook was used extensively in the preparation of this analysis. SCAQMD is currently in the process of replacing the *CEQA Air Quality Handbook* with the *Air Quality Analysis Guidance Handbook*. While this process is underway, the SCAQMD recommends that lead agencies avoid using the screening tables in Chapter 6 (Determining the Air Quality Significance of a Project) and the on-road mobile-source emission factors in Table A9-5-J1 through A9-5 of the *CEQA Air Quality Handbook* because they are outdated (SCAQMD 2022).

The SCAQMD instead recommends using other approved models to calculate emissions from land use projects (SCAQMD 2022). Examples of such other models include the CalEEMod software, which is a model developed for California Air Pollution Control Officers Association in collaboration with the California air districts (CAPCOA 2021). CalEEMod is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify criteria pollutant and GHG emissions from a variety of land use projects.

The SCAQMD has also adopted land use planning guidelines in its *Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning*, which considers impacts to sensitive receptors from facilities that emit TAC emissions (SCAQMD 2005). SCAQMD's general land use siting distance recommendations are the same as those provided by CARB (e.g., a 500-foot siting distance for sensitive land uses proposed in proximity to freeways and high-traffic roads, a 1,000-foot siting distance for sensitive land uses proposed in proximity to a major service and maintenance rail yard, and the same siting criteria for distribution centers and dry-cleaning facilities). The SCAQMD's document introduces land use-related policies that rely on design and distance parameters to minimize emissions and lower potential health risk. SCAQMD's guidelines are voluntary initiatives recommended for consideration by local planning agencies.

The SCAQMD has published a guidance document called the *Final Localized Significance Threshold Methodology* for CEQA evaluations that is intended to provide guidance when evaluating the localized impacts from mass emissions during construction (SCAQMD 2008). The SCAQMD adopted additional guidance regarding PM_{2.5} emissions in a document called *Final Methodology to Calculate Particulate Matter (PM) 2.5 and PM2.5 Significance Thresholds* (SCAQMD 2006). This latter document has been incorporated by the SCAQMD into its CEQA significance thresholds and *Final Localized Significance Threshold Methodology*.

SCAQMD has adopted two rules to limit cancer and non-cancer health risks from facilities located within its jurisdiction. Rule 1401 (New Source Review of Toxic Air Contaminants) regulates new or modified facilities, and Rule 1402 (Control of Toxic Air Contaminants from Existing Sources) regulates facilities that are already operating. Rule 1402 incorporates the requirements of the AB 2588 program, including implementation of risk reduction plans for significant risk facilities (SCAQMD 2016b).

South Coast Air Quality Management District Rules and Regulations

The SCAQMD has adopted many rules and regulations to regulate sources of air pollution in the SCAB and to help achieve air quality standards. A list of rules and regulations relevant to this analysis follows.

Regulation IV—Prohibitions: This regulation sets forth the restrictions for visible emissions, odor nuisance, fugitive dust, various air emissions, fuel contaminants, start-up/shutdown exemptions and breakdown events.

Rule 401—Visible Emissions: This rule states that a person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is as dark or darker in shade as that designated No. 1 on the Ringelmann Chart or of such opacity as to obscure an observer's view.

Rule 402—Nuisance: This rule states that a person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

Rule 403—Fugitive Dust: This rule requires projects to prevent, reduce or mitigate fugitive dust emissions from a site. Rule 403 restricts visible fugitive dust to the Project property line, restricts the net PM₁₀ emissions to less than 50 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) and restricts the tracking out of bulk materials onto public roads. Additionally, projects must utilize one or more of the best available control measures (identified in the tables within the rule). Control measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering or using nontoxic chemical stabilizers to prevent the generation of visible dust plumes, limiting vehicle speeds to 15 miles per hour on unpaved surfaces, and/or ceasing all activities. Finally, a contingency plan may be required if so determined by USEPA.

Rule 403.2—Fugitive Dust from Large Roadway Projects: This rule requires fugitive dust control measures intended to reduce potential air quality impacts on people who may be exposed to fugitive dust generated by large roadway projects. The provisions of this rule supplement the requirements of Rule 403 and shall apply only when rule-specified activities for a large roadway project are or will be conducted close to an area of public exposure or sensitive receptors near a large roadway, as defined in Rule 403.2. This rule contains control measures for aggregate crushing and grinding operations, material piles, construction and demolition activities, earthmoving, and vehicles traveling on unpaved surfaces.

Rule 410—Odors from Transfer Stations and Material Recovery Facilities: The purpose of this rule is to establish odor management practices and requirements to reduce odors from municipal solid waste transfer stations and material recovery facilities.

Rule 431.2—Sulfur Content of Liquid Fuels: This rule limits the sulfur content in diesel and other liquid fuels for the purpose both of reducing the formation of SO_x and particulates during combustion and of enabling the use of add-on control devices for diesel-fueled internal combustion engines. The rule applies to all refiners, importers, and other fuel suppliers such as distributors, marketers, and retailers, as well as to users of diesel, low-sulfur diesel, and other liquid fuels for stationary-source applications in the SCAQMD. The rule also affects diesel fuel supplied for mobile-source applications.

Rule 442—Usage of Solvents: The purpose of this rule is to reduce emissions of VOCs from VOC-containing materials or equipment not subject to the VOC limits in any Regulation XI rule. The rule sets VOC emission limits for facilities subject to the rule.

Rule 445—Wood Burning Devices: This rule reduces the emission of particulate matter from woodburning devices and establish contingency measures for applicable ozone standards for the reduction of VOCs. Per Rule 445, no person shall permanently install a wood-burning device into any new development.

Regulation XI—Source Specific Standards: Regulation XI sets emissions standards for specific sources.

Rule 1107—Coating of Metal Parts and Products: This rule sets VOC emissions limits from the coating of metal parts and products and applies to all metal coatings operations with certain exceptions as defined in the rule.

Rule 1110.2—Emissions from Gaseous- and Liquid-Fueled Engines: This rule applies to stationary and portable engines rated at greater than 50 horsepower. The purpose of Rule 1110.2 is to reduce NO_x, VOCs, and CO emissions from engines. Emergency engines, including those powering standby generators, are generally exempt from the

emissions and monitoring requirements of this rule because they have permit conditions that limit operation to 200 hours or less per year as determined by an elapsed operating time meter.

Rule 1113—Architectural Coatings: This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.

Rule 1121—Control of Nitrogen Oxides from Residential Type, Natural Gas-Fired Water Heaters: This rule specifies NO_x emission limits for natural gas-fired water heaters, with heat input rates less than 75,000 British thermal units per hour.

Rule 1133—Composting and Related Operations—General Administrative Requirements: This rule sets forth administrative requirements for existing and new chipping and grinding activities and composting operations. The purpose of this rule is to create an emissions-related informational database on composting and related operations through a registration process.

Rule 1133.2—Emission Reductions from Co-Composting Operations: The purpose of this rule is to reduce VOC and ammonia emissions from co-composting operations.

Rule 1133.3—Emission Reductions from Greenwaste Composting Operations: The purpose of this rule is to reduce fugitive emissions of VOC and ammonia occurring during greenwaste composting operations.

Rule 1138—Control of Emissions from Restaurant Operations: This rule specifies particulate matter and VOC emissions and odor control requirements for commercial cooking operations that use chain-driven charbroilers to cook meat.

Rule 1146.1—Emissions of Oxides of Nitrogen from Small Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters: This rule requires manufacturers, distributors, retailers, refurbishers, installers, and operators of new and existing units to reduce NO_x emissions from natural gas-fired boilers, steam generators, and process heaters as defined in this rule.

Rule 1146.2—Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters: This rule requires manufacturers, distributors, retailers, refurbishers, installers, and operators of new and existing units to reduce NO_x emissions from natural gas-fired water heaters, boilers, and process heaters as defined in this rule.

Rule 1171—Solvent Cleaning Operations: The purpose of this rule is to reduce emissions of VOCs, toxic air contaminants, and stratospheric ozone-depleting or global-warming compounds from the use, storage and disposal of solvent cleaning materials in solvent cleaning operations and activities. A solvent cleaning operation is solvent cleaning conducted as part of a business.

Rule 1186—PM₁₀ Emissions from Paved and Unpaved Roads, and Livestock Operations: This rule applies to owners and operators of paved and unpaved roads and livestock operations. The rule is intended to reduce PM₁₀ emissions by requiring the cleanup of material deposited onto paved roads, use of certified street sweeping equipment, and treatment of high-use unpaved roads (see also Rule 403).

Regulation XIV—Toxics and Other Non-Criteria Pollutants: Regulation XIV sets requirements for new permit units, relocations, or modifications to existing permit units which emit toxic air contaminants or other non-criteria pollutants.

Rule 1401 and Rule 1402—New Source Review of Toxic Air Contaminants and Control of Toxic Air Contaminants from Existing Sources: SCAQMD has adopted two rules to limit cancer and non-cancer health risks from facilities located within its jurisdiction. Rule 1401 (New Source Review of Toxic Air Contaminants) regulates new or modified facilities, and Rule 1402 (Control of Toxic Air Contaminants from Existing Sources) regulates facilities that are already operating. Rule 1402 incorporates the requirements of the AB 2588 program, including implementation of risk reduction plans for significant risk facilities.

Rule 1403—Asbestos Emissions from Demolition/Renovation Activities: This rule requires owners and operators of any demolition or renovation activity and the associated disturbance of asbestos-containing materials, any asbestos storage facility, or any active waste disposal site to implement work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials.

Rule 1470—Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines: This rule applies to stationary compression ignition engines greater than 50 brake horsepower, such as emergency generators, and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing.

Attainment Status

Table 3.4-4, *South Coast Air Basin Attainment Status (Los Angeles County)*, shows the attainment status of the Los Angeles County portion of the SCAB for each criteria pollutant. As shown in Table 3.4-4, the Los Angeles County portion of the SCAB is designated under federal or state ambient air quality standards as nonattainment for ozone, PM₁₀, and PM_{2.5}. The Los Angeles County portion of the SCAB is designated as nonattainment for the federal lead standard; however, this was due to localized emissions from two lead-acid battery recycling facilities in the city of Vernon and the City of Industry that are no longer operating (SCAQMD 2005).

**TABLE 3.4-4
SOUTH COAST AIR BASIN ATTAINMENT STATUS (LOS ANGELES COUNTY)**

Pollutant	National Standards (NAAQS)	California Standards (CAAQS)
Ozone (1-hour standard)	N/A	Non-attainment–Extreme
Ozone (8-hour standard)	Non-attainment–Extreme	Non-attainment
Carbon Monoxide	Attainment (Maintenance area)	Attainment
Nitrogen Dioxide	Attainment	Attainment
Sulfur Dioxide	Attainment	Attainment
PM ₁₀	Attainment	Non-attainment
PM _{2.5}	Non-attainment–Serious	Non-attainment
Lead	Non-attainment (Partial) ^b	Attainment
Visibility-Reducing Particles	N/A	Unclassified
Sulfates	N/A	Attainment
Hydrogen Sulfide	N/A	Unclassified
Vinyl Chloride ^c	N/A	N/A

NOTES:

CAAQS = California ambient air quality standard; N/A = not applicable; NAAQS = national ambient air quality standard; PM_{2.5} = inhalable particles with diameters that are generally 2.5 micrometers and smaller; PM₁₀ = inhalable particles with diameters that are generally 10 micrometers and smaller

^a The NAAQS for 1-hour ozone was revoked on June 15, 2005, for all areas except Early Action Compact areas.

^b Partial Non-attainment designation—Los Angeles County portion of the South Coast Air Basin only for near-source monitors.

^c In 1990, the California Air Resources Board (CARB) identified vinyl chloride as a toxic air contaminant and determined that it does not have an identifiable threshold. Therefore, CARB does not monitor or make status designations for this pollutant.

SOURCE: USEPA 2021d

Antelope Valley Air Quality Management District

The AVAQMD covers the western portion of the MDAB and has jurisdiction over the northern, desert portion of the County, including the incorporated cities of Lancaster and Palmdale, Air Force Plant 42, and the southern portion of Edwards Air Force Base (AVAQMD 2016). The AVAQMD operates monitoring stations in the Antelope Valley, develops rules and regulations for stationary sources and equipment, prepares emissions inventory and air quality management planning documents, and conducts source testing and inspections. The AVAQMD is the regional agency responsible for the regulation and enforcement of federal, state, and local air pollution control regulations in the Antelope Valley region of the MDAB.

Antelope Valley Air Quality Management District Air Quality Management Plan

The AVAQMD has a variety of air quality management and attainment plans that include control measures and strategies to be implemented to attain the CAAQS and NAAQS in the Antelope Valley. The AVAQMD then implements these control measures as regulations to control or reduce criteria pollutant emissions from stationary sources or equipment.

AVAQMD air quality management and attainment plans include the following (AVAQMD 2017):

- 2004 State and Federal Ozone Attainment Plan
- 2006 8-hour Ozone Reasonably Available Control Technology—State Implementation Plan (RACT SIP) Analysis

- 2008 Federal 8-Hour Ozone Attainment Plan (Western Mojave Desert Nonattainment Area)
- 2014 Supplement to the 8-hour Ozone RACT SIP Analysis
- 2015 8-hour RACT SIP Analysis³
- 2017 Federal 75 ppb Ozone Attainment Plan⁴

Antelope Valley Air Quality Management District Rules and Regulations

AVAQMD rules and regulations applicable to this analysis include:

Rule 401—Visible Emissions: This rule states that a person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is as dark or darker in shade as that designated No. 1 on the Ringelmann Chart or of such opacity as to obscure an observer's view.

Rule 402—Nuisance: This rule states that a person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

Rule 403—Fugitive Dust: This rule requires projects to prevent, reduce or mitigate fugitive dust emissions from a site. Rule 403 restricts visible fugitive dust to the Project property line, restricts the net PM₁₀ emissions to less than 50 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$), and restricts the tracking out of bulk materials onto public roads. Additionally, projects must utilize one or more of the best available control measures (identified in the tables within the rule). Control measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering or using nontoxic chemical stabilizers to prevent the generation of visible dust plumes, limiting vehicle speeds to 15 miles per hour on unpaved surfaces, and/or ceasing all activities. Finally, a contingency plan may be required if so determined by USEPA.

Rule 431.2—Sulfur Content of Liquid Fuels: This rule limits the sulfur content in diesel and other liquid fuels for the purpose both of reducing the formation of SO_x and particulates during combustion and of enabling the use of add-on control devices for diesel-fueled internal combustion engines. The rule applies to all refiners, importers, and other fuel suppliers such as distributors, marketers, and retailers, as well as to users of diesel, low-sulfur diesel, and other liquid fuels for stationary-source applications in the AVAQMD. The rule also affects diesel fuel supplied for mobile-source applications.

Rule 442—Usage of Solvents: The purpose of this rule is to reduce emissions of VOCs from VOC-containing materials or equipment not subject to the VOC limits in any Regulation XI rule. The rule sets VOC emission limits for facilities subject to the rule.

³ This document builds upon the 2006 and 2014 versions of the RACT SIP Analyses and combined represent a current and complete RACT SIP Analysis.

⁴ This document replaces or updates all previously submitted federal ozone plans in the AVAQMD.

Rule 1107—Coating of Metal Parts and Products: This rule sets VOC emissions limits from the coating of metal parts and products and applies to all metal coatings operations with certain exceptions as defined in the rule.

Rule 1113—Architectural Coatings: This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.

Rule 1121—Control of Nitrogen Oxides from Residential Type, Natural Gas-Fired Water Heaters: This rule specifies NO_x emission limits for natural gas-fired water heaters, with heat input rates less than 75,000 British thermal units per hour.

Rule 1133—Composting and Related Operations: The purpose of this rule is to limit emissions of VOCs and ammonia from composting and related operations; prevent inadvertent decomposition occurring during chipping and grinding operations; and create an emissions-related informational database on composting and related operations through administrative requirements as part of a composting registration program.

Rule 1146.1—Emissions of Oxides of Nitrogen from Small Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters: This rule requires manufacturers, distributors, retailers, refurbishers, installers, and operators of new and existing units to reduce NO_x emissions from natural gas-fired boilers, steam generators, and process heaters as defined in this rule.

Rule 1171—Solvent Cleaning Operations: The purpose of this rule is to reduce emissions of VOCs, toxic air contaminants, and stratospheric ozone-depleting or global-warming compounds from the use, storage and disposal of solvent cleaning materials in solvent cleaning operations and activities. A solvent cleaning operation is solvent cleaning conducted as part of a business.

Rule 1186—PM₁₀ Emissions from Paved and Unpaved Roads, and Livestock Operations: This rule applies to owners and operators of paved and unpaved roads and livestock operations. The rule is intended to reduce PM₁₀ emissions by requiring the cleanup of material deposited onto paved roads, use of certified street sweeping equipment, and treatment of high-use unpaved roads (see also Rule 403).

Rule 1401 and Rule 1402—New Source Review of Toxic Air Contaminants and Control of Toxic Air Contaminants from Existing Sources: SCAQMD has adopted two rules to limit cancer and non-cancer health risks from facilities located within its jurisdiction. Rule 1401 (New Source Review of Toxic Air Contaminants) regulates new or modified facilities, and Rule 1402 (Control of Toxic Air Contaminants from Existing Sources) regulates facilities that are already operating. Rule 1402 incorporates the requirements of the AB 2588 program, including implementation of risk reduction plans for significant risk facilities.

Rule 1403—Asbestos Emissions from Demolition/Renovation Activities: This rule requires owners and operators of any demolition or renovation activity and the associated disturbance of asbestos-containing materials, any asbestos storage facility, or any active waste disposal site to implement work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials.

Attainment Status

Table 3.4-5, *Mojave Desert Air Basin Attainment Status (Los Angeles County)*, shows the attainment status in the AVAQMD for each criteria pollutant. As shown in Table 3.4-5, the Los Angeles County portion of the MDAB is designated under federal and state ambient air quality standards as nonattainment for ozone and state nonattainment for PM₁₀.

**TABLE 3.4-5
 MOJAVE DESERT AIR BASIN ATTAINMENT STATUS (LOS ANGELES COUNTY)**

Pollutant	National Standards (NAAQS)	California Standards (CAAQS)
Ozone (1-hour standard)	N/A	Non-attainment
Ozone (8-hour standard)	Non-attainment–Severe ^b	Non-attainment
Carbon Monoxide	Unclassified/Attainment	Attainment
Nitrogen Dioxide	Unclassified/Attainment	Attainment
Sulfur Dioxide	Unclassified/Attainment	Attainment
PM ₁₀	Unclassified/Attainment	Non-attainment
PM _{2.5}	Unclassified/Attainment ^c	Unclassified
Lead	Unclassified/Attainment	Attainment
Visibility-Reducing Particles	N/A	Unclassified
Sulfates	N/A	Attainment
Hydrogen Sulfide	N/A	Unclassified
Vinyl Chloride ^d	N/A	Unclassified

NOTES:

CAAQS = California ambient air quality standard; N/A = not applicable; NAAQS = national ambient air quality standard; PM_{2.5} = inhalable particles with diameters that are generally 2.5 micrometers and smaller; PM₁₀ = inhalable particles with diameters that are generally 10 micrometers and smaller

^a The NAAQS for 1-hour ozone was revoked on June 15, 2005, for all areas except Early Action Compact areas.

^b West Mojave Desert (Los Angeles County) portion of the basin, where the Draft 2045 CAP would apply, is designated severe nonattainment.

^c The measures and actions set forth in the Draft 2045 CAP would be implemented in an area designated unclassified/attainment in the West Mojave Desert (Los Angeles County) portion of the basin.

^d In 1990, the California Air Resources Board (CARB) identified vinyl chloride as a toxic air contaminant and determined that it does not have an identifiable threshold. Therefore, CARB does not monitor or make status designations for this pollutant.

Southern California Association of Governments

The Southern California Association of Governments (SCAG) is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino and Imperial counties, and addresses regional issues related to transportation, the economy, community development and the environment. SCAG is the federally designated metropolitan planning organization (MPO) for the majority of the Southern California region and is the largest MPO in the nation.

Pursuant to Health and Safety Code Section 40460, SCAG is responsible for preparing and approving the portions of the AQMP related to regional demographic projections and integrated regional land use, housing, employment and transportation programs, measures and strategies (SCAQMD 2017). Regarding transportation planning, SCAG adopted the *2016–2040 Regional Transportation Plan/Sustainable Communities Strategy* (2016–2040 RTP/SCS) in April 2016,

which contains such regional development and growth forecasts. These regional development and growth forecasts form the basis for the land use and transportation control portions of the 2016 AQMP, and its growth forecasts were utilized in the preparation of the air quality forecasts and consistency analysis included in the 2016 AQMP (SCAQMD 2017). Both the RTP/SCS and the AQMP are based on projections that originate with local jurisdictions. On September 3, 2020, the SCAG Regional Council adopted the 2020–2045 *Regional Transportation Plan/Sustainable Communities Strategy* (2020–2045 RTP/SCS) (SCAG 2020). However, the 2020–2045 RTP/SCS is not yet incorporated into the approved AQMPs for the SCAQMD or AVAQMD.

SCAG is required to adopt an SCS along with its RTP pursuant to Senate Bill (SB) 375 (Chapter 728, Statutes of 2008), which required the development of regional targets for reducing passenger vehicle GHG emissions. Under SB 375, CARB is required, in consultation with the state’s MPOs, to set regional GHG reduction targets for the passenger vehicle and light-duty truck sector for 2020 and 2035. SCAG’s target set in 2011 was a per capita reduction of 8 percent for 2020 and 13 percent for 2035 compared to the 2005 baseline (SCAG 2016; CARB 2018). SCAG’s 2016–2040 RTP/SCS meets or exceeds these targets, lowering GHG emissions (below 2005 levels) by eight percent by 2020; 18 percent by 2035; and 21 percent by 2040 (SCAG 2016). Although the RTP/SCS is not focused specifically on air emissions, air quality is affected by the growth projections established in the 2016–2040 RTP/SCS and incorporated in the 2016 AQMP through land use planning and the consequential reduction of emissions from passenger and light-duty vehicles.

Los Angeles County General Plan 2035

The County has authority and responsibility to reduce air pollution through its police power by assessing and mitigating air emissions resulting from its land use decisions. The County also is responsible for the implementation of transportation control measures as outlined in the AQMP. Examples of such measures include bus turnouts, energy-efficient streetlights, and synchronized traffic signals. Consistent with CEQA, the County assesses the air quality impacts of new development projects, requires mitigation of potentially significant air quality impacts by conditioning discretionary permits, and monitors and enforces implementation of such mitigation measures.

The General Plan provides the fundamental basis for the County’s land use and development policy, and represents the basic community values, ideals, and aspirations to govern a shared environment through 2035. General goals and policies relevant to the Draft 2045 CAP include those related to infill development (Goal LU 4); vibrant, livable and healthy communities that contain a mix of community-serving uses (Goal LU 5); land use patterns and community infrastructure that promote health and wellness for all neighborhoods (Goal LU 9); well-designed, healthy places (Goal LU 10); interconnected and safe bicycle- and pedestrian-friendly streets, sidewalks, paths and trails that promote active transportation and transit use (e.g., Goal M 2, Goal M 5) as well as safe spaces for pedestrian use (e.g., Policy M 2.7, Policy M 2.8); sustainable agricultural practices (Goal C/NR 9) and sustainable management of renewable and nonrenewable energy resources (Goal C/NR 12); and others. Approval of the Draft 2045 CAP would result in the revisions to the General Plan’s Air Quality Element set forth in Table 2-1,

Updates to General Plan Air Quality Element, and Table 2-2, General Plan Implementation Program Updates, in Chapter 2, Project Description.

3.4.2 Impact Analysis

3.4.2.1 Significance Criteria

To determine the level of significance of an identified impact, the following thresholds are consistent with and modified from the CEQA Guidelines Appendix G Environmental Checklist.

The Project would result in a significant impact on air quality if it would:

- a) Conflict with or obstruct implementation of the applicable air quality plan;
- b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard;
- c) Expose sensitive receptors to substantial pollutant concentrations; or
- d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Pursuant to CEQA Guidelines Section 15064.7, a lead agency may consider using significance criteria established by the applicable air quality management district or air pollution control district when making determinations of significance. The measures and actions of the Draft 2045 CAP, if approved, would be implemented within the boundaries of both the AVAQMD and the SCAQMD. SCAQMD has established air quality significance thresholds in its *CEQA Air Quality Handbook*. These thresholds are based on the recognition that the SCAB and MDAB are distinct geographic areas with critical air pollution problems for which ambient air quality standards have been promulgated to protect public health (SCAQMD 1993). Air quality impacts in this EIR are evaluated according to the most recent thresholds adopted by the SCAQMD in connection with its CEQA Air Quality Handbook, Air Quality Analysis Guidance Handbook, and subsequent SCAQMD guidance as well as the AVAQMD CEQA and Federal Conformity Guidelines (AVAQMD 2016).⁵ In determining the level of significance, the analysis assumes that projects facilitated by the Draft 2045 CAP measures and actions would comply with relevant federal, state, and local regulations, laws, and policies.

3.4.2.2 Methodology

The Draft 2045 CAP identifies types of future projects that could be proposed in furtherance of the measures and actions set forth in the Draft 2045 CAP. However, the Draft 2045 CAP is a policy document and does not propose any specific future project. As a result, no emissions calculations were performed for the types of projects that could be facilitated by adoption of the Draft 2045 CAP. This analysis assumes that the California Emissions Estimator Model (CalEEMod), or a

⁵ While the SCAQMD CEQA Air Quality Handbook contains significance thresholds for lead, projects undertaken in furtherance of the Draft 2045 CAP would not include sources of lead emissions and would not exceed the established thresholds for lead. Unleaded fuel and unleaded paints have virtually eliminated lead emissions from commercial and residential land use projects. As a result, lead emissions are not further evaluated.

successor model that is approved for use for CEQA air quality analyses by the SCAQMD and AVAQMD, would be used to calculate construction and operational emissions before any such project would be allowed to proceed.

The SCAQMD provides guidance for conducting the analysis of localized emissions in their *Localized Significance Threshold Methodology* (SCAQMD 2008), which relies on on-site mass emission rate screening tables and project-specific dispersion modeling typically for sites sized one, two, and five acres. The SCAQMD has established screening criteria that can be used to determine the maximum allowable daily emissions that would satisfy the localized significance thresholds and therefore not cause or contribute to an exceedance of the applicable ambient air quality standards without project-specific dispersion modeling. The screening criteria depend on: (1) the area in which a project is located, (2) the size of a project area, and (3) the distance between a project area and the nearest sensitive receptor. The localized significance thresholds are applicable to NO_x, CO, PM₁₀, and PM_{2.5}. The SCAQMD *Localized Significance Threshold Methodology* (SCAQMD 2008) provides screening localized significance thresholds for projects up to five acres in size located up to 500 meters of the nearest sensitive receptors. Should individual projects exceed applicable screening level thresholds in the SCAQMD *Localized Significance Threshold Methodology* (or successor guidance document), project-specific dispersion modeling may be conducted to demonstrate that no exceedance of the concentration-based thresholds (from which the screening tables are derived) would occur (SCAQMD 2008).⁶

Construction Emissions

Because precise descriptions and locations of activities involving construction approved for site-specific projects facilitated by the Draft 2045 CAP are not known at this time, it is not possible to quantify construction emissions. Thus, construction air quality impact predictions in this analysis are qualitatively based on the possibility for projects facilitated by implementation of Draft 2045 CAP measures to exceed the SCAQMD and/or AVAQMD significance thresholds for construction emissions.

There are six default CalEEMod construction phases commonly used to evaluate construction emissions: demolition, site preparation, grading, building construction, paving, and architectural coating. For example, due to the developed nature of some County parcels, many projects may only require a demolition (existing buildings and asphalt pavement) phase and minor site preparation phase prior to building construction, while some projects may require renovation, which would be less intensive than reconstruction. In addition, some projects may not require any demolition, but would require site preparation and/or grading to prepare the site for development.

Any future construction facilitated by the Draft 2045 CAP would be required to comply with SCAQMD Rule 403 and AVAQMD Rule 403 to control dust emissions during any dust-generating activities. SCAQMD Rule 403 and AVAQMD Rule 403 require implementation of various best available fugitive dust control measures for all construction activity sources within its jurisdictional boundaries. Dust control measures include, but are not limited to, maintaining stability of soil through pre-watering of site prior to clearing, grubbing, cut and fill, and earth-moving activities;

⁶ The AVAQMD does not have a similar guidance to that of the SCAQMD's localized significance thresholds.

stabilizing soil during and immediately after clearing, grubbing, cut and fill, and other earth-moving activities; stabilizing backfill during handling and at completion of activity; and pre-watering material prior to truck loading and ensuring that freeboard exceeds six inches. Any future construction involving a large roadway project in the SCAQMD region and located near an area of public exposure or sensitive receptors facilitated by the Draft 2045 CAP would be required to comply with SCAQMD Rule 403.2 and implement supplemental dust control measures as applicable in Rule 403.2.

Operational Emissions

Because precise descriptions and locations of activities involving operation approved for site-specific projects facilitated by the Draft 2045 CAP are not known at this time, it is not possible to quantify operational emissions.⁷ Thus, operational air quality impact predictions were qualitatively based on the possibility of projects facilitated by the Draft 2045 CAP measures and actions to exceed the SCAQMD and/or AVAQMD significance thresholds for operational emissions.

There are several categories of emissions in CalEEMod for operations commonly used to evaluate operational emissions: area sources, energy sources, mobile sources, and other sources. Area sources typically include consumer product use (e.g., cleaners, solvents, and other household or institutional cleaning products), architectural coatings, and landscape maintenance equipment. These sources of operational emissions would change in frequency or magnitude over each of the Draft 2045 CAP horizon years of 2030, 2035, and 2045.

Consumer products are chemically formulated products used by household and institutional consumers, including detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn, and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products. Architectural coatings are paints for coating buildings, structures, and roadway striping. Consumer products and architectural coatings generate VOC emissions. Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, rototillers, shredders/grinders, blowers, trimmers, chain saws, and hedge trimmers. Landscape equipment may be gasoline fueled and may result in fuel combustion emissions (e.g., VOC, NO_x, CO, PM₁₀, and PM_{2.5} with trace amounts of SO_x). Future operational activities facilitated by the Draft 2045 CAP may also include sources of fugitive dust emissions, such as dust settling on solar panels that could be resuspended during wind events, or the exposure of large areas of bare dirt under and around utility-scale solar farms where dust could be suspended during wind events.

⁷ Section 3.5, *Greenhouse Gas Emissions*, also does not provide GHG emissions quantification of any specific projects that may be facilitated by the Draft 2045 CAP. The GHG analysis includes a 2015 baseline GHG inventory, a 2018 GHG inventory update, and 2030, 2035, and 2045 emissions projections for the unincorporated County-wide level based on growth in population, housing, and employment that is expected for the County through the year 2045. However, unlike GHG emissions, which generate exclusively cumulative impacts, air quality significance thresholds are based on individual project-level emissions. Information is not available to quantify individual project-level air pollutant emissions and such quantification would be speculative at this time.

As represented in CalEEMod, energy sources generate air pollutant emissions from the combustion of natural gas for building heating and cooking (e.g., VOC, NO_x, CO, PM₁₀, and PM_{2.5} with trace amounts of SO_x).

Mobile sources consist of motor vehicles (automobiles and light-duty trucks) traveling to and from the parcels developed or from other development facilitated by Draft 2045 CAP measures and actions. Motor vehicles may be fueled with gasoline, diesel, or alternative fuels. Emissions from motor vehicles consist of tailpipe fuel combustion emissions (e.g., VOC, NO_x, CO, PM₁₀, and PM_{2.5} with trace amounts of SO_x) and road dust emissions (e.g., PM₁₀ and PM_{2.5} from brake wear, tire wear and re-entrained road dust). Vehicles operating under alternative fuel or electric battery power would generate reduced or no tailpipe air pollutant emissions compared to gasoline- or diesel-fueled vehicles but would still generate road dust emissions. Road dust emissions may increase from future developments facilitated by the Draft 2045 CAP, such as an increased number of solar farms, that could increase ground disturbance from vehicle trips on paved and unpaved roads.

Due to the general nature of the Draft 2045 CAP, projects facilitated by the Draft 2045 CAP measures and actions could result in additional operational emissions sources that are not listed above or for which specifics are not known. Note that all stationary sources of TACs resulting from projects facilitated by the Draft 2045 CAP would be required to comply with applicable SCAQMD or AVAQMD rules and regulations and may be required to obtain a permit to operate from the SCAQMD or AVAQMD if subject to air quality permitting regulations. Furthermore, any future operational activities facilitated by the Draft 2045 CAP would be required to comply with SCAQMD Rule 403 and AVAQMD Rule 403 to control dust emissions during any operational activities that would generate fugitive dust. SCAQMD Rule 403 and AVAQMD Rule 403 require that various best-available fugitive dust control measures be implemented for operational activity sources generating fugitive dust within its jurisdictional boundaries. Dust control measures include those discussed above for construction and other measures specified in the respective air districts' Rule 403, as applicable to the operational activity.

The operation of future projects facilitated by Draft 2045 CAP, measures and actions would be required to comply with applicable SCAQMD and AVAQMD, including those listed above in Section 3.4.1.3.

3.4.2.3 Project Impacts

The Draft 2045 CAP identifies 10 strategies, 25 measures, and various implementing actions to reduce GHG emissions in unincorporated areas of the County. See also Section 2.6.2 of Chapter 2, *Project Description*, which lists the proposed GHG emissions reduction strategies and measures. None of the proposed measures or actions indicate where specific projects would be constructed, their size, or their specific characteristics. As explained in Draft EIR Section 3.1.3.6, *Future Projects Facilitated by the Draft 2045 CAP*, the potential impacts of new utility-scale, ground-mounted solar photovoltaic projects, and associated energy storage and distribution facilities are qualitatively evaluated at a programmatic level.

As a program EIR, this Draft EIR does not speculate on the specific environmental impacts of individual projects that could be facilitated by Draft 2045 CAP measures and actions. However, impacts of implementation of specific measures and actions were considered as part of this analysis to the degree that specific information about implementation is known for horizon years 2030, 2035, and 2045.

The Draft 2045 CAP details the GHG emissions reduction vision and goals of the OurCounty Sustainability Plan for unincorporated Los Angeles County and would implement the GHG emissions reduction strategies of the General Plan's Air Quality Element. Specifically, the Draft 2045 CAP, once approved, would replace the existing implementation strategy of the Air Quality Element, known as the *Unincorporated Los Angeles County Community Climate Action Plan 2020*. The Draft 2045 CAP is a policy document intended to reduce community-wide GHG emissions and would support development already allowed under the land use assumptions identified in the General Plan's Land Use Element and 2021–2029 Housing Element. No changes to General Plan land use designations, zoning, or land use-specific projects are proposed as part of the Draft 2045 CAP for any of the horizon years.

Consistent with the requirements of CEQA Guidelines Section 15168, this EIR provides a program-level discussion of the impacts of implementing these measures that could result, rather than project-level or site-specific physical impacts of such actions. Table ES-1, *Summary of Draft 2045 CAP Measures and Affected Resource Areas*, in the Executive Summary, identifies certain measures and actions relevant to this analysis of air quality-related impacts. These and other relevant measures and actions include: Action ES1.2 regarding the control of fugitive emissions from active, idle, and abandoned oil wells; Action T6.7 regarding increased use of green hydrogen vehicles throughout the County; Measure T8 regarding the acceleration of freight decarbonization; Measure T9 regarding the expanded use of zero-emission technologies for off-road vehicles and equipment; and Action E3.4 regarding refrigerant management as among the Draft 2045 CAP measures and actions that are particularly relevant to the analysis of impacts to air quality. Projects facilitated by Measure W2, *Increase Organic Waste Diversion*, also could result in odor-related impacts to air quality depending on where any new facilities are proposed to be located. Specific air quality-related impacts of implementing Draft 2045 CAP measures and actions are analyzed below.

The time frame during which the implementation of these actions and measures would generate (or reduce) air pollutant emissions, and potentially cause impacts exceeding significance thresholds to be exceeded, would depend on the specific timing of implementation timing, as shown in Table 2-11 in Chapter 2, Project Description. The impact would occur immediately and continue through 2045 at the CAP's ultimate horizon year. The magnitude of long-term impacts would increase over time to the extent that more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets (this is not true for all air quality impacts, as explained in the individual impact analyses). Specific GHG emissions-related impacts of implementing Draft 2045 CAP measures and actions are analyzed below.

CEQA Guidelines Section 15183.5 allows future development projects to streamline their GHG emissions analysis by showing consistency with a qualified CAP. As part of the 2045 Climate Action Plan Consistency Review Checklist provided with the Draft 2045 CAP (Appendix F to the 2045 CAP), the County will develop an offsite GHG emissions reduction program. Future development projects that either cannot achieve net-zero GHG emissions or are unable to comply with all required checklist items would have the option to participate in the offsite GHG emissions reduction program. This program would allow project applicants to fund or implement local projects that reduce GHG emissions within unincorporated Los Angeles County. Such projects must not be otherwise required by law or regulation, and would not have happened on the 2045 CAP's proposed schedule but for the requirements placed on the projects by the 2045 CAP Checklist. If offsite GHG emissions reduction projects are implemented via this program, then, to the extent that such projects include types of activities similar to those contemplated by the Draft 2045 CAP's measures and actions, the resulting environmental impacts would be similar to those disclosed below. Further, project applicants' CEQA documents would be required to disclose the impacts of any GHG emissions reduction projects that are proposed to be funded or implemented.

Criterion a) Whether the Project would conflict with or obstruct implementation of applicable air quality plans of either the AVAQMD or the SCAQMD.

Impact 3.4-1: The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, would conflict with or obstruct implementation of the applicable air quality plan. (Significant and Unavoidable)

South Coast Air Quality Management District Air Quality Plans

The following analysis addresses the Project's consistency with applicable SCAQMD plans, inclusive of regulatory compliance, for horizon years 2030, 2035, and 2045. The SCAQMD recommends, when determining whether a project is consistent with the 2016 AQMP, that the lead agency assess whether a project would directly obstruct implementation of the plans by impeding SCAQMD's efforts to achieve attainment with respect to any criteria air pollutant for which it is currently not in attainment of the NAAQS and CAAQS (e.g., ozone, PM₁₀, and PM_{2.5}), and whether it is consistent with the demographic and economic assumptions (typically land use related, such as employment and population/residential units) upon which the plan is based.

In accordance with SCAQMD's *CEQA Air Quality Handbook*, the Draft 2045 CAP would have a significant impact relative to criterion a) if it would do any of the following: (i) Result in an increase in the frequency or severity of existing air quality violations; (ii) cause or contribute to new air quality violations; or (iii) delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP (Criterion No. 1).

The Draft 2045 CAP would have a significant impact relative to criterion a) if it would exceed the assumptions utilized in preparing the AQMP (Criterion No. 2). The AQMP control measures and related emissions reduction estimates are based upon emissions projections for a future development scenario derived from growth in land use, population, and employment characteristics incorporated into the SCAG RTP. Accordingly, conformance with the AQMP for

development projects is also determined by demonstrating compliance with local land use plans and/or population projections.

The AQMP uses the assumptions and projections of local planning agencies to determine control strategies for regional compliance status. Because the AQMP is based on local land use plans, projects that are deemed consistent with local land use plans are found to be consistent with the AQMP. CEQA requires that general plans and projects be evaluated for consistency with the AQMP using the two key criteria for consistency with the AQMP.

Criterion No. 1

The first criterion evaluates the potential for a project to result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations or delay the timely attainment of air quality standards of the interim emissions reductions specified in the AQMP. The SCAQMD numerical significance thresholds for construction and operational emissions are designed for the analysis of individual projects and not for long-term planning documents, such as the Draft 2045 CAP. Emissions are dependent on the exact size, nature, and location of an individual land use type, combined with reductions in localized impacts from the removal of existing land use types, as applicable (i.e., conversion of light industrial uses).

The Draft 2045 CAP would be implemented through future projects facilitated by the proposed Draft 2045 CAP measures and actions, as well as through the application of the Draft 2045 CAP Consistency Checklist (**Appendix F**) to allow for streamlining of GHG impacts under CEQA. Additional analysis would be needed to determine the impacts of implementation of these measures at specific locations, and future projects would be analyzed at the project level and would be subject to CEQA.

For future projects seeking to use the Draft 2045 CAP Consistency Checklist for CEQA GHG streamlining, the County would determine whether the future project would be consistent with the Draft 2045 CAP. As described above, projects implementing Draft 2045 CAP measures and actions that are deemed consistent with local land use plans would also be consistent with the AQMP, and this applies to each horizon year.

Construction

With respect to the first criterion, as discussed under the analysis for Impact 3.4-3 below, construction of future individual projects in the unincorporated areas of the County that would be facilitated by Draft 2045 CAP measures and actions have the potential to create localized air quality impacts through the use of heavy-duty construction equipment. No specific projects are included in the Draft 2045 CAP because no information currently is available regarding specific projects that could be facilitated by the Draft 2045 CAP measures and actions. Other details necessary to provide a meaningful estimate of emissions also cannot be quantified, as specific sites, buildings and facilities to be constructed or modified, construction schedules, and quantities of earthmoving are unknown.

Because this information is unknown, localized emissions modeling is not feasible and would be speculative. New facilities may be facilitated by Draft 2045 CAP measures and actions—such as

new renewable energy facilities (Measure ES3), new or expanded wastewater facilities (Measure E5), new electric vehicle charging station infrastructure (Measure T6), and new or expanded waste processing facilities (Measures W1 and W2)—which may occur as large construction projects and could result in a significant air quality impact from the construction of such future facilities even with implementation of these Draft 2045 CAP measures and actions. In addition, because future projects facilitated by the Draft 2045 CAP could occur close to existing sensitive receptors, construction of projects facilitated by the Draft 2045 CAP measures and actions could generate localized emissions in excess of the concentration-based localized significance thresholds.

Therefore, in response to Criterion No. 1, the construction of future projects facilitated by the Draft 2045 CAP measures and actions for horizon years 2030, 2035, and 2045 could increase the frequency or severity of an existing violation or cause or contribute to new violations and impacts would be significant. The frequency with which these impacts may be significant and their degree of severity are likely to vary across horizon years 2030, 2035, and 2045, depending on the future projects that may be facilitated by the Draft 2045 CAP measures and actions. The magnitude of long-term impacts would increase over time to the extent that more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets.

Applicants for future projects facilitated by the Draft 2045 CAP would be required to comply with SCAQMD Rules 403 and 403.2 to control dust emissions during any construction activities that generate fugitive dust, utilizing measures specified in these rules as applicable to each construction activity. The frequency and severity of air quality impacts could decline in future horizon years 2035 and 2045 relative to horizon year 2030. Such a decline could occur as the County-wide inventory of construction vehicles and equipment turns over and a greater percentage of the inventory meets more stringent emissions standards, such as the CARB Truck and Bus regulation (13 CCR Section 2025) and the CARB emissions standards for off-road diesel construction equipment (13 CCR Section 2449). These changes would reduce the potential for impacts related to NO_x, PM₁₀, and PM_{2.5} exhaust emissions.⁸

Operations

The Draft 2045 CAP is a comprehensive planning document outlining the County's proposed approach to address climate change impacts. Several Draft 2045 CAP measures would actively reduce air pollution from both stationary and mobile pollutant sources as a component of the broader strategies that would reduce energy consumption and vehicle miles traveled (VMT), which include a number of land use strategies such as: planning for growth around livable corridors (addressed in Draft 2045 CAP Measures T1 and T2); limit parking (Measure T5); providing more options for short trips/neighborhood mobility areas (Measures T3 and T4); supporting zero-emission vehicles and expanding vehicle charging stations (Measures T6–T9); and supporting local sustainability planning (Measures ES1–ES5, E1–E6, and W1–W2).

The frequency and severity of air quality impacts related to combustion emissions from operational activities (e.g., NO_x, PM₁₀ exhaust, PM_{2.5} exhaust) would likely decline in future

⁸ PM₁₀ and PM_{2.5} exhaust emissions from diesel-fueled equipment and vehicles includes diesel particulate matter (i.e., DPM).

horizon years 2035 and 2045 relative to horizon year 2030. Such a decline could occur as County-wide operational sources of air pollutants transition to increased electrification, particularly as a result of the CARB Advanced Clean Cars II rule and the increased utility-scale renewable energy. The Advanced Clean Cars II rule states that by 2035, 100 percent of new passenger vehicles, light-duty trucks, and SUVs sold in California must be zero-emission vehicles (ZEVs) (CARB 2023b). As the vehicle fleet turns over and vehicles are replaced with ZEV models, future-horizon-year emissions from mobile sources associated with future development under the Draft 2045 CAP would decrease.

Further, as utility providers increase the percentage of renewably sourced electricity pursuant to the mandated Statewide Renewables Portfolio Standard (RPS) targets (refer to Section 3.9, *Greenhouse Gas Emissions*, of this Revised Draft PEIR for additional information), energy emissions associated with future development under the Draft 2045 CAP would decrease. The RPS targets would result in further additive emissions reductions for the electric vehicle fleet.

Future projects may be facilitated by the Draft 2045 CAP, such as new renewable energy facilities (Measure ES3), new or expanded recycled water facilities (Measure E5), and new or expanded waste processing facilities (Measures W1 and W2). Operation of these future facilities may result in fugitive dust emissions from increased vehicle travel on paved and unpaved roads and windblown dust that has settled on solar panels. Such future projects, if located in areas prone to high wind and/or in areas with exposed surfaces (e.g., unpaved surfaces with limited vegetated ground cover), could be subjected to re-entrained fugitive dust and/or windblown dust.

Applicants for future projects facilitated by the Draft 2045 CAP would be required to comply with SCAQMD Rule 403 to control dust emissions during any operational activities that generate fugitive dust, utilizing measures specified in these rules as applicable to each operational activity. All future discretionary projects would be subject to project-level CEQA analysis to determine whether operational air quality emissions are consistent with this indicator.

The location, design, and land use of future projects facilitated by the Draft 2045 CAP in unincorporated areas of the County within the SCAB would incorporate Draft 2045 CAP land use and transportation strategies related to reducing vehicle trips for residents and employees, by (a) focusing increasing residential density near transit and including affordable housing options (Measure T1); and (b) increasing commercial and residential density, with new residential development planned for multi-family dwelling units (Measure T2). This would allow for increased mixed-use density at infill locations and near public transit and may reduce impacts across the horizon years, as combustion emissions (e.g., NO_x, PM₁₀ exhaust, PM_{2.5} exhaust) would be anticipated to decline in future horizon years 2035 and 2045 relative to horizon year 2030. Such a decline could occur as County-wide operational sources of operational air pollutants transition to increased electrification, as discussed above.

Future projects facilitated by the Draft 2045 CAP that implement these measures would not conflict with AQMP land use and transportation strategies that are intended to reduce VMT, reduce the frequency or severity of existing air quality violations or new violations, and achieve the timely attainment of air quality standards specified in the AQMP. However, projects

facilitated by the Draft 2045 CAP measures and actions could create significant emissions of criteria pollutants if they would include a sufficiently large number of operational emissions sources or intensive operational uses or processes. For instance, Draft 2045 CAP Measure ES3 would expand local solar power generation on existing and new development throughout the County and at County facilities, and would provide for utility-scale solar and associated infrastructure. Incorporating solar infrastructure on existing or new developments in the County and at County facilities and utilities (Measure ES3) would likely require ongoing maintenance (e.g., for cleaning solar photovoltaic [PV] panels and repairing or replacing PV panels as a result of general wear and malfunctioning components). Operation of these future facilities facilitated by the Draft 2045 CAP measures and actions could result in fugitive dust emissions from vehicle trips on unpaved surfaces, windblown dust settling on solar panels, or other similar types of operational activities. As a result, the Project could result in an increase in the frequency or severity of existing air quality violations, cause or contribute to new violations, or delay timely attainment of the ambient air quality standards (AAQS) or emission reductions in the AQMP. Therefore, operation of the Project may be inconsistent with Criterion No. 1 and impacts would be significant.

Criterion No. 2

While striving to achieve the NAAQS for ozone and PM_{2.5} and the CAAQS for ozone, PM₁₀, and PM_{2.5} through a variety of air quality control measures, the 2016 AQMP also accommodates planned growth in the SCAB. With respect to the second criterion for determining consistency with AQMP growth assumptions, the projections in the AQMP for achieving air quality goals are based on assumptions in SCAG's 2016–2040 RTP/SCS regarding population, housing, and growth trends. Determining whether or not a project exceeds the assumptions reflected in the AQMP involves the evaluation of consistency with applicable population, housing, and employment growth projections and appropriate incorporation of AQMP control measures. The following discussion provides an analysis with respect to this criterion.

For future projects located within the SCAB, which is under the jurisdiction of the SCAQMD, the SCAQMD's 2016 AQMP is the applicable air quality plan. The 2016 AQMP relies on emissions forecasts based on the demographic and economic growth projections provided by SCAG's 2016–2040 RTP/SCS in devising its control strategies for reducing emissions of ozone and PM_{2.5} to meet five NAAQS standards (SCAQMD 2017). SCAG is charged by California law to prepare and approve "the portions of each AQMP relating to demographic projections and integrated regional land use, housing, employment, and transportation programs, measures and strategies." (SCAQMD 2017). Projects whose growth is included in the projections used in the formulation of the AQMP are considered to be consistent with the plan and not to interfere with its attainment (SCAQMD 1993).

Construction

Control Strategies

The SCAB is designated nonattainment for ozone and PM_{2.5} under the CAAQS and NAAQS, nonattainment for lead (Los Angeles County only) under the NAAQS, and nonattainment for PM₁₀ under the CAAQS. The emissions of criteria pollutants associated with future projects facilitated by the Draft 2045 CAP could exceed SCAQMD thresholds for criteria pollutants. Any

future project facilitated by Draft 2045 CAP measures and actions would be required to comply with CARB's requirements to minimize short-term emissions from on-road and off-road diesel equipment, including the ATCM to limit heavy-duty diesel motor vehicle idling to no more than five minutes at any given time, with SCAQMD's regulations such as Rule 403 for controlling fugitive dust, and Rule 1113 for controlling VOC emissions from architectural coatings. Furthermore, as applicable to the type of project, individual projects facilitated by Draft 2045 CAP measures and actions would comply with fleet rules to reduce on-road truck emissions.

Compliance with these measures and requirements would be consistent with and meet or exceed the AQMP compliance requirements for control strategies intended to reduce emissions from construction equipment and activities. Therefore, future construction facilitated by Draft 2045 CAP measures and actions would be consistent with the control strategies of the AQMP and impacts would be less than significant across horizon years 2030, 2035, and 2045. The magnitude of long-term impacts would remain relatively constant over time, even though more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets, because all future projects would be required to comply with AQMP construction control strategies.

Growth Projections

The Draft 2045 CAP would facilitate an increase in short-term employment compared to existing conditions. Although any construction facilitated by the Project would generate construction workers, it would be unlikely to create a substantial number of new construction jobs; construction-related jobs generated by the Project would likely be filled by employees within the construction industry in the greater Los Angeles County region. Construction industry jobs generally have no regular place of business, as construction workers commute to job sites throughout the region, which may change several times a year. Moreover, these jobs would be temporary, lasting only through the duration of construction. This applies to potential impacts across horizon years 2030, 2035, and 2045. Furthermore, although projects facilitated by the Draft 2045 CAP could result in temporary construction jobs, the Draft 2045 CAP would support development already allowed under the General Plan land use and employment assumptions, and housing expectations set forth in the 2021–2029 Housing Element.

As such, the Draft 2045 CAP would not result in an unanticipated increase in jobs outside of what was accounted for and projected within the General Plan. Therefore, the construction jobs generated by projects facilitated by the Project would not conflict with the long-term employment or population projections upon which the AQMPs are based and impacts would be less than significant across horizon years 2030, 2035, and 2045. The magnitude of long-term impacts would remain constant over time, even though more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets, because the Draft 2045 CAP would not result in an unanticipated increase in jobs outside of what was accounted for and projected within the General Plan in all horizon years.

Operations

Control Strategies

Projects facilitated by the Draft 2045 CAP measures and actions in the unincorporated areas of the County within the SCAB would be required to comply with CARB motor vehicle standards, SCAQMD regulations for stationary sources and architectural coatings, Title 24 energy efficiency standards, and, to the extent applicable, to the growth projections in the 2016–2040 RTP/SCS, which are incorporated into the 2016 AQMP.

In addition, the Draft 2045 CAP outlines several measures and actions that would result in GHG emissions reductions, which would support AQMP consistency for projects facilitated by the Draft 2045 CAP across the horizon years within the incorporated areas of the County. The AQMP's strategies are discussed below with references to relevant Draft 2045 CAP measures.

The AQMP includes land use and transportation strategies from the 2016–2040 RTP/SCS that are intended to reduce VMT and resulting regional mobile-source emissions. The applicable land use strategies included in the Draft 2045 CAP that would reduce emissions are as follows: planning for growth around livable corridors (addressed in Draft 2045 CAP Measures T1 and T2); limit parking (Measure T5); providing more options for short trips/ neighborhood mobility areas (Measures T3 and T4); supporting zero emission vehicles and expanding vehicle charging stations (Measures T6–T9); and supporting local sustainability planning (Measures ES1–ES5, E1–E6, and W1–W2). The applicable transportation strategies include: managing through the Transportation Demand Management (TDM) Program and the Transportation System Management (TSM) Plan including advanced ramp metering; expansion and integration of the traffic synchronization network; and promoting active transportation. The majority of the transportation strategies would be implemented by cities, counties, and other regional agencies such as SCAG and SCAQMD, although some can be furthered by individual projects.

The location, design, and land use of future General Plan-anticipated growth in the unincorporated areas of the County would implement Draft 2045 CAP land use and transportation strategies related to reducing vehicle trips for residents and employees by increasing commercial and residential density with new residential development planned for multi-family dwelling units (Measure T2), which would allow for increased mixed-use density at infill locations and near public transit. Draft 2045 CAP Measure T1 focuses primarily on increasing residential density near transit and affordable housing.

Therefore, the Draft 2045 CAP, and projects facilitated by Draft 2045 CAP measures and actions, would not conflict with AQMP land use and transportation strategies that are intended to reduce VMT. Rather, the Draft 2045 CAP includes measures and actions that would support the VMT reduction goals in the SCAB. These measures and actions are expected to reduce VMT across the horizon years 2030, 2035, and 2045, particularly because Draft 2045 CAP Measures T1 and T2 focus growth in residential and employment density near transit and infill locations. The Project, and projects facilitated by Draft 2045 CAP measures and actions across horizon years, would not conflict with the control strategies of the AQMP, and impacts would be less than significant. The magnitude of long-term impacts would remain relatively constant over time, even though more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's

increasingly aggressive 2030, 2035, and 2045 GHG reduction targets, because all future projects would be required to comply with AQMP operational control strategies.

Growth Projections

The emissions inventory for the SCAB is formed, in part, by existing city and county general plans. The AQMP is based on population, employment and VMT forecasts by SCAG. A project might be in conflict with the AQMP if the development's growth is greater than that anticipated in the local general plan and SCAG's growth projections. Projects facilitated by Draft 2045 CAP measures and actions would be required to undergo subsequent environmental review pursuant to CEQA and would be required to demonstrate compliance with the AQMP. Individual projects also would be required to demonstrate compliance with SCAQMD rules and regulations governing air quality.

The County continues to coordinate with SCAQMD and SCAG to ensure relevant growth projections, land use planning efforts, and local development patterns are accounted for in the regional planning and air quality planning processes. As discussed above, the Draft 2045 CAP is a policy document intended to reduce community-wide GHG emissions and would support development already allowed under the land use assumptions identified in the General Plan's Land Use Element and 2021–2029 Housing Element. The Draft 2045 CAP itself does not propose any change to existing General Plan land use or zoning designations for any parcel in the unincorporated areas of the County, nor does it propose land use-specific projects. Therefore, the implementation of Draft 2045 CAP measures and actions would not conflict with growth projections and would not conflict with or obstruct the implementation of the applicable air quality plan. Many proposed Draft 2045 CAP measures would reduce emissions, which would avoid impacts related to conflicts with an applicable air quality plan.

The purpose of the Draft 2045 CAP is to reduce GHG emissions across the horizon years. The Draft 2045 CAP's measures and actions encompass the broad categories of climate leadership, transportation, building energy and water, and waste. While these measures may result in short-term increases of air pollutant emissions during construction of new facilities, implementation of the Draft 2045 CAP would result in an overall improvement in regional long-term air quality by establishing a more sustainable framework. The 2016 AQMP was prepared to accommodate growth, reduce the levels of pollutants within the areas under the jurisdiction of SCAQMD, return clean air to the region, and minimize the impact on the economy. Projects that are considered consistent with the AQMP would not interfere with attainment because this growth is included in the projections used in the formulation of the AQMP.

The Draft 2045 CAP is a policy-level document that does not include site-specific projects. Future projects in the Los Angeles Basin portion of the unincorporated areas of the County that would be facilitated by Draft 2045 CAP measures and actions primarily would be located primarily within the urban environment. The Draft 2045 CAP does not propose changes to existing General Plan land use designations. The Draft 2045 CAP would support development already allowed under the General Plan land use assumptions and 2021–2029 Housing Element; and would include measures such as Measure T1, to encourage density near high-quality transit areas, and Measure T2, to develop land use plans addressing jobs/housing balance and increased mixed use to the extent allowed by the General Plan. Therefore, the Draft 2045 CAP would not

result in an unanticipated increase in density or population growth outside of what was accounted for in the General Plan with the 2021–2029 Housing Element and would not conflict with the 2016 AQMP growth projections.⁹

The 2016 AQMP (including its VMT reduction goals) is based on the growth projections in the 2016–2040 RTP/SCS. The Draft 2045 CAP is based on similar population and employment numbers in the 2045 forecast as compared to those in the 2020–2045 RTP/SCS’s 2045 forecast. As discussed above under control strategies, the Draft 2045 CAP includes measures that are expected to result in substantially less daily VMT and therefore reduce VMT per service population across horizon years 2030, 2035, and 2045. The VMT reduction goals in the Draft 2045 CAP measures would be consistent with the VMT reduction goals and corresponding growth projections of the AQMP and impacts would be less than significant. The magnitude of long-term impacts would remain constant over time, even though more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP’s increasingly aggressive 2030, 2035, and 2045 GHG reduction targets, because the Draft 2045 CAP would be consistent with the VMT reduction goals and corresponding growth projections of the AQMP for each horizon year.

Antelope Valley Air Quality Management District Air Quality Plan

The following analysis addresses the Project’s consistency with applicable AVAQMD plans, inclusive of regulatory compliance. The AVAQMD CEQA and Federal Conformity Guidelines (August 2016) do not provide a specific methodology for evaluating conflicts with an applicable air quality plan; therefore, the same approach used for the SCAQMD is used for this EIR. Thus, the Draft 2045 CAP would have a significant impact relative to criterion a) if it would do any of the following: (i) Result in an increase in the frequency or severity of existing air quality violations; (ii) cause or contribute to new air quality violations; or (iii) delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP (Criterion No. 1). The Draft 2045 CAP would have a significant impact relative to criterion a) if it would exceed the assumptions utilized in preparing the AQMP (Criterion No. 2).

Criterion No. 1

The AVAQMD numerical significance thresholds for construction and operational emissions are designed for the analysis of individual projects and not for long-term planning documents, such as the Draft 2045 CAP. Emissions are dependent on the exact size, nature, and location of an individual land use type, combined with reductions in localized impacts from the removal of existing land use types, as applicable (i.e., conversion of light industrial uses).

The Draft 2045 CAP would be implemented through future projects facilitated by the proposed Draft 2045 CAP measures and actions, as well as through the application of the Draft 2045 CAP Consistency Checklist (Appendix F) to allow for streamlining of GHG impacts under CEQA.

⁹ The SCAG 2016–2040 RTP/SCS forecasts a 2040 population of 1,273,700 persons in unincorporated Los Angeles County (see Demographics & Growth Forecast Appendix [SCAG 2016]). The 2021–2029 Housing Element forecast a 2045 population of 1,258,000 (see Section 4.14 of Los Angeles County 2021). Given that the projected population in 2045 under the Draft 2045 CAP would be less than the projected population in 2040 in the SCAG 2016–2040 RTP/SCS, the Draft 2045 CAP would not conflict with the growth projections.

Additional analysis would be needed to determine the impacts of implementation of these measures at specific locations, and future projects would be analyzed at the project level and would be subject to CEQA, as required.

For future projects seeking to use the Draft 2045 CAP Consistency Checklist for CEQA GHG streamlining, the County would determine whether the future project would be consistent with the Draft 2045 CAP. As described above, projects implementing Draft 2045 CAP measures and actions that are deemed consistent with local land use plans would also be consistent with the AVAQMD 2015 8-hour RACT SIP Analysis and 2017 Federal 75 ppb Ozone Attainment Plan.

Construction

With respect to the first criterion, as discussed under the analysis for Impact 3.4-3 below, construction of future individual projects in the unincorporated areas of the County that would be facilitated by Draft 2045 CAP measures and actions have the potential to create localized air quality impacts through the use of heavy-duty construction equipment. No specific projects are included in the Draft 2045 CAP because no information currently is available regarding specific projects that could be facilitated by the Draft 2045 CAP measures and actions. Other details necessary to provide a meaningful estimate of emissions also cannot be quantified, as specific sites, buildings and facilities to be constructed or modified, construction schedules, and quantities of earthmoving are unknown.

Because this information is unknown, localized emissions modeling is not feasible and would be speculative. New facilities may be facilitated by Draft 2045 CAP measures and actions, such as new renewable energy facilities including utility-scale solar projects and associated infrastructure in the Antelope Valley (Measure ES3), new or expanded recycled water facilities (Measure E5), new electric vehicle charging station infrastructure (Measure T6), and new or expanded waste processing facilities (Measures W1 and W2), which may occur as large construction projects and could result in a significant air quality impact from the construction of such future facilities even with implementation of these Draft 2045 CAP measures. In addition, because future projects facilitated by the Draft 2045 CAP measures and actions could occur close to existing sensitive receptors, construction of projects facilitated by the Draft 2045 CAP measures and actions could generate localized emissions that exceed the concentration-based ambient air quality standards.

Therefore, in response to Criterion No. 1, the construction of future projects facilitated by the Draft 2045 CAP measures and actions for horizon years 2030, 2035, and 2045 could increase the frequency or severity of an existing violation or cause or contribute to new violations and impacts would be significant. The frequency with which these impacts may be significant and their degree of severity are likely to vary across horizon years 2030, 2035, and 2045, depending on the future projects that may be facilitated by the Draft 2045 CAP measures and actions. The magnitude of long-term impacts would increase over time to the extent that more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets.

Applicants for future projects facilitated by the Draft 2045 CAP would be required to comply with AVAQMD Rule 403 to control dust emissions during any construction activities that generate fugitive dust, utilizing measures specified in the rule as applicable to each construction activity.

The frequency and severity of air quality impacts could decline in future horizon years 2035 and 2045 relative to horizon year 2030. Such a decline could occur as the County-wide inventory of construction vehicles and equipment turns over and a greater percentage of the inventory meets more stringent emissions standards, such as the CARB Truck and Bus regulation (13 CCR Section 2025) and the CARB emissions standards for off-road diesel construction equipment (13 CCR Section 2449). These changes would reduce the potential for impacts related to NO_x, PM₁₀, and PM_{2.5} exhaust emissions.

Operations

The Draft 2045 CAP is a comprehensive planning document outlining the County's proposed approach to address climate change impacts. Several Draft 2045 CAP measures would actively reduce air pollution from both stationary and mobile pollutant sources as a component of the broader strategies that would reduce energy consumption and VMT, which include a number of land use strategies such as: planning for growth around livable corridors (addressed in Draft 2045 CAP Measures T1 and T2); limit parking (Measure T5); providing more options for short trips/neighborhood mobility areas (Measures T3 and T4); supporting zero emission vehicles and expanding vehicle charging stations (Measures T6–T9); and supporting local sustainability planning (Measures ES1–ES5, E1–E6, and W1–W2).

The frequency and severity of air quality impacts related to combustion emissions from operational activities (e.g., NO_x, PM₁₀ exhaust, PM_{2.5} exhaust) would likely decline in future horizon years 2035 and 2045 relative to horizon year 2030. Such a decline could occur as County-wide operational sources of air pollutants transition to increased electrification, particularly as a result of the CARB Advanced Clean Cars II rule. This rule states that by 2035, 100 percent of new passenger vehicles, light-duty trucks, and SUVs sold in California must be ZEVs (CARB 2023b). As the vehicle fleet turns over and vehicles are replaced with ZEV models, future horizon year emissions from mobile sources associated with future development under the Draft 2045 CAP would decrease.

Further, as utility providers increase the percentage of renewably sourced electricity pursuant to the mandated RPS targets (refer to Section 3.9, *Greenhouse Gas Emissions*, of this Revised Draft PEIR for additional information), energy emissions associated with future development under the Draft 2045 CAP would decrease. This would result in further additive emissions reductions for the electric vehicle fleet.

Future projects may be facilitated by the Draft 2045 CAP, such as new renewable energy facilities (Measure ES3) including utility-scale solar projects and associated infrastructure in the Antelope Valley, new or expanded recycled water facilities (Measure E5), and new or expanded waste processing facilities (Measures W1 and W2). Operation of these future facilities could result in fugitive dust emissions from increased vehicle travel on paved and unpaved roads and windblown dust that has settled on solar panels. Such future projects, if located in areas prone to high wind and/or in areas with exposed surfaces (e.g., unpaved surfaces with limited vegetated ground cover), could be subjected to re-entrained fugitive dust and/or windblown dust.

Applicants for future projects facilitated by the Draft 2045 CAP would be required to comply with AVAQMD Rule 403 to control dust emissions during any operational activities that generate fugitive dust, utilizing measures specified in these rules as applicable to each operational activity. All future discretionary projects would be subject to project-level CEQA analysis to determine whether operational air quality emissions are consistent with this criterion.

The location, design, and land use of future projects facilitated by the Draft 2045 CAP in the unincorporated areas of the County within the Antelope Valley Air Basin (AVAB) would incorporate Draft 2045 CAP land use and transportation strategies related to reducing vehicle trips for residents and employees, by (a) focusing increasing residential density near transit and including affordable housing options (Measure T1); and (b) increasing commercial and residential density, with new residential development planned for multi-family dwelling units (Measure T2). This would allow for increased mixed-use density at infill locations and near public transit and may reduce impacts across the horizon years, as combustion emissions (e.g., NO_x, PM₁₀ exhaust, PM_{2.5} exhaust) would be anticipated to decline in future horizon years 2035 and 2045 relative to horizon year 2030. Such a decline could occur as County-wide operational sources of operational air pollutants transition to increased electrification, as discussed above.

Future projects facilitated by the Draft 2045 CAP that implement these measures would not conflict with AQMP land use and transportation strategies that are intended to reduce VMT, reduce the frequency or severity of existing air quality violations or new violations, and achieve the timely attainment of air quality standards specified in the AVAQMD 2015 8-hour RACT SIP Analysis and 2017 Federal 75 ppb Ozone Attainment Plan. However, projects facilitated by the Draft 2045 CAP measures and actions could create significant emissions of criteria pollutants if they would include a sufficiently large number of operational emissions sources or intensive operational uses or processes. For instance, Draft 2045 CAP Measure ES3 would expand local solar power generation on existing and new development throughout the County and at County facilities, the operation of which could result in fugitive dust emissions from vehicle trips on unpaved surfaces, windblown dust settling on solar panels, or other similar types of operational activities. Therefore, operation of the Project may be inconsistent with Criterion No. 1 and impacts would be significant.

Criterion No. 2

While striving to achieve the NAAQS for ozone and the CAAQS for ozone and PM₁₀ through a variety of air quality control measures, the AVAQMD 2015 8-hour RACT SIP Analysis and 2017 Federal 75 ppb Ozone Attainment Plan and AVAQMD rules and regulations accommodates planned growth in the AVAB. With respect to the second criterion for determining consistency with air quality plan growth assumptions, the projections in the AVAQMD air quality plans for achieving air quality goals are based on assumptions in SCAG's 2016–2040 RTP/SCS regarding population, housing, and growth trends. Determining whether or not a project exceeds the assumptions reflected in the AVAQMD air quality plans involves the evaluation of consistency with applicable population, housing, and employment growth projections and appropriate incorporation of AQMP control measures. The following discussion provides an analysis with respect to this criterion.

For future projects located within the AVAB, which is under the jurisdiction of the AVAQMD, the AVAQMD 2015 8-hour RACT SIP Analysis and 2017 Federal 75 ppb Ozone Attainment Plan are the applicable air quality plans. The AVAQMD air quality plans rely on emissions forecasts based on the demographic and economic growth projections provided by SCAG's 2016–2040 RTP/SCS in devising its control strategies for reducing emissions to meet the NAAQS standards (AVAQMD 2017). The AVAQMD incorporates “VMT and speed distribution data... from the 2016 RTP/SCS adopted by SCAG” (AVAQMD 2017).

Construction

Control Strategies

The AVAB is designated nonattainment for ozone under the NAAQS and nonattainment for ozone and PM₁₀ under the CAAQS. The emissions of criteria pollutants associated with future projects facilitated by the Draft 2045 CAP could exceed AVAQMD thresholds for criteria pollutants. Any future project facilitated by Draft 2045 CAP measures and actions across horizon years 2030, 2035, and 2045 would be required to comply with CARB's requirements to minimize short-term emissions from on-road and off-road diesel equipment, including the ATCM to limit heavy-duty diesel motor vehicle idling to no more than five minutes at any given time, with AVAQMD's regulations such as Rule 403 for controlling fugitive dust, and Rule 1113 for controlling VOC emissions from architectural coatings. Furthermore, as applicable to the type of project, individual projects facilitated by Draft 2045 CAP measures and actions would comply with fleet rules to reduce on-road truck emissions.

Compliance with these measures and requirements would be consistent with and meet or exceed the requirements of the AVAQMD air quality plans for control strategies intended to reduce emissions from construction equipment and activities. Therefore, future construction facilitated by the Draft 2045 CAP measures and actions would be consistent with the control strategies of the AVAQMD air quality plans and impacts would be less than significant across horizon years 2030, 2035, and 2045. The magnitude of long-term impacts would remain relatively constant over time, even though more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets, because all future projects would be required to comply with AVAQMD construction control strategies.

Growth Projections

The Draft 2045 CAP would facilitate an increase in short-term employment compared to existing conditions. Although any construction facilitated by the Project would generate construction workers, it would be unlikely to create a substantial number of new construction jobs; construction-related jobs generated by the Project would likely be filled by employees within the construction industry within the greater Los Angeles County region and nearby population centers in counties adjacent to the Antelope Valley. Construction industry jobs generally have no regular place of business, as construction workers commute to job sites throughout the region, which may change several times a year. Moreover, these jobs would be temporary, lasting only through the duration of construction. This applies to potential impacts across horizon years 2030, 2035, and 2045. Furthermore, although projects facilitated by the Draft 2045 CAP could result in temporary construction jobs, the Draft 2045 CAP would support development already allowed

under the General Plan land use and employment assumptions, and housing expectations set forth in the 2021–2029 Housing Element.

As such, the Draft 2045 CAP would not result in an unanticipated increase in jobs outside of what was accounted for and projected within the General Plan. Therefore, the construction jobs generated by projects facilitated by the Project would not conflict with the long-term employment or population projections upon which the AVAQMD air quality plans are based and impacts would be less than significant across horizon years 2030, 2035, and 2045. The magnitude of long-term impacts would remain constant over time, even though more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP’s increasingly aggressive 2030, 2035, and 2045 GHG reduction targets, because the Draft 2045 CAP would not result in an unanticipated increase in jobs outside of what was accounted for and projected within the General Plan in all horizon years.

Operations

Control Strategies

Projects facilitated by the Draft 2045 CAP measures and actions in the unincorporated areas of the County within the AVAB would be required to comply with CARB motor vehicle standards, AVAQMD regulations for stationary sources and architectural coatings, Title 24 energy efficiency standards, and, to the extent applicable, to the growth projections in the 2016–2040 RTP/SCS, which are incorporated into the AVAQMD air quality plans.

In addition, the Draft 2045 CAP outlines several measures and actions that would result in GHG emissions reductions, which would support consistency with AVAQMD air quality plans for projects facilitated by the Draft 2045 CAP across the horizon years within the incorporated areas of the County. The AVAQMD air quality plans emissions reductions strategies are discussed below with references to relevant Draft 2045 CAP measures.

The AVAQMD air quality plans include land use and transportation strategies from the 2016–2040 RTP/SCS that are intended to reduce VMT and resulting regional mobile-source emissions. The applicable land use strategies included in the Draft 2045 CAP that would reduce emissions are as follows: planning for growth around livable corridors (addressed in Draft 2045 CAP Measures T1 and T2); limit parking (Measure T5); providing more options for short trips/neighborhood mobility areas (Measures T3 and T4); supporting zero emission vehicles and expanding vehicle charging stations (Measures T6–T9); and supporting local sustainability planning (Measures ES1–ES5, E1–E6, and W1–W2).

The location, design, and land use of future General Plan–anticipated growth in the unincorporated areas of the County would implement Draft 2045 CAP land use and transportation strategies related to reducing vehicle trips for residents and employees by increasing commercial and residential density with new residential development planned for multi-family dwelling units (Measure T2), which would allow for increased mixed-use density at infill locations and near public transit. Draft 2045 CAP Measure T1 focuses primarily on increasing residential density near transit and affordable housing.

Therefore, the Draft 2045 CAP, and projects implementing Draft 2045 CAP measures and actions, would not conflict with land use and transportation strategies in the AVAQMD air quality plans that are intended to reduce VMT. Rather, the Draft 2045 CAP includes measures and actions that would support the VMT reduction goals in the AVAB. These measures and actions are likely to result in greater reductions in VMT across the horizon years 2030, 2035, and 2045, particularly because Draft 2045 CAP Measures T1 and T2 focus growth in residential and employment density near transit and infill locations. The Project, and projects facilitating Draft 2045 CAP measures and actions across the horizon years, would not conflict with the control strategies of the AVAQMD air quality plans and impacts would be less than significant. The magnitude of long-term impacts would remain relatively constant over time, even though more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets, because all future projects would be required to comply with AVAQMD operational control strategies.

Growth Projections

The emissions inventory for the AVAB is formed, in part, by existing city and county general plans and population, employment and VMT forecasts by SCAG. A project might be in conflict with the applicable air quality plan if the development's growth is greater than that anticipated in the local general plan and SCAG's growth projections. Projects facilitated by Draft 2045 CAP measures and actions would be required to undergo subsequent environmental review pursuant to CEQA and would be required to demonstrate compliance with the AVAQMD air quality plans. Individual projects also would be required to demonstrate compliance with AVAQMD rules and regulations governing air quality.

The County continues to coordinate with AVAQMD and SCAG to ensure relevant growth projections, land use planning efforts, and local development patterns are accounted for in the regional planning and air quality planning processes. As discussed above, the Draft 2045 CAP is a policy document intended to reduce community-wide GHG emissions and would support development already allowed under the land use assumptions identified in the General Plan's Land Use Element and 2021–2029 Housing Element. The Draft 2045 CAP itself does not propose any change to existing General Plan land use or zoning designations for any parcel in the unincorporated areas of the County, nor does it propose land use specific projects. Therefore, the implementation of Draft 2045 CAP measures and actions would not conflict with growth projections and would not conflict with or obstruct the implementation of the applicable air quality plan. Many proposed Draft 2045 CAP measures would reduce emissions, which would avoid impacts related to conflicts with an applicable air quality plan.

The purpose of the Draft 2045 CAP is to reduce GHG emissions across the horizon years. The Draft 2045 CAP's measures and actions encompass the broad categories of climate leadership, transportation, building energy and water, and waste. While these measures may result in short-term increases of air pollutant emissions during construction of new facilities, implementation of the Draft 2045 CAP would result in an overall improvement in regional long-term air quality by establishing a more sustainable framework. The AVAQMD air quality plans were prepared to accommodate growth, reduce the levels of pollutants within the areas under the jurisdiction of AVAQMD, return clean air to the region, and minimize the impact on the economy. Projects that

are considered consistent with the AVAQMD air quality plans would not interfere with attainment because this growth is included in the projections used in the formulation of the AVAQMD air quality plans.

The Draft 2045 CAP is a policy-level document that does not include site-specific projects. Because the Draft 2045 CAP does not propose changes to existing General Plan land use designations, the Draft 2045 CAP would support development already allowed under the General Plan land use assumptions and 2021–2029 Housing Element; and would include measures, such as Measure T1 to encourage density near high-quality transit areas and Measure T2 to develop land use plans addressing jobs/housing balance and increased mixed use to the extent allowed by the general Plan. Therefore, the Draft 2045 CAP would not result in an unanticipated increase in density or population growth outside of what was accounted for in the General Plan with the 2021–2029 Housing Element and would not conflict with the growth projections.¹⁰

The AVAQMD air quality plans (including its VMT reduction goals) are based on the growth projections in the 2016–2040 RTP/SCS. The Draft 2045 CAP is based on similar population and employment numbers in the 2045 forecast as compared to those in the 2020–2045 RTP/SCS's 2045 forecast. As discussed above under control strategies, the Draft 2045 CAP includes measures that are expected to result in substantially less daily VMT and therefore reduce VMT per service population across horizon years 2030, 2035, and 2045. The VMT reduction goals in the Draft 2045 CAP measures would be consistent with the VMT reduction goals and corresponding growth projections of the AQMP and impacts would be less than significant. The magnitude of long-term impacts would remain constant over time, even though more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets, because the Draft 2045 CAP would be consistent with the VMT reduction goals and corresponding growth projections of the AVAQMD for each horizon year.

Summary

The Draft 2045 CAP identifies strategies, measures, and various implementing actions to reduce GHG emissions in unincorporated areas of the County. The GHG emissions reduction goals of the Draft 2045 CAP were informed by the development assumptions of the adopted 2021–2029 Housing Element and the General Plan buildout conditions. The 2021–2029 Housing Element Program EIR concluded that, while the 2021–2029 Housing Element was consistent with the applicable air quality plan policies of the applicable air quality plans aimed at reducing air emissions and would not increase population or employment in the County, the 2021–2029 Housing Element would have the potential to exceed the applicable criteria pollutant mass daily thresholds. As the Draft 2045 CAP would not alter the development assumptions of the adopted

¹⁰ The SCAG 2016–2040 RTP/SCS forecasts a 2040 population of 1,273,700 persons in unincorporated Los Angeles County (see Demographics & Growth Forecast Appendix [SCAG 2016]). The 2021–2029 Housing Element forecast a 2045 population of 1,258,000 (see Section 4.14 of Los Angeles County 2021). Given that the projected population in 2045 under the Draft 2045 CAP would be less than the projected population in 2040 in the SCAG 2016–2040 RTP/SCS, the Draft 2045 CAP would not conflict with the growth projections.

2021–2029 Housing Element, the Project would not be the cause of or alter the significant and unavoidable impact identified in the 2019 Program EIR.

As discussed above in response to Criterion No. 1, the construction of future projects facilitated by the Draft 2045 CAP measures and actions could increase the frequency or severity of an existing violation or cause or contribute to new violations and impacts would be significant. The frequency with which these impacts may be significant and their degree of severity are likely to vary across horizon years 2030, 2035, and 2045, depending on the future projects that may be facilitated by the Draft 2045 CAP measures and actions.

The operation of future projects facilitated by the Draft 2045 CAP that would implement the Draft 2045 CAP measures and actions would not conflict with the applicable SCAQMD and AVAQMD air quality plan land use and transportation strategies that are intended to reduce VMT; however, these projects may increase the frequency or severity of existing air quality violations or new violations, and may prevent the achievement of the timely attainment of air quality standards specified in the applicable air quality plan. As such, the Draft 2045 CAP would result in a significant impact related to a conflict or obstruction of implementation of applicable air quality plans related to Criterion No. 1.

Measures and actions are included in the Draft 2045 CAP that would reduce air pollutant emissions, likely to greater effect across horizon years 2030, 2035, and 2045. Nonetheless, the Draft 2045 CAP could conflict with Criterion No. 1 (numerical significance thresholds), causing a significant impact to result. The magnitude of long-term impacts would increase over time to the extent that more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets. The Draft 2045 CAP would not conflict with Criterion No. 2.

Mitigation Measures 3.4-1 and 3.4-2 would reduce this impact. Mitigation measures would apply only if specific projects have potentially significant impacts after compliance with independently enforceable air quality regulations that reduce impacts.

Mitigation Measure 3.4-1: Construction Emissions. If, during subsequent project-level environmental review, construction-related criteria air pollutants are determined to have the potential to exceed the applicable air quality management district (AQMD) adopted thresholds of significance, the lead agency shall require applicants for new projects facilitated by the Draft 2045 CAP measures and actions to incorporate mitigation measures to avoid or reduce air pollutant emissions during construction activities. Mitigation measures that may be identified during the environmental review include, but are not limited to:

- When wind gusts exceed 25 miles per hour, cease all active construction activities or follow the applicable guidelines outlined in Table 3 of SCAQMD Rule 403 or Sections (C)(10) through (C)(14) of AVAQMD Rule 403.
- Use construction equipment rated by the U.S. Environmental Protection Agency (USEPA) as having Tier 3 (model year 2006 or newer) or Tier 4 (model year 2008 or newer) emission limits, applicable for engines between 50 and 750 horsepower, as commercially available.

- Ensure that construction equipment is properly serviced and maintained to the manufacturer's standards.
- Limit nonessential idling of construction equipment to no more than five consecutive minutes.
- Where acceptable to the fire department, control weed growth by mowing instead of disking, thereby leaving the ground undisturbed and with a mulch covering.
- Water all active construction areas at least three times daily or four times daily if needed to control dust emissions. Watering should be sufficient to prevent airborne visible dust from leaving the site. Where local water supplies are not available in sufficient quantities within unincorporated areas of the County, use nontoxic chemical soil stabilizers or dust suppressants to control dust emissions in sufficient amounts to prevent airborne visible dust from leaving the site.
- Increase watering frequency and/or application frequency of nontoxic chemical soil stabilizers or dust suppressants whenever wind speeds exceed 25 miles per hour. Reclaimed water shall be used whenever possible.
- Cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least two feet of freeboard (i.e., the minimum required space between the top of the load and the top of the trailer).
- Pave, apply water three times daily or as often as necessary to control dust, or where local water supplies are not available in sufficient quantities within unincorporated areas of the County, apply (nontoxic) soil stabilizers or dust suppressants on all unpaved access roads, parking areas, and staging areas at construction sites.
- Sweep daily (with water sweepers using reclaimed water if possible), or as often as needed, all paved access roads, parking areas, and staging areas at the construction site to control dust.
- Sweep public streets daily (with water sweepers using reclaimed water if possible) in the vicinity of the Project site, or as often as needed, to keep streets free of visible soil material.
- Where local water supplies are not available in sufficient quantities within unincorporated areas of Los Angeles County, hydroseed or apply nontoxic chemical soil stabilizers or dust suppressants to inactive construction areas.
- Enclose, cover, water three times daily, or apply nontoxic chemical soil stabilizers or dust suppressants to exposed stockpiles (dirt, sand, etc.).
- In areas with existing vegetation, install the facility components with minimal disturbance. Take all necessary precautions to not use vehicles or machinery for grading or alter the existing grade in these areas.
- Design project facilities to limit ground disturbance or grading to only the access roads, substations and related underground transmission lines, tanks, basins, inverter pads, or other areas required by the County. Ensure that the facilities comply with all applicable grading standards.

- Site utility-scale renewable energy projects in a way that minimizes site disturbance, such as grading, brush clearance, and other forms of earthwork.
- In areas with existing vegetation, install facility components with minimal disturbance. Take all necessary precautions to avoid using vehicles or machinery for grading, or altering the existing grade in these areas.
- Establish and maintain a landscaped buffer:
 - Maintain a landscaped area at least 10 feet deep along any facility perimeter fencing and between such fencing and any public right-of-way or adjacent property with an existing residential or agricultural use.
 - Establish the landscaped area in such manner that adequate corner sight distance is maintained from all access roads to the public right-of-way to the satisfaction of the County of Los Angeles Department of Public Works.
 - Maintain the landscaped area throughout the life of the facility.

Mitigation Measure 3.4-2: Operational Fugitive Dust Emissions. If, during subsequent project-level environmental review, operational fugitive dust emissions are determined to have the potential to be significant, the lead agency shall require applicants for new projects facilitated by the Draft 2045 CAP measures and actions to incorporate mitigation measures to avoid or reduce air pollutant emissions during operational activities. Mitigation measures that may be identified during the environmental review include, but are not limited to, the following:

- Unpaved main access roads for operational vehicle trips shall be paved or effectively stabilized using soil stabilizers that can be determined to be as efficient as or more efficient for fugitive dust control than California Air Resources Board–approved soil stabilizers, and that shall not increase any other environmental impacts, including loss of vegetation.
- All other unpaved roads shall be stabilized using water or soil stabilizers so that vehicle travel on these roads does not cause visible dust plumes.
- Gravel pads, grizzly strips, or other material track-out control methods approved for use by the local AQMD shall be installed where vehicles enter or exit unpaved roads onto paved roadways.
- Traffic speeds on unpaved roads shall be limited to no more than 10 miles per hour, except that vehicles may travel up to 25 miles per hour on stabilized unpaved roads as long as such speeds do not create visible dust emissions. Traffic speed signs shall be displayed prominently at all site entrances and at egress point(s) from the central maintenance complex.
- Where acceptable to the local and County fire departments, all unpaved, non-road surfaces that may potentially be disturbed shall be covered with a minimum of 3 inches of mulch. Where acceptable to the local and County fire departments, vegetation shall be maintained at 6 inches height.
- All trucks hauling dirt, sand, soil, or other loose materials shall be covered or shall maintain at least 6 inches of freeboard (minimum vertical distance between top of the

load and top of the trailer) in accordance with California Vehicle Code Section 23114.

- A fugitive dust control plan that includes a dust plume response plan shall be prepared for review and approval by applicable agencies before any earthwork activities.
- Where acceptable to the local and County fire departments, weed control shall be accomplished by mowing instead of disking, thereby leaving the ground undisturbed and with a mulch covering.
- Existing vegetation may be mowed, but removal of existing vegetation root systems shall be prohibited, except where necessary for construction of access roads, substations and related underground transmission lines, tanks, basins, inverter pads, or other areas required by the County.
- Continuous particulate monitors shall be installed at the discretion of the lead agency.

Mitigation Measure 3.4-3: Architectural Coating VOC Emissions. If, during subsequent project-level environmental review, it is determined that VOC emissions impacts may be significant, the lead agency shall require Super-Compliant VOC-content architectural coatings (0 grams per liter to less than 10 grams per liter VOC) to be used during construction and operational application of paints and other architectural coatings to reduce ozone precursors. If paints and coatings with VOC content of 0 grams/liter to less than 10 grams/liter cannot be utilized, the developer shall avoid application of architectural coatings during days when the USEPA, CARB, or SCAQMD has forecasted the Air Quality Index for ozone to be greater than 100 for the project location.

Significance after Mitigation: Future projects in the unincorporated County that would implement Draft 2045 CAP measures and actions would result in a significant and unavoidable impact related to Criterion No. 1 regarding whether the Project, as a result of projects facilitated by the Draft 2045 CAP measures and actions, would conflict with or obstruct the implementation of the applicable air quality plan. Implementation of Mitigation Measures 3.4-1 through 3.4-3 would reduce the severity of construction and operational emissions. However, even with the implementation of the measures, these impacts are not accurately quantifiable at this time and may not be reduced to below the thresholds. As a result, the impact under Criterion No. 1 for construction and operation would remain significant and unavoidable. No feasible mitigation measures are available that would reduce impacts below SCAQMD's or AVAQMD's thresholds on a programmatic level, and feasible mitigation may not be available for individual projects facilitated by the Draft 2045 CAP measures and actions. Impacts would be significant and unavoidable. No additional feasible mitigation measures are available. The magnitude of long-term impacts would increase over time to the extent that more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets. Because the exact specifications for projects that may be facilitated by the Draft 2045 CAP are unknown, this determination applies to horizon years 2030, 2035, and 2045.

Criterion b) Whether the Project would result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard.

Impact 3.4-2: The Project, as a result of projects facilitated by Draft 2045 CAP measures and actions, could result in a cumulatively considerable net increase of a criteria pollutant for which the Project region is nonattainment under an applicable federal or state ambient air quality standard. (Significant and Unavoidable)

Implementation of Draft 2045 CAP measures and actions could result in construction and operational emissions that may cause a cumulatively considerable net increase of a criteria pollutant for which the region is nonattainment. The SCAB is designated under federal and state ambient air quality standards as nonattainment for ozone and PM_{2.5} and state nonattainment for PM₁₀. MDAB is designated under federal and state ambient air quality standards as nonattainment for ozone and state nonattainment for PM₁₀. Based on the most recently adopted significance thresholds in the SCAQMD CEQA Air Quality Handbook and the AVAQMD CEQA and Federal Conformity Guidelines, the Draft 2045 CAP would result in a significant impact of a federal or state nonattainment pollutant if emissions would exceed the values shown in **Table 3.4-6, Criteria Pollutant Emissions Significance Thresholds—Los Angeles County.**

**TABLE 3.4-6
CRITERIA POLLUTANT EMISSIONS SIGNIFICANCE THRESHOLDS—LOS ANGELES COUNTY**

Phase	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
South Coast Air Basin (Los Angeles County); Pounds per Day						
Construction	75	100	550	150	150	55
Operations	55	55	550	150	150	55
Antelope Valley Air Basin (Los Angeles County); Pounds per Day						
Construction	137	137	548	137	82	65
Operations	137	137	548	137	82	65
Antelope Valley Air Basin (Los Angeles County); Tons per Year						
Construction	25	25	100	25	15	12
Operations	25	25	100	25	15	12

NOTES: CO = carbon monoxide; NO_x = nitrogen oxides; PM_{2.5} = inhalable particles with diameters that are generally 2.5 micrometers and smaller; PM₁₀ = inhalable particles with diameters that are generally 10 micrometers and smaller; SO_x = sulfur oxides; VOC = volatile organic compounds
SOURCES: SCAQMD 2019; AVAQMD 2016.

Construction Emissions

Emissions of ozone precursors, such as VOC and NO_x, are produced from the use of on-road and off-road motorized vehicles and heavy-duty construction equipment associated with construction activities. In addition, fugitive dust emissions would result from demolition and various soil-handling activities. Localized concentrations of construction-generated TAC emissions, including emissions of diesel particulate matter from diesel-powered equipment, can increase health risk for

nearby sensitive receptors. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of construction activity, and prevailing weather conditions.

Implementation of several of the Draft 2045 CAP measures would reduce construction emissions resulting from projects facilitated by the Draft 2045 CAP measures and actions within the unincorporated areas of the County. The Draft 2045 CAP transportation measures would expand the use of zero-emission technologies for off-road vehicles and equipment, per Measure T9, which would reduce construction emissions. However, Draft 2045 CAP measures and actions may facilitate new facilities and projects such as building electrification (Measures E1 and E2), new renewable energy facilities (Measure ES3), energy storage facilities (Measure ES4), building retrofits for energy efficiency (Measure E4), new or expanded recycled water facilities (Measure E5), new electric vehicle charging station infrastructure (Measure T6), new or expanded waste processing facilities (Measures W1 and W2), and demolition of impervious surfaces and planting trees (Measure A3). These measures and actions may result in construction activities that cause an increase in temporary air pollutant emissions that could vary across horizon years 2030, 2035, and 2040.

The frequency with which these impacts may be significant and their degree of severity are likely to vary across the horizon years, depending on the future projects that may be facilitated by the Draft 2045 CAP measures and actions. The frequency and severity of air quality impacts could decline in future horizon years 2035 and 2045 relative to horizon year 2030. Such a decline could occur as County-wide construction vehicle and equipment inventories turn over and a greater percentage of the inventory meets more stringent emissions standards, such as the CARB Truck and Bus regulation (13 CCR Section 2025) and the CARB emissions standards for off-road diesel construction equipment (13 CCR Section 2449). These changes would reduce the potential for impacts related to NO_x, PM₁₀, and PM_{2.5} exhaust emissions.

The size and intensity of any future project facilitated by Draft 2045 CAP measures and actions would dictate whether the quantity of air pollutant emissions during construction are above or below the thresholds of significance. New facilities may be facilitated by Draft 2045 CAP measures and actions, such as new renewable energy facilities including County facilities and utility-scale solar and associated infrastructure (Measure ES3), new or expanded recycled water facilities (Measure E5), new electric vehicle charging station infrastructure (Measure T6), and new or expanded waste processing facilities (Measures W1 and W2), which may occur as large construction projects. There is also the potential that the cumulative impact of multiple small-scale projects, such as multiple projects for building retrofits (Measure E4) and the demolition of impervious surfaces and planting of trees (Measure A3), could be significant from the construction of such future facilities and projects even with implementation of these Draft 2045 CAP measures.

Any future project developed within the County facilitated by Draft 2045 CAP measures and actions would be required to comply with SCAQMD and AVAQMD rules and regulations as well as conduct their own applicable CEQA analysis. Significance determinations would be based on the individual project specifics. Furthermore, future construction activities associated with the

Draft 2045 CAP would be required to comply with the CARB Air Toxics Control Measure, which limits diesel-powered equipment and vehicle idling to no more than five minutes at a location, and the CARB In-Use Off-Road Diesel Vehicle regulation, CARB Truck and Bus regulation, and CARB ACT regulation, which all require construction equipment and vehicle fleet operators to repower or replace higher-emitting equipment with less polluting models, including zero- and near-zero-emissions on-road truck technologies as they become developed and commercially available. Additionally, construction of projects facilitated by the Draft 2045 CAP measures and actions would be required to comply with SCAQMD and AVAQMD rules and regulations including Rule 403 for the control of fugitive dust and Rule 1113 for the control of VOC emissions from architectural coatings (please note that both air districts share the same numbering system for these rules). Any large roadway construction project facilitated by Draft 2045 CAP measures and actions in the SCAQMD would also be required to comply with SCAQMD Rule 403.2, which specifies additional fugitive dust controls. Mandatory compliance with these CARB and SCAQMD rules and regulations would reduce emissions, particularly for NO_x, PM₁₀, and PM_{2.5}, during future construction activities of future projects facilitated by the Draft 2045 CAP.

Even with mandatory compliance with CARB, SCAQMD, and AVAQMD rules regulations, some future projects associated with implementation of Draft 2045 CAP measures and actions could be large enough in scale and/or intensity such that many pieces of heavy-duty construction equipment and/or heavy-duty trucks may be required and that construction period emissions could exceed the significance thresholds. Therefore, construction activities associated with future projects facilitated by Draft 2045 CAP measures and actions could result in significant criteria pollutant air quality impacts. These impacts apply to each horizon year; however, the frequency and severity to which these impacts may be significant is likely to vary across horizon years 2030, 2035, and 2045, as explained above, depending on the future projects that may be facilitated by the Draft 2045 CAP measures and actions. The magnitude of long-term impacts would increase over time to the extent that more projects would be facilitated by CAP measures and actions to meet the Draft 2045 CAP's increasingly aggressive 2030, 2035, and 2045 GHG reduction targets.

Operational Emissions

Implementation of the Draft 2045 CAP measures and actions could affect operational criteria pollutant emissions resulting from projects facilitated by the Draft 2045 CAP measures and actions in the unincorporated County portion in the SCAB and MDAB from vehicle trips traveling within the County, energy sources such as natural gas combustion, and area sources such as landscaping equipment and consumer products usage.

Several Draft 2045 CAP measures promote additional transit facilities and operations as well as pedestrian and bicycle facilities to reduce vehicle fuel use by encouraging a shift in the mode of transportation that people use. Draft 2045 CAP measures T3 and T4 would expand bicycle and pedestrian infrastructure and encourage transit, active transportation, and alternative modes of transportation. Draft 2045 CAP measures W1 and W2 would divert organic waste and recyclable materials from landfills, and these measures may result in new or expanded waste facilities such as composting facilities or recycling centers that have the potential to produce odor, dust, and

other emissions during operation; but the increased waste diversion from landfills to potentially closer facilities, such as recycling centers, would reduce regional Countywide vehicle trips and VMT. These reductions may vary across horizon years 2030, 2035, and 2045 as these measures are implemented. Any projects facilitated by Draft 2045 CAP measures and actions would not represent a change in local land use policies.
